```

```

inline operator fun <K, V> MutableMap<K, V>.set(key: K, value: V): Unit {
    put(key, value)
}

Returns `true` if the map contains the specified [key].
Allows to overcome type-safety restriction of `containsKey` that requires to pass a key of type `K`.
@kotlin.internal.InlineOnly
public inline fun
<@kotlin.internal.OnlyInputTypes K> Map<out K, *>.containsKey(key: K): Boolean =
    @Suppress("UNCHECKED_CAST") (this as Map<K, *>).containsKey(key)

Returns `true` if the map maps one or more keys to the specified [value].
Allows to overcome type-safety restriction of `containsValue` that requires to pass a value of type `V`.
@sample
samples.collections.Maps.Usage.containsValue
^
@Suppress("EXTENSION_SHADOWED_BY_MEMBER")
// false warning, extension takes precedence in some cases
@kotlin.internal.InlineOnly
public inline fun <K,
@kotlin.internal.OnlyInputTypes V> Map<K, V>.containsValue(value: V): Boolean
= this.containsValue(value)

Removes the specified key and its corresponding value from this map.
@return the previous value associated with the key, or `null` if the key was not present in the map.
Allows to overcome type-safety restriction of `remove` that requires to pass a key of type `K`.
^
@kotlin.internal.InlineOnly
public inline fun <@kotlin.internal.OnlyInputTypes K, V> MutableMap<out K,
V>.remove(key: K): V? =
    @Suppress("UNCHECKED_CAST") (this as MutableMap<K,
V>).remove(key)

Returns the key component of the map entry.
This method allows to use destructuring declarations when working with maps, for example:
```
for ((key, value) in map) {
 // do something with the key and the value
}
^
@kotlin.internal.InlineOnly
public inline operator fun <K,
V> Map.Entry<K, V>.component1(): K = key

Returns the value component of the map entry.
This method allows to use destructuring declarations when working with maps, for example:
```
for ((key, value) in map) {
    // do something with the key and the value
}
^
@kotlin.internal.InlineOnly
public inline operator fun <K, V>
Map.Entry<K, V>.component2(): V = value

Converts entry to [Pair] with key being first component and value being second.
^
@kotlin.internal.InlineOnly
public inline fun <K, V> Map.Entry<K, V>.toPair():
Pair<K, V> = Pair(key, value)

Returns the value for the given key, or the result of the [defaultValue] function if there was no entry for the given key.
@sample
samples.collections.Maps.Usage.getOrElse
^
@kotlin.internal.InlineOnly
public inline fun <K, V> Map<K, V>.getOrElse(key: K, defaultValue: () -> V): V
= get(key) ?: defaultValue()

internal inline fun <K, V> Map<K, V>.getOrElseNullable(key: K, defaultValue: ()
-> V): V {
    val value = get(key)
    if (value == null && !containsKey(key)) {
        return defaultValue()
    } else {
        @Suppress("UNCHECKED_CAST")
        return value as V
    }
}

Returns the value for the given [key] or throws an exception if there is no such key in the map.
If the map was created by [withDefault], resorts to its `defaultValue` provider function instead of throwing an exception.
@throws NoSuchElementException when the map doesn't contain a value for the specified key and no implicit default value was provided for that map.
^
@SinceKotlin("1.1")
public fun <K, V> Map<K, V>.getValue(key: K): V
= getOrDefault(key)

Returns the value for the given key. If the key is not found in the map, calls the [defaultValue] function, puts its result into the map under the given key and returns it.
Note that the operation is not guaranteed to be atomic if the map is being modified concurrently.
@sample
samples.collections.Maps.Usage.getOrPut
^
public inline fun <K, V> MutableMap<K, V>.getOrPut(key:
K, defaultValue: () -> V): V {
    val value = get(key)
    return if (value == null) {
        val answer =
defaultValue()
        put(key, answer)
        answer
    } else {
        value
    }
}

Returns an [Iterator] over the entries in the [Map].
@sample
samples.collections.Maps.Usage.forOverEntries
^
@kotlin.internal.InlineOnly
public inline operator fun <K, V> Map<out K, V>.iterator():
Iterator<Map.Entry<K, V>> = entries.iterator()

Returns a [MutableIterator] over the mutable entries in the [MutableMap].
^
@kotlin.jvm.JvmName("mutableIterator")
@kotlin.internal.InlineOnly
public inline operator fun <K, V> MutableMap<K, V>.iterator(): MutableIterator<MutableMap.MutableEntry<K, V>> =
entries.iterator()

@file:kotlin.jvm.JvmName("ComparisonsKt")
@file:kotlin.jvm.JvmMultifileClass
package
kotlin.comparisons

Compares
two values using the specified functions [selectors] to calculate the result of the comparison.
The functions are
called sequentially, receive the given values [a] and [b] and return [Comparable]
objects. As soon as the
[Comparable] instances returned by a function for [a] and [b] values do not
compare as equal, the result of that
comparison is returned.

@sample samples.comparisons.Comparisons.compareValuesByWithSelectors

public fun <T> compareValuesBy(a: T, b: T, vararg selectors: (T) -> Comparable<*>?): Int {
    require(selectors.size > 0)
    return compareValuesByImpl(a, b, selectors)
}

private fun <T>
compareValuesByImpl(a: T, b: T, selectors: Array<out (T) -> Comparable<*>?): Int {
    for (fn in selectors) {
        val v1 = fn(a)
        val v2 = fn(b)
        val diff = compareValues(v1, v2)
        if (diff != 0) return diff
    }
    return 0
}

Compares two values using the specified [selector] function to calculate the
result of the comparison.
The function is applied to the given values [a] and [b] and return [Comparable]
objects.
The result of comparison of these [Comparable] instances is returned.

@sample
samples.comparisons.Comparisons.compareValuesByWithSingleSelector

@kotlin.internal.InlineOnly
public
inline fun <T> compareValuesBy(a: T, b: T, selector: (T) -> Comparable<*>?): Int {
    return
compareValues(selector(a), selector(b))
}

Compares two values using the specified [selector] function to
calculate the result of the comparison.
The function is applied to the given values [a] and [b] and return objects
of type K which are then being
compared with the given [comparator].

@sample
samples.comparisons.Comparisons.compareValuesByWithComparator

@kotlin.internal.InlineOnly
public
inline fun <T, K> compareValuesBy(a: T, b: T, comparator: Comparator<in K>, selector: (T) -> K): Int {
    return
comparator.compare(selector(a), selector(b))
}

Not so useful without type inference for receiver of expression
compareValuesWith(v1, v2, compareBy {
    it.prop1 } thenByDescending { it.prop2 })

Compares two values using the specified [comparator].

@Suppress("NOTHING_TO_INLINE")
public inline fun <T> compareValuesWith(a: T, b: T, comparator:
Comparator<T>): Int = comparator.compare(a, b)

Compares two nullable [Comparable] values. Null
is considered less than any value.

@sample samples.comparisons.Comparisons.compareValues

public fun <T : Comparable<*>> compareValues(a: T?, b: T?): Int {
    if (a === b) return 0
    if (a == null) return -1
    if (b == null) return 1
    @Suppress("UNCHECKED_CAST")
    return (a as
Comparable<Any>).compareTo(b)
}

Creates a comparator using the sequence of functions to calculate a
result of comparison.
The functions are called sequentially, receive the given values `a` and `b` and return
[Comparable]
objects. As soon as the [Comparable] instances returned by a function for `a` and `b` values do not
compare as
equal, the result of that comparison is returned from the [Comparator].

@sample
samples.comparisons.Comparisons.compareByWithSelectors

public fun <T> compareBy(vararg selectors: (T)
-> Comparable<*>?): Comparator<T> {
    require(selectors.size > 0)
    return Comparator { a, b ->
compareValuesByImpl(a, b, selectors) }
}

Creates a comparator using the function to transform value
to a [Comparable] instance for comparison.

@sample
samples.comparisons.Comparisons.compareByWithSingleSelector

@kotlin.internal.InlineOnly
public inline
fun <T> compareBy(crossinline selector: (T) -> Comparable<*>?): Comparator<T> =
Comparator { a, b ->
compareValuesBy(a, b, selector) }

Creates a comparator using the [selector] function to transform values
being compared and then applying
the specified [comparator] to compare transformed
values.

@sample samples.comparisons.Comparisons.compareByWithComparator

@kotlin.internal.InlineOnly
public inline fun <T, K> compareBy(comparator: Comparator<in K>, crossinline
selector: (T) -> K): Comparator<T> =
Comparator { a, b -> compareValuesBy(a, b, comparator, selector)
}

Creates a descending comparator using the function to transform value to a [Comparable] instance for

```

```

comparison.\n *\n * @sample samples.comparisons.Comparisons.compareByDescendingWithSingleSelector\n

    for (element in this)
        result[index++] = element
    return result
}

```

Returns a `[Map]` containing key-value pairs provided by `[transform]` function applied to elements of the given collection. If any of two pairs would

have the same key the last one gets added to the map.

The returned map preserves the entry iteration order of the original collection.

`@sample samples.collections.Collections.Transformations.associate`

```

public inline fun <T, K, V> Iterable<T>.associate(transform: (T) -> Pair<K, V>): Map<K, V> {
    val capacity = mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16)
    return associateTo(LinkedHashMap<K, V>(capacity), transform)
}

```

Returns a [Map] containing the elements from the given collection indexed by the key returned from [keySelector] function applied to each element.

If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

The returned map preserves the entry iteration order of the original collection.

`@sample samples.collections.Collections.Transformations.associateBy`

```

public inline fun <T, K> Iterable<T>.associateBy(keySelector: (T) -> K): Map<K, T> {
    val capacity = mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16)
    return associateByTo(LinkedHashMap<K, T>(capacity), keySelector)
}

```

Returns a [Map] containing the values provided by [valueTransform] and indexed by [keySelector] functions applied to elements of the given collection.

If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

The returned map preserves the entry iteration order of the original collection.

`@sample samples.collections.Collections.Transformations.associateByWithValueTransform`

```

public inline fun <T, K, V> Iterable<T>.associateBy(keySelector: (T) -> K, valueTransform: (T) -> V): Map<K, V> {
    val capacity = mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16)
    return associateByTo(LinkedHashMap<K, V>(capacity), keySelector, valueTransform)
}

```

Populates and returns the [destination] mutable map with key-value pairs, where key is provided by the [keySelector] function applied to each element of the given collection and value is the element itself.

If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

`@sample samples.collections.Collections.Transformations.associateByTo`

```

public inline fun <T, K, M : MutableMap<in K, in T>> Iterable<T>.associateByTo(destination: M, keySelector: (T) -> K): M {
    for (element in this) {
        destination.put(keySelector(element), element)
    }
    return destination
}

```

Populates and returns the [destination] mutable map with key-value pairs, where key is provided by the [keySelector] function and value is provided by the [valueTransform] function applied to elements of the given collection.

If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

`@sample samples.collections.Collections.Transformations.associateByToWithValueTransform`

```

public inline fun <T, K, V, M : MutableMap<in K, in V>> Iterable<T>.associateByTo(destination: M, keySelector: (T) -> K, valueTransform: (T) -> V): M {
    for (element in this) {
        destination.put(keySelector(element), valueTransform(element))
    }
    return destination
}

```

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given collection.

If any of two pairs would have the same key the last one gets added to the map.

`@sample samples.collections.Collections.Transformations.associateTo`

```

public inline fun <T, K, V, M : MutableMap<in K, in V>> Iterable<T>.associateTo(destination: M, transform: (T) -> Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

```

Returns a [Map] where keys are elements from the given collection and values are produced by the [valueSelector] function applied to each element.

If any two elements are equal, the last one gets added to the map.

The returned map preserves the entry iteration order of the original collection.

`@sample samples.collections.Collections.Transformations.associateWith`

```

@SinceKotlin("1.3")
public inline fun <K, V> Iterable<K>.associateWith(valueSelector: (K) -> V): Map<K, V> {
    val result = LinkedHashMap<K, V>(mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16))
    return associateWithTo(result, valueSelector)
}

```

Populates and returns the [destination] mutable map with key-value pairs for each element of the given collection, where key is the element itself and value is provided by the [valueSelector]

```

to take in each list, must be positive and can be greater than the number of elements in this collection.\n * \n *
@sample samples.collections.Collections.Transformations.chunked\n *\n*\n@SinceKotlin("1.2")\npublic fun <T>
Iterable<T>.chunked(size: Int): List<List<T>> {\n    return windowed(size, size, partialWindows = true)\n}\n\n/**\n
* Splits this collection into several lists each not exceeding the given [size]\n * and applies the given [transform]
function to an each.\n * \n * @return list of results of the [transform] applied to an each list.\n * \n * Note that the
list passed to the [transform] function is ephemeral and is valid

```

only inside that function.

You should not store it or allow it to escape in some way, unless you made a snapshot of it.

The last list may have fewer elements than the given [size].

@param size the number of elements to take in each list, must be positive and can be greater than the number of elements in this collection.

@sample samples.text.Strings.chunkedTransform

```

@SinceKotlin("1.2")
public fun <T, R>
Iterable<T>.chunked(size: Int, transform: (List<T>) -> R): List<R> {
    return windowed(size, size,
partialWindows = true, transform = transform)
}

```

Returns a list containing all elements of the original collection without the first occurrence of the given [element].

```

public operator fun <T>
Iterable<T>.minus(element: T): List<T> {
    val result = ArrayList<T>(collectionSizeOrDefault(10))
    var removed = false
    return this.filterTo(result) { if (!removed && it == element) { removed = true; false } else true }
}

```

Returns a list containing all elements of the original collection except the elements contained in the given [elements] array.

Before Kotlin 1.6, the [elements] array may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property `kotlin.collections.convert_arg_to_set_in_removeAll` set to `true`.

```

public operator fun <T>
Iterable<T>.minus(elements: Array<out T>): List<T> {
    if (elements.isEmpty()) return this.toList()
    val other = elements.convertToSetForSetOperation()
    return this.filterNot { it in other }
}

```

Returns a list containing all elements of the original collection except the elements contained in the given [elements] collection.

Before Kotlin 1.6, the [elements] collection may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property `kotlin.collections.convert_arg_to_set_in_removeAll` set to `true`.

```

public operator fun <T>
Iterable<T>.minus(elements: Iterable<T>): List<T> {
    val other = elements.convertToSetForSetOperationWith(this)
    if (other.isEmpty()) return this.toList()
    return this.filterNot { it in other }
}

```

Returns a list containing all elements of the original collection except the elements contained in the given [elements] sequence.

Before Kotlin 1.6, the [elements] sequence may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property `kotlin.collections.convert_arg_to_set_in_removeAll` set to `true`.

```

public operator fun <T>
Iterable<T>.minus(elements: Sequence<T>): List<T> {
    val other = elements.convertToSetForSetOperation()
    if (other.isEmpty()) return this.toList()
    return this.filterNot { it in other }
}

```

Returns a list containing all elements of the original collection without the first occurrence of the given [element].

```

@kotlin.internal.InlineOnly
public inline fun <T>
Iterable<T>.minusElement(element: T): List<T> {
    return minus(element)
}

```

Splits the original collection into pair of lists, where `first` list contains elements for which [predicate] yielded `true`, while `second` list contains elements for which [predicate] yielded `false`.

@sample samples.collections.Iterables.Operations.partition

```

public inline fun <T>
Iterable<T>.partition(predicate: (T) -> Boolean): Pair<List<T>, List<T>> {
    val first = ArrayList<T>()
    val second = ArrayList<T>()

package kotlin
Creates a Char with the specified [code], or throws an exception if the [code] is out of `Char.MIN_VALUE.code..Char.MAX_VALUE.code``.
If the program that calls this function is written in a way that only valid [code] is passed as the argument, using the overload that takes a [UShort] argument is preferable (`Char(intValue.toUShort())`).
That overload doesn't check validity of the argument, and may improve program performance when the function is called routinely inside a loop.

import kotlin.random.*
Returns `true` if [element] is found in the sequence.
The operation is `_terminal_`.
public operator fun

```

<@kotlin.internal.OnlyInputTypes T> Sequence<T>.contains(element: T): Boolean {
    return indexOf(element)
    >= 0
}

Returns
an element at the given [index] or throws an [IndexOutOfBoundsException] if the [index] is out of bounds of this
sequence.

The operation is _terminal_.

@sample
samples.collections.Collections.Elements.elementAt

public fun <T> Sequence<T>.elementAt(index: Int): T
{
    return elementAtOrElse(index) { throw IndexOutOfBoundsException("Sequence doesn't contain element at
    index $index.") }
}

Returns an element at the given [index] or the result of calling the [defaultValue]
function if the [index] is out of bounds of this sequence.

The operation is _terminal_.

@sample
samples.collections.Collections.Elements.elementAtOrElse

public fun <T>
Sequence<T>.elementAtOrElse(index: Int, defaultValue: (Int) -> T): T
{
    if (index < 0)
        return
        defaultValue(index)
    val iterator = iterator()
    var count = 0
    while (iterator.hasNext())
    {
        val element
        = iterator.next()
        if (index == count++)
            return element
    }
    return defaultValue(index)
}

Returns an element at the given [index] or `null`
if the [index] is out of bounds of this sequence.

The operation is _terminal_.

@sample
samples.collections.Collections.Elements.elementAtOrNull

public fun <T>
Sequence<T>.elementAtOrNull(index: Int): T?
{
    if (index < 0)
        return null
    val iterator = iterator()
    var count = 0
    while (iterator.hasNext())

        val element = iterator.next()
        if (index == count++)
            return element
    }
    return null
}

Returns the first element matching the given [predicate], or `null`
if no such element was found.

The operation is _terminal_.

@sample
samples.collections.Collections.Elements.find

public inline fun <T>
Sequence<T>.find(predicate: (T) -> Boolean): T?
{
    return firstOrNull(predicate)
}

Returns the last
element matching the
given [predicate], or `null` if no such element was found.

The operation is _terminal_.

@sample
samples.collections.Collections.Elements.find

public inline fun <T>
Sequence<T>.findLast(predicate: (T) -> Boolean): T?
{
    return lastOrNull(predicate)
}

Returns first
element.

@throws [NoSuchElementException] if the sequence is empty.

The operation is _terminal_.

public fun <T> Sequence<T>.first(): T
{
    val iterator = iterator()
    if (!iterator.hasNext())
        throw
        NoSuchElementException("Sequence is empty.")
    return iterator.next()
}

Returns the first element
matching the given [predicate].

@throws [NoSuchElementException] if no such element is found.

The operation is _terminal_.

public inline fun <T> Sequence<T>.first(predicate: (T) -> Boolean): T
{
    for
    (element in this) if (predicate(element)) return element
    throw NoSuchElementException("Sequence
    contains no element matching the predicate.")
}

Returns the first non-null value produced by
[transform] function being applied to elements of this sequence in iteration order,
or throws
[NoSuchElementException] if no non-null value was produced.

The operation is _terminal_.

@sample
samples.collections.Collections.Transformations.firstNotNullOf

@SinceKotlin("1.5")
public inline fun <T, R : Any>
Sequence<T>.firstNotNullOf(transform: (T) -> R?): R
{
    return firstNotNullOfOrNull(transform) ?: throw
    NoSuchElementException("No element of the sequence was transformed to a non-null value.")
}

Returns the first non-null value produced by [transform] function being applied to elements of this sequence in
iteration order,
or `null` if no non-null value was produced.

The operation is _terminal_.

@sample
samples.collections.Collections.Transformations.firstNotNullOf

    return destination
}

Creates a [Grouping] source from a sequence to be used later with one of group-and-fold operations using the specified [keySelector] function to extract a key from each element. The operation is _intermediate_ and _stateless_.

@sample samples.collections.Grouping.groupingByEachCount

public inline fun <T, K> Sequence<T>.groupBy(crossinline keySelector: (T) -> K): Grouping<T, K> {
    return object : Grouping<T, K> {
        override fun sourceIterator(): Iterator<T> = this@groupBy.iterator()
        override fun keyOf(element: T): K = keySelector(element)
    }
}

Returns a sequence containing the results of applying the given [transform] function to each element in the original sequence. The operation is _intermediate_ and _stateless_.

@sample samples.collections.Collections.Transformations.map

public fun <T, R> Sequence<T>.map(transform: (T) -> R): Sequence<R> {
    return TransformingSequence(this, transform)
}

Returns a sequence containing the results of applying the given [transform] function to each element and its index in the original sequence.

@param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element. The operation is _intermediate_ and _stateless_.

public fun <T, R> Sequence<T>.mapIndexed(transform: (index: Int, T) -> R): Sequence<R> {
    return TransformingIndexedSequence(this, transform)
}

Returns a sequence containing only the non-null results of applying the given [transform] function to each element and its index in the original sequence.

@param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element. The operation is _intermediate_ and _stateless_.

public fun <T, R : Any> Sequence<T>.mapIndexedNotNull(transform: (index: Int, T) -> R?): Sequence<R> {
    return TransformingIndexedSequence(this, transform).filterNotNull()
}

Applies the given [transform] function to each element and its index in the original sequence and appends only the non-null results to the given [destination].

@param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element. The operation is _terminal_.

public inline fun <T, R : Any, C : MutableCollection<in R>> Sequence<T>.mapIndexedNotNullTo(destination: C, transform: (index: Int, T) -> R?): C {

    var sum: UInt = 0.toUInt()
    for (element in this) {
        sum += selector(element)
    }
    return sum
}

```

* Returns the sum of all values produced by [selector] function applied to each element in the sequence.

* The operation is `_terminal_`.

```

@SinceKotlin("1.5")
@OptIn(kotlin.experimental.ExperimentalTypeInference::class)
@OverloadResolutionByLambdaReturnType
@kotlin.jvm.JvmName("sumOfULong")
@WasExperimental(ExperimentalUnsignedTypes::class)
@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.sumOf(selector: (T) -> ULong): ULong {
    var sum: ULong = 0.toULong()
    for (element in this) {
        sum += selector(element)
    }
    return sum
}

```

* Returns an original collection containing all the non-`null` elements, throwing an `IllegalArgumentException` if there are any `null` elements.

* The operation is `_intermediate_` and `_stateless_`.

```

public fun <T : Any> Sequence<T?.>.requireNonNulls(): Sequence<T> {
    return map { it?.throw IllegalArgumentException("null element found in $this.") }
}

```

* Splits this sequence into a sequence of lists each not exceeding the given [size].

* The last list in the resulting sequence may have fewer elements than the given [size].

* @param size the number of elements to take in each list, must be positive and can be greater than the number of elements in this sequence.

* The operation is `_intermediate_` and `_stateful_`.

* @sample samples.collections.Collections.Transformations.chunked

```

@SinceKotlin("1.2")
public fun <T> Sequence<T>.chunked(size: Int): Sequence<List<T>> {
    return windowed(size, size, partialWindows = true)
}

```

* Splits this sequence into several lists each not exceeding the given [size]

and applies the given [transform] function to an each.

* @return sequence of results of the [transform] applied to an each list.

* Note that the list passed to the [transform] function is ephemeral and is valid only inside that function.

* You should not store it or allow it to escape in some way, unless you made a snapshot of it.

* The last list may have fewer elements than the given [size].

* @param size the number of elements to

take in each list, must be positive and can be greater than the number of elements in this sequence.

```

 * The operation is _intermediate_ and _stateful_.
 * @sample samples.text.Strings.chunkedTransform
 * Since Kotlin("1.2")
 public fun <T, R> Sequence<T>.chunked(size: Int, transform: (List<T>) -> R):
 Sequence<R> {
     return windowed(size, size, partialWindows = true, transform = transform)
 }
 
```

Returns a sequence containing all elements of the original sequence without the first occurrence of the given [element].

```

 * The operation is _intermediate_ and _stateless_.
 * public operator fun <T> Sequence<T>.minus(element:
 T): Sequence<T> {
     return object: Sequence<T> {
         override fun iterator(): Iterator<T> {
             var removed = false
             return this@minus.filter { if (!removed && it == element) { removed = true; false } else true }.iterator()
         }
     }
 }
 
```

Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] array.

Note that the source sequence and the array being subtracted are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

Before Kotlin 1.6, the [elements] array may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property `kotlin.collections.convert_arg_to_set_in_removeAll` set to `true`.

```

 * The operation is _intermediate_ and _stateful_.
 * public operator fun <T> Sequence<T>.minus(elements: Array<out T>): Sequence<T> {
     if (elements.isEmpty()) return this
     return object: Sequence<T> {
         override fun iterator(): Iterator<T> {
             val other = elements.convertToSetForSetOperation()
             return this@minus.filterNot { it in other }.iterator()
         }
     }
 }
 
```

Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] collection.

Note that the source sequence and the collection being subtracted are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

Before Kotlin 1.6, the [elements] collection may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property `kotlin.collections.convert_arg_to_set_in_removeAll` set to `true`.

```

 * The operation is _intermediate_ and _stateful_.
 * public operator fun <T> Sequence<T>.minus(elements: Iterable<T>): Sequence<T> {
     return object: Sequence<T> {
         override fun iterator(): Iterator<T> {
             val other = elements.convertToSetForSetOperation()
             if (other.isEmpty()) return this@minus.iterator()
             else return this@minus.filterNot { it in other }.iterator()
         }
     }
 }
 
```

Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] sequence.

Note that the source sequence and the sequence being subtracted are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is `_intermediate_` for this sequence and `_terminal_` and `_stateful_` for the [elements] sequence.

Before Kotlin 1.6, the [elements] sequence may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of `hashCode()` that didn't change between successive invocations.

On JVM, you can enable this behavior back with the system property `kotlin.collections.convert_arg_to_set_in_removeAll` set to `true`.

```

 * public operator fun <T>
 Sequence<T>.minus(elements: Sequence<T>): Sequence<T> {
     return object: Sequence<T> {
         override fun iterator(): Iterator<T> {
             val other = elements.convertToSetForSetOperation()
             if (other.isEmpty()) return this@minus.iterator()
             else return this@minus.filterNot { it in other }.iterator()
         }
     }
 }
 
```

Returns a sequence containing all elements of the original sequence without the first occurrence of the given [element].

The operation is `_intermediate_` and `_stateless_`.

```

 * @kotlin.internal.InlineOnly
 * public inline fun <T> Sequence<T>.minusElement(element: T):
 Sequence<T> {
     return minus(element)

Boolean): String // JVM- and JS-specific

`replace(regex: Regex, replacement: String): String` * Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the given [replacement]. The [replacement] can consist of any combination of literal text and \$-substitutions. To treat the replacement string literally escape it with the [kotlin.text.Regex.Companion.escapeReplacement] method.

`replace(regex: Regex, replacement: String): String` * Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the result of the given function [transform] that takes [MatchResult] and returns a string to be used as a replacement for that match.

`replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String` * Replaces the first occurrence of the given regular expression [regex] in this char sequence with specified [replacement] expression. @param replacement A replacement expression that can include substitutions. See [Regex.replaceFirst] for details.

`replaceFirst(regex: Regex, replacement: String): String` * Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty. @param transform function that takes the first character and returns the result of the transform applied to the character.

`replaceFirstChar(transform: (Char) -> Char): String` * Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty. @param transform function that takes the first character and returns the result of the transform applied to the character.

`replaceFirstChar(transform: (Char) -> CharSequence): String` * Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty. @param transform function that takes the first character and returns the result of the transform applied to the character.

`matches(regex: Regex): Boolean` * Implementation of [regionMatches] for CharSequences. Invoked when it's already known that arguments are not Strings, so that no additional type checks are performed.

`regionMatchesImpl(thisOffset: Int, other: CharSequence, otherOffset: Int, length: Int, ignoreCase: Boolean): Boolean` * Returns true if this char sequence starts with the specified character.

`startsWith(char: Char, ignoreCase: Boolean = false): Boolean` * Returns true if this char sequence starts with the specified character.

`endsWith(char: Char, ignoreCase: Boolean = false): Boolean` * Returns true if this char sequence ends with the specified character.

`startsWith(prefix: CharSequence, ignoreCase: Boolean = false): Boolean` * Returns true if this char sequence starts with the specified prefix.

`startsWith(prefix: CharSequence, ignoreCase: Boolean = false): Boolean` * Returns true if a substring of this char sequence starting at the

```

/*
 * Exports top-level declaration on JS platform.
 *
 * Compiled module exposes declarations that are marked with this annotation without name mangling.
 *
 * This annotation can be applied to either files or top-level declarations.
 *
 * It is currently prohibited to export the following kinds of declarations:
 * - `expect` declarations
 * - inline functions with reified type parameters
 * - suspend functions
 * - secondary constructors without `@JsName`
 * - extension properties
 * - enum classes
 * - annotation classes
 *
 * Signatures of exported declarations must only contain "exportable" types:
 * - `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`,

```

```

`Double`\n * * `BooleanArray`,
`ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`\n * * `Array<exportable-type>`\n * *
Function types with exportable parameters and return types\n * * `external` or `@JsExport` classes and interfaces\n
* * Nullable counterparts of types above\n * * Unit return type. Must not be nullable\n *\n * This annotation is
experimental, meaning that restrictions mentioned above are subject to change.\n

annotation class marker\n\n/**\n * Gives a declaration (a function, a property or a class) specific name in
JavaScript.\n * This may be useful in the following cases:\n * * There are two functions for which the
compiler gives same name in JavaScript, you can\n *   mark one with `@JsName(...)` to prevent the compiler from
reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names\n *   for
functions with parameters, which is unnatural for usual JavaScript developer.\n *   You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n *   for a concept provided by the declaration, which is uncommon in Kotlin.\n\n
*/\n\n * Example:\n */\n\n * ````\n * kotlin\n * class Person(val name: String) {\n *     fun hello() {\n *         println("Hello
$name!")\n *     }\n *     @JsName("helloWithGreeting")\n *     fun hello(greeting: String) {\n *         println("$greeting
$name!")\n *     }\n * }\n *\n * ````\n\n * @property
name the name which compiler uses both for declaration itself and for all references to the declaration.\n *   It's
required to denote a valid JavaScript identifier.\n */\n\n
