

DOCSIS Load Balancing Groups

First Published: April 11, 2015

Support for the restricted load balancing group (RLBG)/general load balancing group (GLBG) is based on DOCSIS 3.0 specifications.

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Prerequisites for DOCSIS Load Balancing Groups

DOCSIS Load Balancing Groups including Restricted/General Load Balancing groups with Downstream Dynamic Load Balancing feature has the following prerequisites:

- A RLBG and a DOCSIS 2.0 GLBG should have a load balancing group (LBG) ID.
- A LBG should have a default policy ID.
- During registration, a cable modem (CM) that has been assigned to a LBG must also be assigned a policy ID and priority, through Simple Network Management Protocol (SNMP), the cable modem configuration file, or Cisco Cable Modem Termination System (CMTS) configuration.

• The cable modem must send service type identifier (STID), service class name, and DOCSIS version and capability type/length/value (TLV) settings to the Cisco CMTS for registration if the fields are used by general tagging.

Restrictions for DOCSIS Load Balancing Groups

The DOCSIS Load Balancing Groups (LBG) including RLBG/GLBG Support with DLB Support feature has the following restrictions:

- A maximum of 256 DOCSIS policies and 256 rules per chassis are supported.
- Cross-line card (LC) configuration or moving of cable modems is not supported.
- When deployed with channel restriction features, if the target upstream channel attribute masks are against that of the cable modem, then the cable modem on the higher load upstream will not be load balanced, as the current load balancing moves cable modems only to the target upstream. However, cable modems that do not have an attribute mask can still be load balanced. You should consider the following while deploying the load balancing groups: the target upstream will always be the upstream that has the lowest load. If some other upstreams have the same load, the upstream with the lowest index will be chosen as the target upstream.
- We recommend all LBGs that share channels must use the same LB method.

The DOCSIS LBG with RLBG/GLBG Support and DLB Support feature have the following cross functional restrictions:

- Cable modems operating in the multiple transmit channel (MTC) mode do not register for a RLBG assignment, even if their configuration file contains relevant TLVs, such as STID and LBG ID. However, cable modems operating in the multiple receive channel (MRC) can register for a RLBG assignment.
- The Cisco CMTS can parse a specific TLV encoded in cable modem configuration file, and prohibit any DCC operation on the cable modems.
- DOCSIS MAC domain downstream service group (MD-DS-SG) channels in MDD messages are incorrect when a combination of channels from multiple line card types are placed in the same fiber node.

In a complex fiber node setup, with channels from more than one line card, or downstream channels of one MAC domain in more than one fiber node, some modems may not come w-online (wideband online). If a MAC domain has more than one MD-DS-SG, the MDD will contain more than one MD-DS-SG and cause the modem to perform downstream ambiguity resolution. When the modem analyzes the downstream channels from the other line card, it will not see MDD packets and disqualify the channel and the MD-DS-SG. The modem then sends a requested MD-DS-SG of 0 to the CMTS implying it will not participate in a bonding group.

Use the **show cable mac-domain downstream-service-group** command to see the channels in the same MD-DS-SG.

The DOCSIS LBG with RLBG/GLBG Support and DLB Support feature have the following scaling limitations:

- The total number of RLBGs and DOCSIS 2.0 GLBGs cannot exceed 256.
- The total number of tags in a Cisco CMTS cannot exceed 256.
- The total number of DOCSIS 3.0 GLBGs is bounded by free memory.
- A cable modem reset occurs if a CM moves from one cable interface to another because DCC init-tech 0 resets a cable modem during a LB move. A cable modem also resets if the two cable interfaces have been configured with a mismatched **cable ip-init** command.

Information About DOCSIS Load Balancing Groups

The DOCSIS 2.0 "Autonomous Load Balancing" specification is CM-centric, allowing a channel (US or DS) to be part of multiple RLBGs. Therefore, with the DOCSIS 2.0 specifications, you can decide on which channel the CM can be load balanced.

To configure the Restricted/General Load Balancing and Narrowband Dynamic Bandwidth Sharing with Downstream Dynamic Load Balancing feature, you should understand the following concepts:

Service-Based Load Balancing

Using the DOCSIS 3.0 modem-based load balancing specifications, you can manage the LB activity on a per-modem basis as follows:

- 1. Modem to RLBG association through STID
- 2. Modem to RLBG association through LBG ID
- 3. Per-modem LB policy assignment
- 4. Per-modem LB priority assignment
- 5. Per-modem channel restriction

Implementing the DOCSIS 3.0 modem-based LB specifications enables the Cisco CMTS to provide an advanced service-based LB. The service-based LB can be used to alleviate the burden for the modem-based provisioning and provide the operator an ability to selectively control LB activity based on modem service type. For example, for LB purposes modems can be classified based on:

- Device type
- DOCSIS version
- · Service class

The results of the classification can then be used to selectively control the modem LB activity by mapping the modem to the following settings:

- LBG
- Policy

With the service-based LB enabled, existing service-based cable modem segregation features and channel restriction become special cases and can be handled within the same LB framework.

Functionality

The Cisco CMTS functions in the following ways for general tagging and service-based LB:

- The Cisco CMTS can classify some modems with user-defined modem classifiers using the STID, service class name, DOCSIS version and capability TLVs and MAC Organization Unique Identifier (OUI).
- Each modem classifier has a unique tag. The Cisco CMTS allows each modem to carry one tag. When multiple tags match one cable modem, the tag that has the least index gets applied on the cable modems.
- The Cisco CMTS classifies a CM and assigns a tag, and if a RLBG with that tag is configured, the CM gets assigned to that RLBG.
- The Cisco CMTS can match multiple tags to a RLBG and a DOCSIS policy.
- On the Cisco CMTS, a user can configure whether the general tagging overrides the RLBG or DOCSIS policy assignment using TLVs in the CM configuration file and SNMP when a conflict occurs.

- When doing autonomous LB, the Cisco CMTS ensures that the target channels are available to a specific CM with regard to admission control, the SF attribute masks, and CM attribute masks.
- The user can configure the number of times that a DCC fails a CM before the CM is removed from dynamic LB on the Cisco CMTS.
- The user can configure DCC initialization techniques or whether to use Upstream Channel Change (UCC) for a LBG or for a particular source and target pair on the Cisco CMTS. However, DCC is not issued to cable modems provisioned in DOCSIS 1.0 mode. By default, the UCC for a LBG is not configured and therefore, all channel changes are done through DCC.
- The Cisco CMTS supports LB on at least one logical channel on a physical US channel that has multiple logical US channels.
- As per the DOCSIS 3.0 specifications, a lower load balancing priority indicates a higher likelihood that a CM will be moved due to load balancing operations.
- You can create a policy to set the lower bandwidth for CMs. the LBG can only move cable modems with throughput that is above the threshold.

Compatibility

Both downstream and upstream autonomous load balancing is supported for single channel cable modems.

RLBG/GLBG Assignment

The user can configure one or more service type IDs for each RLBG. The user can also configure the Cisco CMTS, using CLI or SNMP, to restrict a particular cable modem to a certain STID and RLBG ID. However, if such a configuration is made, both the STID and RLBG ID in the configuration file are ignored by the Cisco CMTS.

When the STID is configured by CLI or SNMP or the STID is present in the cable modem configuration file, the Cisco CMTS selects an upstream and downstream channel, which offers the signaled service type, from a RLBG, if such channels exist. However, if an upstream and downstream channel do not exist that provide the signaled service type the Cisco CMTS assigns an upstream and downstream channel that does not offer the signaled service type.

When the LBG ID is configured by CLI or SNMP or the LBG ID is present in the cable modem configuration file, the Cisco CMTS examines the available choices for upstream and downstream channels and, if they include a channel pair associated with the signaled LBG, the Cisco CMTS assigns the cable modem to the signaled LBG. If these conditions are not met, the Cisco CMTS disregards the LBG ID.

If there are multiple upstream and downstream channels available that meet the requirements of the STID, if present, and the LBG ID, if present, the Cisco CMTS selects an upstream and/or downstream channel that meet the cable modem required and forbidden attribute masks requested in the configuration file. If upstream and downstream channels are not available that meet these criteria, the Cisco CMTS can disregard the cable modem attribute masks and select an alternative upstream and/or downstream channel.

In determining a target channel pair for a cable modem during registration time, the Cisco CMTS tries to find the target channel pair that can actually reach the cable modem by checking the current channel pair, the MD-DS-SG-ID (Media Access Control Domain Downstream Service Group Identifier) of cable modem (CM-DS-SG-ID) and the MD-US-SG-ID (Media Access Control Domain Upstream Service Group Identifier) of cable modem (CM-US-SG-ID), if present, and fiber node (FN) configurations. If the target channel pair is available to the cable modem and is different from the current channel pair, the Cisco CMTS is required to move the CM by means of DCC technique 0 or downstream frequency override (DFO).

When the Cisco CMTS identifies multiple candidate RLBGs for a CM, but cannot determine which fiber node configuration the cable modem is actually wired to, or cannot determine if the wired RLBG is unusable (when

interfaces in the load balance group are disabled or in an administratively down state), the Cisco CMTS assigns the cable modem to the RLBG with the lowest group index. This assignment causes the Cisco CMTS to attempt to move the cable modem to interfaces it is not physically connected to, resulting in service outages for the CM.

The Cisco CMTS enforces fiber node checking during RLBG assignment.

The Cisco CMTS follows the following RLBG assignment rules:

- If there is no fiber node configuration, there is no change in the candidate RLBG list. However, if the fiber node is configured, the fiber node must be configured correctly to reflect the real fiber node connection.
- If the cable modem is inside a fiber node, only those RLBGs that are inside that fiber node are selected.
- If the cable modem is not inside any fiber node, that is, the fiber node configuration does not cover all the channels, only those RLBGs that are not inside any fiber node are selected.
- If an RLBG spans across multiple fiber nodes, it is not considered to be inside any fiber node.
- If no candidate RLBG is found, cable modems are assigned to the GLBG, if the GLBG exists.

Channel Assignment

For cable modems operating in MRC mode, the registration request message can have multiple TLVs to influence the selection of upstream and downstream channels that the Cisco CMTS assigns. To avoid conflicts between the multiple TLVs, the Cisco CMTS follows the precedence order defined below:

- 1. TLV 56—Channel Assignment
- 2. TLV 43.11—Service Type Identifier
- **3.** TLV 43.3—Load Balancing Group ID
- **4.** TLVs 24/25.31-33—Service Flow Attribute Masks
- 5. TLV 43.9—CM Attribute Masks

The Cisco CMTS must follow this TLV precedence order for cable modems not operating in MRC mode:

- **1.** TLV 43.11—Service Type Identifier
- 2. TLV 43.3—Load Balancing Group ID
- 3. TLV 43.9—CM Attribute Masks
- 4. TLVs 24/25.31-33—Service Flow Attribute Masks

Note

When a target for the new receive channel configuration (RCC) and Transmit channel configuration (TCC) is selected, ensure that the service level for cable modems is not decreased. Target total RCCs and TCCs must not be less than the source total RCCs and TCCs so that cable modems can keep their service level unchanged. This may cause some unbalanced results when high capacity cable modems come online, later releases..

The Cisco CMTS also considers the DOCSIS 3.0 cable modem capabilities defined in the registration request message and assigns the maximum number of channels that the CM requests.

The tables below define the load balancing matrix for RLBG and GLBG assignment:

Table 2: RLBG Assignment for DOCSIS Cable Modems

Operational Mode	MAC Version				
	DOCSIS 3.0 CM	DOCSIS 2.x CM	DOCSIS 2.0 CM	DOCSIS 1.1 CM	DOCSIS 1.0 CM

Operational Mode	Mode MAC Version				
Non-MRC mode (online)	Assigned	Assigned	Assigned	Assigned	Assigned
MRC mode only (w-online)	Assigned	Assigned	Assigned	NA	NA
MRC/MTC mode	Assigned	NA	NA	NA	NA
(UB-online)	DOCSIS 3.0 cable modems are assigned to the DOCSIS 3.0 RLBG	NA	NA	NA	NA

Table 3: GLBG Assignment for DOCSIS Cable Modems

Operational Mode	MAC Version				
	DOCSIS 3.0 CM	DOCSIS 2.x CM	DOCSIS 2.0 CM	DOCSIS 1.1 CM	DOCSIS 1.0 CM
Non-MRC mode (online)	Assigned to the DOC	CSIS 2.0 GLBG witho	ut MD-DS-SG-ID/M	D-US-SG-ID	
(omme)	Assigned to the DOC MD-DS-SG-ID/MD-		NA	NA	NA
MRC mode only	Assigned to the DOCSIS 2.0 GLBG without MD-DS-SG-ID/MD-US-SG-ID				
(w-online)	Assigned to the DOC MD-DS-SG-ID/MD-	CSIS 3.0 GLBG with US-SG-ID	NA	NA	NA
MRC/MTC mode	Assigned	NA	NA	NA	NA
(UB-online)	DOCSIS 3.0 cable modems are assigned to the DOCSIS 3.0 GLBG	NA	NA	NA	NA

The tables below give a snapshot view of the load balancing methods and the operations used to "move" bonded and non-bonded CMs.

Table 4: Load Balancing Method to Move Bonded and Non-bonded cable modems

Modem Mode	Dynamic Service Charge (Initialization Technique)		
	Within MAC Domain	Across MAC Domains	
DOCSIS 3.0 cable modems in MTC mode	NA	DCC initialization technique 0	

Modem Mode Dynamic Service Charge (Initialization Technique)			
DOCSIS 3.0/DOCSIS 2.x cable modems in MRC-only mode	DCC in	control of the contro	DCC initialization technique 0
DOCSIS 3.0 cable modems in MRC-only mode	DCC Note	CM outside RLBG moves inside RLBG with DOCSIS 2.0 LB.	DCC initialization technique 0
DOCSIS 2.x cable modems in MRC-only mode	DCC/U Note	CC CM outside RLBG moves inside RLBG with DOCSIS 2.0 LB.	DCC initialization technique 0
DOCSIS 2.0 /DOCSIS 1.1 cable modems in NB mode	DCC Note	CM outside RLBG moves inside RLBG with DOCSIS 2.0 LB.	DCC initialization technique 0
	UCC Note	CM outside RLBG moves inside RLBG with DOCSIS 2.0 LB.	UCC
DOCSIS 1.0 in NB mode	Force ro	einitialize CM CM outside RLBG moves inside RLBG with DOCSIS 2.0 LB.	Force reinitialize CM
	UCC Note	CM outside RLBG moves inside RLBG with DOCSIS 2.0 LB.	UCC

Table 5: Using DCC/DBC to Load Balance Bonded and Non-bonded Cable Modems

Channel	CM in MRC, non-MTC Mode	DOCSIS 1.1/DOCSIS 2.0 cable modems with Single US/DS	DOCSIS 1.0 cable modems with Single US/DS
Upstream (US)	DCC	DCC	UCC
Downstream (DS)	NA (within the same MAC domain)	DCC (within the same MAC domain).	Force reinitialize CM
(55)	DCC with initialization technique 0 when moving cable modems across MAC domains.	DCC with initialization technique 0 when moving cable modems across MAC domains.	Force reinitialize CM

Error Handling of Channel Assignment

This restriction is modified. As long as the interface state of the channels is not "administratively down", all channels are available for LBG assignment. For other load balancing operations, such as moving modems

using DCC, UCC, or DBC, the interface state of the channels should be in "initial", "up", "suspicious", or "testing" states.

The following conditions apply when an LBG is disabled:

- cable modems that match all load balancing criteria can be assigned to an LBG.
- cable modem moves for load balancing are disabled, but cable modem moves from outside of the LBG to inside of the LBG are allowed.

Upstream Load Balancing for DOCSIS 3.0 Cable Modems in Single Upstream Mode

The upstream load balancing functionality enables the Cisco CMTS router to effectively handle upstream traffic for wideband and narrowband cable modems that are in single upstream mode. Single upstream mode (Mx1) means that the modems cannot send upstream traffic on multiple upstream channels. In the event of traffic overload on a single upstream channel of a wideband or narrowband cable modem, the Cisco CMTS router automatically moves the cable modem to another upstream channel in the same load balancing group.

Note

A cable modem operating in single upstream mode is assigned to a load balancing group based on the primary channel of the modem. A cable modem in single upstream mode can support multiple receive channel (MRC) mode or narrowband mode. However, a cable modem in single upstream mode cannot support multiple transmit channel mode (MTC).

Auto-generate DOCSIS 2.0 GLBG

Cisco CMTS does not automatically implement DOCSIS 2.0 GLBG. DOCSIS 2.0 GLBG is configured manually after a new fiber node - MAC domain (FN-MD) pair is added.

This enhancement to automatically generate DOCSIS 2.0 GLBG after adding a new FN-MD pair and resolving a new combination of MAC domain, cable modem, and service group (MD-CM-SG). This enhancement is implemented through a new command **cable load-balance d20 GLBG auto-generate**. The command has options to renew and update DOCSIS 2.0 GLBGs for a fiber node configuration.

Independent Upstream/Downstream Throughput Rules

Currently, during upstream or downstream load balancing, to move modems in load balancing operations, Cisco CMTS applies the DOCSIS policy throughput rules to both upstream and downstream throughput to upstream or downstream load balancing operations. In other words, for downstream load balancing, both upstream and downstream sets of rules are applied and similarly for upstream load balancing both set of rules are applied. This prevents movement of modems with low upstream or high downstream throughput and high upstream or low downstream throughput.

Upstream or downstream throughput rules are checked independently to corresponding upstream or downstream load balancing operations. During upstream load balancing, only upstream throughput rules are checked, and during downstream load balancing, only downstream throughput rules are checked.

The following important points are implemented for independent upstream/downstream throughput rules:

- If DOCSIS 2.0 load balancing policy configured is **us-across-ds**, it is recommended to configure a maximum of 16 downstream channels and 8 upstream channels.
- If a load balancing operation involves a change only in the downstream channel of a cable modem without any change to the upstream channel, then only the downstream lower boundary rules are checked.
- If a load balancing operation involves a change only in the upstream channel of a cable modem without any change to the downstream channel, then only the upstream lower boundary rules are checked.
- If a load balancing operation involves a change in both the upstream and downstream channels of a cable modem, then the modem rule check must pass all the rules for that (upstream or downstream) load balancing.
- If the load balancing policy configured is pure-ds-load, then only the downstream rules are checked.
- If the load balancing policy configured is **us-across-ds** or both **us-across-ds** and **pure-ds-load**, then two types of target interfaces occur as follows:
 - Local interface—where the cable modem shares the upstream with the source. Only downstream load balancing operation occurs.
 - Remote interface—where the the cable modem does not share the upstream with the source. The upstream/downstream load balancing is triggered by upstream load.

If the load balancing policy configured is neither us-across-ds nor pure-ds-load, then the load balancing is done based on Mac domain load.

How to Configure DOCSIS Load Balancing Groups

The Restricted/General Load Balancing and Narrowband Dynamic Bandwidth Sharing with Downstream Dynamic Load Balancing feature can be configured as follows:

- A user can configure a DOCSIS 2.0 general load balancing group (GLBG) on the Cisco CMTS according
 to DOCSIS specification. The Cisco CMTS creates a DOCSIS 3.0 GLBG for each Media Access Control
 Domain Cable Modem Service Group (MD-CM-SG) automatically and checks whether the GLBG
 contains both upstream and downstream channels.
- A cable modem that is not provisioned to any RLBG and cannot resolve its MD-CM-SG gets assigned to a DOCSIS 2.0 GLBG. However, if the cable modem resolves its MD-CM-SG, it gets assigned to a DOCSIS 3.0 GLBG.
- A user can configure RLBGs and any upstream or downstream channel into multiple RLBGs on the Cisco CMTS. The Cisco CMTS checks whether a RLBG contains both upstream and downstream channels. A RLBG can cross multiple MDs.
- A backward compatibility with existing Cisco LB schemes is maintained. The users can switch between the old and new DOCSIS 3.0 compliant LB schemes.

Note

When the Cisco IOS system is upgraded, if the docsis-policy configuration of the DOCSIS load balancing groups, is missing in the output of the **show running-config** command, apply the docsis-policy to the DOCSIS load balancing groups using the **docsis-policy** *policy-id* command again.

The following sections describe how to create and configure DOCSIS load balancing groups to enable DOCSIS load balancing on the Cisco CMTS:

Configuring DOCSIS 3.0 and 2.0 RLBG and DOCSIS 2.0 GLBG

This section describes how to create and configure a DOCSIS load balancing group. There is a separate configuration mode for a DOCSIS load balancing group that is different from the legacy load balancing group.

Note

UGS/PCMM policy and threshold do not apply on DOCSIS 3.0 LB.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	cable load-balance docsis-enable	Enables DOCSIS load balancing on the Cisco CMTS.
	Example:	
	Router(config)# cable load-balance docsis-enable	
Step 4	cable load-balance docsis-group docsis-group-id	Creates a DOCSIS load balance group on the Cisco CMTS, with the following parameter:
	Example: Router(config) # cable load-balance docsis-group 1	The router enters DOCSIS load balancing group configuration mode.
Step 5	init-tech-list tech-list [ucc]	Sets the DCC initialization techniques that the Cisco CMTS
	Example:	can use to load balance cable modems.
	Router(config-lb-group)# init-tech-list 1 ucc	
Step 6	downstream {Cable {slot/subslot/port slot/port} Integrated-Cable {slot/subslot/bay slot/port} {rf-channel group list} { slot/port} {rf-channel group list}}	Sets the downstream RF channels.

	Command or Action	Purpose
	Example:	
	Router(config-lb-group) # downstream integrated-Cable 5/0/0 rf-channel 2	
Step 7	upstream Cable {slot/subslot/port slot/port} upstream-list	Sets upstream channels with the following parameters:
	Example:	
	Router(config-lb-group)# upstream Cable 1/0 2	
Step 8	docsis-policy policy-id	Assigns a policy to a group with the parameter that
	Example:	becomes the default policy assigned to the CM, if the CM does not choose a different policy.
	Router(config-lb-group)# docsis-policy 0	
Step 9	restricted	Selects the restricted group type. By default, the general
	Example:	group type is selected.
	Router(config-lb-group)# restricted	
Step 10	init-tech-ovr Cable {slot/subslot/port slot/port} upstream Cable {slot/subslot/port } slot/port upstream init-tech-list 0-4 [ucc]	<u> </u>
	Example:	balancing.
	Router(config-lb-group)# init-tech-ovr Cable 8/1/0 0 Cable 8/1/1 1 init-tech-list 1 ucc	The following parameters override the physical upstream channel pair:
		Note The init-tech-list keyword accepts an upstream that is not added into the load balancing group. The upstream channel pair is invalid until the upstream is added. When the load balancing group is removed, all upstream channel pairs are also removed.
Step 11	service-type-id string	Adds a service type ID, with the following parameter, that
	Example:	is compared against the cable modem provisioned service type ID, to determine an appropriate restricted load
	<pre>Router(config-lb-group)# service-type-id commercial</pre>	balancing group (RLBG):
Step 12	tag tag name	Adds a tag to the RLBG.
	Example:	

	Command or Action	Purpose
	Router(config-lb-group)# tag t1	
Step 13	<pre>interval <1-1000> Example: Router(config-lb-group) # interval 60</pre>	Sets the time interval, the Cisco CMTS waits before checking the load on an interface.
Step 14	method {modems service-flows utilization} {us-method {modems service-flows utilization}} {example: Router(config-lb-group) # method modems us-method modems	Selects the method the Cisco CMTS use to determine the load.
Step 15	<pre>policy {pcmm ugs us-across-ds pure-ds-load} Example: Router(config-lb-group) # policy us-across-ds Router(config-lb-group) # policy ugs Router(config-lb-group) # policy pure-ds-load</pre>	Selects the modems based on the type of service flow that are balanced.
Step 16	threshold {load {minimum <1-100> <1-100>} pcmm <1-100> stability <0-100> ugs <1-100>} Example: Router(config-lb-group) # threshold load minimum 10 Router(config-lb-group) # threshold pcmm 70 Router(config-lb-group) # threshold load 10 Router(config-lb-group) # threshold stability 50 Router(config-lb-group) # threshold ugs 70	Selects the percentage of use beyond which load balancing occurs.
Step 17	exit Example:	Exits DOCSIS LBG configuration.
	Router# exit	

Configuring DOCSIS 3.0 GLBG

The following sections describe how to configure a DOCSIS 3.0 GLBG and also how to configure default values of DOCSIS 3.0 certification for the DOCSIS 3.0 general group:

Note

If a Cable interface on the line card is in "no shut down" state, the associated DOCSIS 3.0 GLBGs are restored in the running-configuration.

Configuring a DOCSIS 3.0 General Load Balancing Group

This section describes how to configure a DOCSIS 3.0 general load balancing group.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	cable load-balance docsis-enable	Enables DOCSIS load balancing on the Cisco CMTS.
	Example:	
	Router(config)# cable load-balance docsis-enable	
Step 4	cable load-balance docsis-group FN fn-id MD cable {slot/subslot/port slot/port}	Enters the DOCSIS load balancing group configuration mode.
	Example:	
	Router(config)# cable load-balance docsis-group FN 1 MD c5/0/0	
Step 5	init-tech-list tech-list [ucc]	Sets the DCC initialization technique list, with the
	Example:	following parameters.
	Router(config-lb-group) # init-tech-list 1 ucc	
Step 6	disable	Disables the load balance group.
	Example:	
	Router(config-lb-group) # disable	
Step 7	docsis-policy policy-id	Sets the load balance group policy.
	Example:	
	Router(config-lb-group) # docsis-policy 0	
Step 8	interval 1-1000	Sets the interface polling interval.
	Example:	
	Router(config-lb-group) # interval 10	
Step 9	method {modems service-flows utilization} {us-method {modems service-flows utilization}}	Sets the load balancing type or method.
	Example:	
	Router(config-lb-group) # method modems us-method modems	

	Command or Action	Purpose
Step 10	policy {pcmm ugs us-across-ds pure-ds-load}	Sets load balancing policy.
	Example:	
	Router(config-lb-group)# policy us-across-ds	
Step 11	threshold {load {minimum 1-100 1-100} pcmm 1-100 stability 0-100 ugs 1-100}	Sets the load balancing threshold in percentage.
	Example:	
	Router(config-lb-group)# threshold pcmm 70	
Step 12	exit	Exits the DOCSIS load balancing group configuration
	Example:	mode.
	Router# exit	

Configuring Default Values of DOCSIS 3.0 Load Balancing Group

This section describes how to configure default values of DOCSIS 3.0 certification for a DOCSIS 3.0 general group on the Cisco CMTS. A DOCSIS 3.0 general group is automatically created for each MD-CM-SG derived from the fiber node (FN) configuration, and the group parameters are set as default values.

Note

The configured default values of DOCSIS 3.0 certification are applicable to the new automatically created DOCSIS 3.0 GLBGs and do not affect the existing DOCSIS 3.0 GLBGs. When a DOCSIS 3.0 GLBG is removed and recreated, its group parameters do not change.

Note

The default settings for interface polling interval, load balancing method, policy for modems selection, and threshold usage in percent, can be configured for DOCSIS 3.0 general group. For more information, see the Cisco CMTS Cable Command Reference.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	cable load-balance d30-ggrp-default disable	Disables the default values of the DOCSIS 3.0 general load
-	Example:	balance group (GLBG).

	Command or Action	Purpose		
	Router(config)# cable load-balance d30-ggrp-default disable			
Step 4	cable load-balance d30-ggrp-default init-tech-list tech-list	•		
	Example:	bonding change (DBC) initialization techniques.		
	<pre>Router(config)# cable load-balance d30-ggrp-default init-tech-list 1</pre>			
Step 5	cable load-balance d30-ggrp-default docsis-policy 0-0xfffffff	Sets the default DOCSIS 3.0 GLBGs policy ID.		
	Example:			
	Router(config)# cable load-balance d30-ggrp-default docsis-policy 2			
Step 6	exit	Exits the global configuration mode.		
	Example:			
	Router# exit			

Configuring Cable Modems to RLBG or a Service Type ID

This section shows how to configure a list of cable modems that are statically provisioned at the Cisco CMTS to a RLBG or a service type ID.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	cable load-balance restrict modem index mac-addr [mac-mask] {docsis-group docsis-group-id service-type-id string}	Assigns a modem or a group of modems with a common MAC mask to a load balancing group or a service type ID.
	Example:	
	Router(config) # cable load-balance restrict modem 1 001a.c30c.7eee FFFF.FFFF.0000 docsis-group 100	
Step 4	exit	Exits the global configuration mode.
	Example:	
	Router# exit	

Configuring Rules and Policies

This section shows how to create and configure rules and DOCSIS policies to restrict the movement of modems during load balancing. Rules determine whether a modem can be moved and during which time periods. The time periods are measured in seconds with the start time being an offset from midnight measured in seconds. Rules are created individually and can be combined into policies. The user is able to create DOCSIS policies that consist of one or more rules. When more than one rule is part of a DOCSIS policy, all rules apply. Each group has a default DOCSIS policy.

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	cable load-balance rule rule-id	Creates a rule to prevent the modem from being moved.
	Example:	
	Router(config)# cable load-balance rule 1	
Step 4	cable load-balance rule rule-id {enabled disabled	Configures the rule.
	{disable-period dis-start 0-86400 dis-period <0-86400>}	Note Static multicast groups should be configured on
	disable-throughput-lowerbound ds us thrupt in kbps vdoc-enabled}	the appropriate bundle interface as well as on
	Example:	the correct forwarding interfaces to enable this rule. This feature will not be supported on load
	Router(config)# cable load-balance rule 1	balancing groups which are derived from fiber
	disable-period dis-start 40 dis-period 50	node configuration and with multicast encryption.
		eneryption.
Step 5	cable load-balance docsis-policy policy-id rule rule-id	Associates a particular rule with the DOCSIS policy with
	Example:	the following parameters:
	Router(config) # cable load-balance docsis-policy 2 rule 1	
Step 6	exit	Exits the global configuration mode.
	Example:	
	Router# exit	

Troubleshooting Tips

Problem When you disable load balancing and enable it for the next day using the **cable load-balance rule** *rule-id* **disable-period dis-start** *start-time* **dis-period** *disable-period* command, the load balancing is enabled at 12.00 am instead of the configured *disable-period*.

Possible Cause Load balancing rule cannot be disabled and enabled on the next day (that is, after 24 hours) using a single load balancing rule.

Solution Configure separate load balancing rules for disabling load balancing and enabling it on the next day. Configure the rule to disable load balancing using the **cable load-balance rule** *rule-id* **disable-period dis-start** *start-time* **dis-period 0** command. Configure the rule to enable load balancing using the **cable load-balance rule** *rule-id* **disable-period dis-start 0 dis-period** *disable-period* command to enable it for the next day.

Configuring Load Balancing Parameter for a Cable Modem Movement Failure

This section describes how to configure the number of times a CM can fail before the CM is removed from the dynamic load balancing group.

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	cable load-balance modem max-failures 0-100	Configures the number of times a CM can fail before the
	Example:	CM is removed from the dynamic load balancing group.
	Router(config)# cable load-balance modem max-failures 10	
Step 4	exit	Exits the global configuration mode.
	Example:	
	Router# exit	

Creating and Configuring TLV type Tag

The tags for TLV type matching rule are created and configured in this section.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	

	Command or Action	Purpose	
	Router# configure terminal		
Step 3	cable tag 1-1000	Creates a tag.	
	Example:	Enters the cmts-tag configuration mode.	
	Router(config)# cable tag 1		
Step 4	name tag name	Specifies the name of the tag.	
	Example:		
	Router(cmts-tag)# name CSCO		
Step 5	[exclude] service-type-id service-type-id	Configures the specified service type ID for the tag.	
	Example:		
	Router(cmts-tag)# service-type-id HSD		
Step 6	[exclude]service-class service-class-name	Configures the specified service class name for the tag.	
	Example:		
	Router(cmts-tag)# service-class work		
Step 7	[exclude] docsis-version docsis version	Configures the specified DOCSIS version of the cable	
	Example:	modem for the tag.	
	Router(cmts-tag)# docsis-version docsis20		
Step 8	[exclude] oui oui of CM	Configures the specified OUI of the cable modem for the	
	Example:	tag.	
	Router(cmts-tag)# oui 00.1a.c3		
Step 9	[exclude] tlv type value	Configures the specified TLV type for the tag.	
	Example:		
	Router(cmts-tag)# tlv mrcs 4		
Step 10	override	Overrides the TLV or SNMP during load balancing an	
	Example:	RLBG.	
	Router(cmts-tag)# override		
Step 11	exit	Exits the cmts-tag configuration mode.	
	Example:		
	Router(cmts-tag)# exit		
Step 12	cable load-balance docsis-group docsis-group-id	Creates a DOCSIS load balancing group on the Cisco	
	Example:	CMTS.	
	Router(config) # cable load-balance docsis-group 1	If the DOCSIS load balancing group is already present, the router enters the specified DOCSIS load balancing group configuration mode.	

	Command or Action	Purpose
Step 13	tag tag name	Adds a tag to the load balancing group.
	Example:	
	Router(config-lb-group)# tag CSCO	
Step 14	exit	Exits the DOCSIS load balancing group configuration
	Example:	mode.
	Router(config-lb-group)# exit	
Step 15	cable load-balance docsis-policy policy-id tag tag name [override]	Creates a DOCSIS policy and associates a new rule or an existing rule with the policy.
	Example:	
	Router(config)# cable load-balance docsis-policy 2 tag CSCO	
Step 16	exit	Exits the global configuration mode.
	Example:	
	Router# exit	

Configuration Examples for DOCSIS Load Balancing Groups

This section describes a sample configuration example for configuring DOCSIS Load Balancing Groups including Restricted/General Load Balancing and downstream dynamic load balancing:

Example: Configuring a Tag

The following example shows how you can configure the tag to exclude a DOCSIS version, a MAC address, a service class name or a service type ID:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config) # cable tag 1
Router(cmts-tag) # exclude ?
  docsis-version set the match rule for docsis version
                  set the match rule for oui
                 set the match rule for service class name
 service-class
 service-type-id set the match rule for service type id
Router(cmts-tag)# exclude docsis-version ?
 docsis10 Match docsis 1.0 modems
  docsis11 Match docsis 1.1 modems
  docsis20 Match docsis 2.0 modems
 docsis30 Match docsis 3.0 modems
Router(cmts-tag) # exclude docsis-version docsis10
Router(cmts-tag)# exclude oui ?
 WORD OUI of the vendor in the format xx.xx.xx or xx:xx:xx
Router(cmts-tag) # exclude oui 00.1a.c3
Router(cmts-tag) # exclude service-class ?
 WORD Service class name
Router(cmts-tag) # exclude service-class work
Router(cmts-tag)# exclude service-type-id ?
```

```
WORD Service Type ID Router(cmts-tag)# exclude service-type-id commercial
```

Example: Disabling Load Balancing

Use the following commands to disable DOCSIS 3.0 GLBG:

```
Router(config) # cable load-balance docsis-group FN 1 MD cable 6/0/0
Router(config-lb-group) # disable
Router(config-lb-group) #

Use the following commands to disable DOCSIS 3.0 RLBG:

Router(config) # cable load-balance docsis-group 1
```

How to Configure Load Balancing with Operational Simplification

Router(config-lb-group) # disable

Router(config-lb-group) #

To configure Load Balancing Groups with Operational Simplification, complete the following steps:

SUMMARY STEPS

- 1. Define the global common Load Balancing profile. Specify the Load Balancing Group configure: method, interval, threshold, policy, and so on.
- **2.** Define the Load Balancing Group under service-group profile. Associate the Load Balancing profile with Load Balancing group. Configure the DS and US channels.
- **3.** Define the physical mapping info for US or DS channels under fiber-mode.
- **4.** Define the service-group profile under Fiber-node.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Define the global common Load Balancing profile. Specify the Load Balancing Group configure: method, interval, threshold, policy, and so on.	
	Example:	
	cable profile load-balance lb_1 disable method utilization primary-distributed us-method utilization threshold load 2 policy pcmm interval 1	

	Command or Action	Purpose
Step 2	Define the Load Balancing Group under service-group profile. Associate the Load Balancing profile with Load Balancing group. Configure the DS and US channels.	
	Example:	
	cable profile service-group sg load-balance docsis-group 0 profile lb_1 downstream sg-channel 0-7 upstream 0 sg-channel 0 upstream 1 sg-channel 1	
Step 3	Define the physical mapping info for US or DS channels under fiber-mode.	
	Example:	
	cable fiber-node 1 downstream sg-channel 0 15 downstream-Cable 6/0/0 rf-channel 0 15 upstream sg-channel 0 3 Upstream-Cable 6/0/0 us-channel 0 3	
Step 4	Define the service-group profile under Fiber-node.	
	Example:	
	cable fiber-node 1 service-group profile sg	

The Load Balancing Groups are auto-generated when the SG profile is applied.

Example

An example of the Load Balancing Groups Operational Simplification configuration, **show run** as is as follows:

```
cable profile load-balance lb
method utilization primary-distributed us-method utilization
threshold load 22
 threshold load lcmm 33
policy lcmm
policy pure-ds-load
init-tech-list 1-3
cable profile service-group sg
    load-balance docs is-group 0 profile lb
    downstream sg-channel 0 15
    upstream 0 sg-channel 0
   upstream 1 sg-channel 1
   upstream 2 sg-channel upstream 3 sg-channel
                            2
load-balance docsis-group 2 profile RLBG_STB
    downstream sg-channel 0-3 8-11
     upstream 0 sg-channel 0
```

```
cable fiber-node 1
  downstream Downstream-Cable 6/0/0
  upstream Upstream-Cable 6/0/0
  downstream sg-channel 0 15 downstream-Cable downstream-Cable 6/0/0 rf-channel 0 15
       upstream sg-channel 0 3 Upstream-Cable 6/0/0 us-channel 0 3
  service-group profile sg
```

An example of the Load Balancing Groups Operational Simplification configuration, **show derived** as is as follows:

```
cable profile load-balance lb
method utilization primary-distributed us-method utilization
 threshold load 22
 threshold load lcmm 33
policy lcmm
policy pure-ds-load
init-tech-list 1-3
Cable profile service-group sg
  Load-balance docsis-group 0 profile 1b
  downstream sg-channel 0 15
   upstream 0 sg-channel 0
   upstream 1 sg-channel 1
   upstream 2 sg-channel
   upstream 3 sg-channel
load-balance docsis-group 2 profile RLBG STB
     downstream sg-channel 0-3 8-11
     upstream 0 sg-channel 0
Cable fiber-node 1
 downstream Downstream-Cable 6/0/0
upstream Upstrea-CAble 6/0/0
 downstream sg-channel 0 15 downstream-Cable 6/0/0 rf-channel 0 15
upstream sg-channel 0 3 Upstream-Cable 6/0/0 us-channel 0 3
 service-group profile sg
Cable load-balance docsis-group 2
 downstream Downstream-Cable 6/0/0/ rf-channel 0 15
 upstream Upstream-Cable 6/0/0 us-channel 0-3
method utilization primary-distributed
threshold load 22
threshold pcmm 33
policy lcmm
 policy pure-ds-load
 init-tech-list 1-3
 cable managed fiber-node 1

cable load-balance docsis-group 3
 restricted
downstream Downstream-Cable 6/0/0 rf-channel 0-3 8-11
Upstream Upstream-Cable 6/0/0 us-channel 0
Threshold load 55
Interval 5
Cable managed fiber-node 1
Cable load-balance-profile RLBG STB
```

Load Balancing Groups with Operational Simplification

The Cisco IOS XE Gibraltar 16.10.1d supports simplified Load Balancing configuration in the Operational Simplification service group profile. Currently, CMTS supports auto creation of D30 GLBGs based on the existing configuration. Load Balancing would now support creation of RLBGs and D20 GLBGs.

Following are the salient features of the feature:

- For D20 GLBG created by Operational Simplification, the Group ID is in range [65024, 65535]. This follows legacy design.
- For RLBG created by Operational Simplification, the Group ID is related to the information of fiber-node id/us channel controller/docsis-group index in service group file. This also follows legacy range [1, 2147483647]. For example: RLBG ID: 12330208. Where '123' is the Fiber node ID, '302' is the Upstream-Cable 6/0/0, and '08' is the docsis-group index in service group profile.

```
cable profile service-group sg
  load-balance docsis-group 8 profile lb_1
  downstream sg-channel 0-7
  upstream 0 sg-channel 0
  upstream 1 sg-channel 1
```

- The default value of Load Balance profile are equal to the value of "cable load-balance d20-ggrp-default xxx".
- For Load Balancing Groups that are created by Operational Simplification, the user cannot configure them with CLI.
- For one service group profile, a user is only allowed to configure one GLBG load balance.
- A user can configure a maximum of 20 tags into one load balance profile.
- A user can configure a maximum of 15 service-type-ids into one load balance profile.
- Load Balancing Groups by Operational Simplification supports fly modification.
- For Load Balancing Groups created by Operational Simplification, if a user changes the option of Load Balance profile, the OPS would update all the related LBGs automatically. However, the user cannot change the type of LBGs.

For the Load Balaning Groups created by Operational Simplification, the configuration of the groups would not be dispalyed for the **show run** or the **show run all** commands. The Load Balancing Groups would only be displayed using the **derived** command. This change can simplify the running configuration.

```
clab-cbr-S11K01#show derived-config | sec cable load
cable load-balance docsis-group 1
restricted
downstream Downstream-Cable 6/0/0 rf-channel 0-7
upstream Upstream-Cable 6/0/0 us-channel 0-1
method utilization primary-distributed
threshold load 2
cable managed fiber-node 1
cable load-balance-profile lb_1
```

Verifying DOCSIS Load Balancing Groups

This section describes how to use certain show commands to verify the configuration of the Restricted/General Load Balancing and Narrowband Dynamic Bandwidth Sharing with Downstream Dynamic Load Balancing feature.

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Router> enable	Enter your password if prompted.
Step 2	show cable load-balance docsis-group {docsis-group-id FN fn-id MD cable {slot/subslot/port slot/port}} [all load pending statistics target modem-list primary-load]	Displays real-time configurational, statistical, and operational information of the load balancing operations on the router.
	Example:	
	Router# show cable load-balance docsis-group 1 Router# show cable load-balance docsis-group fn 1 MD c8/1/4	
Step 3	show cable fiber-node fiber-node-id [spectrum]	Displays information about a fiber node.
	Example:	
	Router# show cable fiber-node 3	
Step 4	show cable load-balance [group n] [all load pending statistics target fiber-node-validation] Example: Router# show cable load-balance group 1	Displays real-time statistical and operational information for load balancing operations. If given without any options, this command displays information for the load balancing groups and each cable interface's current load and load balancing status.
Step 5	show cable modem [ip-address mac-address cable slot/port [upstream port] name fqdn] [verbose]	Displays information for the registered and unregistered CMs.
	Example:	
	Router# show cable modem 40.3.160.15 verbose	

Examples

Use the **show cable load-balance docsis-group** command to see the DOCSIS group status and to see the list of modems in the group, use the **show cable fiber-node** command to see the information on fiber nodes, use the **show cable load-balance** command to see information on LBG and DOCSIS channels, and use the **show cable modem** command to see the information on all the CMs.

The following examples show the output of the show cable load-balance docsis-group command:

Router# show cable load-balance docsis-group 2

```
DOCSIS LB Enabled: Yes
      Group Status Interval DCC mask Policy Method Threshold
DOCSTS
         Index /UCC DS/US M/E/U/P/S
82 RE 10 0xF8(0)/N 0 s/s 1/1/70/70/50
                                                DS/US M/E/U/P/S
Group
2
Router# show cable load-balance docsis-group 1 modem-list
             Group Index Mac Address Priority
Mo1/0/0:0/U0
                    81
                                (1)
                               0000.ca45.9898 0
Mo1/0/0:0/U1
                    81
                               (0)
Mo1/0/0:0/U2
                    81
                                (2)
                                0013.711c.0820
                                               Ω
                                0016.924f.8300
```

The output of the **show cable load-balance docsis-group** command is modified to include an additional field MUPFXLR to display more status information on the modems in the DOCSIS groups. For more information, see the Cisco IOS CMTS Cable Command Reference.

The following example shows the modified output of the **show cable load-balance docsis-group** command:

```
Router#show cable load docsis-group fn 1 md c6/0/0 modem-list
Load for five secs: 1%/0%; one minute: 2%; five minutes: 1%

LB policy ID in config file : 0
LB priority : 0
Tag :
```

DOCSIS 3.0 GLBG is generated dynamically by the fiber node configuration, if a valid fiber node is configured.

For example, if the fiber node configuration is:

```
cable fiber-node 2
downstream Modular-Cable 1/0/0 rf-channel 0-3
downstream Cable7/0/0
upstream Cable 7/0 connector 0-3
'
```

The GLBG generated by this fiber node is similar to:

Router# show cable load-balance docsis-group fn 2 md cable 7/0/0

```
DOCSIS 3.0 General LB

Technical Assistance

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies.	http://www.cisco.com/support
To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds.	
Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	

Feature Information for DOCSIS Load Balancing Groups

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 6: Feature Information for DOCSIS Load Balancing Groups

Feature Name	Releases	Feature Information
DOCSIS Load Balancing Groups	Cisco IOS XE Fuji 16.7.1	This feature was integrated on the cisco cBR Series Converged Broadband Routers.
Load Balancing with Operational Simplification	Cisco IOS XE Gibraltar 16.10.1d.	This feature was integrated on the cisco cBR Series Converged Broadband Routers.
