

Cisco Nexus Dashboard Offer

Cisco Data Center Networking (DCN) Nexus
Dashboard and Day 2 Operations licenses

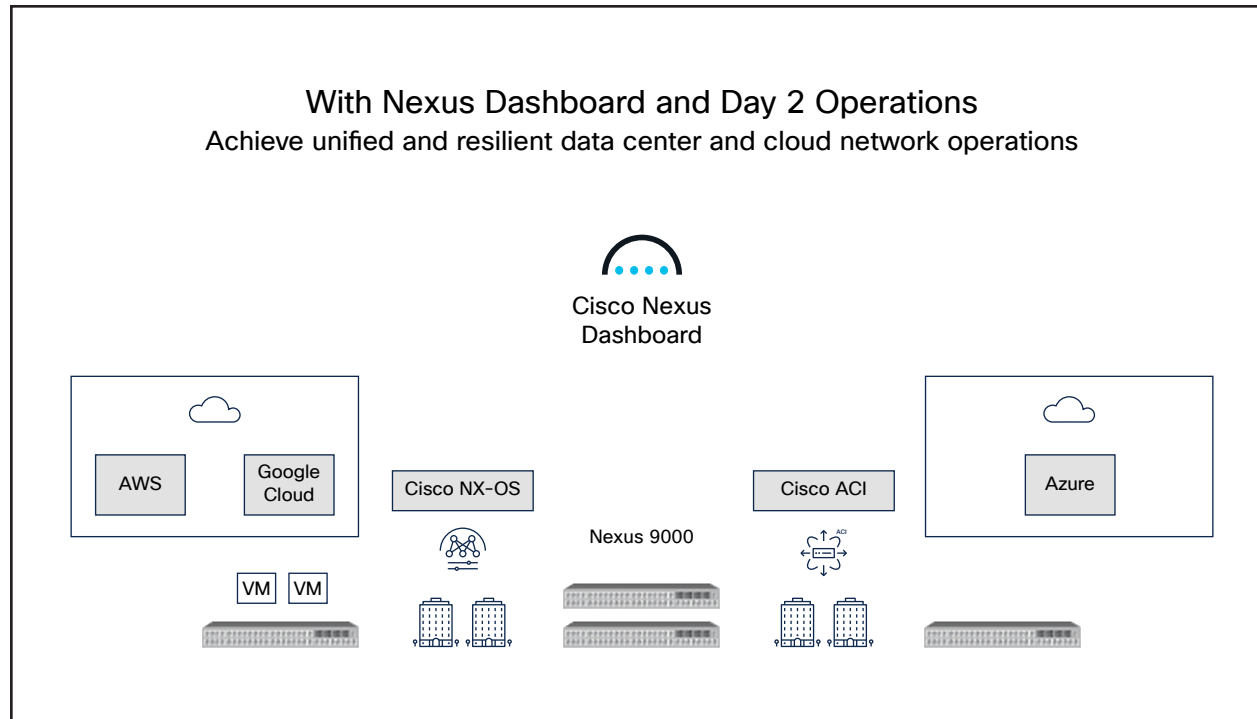

Figure 1. Data Center Networking Operations and Automation with Cisco Nexus Dashboard

As more diverse and containerized applications and services continue to come onto the network, increasing the complexity of managing widely distributed data over on-premises, edge-cloud, and public-cloud data center locations, organizations need to meet this increased demand.

Cisco Nexus® Dashboard addresses the challenges of managing, monitoring, and troubleshooting networks and applications, by providing unified proactive operations and actionable insights from a single pane of glass. Customers can:

- **Unify operations:** Avoid managing and monitoring individual devices and fabrics independently by consolidating a powerful and consistent operational model under one view. Reduce time spent on release notes and guidelines by getting embedded software recommendations to keep your networks running under support and following your own configuration and communication rules.
- **Accelerate innovation:** Make the most out of built-in and Infrastructure-as-Code (IaC) network automation to deliver connectivity faster to your switches (through Nexus Dashboard Fabric Controller), across fabrics (through Nexus Dashboard Orchestrator), or even across clouds.
- **Minimize downtime:** Leverage Cisco Nexus Dashboard Insights to increase visibility and identify issues and recommendations to fix them, gathering years of experience under a single network-operations platform.
- **Increase environmental sustainability:** Learn your network's impact on KWh, cost, and CO2 emissions through Cisco Nexus Dashboard Insights sustainability reports.

And now...

...each **Cisco Nexus Dashboard** cluster is now bundled with six (6) **Day 2 Operations 5-year term Licenses** to accelerate and enable the customer journey with Nexus Dashboard Insights.
