true Use Uint8Array implementation (fastest)\n * === false Use Object implementation (most compatible, even
IE6)\n * \n * Browsers
that support typed arrays are IE 10+, Firefox 4+, Chrome 7+, Safari 5.1+,\n * Opera 11.6+, iOS 4.2+.\n * \n * Due to
various browser bugs, sometimes the Object implementation will be used even\n * when the browser supports typed
arrays.\n * \n * Note:\n * - Firefox 4-29 lacks support for adding new properties to `Uint8Array` instances,\n *
See: https://bugzilla.mozilla.org/show\_bug.cgi?id=695438.\n * - Chrome 9-10 is missing the
`TypedArray.prototype.subarray` function.\n * - IE10 has a broken `TypedArray.prototype.subarray` function
which returns arrays of\n * incorrect length in some situations.\n * \n * We detect these buggy browsers and set
`Buffer.TYPED_ARRAY_SUPPORT` to `false` so they\n * get the Object implementation, which is slower but
behaves correctly.\n * \n * \n * Buffer.TYPED_ARRAY_SUPPORT = global.TYPED_ARRAY_SUPPORT !==

Creates an IOHandler subtype that sends model artifacts to HTTP server.\n * An HTTP request of the
`multipart/form-data` mime type will be sent to the\n * `path` URL. The form data includes artifacts that represent
the topology\n * and/or weights of the model. In the case of Keras-style `tf.Model`, two\n * blobs (files) exist in
form-data:\n * - A JSON file consisting of `modelTopology` and `weightsManifest`.\n * - A binary weights file
consisting of the concatenated weight values.\n * These files are in the same format as the one generated by\n *
[tfjs_converter](https://js.tensorflow.org/tutorials/import-keras.html).\n * The following code snippet
exemplifies
the client-side code that uses this\n * function:\n * ```\n * const model = tf.sequential();\n * model.add(\n *
tf.layers.dense({units: 1, inputShape: [100], activation: 'sigmoid'}));\n * \n * const saveResult = await
model.save(tf.io.http(\n * 'http://model-server:5000/upload', {requestInit: {method: 'PUT'}}));\n *
console.log(saveResult);\n * ```\n * \n * If the default `POST` method is to be used, without any custom parameters\n
* such as headers, you can simply pass an HTTP or HTTPS URL to `model.save`:\n * ```\n * const saveResult
= await model.save('http://model-server:5000/upload');\n * ```\n * \n * The following GitHub Gist\n *
https://gist.github.com/dsmilkov/1b6046fd6132d7408d5257b0976f7864\n * implements a server based on
[flask](https://github.com/pallets/flask) that\n * can receive the request. Upon receiving the model artifacts via the
request,\n * this particular server reconstitutes instances of [Keras\n * Models](https://keras.io/models/model/) in
memory.\n

Draws a `tf.Tensor` of pixel values to a byte array or optionally a canvas.
When the dtype of the input is 'float32', we assume values in the range [0-1].
Otherwise, when input is 'int32', we assume values in the range [0-255].
Returns a promise that resolves when the canvas has been drawn to.
@param img A rank-2 or rank-3 tensor. If rank-2, draws grayscale. If rank-3, must have depth of 1, 3 or 4.
When depth of 1, draws grayscale. When depth of 3, we draw with the first three components of the depth dimension

```

corresponding to r, g, b and alpha = 1. When depth of  $n * 4$ , all four components of the depth dimension correspond to r, g, b, a.

`@param canvas` The canvas to draw to.

containing\n * `inChannels` convolutional filters of depth 1, this op applies a\n * different filter to each input
channel (expanding from 1 channel to\n * `channelMultiplier` channels for each), then concatenates the results\n *
together. The output has `inChannels * channelMultiplier` channels.\n * \n * See\n *
https://www.tensorflow.org/api_docs/python/tf/nn/depthwise_conv2d(\n *
https://www.tensorflow.org/api_docs/python/tf/nn/depthwise_conv2d)\n * for more details.\n * \n * @param x The
input tensor, of rank 4 or rank 3, of shape\n * `[batch, height, width, inChannels]`. If rank 3, batch of 1 is\n *
assumed.\n * @param filter The filter tensor, rank 4, of shape\n * `[filterHeight, filterWidth, inChannels,
channelMultiplier]`.\n * @param strides The
 strides of the convolution: `[strideHeight,\n * strideWidth]`. If strides is a single number, then `strideHeight ==\n *
strideWidth`.\n * @param pad The type of padding algorithm.\n * - `same` and stride 1: output will be of same size
as input,\n * regardless of filter size.\n * - `valid`: output will be smaller than input if filter is larger\n *
than 1x1.\n * - For more info, see this guide:\n * https://www.tensorflow.org/api_guides/python/nn#Convolution(\n *
https://www.tensorflow.org/api_guides/python/nn#Convolution)\n * @param dilations The dilation rates:
`[dilationHeight, dilationWidth]`\n * in which we sample input values across the height and width dimensions\n *
in atrous convolution. Defaults to `[1, 1]`. If `rate` is a single\n * number, then `dilationHeight ==
dilationWidth`. If it is greater than\n * 1, then all values of `strides` must be 1.\n * @param dataFormat: An
optional string from: "NHWC", "NCHW". Defaults to\n *
 "NHWC". Specify the data format of the input and output data. With the\n * default format "NHWC", the
data is stored in the order of: [batch,\n * height, width, channels]. Only "NHWC" is currently supported.\n *

// A Javascript implementaion of Richard Brent's Xorgens xor4096 algorithm.
// This fast non-cryptographic random number generator is designed for use in Monte-Carlo algorithms. It combines a long-period xorshift generator with a Weyl generator, and it passes all common batteries of stastical tests for randomness while consuming only a few nanoseconds for each prng generated. For background on the generator, see Brent's paper: "Some long-period random number generators using shifts and xors."
// http://arxiv.org/pdf/1004.3115v1.pdf
Usage:
var xor4096 = require('xor4096');
random = xor4096(1); // Seed with int32 or string
assert.equal(random(), 0.1520436450538547); // (0, 1) range, 53 bits.
assert.equal(random.int32(), 1806534897); // signed int32, 32 bits.
// For nonzero numeric keys, this impelementation provides a sequence identical to that by Brent's xorgens 3 implementaion in C. This implementation also provides for initalizing the generator with string seeds, or for saving and restoring the state of the generator.
// On Chrome, this prng benchmarks about 2.1 times slower than Javascript's built-in Math.random().

filters of depth 1, this op applies a\n * different filter to each input channel (expanding from 1 channel to\n *

object with the following properties:\n * @param x The input tensor, of rank 4 or rank 3, of shape\n *
`[batch, height, width, inChannels]`. If rank 3, batch of 1 is\n * assumed.\n * @param filter The filter tensor, rank 4, of
shape\n * `[filterHeight, filterWidth, inChannels, channelMultiplier]`. \n * @param strides The strides of the
convolution: `[strideHeight,\n * strideWidth]`. If strides is a single number, then `strideHeight ==\n *
strideWidth`. \n * @param pad The type of padding algorithm.\n * - `same` and stride 1: output will be of same size

```

as input, regardless of filter size. - `valid`: output will be smaller than input if filter is larger than 1x1. - For more info, see this guide: https://www.tensorflow.org/api_guides/python/nn#Convolution

`@param dilations` The dilation rates: `[dilationHeight, dilationWidth]` in which we sample input values across the height and width dimensions in atrous convolution. Defaults to `[1, 1]`. If `rate` is a single number, then dilationHeight == dilationWidth` . If it is greater than 1, then all values of strides` must be 1.`

`@param dataType` An optional string from: `"NHWC", "NCHW"`. Defaults to `"NHWC"`. Specify the data format of the input and output data. With the default format `"NHWC"`, the data is stored in the order of: `[batch, height, width, channels]`. Only `"NHWC"` is currently supported.

`@param dimRoundingMode` A string from: `'ceil', 'round', 'floor'`. If none is provided, it will default to `truncate`.

`@param bias` Tensor to be added to the result.

`@param activation` Name of activation kernel (defaults to `'linear'`).

`@param preluActivationWeights` Tensor of prelu weights to be applied as part of a `'prelu'` activation, typically the same shape as `x`.`

`@param leakyreluAlpha` Optional. Alpha to be applied as part of a `'leakyrelu'` activation.

import { BackendValues, DataType, TensorBuffer, TypedArray,
util } from '@tensorflow/tfjs-core';
export function uniqueImpl(
  values: BackendValues, axis: number, shape:
number[], dtype: DataType): {
  outputValues: BackendValues,
  outputShape: number[],
  indices:
BackendValues
} {
  // Normalize and validate axis.
  const $axis = util.parseAxisParam(axis, shape)[0];
  //
  // Calculate the new shape that is suitable for extracting data along the
  // given axis.
  //
  // The rank is 3.
  // The
size of the 1st dimension is the size of all the axes < the given axis.
  // The size of the 2nd dimension is the same as
the size of the given axis.
  // The size of the 3rd dimension is the size of all the axes > the given axis.
  //
  // For
example, for a 4D tensor with shape=[2, 3, 5, 4] and axis=2, the
  // newShape would be: [2*3, 5, 4].
  //
  // Note
that this is not the final output shape. This will be the shape for an
  // intermediate TensorBuffer (see inputBuffer
below) to allow us to extract
  // values along
the given axis. To demonstrate how it works, consider the
  // following example:
  //
  // Input: a 3D tensor, with
shape [1, 2, 3]
  //
  //
  // [1,2,3],
  // [4,5,6]
  // ]
  //
  // Axis: 2 (the last axis).
  // Along axis
2, we expect to extract 3 tensors: [1,4], [2,5], [3,6].
  //
  // For this example, newShape would be: [2, 3, 1], where
2 is calculated from
  // 1*2. The re-shaped data would look like:
  //
  //
  // [1], [2], [3]
  //
  // ],
  //
  // [4], [5], [6]
  //
  // ]
  //
  // Then, we can construct a 3-level nested loop by the following
dimension
  // order to extract the values along the axis (dimension1):
  // i: dimension1 // 0,1,2
(newShape[1])
  // m: dimension0 // 0,1 (newShape[0])
  // n: dimension2 // 0 (newShape[2])
  //
  //
  // m, i, n
