

Username Update on Cisco Business Dashboard

Objective

This brief article explains the need to select a username other than *cisco* when logging into the Web User Interface (UI) for management.

Applicable Devices | Firmware Version

- Cisco Business Dashboard | 2.3.0

Here's the Deal

Per Secure Development Lifecycle Methodology (CSDL), *cisco* is no longer a valid username. This new standard has been implemented to reduce it as a vulnerability in operational systems.

The default login credentials will still use the username of *cisco* and a password of *cisco* out of the box. Once you perform the first login, you will be prompted to choose both a new username and a new password. This applies to new installations. The username change is not enforced on an in-place upgrade.

If you attempt to use *cisco* as your username, you will receive a little reminder of this new standard. Pick a different username and whatever you do, don't forget it!

Change Default Administrator

User Name*

cisco

Old Password* Can't use cisco as the use name of default administrator

.....

New Password*

.....

Retype New Password*

.....

Feel free to keep *cisco* as your username for console access as that access method is not affected.

Conclusion

That's it, just one small step to get you on your way.
