The elements are compared for equality with the [equals][Any.equals] function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`@SinceKotlin("1.4")`

public expect infix fun ShortArray?.contentEquals(other: ShortArray?): Boolean

* Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order. The elements are compared for equality with the [equals][Any.equals] function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`@SinceKotlin("1.4")`

public expect infix fun IntArray?.contentEquals(other: IntArray?): Boolean

* Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order. The elements are compared for equality with the [equals][Any.equals] function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`@SinceKotlin("1.4")`

public expect infix fun LongArray?.contentEquals(other: LongArray?): Boolean

* Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order. The elements are compared for equality with the [equals][Any.equals] function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`@SinceKotlin("1.4")`

public expect infix fun FloatArray?.contentEquals(other: FloatArray?): Boolean

* Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order. The elements are compared for equality with the [equals][Any.equals] function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`@SinceKotlin("1.4")`

public expect infix fun DoubleArray?.contentEquals(other: DoubleArray?): Boolean

* Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order. The elements are

compared for equality with the [equals][Any.equals] function.

* For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`BooleanArray?.contentEquals(other: BooleanArray?): Boolean`

* Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order.

* The elements are compared for equality with the [equals][Any.equals] function.

* For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`CharArray?.contentEquals(other: CharArray?): Boolean`

* Returns a hash code based on the contents of this array as if it is [List].

`IntArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`LongArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`FloatArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`DoubleArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`BooleanArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`CharArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`<T> Array<out T>?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`ByteArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`ShortArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`IntArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`LongArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`FloatArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`DoubleArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

`BooleanArray?.contentHashCode(): Int`

* Returns a hash code based on the contents of this array as if it is [List].

inline fun <K, V, M : MutableMap<in K, in V>> IntArray.associateTo(destination: M, transform: (Int) -> Pair<K,
V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given array. If any of two pairs would have the same key the last one gets added to the map.

@sample
samples.collections.Arrays.Transformations.associateArrayOfPrimitivesTo

public inline fun <K, V, M :
MutableMap<in K, in V>> LongArray.associateTo(destination: M, transform: (Long) -> Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given array. If any of two pairs would have the same key the last one gets added to the map.

@sample
samples.collections.Arrays.Transformations.associateArrayOfPrimitivesTo

public inline fun <K, V, M : MutableMap<in K, in V>> FloatArray.associateTo(destination: M, transform: (Float) ->
Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given array. If any of two pairs would have the same key the last one gets added to the map.

@sample
samples.collections.Arrays.Transformations.associateArrayOfPrimitivesTo

public inline fun <K, V, M :
MutableMap<in K, in V>> DoubleArray.associateTo(destination: M, transform: (Double) -> Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given array. If any of two pairs would have the same key the last one gets added to the map.

@sample
samples.collections.Arrays.Transformations.associateArrayOfPrimitivesTo

public inline fun <K, V, M :
MutableMap<in K, in V>> BooleanArray.associateTo(destination: M, transform: (Boolean) -> Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given array. If any of two pairs would have the same key the last one gets added to the map.

@sample
samples.collections.Arrays.Transformations.associateArrayOfPrimitivesTo

public inline fun <K, V, M : MutableMap<in K, in V>> CharArray.associateTo(destination: M, transform: (Char) ->
Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

Returns a [Map] where keys are elements from the given array and values are produced by the [valueSelector] function applied to each element. If any two elements are equal, the last one gets added to the map. The returned map preserves the entry iteration order of the original array.

@sample
samples.collections.Collections.Transformations.associateWith

@SinceKotlin("1.4")
public inline fun <K,
V> Array<out K>.associateWith(valueSelector: (K) -> V): Map<K, V> {
    val result = LinkedHashMap<K, V>(mapCapacity(size).coerceAtLeast(16))
    return associateWithTo(result, valueSelector)
}

Returns a [Map] where keys are elements from the given array and values are produced by the [valueSelector] function applied to each element. If any two elements are equal, the last one gets added to the map. The returned map preserves the entry iteration order of the original array.

@sample
samples.collections.Collections.Transformations.associateWith

}

```

Returns a list containing only elements from the given array having distinct keys returned by the given [selector] function.

Among elements of the given array with equal keys, only the first one will be present in the resulting list.

The elements in the resulting list are in the same order as they were in the source array.

```

@sample
samples.collections.Collections.Transformations.distinctAndDistinctBy
public inline fun <T, K> Array<out T>.distinctBy(selector: (T) -> K): List<T> {
    val set = HashSet<K>()
    val list = ArrayList<T>()
    for (e in this) {
        val key = selector(e)
        if (set.add(key)) list.add(e)
    }
    return list
}

```

Returns a list containing only elements from the given array having distinct keys returned by the given [selector] function.

The elements in the resulting list are in the same order as they were in the source array.

```

@sample samples.collections.Collections.Transformations.distinctAndDistinctBy

```

restriction of `remove` that requires to pass a key of type `K`.
@kotlin.internal.OnlyInputTypes K, V> MutableMap<out K, V>.remove(key: K): V? =
@Suppress("UNCHECKED_CAST") (this as MutableMap<K, V>).remove(key)
Returns the key component of the map entry.
This method allows to use destructuring declarations when working with maps,
for example:
for ((key, value) in map) { // do something with the key and the value }
@kotlin.internal.OnlyInputTypes K, V> Map.Entry<K, V>.component1(): K =
key
Returns the value component of the map entry.
This method allows to use destructuring
declarations when working with maps, for
example:
for ((key, value) in map) { // do something with the key and the value }
@kotlin.internal.OnlyInputTypes K, V> Map.Entry<K, V>.component2(): V =
value
Converts entry to [Pair] with key being first component and value being second.
@kotlin.internal.OnlyInputTypes K, V> Map.Entry<K, V>.toPair(): Pair<K, V> = Pair(key,
value)
Returns the value for the given key, or the result of the [defaultValue] function if there was no
entry for the given key.
@sample samples.collections.Maps.Usage.getOrElse
@kotlin.internal.OnlyInputTypes K, V> Map<K, V>.getOrElse(key: K, defaultValue: () -> V): V
= get(key) ?: defaultValue
internal inline fun <K, V> Map<K, V>.getOrElseNullable(key: K, defaultValue: ()
-> V): V {
    val value = get(key)
    if (value == null && !containsKey(key)) {
        return defaultValue()
    }
    else {
        @Suppress("UNCHECKED_CAST")
        return value as V
    }
}
Returns the value for the given [key] or throws an exception if there is no
such key in the map.
If the map was created by [withDefault], resorts to its `defaultValue` provider
function instead of throwing an exception.
@throws NoSuchElementException when the map doesn't
contain a value for the specified key and no implicit default value was provided for that map.
@SinceKotlin("1.1")
public fun <K, V> Map<K, V>.getValue(key: K): V =
getOrDefault(key)
Returns the value for the given key. If the key is not found in the map, calls
the [defaultValue] function, puts its result into the map under the given key and returns it.
Note that the
operation is not guaranteed to be atomic if the map is being modified concurrently.
@sample
samples.collections.Maps.Usage.getOrPut
public inline fun <K, V> MutableMap<K, V>.getOrPut(key: K,
defaultValue: () -> V):
V {
    val value = get(key)
    return if (value == null) {
        val answer = defaultValue()
        put(key,
answer)
        answer
    } else {
        value
    }
}
Returns an [Iterator] over the entries in the
[Map].
@sample samples.collections.Maps.Usage.forOverEntries
@kotlin.internal.OnlyInputTypes K, V> Map<out K, V>.iterator(): Iterator<Map.Entry<K, V>> = entries.iterator()
Returns a [MutableIterator] over the mutable entries in the [MutableMap].
@kotlin.jvm.JvmName("mutableIterator")
@kotlin.internal.OnlyInputTypes K, V>
MutableMap<K, V>.iterator(): MutableIterator<MutableMap.MutableEntry<K, V>> = entries.iterator()
Populates the given [destination] map with entries having the keys of this map and the values obtained
by
applying the [transform] function to each entry in this [Map].
public inline fun <K, V, R, M : MutableMap<in K, in R>> Map<out
K, V>.mapValuesTo(destination: M, transform: (Map.Entry<K, V>) -> R): M {
    return
entries.associateByTo(destination, { it.key }, transform)
}
Populates the given [destination] map with
entries having the keys obtained by applying the [transform] function to each entry in this [Map] and the values
of this map.
In case if any two entries are mapped to the equal keys, the value of the latter one will
overwrite the value associated with the former one.
public inline fun <K, V, R, M : MutableMap<in R, in V>> Map<out K, V>.mapKeysTo(destination: M, transform: (Map.Entry<K, V>) -> R): M {
    return
entries.associateByTo(destination, transform, { it.value })
}
Puts all the given [pairs] into this
[MutableMap] with the first component in the pair being the key and the second the value.
public fun <K, V>
MutableMap<in K, in V>.putAll(pairs: Array<out Pair<K, V>>): Unit {
    for ((key, value) in pairs) {
        put(key, value)
    }
}

```

```

}
}
}

Put all the elements of the given collection into this [MutableMap] with the first component in the pair being the key and the second the value.
public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Iterable<Pair<K, V>>): Unit {
    for ((key, value) in pairs) {
        put(key, value)
    }
}

Put all the elements of the given sequence into this [MutableMap] with the first component in the pair being the key and the second the value.
public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Sequence<Pair<K, V>>): Unit {
    for ((key, value) in pairs) {
        put(key, value)
    }
}

Returns a new map with entries having the keys of this map and the values obtained by applying the [transform] function to each entry in this [Map].
The returned map preserves the entry iteration order of the original map.
@sample
samples.collections.Maps.Transformations.mapValues
public inline fun <K, V, R> Map<out K, V>.mapValues(transform: (Map.Entry<K, V>) -> R): Map<K, R> {
    return mapValuesTo(LinkedHashMap<K, R>(mapCapacity(size)), transform) // .optimizeReadOnlyMap()
}

Returns a new Map with entries having the keys obtained by applying the [transform] function to each entry in this [Map] and the values of this map.
In case if any two entries are mapped to the equal keys, the value of the latter one will overwrite the value associated with the former one.
The returned map preserves the entry iteration order of the original map.
@sample
samples.collections.Maps.Transformations.mapKeys
public inline fun <K, V, R> Map<out K, V>.mapKeys(transform: (Map.Entry<K, V>) -> R): Map<R, V> {
    return mapKeysTo(LinkedHashMap<R, V>(mapCapacity(size)), transform) // .optimizeReadOnlyMap()
}

Returns a map containing all key-value pairs with keys matching the given [predicate].
The returned map preserves the entry iteration order of the original map.
@sample
samples.collections.Maps.Filtering.filterKeys
public inline fun <K, V> Map<out K, V>.filterKeys(predicate: (K) -> Boolean): Map<K, V> {
    val result = LinkedHashMap<K, V>()
    for (entry in this) {
        if (predicate(entry.key)) {
            result.put(entry.key, entry.value)
        }
    }
    return result
}

Returns a map containing all key-value pairs with values matching the given [predicate].
The returned map preserves the entry iteration order of the original map.
@sample
samples.collections.Maps.Filtering.filterValues
public inline fun <K, V> Map<out K, V>.filterValues(predicate: (V) -> Boolean): Map<K, V> {
    val result = LinkedHashMap<K, V>()
    for (entry in this) {
        if (predicate(entry.value)) {
            result.put(entry.key, entry.value)
        }
    }
    return result
}

Appends all entries matching the given [predicate] into the mutable map given as [destination] parameter.
@return the destination map.
@sample
samples.collections.Maps.Filtering.filterTo
public inline fun <K, V, M : MutableMap<in K, in V>> Map<out K, V>.filterTo(destination: M, predicate: (Map.Entry<K, V>) -> Boolean): M {
    for (element in this) {
        if (predicate(element)) {
            destination.put(element.key, element.value)
        }
    }
    return destination
}

Returns a new map containing all key-value pairs matching the given [predicate].
The returned map preserves the entry iteration order of the original map.
@sample
samples.collections.Maps.Filtering.filter
public inline fun <K, V> Map<out K, V>.filter(predicate: (Map.Entry<K, V>) -> Boolean): Map<K, V> {
    return filterTo(LinkedHashMap<K, V>(), predicate)
}

Appends all entries not matching the given [predicate] into the given [destination].
@return the destination map.
@sample
samples.collections.Maps.Filtering.filterNotTo
public inline fun <K, V, M : MutableMap<in K, in V>> Map<out K, V>.filterNotTo(destination: M, predicate: (Map.Entry<K, V>) -> Boolean): M {
    for (element in this) {
        if (!predicate(element)) {
            destination.put(element.key, element.value)
        }
    }
    return destination
}

Returns a new map containing all key-value pairs not matching the given [predicate].
The returned map preserves the entry iteration order of the original map.
@sample
samples.collections.Maps.Filtering.filterNot
public inline fun <K, V> Map<out K, V>.filterNot(predicate: (Map.Entry<K, V>) -> Boolean): Map<K, V> {
    return filterNotTo(LinkedHashMap<K, V>(), predicate)
}

Returns a new map containing all key-value pairs from the given collection of pairs.
The returned map preserves the entry iteration order of the original collection.
If any of two pairs would have the same key the last one gets added to the map.
public

```

```

 Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order.
 * The elements are compared for equality with the [equals][Any.equals] function.
 For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

return destination

```

Returns a lazy [Iterable] that wraps each element of the original collection into an [IndexedValue] containing the index of that element and the element itself.

```

public fun <T> Iterable<T>.withIndex(): Iterable<IndexedValue<T>> {
    return IndexingIterable {
        iterator()
    }
}

```

Returns a list containing only distinct elements from the given collection.

Among equal elements of the given collection, only the first one will be present in the resulting list.

The elements in the resulting list are in the same order as they were in the source collection.

@sample samples.collections.Collections.Transformations.distinctAndDistinctBy

```

public fun <T> Iterable<T>.distinct(): List<T> {
    return this.toMutableSet().toList()
}

```

Returns a list containing only elements from the given collection having distinct keys returned by the given [selector] function.

Among elements of the given collection with equal keys, only the first one will be present in the resulting list.

The elements in the resulting list are in the same order as they were in the source collection.

@sample samples.collections.Collections.Transformations.distinctAndDistinctBy

```

public inline fun <T, K>
Iterable<T>.distinctBy(selector: (T) -> K): List<T> {
    val set = HashSet<K>()
    val list = ArrayList<T>()
    for (e in this) {
        val key = selector(e)
        if (set.add(key))
            list.add(e)
    }
    return list
}

```

Returns a set containing all elements that are contained by both this collection and the specified collection.

The returned set preserves the element iteration order of the original collection.

To get a set containing all elements that are contained at least in one of these collections use [union].

```

public infix fun <T> Iterable<T>.intersect(other: Iterable<T>): Set<T> {
    val set = this.toMutableSet()
    set.retainAll(other)
    return set

    }
}

```

Converts this character to lower case using Unicode mapping rules of the invariant locale. Use lowercaseChar() instead.

```

@DeprecatedSinceKotlin(warningSince = "1.5")
public expect fun Char.toLowerCase(): Char

```

Converts this character to lower case using Unicode mapping rules of the invariant locale. This function performs one-to-one character mapping. To support one-to-many character mapping use the [toLowerCase] function. If this character has no mapping equivalent, the character itself is returned.

```

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class)
public expect fun Char.toLowerCaseChar(): Char

```

Converts this character to lower case using Unicode mapping rules of the invariant locale. This function supports one-to-many character mapping, thus the length of the returned string can be greater than one. For example, `"\u0130".toLowerCase()` returns `"\u0069\u0307"`, where `"\u0130"` is the LATIN CAPITAL LETTER I WITH DOT ABOVE character (`\ufffd\uffd`). If this character has no lower case mapping, the result of `toString()` of this char is returned.

```

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class)
public expect fun Char.toLowerCase(): String

```

Converts this character to upper case using Unicode mapping rules of the invariant locale. Use uppercaseChar() instead.

```

@DeprecatedSinceKotlin(warningSince = "1.5")
public expect fun Char.toUpperCase(): Char

```

Converts this character to upper case using Unicode mapping rules of the invariant locale. This function performs one-to-one character mapping. To support one-to-many character mapping use the [toUpperCase] function. If this character has no mapping equivalent, the character itself is returned.

```

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class)
public expect fun Char.toUpperCaseChar(): Char

```

Converts this character to upper case using Unicode mapping rules of the invariant locale. This function supports one-to-many character mapping, thus the length of the returned string can be greater than one. For example, `"\uFB00".toUpperCase()` returns `"\u0046\u0046"`, where `"\uFB00"` is the LATIN SMALL LIGATURE FF character (`\ufffd\uffd\uffd`). If this character has no upper case mapping, the result of `toString()` of this char is returned.

```

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class)
public expect fun Char.toUpperCase(): String

```

Converts this character to title case using Unicode mapping rules of the invariant locale. This function performs one-to-one character mapping. To support one-to-many character mapping use the [titlecase] function. If this character has no mapping equivalent, the result of calling [uppercaseChar] is returned.

```

@SinceKotlin("1.5")
public expect fun Char.titlecaseChar(): Char

```

Converts this character to title case using Unicode mapping rules of the invariant locale. This function supports one-to-many character mapping, thus the length of the returned string can be greater than one. For example, `"\uFB00".titlecase()` returns `"\u0046\u0066"`, where

`“\uFB00”` is the LATIN SMALL LIGATURE FF character
`(\ufffd\uFFFD\uFFFD)`.
 * If this character has no title case mapping, the result of `[uppercase]` is returned instead.
 * `@sample samples.text.Chars.titlecase`

```

Int, T) -> R?): C {
    foreachIndexed { index, element -> transform(index, element)?.let
    { destination.add(it) } }
    return destination
}

```

Applies the given [transform] function to each element and its index in the original sequence and appends the results to the given [destination]. @param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element. The operation is `_terminal_`.

```

public inline fun <T, R, C : MutableCollection<in R>>
Sequence<T>.mapIndexedTo(destination: C, transform: (index: Int, T) -> R): C {
    var index = 0
    for (item in this)
        destination.add(transform(checkIndexOverflow(index++), item))
    return destination
}

```

Returns a sequence containing only the non-null results of applying the given [transform] function to each element in the original sequence. The operation is `_intermediate_` and `_stateless_`. @sample `samples.collections.Collections.Transformations.mapNotNull`

```

public
fun <T, R : Any> Sequence<T>.mapNotNull(transform: (T) -> R?): Sequence<R> {
    return
    TransformingSequence(this, transform).filterNotNull()
}

```

Applies the given [transform] function to each element in the original sequence and appends only the non-null results to the given [destination]. The operation is `_terminal_`.

```

public inline fun <T, R : Any, C : MutableCollection<in R>>
Sequence<T>.mapNotNullTo(destination: C, transform: (T) -> R?): C {
    foreach { element ->
    transform(element)?.let { destination.add(it) } }
    return destination
}

```

Applies the given [transform] function to each element of the original sequence and appends the results to the given [destination]. The operation is `_terminal_`.

```

public inline fun <T, R, C : MutableCollection<in R>>
Sequence<T>.mapTo(destination: C, transform: (T) -> R): C {
    for (item in this)
        destination.add(transform(item))
    return destination
}

```

Returns a sequence that wraps each element of the original sequence into an [IndexedValue] containing the index of that element and the element itself. The operation is `_intermediate_` and `_stateless_`.

```

public fun <T>
Sequence<T>.withIndex(): Sequence<IndexedValue<T>> {
    return IndexingSequence(this)
}

```

Returns a sequence containing only distinct elements from the given sequence. Among equal elements of the given sequence, only the first one will be present in the resulting sequence. The elements in the resulting sequence are in the same order as they were in the source sequence. The operation is `_intermediate_` and `_stateful_`. @sample `samples.collections.Collections.Transformations.distinctAndDistinctBy`

```

public
fun <T> Sequence<T>.distinct(): Sequence<T> {
    return this.distinctBy { it }
}

```

Returns a sequence containing only elements from the given sequence having distinct keys returned by the given [selector] function.

Among elements of the given sequence with equal keys, only the first one will be present in the resulting sequence. The elements in the resulting sequence are in the same order as they were in the source sequence.

The operation is `_intermediate_` and `_stateful_`. @sample `samples.collections.Collections.Transformations.distinctAndDistinctBy`

```

public fun <T, K>
Sequence<T>.distinctBy(selector: (T) -> K): Sequence<T> {
    return DistinctSequence(this, selector)
}

```

Returns a new [MutableSet] containing all distinct elements from the given sequence. The returned set preserves the element iteration order of the original sequence. The operation is `_terminal_`.

```

public fun
<T> Sequence<T>.toMutableSet(): MutableSet<T> {
    val set = LinkedHashSet<T>()
    for (item in this)
        set.add(item)
    return set
}

```

Returns `true` if all elements match the given [predicate]. The operation is `_terminal_`.

@sample `samples.collections.Collections.Aggregates.all`

```

public inline fun <T>
Sequence<T>.all(predicate: (T) -> Boolean): Boolean {
    for (element in this) if (!predicate(element)) return

 for (element in this) {
 sum += selector(element)
 }
 return sum
}

* Returns an original collection containing all the non-`null` elements, throwing an `IllegalArgumentException` if there are any `null` elements.

The operation is `_intermediate_ and _stateless_`.

`Sequence.requireNonNulls(): Sequence` {
 return map { it ?: throw IllegalArgumentException("null element found in \$this.") }
}

* Splits this sequence into a sequence of lists each not exceeding the given [size].

The last list in the resulting sequence may have fewer elements than the given [size].

@param size the number of elements to take in each list, must be positive and can be greater than the number of elements in this sequence.

The operation is `_intermediate_ and _stateful_`.

@sample
 samples.collections.Collections.Transformations.chunked

`Sequence.chunked(size: Int): Sequence<List<T>>` {
 return windowed(size, size, partialWindows = true)
}

* Splits this sequence into several lists each not exceeding the given [size] and applies the given [transform] function to an each.

@return sequence of results of the [transform] applied to an each list.

Note that the list passed to the [transform] function is ephemeral and is valid only inside that function.

You should not store it or allow it to escape in some way, unless you made a snapshot of it.

The last list may have fewer elements than the given [size].

@param size the number of elements to take in each list, must be positive and can be greater than the number of elements in this sequence.

The operation is `_intermediate_ and _stateful_`.

@sample
 samples.text.Strings.chunkedTransform

`Sequence.chunked(size: Int, transform: (List<T>) -> R): Sequence<R>` {
 return windowed(size, size, partialWindows = true, transform = transform)
}

* Returns a sequence containing all elements of the original sequence without the first occurrence of the given [element].

The operation is `_intermediate_ and _stateless_`.

`Sequence.minus(element: T): Sequence` {
 return object: Sequence {
 override fun iterator(): Iterator {
 var removed = false
 return this@minus.filter { if (!removed && it == element) { removed = true; false } else true }.iterator()
 }
 }
}

* Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] array.

Note that the source sequence and the array being subtracted are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

Before Kotlin 1.6, the [elements] array may have been converted to a `[HashSet]` to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property ``kotlin.collections.convert_arg_to_set_in_removeAll`` set to ``true``.

The operation is `_intermediate_ and _stateful_`.

`Sequence.minus(elements: Array<out T>): Sequence` {
 if (elements.isEmpty()) return this
 return object: Sequence {
 override fun iterator(): Iterator {
 val other = elements.convertToSetForSetOperation()
 return this@minus.filterNot { it in other }.iterator()
 }
 }
}

* Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] collection.

Note that the source sequence and the collection being subtracted are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

Before Kotlin 1.6, the [elements] collection may have been converted to a `[HashSet]` to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property ``kotlin.collections.convert_arg_to_set_in_removeAll`` set to ``true``.

The operation is `_intermediate_ and _stateful_`.

```

along this sequence with the given [step], where each snapshot is a list. Several last lists may have fewer elements than the given [size]. Both [size] and [step] must be positive and can be greater than the number of elements in this sequence. @param size the number of elements to take in each window @param step the number of elements to move the window forward by on an each step, by default 1 @param partialWindows controls whether

or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

```
samples.collections.Sequences.Transformations.takeWindows
*Since Kotlin("1.2")
public fun <T> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = false)
}
Returns a sequence of results of applying the given [transform] function to an each list representing a view over the window of the given [size] sliding along this sequence with the given [step].
Note that the list passed to the [transform] function is ephemeral and is valid only inside that function. You should not store it or allow it to escape in some way, unless you made a snapshot of it. Several last lists may have fewer elements than the given [size]. Both [size] and [step] must be positive and can be greater than the
```

number of elements in this sequence. @param size the number of elements to take in each window @param step the number of elements to move the window forward by on an each step, by default 1 @param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

```
samples.collections.Sequences.Transformations.averageWindows
*Since Kotlin("1.2")
public fun <T, R> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false, transform: (List<T>) -> R): Sequence<R> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = true).map(transform)
}
Returns a sequence of values built from the elements of `this` sequence and the [other] sequence with the same index. The resulting sequence ends as soon as the shortest input sequence ends.
The operation is _intermediate_ and _stateless_.
@sample
```

```
samples.collections.Sequences.Transformations.zip
*public infix fun <T, R> Sequence<T>.zip(other: Sequence<R>): Sequence<Pair<T, R>> {
    return MergingSequence(this, other) { t1, t2 -> t1 to t2 }
}
Returns a sequence of values built from the elements of `this` sequence and the [other] sequence with the same index using the provided [transform] function applied to each pair of elements. The resulting sequence ends as soon as the shortest input sequence ends.
The operation is _intermediate_ and _stateless_.
@sample
samples.collections.Sequences.Transformations.zipWithTransform
*public fun <T, R, V> Sequence<T>.zip(other: Sequence<R>, transform: (a: T, b: R) -> V): Sequence<V> {
    return MergingSequence(this, other, transform)
}
Returns a sequence of pairs of each two adjacent elements in this sequence. The returned sequence is empty if this sequence contains less than two elements.
The operation is _intermediate_ and _stateless_.
@sample
```

```
samples.collections.Collections.Transformations.zipWithNext
*Since Kotlin("1.2")
public fun <T> Sequence<T>.zipWithNext(): Sequence<Pair<T, T>> {
    return zipWithNext { a, b -> a to b }
}
Returns a sequence containing the results of applying the given [transform] function to an each pair of two adjacent elements in this sequence. The returned sequence is empty if this sequence contains less than two elements.
The operation is _intermediate_ and _stateless_.
@sample
```

```
samples.collections.Collections.Transformations.zipWithNextToFindDeltas

```

```

String.substringBeforeLast(delimiter: String, missingDelimiterValue: String = this): String {
    val index = lastIndexOf(delimiter)
    return if (index == -1) missingDelimiterValue else substring(0, index)
}

Returns a substring after the last occurrence of [delimiter].
If the string does not contain the delimiter, returns [missingDelimiterValue] which defaults to the original string.

public fun String.substringAfterLast(delimiter: Char, missingDelimiterValue: String = this): String {
    val index = lastIndexOf(delimiter)
    return if (index == -1) missingDelimiterValue else substring(index + 1, length)
}

Returns a substring after the last occurrence of [delimiter].
If the string does not contain the delimiter, returns [missingDelimiterValue] which defaults to the original string.

public fun String.substringAfterLast(delimiter: String, missingDelimiterValue: String = this): String {
    val index = lastIndexOf(delimiter)
    return if (index == -1) missingDelimiterValue else substring(index + delimiter.length, length)
}

Returns a char sequence with content of this char sequence where its part at the given range is replaced with the [replacement] char sequence.
@param startIndex the index of the first character to be replaced.
@param endIndex the index of the first character after the replacement to keep in the string.

public fun CharSequence.replaceRange(startIndex: Int, endIndex: Int, replacement: CharSequence): CharSequence {
    if (endIndex < startIndex)
        throw IndexOutOfBoundsException("End index ($endIndex) is less than start index ($startIndex).")
    val sb = StringBuilder()
    sb.appendRange(this, 0, startIndex)
    sb.append(replacement)
    sb.appendRange(this, endIndex, length)
    return sb
}

Replaces the part of the string at the given range with the [replacement] char sequence.
@param startIndex the index of the first character to be replaced.
@param endIndex the index of the first character after the replacement to keep in the string.

@kotlin.internal.InlineOnly
public inline fun String.replaceRange(startIndex: Int, endIndex: Int, replacement: CharSequence): String =
    (this as CharSequence).replaceRange(startIndex, endIndex, replacement).toString()

Returns a char sequence with content of this char sequence where its part at the given [range] is replaced with the [replacement] char sequence.
The end index of the [range] is included in the part to be replaced.

public fun CharSequence.replaceRange(range: IntRange, replacement: CharSequence): CharSequence =
    replaceRange(range.start, range.endInclusive + 1, replacement)

Replace the part of string at the given [range] with the [replacement] string.
The end index of the [range] is included in the part to be replaced.

@kotlin.internal.InlineOnly
public inline fun String.replaceRange(range: IntRange, replacement: CharSequence): String =
    (this as CharSequence).replaceRange(range, replacement).toString()

Returns a char sequence with content of this char sequence where its part at the given range is removed.
@param startIndex the index of the first character to be removed.
@param endIndex the index of the first character after the removed part to keep in the string.
[endIndex] is not included in the removed part.

public fun CharSequence.removeRange(startIndex: Int, endIndex: Int): CharSequence {
    if (endIndex < startIndex)

    val sb = StringBuilder(length - (endIndex - startIndex))
    sb.appendRange(this, 0, startIndex)
    sb.appendRange(this, endIndex, length)
    return sb
}

Removes the part of a string at a given range.
@param startIndex the index of the first character to be removed.
@param endIndex the index of the first character after the removed part to keep in the string.
[endIndex] is not included in the removed part.

@kotlin.internal.InlineOnly
public inline fun String.removeRange(startIndex: Int, endIndex: Int): String =
    (this as CharSequence).removeRange(startIndex, endIndex).toString()

Returns a char sequence with content of this char sequence where its part at the given [range] is removed.
The end index of the [range] is included in the removed part.

public fun CharSequence.removeRange(range: IntRange): CharSequence =
    removeRange(range.start, range.endInclusive + 1)

Removes the part of a string at the given [range].
The end index of the [range] is included in the removed part.

@kotlin.internal.InlineOnly
public inline fun String.removeRange(range: IntRange): String =
    (this as CharSequence).removeRange(range).toString()

AnnotationTarget

```

import kotlin.annotation.AnnotationTarget

```

Contains the list of code elements which are the possible annotation targets

```

public enum class AnnotationTarget {
    /** Class, interface or object,
     * annotation class is also included */
    CLASS,
    /** Annotation class only */
    ANNOTATION_CLASS,
    /** Generic type parameter */
    TYPE_PARAMETER,
    /** Property */
    PROPERTY,
    /** Field, including property's backing field */
    FIELD,
    /** Local variable */
    LOCAL_VARIABLE,
    /** Value parameter of a function or a constructor */
    VALUE_PARAMETER,
    /** Constructor only (primary or secondary) */
    CONSTRUCTOR,
    /** Function (constructors are not included) */
    FUNCTION,
    /** Property getter only */
    PROPERTY_GETTER,
    /** Property setter only */
    PROPERTY_SETTER,
    /** Type usage */
    TYPE,
    /** Any expression */
    EXPRESSION,
    /** File */
    FILE,
    /** Type alias */
    @SinceKotlin("1.1")
    TYPEALIAS
}

```

Contains the list of possible annotation's retentions.

Determines how an annotation is stored in binary output.

```

public enum class AnnotationRetention {
    /**
     * Annotation isn't stored in binary output
     */
    SOURCE,
    /**
     * Annotation is stored in binary output, but invisible for reflection
     */
    BINARY,
    /**
     * Annotation is stored in binary output and visible for reflection (default retention)
     */
    RUNTIME
}

```

This meta-annotation indicates the kinds of code elements which are possible targets of an annotation.

If the target meta-annotation is not present on an annotation declaration, the annotation is applicable to the following elements: [CLASS], [PROPERTY], [FIELD], [LOCAL_VARIABLE], [VALUE_PARAMETER], [CONSTRUCTOR], [FUNCTION], [PROPERTY_GETTER], [PROPERTY_SETTER].

@property allowedTargets list of allowed annotation targets

```

@Target(AnnotationTarget.ANNOTATION_CLASS)
@MustBeDocumented
public annotation class Target(
    vararg val allowedTargets: AnnotationTarget
)

```

This meta-annotation determines whether an annotation is stored in binary output and visible for reflection. By default, both are true.

@property value necessary annotation retention (RUNTIME, BINARY or SOURCE)

```

@Target(AnnotationTarget.ANNOTATION_CLASS)
public annotation class Retention(
    val value: AnnotationRetention = AnnotationRetention.RUNTIME
)

```

This meta-annotation determines that an annotation is applicable twice or more on a single code element

```

```

coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <T> (suspend () -> T).startCoroutineUninterceptedOrReturn(
    completion: Continuation<T>): Any? =
    this.asDynamic()(completion, false)

```

Starts an unintercepted coroutine with receiver type [R] and result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception. The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <R, T> (suspend R.() -> T).startCoroutineUninterceptedOrReturn(
    receiver: R, completion: Continuation<T>): Any? =
    this.asDynamic()(receiver, completion, false)

```

internal actual inline fun <R, P, T> (suspend R.(P) -> T).startCoroutineUninterceptedOrReturn(
 receiver: R, param: P, completion: Continuation<T>): Any? = this.asDynamic()(receiver, param, completion, false)

Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <T> (suspend () -> T).createCoroutineUnintercepted(
    completion: Continuation<T>): Continuation<Unit> =
    // Kotlin/JS suspend lambdas have an extra parameter `suspended`
    if (this.asDynamic().length == 2) {
        // When `suspended` is true the continuation is created, but not executed
        this.asDynamic()(completion, true)
    } else {
        createCoroutineFromSuspendFunction(completion) {
            this.asDynamic()(completion)
        }
    }

```

Creates unintercepted coroutine with receiver type [R] and result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation

corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

* Since Kotlin("1.3")
public actual fun <R, T> (suspend R.() -> T).createCoroutineUnintercepted(
receiver: R,
completion: Continuation<T>): Continuation<Unit> =
// Kotlin/JS suspend lambdas have an
extra parameter `suspended`
if (this.asDynamic().length == 3) {
// When `suspended` is true the
continuation is created, but not executed
this.asDynamic()(receiver, completion, true)
} else {
createCoroutineFromSuspendFunction(completion) {
this.asDynamic()(receiver, completion)
}
}
}
* Intercepts this continuation with [ContinuationInterceptor].
* This function shall be used on the
immediate result of [createCoroutineUnintercepted] or [suspendCoroutineUninterceptedOrReturn],
in which
case it checks for [ContinuationInterceptor] in the continuation's [context][Continuation.context],
invokes
[ContinuationInterceptor.interceptContinuation], caches and returns the result.
* If this function is invoked on
other [Continuation] instances it returns `this` continuation unchanged.
