Cisco DX80

The Cisco DX80 is an unparalleled, all-in-one collaboration device for the personal workspace that seamlessly transitions from use as a computer screen to phone, video, and unified communications features. The large, 23-inch screen acts as a touch interface so you can easily move from one collaboration tool to another. Superior audio features ensure that the DX80 supports open work environments.

Best Practice

A DX80 for high-quality video collaboration increases the productivity for the mobile worker, while simultaneously serving as an extended screen surface for the laptop. The camera sees a calm, video-friendly background. Additional space on the desktop in front of the system allows use of the document camera to share anything from handwritten notes to physical prototypes.

Give special attention to creating the acoustic privacy and comfort of the quiet rooms. In addition to securing low reverberation times with sufficient sound absorption, build the room with sufficient sound insulation from the surrounding spaces. Use a properly insulated door rather than regular sliding doors without insulation.

This is a representation of a physical setup built and tested by Cisco R&D. Other setups are possible and might be equally good. Room dimensions should always adhere to local rules and regulations. Further detailing and development will occur with future versions of Project Workspace.
