

Remote PHY DVB Video on Demand

The Digital Video Broadcasting (DVB) protocol for encrypting video services as defined in the ETSI TS 103 197 DVB Simulcrypt specification has been implemented on the line card for DVB R-PHY on Cisco cBR-8. This document contains an overview of the commands for configuring DVB and the commands for viewing the status of the encryption of services.

Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

Use Cisco Feature Navigator to find information about the platform support and Cisco software image support. To access Cisco Feature Navigator, go to the link <http://tools.cisco.com/ITDIT/CFN/>. An account at the <http://www.cisco.com/> site is not required.

Information About DVB VOD

Overview of DVB VOD

This feature enables the operator to scramble the video sessions on the chassis. It involves the configuration to establish a connection with the Entitlement Control Message Generator (ECMG) and the Event Information Scheduler (EIS).

The two primary modes of scrambling are: session based scrambling and tier-based scrambling. The basic difference between the two modes is that the manner in which the Entitlement Control Messages (ECM) are requested from the ECMG. For session based scrambling, a control word (CW) is generated once every Crypto Period (CP) and the ECM is requested for each session. For tier-based scrambling, the control word is generated once every CP and the ECM generated by the ECMG for the CW is used by all the sessions in the chassis.

Session based Scrambling Setup

The connection with the external EIS Server is established via the Virtual Port Group in the Supervisor. The connection with the external ECMG server is established via the linecard.

Figure 1: Session based Setup

Fail-to-Clear

The fail-to-clear-duration feature is supported on DVB sessions and DualCrypt encryption modes. Based on the session encryption, the following two features are supported on the Cisco cBR Series Converged Broadband Routers.

Fail-to-Clear Duration for DVB Session-based Encryption

This feature is used along with DVB or DualCrypt encryption with external Event Information Scheduler (EIS) configuration. When encryption for a session fails in the Cisco cBR-8, this feature enables the operator to control the configured DVB-encrypted sessions to function without encryption for a configured duration. If the encryption still fails, the DVB session is marked as `Fail-to-black` after the fail-to-clear duration timeout.

Fail-to-Clear for DVB Tier-based Encryption

This feature is used along with Tier-based configuration. When encryption for a session fails in Cisco cBR-8, this feature enables the operator to control the configured DVB-encrypted sessions to function without encryption.

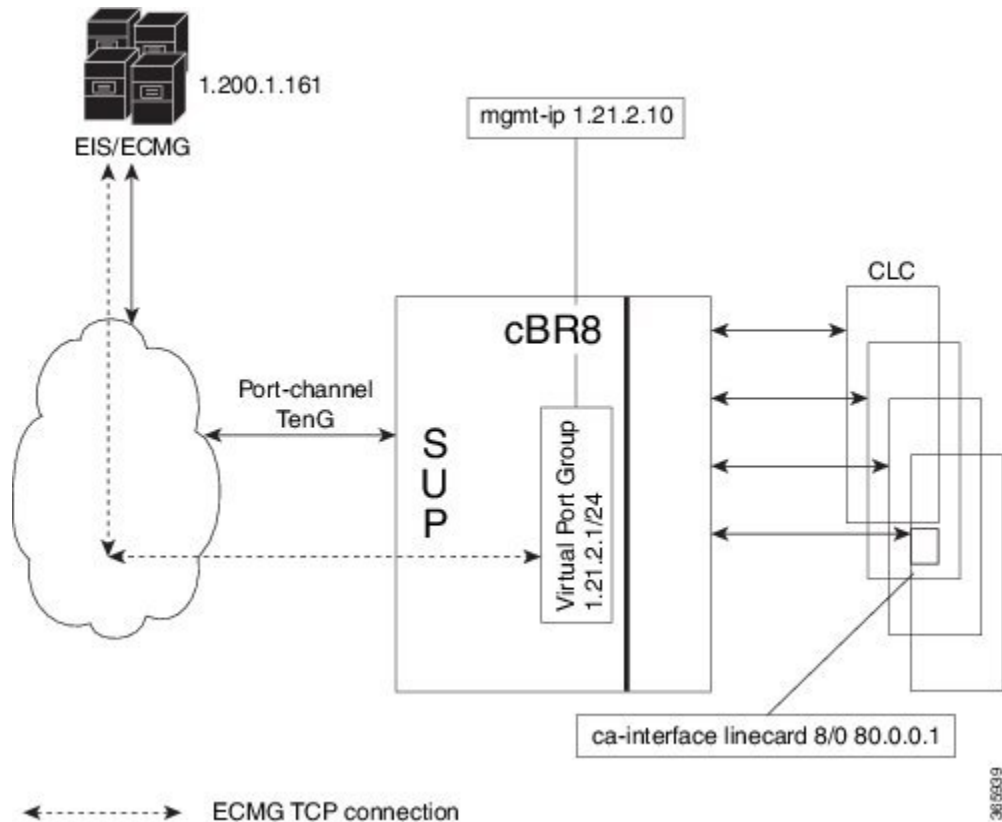

If fail-to-clear is configured, tier-based configuration is enabled, and then if the encryption fails, the DVB session's `Encrypt Status` is marked as `clear`. The status changes to `Encrypted` when the encryption starts.

This feature is not enabled by default.

Tier based Scrambling Setup

The connection with the external ECMG server is established via the Virtual Port Group in the Supervisor.

Figure 2: Tier based Setup

Restrictions for DVB

- This feature is applicable only for remapped table based sessions.
- Fail-to-clear-duration feature is applicable only to session-based scrambling for DVB CAS encryption.
- Fail-to-clear feature is applicable only to DVB tier-based scrambling sessions.

How to Configure DVB

Configuring RPHY DVB VoD

Before You Begin

- Virtual Port Group interface must be configured and the management IP for DVB must be identified.
- Management interface is set to this Virtual Port Group interface under cable video configuration.

- Logical Edge Device is configured with the table based protocol.
- The encryption algorithm of the linecard is set to DVB-CSA.
- For session based scrambling, the CA interface on the linecard and the route for reaching the ECMG server must be specified.

To configure session based scrambling, follow the steps below:

```
enable
config terminal
interface int_id
  vrf forwarding vrf_script_red_1
  ip address ip-address subnet-mask
  no mop enabled
  no mop sysid
  exit
cable video
  mgmt-intf VirtualPortGroup group_id
  encryption
    linecard slot/bay ca-system dvb scrambler dvb-csa
    dvb
      route-ecmg ECMG_Server_IP_Address Netmask Interface Forwarding_Router_IP_Address
      mgmt-ip management ip address
      eis EIS_name id EIS_id
        listening-port <1-65535> bind led id <led id | led name>
      ca-interface linecard slot/bay IP_Address
      ecmg ECMG_Name id ECMG_ID
        mode vod linecard slot/bay
        type standard
        ca-system-id CA_System_ID CA_Subsystem_ID
        auto-channel-id
        ecm-pid-source sid
        connection id ID priority connection_priority IP_Address Port
      service-distribution-group sdg name id SDG_ID onid onid number
      rpd downstream-cable slot/subslot/bay
      virtual-carrier-group vcg-name id vcg_id
      encrypt
        service-type narrowcast
        rf-channel channel tsid tsid_number output-port-number number
      bind-vcg
        vcg vcg-name sdg sdg-name
      logical-edge-device led-name id led_id
        protocol gqi
        mgmt-ip IP_Address
        mac-address MAC address
        server server_ip_address
        keepalive retry 3 interval 10
        reset interval 8
        virtual-edge-input-ip IP address input-port-number 1
        vcg vcg-name
        active
```

The fail-to-clear-duration is measured in seconds. The valid values are in the range from 0 to 10800 seconds. The default value is 0.

To configure tier based scrambling, follow the steps below:

```
enable
config terminal
interface VirtualPortGroup group_id
  vrf forwarding Mgmt-intf
  ip address ip-address subnet-mask
```

```

no mop enabled
no mop sysid
exit

cable video
mgmt-intf VirtualPortGroup group_id
encryption
  linecard slot/bay ca-system dvb scrambler dvb-csa
  dvb
    route-ecmg ECMG_Server_IP_Address Netmask Interface Forwarding_Router_IP_Address
    ecmg ECMG_Name id ECMG_ID
      mode tier-based
      type standard
      ca-system-id CA_System_ID CA_Subsystem_ID
      auto-channel-id
      ecm-pid-source sid
      connection id ID priority connection_priority IP_Address Port
      tier-based
        ecmg id ECMG_ID access- criteria access_criteria_in_hex
        fail-to-clear
        enable
    service-distribution-group sdg name id SDG ID onid onid number
      rpd downstream-cable slot/subslot/port
    virtual-carrier-group vcg-name id vcg_id
      encrypt
      service-type narrowcast
      rf-channel channel tsid tsid_number output-port-number number
    bind-vcg
      vcg vcg-name sdg sdg-name
    logical-edge-device led-name id led_id
      protocol table-based
      virtual-edge-input-ip IP address input-port-number 1
      vcg vcg-name
      active
    table-based
      vcg vcg-name
      rf-channel channel
        session session_name input-port id start-udp-port udp port number processing-type
    remap start-program 1 cbr

```

Note If the tier-based configuration is already enabled, you must first disable the tier-based configuration using the **no enable**, before you configure fail-to-clear feature.

Verifying the DVB Configuration

To verify the configuration of the encryption algorithm on the linecard, use the **show cable video encryption linecard** command as shown in the example below:

```

Router# show cable video encryption linecard 7/0
Line card: 7/0
CA System      Scrambler      DVB-Conformance
=====
dvb            dvb-csa        Enabled

```

To verify the ECMG connection, use the **show cable video encryption dvb ecmg id id connection** command as shown in the example below:

```
Router# show cable video encryption dvb ecmg id 1 connection
```

ECMG ID	ECMG Name	ECMG Slot	ECMG Type	ECMG Connections	CA Sys ID	CA Subsys ID	PID Source	Lower limit	Upper limit	Streams/ECMG	Open Streams/ECMG	ID
1	polaris_ecmg01		standard	1	0x4748	0x0	sid	0	0	1	1	
Enabled RP Tier-Based												

```
ECMG Connections for ECMG ID = 1
```

Conn -ID	Conn Priority	IP Address	Port Number	Channel ID	Conn Status	Open Streams
1	1	10.10.1.1	8888	1	Open	1

The sample output of the session based scrambling configuration verification command is shown below:

```
Router# show cable video encryption dvb ecmg id 7 connection
```

ECMG ID	ECMG Name	ECMG Slot	ECMG Type	ECMG Connections	CA Sys ID	CA Subsys ID	PID Source	Lower limit	Upper limit	Streams/ECMG	Open Streams/ECMG	ID
7	ecmg-7		standard	1	0x950	0x1234	sid	0	0	1680	1680	
Enabled VOD												

```
ECMG Connections for ECMG ID = 1
```

Conn -ID	Conn Priority	IP Address	Port Number	Channel ID	Conn Status	Open Streams
1	1	10.10.1.10	8888	1	Open	1

The status of the connection with the ECMG Server is indicated by the Conn Status. The Open Streams field indicates the number of Active ECM Streams.

To verify the EIS connection, use the **show cable video encryption dvb eis id id** command as shown in the example below:

```
Router# show cable video encryption dvb eis id 1
```

EIS ID	EIS Name	Peer IP	Management IP	TCP Port	CP Overrule	CP Duration	Overwrite SCG	Fail-To-Clear Duration	Connection Status
1	test	10.10.1.11	10.10.1.1	9898	DISABLED	0	DISABLED	400	Connected

To verify the CA Interface configuration in the case of session based scrambling, use the **show cable video encryption dvb ca-interface brief** command as shown in the example below:

```
Router# show cable video encryption dvb ca-interface brief
CA Interface configuration
```

Linecard	IP Address	VRF
7	10.10.1.1	N/A

```
ECMG Route configuration
```

```

IP Address      NetMast          Interface
-----
10.10.1.10     255.255.255.224  TenGigabitEthernet4/1/2

```

To verify the encryption status of the sessions, use the **show cable video session logical-edge-device id** command as shown in the example below:

```

Router# show cable video session logical-edge-device id 1
Total Sessions = 1

Session Output Streaming Session Session Source          UDP   Output  Input
Output Input  Output Encrypt Encrypt  Low   Session
Id      Port   Type   Type   Ucast Dest IP/Mcast IP (S, G) Port  Program State
State  Bitrate Bitrate Type   Status Latency Name
-----
1048576 1      Remap  UDP    10.10.1.1          49167 20    ACTIVE-PSI
      1695161 1689747 DVB    Encrypted N      dvbsess.1.0.1.0.23167

```

To verify the ECM PID and whether the CA Descriptor is added to the PMT, use the **show cable video session logical-edge-device id session-id** command as shown in the example below:

```

Router# show cable video session logical-edge-device id 1 session-id 1048576
Output PMT Info:
=====
Program 20, Version 3, PCR 49, Info len 18, (CA SYS-ID 4748, PID 79)
PID 49: Type 2, Info len 0
PID 50: Type 3, Info len 6, (lang eng)

```

Troubleshooting Tips

If some configuration errors occur, see the following troubleshooting tips:

- The Management IP must be unique and in the subnet of virtual port group.
- Ensure that the ECMG Server is pingable with source interface as the virtual port group from the Cisco cBR-8 console. This indicates that the ECMG Server is reachable and route is valid.
- Ensure that the TCP port number configured for the ECMG Server in the Cisco cBR-8 is the same as that of the ECMG Server listening port.
- Ensure that the management IP is pingable from the EIS Server. Otherwise, check the routing between the cBR-8 chassis and the EIS server.
- Ensure that the listening port that is configured for the EIS is used for establishing the connection from the EIS Server.
- Ensure that the Virtual Port Group interface is active.
- Ensure that the TenGigabitEthernet interface using which the management traffic reaches the Cisco cBR-8 and the interface through which the CA interface route is configured are active.

Configuration Examples

This section provides examples for the DVB configuration.

Example: Basic Session-based Scrambling Configuration

```

enable
config terminal
interface VirtualPortGroup0
  vrf forwarding vrf_script_red_1
  ip address 10.10.1.1 255.255.255.224
  no mop enabled
  no mop sysid
  exit
cable video
  mgmt-intf VirtualPortGroup 0
  encryption
    linecard 7/0 ca-system dvb scrambler dvb-csa
    dvb
      route-ecmg 10.20.1.1 255.255.255.224 TenGigabitEthernet4/1/2 10.20.1.1
      mgmt-ip 10.10.1.2
      eis eis-1 id 1
        listening-port 8890 bind led id 1
      ca-interface linecard 7/0 10.30.1.1
      ecmg ecmg-7 id 7
        mode vod linecard 7/0
        type standard
        ca-system-id 950 1234
        auto-channel-id
        ecm-pid-source sid
        connection id 1 priority 1 10.20.1.3 8888
      service-distribution-group sdg-1 id 1 onid 1
        rpd downstream-cable 7/0/1
      virtual-carrier-group vcg-1 id 1
        encrypt
        service-type narrowcast
        rf-channel 0 tsid 1 output-port-number 1
      bind-vcg
        vcg vcg-1 sdg sdg-1
      logical-edge-device led-1 id 1
        protocol table-based
        virtual-edge-input-ip 192.0.2.0 input-port-number 1
        vcg vcg-1
        active
      table-based
        vcg vcg-1
      rf-channel 0
      session dvb-1 input-port 1 start-udp-port 49152 processing-type
      remap start-program 1 cbr

```

Example: Basic Tier-based Scrambling Configuration

```

enable
config terminal
interface VirtualPortGroup0
  vrf forwarding vrf_script_red_1
  ip address 10.10.1.1 255.255.255.224
  no mop enabled
  no mop sysid
  exit
cable video
  mgmt-intf VirtualPortGroup 0
  encryption
    linecard 7/0 ca-system dvb scrambler dvb-csa

```

```

dvb
 route-ecmg 10.20.1.0 255.255.255.224 TenGigabitEthernet4/1/2 10.20.1.1

Feature Information for RPHY DVB VoD Support

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the www.cisco.com/go/cfn link. An account on the Cisco.com page is not required.

Note The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 1: Feature Information for RPHY DVB VoD Support

Feature Name	Releases	Feature Information
RPHY DVB VoD Support	Cisco 1x2 / Compact Shelf RPD Software 3.1	This feature was introduced on the Cisco Remote PHY Device.
