Cisco DX70

The Cisco DX70 offers a combination of value and superior collaboration capabilities on a personal workspace device that transparently transitions between phone, video, and unified communications features. The 14-inch screen acts as the touch interface so you can easily move from one collaboration tool to another. The DX70 can connect with an external monitor in mirror mode to work on a larger screen.

Best Practice

A DX70 increases the productivity for the remote worker, while simultaneously serving as an extended screen surface for the laptop. The system is placed so that daylight coming from the windows contributes positively to the video quality and no direct sunlight enters directly into the camera. The camera sees a calm, video-friendly background.

Additional space on the desktop in front of the system allows use of the document camera to share anything from handwritten notes to physical prototypes.

To reduce the reverberation in the room, an acoustical panel with a printed image is placed on the wall behind the system and some curtains are placed at the windows. Bookshelves on the sidewall also help to diffuse the sound and reduce the risk of flutter echo.

* This is a representation of a physical setup built and tested by Cisco R&D. Other setups are possible and might be equally good. Room dimensions should always adhere to local rules and regulations. Further detailing and development will occur with future versions of Project Workspace.
