

Overview

This chapter contains the following topic:

- [Overview, on page 1](#)

Overview

The Cisco Application Centric Infrastructure (ACI) supports security features that can protect your network against degradation or failure and also against data loss or compromise resulting from intentional attacks and from unintended but damaging mistakes by well-meaning network users.

For information on core fabric services, see the *Cisco APIC Basic Configuration Guide*, which you can find on the [Cisco Application Policy Infrastructure Controller \(APIC\) documentation page](#).
