 }

```

Builds a new read-only `[Set]` by populating a `[MutableSet]` using the given `[builderAction]` and returning a read-only set with the same elements.

The set passed as a receiver to the `[builderAction]` is valid only inside that function. Using it outside of the function produces an unspecified behavior.

Elements of the set are iterated in the order they were added by the `[builderAction]`.

The returned set is serializable (JVM).

```

 @sample
 samples.collections.Builders.Sets.buildSetSample
 @SinceKotlin("1.6")
 @WasExperimental(ExperimentalStdlibApi::class)
 @kotlin.internal.InlineOnly
 public inline fun <E> buildSet(@BuilderInference builderAction: MutableSet<E>().->Unit): Set<E> {
 contract {
 callsInPlace(builderAction, InvocationKind.EXACTLY_ONCE)
 }
 return
 buildSetInternal(builderAction)
 }

```

`buildSetInternal(builderAction)` Builds a new read-only `[Set]` by populating a `[MutableSet]` using the given `[builderAction]` and returning a read-only set with the same elements.

The set passed as a receiver to the `[builderAction]` is valid only inside that function. Using it outside of the function produces an unspecified behavior.

`[capacity]` is used to hint the expected number of elements added in the `[builderAction]`.

Elements of the set are iterated in the order they were added by the `[builderAction]`.

The returned set is serializable (JVM).

@throws `IllegalArgumentException` if the given `[capacity]` is negative.

```

 @sample
 samples.collections.Builders.Sets.buildSetSample
 @SinceKotlin("1.6")
 @WasExperimental(ExperimentalStdlibApi::class)
 @kotlin.internal.InlineOnly
 public inline fun <E> buildSet(capacity: Int, @BuilderInference builderAction: MutableSet<E>().->Unit): Set<E> {
 contract {
 callsInPlace(builderAction, InvocationKind.EXACTLY_ONCE)
 }
 return buildSetInternal(capacity,
 builderAction)
 }

```

`buildSetInternal(capacity, builderAction)` Builds a new read-only `[Set]` by populating a `[MutableSet]` using the given `[builderAction]` and returning a read-only set with the same elements.

The set passed as a receiver to the `[builderAction]` is valid only inside that function. Using it outside of the function produces an unspecified behavior.

`[capacity]` is used to hint the expected number of elements added in the `[builderAction]`.

Elements of the set are iterated in the order they were added by the `[builderAction]`.

The returned set is serializable (JVM).

@throws `IllegalArgumentException` if the given `[capacity]` is negative.

```

 @sample
 samples.collections.Builders.Sets.buildSetSample
 @SinceKotlin("1.6")
 @WasExperimental(ExperimentalStdlibApi::class)
 @kotlin.internal.InlineOnly
 public inline fun <E> buildSet(capacity: Int, @BuilderInference builderAction: MutableSet<E>().->Unit): Set<E> {
 contract {
 callsInPlace(builderAction, InvocationKind.EXACTLY_ONCE)
 }
 return buildSetInternal(capacity,
 builderAction)
 }

```

Returns this `Set` if it's not `null` and the empty set otherwise.

```

 @kotlin.internal.InlineOnly
 public inline fun <T>
 Set<T>?.orEmpty(): Set<T> = this ?: emptySet()

```

`optimizeReadOnlySet()` Returns a new read-only `[Set]` with the same elements as this `Set`.

```

 @kotlin.internal.InlineOnly
 public inline fun <T>
 Set<T>.optimizeReadOnlySet(): Set<T> = when (size) {
 0 -> emptySet()
 1 -> setOf(iterator().next())
 else -> this
 }

```

}

Creates a [Grouping] source from a sequence to be used later with one of group-and-fold operations using the specified [keySelector] function to extract a key from each element. The operation is _intermediate_ and _stateless_.

@sample
samples.collections.Grouping.groupingByEachCount

Since Kotlin("1.1")
public inline fun <T, K> Sequence<T>.groupingBy(crossinline keySelector: (T) -> K): Grouping<T, K> {
 return object : Grouping<T, K> {
 override fun sourceIterator(): Iterator<T> = this@groupingBy.iterator()
 override fun keyOf(element: T): K = keySelector(element)
 }
}

Returns a sequence containing the results of applying the given [transform] function to each element in the original sequence. The operation is _intermediate_ and _stateless_.

@sample
samples.collections.Collections.Transformations.map

public fun <T, R> Sequence<T>.map(transform: (T) -> R): Sequence<R> {
 return TransformingSequence(this, transform)
}

Returns a sequence containing the results of applying the given [transform] function to each element and its index in the original sequence.

@param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element.

The operation is _intermediate_ and _stateless_.

public fun <T, R> Sequence<T>.mapIndexed(transform: (index: Int, T) -> R): Sequence<R> {
 return TransformingIndexedSequence(this, transform)
}

Returns a sequence containing only the non-null results of applying the given [transform] function to each element and its index in the original sequence.

@param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element.

The operation is _terminal_.

public inline fun <T, R : Any, C : MutableCollection<in R>> Sequence<T>.mapIndexedNotNullTo(destination: C, transform: (index: Int, T) -> R?): C {
 forEachIndexed { index, element -> transform(index, element) }.let { destination.add(it) }
 return destination
}

Applies the given [transform] function to each element and its index in the original sequence and appends the results to the given [destination].

@param [transform] function that takes the index of an element and the element itself and returns the result of the transform applied to the element.

The operation is _terminal_.

public inline fun <T, R, C : MutableCollection<in R>> Sequence<T>.mapIndexedNotNullTo(destination: C, transform: (index: Int, T) -> R?): C {
 var index = 0
 for (item in this) {
 destination.add(transform(checkIndexOverflow(index++), item))
 }
 return destination
}

Returns a sequence containing only the non-null results of applying the given [transform] function to each element in the original sequence.

The operation is _intermediate_ and _stateless_.

@sample
samples.collections.Collections.Transformations.mapNotNull

public fun <T, R : Any> Sequence<T>.mapNotNull(transform: (T) -> R?): Sequence<R> {
 return TransformingSequence(this, transform).filterNotNull()
}

Applies the given [transform] function to each element in the original sequence and appends only the non-null results to the given [destination].

The operation is _terminal_.

public inline fun <T, R : Any, C : MutableCollection<in R>> Sequence<T>.mapNotNullTo(destination: C, transform: (T) -> R?): C {
 forEach { element -> transform(element) }.let { destination.add(it) }
 return destination
}

Applies the given [transform] function to each element of the original sequence and appends the results to the given [destination].

The operation is _terminal_.

public inline fun <T, R, C : MutableCollection<in R>>

```

```

Sequence<T>.mapTo(destination: C, transform: (T) -> R): C {
 for (item in this)
 destination.add(transform(item))
}
return destination
}

* Returns a sequence that wraps each element of the original sequence into an [IndexedValue] containing the index of that element and the element itself.
The operation is _intermediate_ and _stateless_.

public fun <T> Sequence<T>.withIndex(): Sequence<IndexedValue<T>> {
 return IndexingSequence(this)
}

* Returns a sequence containing only distinct elements from the given sequence.
Among equal elements of the given sequence, only the first one will be present in the resulting sequence.
The elements in the resulting sequence are in the same order as they were in the source sequence.
The operation is _intermediate_ and _stateful_.

@sample samples.collections.Collections.Transformations.distinctAndDistinctBy

public fun <T> Sequence<T>.distinct(): Sequence<T> {
 return this.distinctBy { it }
}

* Returns a sequence containing only elements from the given sequence having distinct keys returned by the given [selector] function.
Among elements of the given sequence with equal keys, only the first one will be present in the resulting sequence.
The elements in the resulting sequence are in the same order as they were in the source sequence.
The operation is _intermediate_ and _stateful_.

@sample samples.collections.Collections.Transformations.distinctAndDistinctBy

public fun <T, K> Sequence<T>.distinctBy(selector: (T) -> K): Sequence<T> {
 return DistinctSequence(this, selector)
}

* Returns a new [MutableSet] containing all distinct elements from the given sequence.
The returned set preserves the element iteration order of the original sequence.
The operation is _terminal_.

public fun <T> Sequence<T>.toMutableSet(): MutableSet<T> {
 val set = LinkedHashSet<T>()
 for (item in this)
 set.add(item)
 return set
}

array of the specified [size], where each element is calculated by calling the specified [init] function. The function [init] is called for each array element sequentially starting from the first one. It should return the value for an array element given its index.

```
kotlin.js\n\nimport kotlin.annotation.AnnotationTarget.*\n\n@Target(FUNCTION)\n@Deprecated("Use inline extension function with body using dynamic")\npublic annotation class
```

nativeGetter\n\n@Target(FUNCTION)\n@Deprecated("Use inline extension function with body using

dynamic")\n\npublic annotation class nativeSetter\n\n@Target(FUNCTION)\n@Deprecated("Use inline extension

function with body using dynamic")\n\npublic annotation class nativeInvoke\n\n@Target(CLASS, FUNCTION, PROPERTY)\n\ninternal annotation class library(public val name: String = "")\n\n@Target(CLASS)\n\ninternal

annotation class marker\n\n/\*\*\n \* Gives a declaration (a function, a property or a class) specific name in

JavaScript.\n \*\n \* This may be useful in the following cases:\n \*\n \* \* There are two functions for which the

compiler gives same name in JavaScript, you can\n \* mark one with `@JsName(...)` to prevent

the compiler from reporting error.\n \* \* You are writing a JavaScript library in Kotlin. The compiler produces

mangled names\n \* for functions with parameters, which is unnatural for usual JavaScript developer.\n \* You

can put `@JsName(...)` on functions you want to be available from JavaScript.\n \* \* For some reason you want to

rename declaration, e.g. there's common term in JavaScript\n \* for a concept provided by the declaration, which

in uncommon in Kotlin.\n \*\n \* Example:\n \*\n \* ``` kotlin\n \* class Person(val name: String) {\n \* fun hello()\n \* println("Hello \$name!")\n \* }\n \* @JsName("helloWithGreeting")\n \* fun hello(greeting: String) {\n \* println("\$greeting \$name!")\n \* }\n \* }\n \* ```\n \*\n \* @property name the name which

compiler uses both for declaration itself and for all references to the declaration.\n \* It's required to denote a

valid JavaScript identifier.\n \*\n \* @Retention(AnnotationRetention.BINARY)\n \* @Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY\_GETTER, PROPERTY\_SETTER)\n \* public actual

annotation class JsName(actual val name: String)\n\n/\*\*\n \* Denotes an `external` declaration that must be imported

from native JavaScript library.\n \*\n \* The compiler produces the code relevant for the target module system, for

example, in case of CommonJS,\n \* it will import the declaration via the `require(...)` function.\n \*\n \* The

annotation can be used on top-level external declarations (classes, properties, functions) and files.\n \*\n \* In case of file

(which can't be `external`) the following rule applies: all the declarations in\n \* the file must be `external`. By

applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object\n \* that contain all the

declarations from the file.\n \*\n \* Example:\n \*\n \* ``` kotlin\n \* @JsModule("jquery")\n \* external abstract class JQuery() {\n \* // some declarations here\n \* }\n \* @JsModule("jquery")\n \* external fun JQuery(element: Element): JQuery\n \* ```\n \*\n \* @property import name of a module to import

declaration from.\n \* It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module

system.\n \*\n \* @see JsNonModule\n \*\n \* @Retention(AnnotationRetention.BINARY)\n \* @Target(CLASS, PROPERTY, FUNCTION, FILE)\n \* public annotation class JsModule(val import: String)\n\n/\*\*\n \* Denotes an

to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation. For example:

```

kotlin
@JsModule("jquery")
@JsNonModule
@JsName("$")
external abstract class
jQuery() {
 // some declarations here
}
@JsModule("jquery")
@JsNonModule
@JsName("$")
external fun jQuery(element: Element): jQuery
@see JsModule
@Retention(AnnotationRetention.BINARY)
@Target(CLASS, PROPERTY, FUNCTION, FILE)
public
annotation class JsNonModule

```

Adds prefix to `external` declarations in a source file. JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects. The compiler turns references to `external` declarations either to plain unprefix names (in case of `plain` modules) or to plain imports. However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this. You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`

annotation. Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. Example:

```

kotlin
@file:JsQualifier("my.jsPackageName")
package
some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String

```

property value the qualifier to add to the declarations in the generated code. It must be a sequence of valid JavaScript identifiers separated by the `.` character. Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`.

```

@see JsModule
@Retention(AnnotationRetention.BINARY)
@Target(AnnotationTarget.FILE)
public
annotation class JsQualifier(val value: String)

```

Exports top-level declaration on JS platform. Compiled module exposes declarations that are marked with this annotation without name mangling. This annotation can be applied to either files or top-level declarations. It is currently prohibited to export the following kinds of declarations:

- `expect` declarations
- inline functions with reified type parameters
- suspend functions
- secondary constructors without `@JsName`
- extension properties
- enum classes
- annotation classes

Signatures of exported declarations must only contain "exportable" types: `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`, `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`, `Array<exportable-type>` Function types with exportable parameters and return types `external` or `@JsExport` classes and interfaces Nullable counterparts of types above Unit return type. Must not be nullable This annotation is experimental, meaning that restrictions mentioned above are subject to change.

```

@ExperimentalJsExport
@Retention(AnnotationRetention.BINARY)
@Target(CLASS,
PROPERTY, FUNCTION, FILE)
@SinceKotlin("1.3")
public actual annotation class JsExport

```

Forces a top-level property to be initialized eagerly, opposed to lazily on the first access to file and/or property.

```

@ExperimentalStdlibApi
@Retention(AnnotationRetention.BINARY)
@Target(AnnotationTarget.PROPER
TY)
@SinceKotlin("1.6")
@Deprecated("This annotation is a temporal migration assistance and may be
removed in the future releases, please consider filing an issue about the case where it is needed")
public annotation
class EagerInitialization

Copyright 2008 Google Inc.

The implementation of the [MutableSet] interface, backed by a [HashMap] instance.

Classes that extend HashSet and implement `build()` (freezing) operation

have to make sure mutating methods check `checkIsMutable`.

```

public actual open class HashSet<E> : AbstractMutableSet<E>, MutableSet<E> {
 internal val map: HashMap<E, Any>
 /** Constructs a new empty [HashSet].
 actual constructor() {
 map = HashMap<E, Any>()
 }
 /** Constructs a new [HashSet] filled with the elements of the specified collection.
 actual constructor(elements: Collection<E>) {
 map = HashMap<E, Any>(elements.size)
 addAll(elements)
 }
 /** Constructs a new empty [HashSet].
 * @param initialCapacity the initial capacity (ignored)
 * @param loadFactor the load factor (ignored)
 * @throws IllegalArgumentException if the initial capacity or load factor are negative
 actual constructor(initialCapacity: Int, loadFactor: Float) {
 map = HashMap<E, Any>(initialCapacity, loadFactor)
 }
 actual constructor(initialCapacity: Int) : this(initialCapacity, 0.0f)
 /** Protected constructor to specify the underlying map. This is used by
 * LinkedHashSet.
 * @param map underlying map to use.
 internal constructor(map: HashMap<E, Any>) {
 this.map = map
 }
 actual override fun add(element: E): Boolean {
 val old = map.put(element, this)
 return old == null
 }
 actual override fun clear() {
 map.clear()
 }
 public override fun clone(): Any {
 return HashSet<E>(this)
 }
 actual override operator fun contains(element: E): Boolean = map.containsKey(element)
 actual override fun isEmpty(): Boolean = map.isEmpty()
 actual override fun iterator(): MutableIterator<E> = map.keys.iterator()
 actual override fun remove(element: E): Boolean = map.remove(element) != null
 actual override val size: Int get() = map.size
}

```

Creates a new instance of the specialized implementation of [HashSet] with the specified [String] elements, which elements the keys as properties of JS object without hashing them.

```

public fun stringSetOf(vararg elements: String): HashSet<String> {
 return HashSet(stringMapOf<Any>()).apply { addAll(elements) }
}

```

Based on GWT InternalHashMap

Copyright 2008 Google Inc.

```

package kotlin.collections
import kotlin.collections.MutableMap.MutableEntry
import kotlin.collections.AbstractMutableMap.SimpleEntry

```

A simple wrapper around JavaScriptObject to provide [java.util.Map]-like semantics for any key type.

Implementation notes:

- A key's hashCode is the index in backingMap which should contain that key. Since several keys may have the same hash, each value in hashCodeMap is actually an array containing all entries whose keys share the same hash.

```

internal class InternalHashMap<K, V>(override val equality: EqualityComparator) : InternalMap<K, V> {
 private var backingMap: dynamic = createJsMap()
