LAN Fabrics

The following terms are referred to in the document:

- **Greenfield Deployments:** Applicable for provisioning new VXLAN EVPN fabrics, and eBGP based Routed fabrics.
- **Brownfield Deployments:** Applicable for existing VXLAN EVPN fabrics:
 - Migrate CLI configured VXLAN EVPN fabrics to Nexus Dashboard Fabric Controller using the Easy_Fabric fabric template.
 - NFM migration to Cisco Nexus Dashboard Fabric Controller using the Easy_Fabric fabric template.

For information about upgrades, refer to the *Cisco Nexus Dashboard Fabric Controller Installation and Upgrade Guide for LAN Controller Deployment*.

The following table describes the fields that appear on **LAN > Fabrics**.

Field	Description
Fabric Name	Displays the name of the fabric.
Fabric Technology	Displays the fabric technology based on the fabric template.

Field	Description
Fabric Type	Displays the type of the fabric—Switch Fabric, LAN Monitor, or External
ASN	Displays the ASN for the fabric.
Fabric Health	Displays the health of the fabric.

The following table describes the action items, in the Actions menu drop-down list, that appear on **LAN > Fabrics**.

Action Item	Description
Create Fabric	From the Actions drop-down list, select Create Fabric . For more instructions, see Create a Fabric, on page 5 .
Edit Fabric	Select a fabric to edit. From the Actions drop-down list, select Edit Fabric . Make the necessary changes and click Save . Click Close to discard the changes.
Delete Fabric	Select a fabric to delete. From the drop-down list, select Delete Fabric . Click Confirm to delete the fabric.

This section contains the following topics:

Fabric Summary

Click on the Fabric to open the side kick panel. The following sections display the summary of the Fabric.

Health - shows the health of the Fabric.

Alarms - displays the alarms based on the categories.

Fabric Info - This section provides basic about the Fabric.

Inventory - This section provides information about Switch Configuration and Switch Health.

Click the **Launch** icon to the right top corner to view the Fabric Overview.

Prerequisites to Create a Fabric

- Update the ESXi host settings in the vSphere client to accept overriding changes in Promiscuous mode. For more information, see the *Overriding the Changes in Promiscuous Mode* section.
- Configure the persistent IP addresses in Nexus Dashboard. For more information, refer to *Cluster Configuration* section in [Cisco Nexus Dashboard User Guide](#).

Fabric Templates Summary

The following table provides information about the fabric templates summary:

Fabric Template	Description	Detailed Procedures
Easy_Fabric	Fabric Template for a VXLAN BGP EVPN deployment with an IGP (OSPF, IS-IS) and iBGP deployment for Nexus 9000 and 3000 switches. Both IPv4 and IPv6 underlay are supported.	Creating a New VXLAN BGP EVPN Fabric, on page 8
Easy_Fabric_IOS_XE	Fabric Template for a VXLAN BGP EVPN deployment with Catalyst 9000 switches.	Create Easy Fabric for Cisco Catalyst 9000 Series Switches, on page 50
Easy_Fabric_eBGP	Fabric Template for an eBGP based Routed Fabric deployment with Nexus 9000 and 3000 switches. This template also supports an eBGP VXLAN BGP EVPN deployment with eBGP used as both the underlay and overlay protocol.	LAN Fabrics, on page 1
External_Fabric	Fabric Template that supports Nexus and non-Nexus devices. Non-nexus device support includes other Cisco devices (IOS-XE, IOS-XR) as well as third-party switches. This template has capabilities to manage BGP configuration on core and edge routers. Few use cases of this template include - Classic hierarchical 2/3 Tier vPC or Fabric Path like networks, VXLAN EVPN deployments for Nexus switches other than Nexus 3k/9k, VRF-Lite on Core/Edge Devices and using NDFC in monitored mode (Useful when you want to eventually move to managed mode after trying monitor mode).	Creating an External Fabric, on page 60
LAN_Classic	Fabric Template to monitor and manage various Nexus based greenfield and brownfield deployments including the traditional 2 or 3-tier, vPC and/or Fabric Path data center topologies.	LAN Fabrics, on page 1
Fabric_Group	Fabric Template that contain other LAN_Classic fabrics thereby allowing visualizing of groups of Classic LAN fabrics and their interconnections.	LAN Fabrics, on page 1

Fabric Template	Description	Detailed Procedures
LAN_Monitor	Fabric template to support Fabric Discovery persona for monitoring purposes only. Nexus Dashboard Insights (NDI) can operate on such a fabric. No configuration provisioning or image management is supported.	LAN Fabrics, on page 1
MSD_Fabric	Fabric Template for a VXLAN BGP EVPN Multi-Site Domain (MSD) deployment, that can contain other VXLAN BGP EVPN fabrics with Layer-2/Layer-3 Overlay DCI Extensions.	Creating an MSD Fabric and Associating Member Fabrics
IPFM_Classic	Fabric Template for existing deployments of IP Fabric for Media (IPFM). IPFM enables media content providers and broadcasters to use a flexible and scalable IP-based infrastructure.	Creating an IPFM Classic Fabric, on page 80
Easy_Fabric_IPFM	Fabric Template for an easy greenfield deployment of a IP Fabric for Media (IPFM) fabric. IPFM enables media content providers and broadcasters to use a flexible and scalable IP-based infrastructure.	Creating an IPFM Easy Fabric, on page 83

Override ESXi Networking for Promiscuous Mode

For NDFC to run on top of the virtual Nexus Dashboard (vND) instance, you must enable promiscuous mode on port groups that are associated with Nexus Dashboard interfaces where External Service IP addresses are specified. vND comprises of Nexus Dashboard management interface and data interface. By default, for LAN deployments, 2 external service IP addresses are required for the Nexus Dashboard management interface subnet. Therefore, you must enable promiscuous mode for the associated port-group. If inband management or Endpoint Locator (EPL) is enabled, you must specify External Service IP addresses in the Nexus Dashboard data interface subnet. You must also enable the promiscuous mode for the Nexus Dashboard data/fabric interface port-group. For NDFC SAN Controller, promiscuous mode must be enabled only on the Nexus Dashboard data interface associated port-group. For NDFC SAN Controller, promiscuous mode only needs to be enabled on the Nexus Dashboard data interface associated port-group. For more information, refer to .

Procedure

-
- Step 1** Log into your **vSphere** Client.
 - Step 2** Navigate to the ESXi host.
 - Step 3** Right-click the host and choose **Settings**.

A sub-menu appears.

- Step 4** Choose **Networking > Virtual Switches**.
All the virtual switches appear as blocks.
- Step 5** Click **Edit Settings** of the VM Network.
- Step 6** Navigate to the **Security** tab.
- Step 7** Update the **Promiscuous mode** settings as follows:
- Check the **Override** check box.
 - Choose **Accept** from the drop-down list.
- Step 8** Click **OK**.
-

Create a Fabric

To create a Fabric using Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Choose **LAN > Fabrics > Fabrics**.
- Step 2** From the **Actions** drop-down list, select **Create Fabric**.
- Step 3** Enter the fabric name and click **Choose Template**.
Only **LAN_Monitor** template is available.
- Step 4** Based on your fabric requirements, select one of the fabric templates and click **Select**.
- Step 5** Specify the values for the fabric settings and click **Save**.
-

VXLAN BGP EVPN Fabrics Provisioning

Cisco Nexus Dashboard Fabric Controller introduces an enhanced “Easy” fabric workflow for unified underlay and overlay provisioning of VXLAN BGP EVPN configuration on Nexus 9000 and 3000 series of switches. The configuration of the fabric is achieved via a powerful, flexible, and customizable template-based framework. Using minimal user inputs, an entire fabric can be brought up with Cisco recommended best practice configurations, in a short period of time. The set of parameters exposed in the Fabric Settings allow users to tailor the fabric to their preferred underlay provisioning options.

Border devices in a fabric typically provide external connectivity via peering with appropriate edge/core/WAN routers. These edge/core routers may either be managed or monitored by Nexus Dashboard Fabric Controller. These devices are placed in a special fabric called the External Fabric. The same Nexus Dashboard Fabric Controller can manage multiple VXLAN BGP EVPN fabrics while also offering easy provisioning and management of Layer-2 and Layer-3 DCI underlay and overlay configuration among these fabrics using a special construct called a Multi-Site Domain (MSD) fabric.

Note that in this document the terms switch and device are used interchangeably.

The Nexus Dashboard Fabric Controller GUI functions for creating and deploying VXLAN BGP EVPN fabrics are as follows:

LAN > Fabrics > LAN Fabrics Create Fabric under **Actions** drop-down list.

Create, edit, and delete a fabric:

- Create new VXLAN, MSD, and external VXLAN fabrics.
- View the VXLAN and MSD fabric topologies, including connections between fabrics.
- Update fabric settings.
- Save and deploy updated changes.
- Delete a fabric (if devices are removed).

Device discovery and provisioning start-up configurations on new switches:

- Add switch instances to the fabric.
- Provision start-up configurations and an IP address to a new switch through POAP configuration.
- Update switch policies, save, and deploy updated changes.
- Create intra-fabric and inter-fabric links (also called Inter-Fabric Connections [IFCs]).

LAN > Interfaces > LAN Fabrics Create New Interface under **Actions** drop-down list.

Underlay provisioning:

- Create, deploy, view, edit, and delete a port-channel, vPC switch pair, Straight Through FEX (ST-FEX), Active-Active FEX (AA-FEX), loopback, subinterface, etc.
- Create breakout and unbreakout ports.
- Shut down and bring up interfaces.
- Rediscover ports and view interface configuration history.

LAN > Switches > LAN Fabrics Add under **Actions** drop-down list.

Overlay network provisioning.

- Create new overlay networks and VRFs (from the range specified in fabric creation).
- Provision the overlay networks and VRFs on the switches of the fabric.
- Undeploy the networks and VRFs from the switches.
- Remove the provisioning from the fabric in Nexus Dashboard Fabric Controller.

LAN > Services menu option.

Provisioning of configuration on service leafs to which L4-7 service appliances may be attached. For more information, see *L4-L7 Service Basic Workflow*.

This chapter mostly covers configuration provisioning for a single VXLAN BGP EVPN fabric. EVPN Multi-Site provisioning for Layer-2/Layer-3 DCI across multiple fabrics using the MSD fabric, is documented in a separate chapter. The deployment details of how overlay Networks and VRFs can be easily provisioned

from the Fabric Controller, is covered in the Creating Networks and Creating VRFs in the [Networks](#) and [VRFs](#) sections.

Guidelines for VXLAN BGP EVPN Fabrics Provisioning

- For any switch to be successfully imported into Nexus Dashboard Fabric Controller, the user specified for discovery/import, should have the following permissions:
 - SSH access to the switch
 - Ability to perform SNMPv3 queries
 - Ability to run the **show** commands including show run, show interfaces, etc.
 - Ability to execute the **guestshell** commands, which are prefixed by **run guestshell** for the Nexus Dashboard Fabric Controller tracker.
- The switch discovery user need not have the ability to make any configuration changes on the switches. It is primarily used for read access.
- When an invalid command is deployed by Nexus Dashboard Fabric Controller to a device, for example, a command with an invalid key chain due to an invalid entry in the fabric settings, an error is generated displaying this issue. This error is not cleared after correcting the invalid fabric entry. You need to manually clean up or delete the invalid commands to clear the error.

Note that the fabric errors related to the command execution are automatically cleared only when the same failed command succeeds in the subsequent deployment.
- LAN credentials are required to be set of any user that needs to be perform any write access to the device. LAN credentials need to be set on the Nexus Dashboard Fabric Controller, on a per user per device basis. When a user imports a device into the Easy Fabric, and LAN credentials are not set for that device, Nexus Dashboard Fabric Controller moves this device to a migration mode. Once the user sets the appropriate LAN credentials for that device, a subsequent Save & Deploy retriggers the device import process.
- The **Save & Deploy** button triggers the intent regeneration for the entire fabric as well as a configuration compliance check for all the switches within the fabric. This button is required but not limited to the following cases:
 - A switch or a link is added, or any change in the topology
 - A change in the fabric settings that must be shared across the fabric
 - A switch is removed or deleted
 - A new vPC pairing or unpairing is done
 - A change in the role for a device

When you click **Recalculate Config**, the changes in the fabric are evaluated, and the configuration for the entire fabric is generated. Click **Preview Config** to preview the generated configuration, and then deploy it at a fabric level. Therefore, **Deploy Config** can take more time depending on the size of the fabric.

When you right-click on a switch icon, you can use the **Deploy config to switches** option to deploy per switch configurations. This option is a local operation for a switch, that is, the expected configuration or intent for a switch is evaluated against it's current running configuration, and a config compliance check is performed for the switch to get the **In-Sync** or **Out-of-Sync** status. If the switch is out of sync,

the user is provided with a preview of all the configurations running in that particular switch that vary from the intent defined by the user for that respective switch.

- Persistent configuration diff is seen for the command line: **system nve infra-vlan int force**. The persistent diff occurs if you have deployed this command via the freeform configuration to the switch. Although the switch requires the **force** keyword during deployment, the running configuration that is obtained from the switch in Nexus Dashboard Fabric Controller doesn't display the **force** keyword. Therefore, the **system nve infra-vlan int force** command always shows up as a diff.

The intent in Nexus Dashboard Fabric Controller contains the line:

```
system nve infra-vlan int force
```

The running config contains the line:

```
system nve infra-vlan int
```

As a workaround to fix the persistent diff, edit the freeform config to remove the **force** keyword after the first deployment such that it is **system nve infra-vlan int**.

The **force** keyword is required for the initial deploy and must be removed after a successful deploy. You can confirm the diff by using the **Side-by-side Comparison** tab in the **Config Preview** window.

The persistent diff is also seen after a write erase and reload of a switch. Update the intent on Nexus Dashboard Fabric Controller to include the **force** keyword, and then you need to remove the **force** keyword after the first deployment.

- When the switch contains the **hardware access-list tcam region arp-ether 256** command, which is deprecated without the **double-wide** keyword, the below warning is displayed:

```
WARNING: Configuring the arp-ether region without "double-wide" is deprecated and can result in silent non-vxlan packet drops. Use the "double-wide" keyword when carving TCAM space for the arp-ether region.
```

Since the original **hardware access-list tcam region arp-ether 256** command doesn't match the policies in Nexus Dashboard Fabric Controller, this config is captured in the **switch_freeform** policy. After the **hardware access-list tcam region arp-ether 256 double-wide** command is pushed to the switch, the original **tcam** command that does not contain the **double-wide** keyword is removed.

You must manually remove the **hardware access-list tcam region arp-ether 256** command from the **switch_freeform** policy. Otherwise, config compliance shows a persistent diff.

Here is an example of the **hardware access-list** command on the switch:

```
switch(config)# show run | inc arp-ether
switch(config)# hardware access-list tcam region arp-ether 256
Warning: Please save config and reload the system for the configuration to take effect
switch(config)# show run | inc arp-ether
hardware access-list tcam region arp-ether 256
switch(config)#
switch(config)# hardware access-list tcam region arp-ether 256 double-wide
Warning: Please save config and reload the system for the configuration to take effect
switch(config)# show run | inc arp-ether
hardware access-list tcam region arp-ether 256 double-wide
```

You can see that the original **tcam** command is overwritten.

Creating a New VXLAN BGP EVPN Fabric

This procedure shows how to create a new VXLAN BGP EVPN fabric.

This procedure contains descriptions for the IPv4 underlay. For information about IPv6 underlay, see [IPv6 Underlay Support for Easy Fabric, on page 24](#).

1. From Actions drop-down list, choose **Create Fabric**.

The **Create Fabric** window appears.

2. Enter a unique name for the Fabric.

Click on **Choose Template** to pick a template for your fabric.

A list of all available fabric templates are listed.

3. From the available list of Fabric templates, choose **Easy_Fabric** template.

Click **Select**.

Enter the necessary field values to create a Fabric.

The tabs and their fields in the screen are explained in the subsequent points. The overlay and underlay network parameters are included in these tabs.

Note If you're creating a standalone fabric as a potential member fabric of an MSD fabric (used for provisioning overlay networks for fabrics that are connected through EVPN Multi-Site technology), then see [Multi-Site Domain for VXLAN BGP EVPN Fabrics](#) topic before member fabric creation.

4. The **General Parameters** tab is displayed by default. The fields in this tab are:

BGP ASN – Enter the BGP AS number the fabric is associated with. This must be same as existing fabric.

Enable IPv6 Underlay – Enable the IPv6 underlay feature. For information, see [IPv6 Underlay Support for Easy Fabric, on page 24](#).

Enable IPv6 Link-Local Address – Enables the IPv6 Link-Local address.

Fabric Interface Numbering – Specifies whether you want to use point-to-point (**p2p**) or unnumbered networks.

Underlay Subnet IP Mask – Specifies the subnet mask for the fabric interface IP addresses.

Underlay Subnet IPv6 Mask – Specifies the subnet mask for the fabric interface IPv6 addresses.

Underlay Routing Protocol – The IGP used in the fabric, OSPF, or IS-IS.

Route-Reflectors (RRs) – The number of spine switches that are used as route reflectors for transporting BGP traffic. Choose 2 or 4 from the drop-down box. The default value is 2.

To deploy spine devices as RRs, Nexus Dashboard Fabric Controller sorts the spine devices based on their serial numbers, and designates two or four spine devices as RRs. If you add more spine devices, existing RR configuration won't change.

Increasing the count – You can increase the route reflectors from two to four at any point in time. Configurations are automatically generated on the other two spine devices designated as RRs.

Decreasing the count – When you reduce four route reflectors to two, remove the unneeded route reflector devices from the fabric. Follow these steps to reduce the count from 4 to 2.

- a. Change the value in the drop-down box to 2.

- b. Identify the spine switches designated as route reflectors.

An instance of the **rr_state** policy is applied on the spine switch if it's a route reflector. To find out if the policy is applied on the switch, right-click the switch, and choose **View/edit policies**. In the View/Edit Policies screen, search **rr_state** in the **Template** field. It is displayed on the screen.

- c. Delete the unneeded spine devices from the fabric (right-click the spine switch icon and choose **Discovery > Remove from fabric**).

If you delete existing RR devices, the next available spine switch is selected as the replacement RR.

- d. Click **Deploy Config** in the fabric topology window.

You can preselect RRs and RPs before performing the first **Save & Deploy** operation. For more information, see *Preselecting Switches as Route-Reflectors and Rendezvous-Points*.

Anycast Gateway MAC – Specifies the anycast gateway MAC address.

Enable Performance Monitoring – Check the check box to enable performance monitoring.

5. Click the **Replication** tab. Most of the fields are auto generated. You can update the fields if needed.

Replication Mode – The mode of replication that is used in the fabric for BUM (Broadcast, Unknown Unicast, Multicast) traffic. The choices are Ingress Replication or Multicast. When you choose Ingress replication, the multicast related fields get disabled.

You can change the fabric setting from one mode to the other, if no overlay profile exists for the fabric.

Multicast Group Subnet – IP address prefix used for multicast communication. A unique IP address is allocated from this group for each overlay network.

The replication mode change isn't allowed if a policy template instance is created for the current mode. For example, if a multicast related policy is created and deployed, you can't change the mode to Ingress.

Enable Tenant Routed Multicast (TRM) – Check the check box to enable Tenant Routed Multicast (TRM) that allows overlay multicast traffic to be supported over EVPN/MVPN in the VXLAN BGP EVPN fabric.

Default MDT Address for TRM VRFs – The multicast address for Tenant Routed Multicast traffic is populated. By default, this address is from the IP prefix specified in the **Multicast Group Subnet** field. When you update either field, ensure that the TRM address is chosen from the IP prefix specified in **Multicast Group Subnet**.

For more information, see [Overview of Tenant Routed Multicast, on page 24](#).

Rendezvous-Points – Enter the number of spine switches acting as rendezvous points.

RP mode – Choose from the two supported multicast modes of replication, ASM (for Any-Source Multicast [ASM]) or BiDir (for Bidirectional PIM [BIDIR-PIM]).

When you choose ASM, the BiDir related fields aren't enabled. When you choose BiDir, the BiDir related fields are enabled.

Note BIDIR-PIM is supported on Cisco's Cloud Scale Family platforms 9300-EX and 9300-FX/FX2, and software release 9.2(1) onwards.

When you create a new VRF for the fabric overlay, this address is populated in the **Underlay Multicast Address** field, in the **Advanced** tab.

Underlay RP Loopback ID – The loopback ID used for the rendezvous point (RP), for multicast protocol peering purposes in the fabric underlay.

The next two fields are enabled if you choose BIDIR-PIM as the multicast mode of replication.

Underlay Primary RP Loopback ID – The primary loopback ID used for the phantom RP, for multicast protocol peering purposes in the fabric underlay.

Underlay Backup RP Loopback ID – The secondary loopback ID used for the phantom RP, for multicast protocol peering purposes in the fabric underlay.

Underlay Second Backup RP Loopback Id and **Underlay Third Backup RP Loopback Id** – Used for the second and third fallback Bidir-PIM Phantom RP.

6. Click the **VPC** tab. Most of the fields are auto generated. You can update the fields if needed.

vPC Peer Link VLAN – VLAN used for the vPC peer link SVI.

Make vPC Peer Link VLAN as Native VLAN – Enables vPC peer link VLAN as Native VLAN.

vPC Peer Keep Alive option – Choose the management or loopback option. If you want to use IP addresses assigned to the management port and the management VRF, choose management. If you use IP addresses assigned to loopback interfaces (and a non-management VRF), choose loopback.

If you use IPv6 addresses, you must use loopback IDs.

vPC Auto Recovery Time – Specifies the vPC auto recovery time-out period in seconds.

vPC Delay Restore Time – Specifies the vPC delay restore period in seconds.

vPC Peer Link Port Channel ID – Specifies the Port Channel ID for a vPC Peer Link. By default, the value in this field is 500.

vPC IPv6 ND Synchronize – Enables IPv6 Neighbor Discovery synchronization between vPC switches. The check box is enabled by default. Clear the check box to disable the function.

vPC advertise-pip – Select the check box to enable the Advertise PIP feature.

You can enable the advertise PIP feature on a specific vPC as well. .

Enable the same vPC Domain Id for all vPC Pairs – Enable the same vPC Domain ID for all vPC pairs. When you select this field, the **vPC Domain Id** field is editable.

vPC Domain Id – Specifies the vPC domain ID to be used on all vPC pairs.

vPC Domain Id Range – Specifies the vPC Domain Id range to use for new pairings.

Enable QoS for Fabric vPC-Peering – Enable QoS on spines for guaranteed delivery of vPC Fabric Peering communication. .

Note QoS for vPC fabric peering and queuing policies options in fabric settings are mutually exclusive.

QoS Policy Name – Specifies QoS policy name that should be same on all fabric vPC peering spines. The default name is **spine_qos_for_fabric_vpc_peering**.

7. Click the **Protocols** tab. Most of the fields are auto generated. You can update the fields if needed.

Underlay Routing Loopback Id – The loopback interface ID is populated as 0 since loopback0 is usually used for fabric underlay IGP peering purposes.

Underlay VTEP Loopback Id – The loopback interface ID is populated as 1 since loopback1 is used for the VTEP peering purposes.

Underlay Anycast Loopback Id – The loopback interface ID is greyed out and used for vPC Peering in VXLANv6 Fabrics only.

Underlay Routing Protocol Tag – The tag defining the type of network.

OSPF Area ID – The OSPF area ID, if OSPF is used as the IGP within the fabric.

Note The OSPF or IS-IS authentication fields are enabled based on your selection in the **Underlay Routing Protocol** field in the **General** tab.

Enable OSPF Authentication – Select the check box to enable OSPF authentication. Deselect the check box to disable it. If you enable this field, the OSPF Authentication Key ID and OSPF Authentication Key fields get enabled.

OSPF Authentication Key ID – The Key ID is populated.

OSPF Authentication Key – The OSPF authentication key must be the 3DES key from the switch.

Note Plain text passwords are not supported. Log in to the switch, retrieve the encrypted key and enter it in this field. Refer, *Retrieving the Authentication Key* section for details.

IS-IS Level – Select the IS-IS level from this drop-down list.

Enable IS-IS Network Point-to-Point – Enables network point-to-point on fabric interfaces which are numbered.

Enable IS-IS Authentication – Select the check box to enable IS-IS authentication. Deselect the check box to disable it. If you enable this field, the IS-IS authentication fields are enabled.

IS-IS Authentication Keychain Name – Enter the Keychain name, such as CiscoisisAuth.

IS-IS Authentication Key ID – The Key ID is populated.

IS-IS Authentication Key – Enter the Cisco Type 7 encrypted key.

Note Plain text passwords are not supported. Log in to the switch, retrieve the encrypted key and enter it in this field. Refer the *Retrieving the Authentication Key* section for details.

Set IS-IS Overload Bit – When enabled, set the overload bit for an elapsed time after a reload.

IS-IS Overload Bit Elapsed Time – Allows you to clear the overload bit after an elapsed time in seconds.

Enable BGP Authentication - Select the check box to enable BGP authentication. Deselect the check box to disable it. If you enable this field, the BGP Authentication Key Encryption Type and BGP Authentication Key fields are enabled.

Note If you enable BGP authentication using this field, leave the iBGP Peer-Template Config field blank to avoid duplicate configuration.

BGP Authentication Key Encryption Type – Choose the 3 for 3DES encryption type, or 7 for Cisco encryption type.

BGP Authentication Key – Enter the encrypted key based on the encryption type.

Note Plain text passwords are not supported. Log in to the switch, retrieve the encrypted key and enter it in the BGP Authentication Key field. Refer the Retrieving the Authentication Key section for details.

Enable PIM Hello Authentication – Select this check box to enable PIM hello authentication on all the intra-fabric interfaces of the switches in a fabric. This check box is editable only for the Multicast replication mode. Note this check box is valid only for the IPv4 underlay.

PIM Hello Authentication Key – Specifies the PIM hello authentication key. For more information, see Retrieving PIM Hello Authentication Key.

To retrieve PIM Hello Authentication Key, perform the following steps:

- a. SSH into the switch.
- b. On an unused switch interface, enable the following:

```
switch(config)# interface e1/32
switch(config-if)# ip pim hello-authentication ah-md5 pimHelloPassword
```

In this example, **pimHelloPassword** is the cleartext password that has been used.

- c. Enter the **show run interface** command to retrieve the PIM hello authentication key.

```
switch(config-if)# show run interface e1/32 | grep pim
ip pim sparse-mode
ip pim hello-authentication ah-md5 3 d34e6c5abc7fecf1caa3b588b09078e0
```

In this example, **d34e6c5abc7fecf1caa3b588b09078e0** is the PIM hello authentication key that should be specified in the fabric settings.

Enable BFD: Select the check box to enable **feature bfd** on all switches in the fabric. This feature is valid only on IPv4 underlay and the scope is within a fabric.

BFD within a fabric is supported natively. The BFD feature is disabled by default in the Fabric Settings. If enabled, BFD is enabled for the underlay protocols with the default settings. Any custom required BFD configurations must be deployed via the per switch freeform or per interface freeform policies.

The following config is pushed after you select the **Enable BFD** check box:

```
feature bfd
```

For information about BFD feature compatibility, refer your respective platform documentation and for information about the supported software images, see *Compatibility Matrix for Cisco Nexus Dashboard Fabric Controller*.

Enable BFD for iBGP – Select the check box to enable BFD for the iBGP neighbor. This option is disabled by default.

Enable BFD for OSPF – Select the check box to enable BFD for the OSPF underlay instance. This option is disabled by default, and it is grayed out if the link state protocol is ISIS.

Enable BFD for ISIS – Select the check box to enable BFD for the ISIS underlay instance. This option is disabled by default, and it is grayed out if the link state protocol is OSPF.

Enable BFD for PIM – Select the check box to enable BFD for PIM. This option is disabled by default, and it is be grayed out if the replication mode is Ingress.

Here are the examples of the BFD global policies:

```
router ospf <ospf tag>
  bfd

router isis <isis tag>
  address-family ipv4 unicast
  bfd

ip pim bfd

router bgp <bgp asn>
  neighbor <neighbor ip>
  bfd
```

Enable BFD Authentication – Select the check box to enable BFD authentication. If you enable this field, the **BFD Authentication Key ID** and **BFD Authentication Key** fields are editable.

Note BFD Authentication is not supported when the **Fabric Interface Numbering** field under the **General** tab is set to **unnumbered**. The BFD authentication fields will be grayed out automatically. BFD authentication is valid for only for P2P interfaces.

BFD Authentication Key ID – Specifies the BFD authentication key ID for the interface authentication. The default value is 100.

BFD Authentication Key – Specifies the BFD authentication key.

For information about how to retrieve the BFD authentication parameters. .

iBGP Peer-Template Config – Add iBGP peer template configurations on the leaf switches to establish an iBGP session between the leaf switch and route reflector.

If you use BGP templates, add the authentication configuration within the template and clear the Enable BGP Authentication check box to avoid duplicate configuration.

In the sample configuration, the 3DES password is displayed after password 3.

```
router bgp 65000
  password 3 sd8478fswerdfw3434fsw4f4w34sdsd8478fswerdfw3434fsw4f4w
```

The following fields can be used to specify different configurations:

- **iBGP Peer-Template Config** – Specifies the config used for RR and spines with border role.
- **Leaf/Border/Border Gateway iBGP Peer-Template Config** – Specifies the config used for leaf, border, or border gateway. If this field is empty, the peer template defined in **iBGP Peer-Template Config** is used on all BGP enabled devices (RRs, leafs, border, or border gateway roles).

In brownfield migration, if the spine and leaf use different peer template names, both **iBGP Peer-Template Config** and **Leaf/Border/Border Gateway iBGP Peer-Template Config** fields need to be set according to the switch config. If spine and leaf use the same peer template name and content (except for the “route-reflector-client” CLI), only **iBGP Peer-Template Config** field in fabric setting needs to be set. If the fabric settings on iBGP peer templates do not match the existing switch configuration, an error message is generated and the migration will not proceed.

8. Click the **Advanced** tab. Most of the fields are auto generated. You can update the fields if needed.

VRF Template and **VRF Extension Template**: Specifies the VRF template for creating VRFs, and the VRF extension template for enabling VRF extension to other fabrics.

Network Template and **Network Extension Template**: Specifies the network template for creating networks, and the network extension template for extending networks to other fabrics.

Overlay Mode – VRF/Network configuration using config-profile or CLI, default is config-profile. For more information, see [Overlay Mode, on page 32](#).

Site ID – The ID for this fabric if you are moving this fabric within an MSD. The site ID is mandatory for a member fabric to be a part of an MSD. Each member fabric of an MSD has a unique site ID for identification.

Intra Fabric Interface MTU – Specifies the MTU for the intra fabric interface. This value should be an even number.

Layer 2 Host Interface MTU - Specifies the MTU for the layer 2 host interface. This value should be an even number.

Unshut Host Interfaces by Default – Select this check box to unshut the host interfaces by default.

Power Supply Mode – Choose the appropriate power supply mode.

CoPP Profile – Choose the appropriate Control Plane Policing (CoPP) profile policy for the fabric. By default, the strict option is populated.

VTEP HoldDown Time – Specifies the NVE source interface hold down time.

Brownfield Overlay Network Name Format – Enter the format to be used to build the overlay network name during a brownfield import or migration. The network name should not contain any white spaces or special characters except underscore (_) and hyphen (-). The network name must not be changed once the brownfield migration has been initiated. See the *Creating Networks for the Standalone Fabric* section for the naming convention of the network name. The syntax is [**<string>** | **\$\$VLAN_ID\$\$**] **\$\$VNI\$\$** [**<string>**| **\$\$VLAN_ID\$\$**] and the default value is

Auto_Net_VNI\$\$VNI\$\$_VLAN\$\$VLAN_ID\$\$. When you create networks, the name is generated according to the syntax you specify. The following table describes the variables in the syntax.

Variables	Description
\$\$VNI\$\$	Specifies the network VNI ID found in the switch configuration. This is a mandatory keyword required to create unique network names.
\$\$VLAN_ID\$\$	Specifies the VLAN ID associated with the network. VLAN ID is specific to switches, hence Nexus Dashboard Fabric Controller picks the VLAN ID from one of the switches, where the network is found, randomly and use it in the name. We recommend not to use this unless the VLAN ID is consistent across the fabric for the VNI.

Variables	Description
<string>	This variable is optional and you can enter any number of alphanumeric characters that meet the network name guidelines.

Example overlay network name: Site_VNI12345_VLAN1234

Note Ignore this field for greenfield deployments. The **Brownfield Overlay Network Name Format** applies for the following brownfield imports:

- CLI-based overlays
- Configuration profile-based overlay

Enable CDP for Bootstrapped Switch – Enables CDP on management (mgmt0) interface for bootstrapped switch. By default, for bootstrapped switches, CDP is disabled on the mgmt0 interface.

Enable VXLAN OAM – Enables the VXLAN OAM functionality for devices in the fabric. This is enabled by default. Clear the check box to disable VXLAN OAM function.

If you want to enable the VXLAN OAM function on specific switches and disable on other switches in the fabric, you can use freeform configurations to enable OAM and disable OAM in the fabric settings.

Note The VXLAN OAM feature in Cisco Nexus Dashboard Fabric Controller is only supported on a single fabric or site.

Enable Tenant DHCP – Select the check box to enable feature dhcp and associated configurations globally on all switches in the fabric. This is a pre-requisite for support of DHCP for overlay networks that are part of the tenant VRFs.

Note Ensure that **Enable Tenant DHCP** is enabled before enabling DHCP-related parameters in the overlay profiles.

Enable NX-API - Specifies enabling of NX-API on HTTPS. This check box is checked by default.

Enable NX-API on HTTP Port – Specifies enabling of NX-API on HTTP. Enable this check box and the **Enable NX-API** check box to use HTTP. This check box is checked by default. If you uncheck this check box, the applications that use NX-API and supported by Cisco Nexus Dashboard Fabric Controller, such as Endpoint Locator (EPL), Layer 4-Layer 7 services (L4-L7 services), VXLAN OAM, and so on, start using the HTTPS instead of HTTP.

Note If you check the **Enable NX-API** check box and the **Enable NX-API on HTTP** check box, applications use HTTP.

Enable Policy-Based Routing (PBR) – Select this check box to enable routing of packets based on the specified policy. Starting with Cisco NX-OS Release 7.0(3)I7(1) and later releases, this feature works on Cisco Nexus 9000 Series switches with Nexus 9000 Cloud Scale (Tahoe) ASICs. This feature

is used along with the Layer 4-Layer 7 service workflow. For information on Layer 4-Layer 7 service, refer the *Layer 4-Layer 7 Service* chapter.

Enable Strict Config Compliance – Enable the Strict Config Compliance feature by selecting this check box. It enables bi-directional compliance checks to flag additional configs in the running config that are not in the intent/expected config. By default, this feature is disabled.

Enable AAA IP Authorization – Enables AAA IP authorization, when IP Authorization is enabled in the remote authentication server. This is required to support Nexus Dashboard Fabric Controller in scenarios where customers have strict control of which IP addresses can have access to the switches.

Enable NDFC as Trap Host – Select this check box to enable Nexus Dashboard Fabric Controller as an SNMP trap destination. Typically, for a native HA Nexus Dashboard Fabric Controller deployment, the eth1 VIP IP address will be configured as SNMP trap destination on the switches. By default, this check box is enabled.

Anycast Border Gateway advertise-pip – Enables to advertise Anycast Border Gateway PIP as VTEP. Effective on MSD fabric 'Recalculate Config'.

Greenfield Cleanup Option – Enable the switch cleanup option for switches imported into Nexus Dashboard Fabric Controller with Preserve-Config=No, without a switch reload. This option is typically recommended only for the fabric environments with Cisco Nexus 9000v Switches to improve on the switch clean up time. The recommended option for Greenfield deployment is to employ Bootstrap or switch cleanup with a reboot. In other words, this option should be unchecked.

Enable Precision Time Protocol (PTP) – Enables PTP across a fabric. When you select this check box, PTP is enabled globally and on core-facing interfaces. Additionally, the **PTP Source Loopback Id** and **PTP Domain Id** fields are editable. For more information, see [Precision Time Protocol for Easy Fabric](#).

PTP Source Loopback Id – Specifies the loopback interface ID Loopback that is used as the Source IP Address for all PTP packets. The valid values range from 0 to 1023. The PTP loopback ID cannot be the same as RP, Phantom RP, NVE, or MPLS loopback ID. Otherwise, an error will be generated. The PTP loopback ID can be the same as BGP loopback or user-defined loopback which is created from Nexus Dashboard Fabric Controller.

If the PTP loopback ID is not found during **Deploy Config**, the following error is generated:

Loopback interface to use for PTP source IP is not found. Create PTP loopback interface on all the devices to enable PTP feature.

PTP Domain Id – Specifies the PTP domain ID on a single network. The valid values range from 0 to 127.

Enable MPLS Handoff – Select the check box to enable the MPLS Handoff feature. For more information, see the [MPLS SR and LDP Handoff](#) chapter in External/WAN Layer 3 Connectivity for VXLAN BGP EVPN Fabrics.

Underlay MPLS Loopback Id – Specifies the underlay MPLS loopback ID. The default value is 101.

Enable TCAM Allocation – TCAM commands are automatically generated for VXLAN and vPC Fabric Peering when enabled.

Enable Default Queuing Policies – Check this check box to apply QoS policies on all the switches in this fabric. To remove the QoS policies that you applied on all the switches, uncheck this check box, update all the configurations to remove the references to the policies, and save and deploy. Pre-defined QoS configurations are included that can be used for various Cisco Nexus 9000 Series Switches. When you check this check box, the appropriate QoS configurations are pushed to the switches in the fabric.

The system queuing is updated when configurations are deployed to the switches. You can perform the interface marking with defined queuing policies, if required, by adding the required configuration to the per interface freeform block.

Review the actual queuing policies by opening the policy file in the template editor. From Cisco Nexus Dashboard Fabric Controller Web UI, choose **Operations > Templates**. Search for the queuing policies by the policy file name, for example, **queuing_policy_default_8q_cloudscale**. Choose the file. From the **Actions** drop-down list, select **Edit template content** to edit the policy.

See the *Cisco Nexus 9000 Series NX-OS Quality of Service Configuration Guide* for platform specific details.

N9K Cloud Scale Platform Queuing Policy - Choose the queuing policy from the drop-down list to be applied to all Cisco Nexus 9200 Series Switches and the Cisco Nexus 9000 Series Switches that ends with EX, FX, and FX2 in the fabric. The valid values are **queuing_policy_default_4q_cloudscale** and **queuing_policy_default_8q_cloudscale**. Use the **queuing_policy_default_4q_cloudscale** policy for FEXes. You can change from the **queuing_policy_default_4q_cloudscale** policy to the **queuing_policy_default_8q_cloudscale** policy only when FEXes are offline.

N9K R-Series Platform Queuing Policy – Choose the queuing policy from the drop-down list to be applied to all Cisco Nexus switches that ends with R in the fabric. The valid value is **queuing_policy_default_r_series**.

Other N9K Platform Queuing Policy – Choose the queuing policy from the drop-down list to be applied to all other switches in the fabric other than the switches mentioned in the above two options. The valid value is **queuing_policy_default_other**.

Enable MACsec - Enables MACsec for the fabric. For more information, see [Enabling MACsec](#).

Freeform CLIs - Fabric level freeform CLIs can be added while creating or editing a fabric. They are applicable to switches across the fabric. You must add the configurations as displayed in the running configuration, without indentation. Switch level freeform configurations such as VLAN, SVI, and interface configurations should only be added on the switch. For more information, refer [Enabling Freeform Configurations on Fabric Switches](#). For more information, see [Enabling Freeform Configurations on Fabric Switches](#), on page 43.

Leaf Freeform Config – Add CLIs that should be added to switches that have the *Leaf*, *Border*, and *Border Gateway* roles.

Spine Freeform Config – Add CLIs that should be added to switches with a *Spine*, *Border Spine*, *Border Gateway Spine*, and *Super Spine* roles.

Intra-fabric Links Additional Config – Add CLIs that should be added to the intra-fabric links.

9. Click the **Resources** tab.

Manual Underlay IP Address Allocation – *Do not* select this check box if you are transitioning your VXLAN fabric management to Nexus Dashboard Fabric Controller.

- By default, Nexus Dashboard Fabric Controller allocates the underlay IP address resources (for loopbacks, fabric interfaces, etc) dynamically from the defined pools. If you select the check box, the allocation scheme switches to static, and some of the dynamic IP address range fields are disabled.
- For static allocation, the underlay IP address resources must be populated into the Resource Manager (RM) using REST APIs.

- The Underlay RP Loopback IP Range field stays enabled if BIDIR-PIM function is chosen for multicast replication.
- Changing from static to dynamic allocation keeps the current IP resource usage intact. Only future IP address allocation requests are taken from dynamic pools.

Underlay Routing Loopback IP Range – Specifies loopback IP addresses for the protocol peering.

Underlay VTEP Loopback IP Range – Specifies loopback IP addresses for VTEPs.

Underlay RP Loopback IP Range – Specifies the anycast or phantom RP IP address range.

Underlay Subnet IP Range – IP addresses for underlay P2P routing traffic between interfaces.

Underlay MPLS Loopback IP Range – Specifies the underlay MPLS loopback IP address range.

For eBGP between Border of Easy A and Easy B, Underlay routing loopback and Underlay MPLS loopback IP range must be a unique range. It should not overlap with IP ranges of the other fabrics, else VPNv4 peering will not come up.

Underlay Routing Loopback IPv6 Range – Specifies Loopback0 IPv6 Address Range

Underlay VTEP Loopback IPv6 Range – Specifies Loopback1 and Anycast Loopback IPv6 Address Range.

Underlay Subnet IPv6 Range – Specifies IPv6 Address range to assign Numbered and Peer Link SVI IPs.

BGP Router ID Range for IPv6 Underlay – Specifies BGP router ID range for IPv6 underlay.

Layer 2 VXLAN VNI Range and Layer 3 VXLAN VNI Range - Specifies the VXLAN VNI IDs for the fabric.

Network VLAN Range and VRF VLAN Range – VLAN ranges for the Layer 3 VRF and overlay network.

Subinterface Dot1q Range – Specifies the subinterface range when L3 sub interfaces are used.

VRF Lite Deployment – Specify the VRF Lite method for extending inter fabric connections.

The VRF Lite Subnet IP Range field specifies resources reserved for IP address used for VRF LITE when VRF LITE IFCs are auto-created. If you select Back2BackOnly, ToExternalOnly, or Back2Back&ToExternal then VRF LITE IFCs are auto-created.

Auto Deploy Both – This check box is applicable for the symmetric VRF Lite deployment. When you select this check box, it would set the auto deploy flag to true for auto-created IFCs to turn on symmetric VRF Lite configuration.

This check box can be selected or deselected when the **VRF Lite Deployment** field is not set to Manual. In the case, a user explicitly unchecks the auto-deploy field for any auto-created IFCs, then the user input is always given the priority. This flag only affects the new auto-created IFC and it does not affect the existing IFCs.

VRF Lite Subnet IP Range and VRF Lite Subnet Mask – These fields are populated with the DCI subnet details. Update the fields as needed.

The values shown in your screen are automatically generated. If you want to update the IP address ranges, VXLAN Layer 2/Layer 3 network ID ranges or the VRF/Network VLAN ranges, ensure the following:

Note When you update a range of values, ensure that it does not overlap with other ranges. You should only update one range of values at a time. If you want to update more than one range of values, do it in separate instances. For example, if you want to update L2 and L3 ranges, you should do the following.

- a. Update the L2 range and click **Save**.
- b. Click the **Edit Fabric** option again, update the L3 range and click **Save**.

Service Network VLAN Range – Specifies a VLAN range in the Service Network VLAN Range field. This is a per switch overlay service network VLAN range. The minimum allowed value is 2 and the maximum allowed value is 3967.

Route Map Sequence Number Range – Specifies the route map sequence number range. The minimum allowed value is 1 and the maximum allowed value is 65534.

10. Click the **Manageability** tab.

The fields in this tab are:

Inband Management – Enabling this allows the management of the switches over their front panel interfaces. The Underlay Routing Loopback interface is used for discovery. If enabled, switches cannot be added to the fabric over their out-of-band (OOB) mgmt0 interface. To manage easy fabrics through Inband management ensure that you have chosen **Data** in NDFC Web UI, **Settings > Server Settings > Admin**. Both inband management and out-of-band connectivity (mgmt0) are supported for this setting. For more information, see [Inband Management and Inband POAP in Easy Fabrics, on page 101](#).

DNS Server IPs – Specifies the comma separated list of IP addresses (v4/v6) of the DNS servers.

DNS Server VRFs – Specifies one VRF for all DNS servers or a comma separated list of VRFs, one per DNS server.

NTP Server IPs – Specifies comma separated list of IP addresses (v4/v6) of the NTP server.

NTP Server VRFs – Specifies one VRF for all NTP servers or a comma separated list of VRFs, one per NTP server.

Syslog Server IPs – Specifies the comma separated list of IP addresses (v4/v6) IP address of the syslog servers, if used.

Syslog Server Severity – Specifies the comma separated list of syslog severity values, one per syslog server. The minimum value is 0 and the maximum value is 7. To specify a higher severity, enter a higher number.

Syslog Server VRFs – Specifies one VRF for all syslog servers or a comma separated list of VRFs, one per syslog server.

AAA Freeform Config – Specifies the AAA freeform configurations.

If AAA configurations are specified in the fabric settings, **switch_freeform** PTI with source as **UNDERLAY_AAA** and description as **AAA Configurations** will be created.

11. Click the **Bootstrap** tab.

Enable Bootstrap – Select this check box to enable the bootstrap feature. Bootstrap allows easy day-0 import and bring-up of new devices into an existing fabric. Bootstrap leverages the NX-OS POAP functionality.

Starting from Cisco NDFC Release 12.1.1e, to add more switches and for POAP capability, chose checkbox for **Enable Bootstrap** and **Enable Local DHCP Server**. For more information, see [Inband Management and Inband POAP in Easy Fabrics, on page 101](#)

After you enable bootstrap, you can enable the DHCP server for automatic IP address assignment using one of the following methods:

- External DHCP Server: Enter information about the external DHCP server in the **Switch Mgmt Default Gateway** and **Switch Mgmt IP Subnet Prefix** fields.
- Local DHCP Server: Enable the **Local DHCP Server** check box and enter details for the remaining mandatory fields.

Enable Local DHCP Server – Select this check box to initiate enabling of automatic IP address assignment through the local DHCP server. When you select this check box, the **DHCP Scope Start Address** and **DHCP Scope End Address** fields become editable.

If you do not select this check box, Nexus Dashboard Fabric Controller uses the remote or external DHCP server for automatic IP address assignment.

DHCP Version – Select DHCPv4 or DHCPv6 from this drop-down list. When you select DHCPv4, the **Switch Mgmt IPv6 Subnet Prefix** field is disabled. If you select DHCPv6, the **Switch Mgmt IP Subnet Prefix** is disabled.

Note Cisco Nexus 9000 and 3000 Series Switches support IPv6 POAP only when switches are either Layer-2 adjacent (eth1 or out-of-band subnet must be a /64) or they are L3 adjacent residing in some IPv6 /64 subnet. Subnet prefixes other than /64 are not supported.

DHCP Scope Start Address and **DHCP Scope End Address** - Specifies the first and last IP addresses of the IP address range to be used for the switch out of band POAP.

Switch Mgmt Default Gateway – Specifies the default gateway for the management VRF on the switch.

Switch Mgmt IP Subnet Prefix – Specifies the prefix for the Mgmt0 interface on the switch. The prefix should be between 8 and 30.

DHCP scope and management default gateway IP address specification - If you specify the management default gateway IP address 10.0.1.1 and subnet mask 24, ensure that the DHCP scope is within the specified subnet, between 10.0.1.2 and 10.0.1.254.

Switch Mgmt IPv6 Subnet Prefix – Specifies the IPv6 prefix for the Mgmt0 interface on the switch. The prefix should be between 112 and 126. This field is editable if you enable IPv6 for DHCP.

Enable AAA Config – Select this check box to include AAA configurations from the Manageability tab as part of the device startup config post bootstrap.

DHCPv4/DHCPv6 Multi Subnet Scope – Specifies the field to enter one subnet scope per line. This field is editable after you check the **Enable Local DHCP Server** check box.

The format of the scope should be defined as:

DHCP Scope Start Address, DHCP Scope End Address, Switch Management Default Gateway, Switch Management Subnet Prefix

For example: 10.6.0.2, 10.6.0.9, 10.6.0.1, 24

Bootstrap Freeform Config – (Optional) Enter additional commands as needed. For example, if you require some additional configurations to be pushed to the device and be available post device bootstrap, they can be captured in this field, to save the desired intent. After the devices boot up, they will contain the configuration defined in the **Bootstrap Freeform Config** field.

Copy-paste the running-config to a **freeform config** field with correct indentation, as seen in the running configuration on the NX-OS switches. The freeform config must match the running config. For more information, see [Enabling Freeform Configurations on Fabric Switches](#), on page 43.

12. Click the **Configuration Backup** tab. The fields on this tab are:

Hourly Fabric Backup – Select the check box to enable an hourly backup of fabric configurations and the intent.

The hourly backups are triggered during the first 10 minutes of the hour.

Scheduled Fabric Backup – Check the check box to enable a daily backup. This backup tracks changes in running configurations on the fabric devices that are not tracked by configuration compliance.

Scheduled Time: Specify the scheduled backup time in a 24-hour format. This field is enabled if you check the **Scheduled Fabric Backup** check box.

Select both the check boxes to enable both back up processes.

The backup process is initiated after you click **Save**.

The scheduled backups are triggered exactly at the time you specify with a delay of up to two minutes. The scheduled backups are triggered regardless of the configuration deployment status.

The number of fabric backups that will be retained on NDFC is decided by the **Settings > Server Settings > LAN Fabric > Maximum Backups per Fabric**.

The number of archived files that can be retained is set in the **# Number of archived files per device to be retained:** field in the **Server Properties** window.

Note To trigger an immediate backup, do the following:

- a. Choose **LAN > Topology**.
 - b. Click within the specific fabric box. The fabric topology screen comes up.
 - c. From the **Actions** pane at the left part of the screen, click **Re-Sync Fabric**.
-

You can also initiate the fabric backup in the fabric topology window. Click **Backup Now** in the **Actions** pane.

13. Click on the **Flow Monitor** tab. The fields on this tab are:

Enable Netflow – Check this checkbox to enable Netflow on VTEPs for this Fabric. By default, Netflow is disabled. On Enable, NetFlow configuration will be applied to all VTEPS that support netflow.

Note: When Netflow is enabled on the fabric, you can choose not to have netflow on a particular switch by having a dummy no_netflow PTI.

If netflow is not enabled at the fabric level, an error message is generated when you enable netflow at the interface, network, or vrf level. For information about Netflow support for Cisco NDFC, refer to [Netflow Support](#), on page 95.

In the **Netflow Exporter** area, click **Actions > Add** to add one or more Netflow exporters. This exporter is the receiver of the netflow data. The fields on this screen are:

- **Exporter Name** – Specifies the name of the exporter.
- **IP** – Specifies the IP address of the exporter.
- **VRF** – Specifies the VRF over which the exporter is routed.
- **Source Interface** – Enter the source interface name.
- **UDP Port** – Specifies the UDP port over which the netflow data is exported.

Click **Save** to configure the exporter. Click **Cancel** to discard. You can also choose an existing exporter and select **Actions > Edit** or **Actions > Delete** to perform relevant actions.

In the **Netflow Record** area, click **Actions > Add** to add one or more Netflow records. The fields on this screen are:

- **Record Name** – Specifies the name of the record.
- **Record Template** – Specifies the template for the record. Enter one of the record templates names. In Release 12.0.2, the following two record templates are available for use. You can create custom netflow record templates. Custom record templates saved in the template library are available for use here.
 - **netflow_ipv4_record** – to use the IPv4 record template.
 - **netflow_l2_record** – to use the Layer 2 record template.
- **Is Layer2 Record** – Check this check box if the record is for Layer2 netflow.

Click **Save** to configure the report. Click **Cancel** to discard. You can also choose an existing record and select **Actions > Edit** or **Actions > Delete** to perform relevant actions.

In the **Netflow Monitor** area, click **Actions > Add** to add one or more Netflow monitors. The fields on this screen are:

- **Monitor Name** – Specifies the name of the monitor.
- **Record Name** – Specifies the name of the record for the monitor.
- **Exporter1 Name** – Specifies the name of the exporter for the netflow monitor.
- **Exporter2 Name** – (optional) Specifies the name of the secondary exporter for the netflow monitor.

The record name and exporters referred to in each netflow monitor must be defined in "**Netflow Record**" and "**Netflow Exporter**".

Click **Save** to configure the monitor. Click **Cancel** to discard. You can also choose an existing monitor and select **Actions > Edit** or **Actions > Delete** to perform relevant actions.

14. Click on the **Fabric** to view summary in the slide-in pane. Click on the Launch icon to view the Fabric Overview.

Configuring Fabrics with eBGP Underlay

You can use the **Easy_Fabric_eBGP** fabric template to create a fabric with eBGP underlay. For more information, see *Configuring a Fabric with eBGP Underlay*.

IPv6 Underlay Support for Easy Fabric

You can create an Easy fabric with IPv6 only underlay. The IPv6 underlay is supported only for the **Easy_Fabric** template. For more information, see *Configuring a VXLANv6 Fabric*.

Overview of Tenant Routed Multicast

Tenant Routed Multicast (TRM) enables multicast forwarding on the VXLAN fabric that uses a BGP-based EVPN control plane. TRM provides multi-tenancy aware multicast forwarding between senders and receivers within the same or different subnet local or across VTEPs.

With TRM enabled, multicast forwarding in the underlay is leveraged to replicate VXLAN encapsulated routed multicast traffic. A Default Multicast Distribution Tree (Default-MDT) is built per-VRF. This is an addition to the existing multicast groups for Layer-2 VNI Broadcast, Unknown Unicast, and Layer-2 multicast replication group. The individual multicast group addresses in the overlay are mapped to the respective underlay multicast address for replication and transport. The advantage of using a BGP-based approach allows the VXLAN BGP EVPN fabric with TRM to operate as fully distributed Overlay Rendezvous-Point (RP), with the RP presence on every edge-device (VTEP).

A multicast-enabled data center fabric is typically part of an overall multicast network. Multicast sources, receivers, and multicast rendezvous points might reside inside the data center but also might be inside the campus or externally reachable via the WAN. TRM allows a seamless integration with existing multicast networks. It can leverage multicast rendezvous points external to the fabric. Furthermore, TRM allows for tenant-aware external connectivity using Layer-3 physical interfaces or subinterfaces.

For more information, see the following:

- [Guidelines and Limitations for Tenant Routed Multicast](#)
- [Guidelines and Limitations for Layer 3 Tenant Routed Multicast](#)
- [Guidelines and Limitations for Layer 2/Layer 3 Tenant Routed Multicast \(Mixed Mode\)](#)

Overview of Tenant Routed Multicast with VXLAN EVPN Multi-Site

Tenant Routed Multicast with Multi-Site enables multicast forwarding across multiple VXLAN EVPN fabrics connected via Multi-Site.

The following two use cases are supported:

- Use Case 1: TRM provides Layer 2 and Layer 3 multicast services across sites for sources and receivers across different sites.
- Use Case 2: Extending TRM functionality from VXLAN fabric to sources receivers external to the fabric.

TRM Multi-Site is an extension of BGP-based TRM solution that enables multiple TRM sites with multiple VTEPs to connect to each other to provide multicast services across sites in most efficient possible way. Each TRM site is operating independently and border gateway on each site allows stitching across each site. There can be multiple Border Gateways for each site. In a given site, the BGW peers with Route Server or BGWs of

other sites to exchange EVPN and MVPN routes. On the BGW, BGP will import routes into the local VRF/L3VNI/L2VNI and then advertise those imported routes into the Fabric or WAN depending on where the routes were learnt from.

Tenant Routed Multicast with VXLAN EVPN Multi-Site Operations

The operations for TRM with VXLAN EVPN Multi-Site are as follows:

- Each Site is represented by Anycast VTEP BGWs. DF election across BGWs ensures no packet duplication.
- Traffic between Border Gateways uses ingress replication mechanism. Traffic is encapsulated with VXLAN header followed by IP header.
- Each Site will only receive one copy of the packet.
- Multicast source and receiver information across sites is propagated by BGP protocol on the Border Gateways configured with TRM.
- BGW on each site receives the multicast packet and re-encapsulate the packet before sending it to the local site.

For information about guidelines and limitations for TRM with VXLAN EVPN Multi-Site, see [Configuring Tenant Routed Multicast](#).

Configuring TRM for Single Site Using Cisco Nexus Dashboard Fabric Controller

This section assumes that a VXLAN EVPN fabric has already been provisioned using Cisco Nexus Dashboard Fabric Controller.

Procedure

Step 1

Enable TRM for the selected Easy Fabric. If the fabric template is **Easy_Fabric**, from the Fabric Overview **Actions** drop-down, choose the **Edit Fabric** option. Click the **Replication** tab. The fields on this tab are:

Enable Tenant Routed Multicast (TRM): Select the check box to enable Tenant Routed Multicast (TRM) that allows overlay multicast traffic to be supported over EVPN/MVPN in the VXLAN BGP EVPN fabric.

Default MDT Address for TRM VRFs: When you select the **Enable Tenant Routed Multicast (TRM)** check box, the multicast address for Tenant Routed Multicast traffic is auto populated. By default, this address is from the IP prefix specified in the **Multicast Group Subnet** field. When you update either field, ensure that the TRM address is chosen from the IP prefix specified in **Multicast Group Subnet**.

Click **Save** to save the fabric settings. At this point, all the switches turn “Blue” as it will be in the pending state. From the Fabric Overview **Actions** drop-down list, choose **Recalculate Config** and then choose **Deploy Config** to enable the following:

- Enable feature ngmvpn: Enables the Next-Generation Multicast VPN (ngMVPN) control plane for BGP peering.
- Configure ip multicast multipath s-g-hash next-hop-based: Multipath hashing algorithm for the TRM enabled VRFs.
- Configure ip igmp snooping vxlan: Enables IGMP Snooping for VXLAN VLANs.

- Configure ip multicast overlay-spt-only: Enables the MVPN Route-Type 5 on all MPVN enabled Cisco Nexus 9000 switches.
- Configure and Establish MVPN BGP AFI Peering: This is necessary for the peering between BGP RR and the Leaves.

For VXLAN EVPN fabric created using Easy_Fabric_eBGP fabric template, **Enable Tenant Routed Multicast (TRM)** field and **Default MDT Address for TRM VRFs** field can be found on the **EVPN** tab.

Step 2 Enable TRM for the VRF.

Navigate to **Fabric Overview > VRFs > VRFs** and edit the selected VRF. Navigate to the **Advanced** tab and edit the following TRM settings:

TRM Enable – Select the check box to enable TRM. If you enable TRM, then the RP address and the underlay multicast address must be entered.

Is RP External – Enable this check box if the RP is external to the fabric. If this field is unchecked, RP is distributed in every VTEP.

Note If the RP is external, then select the appropriate option. If the RP is external, then RP loopback ID is greyed out.

RP Address – Specifies the IP address of the RP.

RP Loopback ID – Specifies the loopback ID of the RP, if **Is RP External** is not enabled.

Underlay Mcast Address – Specifies the multicast address associated with the VRF. The multicast address is used for transporting multicast traffic in the fabric underlay.

Overlay Mcast Groups – Specifies the multicast group subnet for the specified RP. The value is the group range in “ip pim rp-address” command. If the field is empty, 224.0.0.0/24 is used as default.

Click **Save** to save the settings. The switches go into the pending state, that is, blue color. These settings enable the following:

- Enable PIM on L3VNI SVI.
- Route-Target Import and Export for MVPN AFI.
- RP and other multicast configuration for the VRF.
- Loopback interface using the above RP address and RP loopback id for the distributed RP.

Step 3 Enable TRM for the network.

Navigate to **Fabric Overview > Networks > Networks**. Edit the selected network and navigate to the **Advanced** tab. Edit the following TRM setting:

TRM Enable – Select the check box to enable TRM.

Click **Save** to save the settings. The switches go into the pending state, that is, the blue color. The TRM settings enable the following:

- Enable PIM on the L2VNI SVI.

- Create a PIM policy **none** to avoid PIM neighborhood with PIM Routers within a VLAN. The **none** keyword is a configured route map to deny any ipv4 addresses to avoid establishing PIM neighborhood policy using anycast IP.

Configuring TRM for Multi-Site Using Cisco Nexus Dashboard Fabric Controller

This section assumes that a Multi-Site Domain (MSD) has already been deployed by Cisco Nexus Dashboard Fabric Controller and TRM needs to be enabled.

Procedure

Step 1

Enable TRM on the BGWs.

Navigate to **Fabric Overview > VRFs > VRFs**. Make sure that the right DC Fabric is selected under the **Scope** and edit the VRF. Navigate to the **Advanced** tab. Edit the TRM settings. Repeat this process for every DC Fabric and its VRFs.

TRM Enable – Select the check box to enable TRM. If you enable TRM, then the RP address and the underlay multicast address must be entered.

Is RP External – Enable this check box if the RP is external to the fabric. If this field is unchecked, RP is distributed in every VTEP.

Note If the RP is external, then select the appropriate option. If the RP is external, then RP loopback ID is greyed out.

RP Address – Specifies the IP address of the RP.

RP Loopback ID – Specifies the loopback ID of the RP, if **Is RP External** is not enabled.

Underlay Mcast Address – Specifies the multicast address associated with the VRF. The multicast address is used for transporting multicast traffic in the fabric underlay.

Overlay Mcast Groups – Specifies the multicast group subnet for the specified RP. The value is the group range in “ip pim rp-address” command. If the field is empty, 224.0.0.0/24 is used as default.

Enable TRM BGW MSite - Select the check box to enable TRM on Border Gateway Multi-Site.

Click on **Save** to save the settings. The switches go into the pending state, that is, blue color. These settings enable the following:

- Enable feature ngmvpn: Enables the Next-Generation Multicast VPN (ngMVPN) control plane for BGP peering.
- Enables PIM on L3VNI SVI.
- Configures L3VNI Multicast Address.
- Route-Target Import and Export for MVPN AFI.
- RP and other multicast configuration for the VRF.
- Loopback interface for the distributed RP.
- Enable Multi-Site BUM ingress replication method for extending the Layer 2 VNI

Step 2 Establish MVPN AFI between the BGWs.

Double-click the MSD fabric to open the **Fabric Overview** window. Choose **Links**. Filter it by the policy - **Overlays**.

Select and edit each overlay peering to enable TRM by checking the **Enable TRM** check box.

Click **Save** to save the settings. The switches go into the pending state, that is, the blue color. The TRM settings enable the MVPN peering's between the BGWs, or BGWs and Route Server.

Precision Time Protocol for Easy Fabric

In the fabric settings for the **Easy Fabric** template, select the **Enable Precision Time Protocol (PTP)** check box to enable PTP across a fabric. When you select this check box, PTP is enabled globally and on core-facing interfaces. Additionally, the **PTP Loopback Id** and **PTP Domain Id** fields are editable.

The PTP feature works only when all the devices in a fabric are cloud-scale devices. Warnings are displayed if there are non-cloud scale devices in the fabric, and PTP is not enabled. Examples of the cloud-scale devices are Cisco Nexus 93180YC-EX, Cisco Nexus 93180YC-FX, Cisco Nexus 93240YC-FX2, and Cisco Nexus 93360YC-FX2 switches.

For more information, see the *Configuring PTP* chapter in *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide* and *Cisco Nexus Dashboard Insights User Guide*.

For Nexus Dashboard Fabric Controller deployments, specifically in a VXLAN EVPN based fabric deployments, you have to enable PTP globally, and also enable PTP on core-facing interfaces. The interfaces could be configured to the external PTP server like a VM or Linux-based machine. Therefore, the interface should be edited to have a connection with the grandmaster clock.

It is recommended that the grandmaster clock should be configured outside of Easy Fabric and it is IP reachable. The interfaces toward the grandmaster clock need to be enabled with PTP via the interface freeform config.

All core-facing interfaces are auto-enabled with the PTP configuration after you click **Deploy Config**. This action ensures that all devices are PTP synced to the grandmaster clock. Additionally, for any interfaces that are not core-facing, such as interfaces on the border devices and leafs that are connected to hosts, firewalls, service-nodes, or other routers, the ttag related CLI must be added. The ttag is added for all traffic entering the VXLAN EVPN fabric and the ttag must be stripped when traffic is exiting this fabric.

Here is the sample PTP configuration:

```
feature ptp

ptp source 100.100.100.10 -> IP address of the loopback interface (loopback0) that is already
  created or user created loopback interface in the fabric settings

ptp domain 1 -> PTP domain ID specified in fabric settings

interface Ethernet1/59 -> Core facing interface
  ptp

interface Ethernet1/50 -> Host facing interface
  ttag
  ttag-strip
```

The following guidelines are applicable for PTP:

- The PTP feature can be enabled in a fabric when all the switches in the fabric have Cisco NX-OS Release 7.0(3)I7(1) or a higher version. Otherwise, the following error message is displayed:

PTP feature can be enabled in the fabric, when all the switches have NX-OS Release 7.0(3)I7(1) or higher version. Please upgrade switches to NX-OS Release 7.0(3)I7(1) or higher version to enable PTP in this fabric.

- For hardware telemetry support in NIR, the PTP configuration is a prerequisite.
- If you are adding a non-cloud scale device to an existing fabric which contains PTP configuration, the following warning is displayed:
TTAG is enabled fabric wide, when all devices are cloud scale switches so it cannot be enabled for newly added non cloud scale device(s).
- If a fabric contains both cloud scale and non-cloud scale devices, the following warning is displayed when you try to enable PTP:
TTAG is enabled fabric wide, when all devices are cloud scale switches and is not enabled due to non cloud scale device(s).

Support for Super Spine Switch Role

Super Spine is a device that is used for interconnecting multiple spine-leaf PODs. You have an extra interconnectivity option with super spines. You can have multiple spine-leaf PODs within the same Easy Fabric that are interconnected via super spines such that, the same IGP domain extends across all the PODs, including the super spines. Within such a deployment, the BGP RRs and RPs (if applicable) are provisioned on the super spine layer. The spine layer becomes a pseudo interconnect between the leafs and super spines. VTEPs may be optionally hosted on the super spines if they have the border functionality.

The following super spine switch roles are supported in NDFC:

- Super Spine
- Border Super Spine
- Border Gateway Super Spine

A border super spine handles multiple functionalities including the functionalities of a super spine, RR, RP (optionally), and a border leaf. Similarly, a border gateway super spine serves a super spine, RR, RP (optional), and a border gateway. It is not recommended to overload border functionality on the super spine or RR layer. Instead, attach border leafs or border gateways to the super spine layer for external connectivity. The super spine layer serves as the interconnect with the RR or RP functionality.

The following are the characteristics of super spine switch roles in NDFC:

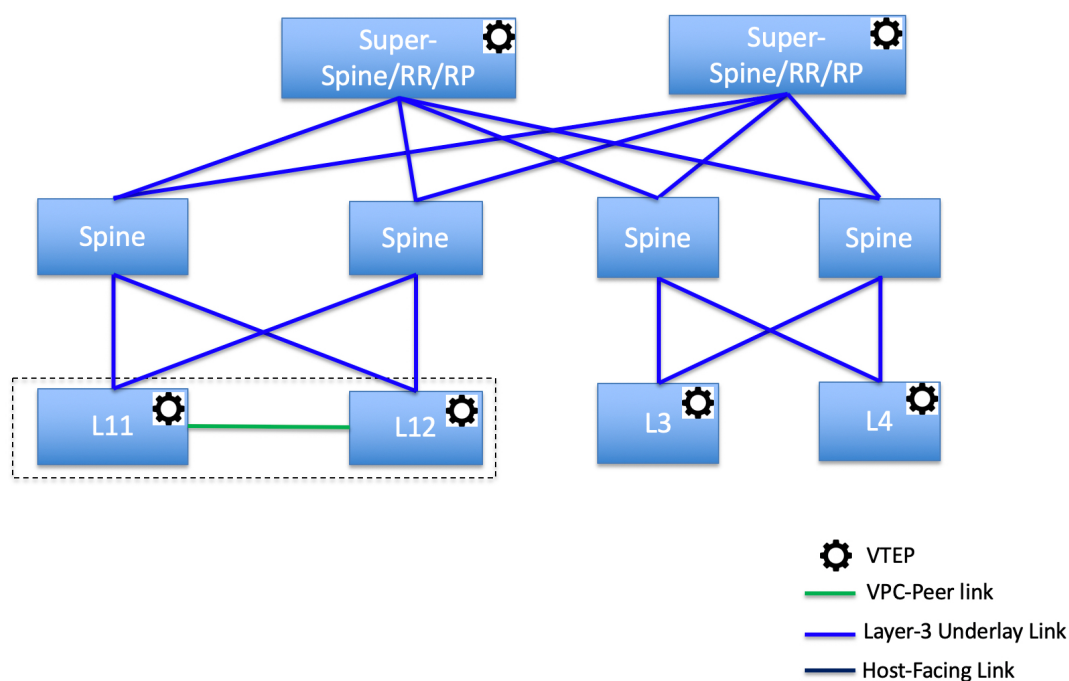

- Supported with Easy Fabrics only.
- From Cisco NDFC Release 12.1.1e, Super Spine switch role and Border Super Spine switch role are also supported with the eBGP routed fabrics for IPv6 underlay using **Easy_Fabric_eBGP** template.
- Can only connect to spines and borders. The valid connections are:
 - Spines to super spines
 - Spines to border super spines and border gateway super spines
 - Super spines to border leafs and border gateway leafs.

- RR or RP (if applicable) functionality is always be configured on super spines if they are present in a fabric. The maximum number of 4 RRs and RPs are supported even with Super Spines.
- Border Super Spine and Border Gateway Super Spine roles are supported for inter-fabric connections.
- vPC configurations aren't supported on super spines.
- Super spines don't support IPv6 underlay configuration.
- During the Brownfield import of switches, if a switch has the super spine role, the following error is displayed:
Serial number: [super spine/border super spine/border gateway superspine] Role isn't supported with preserved configuration yes option.

Supported Topologies for Super Spine Switches

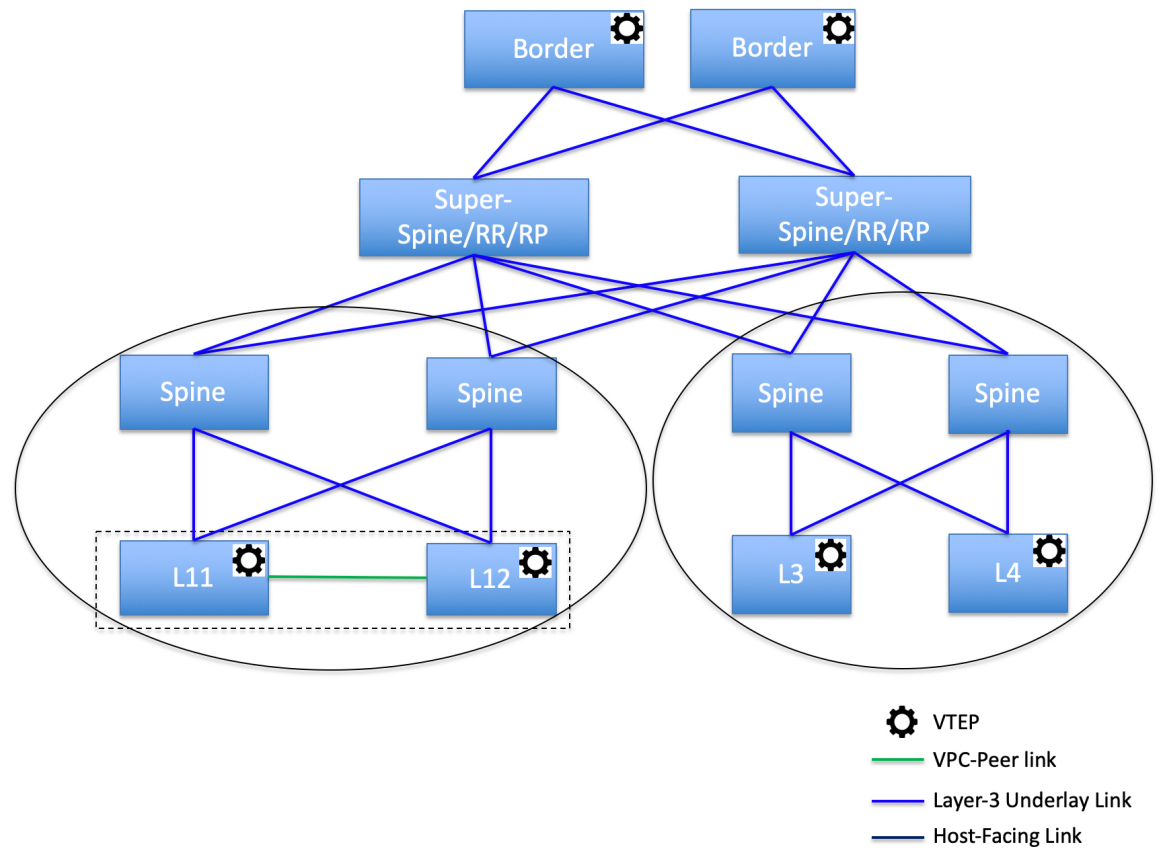

NDFC supports the following topologies with super spine switches.

Topology 1: Super Spine Switches in a Spine Leaf Topology

In this topology, leaf switches are connected to spines, and spines are connected to super spine switches which can be super spines, border super spines, and border gateway super spines.

Topology 2: Super Spine Switches Connected to Border

In this topology, there are four leaf switches connecting to the spine switches, which are connected to two super spine switches. These super spine switches are connected to the border or border gateway leaf switches.

Adding a Super Spine Switch to an Existing VXLAN BGP EVPN Fabric

To add a super spine switch to an existing VXLAN BGP EVPN fabric, perform the following steps:

Procedure

-
- Step 1** Choose **LAN > Fabrics**. Double-click on the required fabric.
The **Fabric Overview** window appears.
- Step 2** On the **Switches** tab, click **Actions > Add Switches**.
For more information, see [Adding Switches to a Fabric](#).
- Step 3** Right-click on an existing switch or the newly added switch, and use the **Set role** option to set the appropriate super spine role.

- Note**
- If the **Super Spine** role exists in the fabric, you can assign border super spine and border gateway super spine roles for any new device.
 - If super spine or any of its variation role is not assigned, you may assign the role to any new device if it is connected to a non-border spine. After a **Recalculate & Deploy**, you will receive an error that can be resolved by clicking on the **Resolve** button as shown in the below steps.

Step 4 On the **Fabric Overview** window, click **Actions > Recalculate & Deploy**.

The following error message is displayed:

Super Spine role cannot be allowed in the existing fabric as it is disruptive. Please go to 'Event Analytics' and click on the resolve button to proceed.

Step 5 Choose **Event Analytics > Alarms**, click on the **ID**.

The **Alarm ID** slide-in pane appears.

Step 6 Click **Resolve**.

The **Confirm action** dialog box appears.

Step 7 Click **Confirm**.

Step 8 On the **Fabric Overview** window, click **Actions > Recalculate & Deploy**.

Do not add a devices with super spine, border super spine, or border gateway super spine role if the device is connected to a border spine or border gateway spine. This action results in an error after you recalculate and deploy the configuration. To use existing devices with border spine roles, remove the device and add the device with appropriate roles.

Overlay Mode

You can create a VRF or network in CLI or config-profile mode at the fabric level. The overlay mode of member fabrics of an MSD fabric is set individually at the member-fabric level. You can change from config-profile mode to CLI mode and from CLI mode to config-profile mode before you apply the overlay configurations on switches in the fabric.

Note Overlay-mode CLI is available only for Easy and eBGP Vxlan Fabrics.

After you upgrade from releases earlier than Cisco Nexus Dashboard Fabric Controller Release 12.0.1a, the existing config-profile mode will function the same.

If the switch has config-profile based overlays, you can import it only in the **config-profile** overlay mode. If you import it in the **cli** overlay mode, you get an error.

If the switch has CLI-based overlays, you can import it in **config-profile** or **cli** overlay mode. If you set the overlay mode as **config-profile** the CLI-based overlays are converted to config-profile overlays.

To choose the overlay mode of VRFs or networks in a fabric, perform the following steps:

1. Navigate to the **Edit Fabric** window.

2. Go to the **Advanced** tab.
3. From the **Overlay Mode** drop-down list, choose **config-profile** or **cli**

The default mode is **config-profile**.

Sync up Out-of-Band Switch Interface Configurations

Any interface level configuration made outside of Nexus Dashboard Fabric Controller (via CLI) can be synced to Nexus Dashboard Fabric Controller and then managed from Nexus Dashboard Fabric Controller. Also, the vPC pair configurations are automatically detected and paired. This applies to the External_Fabric and LAN_Classic fabrics only. The vPC pairing is performed with the **vpc_pair** policy.

Note When Nexus Dashboard Fabric Controller is managing switches, ensure that all configuration changes are initiated from Nexus Dashboard Fabric Controller and avoid making changes directly on the switch.

When the interface config is synced up to the Nexus Dashboard Fabric Controller intent, the switch configs are considered as the reference, that is, at the end of the sync up, the Nexus Dashboard Fabric Controller intent reflects what is present on the switch. If there were any undeployed intent on Nexus Dashboard Fabric Controller for those interfaces before the resync operation, they will be lost.

Guidelines

- Supported in fabrics using the following templates: Easy_Fabric, External_Fabric, and LAN_Classic.
- Supported for Cisco Nexus switches only.
- Supported for interfaces that don't have any fabric underlay related policy associated with them prior to the resync. For example, IFC interfaces and intra fabric links aren't subjected to resync.
- Supported for interfaces that do not have any custom policy (policy template that isn't shipped with Cisco Nexus Dashboard Fabric Controller) associated with them prior to resync.
- Supported for interfaces where the intent is not exclusively owned by a Cisco Nexus Dashboard Fabric Controller feature and/or application prior to resync.
- Supported on switches that don't have Interface Groups associated with them.
- Interface mode (switchport to routed, trunk to access, and so on) changes aren't supported with overlays attached to that interface.

The sync up functionality is supported for the following interface modes and policies:

Interface Mode	Policies
trunk (standalone, po, and vPC PO)	<ul style="list-style-type: none"> • int_trunk_host • int_port_channel_trunk_host • int_vpc_trunk_host

access (standalone, po, and vPC PO)	<ul style="list-style-type: none"> • int_access_host • int_port_channel_access_host • int_vpc_access_host
dot1q-tunnel	<ul style="list-style-type: none"> • int_dot1q_tunnel_host • int_port_channel_dot1q_tunnel_host • int_vpc_dot1q_tunnel_host
routed	int_routed_host
loopback	int_freeform
sub-interface	int_subif
FEX (ST, AA)	<ul style="list-style-type: none"> • int_port_channel_fex • int_port_channel_aa_fex
breakout	interface_breakout
nve	int_freeform (only in External_Fabric/LAN_Classic)
SVI	int_freeform (only in External_Fabric/LAN_Classic)
mgmt0	int_mgmt

In an Easy fabric, the interface resync will automatically update the network overlay attachments based on the access VLAN or allowed VLANs on the interface.

After the resync operation is completed, the switch interface intent can be managed using normal Nexus Dashboard Fabric Controller procedures.

Syncing up Switch Interface Configurations

It is recommended to deploy all switch configurations from NDFC. In some scenarios, it may be necessary to make changes to the switch interface configuration out-of-band. This will cause configuration drift causing switches to be reported Out-of-Sync.

NDFC supports syncing up the out-of-band interface configuration changes back into its intent.

Guidelines and Limitations

The following limitations are applicable after Syncing up Switch Interface Configurations to NDFC:

- The port channel membership changes (once the policy exists) is not supported.
- Changing the interface mode (trunk to access etc.) that have overlays attached is not supported.
- Resync for interfaces that belong to **Interface Groups** are not supported.
- The vPC pairing in **External_Fabric** and **LAN_Classic** templates must be updated with the **vpc_pair** policy.
- This feature is supported for easy fabric, external fabric and LAN classic fabric.

- The resync can be performed for a set of switches and repeated as desired.
- In **Easy_Fabric** fabrics, VXLAN overlay interface attachments are performed automatically based on the allowed VLANs.

Before you begin

- We recommend taking a fabric backup before attempting the interface resync.
- In **External_Fabric** and **LAN_Classic** fabrics, for the vPC pairing to work correctly, both the switches must be in the fabric and must be functional.
- Ensure that the switches are **In-Sync** and switch mode must not be **Migration** or **Maintenance**.
- From the **Actions** drop-list, choose **Discovery** > **Rediscover** to ensure that NDFC is aware of any new interfaces and other changes.

Procedure

- Step 1** Choose **LAN** > **Fabrics** and double-click on a fabric.
The **Fabric Overview** window appears.
- Step 2** Click the **Switches** tab and ensure that switches are present in the fabric and vPC pairings are completed.
- Step 3** Click the **Policies** tab and select one or more switches where the interface intent resync is needed.
- Note**
- If a pair of switches is already paired with either **no_policy** or **vpc_pair**, select only one switch of the pair.
 - If a pair of switches is not paired, then select both the switches.
- Step 4** From the **Actions** drop-down list, choose **Add Policy**.
The **Create Policy** window appears.
- Step 5** On the **Create Policy** window, choose **host_port_resync** from the **Policy** drop-down list.
- Step 6** Click **Save**.
- Step 7** Check the **Mode** column for the switches to ensure that they report **Migration**. For a vPC pair, both switches are in the **Migration-mode**.
- After this step, the switches in the **Topology view** are in **Migration-mode**.
 - Both the switches in a vPC pair are in the migration mode even if one of the switches is placed into this mode.
 - If switch(es) are unintentionally put into the resync mode, they can be moved back to the normal mode by identifying the **host_port_resync** policy instance and deleting it from the **Policies** tab.
- Step 8** After the configuration changes are ready to sync up to NDFC, navigate to the **Switches** tab and select the required switches.
- Step 9** Click **Recalculate & Deploy** to start the resync process.

Note This process might take some time to complete based on the size of the switch configuration and the number of switches involved.

Step 10 The **Deploy Configuration** window is displayed if no errors are detected during the resync operation. The interface intent is updated in NDFC.

Note If the External_Fabric or LAN_Classic fabric is in **Monitored Mode**, an error message indicating that the fabric is in the read-only mode is displayed. This error message can be ignored and doesn't mean that the resync process has failed.

Close the **Deploy Configuration** window, and you can see that the switches are automatically moved out of the **Migration-mode**. Switches in a vPC pair that were not paired or paired with **no_policy** show up as paired and associated with the **vpc_pair** policy.

Note The **host_port_resync** policy that was created for the switch is automatically deleted after the resync process is completed successfully.

Configuration Compliance

The entire intent or expected configuration defined for a given switch is stored in NDFC. When you want to push this configuration down to one or more switches, the configuration compliance (CC) module is triggered. CC takes the current intent, the current running configuration, and then comes up with the set of configurations that are required to go from the current running configuration to the current expected configuration so that everything will be In-Sync.

When performing a software or firmware upgrade on the switches, the current running configuration on the switches is not changed. Post upgrade, if CC finds that the current running configuration does not have the current expected configuration or intent, it reports an Out-of-Sync status. There is no auto deployment of any configurations. You can preview the diffs that will get deployed to get one or more devices back In-Sync.

With CC, the sync is always from the NDFC to the switches. There is no reverse sync. So, if you make a change out-of-band on the switches that conflicts with the defined intent in NDFC, CC captures this diff, and indicates that the device is Out-of-Sync. The pending diffs will undo the configurations done out-of-band to bring back the device In-Sync. Note that such conflicts due to out-of-band changes are captured by the periodic CC run that occurs every 60 minutes by default, or when you click the RESYNC option either on a per fabric or per switch basis. From Cisco NDFC Release 12.1.1e, the periodic CC runs every 24 hours. You can configure the custom interval with the range of 30-3600 minutes. This configuration can be done by navigating to **Server > Server Settings > LAN-Fabric**. Note that you can also capture the out-of-band changes for the entire switch by using the CC REST API. For more information, see *Cisco NDFC REST API Guide*.

To improve ease of use and readability of deployed configurations, CC in NDFC has been enhanced with the following:

- All displayed configurations in NDFC are easily readable and understandable.
- Repeated configuration snippets are not displayed.
- Pending configurations precisely show only the diff configuration.
- Side-by-side diffs has greater readability, integrated search or copy, and diff summary functions.

Top-level configuration commands on the switch that do not have any associated NDFC intent are not checked for compliance by CC. However, CC performs compliance checks, and attempts removal, of the following commands even if there is no NDFC intent:

- **configure profile**
- **apply profile**
- **interface vlan**
- **interface loopback**
- **interface Portchannel**
- Sub-interfaces, for example, **interface Ethernet X/Y.Z**
- **fex**
- **vlan <vlan-ids>**

CC performs compliance checks, and attempts removal, of these commands only when **Easy_Fabric** and **Easy_Fabric_eBGP** templates are used. On **External_Fabric** and **LAN_Classic** templates, top-level configuration commands on the switch, including the commands mentioned above, that do not have any associated NDFC intent are not checked for compliance by CC.

We recommend using the NDFC freeform configuration template to create additional intent and deploy these commands to the switches to avoid unexpected behavior

Now, consider a scenario in which the configuration that exists on the switch has no relationship with the configuration defined in the intent. Examples of such configurations are a new feature that has not been captured in the intent but is present on the switch or some other configuration aspect that has not been captured in the intent. Configuration compliance does not consider these configuration mismatches as a diff. In such cases, Strict Configuration Compliance ensures that every configuration line that is defined in the intent is the only configuration that exists on the switch. However, configuration such as boot string, rommon configuration, and other default configurations are ignored during strict CC checks. For such cases, the internal configuration compliance engine ensures that these config changes are not called out as diffs. These diffs are also not displayed in the **Pending Config** window. But, the Side-by-side diff utility compares the diff in the two text files and does not leverage the internal logic used in the diff computation. As a result, the diff in default configurations are highlighted in red in the **Side-by-side Comparison** window.

In NDFC, such diffs are not highlighted in the **Side-by-side Comparison** window. The auto-generated default configuration that is highlighted in the **Running config** window is not visible in the **Expected config** window.

Any configurations that are shown in the **Pending Config** window are highlighted in red in the **Side-by-side Comparison** window if the configurations are seen in the **Running config** window but not in the **Expected config** window. Also, any configurations that are shown in the **Pending Config** window are highlighted in green in the **Side-by-side Comparison** window if the configurations are seen in the **Expected config** window but not in the **Running config** window. If there are no configurations displayed in the **Pending Config** window, no configurations are shown in red in the **Side-by-side Comparison** window.

All freeform configurations have to strictly match the **show running configuration** output on the switch and any deviations from the configuration will show up as a diff during **Recalculate & Deploy**. You need to adhere to the leading space indentations.

You can typically enter configuration snippets in NDFC using the following methods:

- User-defined profile and templates

- Switch, interface, overlay, and vPC freeform configurations
- Network and VRF per switch freeform configurations
- Fabric settings for Leaf, Spine, or iBGP configurations

Caution The configuration format should be identical to the **show running configuration** of the corresponding switch. Otherwise, any missing or incorrect leading spaces in the configuration can cause unexpected deployment errors and unpredictable pending configurations. If any unexpected diffs or deployment errors are displayed, check the user-provided or custom configuration snippets for incorrect values.

If NDFC displays the "Out-of-Sync" status due to unexpected pending configurations, and this configuration is either unable to be deployed or stays consistent even after a deployment, perform the following steps to recover:

1. Check the lines of config highlighted under the **Pending Config** tab in the **Config Preview** window.
2. Check the same lines in the corresponding **Side-by-side Comparison** tab. This tab shows whether the diff exists in "intent", or "show run", or in both with different leading spaces. Leading spaces are highlighted in the **Side-by-side Comparison** tab.
3. If the pending configurations or switch with an out-of-sync status is due to any identifiable configuration with mismatched leading spaces in "intent" and "running configuration", this indicates that the intent has incorrect spacing and needs to be edited.
4. To edit incorrect spacing on any custom or user-defined policies, navigate to the switch and edit the corresponding policy:
 - a. If the source of the policy is **UNDERLAY**, you will need to edit this from the Fabric settings screen and save the updated configuration.
 - b. If the source is blank, it can be edited from the **View/Edit policies** window for that switch.
 - c. If the source of the policy is **OVERLAY**, but it is derived from a switch freeform configuration. In this case, navigate to the appropriate **OVERLAY** switch freeform configuration and update it.
 - d. If the source of the policy is **OVERLAY** or a custom template, perform the following steps:
 1. Choose **Settings > Server settings**, set the **template.in_use.check** property to **false** and uncheck the **Template In-Use Override** check box and **Save**. This allows the profiles or templates to be editable.
 2. Edit the specific profile or template from the **Operations > Templates > Edit template properties** edit window, and save the updated profile template with the right spacing.
 3. Click **Recalculate & Deploy** to recompute the diffs for the impacted switches.
 4. After the configurations are updated, set the **template.in_use.check** property to **true** and check the **Template In-Use Override** check box and **Save**, as it slows down the performance of the NDFC system, specifically for **Recalculate & Deploy** operations.

To confirm that the diffs have been resolved, click **Recalculate & Deploy** after updating the policy to validate the changes.

Note NDFC checks only leading spaces, as it implies hierarchy of the command, especially in case of multi-command sequences. NDFC does not check any trailing spaces in command sequences.

Example 1: Configuration Compliance in Switch Freeform Policy

Let us consider an example with an incorrect spacing in the Switch Freeform Configuration field.

Create the switch freeform policy.

After deploying this policy successfully to the switch, NDFC persistently reports the diffs.

After clicking the **Side-by-side Comparison** tab, you can see the cause of the diff. The **ip pim rp-address** line has 2 leading spaces, while the running configuration has 0 leading spaces.

To resolve this diff, edit the corresponding Switch Freeform policy so that the spacing is correct.

After you save, you can use the **Push Config** or **Recalculate & Deploy** option to re-compute diffs.

The diffs are now resolved. The **Side-by-side Comparison** tab confirms that the leading spaces are updated.

Example 2: Resolving a Leading Space Error in Overlay Configurations

Let us consider an example with a leading space error that is displayed in the **Pending Config** tab.

In the **Side-by-side Comparison** tab, search for diffs line by line to understand context of the deployed configuration.

A matched count of 0 means that it is a special configuration that NDFC has evaluated to push it to the switch.

You can see that the leading spaces are mismatched between running and expected configurations.

Navigate to the respective freeform configs and correct the leading spaces, and save the updated configuration.

Navigate to **Fabric Overview** window for the fabric and click **Recalculate & Deploy**.

In the **Deploy Configuration** window, you can see that all the devices are in-sync.

Configuration Compliance in External Fabrics

With external fabrics, any Nexus switches, Cisco IOS-XE devices, Cisco IOS XR devices, and Arista can be imported into the fabric, and there is no restriction on the type of deployment. It can be LAN Classic, VXLAN, FabricPath, vPC, HSRP, etc. When switches are imported into an external fabric, the configuration on the switches is retained so that it is non-disruptive. Only basic policies such as the switch username and mgmt0 interface are created after a switch import.

In the external fabric, for any intent that is defined in the Nexus Dashboard Fabric Controller, configuration compliance (CC) ensures that this intent is present on the corresponding switch. If this intent is not present on the switch, CC reports an Out-of-Sync status. Additionally, there will be a Pending Config generated to push this intent to the switch to change the status to In-Sync. Any additional configuration that is on the switch

but not in intent defined in Nexus Dashboard Fabric Controller, will be ignored by CC, as long as there is no conflict with anything in the intent.

When there is user-defined intent added on Nexus Dashboard Fabric Controller and the switch has additional configuration under the same top-level command, as mentioned earlier, CC will only ensure that the intent defined in Nexus Dashboard Fabric Controller is present on the switch. When this user defined intent on Nexus Dashboard Fabric Controller is deleted as a whole with the intention of removing it from the switch and the corresponding configuration exists on the switch, CC will report an Out-of-Sync status for the switch and will generate **Pending Config** to remove the config from the switch. This **Pending Config** includes the removal of the top-level command. This action leads to removal of the other out-of-band configurations made on the switch under this top-level command as well. If you choose to override this behavior, the recommendation is that, you create a freeform policy and add the relevant top-level command to the freeform policy.

Let us see this behavior with an example.

1. A **switch_freeform** policy defined by the user in Nexus Dashboard Fabric Controller and deployed to the switch.
2. Additional configuration exists under **router bgp** in **Running config** that does not exist in user-defined Nexus Dashboard Fabric Controller intent **Expected config**. Note that there is no **Pending Config** to remove the additional config that exists on the switch without a user defined intent on Nexus Dashboard Fabric Controller.
3. The **Pending Config** and the **Side-by-side Comparison** when the intent that was pushed earlier via Nexus Dashboard Fabric Controller is deleted from Nexus Dashboard Fabric Controller by deleting the `switch_freeform` policy that was created in the Step 1.
4. A **switch_freeform** policy with the top-level **router bgp** command needs to be created. This enables CC to generate the configuration needed to remove only the desired sub-config which was pushed from Nexus Dashboard Fabric Controller earlier.
5. The removed configuration is only the subset of the configuration that was pushed earlier from Nexus Dashboard Fabric Controller.

For interfaces on the switch in the external fabric, Nexus Dashboard Fabric Controller either manages the entire interface or does not manage it at all. CC checks interfaces in the following ways:

- For any interface, if there is a policy defined and associated with it, then this interface is considered as managed. All configurations associated with this interface must be defined in the associated interface policy. This is applicable for both logical and physical interfaces. Otherwise, CC removes any out-of-band updates made to the interface to change the status to **In-Sync**.
- Interfaces created out-of-band (applies for logical interfaces such as port-channels, sub interfaces, SVIs, loopbacks, etc.), will be discovered by Nexus Dashboard Fabric Controller as part of the regular discovery process. However, since there is no intent for these interfaces, CC will not report an **Out-of-Sync** status for these interfaces.
- For any interface, there can always be a monitor policy associated with it in Nexus Dashboard Fabric Controller. In this case, CC will ignore the interface's configuration when it reports the **In-Sync** or **Out-of-Sync** config compliance status.

Special Configuration CLIs Ignored for Configuration Compliance

The following configuration CLIs are ignored during configuration compliance checks:

- Any CLI having 'username' along with 'password'

- Any CLI that starts with ‘snmp-server user’

Any CLIs that match the above will not show up in pending diffs and clicking Save & Deploy in the Fabric Builder window will not push such configurations to the switch. These CLIs will not show up in the Side-by-side Comparison window also.

To deploy such configuration CLIs, perform the following procedure:

Procedure

- Step 1** Select **LAN > Fabrics**.
Double click on the fabric name to view **Fabric Overview** screen.
- Step 2** On the Switches tab, double click on the switch name to view **Switch Overview** screen.
On the Policies tab, all the policies applied on the switch within the chosen fabric are listed.
- Step 3** On the Policies tab, from the **Actions** drop-down list, select **Add Policy**.
- Step 4** Add a Policy Template Instances (PTIs) with the required configuration CLIs using the **switch_freeform** template and click **Save**.
- Step 5** Select the created policy and select **Push Config** from the **Actions** drop-down list to deploy the configuration to the switch(es).
-

Resolving Diffs for Case Insensitive Commands

By default, all diffs generated in NDFC while comparing intent, also known as Expected Configuration, and Running Configuration, are case sensitive. However, the switch has many commands that are case insensitive, and therefore it may not be appropriate to flag these commands as differences. These are captured in the **compliance_case_insensitive_clis.txt** template that can be found under **Operations > Templates**.

From Cisco NDFC Release 12.0.1a, **compliance_case_insensitive_clis.txt** file, along with the other two **compliance_strict_cc_exclude_clis.txt** and **compliance_ipv6_clis.txt** files are now part of the shipped templates.

You can find all the templates under **Operations > Templates**. Modification of templates can be done after unchecking the **Template In-Use Override** check box in the **LAN-Fabric** tab in **Server Settings** window.

There could be additional commands not included in the existing **compliance_case_insensitive_clis.txt** file that should be treated as case insensitive. If the pending configuration is due to the differences of cases between the Expected Configuration in NDFC and the Running Configuration, you can configure NDFC to ignore these case differences as follows:

1. Uncheck the **Template In-Use Override** check box from the **LAN-Fabric** tab of **Server Settings** window.
2. Navigate to **Operations > Templates** and search for **compliance_case_insensitive_clis.txt** file.
3. The sample entries in **compliance_case_insensitive_clis.txt** file are displayed.

```

[root@dcnm98 model-config]# pwd
/usr/local/cisco/dcm/dcm/model-config
[root@dcnm98 model-config]# cat compliance_case_insensitive_clis.txt
"^(no |)interface\s+Port(.)"
"^(no |)interface\s+Loo(.)"
"^(no |)interface\s+Eth(.)"
"^update-source\s+Loo(.)"
"^vrf\s+"
"^hardware profile portmode\s+"
"^(.*)route-map\s+(.*)"
"^(.*)neighbor-policy(.)"
"(no |)encapsulation\s+(.*)"
"(.*)alert-group\s+(.*)"
"^streetaddress\s+(.*)"
"^transport email\s+(.*)"
"(no |)action\s+(.*)"
"(no|)\s+d*\s+remark.*"
[root@dcnm98 model-config]# █

```

4. If newer patterns are detected during deployment, and they are triggering pending configurations, you can add these patterns to this file. The patterns need to be valid regex patterns.
5. This enables NDFC to treat the documented configuration patterns as case insensitive while performing comparisons.
6. Click **Recalculate & Deploy** for fabrics to see the updated comparison outputs.

Resolving Configuration Compliance After Importing Switches

After importing switches in Cisco NDFC, configuration compliance for a switch can fail because of an extra space in the management interface (mgmt0) description field.

For example, before importing the switch:

```

interface mgmt0
  description SRC=SDS-LB-LF111-mgmt0, DST=SDS-LB-SW001-Fa0/5

```

After importing the switch and creating a configuration profile:

```

interface mgmt0
  description SRC=SDS-LB-LF111-mgmt0, DST=SDS-LB-SW001-Fa0/5

```

Navigate to Interface Manager and click the **Edit** icon after selecting the mgmt0 interface. Remove the extra space in the description.

Strict Configuration Compliance

Strict configuration compliance checks for diff between the switch configuration and the associated intent and generates **no** commands for the configurations that present on the switch but are not present in the associated intent. When you click **Recalculate and Deploy**, switch configurations that are not present on the associated intent are removed. You can enable this feature by choosing the **Enable Strict Config Compliance** check box under the **Advanced** tab in the **Create Fabric** or **Edit Fabric** window. By default, this feature is disabled.

The strict configuration compliance feature is supported on the Easy Fabric templates - **Easy_Fabric** and **Easy_Fabric_eBGP**. To avoid generating diff for commands that are auto-generated by the switch, such as vdc, rmon, and so on, a file that has a list of default commands is used by CC to ensure that diffs are not

generated for these commands. This file is maintained in **Operations > Templates, compliance_strict_cc_exclude_clis.txt** template.

Example: Strict Configuration Compliance

Let us consider an example in which the **feature telnet** command is configured on a switch but is not present in the intent. In such a scenario, the status of the switch is displayed as **Out-of-sync** after a CC check is done.

Now, click **Preview Config** of the out-of-sync switch. As the strict configuration compliance feature is enabled, the **no** form of the **feature telnet** command appears under **Pending Config** in the **Preview Config** window.

Click the **Side-by-side Comparison** tab to display the differences between the running configuration and the expected configuration. The **Re-sync** button is also displayed at the top right corner under the Side-by-side Comparison tab in the **Preview Config** window. Use this option to resynchronize NDFC state when there is a large scale out-of-band change, or if configuration changes do not register in the NDFC properly.

The re-sync operation does a full CC run for the switch and recollects “show run” and “show run all” commands from the switch. When you initiate the re-sync process, a progress message is displayed. During the re-sync, the running configuration is taken from the switch. The Out-of- Sync/In-Sync status for the switch is recalculated based on the intent defined in NDFC.

Now, close the **Preview Config** window and click **Recalculate and Deploy**. The strict configuration compliance feature ensures that the running configuration on the switch does not deviate from the intent by pushing the **no** form of the **feature telnet** command to the switch. The diff between the configurations is highlighted. The diff other than the **feature telnet** command are default switch and boot configurations and are ignored by the strict CC check.

You can right-click on a switch in the **Fabric Overview** window and select **Preview Config** to display the **Preview Config** window. This window displays the pending configuration that has to be pushed to the switch to achieve configuration compliance with the intent.

Custom freeform configurations can be added in NDFC to make the intended configuration on NDFC and the switch configurations identical. The switches are then in In-Sync status. For more information on how to add custom freeform configurations on NDFC, refer [Enabling Freeform Configurations on Fabric Switches](#), on page 43.

Enabling Freeform Configurations on Fabric Switches

In Nexus Dashboard Fabric Controller, you can add custom configurations through freeform policies in the following ways:

1. Fabric-wide
 - On all leaf, border leaf, and border gateway leaf switches in the fabric, at once.
 - On all spine, super spine, border spine, border super spine, border gateway spine and border switches, at once.
2. On a specific switch at the global level.
3. On a specific switch on a per Network or per VRF level.

Leaf switches are identified by the roles Leaf, Border, and Border Gateway. The spine switches are identified by the roles Spine, Border Spine, Border Gateway Spine, Super Spine, Border Super Spine, and Border Gateway Super Spine.

Note You can deploy freeform CLIs when you create a fabric or when a fabric is already created. The following examples are for an existing fabric. However, you can use this as a reference for a new fabric.

Deploying Fabric-Wide Freeform CLIs on Leaf and Spine Switches

1. Choose **LAN > Fabrics > Fabrics**.
2. Select the Fabric, and select **Edit Fabric** from **Actions** drop-down list.
(If you are creating a fabric for the first time, click **Create Fabric**).
3. Click the **Advanced** tab and update the following fields:
 - Leaf Freeform Config** – In this field, add configurations for all leaf, border leaf, and border gateway leaf switches in the fabric.
 - Spine Freeform Config** - In this field, add configurations for all Spine, Border Spine, Border Gateway Spine, Super Spine, Border Super Spine, and Border Gateway Super Spine switches in the fabric.

Note Copy-paste the intended configuration with correct indentation, as seen in the running configuration on the Nexus switches. For more information, see [Resolving Freeform Config Errors in Switches, on page 46](#).

4. Click **Save**. The fabric topology screen comes up.
5. Click **Deploy Config** from the **Actions** drop-down list to save and deploy configurations.
Configuration Compliance functionality ensures that the intended configuration as expressed by those CLIs are present on the switches and if they are removed or there is a mismatch, then it flags it as a mismatch and indicate that the device is Out-of-Sync.

Incomplete Configuration Compliance - On some Cisco Nexus 9000 Series switches, in spite of configuring pending switch configurations using the **Deploy Config** option, there could be a mismatch between the intended and switch configuration. To resolve the issue, add a **switch_freeform** policy to the affected switch (as explained in the *Deploy Freeform CLIs on a Specific Switch* section). For example, consider the following persistent pending configurations:

```
line vty
logout-warning 0
```

After adding the above configurations in a policy and saving the updates, click **Deploy Config** in the topology screen to complete the deployment process.

To bring back the switch in-sync, you can add the above configuration in a **switch_freeform** policy saved and deployed onto the switch.

Deploying Freeform CLIs on a Specific Switch

1. Choose **LAN > Fabrics > Fabrics**.
2. Select the Fabric, and select **Edit Fabric** from **Actions** drop-down list.

- Click **Policies** tab. From the **Actions** drop-down list, choose **Add Policy**.
The **Create Policy** screen comes up.

Note To provision freeform CLIs on a new fabric, you have to create a fabric, import switches into it, and then deploy freeform CLIs.

- In the **Priority** field, the priority is set to 500 by default. You can choose a higher priority (by specifying a lower number) for CLIs that need to appear higher up during deployment. For example, a command to enable a feature should appear earlier in the list of commands.
- In the **Description** field, provide a description for the policy.
- From the **Template Name** field, select **freeform_policy**.
- Add or update the CLIs in the **Freeform Config CLI** box.
Copy-paste the intended configuration with correct indentation, as seen in the running configuration on the Nexus switches. For more information, see [Resolving Freeform Config Errors in Switches, on page 46](#).
- Click **Save**.
After the policy is saved, it gets added to the intended configurations for that switch.
- From the Fabric Overview window, click the **Switches** tab and choose the required switches.
- On the **Switches** tab, click **Actions** drop-down list and choose **Deploy**.

Pointers for freeform_policy Policy Configuration:

- You can create multiple instances of the policy.
- For a vPC switch pair, create consistent **freeform_policy** policies on both the vPC switches.
- When you edit a **freeform_policy** policy and deploy it onto the switch, you can see the changes being made (in the **Side-by-side** tab of the Preview option).

Freeform CLI Configuration Examples

Console line configuration

This example involves deploying some fabric-wide freeform configurations (for all leaf, and spine switches), and individual switch configurations.

Fabric-wide session timeout configuration:

```
line console
  exec-timeout 1
```

Console speed configuration on a specific switch:

```
line console
  speed 115200
```

IP Prefix List/Route-map configuration

IP prefix list and route-map configurations are typically configured on border devices. These configurations are global because they can be defined once on a switch and then applied to multiple VRFs as needed. The intent for this configuration can be captured and saved in a `switch_freeform` policy. As mentioned earlier, note that the configuration saved in the policy should match the **show run** output. This is especially relevant for prefix lists where the NX-OS switch may generate sequence numbers automatically when configured on the CLI. An example snippet is shown below:

ACL configuration

ACL configurations are typically configured on specific switches and not fabric-wide (leaf/spine switches). When you configure ACLs as freeform CLIs on a switch, you should include sequence numbers. Else, there will be a mismatch between the intended and running configuration. A configuration sample with sequence numbers:

```
ip access-list ACL_VTY
  10 deny tcp 172.29.171.67/32 172.29.171.36/32
  20 permit ip any any
ip access-list vlan65-acl
  10 permit ip 69.1.1.201/32 65.1.1.11/32
  20 deny ip any any

interface Vlan65
  ip access-group vlan65-acl in
line vty
  access-class ACL_VTY in
```

If you have configured ACLs without sequence numbers in a **freeform_policy** policy, update the policy with sequence numbers *as shown in the running configuration of the switch*.

After the policy is updated and saved, right click the device and select the per switch **Deploy Config** option to deploy the configuration.

Resolving Freeform Config Errors in Switches

Copy-paste the running-config to the freeform config with correct indentation, as seen in the running configuration on the NX-OS switches. The freeform config must match the running config. Otherwise, configuration compliance in Nexus Dashboard Fabric Controller marks switches as out-of-sync.

Let us see an example of the freeform config of a switch.

```
feature bash-shell
feature telemetry

clock timezone CET 1 0
# Daylight saving time is observed in Metropolitan France from the last Sunday in March
(O2:00 CET) to the last Sunday in October (03:00 CEST)
clock summer-time CEST 5 Sunday March 02:00 5 Sunday October 03:00 60
clock protocol ntp

telemetry
  destination-profile
    use-vrf management
```

The highlighted line about the daylight saving time is a comment that is not displayed in the **show running config** command output. Therefore, configuration compliance marks the switch as out-of-sync because the intent does not match the running configuration.

Let us check the running config in the switch for the clock protocol.

```
spine1# show run all | grep "clock protocol"
clock protocol ntp vdc 1
```

You can see that **vdc 1** is missing from the freeform config.

In this example, let us copy-paste the running config to the freeform config.

Here is the updated freeform config:

```
feature bash-shell
feature telemetry

clock timezone CET 1 0
clock summer-time CEST 5 Sunday March 02:00 5 Sunday October 03:00 60
clock protocol ntp vdc 1

telemetry
  destination-profile
  use-vrf management
```

After you copy-paste the running config and deploy, the switch will be in-sync. When you click **Recalculate Config**, click the **Pending Config** column. The **Side-by-Side Comparison** to view information about the difference between the defined intent and the running config.

Deploying Freeform CLIs on a Specific Switch on a Per VRF/Network basis

1. Choose **LAN > Fabrics > Fabrics**.
2. Select the Fabric, and select **Edit Fabric** from **Actions** drop-down list.
3. Click **VRFs** tab. From the **Actions** drop-down list, select **Create**.
The **Create VRF** screen comes up.
4. Select an individual switch. The VRF attachment form shows up listing the switch that is selected. In case of a vPC pair, both switches belonging to the pair shows up.
5. Under the CLI Freeform column, select the button labeled **Freeform config**. This option allows a user to specify additional configuration that should be deployed to the switch along with the VRF profile configuration.
6. Add or update the CLIs in the **Free Form Config** CLI box. Copy-paste the intended configuration with correct indentation, as seen in the running configuration on the Nexus switches. For more information, see [Resolving Freeform Config Errors in Switches](#).
7. Click **Deploy Config**.

Note The **Freeform config** button will be gray when there is no per VRF per switch config specified. The button will be blue when some config has been saved by the user.

After the policy is saved, Click **Save** on the VRF Attachment pop-up to save the intent to deploy the VRF to that switch. Ensure that the checkbox on the left next to the switch is checked.

8. Now, optionally, click **Preview** to look at the configuration that will be pushed to the switch.
9. Click **Deploy Config** to push the configuration to the switch.

The same procedure can be used to define a per Network per Switch configuration.

MACsec Support in Easy Fabric and eBGP Fabric

MACsec is supported in the Easy Fabric and eBGP Fabric on intra-fabric links. You should enable MACsec on the fabric and on each required intra-fabric link to configure MACsec. Unlike CloudSec, auto-configuration of MACsec is not supported.

MACsec is supported on switches with minimum Cisco NX-OS Releases 7.0(3)I7(8) and 9.3(5).

Guidelines

- If MACsec cannot be configured on the physical interfaces of the link, an error is displayed when you click **Save**. MACsec cannot be configured on the device and link due to the following reasons:
 - The minimum NX-OS version is not met.
 - The interface is not MACsec capable.
- MACsec global parameters in the fabric settings can be changed at any time.
- MACsec and CloudSec can coexist on a BGW device.
- MACsec status of a link with MACsec enabled is displayed on the **Links** window.
- Brownfield migration of devices with MACsec configured is supported using switch and interface freeform configs.

For more information about MACsec configuration, which includes supported platforms and releases, see the [Configuring MACsec](#) chapter in *Cisco Nexus 9000 Series NX-OS Security Configuration Guide*.

The following sections show how to enable and disable MACsec in Nexus Dashboard Fabric Controller:

Enabling MACsec

Procedure

- Step 1** Navigate to **LAN > Fabrics**.
- Step 2** Click **Actions > Create** to create a new fabric or click **Actions > Edit Fabric** on an existing Easy or eBGP fabric.
- Step 3** Click the **Advanced** tab and specify the MACsec details.

Enable MACsec – Select the check box to enable MACsec for the fabric.

MACsec Primary Key String – Specify a Cisco Type 7 encrypted octet string that is used for establishing the primary MACsec session. For AES_256_CMAC, the key string length must be 130 and for AES_128_CMAC, the key string length must be 66. If these values are not specified correctly, an error is displayed when you save the fabric.

Note The default key lifetime is infinite.

MACsec Primary Cryptographic Algorithm – Choose the cryptographic algorithm used for the primary key string. It can be AES_128_CMAC or AES_256_CMAC. The default value is AES_128_CMAC.

You can configure a fallback key on the device to initiate a backup session if the primary session fails.

MACsec Fallback Key String – Specify a Cisco Type 7 encrypted octet string that is used for establishing a fallback MACsec session. For AES_256_CMAC, the key string length must be 130 and for AES_128_CMAC, the key string length must be 66. If these values are not specified correctly, an error is displayed when you save the fabric.

MACsec Fallback Cryptographic Algorithm – Choose the cryptographic algorithm used for the fallback key string. It can be AES_128_CMAC or AES_256_CMAC. The default value is AES_128_CMAC.

MACsec Cipher Suite – Choose one of the following MACsec cipher suites for the MACsec policy:

- GCM-AES-128
- GCM-AES-256
- GCM-AES-XPB-128
- GCM-AES-XPB-256

The default value is **GCM-AES-XPB-256**.

Note The MACsec configuration is not deployed on the switches after the fabric deployment is complete. You need to enable MACsec on intra-fabric links to deploy the MACsec configuration on the switch.

MACsec Status Report Timer – Specifies MACsec operational status periodic report timer in minutes.

- Step 4** Click a fabric to view the **Summary** in the side kick. Click the side kick to expand. Click **Links** tab.
- Step 5** Choose an intra-fabric link on which you want to enable MACsec and click **Actions > Edit**.
- Step 6** In the **Link Management – Edit Link** window, click **Advanced** in the **Link Profile** section, and select the **Enable MACsec** check box.

If MACsec is enabled on the intra fabric link but not in the fabric settings, an error is displayed when you click **Save**.

When MACsec is configured on the link, the following configurations are generated:

- Create MACsec global policies if this is the first link that enables MACsec.
- Create MACsec interface policies for the link.

- Step 7** From the Fabric Actions drop-down list, select **Deploy Config** to deploy the MACsec configuration.

Disabling MACsec

To disable MACsec on an intra-fabric link, navigate to the **Link Management – Edit Link** window, unselect the **Enable MACsec** check box, click **Save**. From the Fabric Actions drop-down list, select **Deploy Config** to disable MACsec configuration. This action performs the following:

- Deletes MACsec interface policies from the link.
- If this is the last link where MACsec is enabled, MACsec global policies are also deleted from the device.

Only after disabling MACsec on links, navigate to the **Fabric Settings** and unselect the **Enable MACsec** check box under the **Advanced** tab to disable MACsec on the fabric. If there's an intra-fabric link in the fabric with MACsec enabled, an error is displayed when you click **Actions > Recalculate Config** from the **Fabric Actions** drop-down list.

Create Easy Fabric for Cisco Catalyst 9000 Series Switches

You can add Cisco Catalyst 9000 Series Switches to an easy fabric using the `Easy_Fabric_IOS_XE` fabric template. You can add only Cisco Catalyst 9000 IOS XE switches to this fabric. This fabric supports OSPF as underlay protocol and BGP EVPN as the overlay protocol. Using this fabric template allows Nexus Dashboard Fabric Controller to manage all the configurations of a VXLAN EVPN Fabric composed of Cisco Catalyst 9000 IOS-XE switches. Backing up and restoring this fabric is the same as the `Easy_Fabric`.

Guidelines

- EVPN VXLAN Distributed Anycast Gateway is supported when each SVI is configured with the same Anycast Gateway MAC.
- StackWise Virtual switch is supported.
- Brownfield is not supported.
- Upgrade from earlier versions is not supported (However, it is a preview feature in 11.5).
- IPv6 Underlay, VXLAN Multi-site, Anycast RP, and TRM is not supported.
- ISIS, ingress replication, unnumbered intra-fabric link, 4 bytes BGP ASN, and Zero-Touch Provisioning (ZTP) is not supported.

Note For information about configuration compliance, see [Configuration Compliance in External Fabrics](#), on page 39.

Creating Easy Fabric for Cisco Catalyst 9000 Series Switches

UI Navigation: Choose **LAN > Fabrics**.

Perform the following steps to create an easy fabric for Cisco Catalyst 9000 Series Switches:

1. Choose **Create Fabric** from the **Actions** drop-down list.
2. Enter a fabric name and click **Choose Template**.
The **Select Fabric Template** dialog appears.
3. Choose the `Easy_Fabric_IOS_XE` fabric template and click **Select**.
4. Fill in all the required fields and click **Save**.

Note BGP ASN is the only mandatory field.

Adding Cisco Catalyst 9000 Series Switches to IOS-XE Easy Fabrics

Cisco Catalyst 9000 series switches are discovered using SNMP. Hence, before adding them to the fabric, configuring the Cisco Catalyst 9000 series switches includes configuring SNMP views, groups, and users. For more information, see the [Configuring IOS-XE Devices for Discovery](#) section.

For StackWise Virtual switches, configure the StackWise Virtual-related configuration before adding them to the fabric.

UI Navigation

Choose any one of the following navigation paths to add switch(es) in the **Add Switches** window.

- Choose **LAN > Fabrics**. Choose a fabric that uses the **Easy_Fabric_IOS_XE** fabric template from the list, click **Actions**, and choose **Add Switches**.
- Choose **LAN > Fabrics**. Choose a fabric that uses the **Easy_Fabric_IOS_XE** fabric template from the list. Click the **Switches** tab. Click **Actions** and choose **Add Switches**.
- Choose **LAN > Switches**. Click **Actions** and choose **Add Switches**. Click **Choose Fabric**, choose the IOS-XE VXLAN fabric, and click **Select**.

Before you begin

Set the default credentials for the device in the **LAN Credentials Management** window if the default credentials are not set. To navigate to the **LAN Credentials Management** window from the Cisco Nexus Dashboard Fabric Controller Web UI, choose **Settings > LAN Credentials Management**.

Procedure

Step 1 Enter values for the following fields:

Field	Description
Seed IP	Enter the IP address of the switch. You can import more than one switch by providing the IP address range. For example: 10.10.10.40-60 The switches must be properly cabled and reachable to the Cisco Nexus Dashboard Fabric Controller server and the switch status must be manageable.
Authentication Protocol	Choose the authentication protocol from the drop-down list.
Username	Enter the username of the switch(es).
Password	Enter the password of the switch(es).

Note You can change the Discover and LAN credentials only after discovering the switch.

Step 2 Click **Discover Switches**.

The switch details are populated.

Cisco Nexus Dashboard Fabric Controller supports the import of Cisco Catalyst 9500 Switches running in StackWise Virtual. The StackWise Virtual configuration to form a pair of Cisco Catalyst 9500 Switches into a virtual switch has to be in place before the import. For more information on how to configure StackWise Virtual, see the [Configuring Cisco StackWise Virtual](#) chapter in the *High Availability Configuration Guide (Catalyst 9500 Switches)* for the required release.

- Step 3** Check the check boxes next to the switches you want to import.
You can import only switches with the **manageable** status.
- Step 4** Click **Add Switches**.
The switch discovery process is initiated and the discovery status is updated under the **Discovery Status** column in the **Switches** tab.
- Step 5** (Optional) View the details of the device.
After the discovery of the device, the discovery status changes to **ok** in green.

What to do next

1. Set the appropriate role. The supported roles are:
 - Leaf
 - Spine
 - Border

To set the role, choose a switch and click **Actions**. Choose **Set role**. Choose a role and click **Select**.

Note After discovering the switch(es), Nexus Dashboard Fabric Controller usually assigns **Leaf** as the default role.

2. Recalculate the configurations and deploy the configurations to the switches.

Recalculating and Deploying Configurations

To recalculate and deploy the configurations to the switch(es) in the IOS-XE easy fabric, perform the following steps to recalculate configurations:

Before you begin

Set the role of the switch(es) in the IOS-XE easy fabric.

Procedure

- Step 1** Click **Actions** from **Fabric Overview**.
- Step 2** Choose **Recalculate Config**.
Recalculation of configurations starts on the switch(es).
-

Creating DCI Links for Cisco Catalyst Switches in IOS-XE Easy Fabrics

You can create VRF-Lite IFC between a Cisco Catalyst 9000 Series Switch with border role in IOS-XE easy fabrics, and another switch in a different fabric. The other switch can be a Nexus switch in External Fabric, LAN Classic fabric, or Easy Fabric. It can also be a Catalyst 9000 switch in External Fabric or IOS-XE Easy Fabric. The link can be created only from IOS-XE Easy Fabric.

For more information, see [Links, on page 126](#) and [Templates](#).

Note When creating DCI links for IOS-XE Easy Fabric, auto-deploy is supported only if the destination device is a Nexus switch.

To create links for IOS-XE Easy Fabric, perform the following procedure:

1. Navigate to the **Links** tab in the fabric overview.

The list of previously created links is displayed. The list contains intra-fabric links, which are between switches within a fabric, and inter-fabric links, which are between border switches in this fabric and switches in other fabrics.

The inter-fabric links also support edge router switches in the External Fabric, apart from BGW and Border Leaf/Spine.

2. Click **Actions** and choose **Create**.

The **Create Link** window appears. By default, the **Intra-Fabric** option is chosen as the link type.

3. From the **Link Type** drop-down box, choose **Inter-Fabric**. The fields change correspondingly.

4. Choose **VRF_LITE** as the link sub-type, `ext_fabric_setup` template for VRF_LITE IFC, and IOS-XE fabric as the source fabric.

Link Template: The link template is populated.

The templates are autopopulated with corresponding pre-packaged default templates that are based on your selection. The template to use for VRF_LITE IFC is `ext_fabric_setup`.

Note You can add, edit, or delete only the `ext_routed_fabric` template. For more information, see [Templates](#).

5. Choose the IOS-XE fabric as the source fabric from the Source Fabric drop-down list.
6. Choose a destination fabric from the Destination Fabric drop-down list.
7. Choose the source device and Ethernet interface that connects to the destination device.
8. Choose the destination device and Ethernet interface that connects to the source device.
9. Enter values in other fields accordingly.
10. Click **Save**.

Note Instead of the create action, you can also use the **Edit** action to create VRF-Lite IFC(s) using the existing inter fabric link(s). Choose the **VRF_Lite** link subtype. By default, if you select **Edit**, then the data for the fields Link-Type, Source Fabric, Destination Fabric, Source Device, Destination Device, Source Interface and Destination Interface are auto-populated in the **Edit Link** window.

Choose **VRF_LITE** as the link sub-type, `ext_fabric_setup` template for VRF_LITE IFC, and IOS-XE fabric as the source fabric.

To complete the procedure, repeat step 4 to step 10 mentioned above.

Creating VRFs for Cisco Catalyst 9000 Series Switches in IOS-XE Easy Fabrics

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > VRFs > VRFs**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > VRFs > VRFs**.

You can create VRFs for IOS-XE easy fabrics.

To create VRF from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

1. Click **Actions** and choose **Create**.

The **Create VRF** window appears.

2. Enter the required details in the mandatory fields. Some of the fields have default values.

The fields in this window are:

VRF Name - Specifies a VRF name automatically or allows you to enter a name for Virtual Routing and Forwarding (VRF). The VRF name should not contain any white spaces or special characters except underscore (_), hyphen (-), and colon (:).

VRF ID - Specifies the ID for the VRF or allows you to enter an ID for the VRF.

VLAN ID - Specifies the corresponding tenant VLAN ID for the network or allows you to enter an ID for the VLAN. If you want to propose a new VLAN for the network, click **Propose Vlan**.

VRF Template - A universal template is autopopulated. This is only applicable for leaf switches. The default template for IOS_XE Easy Fabric is the **IOS_XE_VRF** template.

VRF Extension Template - A universal extension template is autopopulated. This allows you to extend this network to another fabric. The default template for IOS_XE Easy Fabric is the **IOS_XE_VRF** template.

The VRF profile section contains the **General Parameters** and **Advanced** tabs.

3. The fields on the **General** tab are:

VRF Description - Enter the a description for the VRF.

VRF Intf Description - Specifies the description for the VRF interface.

4. Click the **Advanced** tab to optionally specify the advanced profile settings. The fields on the **Advanced** tab are:

Redistribute Direct Route Map - Specifies the redistribute direct route map name.

Max BGP Paths - Specifies the maximum BGP paths. The valid value range is between 1 and 64.

Max iBGP Paths - Specifies the maximum iBGP paths. The valid value range is between 1 and 64.

Advertise Host Routes - Enable this check box to control advertisement of /32 and /128 routes to Edge routers.

Advertise Default Route - Enable this check box to control advertisement of default route internally.

Config Static 0/0 Route - Enable this check box to control configuration of static default route.

5. Click **Create** to create the VRF or click **Cancel** to discard the VRF.

A message appears indicating that the VRF is created.

The new VRF appears on the **VRFs** horizontal tab. The status is **NA** as the VRF is created but not yet deployed. Now that the VRF is created, you can create and deploy networks on the devices in the fabric.

What to do next

Attach the VRF.

Create a loopback interface selecting the VRF_LITE extension.

For more information about attaching and detaching VRFs, see [VRF Attachments, on page 140](#).

Attaching VRFs on Cisco Catalyst 9000 Series Switches in IOS-XE Easy Fabrics

To attach the VRFs on the Cisco Catalyst 9000 Series Switches in the IOS-XE easy fabric, see [VRF Attachments, on page 140](#).

Note Choose the VRF corresponding to the CAT9000 series switch by checking the check box next to it.

Note Similarly, you can create a loopback interface, and select VRF_LITE extension.

What to do next

Deploy the configurations as follows:

1. Click **Actions** in **Fabric Overview**.
2. Choose **Deploy config to switches**.
3. Click **Deploy** after the configuration preview is complete.
4. Click **Close** after the deployment is complete.

Creating and Deploying Networks in IOS-XE Easy Fabrics

The next step is to create and deploy networks in IOS-XE Easy Fabrics.

-
- Note**
- The Network Template and Network Extension template uses the default IOS_XE_Network template that was created for the IOS-XE easy fabric.
-

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics:

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Networks**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Networks**.

Creating Networks for IOS-XE Easy Fabrics

To create network for IOX-XE easy fabric from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

1. On the **Networks** horizontal tab, click **Actions** and choose **Create**.

The **Create Network** window appears.

2. Enter the required details in the mandatory fields.

The fields in this window are:

Network ID and **Network Name** - Specifies the Layer 2 VNI and name of the network. The network name should not contain any white spaces or special characters except underscore (_) and hyphen (-).

Layer 2 Only - Specifies whether the network is Layer 2 only.

VRF Name - Allows you to select the Virtual Routing and Forwarding (VRF).

When no VRF is created, this field appears blank. If you want to create a new VRF, click **Create VRF**. The VRF name should not contain any white spaces or special characters except underscore (_), hyphen (-), and colon (:).

VLAN ID - Specifies the corresponding tenant VLAN ID for the network. If you want to propose a new VLAN for the network, click **Propose VLAN**.

Network Template - A universal template is autopopulated. This is only applicable for leaf switches.

Network Extension Template - A universal extension template is autopopulated. This allows you to extend this network to another fabric. The VRF Lite extension is supported. The template is applicable for border leaf switches.

Generate Multicast IP - If you want to generate a new multicast group address and override the default value, click **Generate Multicast IP**.

The network profile section contains the **General** and **Advanced** tabs.

3. The fields on the **General** tab are:

-
- Note**
- If the network is a non Layer 2 network, then it is mandatory to provide the gateway IP address.
-

IPv4 Gateway/NetMask - Specifies the IPv4 address with subnet.

Specify the anycast gateway IP address for transporting the L3 traffic from a server belonging to MyNetwork_30000 and a server from another virtual network. The anycast gateway IP address is the same for MyNetwork_30000 on all switches of the fabric that have the presence of the network.

Note If the same IP address is configured in the IPv4 Gateway and IPv4 Secondary GW1 or GW2 fields of the network template, Nexus Dashboard Fabric Controller does not show an error, and you will be able to save this configuration.

However, after the network configuration is pushed to the switch, it would result in a failure as the configuration is not allowed by the switch.

IPv6 Gateway/Prefix List - Specifies the IPv6 address with subnet.

Vlan Name - Enter the VLAN name.

Vlan Interface Description - Specifies the description for the interface. This interface is a switch virtual interface (SVI).

IPv4 Secondary GW1 - Enter the gateway IP address for the additional subnet.

IPv4 Secondary GW2 - Enter the gateway IP address for the additional subnet.

- Click the **Advanced** tab to optionally specify the advanced profile settings. The fields on the **Advanced** tab are:

Multicast Group Address - The multicast IP address for the network is autopopulated.

Multicast group address is a per fabric instance variable and remains the same for all networks by default. If a new multicast group address is required for this network, you can generate it by clicking the **Generate Multicast IP** button.

DHCPv4 Server 1 - Enter the DHCP relay IP address of the first DHCP server.

DHCPv4 Server VRF - Enter the DHCP server VRF ID.

DHCPv4 Server 2 - Enter the DHCP relay IP address of the next DHCP server.

DHCPv4 Server2 VRF - Enter the DHCP server VRF ID.

Loopback ID for DHCP Relay interface (Min:0, Max:1023) - Specifies the loopback ID for DHCP relay interface.

Enable L3 Gateway on Border - Select the check box to enable a Layer 3 gateway on the border switches.

- Click **Create**.

A message appears indicating that the network is created.

The new network appears on the **Networks** page that comes up.

The Status is **NA** since the network is created but not yet deployed on the switches. Now that the network is created, you can create more networks if needed and deploy the networks on the devices in the fabric.

Deploying Networks in IOS-XE Easy Fabrics

You can deploy networks in IOS-XE easy fabrics as follows:

- The network configurations can also be deployed in the **Fabric Overview** window as follows:
 1. Click **Actions** in the fabric overview.
 2. Choose **Deploy config to switches**.
 3. Click **Deploy** after the configuration preview is complete.
 4. Click **Close** after the deployment is complete
- To deploy the network in the IOS-XE easy fabric, see [Network Attachments, on page 148](#).

External Fabrics

You can add switches to the external fabric. Generic pointers:

NDFC will not generate "no router bgp". If you want to change it, go to the switch and do a "no feature bgp" followed by a re-sync if you don't have anything and want to update the ASN.

- The external fabric is a monitor-only or managed mode fabric.
- From Cisco Nexus Dashboard Fabric Controller Release 12.0.1, Cisco IOS-XR family devices Cisco ASR 9000 Series Aggregation Services Routers and Cisco Network Convergence System (NCS) 5500 Series are supported in external fabric in managed mode and monitor mode. NDFC will generate and push configurations to these switches, and configuration compliance will also be enabled for these platforms.
- From Cisco Nexus Dashboard Fabric Controller Release 12.1.1e, you can also add Cisco 8000 Series Routers to external fabrics both in managed mode and monitored mode, and configuration compliance is also supported.
- You can import, remove, and delete switches for an external fabric.
- For Inter-Fabric Connection (IFC) cases, you can choose Cisco 9000, 7000 and 5600 Series switches as destination switches in the external fabric.
- You can use non-existing switches as destination switches.
- The template that supports an external fabric is External_Fabric.
- If an external fabric is an MSD fabric member, then the MSD topology screen displays the external fabric with its devices, along with the member fabrics and their devices.

When viewed from an external fabric topology screen, any connections to non-Nexus Dashboard Fabric Controller managed switches are represented by a cloud icon labeled as **Undiscovered**.

- You can set up a Multi-Site or a VRF-lite IFC by manually configuring the links for the border devices in the VXLAN fabric or by using an automatic Deploy Border Gateway Method or VRF Lite IFC Deploy Method. If you are configuring the links manually for the border devices, we recommend using the Core Router role to set up a Multi-Site eBGP underlay from a Border Gateway device to a Core Router and the Edge Router role to set up a VRF-lite Inter-Fabric Connection (IFC) from a Border device to an Edge device.
- If you are using the Cisco Nexus 7000 Series Switch with Cisco NX-OS Release 6.2(24a) on the LAN Classic or External fabrics, make sure to enable AAA IP Authorization in the fabric settings.
- You can discover the following non-Nexus devices in an external fabric:

- IOS-XE family devices: Cisco CSR 1000v, Cisco IOS XE Gibraltar 16.10.x, Cisco ASR 1000 Series routers, and Cisco Catalyst 9000 Series Switches
 - IOS-XR family devices: ASR 9000 Series Routers, IOS XR Release 6.5.2 and Cisco NCS 5500 Series Routers, IOS XR Release 6.5.3
 - Arista 4.2 (Any model)
- Configure all the non-Nexus devices, except Cisco CSR 1000v, before adding them to the external fabric.
 - You can configure non-Nexus devices as borders. You can create an IFC between a non-Nexus device in an external fabric and a Cisco Nexus device in an easy fabric. The interfaces supported for these devices are:
 - Routed
 - Subinterface
 - Loopback
 - You can configure a Cisco ASR 1000 Series routers and Cisco Catalyst 9000 Series switches as edge routers, set up a VRF-lite IFC and connect it as a border device with an easy fabric.
 - Before a VDC reload, discover Admin VDC in the fabric. Otherwise, the reload operation does not occur.
 - You can connect a Cisco data center to a public cloud using Cisco CSR 1000v. See the *Connecting Cisco Data Center and a Public Cloud* chapter for a use case.
 - In an external fabric, when you add the **switch_user** policy and provide the username and password, the password must be an encrypted string that is displayed in the **show run** command.

For example:

```
username admin password 5 $5$I4sapkBh$S7B7UcPH/iVTihLKH5sgldBeS3O2X1StQsvv3cmbYd1 role
network-admin
```

In this case, the entered password should be

\$5\$I4sapkBh\$S7B7UcPH/iVTihLKH5sgldBeS3O2X1StQsvv3cmbYd1.

- For the Cisco Network Insights for Resources (NIR) Release 2.1 and later, and flow telemetry, **feature lldp** command is one of the required configuration.

Cisco Nexus Dashboard Fabric Controller pushes **feature lldp** on the switches only for the Easy Fabric deployments, that is, for the eBGP routed fabric or VXLAN EVPN fabric.

Therefore, NIR users need to enable **feature lldp** on all the switches in the following scenarios:

- External fabric in Monitored or Managed Mode
- LAN Classic fabric in Monitored or Managed Mode

Move an External Fabric Under an MSD Fabric

You should go to the MSD fabric page to associate an external fabric as its member.

1. On **Topology**, click within the MSD-Parent-Fabric. From **Actions** drop-down list, select **Move Fabrics**.

The Move Fabric screen comes up. It contains a list of fabrics. The external fabric is displayed as a standalone fabric.

2. Select the radio button next to the external fabric and click Add.

Now, in the Scope drop-down box at the top right, you can see that the external fabric appears under the MSD fabric.

External Fabric Depiction in an MSD Fabric Topology

The MSD topology screen displays MSD member fabrics and external fabrics together. The external fabric External65000 is displayed as part of the MSD topology.

Note When you deploy networks or VRFs for the VXLAN fabric, the deployment page (MSD topology view) shows the VXLAN and external fabrics that are connected to each other.

Creating an External Fabric

To create an external fabric using Cisco Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Choose **LAN > Fabrics > Fabrics**.
- Step 2** From the **Actions** drop-down list, select **Create Fabric**.
- Step 3** Enter the fabric name and click **Choose Template**.
- Step 4** From the drop-down list, select **External_Fabric** template.

The fields in this screen are:

BGP AS # – Enter the BGP AS number.

Fabric Monitor Mode – Clear the check box if you want Nexus Dashboard Fabric Controller to manage the fabric. Keep the check box selected to enable a monitor only external fabric.

From Cisco Nexus Dashboard Fabric Controller Release 12.1.1e, you can also add Cisco 8000 Series Routers to external fabrics both in managed mode and monitored mode.

When you create an Inter-Fabric Connection from a VXLAN fabric to this external fabric, the BGP AS number is referenced as the external or neighbor fabric AS Number.

When an external fabric is set to **Fabric Monitor Mode Only**, you cannot deploy configurations on its switches. If you click **Deploy Config**, it displays an error message.

The configurations must be pushed for non-Nexus devices before you discover them in the fabric. You cannot push configurations in the monitor mode.

Enable Performance Monitoring – Check this check box to enable performance monitoring on NX-OS switches only.

- Step 5** Enter values in the fields under the **Advanced** tab.

Power Supply Mode – Choose the appropriate power supply mode.

Enable MPLS Handoff – Select the check box to enable the MPLS Handoff feature. For more information, see the [MPLS SR and LDP Handoff](#) chapter in External/WAN Layer 3 Connectivity for VXLAN BGP EVPN Fabrics.

Underlay MPLS Loopback Id – Specifies the underlay MPLS loopback ID. The default value is 101.

Enable AAA IP Authorization – Enables AAA IP authorization, when IP Authorization is enabled in the AAA Server

Enable Nexus Dashboard Fabric Controller as Trap Host – Select this check box to enable Nexus Dashboard Fabric Controller as a trap host.

Enable CDP for Bootstrapped Switch – Select the check box to enable CDP for bootstrapped switch.

Enable NX-API – Specifies enabling of NX-API on HTTPS. This check box is unchecked by default.

Enable NX-API on HTTP – Specifies enabling of NX-API on HTTP. This check box is unchecked by default. Enable this check box and the **Enable NX-API** check box to use HTTP. If you uncheck this check box, the applications that use NX-API and supported by Cisco Nexus Dashboard Fabric Controller, such as Endpoint Locator (EPL), Layer 4-Layer 7 services (L4-L7 services), VXLAN OAM, and so on, start using the HTTPS instead of HTTP.

Note If you check the **Enable NX-API** check box and the **Enable NX-API on HTTP** check box, applications use HTTP.

Inband Mgmt – For External and Classic LAN Fabrics, this knob enables Nexus Dashboard Fabric Controller to import and manage of switches with inband connectivity (reachable over switch loopback, routed, or SVI interfaces), in addition to management of switches with out-of-band connectivity (aka reachable over switch mgmt0 interface). The only requirement is that for Inband managed switches, there should be IP reachability from Nexus Dashboard Fabric Controller to the switches via the eth2 aka inband interface. For this purpose, static routes may be needed on the Nexus Dashboard Fabric Controller, that in turn can be configured via the Administration->Customization->Network Preferences option. After enabling Inband management, during discovery, provide the IPs of all the switches to be imported using Inband Management and set maximum hops to 0. Nexus Dashboard Fabric Controller has a pre-check that validates that the Inband managed switch IPs are reachable over the eth2 interface. Once the pre-check has passed, Nexus Dashboard Fabric Controller then discovers and learns about the interface on that switch that has the specified discovery IP in addition to the VRF that the interface belongs to. As part of the process of switch import/discovery, this information is captured in the baseline intent that is populated on the Nexus Dashboard Fabric Controller. For more information, see [Inband Management in External Fabrics and LAN Classic Fabrics, on page 98](#).

Note Bootstrap or POAP is only supported for switches that are reachable over out-of-band connectivity, that is, over switch mgmt0. The various POAP services on the Nexus Dashboard Fabric Controller are typically bound to the eth1 or out-of-band interface. In scenarios, where Nexus Dashboard Fabric Controller eth0/eth1 interfaces reside in the same IP subnet, the POAP services are bound to both interfaces.

Enable Precision Time Protocol (PTP) – Enables PTP across a fabric. When you select this check box, PTP is enabled globally and on core-facing interfaces. Additionally, the PTP Source Loopback Id and PTP Domain Id fields are editable. For more information, see [Precision Time Protocol for External Fabrics and LAN Classic Fabrics, on page 96](#).

PTP Source Loopback Id – Specifies the loopback interface ID Loopback that is used as the Source IP Address for all PTP packets. The valid values range from 0 to 1023. The PTP loopback ID cannot be the same as RP, Phantom RP, NVE, or MPLS loopback ID. Otherwise, an error will be generated. The PTP loopback ID can be the same as BGP loopback or user-defined loopback which is created from Nexus Dashboard Fabric Controller. If the PTP loopback ID is not found during Save & Deploy, the following error is generated:

Loopback interface to use for PTP source IP is not found. Please create PTP loopback interface on all the devices to enable PTP feature.

PTP Domain Id – Specifies the PTP domain ID on a single network. The valid values range from 0 to 127.

Fabric Freeform – You can apply configurations globally across all the devices discovered in the external fabric using this freeform field. The devices in the fabric should belong to the same device-type and the fabric should not be in monitor mode. The different device types are:

- NX-OS
- IOS-XE
- IOS-XR
- Others

Depending on the device types, enter the configurations accordingly. If some of the devices in the fabric do not support these global configurations, they will go out-of-sync or fail during the deployment. Hence, ensure that the configurations you apply are supported on all the devices in the fabric or remove the devices that do not support these configurations.

AAA Freeform Config – You can apply AAA configurations globally across all devices discovered in the external fabric using this freeform field.

Step 6 Fill up the **Resources** tab as shown below.

Subinterface Dot1q Range – The subinterface 802.1Q range and the underlay routing loopback IP address range are autopopulated.

Underlay MPLS Loopback IP Range – Specifies the underlay MPLS SR or LDP loopback IP address range.

The IP range should be unique, that is, it should not overlap with IP ranges of the other fabrics.

Step 7 Fill up the **Configuration Backup** tab as shown below.

The fields on this tab are:

Hourly Fabric Backup – Select the check box to enable an hourly backup of fabric configurations and the intent.

You can enable an hourly backup for fresh fabric configurations and the intent as well. If there is a configuration push in the previous hour, Nexus Dashboard Fabric Controller takes a backup. In case of the external fabric, the entire configuration on the switch is not converted to intent on Nexus Dashboard Fabric Controller as compared to the VXLAN fabric. Therefore, for the external fabric, both intent and running configuration are backed up.

Intent refers to configurations that are saved in Nexus Dashboard Fabric Controller but yet to be provisioned on the switches.

The hourly backups are triggered during the first 10 minutes of the hour.

Scheduled Fabric Backup – Check the check box to enable a daily backup. This backup tracks changes in running configurations on the fabric devices that are not tracked by configuration compliance.

Scheduled Time: Specify the scheduled backup time in a 24-hour format. This field is enabled if you check the **Scheduled Fabric Backup** check box.

Select both the check boxes to enable both back up processes.

The backup process is initiated after you click **Save**.

The scheduled backups are triggered exactly at the time you specify with a delay of up to two minutes. The scheduled backups are triggered regardless of the configuration deployment status.

You can also initiate the fabric backup in the fabric topology window. Click **Backup Fabric** in the **Actions** pane.

The backups contain running configuration and intent pushed by Nexus Dashboard Fabric Controller. Configuration compliance forces the running config to be the same as the Nexus Dashboard Fabric Controller config. Note that for the external fabric, only some configurations are part of intent and the remaining configurations are not tracked by Nexus Dashboard Fabric Controller. Therefore, as part of backup, both Nexus Dashboard Fabric Controller intent and running config from switch are captured.

Step 8

Click the **Bootstrap** tab.

Enable Bootstrap – Select this check box to enable the bootstrap feature.

After you enable bootstrap, you can enable the DHCP server for automatic IP address assignment using one of the following methods:

- External DHCP Server: Enter information about the external DHCP server in the **Switch Mgmt Default Gateway** and **Switch Mgmt IP Subnet Prefix** fields.
- Local DHCP Server: Enable the **Local DHCP Server** check box and enter details for the remaining mandatory fields.

From Cisco NDFC Release 12.1.1e, you can choose Inband POAP or out-of-band POAP for External fabrics.

Enable Inband POAP – Choose this check box to enable Inband POAP.

Note You must enable **Inband Mgmt** on the **Advanced** tab to enable this option.

Enable Local DHCP Server – Select this check box to initiate enabling of automatic IP address assignment through the local DHCP server. When you choose this check box, all the remaining fields become editable.

DHCP Version – Select DHCPv4 or DHCPv6 from this drop-down list. When you select DHCPv4, the **Switch Mgmt IPv6 Subnet Prefix** field is disabled. If you select DHCPv6, the **Switch Mgmt IP Subnet Prefix** is disabled.

Note Cisco Nexus Dashboard Fabric Controller IPv6 POAP is not supported with Cisco Nexus 7000 Series Switches. Cisco Nexus 9000 and 3000 Series Switches support IPv6 POAP only when switches are either L2 adjacent (eth1 or out-of-band subnet must be a /64) or they are L3 adjacent residing in some IPv6 /64 subnet. Subnet prefixes other than /64 are not supported.

If you do not select this check box, Nexus Dashboard Fabric Controller uses the remote or external DHCP server for automatic IP address assignment.

DHCP Scope Start Address and **DHCP Scope End Address** – Specifies the first and last IP addresses of the IP address range to be used for the switch out of band POAP.

Switch Mgmt Default Gateway – Specifies the default gateway for the management VRF on the switch.

Switch Mgmt IP Subnet Prefix – Specifies the prefix for the Mgmt0 interface on the switch. The prefix should be between 8 and 30.

DHCP scope and management default gateway IP address specification - If you specify the management default gateway IP address 10.0.1.1 and subnet mask 24, ensure that the DHCP scope is within the specified subnet, between 10.0.1.2 and 10.0.1.254.

Switch Mgmt IPv6 Subnet Prefix – Specifies the IPv6 prefix for the Mgmt0 interface on the switch. The prefix should be between 112 and 126. This field is editable if you enable IPv6 for DHCP.

Enable AAA Config – Select this check box to include AAA configs from Advanced tab during device bootup.

Bootstrap Freeform Config - (Optional) Enter other commands as needed. For example, if you are using AAA or remote authentication-related configurations, add these configurations in this field to save the intent. After the devices boot up, they contain the intent defined in the **Bootstrap Freeform Config** field.

Copy-paste the running-config to a **freeform config** field with correct indentation, as seen in the running configuration on the NX-OS switches. The freeform config must match the running config. For more information, see [Enabling Freeform Configurations on Fabric Switches](#), on page 43.

DHCPv4/DHCPv6 Multi Subnet Scope - Specifies the field to enter one subnet scope per line. This field is editable after you check the **Enable Local DHCP Server** check box.

The format of the scope should be defined as:

DHCP Scope Start Address, DHCP Scope End Address, Switch Management Default Gateway, Switch Management Subnet Prefix

For example: 10.6.0.2, 10.6.0.9, 10.6.0.1, 24

Step 9

Click on the **Flow Monitor** tab. The fields on this tab are:

Enable Netflow – Check this checkbox to enable Netflow on VTEPs for this Fabric. By default, Netflow is disabled. On Enable, NetFlow configuration will be applied to all VTEPS that support netflow.

Note: When Netflow is enabled on the fabric, you can choose not to have netflow on a particular switch by having a dummy no_netflow PTI.

If netflow is not enabled at the fabric level, an error message is generated when you enable netflow at the interface, network, or vrf level. For information about Netflow support for Cisco NDFC, refer to [Netflow Support](#), on page 95.

In the **Netflow Exporter** area, click **Actions > Add** to add one or more Netflow exporters. This exporter is the receiver of the netflow data. The fields on this screen are:

- **Exporter Name** – Specifies the name of the exporter.
- **IP** – Specifies the IP address of the exporter.
- **VRF** – Specifies the VRF over which the exporter is routed.
- **Source Interface** – Enter the source interface name.
- **UDP Port** – Specifies the UDP port over which the netflow data is exported.

Click **Save** to configure the exporter. Click **Cancel** to discard. You can also choose an existing exporter and select **Actions > Edit** or **Actions > Delete** to perform relevant actions.

In the **Netflow Record** area, click **Actions > Add** to add one or more Netflow records. The fields on this screen are:

- **Record Name** – Specifies the name of the record.
- **Record Template** – Specifies the template for the record. Enter one of the record templates names. In Release 12.0.2, the following two record templates are available for use. You can create custom netflow record templates. Custom record templates saved in the template library are available for use here.
 - **netflow_ipv4_record** – to use the IPv4 record template.
 - **netflow_l2_record** – to use the Layer 2 record template.

- **Is Layer2 Record** – Check this check box if the record is for Layer2 netflow.

Click **Save** to configure the report. Click **Cancel** to discard. You can also choose an existing record and select **Actions > Edit** or **Actions > Delete** to perform relevant actions.

In the **Netflow Monitor** area, click **Actions > Add** to add one or more Netflow monitors. The fields on this screen are:

- **Monitor Name** – Specifies the name of the monitor.
- **Record Name** – Specifies the name of the record for the monitor.
- **Exporter1 Name** – Specifies the name of the exporter for the netflow monitor.
- **Exporter2 Name** – (optional) Specifies the name of the secondary exporter for the netflow monitor.

The record name and exporters referred to in each netflow monitor must be defined in **Netflow Record** and **Netflow Exporter**.

Click **Save** to configure the monitor. Click **Cancel** to discard. You can also choose an existing monitor and select **Actions > Edit** or **Actions > Delete** to perform relevant actions.

Step 10 Click **Save**.

After the external fabric is created, the external fabric topology page comes up.

After creating the external fabric, add switches to it.

Adding Switches to the External Fabric

Switches in each fabric are unique, and hence, each switch can only be added to one fabric. To add switches to the external fabric, perform the following steps:

Procedure

Step 1 Choose **LAN > Switches**. From the Actions drop-down list, select **Add Switches**

You can also add switches to a Fabric from **LAN > Fabrics**. Select a fabric and view the **Summary**. On the **Switches** tab, from the **Actions** drop-down list, select **Add switches** to add switches to the selected Fabric.

From Topology, right click on the Fabric and select **Add Switches**.

Step 2 Select **Discover** to discover new switches. Select **Move Neighbor Switches** to add existing switches to the Fabric.

Step 3 If you select **Discover** option, perform the following steps:

- Enter the IP address (Seed IP) of the switch.
- In the **Authentication Protocol** field, from the drop-down list, select the appropriate protocol to add switches to the Fabric.
- Choose the device type from the **Device Type** drop-down list.

The options are **NX-OS**, **IOS XE**, **IOS XR**, and **Other**.

- Select **NX-OS** to discover a Cisco Nexus switch.

- Select **IOS XE** to discover a CSR device.
- Select **IOS XR** to discover an ASR device.
- Select **Other** to discover non-Cisco devices.

Refer the *Adding non-Nexus Devices to External Fabrics* section for more information on adding other non-Nexus devices.

Config compliance is disabled for all non-Nexus devices except for Cisco CSR 1000v.

- Enter the administrator username and password of the switch.
- Click **Discovery Switches** at the bottom part of the screen.

The Scan Details section comes up shortly. Since the Max Hops field was populated with 2, the switch with the specified IP address and switches two hops from it are populated.

Select the check boxes next to the concerned switches and click **Add Switches** into fabric.

You can discover multiple switches at the same time. The switches must be properly cabled and connected to the Nexus Dashboard Fabric Controller server and the switch status must be manageable.

The switch discovery process is initiated. The **Progress** column displays the progress. After Nexus Dashboard Fabric Controller discovers the switch, click **Close** to revert to the previous screen.

Step 4 If you select **Move Neighbor Switches** option, select the switch and click **Move Switch**.

The selected switch is moved to the External Fabric.

Switch Settings for External Fabrics

External Fabric Switch Settings vary from the VXLAN fabric switch settings. Double-click on the switch to view the Switch Overview screen to edit/modify options.

The options are:

Set Role – By default, no role is assigned to an external fabric switch. The allowed roles are Edge Router and Core Router. Assign the Core Router role for a Multi-Site Inter-Fabric Connection (IFC) and the Edge Router role for a VRF Lite IFC between the external fabric and VXLAN fabric border devices.

Note Changing of switch role is allowed only before executing **Deploy Config**.

vPC Pairing – Select a switch for vPC and then select its peer.

Change Modes – Allows you to modify the mode of switch from Active to Operational.

Manage Interfaces – Deploy configurations on the switch interfaces.

Straight-through FEX, Active/Active FEX, and breakout of interfaces are not supported for external fabric switch interfaces.

View/edit Policies – Add, update, and delete policies on the switch. The policies you add to a switch are template instances of the templates available in the template library. After creating policies, deploy them on the switch using the Deploy option available in the View/edit Policies screen.

History – View per switch deployment history.

Recalculate Config – View the pending configuration and the side-by-side comparison of the running and expected configuration.

Deploy Config – Deploy per switch configurations.

Discovery – You can use this option to update the credentials of the switch, reload the switch, rediscover the switch, and remove the switch from the fabric.

Click **Deploy** from the Actions drop-down list. The template and interface configurations form the configuration provisioning on the switches.

When you click **Deploy**, the **Deploy Configuration** screen comes up.

Click **Config** at the bottom part of the screen to initiate pending configuration onto the switch. The **Deploy Progress** screen displays the progress and the status of configuration deployment.

Click **Close** after the deployment is complete.

Note If a switch in an external fabric does not accept default credentials, you should perform one of the following actions:

- Remove the switch in the external fabric from inventory, and then rediscover.
 - LAN discovery uses both SNMP and SSH, so both passwords need to be the same. You need to change the SSH password to match the SNMP password on the switch. If SNMP authentication fails, discovery is stopped with authentication error. If SNMP authentication passes but SSH authentication fails, Nexus Dashboard Fabric Controller discovery continues, but the switch status shows a warning for the SSH error.
-

Discovering New Switches

To discover new switches, perform the following steps:

Procedure

- Step 1** Power on the new switch in the external fabric after ensuring that it is cabled to the Nexus Dashboard Fabric Controller server.
- Boot the Cisco NX-OS and setup switch credentials.
- Step 2** Execute the **write**, **erase**, and **reload** commands on the switch.
- Choose **Yes** to both the CLI commands that prompt you to choose Yes or No.
- Step 3** On the Nexus Dashboard Fabric Controller UI, select the External Fabric. Choose **Edit Fabric** from the **Actions** drop-down list.
- The **Edit Fabric** screen is displayed.
- Step 4** Click the **Bootstrap** tab and update the DHCP information.
- Step 5** Click **Save** at the bottom right part of the **Edit Fabric** screen to save the settings.

Step 6 Double click on the Fabric to view the **Fabric Overview**.

Step 7 On **Switches** tab, from the **Actions** drop-down list, select **Add Switches**.

Step 8 Click the **POAP** tab.

In an earlier step, the reload command was executed on the switch. When the switch restarts to reboot, Nexus Dashboard Fabric Controller retrieves the serial number, model number, and version from the switch and displays them on the Inventory Management along screen. Also, an option to add the management IP address, hostname, and password are made available. If the switch information is not retrieved, refresh the screen using the Refresh icon at the top right part of the screen.

Note At the top left part of the screen, export and import options are provided to export and import the .csv file that contains the switch information. You can pre-provision a device using the import option too.

Select the checkbox next to the switch and add switch credentials: IP address and host name.

Based on the IP address of your device, you can either add the IPv4 or IPv6 address in the **IP Address** field.

You can provision devices in advance.

Step 9 In the **Admin Password** and **Confirm Admin Password** fields, enter and confirm the admin password.

This admin password is applicable for all the switches displayed in the POAP window.

Note If you do not want to use admin credentials to discover switches, you can instead use the AAA authentication, that is, RADIUS or TACACS credentials for discovery only.

Step 10 (Optional) Use discovery credentials for discovering switches.

- a) Click the **Add Discovery Credentials** icon to enter the discovery credentials for switches.
- b) In the **Discovery Credentials** window, enter the discovery credentials such as discovery username and password.

Click **OK** to save the discovery credentials.

If the discovery credentials are not provided, Nexus Dashboard Fabric Controller uses the admin user and password to discover switches.

- Note**
- The discovery credentials that can be used are AAA authentication based credentials, that is, RADIUS or TACACS.
 - The discovery credential is not converted as commands in the device configuration. This credential is mainly used to specify the remote user (or other than the admin user) to discover the switches. If you want to add the commands as part of the device configuration, add them in the **Bootstrap Freeform Config** field under the **Bootstrap** tab in the fabric settings. Also, you can add the respective policy from **View/Edit Policies** window.

Step 11 Click **Bootstrap** at the top right part of the screen.

Nexus Dashboard Fabric Controller provisions the management IP address and other credentials to the switch. In this simplified POAP process, all ports are opened up.

After the added switch completes POAP, the fabric builder topology screen displays the added switch with some physical connections.

Step 12 Monitor and check the switch for POAP completion.

- Step 13** Click **Deploy Config** from the **Actions** drop-down list on the **Fabric Overview** screen to deploy pending configurations (such as template and interface configurations) onto the switches.
- Note**
- If there is a sync issue between the switch and Nexus Dashboard Fabric Controller, the switch icon is displayed in red color, indicating that the fabric is Out-Of-Sync. For any changes on the fabric that results in the out-of-sync, you must deploy the changes. The process is the same as explained in the Discovering Existing Switches section.
 - The discovery credential is not converted as commands in the device configuration. This credential is mainly used to specify the remote user (or other than the admin user) to discover the switches. If you want to add the commands as part of the device configuration, add them in the **Bootstrap Freeform Config** field under the **Bootstrap** tab in the fabric settings. Also, you can add the respective policy from **View/Edit Policies** window.
- During fabric creation, if you have entered AAA server information (in the **Manageability** tab), you must update the AAA server password on each switch. Else, switch discovery fails.
- Step 14** After the pending configurations are deployed, the **Progress** column displays 100% for all switches.
- Step 15** On the Topology screen, click **Refresh Topology** icon to view the update.
- All switches must be in green color indicating that they are functional.
- The switch and the link are discovered in Nexus Dashboard Fabric Controller. Configurations are built based on various policies (such as fabric, topology, and switch generated policies). The switch image (and other required) configurations are enabled on the switch.
- Step 16** Right-click and select History to view the deployed configurations.
- Click the **Success** link in the **Status** column for more details. An example:
- Step 17** On the Nexus Dashboard Fabric Controller UI, the discovered switches can be seen in the fabric topology.
- Up to this step, the POAP is completed with basic settings. All the interfaces are set to trunk ports. You must setup interfaces through the **LAN > Interfaces** option for any additional configurations, but not limited to the following:
- vPC pairing.
 - Breakout interfaces
- Support for breakout interfaces is available for 9000 Series switches.
- Port channels, and adding members to ports.
- Note** After discovering a switch (new or existing), at any point in time you can provision configurations on it again through the POAP process. The process removes existing configurations and provision new configurations. You can also deploy configurations incrementally without invoking POAP.

Adding Non-Nexus Devices to External Fabrics

From Cisco Nexus Dashboard Fabric Controller Release 12.0.1a, you can add Cisco IOS-XR devices to external fabrics in managed mode as well. You can manage the following Cisco IOS-XR devices in external fabrics:

- Cisco ASR 9000 Series Routers

- Cisco NCS 5500 Series Routers, IOS XR Release 6.5.3

From Cisco Nexus Dashboard Fabric Controller Release 12.1.1e, you can also add Cisco 8000 Series Routers to external fabrics both in managed mode and monitored mode.

You can discover non-Nexus devices in an external fabric and perform the configuration compliance of these devices as well. For more information, see the [Configuration Compliance in External Fabrics, on page 39](#) section.

Refer the *Cisco Nexus Dashboard Fabric Controller Compatibility Matrix* to see the non-Nexus devices supported by Cisco Nexus Dashboard Fabric Controller.

Only Cisco Nexus switches support SNMP discovery by default. Hence, configure all the non-Nexus devices before adding it to the external fabric. Configuring the non-Nexus devices includes configuring SNMP views, groups, and users. See the [Configuring Non-Nexus Devices for Discovery](#) section for more information.

Cisco CSR 1000v is discovered using SSH. Cisco CSR 1000v does not need SNMP support because it can be installed in clouds where SNMP is blocked for security reasons. See the *Connecting Cisco Data Center and a Public Cloud* chapter to see a use case to add Cisco CSR 1000v, Cisco IOS XE Gibraltar 16.10.x to an external fabric.

However, Cisco Nexus Dashboard Fabric Controller can only access the basic device information like system name, serial number, model, version, interfaces, up time, and so on. Cisco Nexus Dashboard Fabric Controller does not discover non-Nexus devices if the hosts are part of CDP or LLDP.

The settings that are not applicable for non-Nexus devices appear blank, even if you get many options when you right-click a non-Nexus device in the fabric topology window. You cannot add or edit interfaces for ASR 9000 Series Routers and Arista switches.

You can add IOS-XE devices like Cisco Catalyst 9000 Series switches and Cisco ASR 1000 Series Routers as well to external fabrics.

Configuration Compliance in External Fabrics

With external fabrics, any Nexus switches, Cisco IOS-XE devices, Cisco IOS XR devices, and Arista can be imported into the fabric, and there is no restriction on the type of deployment. It can be LAN Classic, VXLAN, FabricPath, vPC, HSRP, etc. When switches are imported into an external fabric, the configuration on the switches is retained so that it is non-disruptive. Only basic policies such as the switch username and mgmt0 interface are created after a switch import.

In the external fabric, for any intent that is defined in the Nexus Dashboard Fabric Controller, configuration compliance (CC) ensures that this intent is present on the corresponding switch. If this intent is not present on the switch, CC reports an Out-of-Sync status. Additionally, there will be a Pending Config generated to push this intent to the switch to change the status to In-Sync. Any additional configuration that is on the switch but not in intent defined in Nexus Dashboard Fabric Controller, will be ignored by CC, as long as there is no conflict with anything in the intent.

When there is user-defined intent added on Nexus Dashboard Fabric Controller and the switch has additional configuration under the same top-level command, as mentioned earlier, CC will only ensure that the intent defined in Nexus Dashboard Fabric Controller is present on the switch. When this user defined intent on Nexus Dashboard Fabric Controller is deleted as a whole with the intention of removing it from the switch and the corresponding configuration exists on the switch, CC will report an Out-of-Sync status for the switch and will generate **Pending Config** to remove the config from the switch. This **Pending Config** includes the removal of the top-level command. This action leads to removal of the other out-of-band configurations made on the switch under this top-level command as well. If you choose to override this behavior, the recommendation is that, you create a freeform policy and add the relevant top-level command to the freeform policy.

Let us see this behavior with an example.

1. A **switch_freeform** policy defined by the user in Nexus Dashboard Fabric Controller and deployed to the switch.
2. Additional configuration exists under **router bgp** in **Running config** that does not exist in user-defined Nexus Dashboard Fabric Controller intent **Expected config**. Note that there is no **Pending Config** to remove the additional config that exists on the switch without a user defined intent on Nexus Dashboard Fabric Controller.
3. The **Pending Config** and the **Side-by-side Comparison** when the intent that was pushed earlier via Nexus Dashboard Fabric Controller is deleted from Nexus Dashboard Fabric Controller by deleting the **switch_freeform** policy that was created in the Step 1.
4. A **switch_freeform** policy with the top-level **router bgp** command needs to be created. This enables CC to generate the configuration needed to remove only the desired sub-config which was pushed from Nexus Dashboard Fabric Controller earlier.
5. The removed configuration is only the subset of the configuration that was pushed earlier from Nexus Dashboard Fabric Controller.

For interfaces on the switch in the external fabric, Nexus Dashboard Fabric Controller either manages the entire interface or does not manage it at all. CC checks interfaces in the following ways:

- For any interface, if there is a policy defined and associated with it, then this interface is considered as managed. All configurations associated with this interface must be defined in the associated interface policy. This is applicable for both logical and physical interfaces. Otherwise, CC removes any out-of-band updates made to the interface to change the status to **In-Sync**.
- Interfaces created out-of-band (applies for logical interfaces such as port-channels, sub interfaces, SVIs, loopbacks, etc.), will be discovered by Nexus Dashboard Fabric Controller as part of the regular discovery process. However, since there is no intent for these interfaces, CC will not report an **Out-of-Sync** status for these interfaces.
- For any interface, there can always be a monitor policy associated with it in Nexus Dashboard Fabric Controller. In this case, CC will ignore the interface's configuration when it reports the **In-Sync** or **Out-of-Sync** config compliance status.

Special Configuration CLIs Ignored for Configuration Compliance

The following configuration CLIs are ignored during configuration compliance checks:

- Any CLI having 'username' along with 'password'
- Any CLI that starts with 'snmp-server user'

Any CLIs that match the above will not show up in pending diffs and clicking Save & Deploy in the Fabric Builder window will not push such configurations to the switch. These CLIs will not show up in the Side-by-side Comparison window also.

To deploy such configuration CLIs, perform the following procedure:

Procedure

-
- Step 1** Select **LAN > Fabrics**.

Double click on the fabric name to view **Fabric Overview** screen.

- Step 2** On the Switches tab, double click on the switch name to view **Switch Overview** screen.
On the Policies tab, all the policies applied on the switch within the chosen fabric are listed.
- Step 3** On the Policies tab, from the **Actions** drop-down list, select **Add Policy**.
- Step 4** Add a Policy Template Instances (PTIs) with the required configuration CLIs using the **switch_freeform** template and click **Save**.
- Step 5** Select the created policy and select **Push Config** from the **Actions** drop-down list to deploy the configuration to the switch(es).

Configuring Non-Nexus Devices for Discovery

Before discovering any non-Nexus device in Cisco Nexus Dashboard Fabric Controller, configure it on the switch console.

Configuring IOS-XE Devices for Discovery

Before you discover the Cisco IOS-XE devices in Nexus Dashboard Fabric Controller, perform the following steps:

Procedure

- Step 1** Run the following SSH commands on the switch console.

```
switch (config)# hostname <hostname>
switch (config)# ip domain name <domain_name>
switch (config)# crypto key generate rsa
switch (config)# ip ssh time-out 90
switch (config)# ip ssh version 2
switch (config)# line vty 1 4
switch (config-line)# transport input ssh
switch (config)# aaa authentication login default local
switch (config)# aaa authorization exec default local none
switch (config)# username admin privilege secret <password>
switch (config)# aaa new-model
switch (config)# session-id-common
```

- Step 2** Run the following command in NDFC console to perform an SNMP walk.

```
snmpbulkwalk -v3 -u admin -A <password> -l AuthNoPriv -a MD5 ,switch-mgmt-IP>
.1.3.6.1.2.1.2.2.1.2
```

- Step 3** Run the following SNMP command on the switch console.

```
snmp-server user username
                    group-name [remote host {v1 | v2c | v3 [encrypted] [auth {md5 | sha}
auth-password]} [priv des 256 privpassword] vrf vrf-name [access access-list]
```

Configuring Arista Devices for Discovery

Enable Privilege Exec mode using the following command:

```
switch> enable
switch#

switch# show running configuration | grep aaa          /* to view the authorization*/
aaa authorization exec default local
```

Run the following commands in the switch console to configure Arista devices:

```
switch# configure terminal
switch (config)# username ndfc privilege 15 role network-admin secret cisco123
snmp-server view view_name SNMPv2 included
snmp-server view view_name SNMPv3 included
snmp-server view view_name default included
snmp-server view view_name entity included
snmp-server view view_name if included
snmp-server view view_name iso included
snmp-server view view_name lldp included
snmp-server view view_name system included
snmp-server view sys-view default included
snmp-server view sys-view ifmib included

snmp-server community private ro
snmp-server community public ro
snmp-server group group_name v3 auth read view_name
snmp-server user username group_name v3 auth md5 password priv aes password
```

Note SNMP password should be same as the password for username.

You can verify the configuration by running the **show run** command, and view the SNMP view output by running the **show snmp view** command.

Show Run Command

```
switch (config)# snmp-server engineID local f5717f444ca824448b00
snmp-server view view_name SNMPv2 included
snmp-server view view_name SNMPv3 included
snmp-server view view_name default included
snmp-server view view_name entity included

```

Configuring Cisco IOS-XR Devices for Discovery

Run the following commands in the switch console to configure IOS-XR devices:

```

switch# configure terminal
switch (config)# snmp-server view view_name cisco included
snmp-server view view_name mib-2 included
snmp-server group group_name v3 auth read view_name write view_name
snmp-server user user_name
                    group_name v3 auth md5 password priv des56 password SystemOwner

```

Note SNMP password must be same as password for username.

You can verify the configuration by running the show run command.

Configuration and Verification of Cisco IOS-XR Devices

```

RP/0/RSP0/CPU0:ios(config)#snmp-server view view_name cisco included
RP/0/RSP0/CPU0:ios(config)#snmp-server view view_name mib-2 included

```

Discovering Non-Nexus Devices in an External Fabric

To add non-Nexus devices to an external fabric in the fabric topology window, perform the following steps:

Before you begin

Ensure that the configurations are pushed for non-Nexus devices before adding them to an external fabric. You cannot push configurations in a fabric in the monitor mode.

Procedure

- Step 1** Click **Add switches** in the **Actions** pane.
- Step 2** Enter values for the following fields under the **Discover Existing Switches** tab:

Field	Description
Seed IP	<p>Enter the IP address of the switch.</p> <p>You can import more than one switch by providing the IP address range. For example: 10.10.10.40-60</p> <p>The switches must be properly cabled and connected to the Nexus Dashboard Fabric Controller server and the switch status must be manageable.</p>
Device Type	<ul style="list-style-type: none"> Choose IOS XE from the drop-down list for adding Cisco CSR 1000v, Cisco ASR 1000 Series routers, or Cisco Catalyst 9000 Series Switches. Choose IOS XR from the drop-down list for adding ASR 9000 Series Routers, Cisco NCS 5500 Series Routers, IOS XR Release 6.5.3 or Cisco 8000 Series Routers. <p>Note To add Cisco IOS XR devices in managed mode, navigate to the General Parameters tab in the fabric settings and uncheck the Fabric Monitor Mode check box.</p> <ul style="list-style-type: none"> Choose Other from the drop-down list for adding non-Cisco devices, like Arista switches.
Username	Enter the username.
Password	Enter the password.

Note An error message appears if you try to discover a device that is already discovered.

Set the password of the device in the **LAN Credentials** window if the password is not set. To navigate to the **LAN Credentials** window from the Cisco Nexus Dashboard Fabric Controller Web UI, choose **Administration > LAN Credentials**.

Step 3 Click **Start Discovery**.

The **Scan Details** section appears with the switch details populated.

Step 4 Check the check boxes next to the switches you want to import.

Step 5 Click **Import into fabric**.

The switch discovery process is initiated. The **Progress** column displays the progress.

Discovering devices takes some time. A pop-up message appears at the bottom-right about the device discovery after the discovery progress is **100%**, or **done**. For example: **<ip-address> added for discovery**.

Step 6 Click **Close**.

The fabric topology window appears with the switches.

Step 7 (Optional) Click **Refresh topology** to view the latest topology view.

Step 8 (Optional) Click **Fabric Overview**.

The switches and links window appears, where you can view the scan details. The discovery status is **discovering** in red with a warning icon next to it if the discovery is in progress.

Step 9 (Optional) View the details of the device.

After the discovery of the device:

- The discovery status changes to **ok** in green with a check box checked next to it.
- The value of the device under the **Fabric Status** column changes to **In-Sync**.

Note When a switch is in **Unreachable** discovery status, the last available information of the switch is retained in other columns. For example, if the switch was in **RUNNING** tracker status before it becomes unreachable, the value under the **Tracker Status** column for this switch will still be **RUNNING** despite the switch being in **Unreachable** discovery status.

What to do next

Set the appropriate role. Right-click the device, choose **Set role**.

If you added these devices under managed mode, you can add policies too.

Managing Non-Nexus Devices to External Fabrics

From Nexus Dashboard Fabric Controller 12.0.1a, IOS-XR is supported in managed mode.

Note Configuration compliance is enabled for IOS-XE and IOS-XR switches, similar to the way the Nexus switches are handled in External Fabric. For more information, see [Configuration Compliance in External Fabrics](#), on page 39.

Nexus Dashboard Fabric Controller sends commit at the end of deployment for IOS-XR devices.

Nexus Dashboard Fabric Controller provides a few templates for IOS-XR devices. Use the **ios_xr_Ext_VRF_Lite_Jython.template** for IOS-XR switch to be an edge router to establish eBGP peering with border. This will create config for vrf, eBGP peering for the vrf and the sub-interface. Similarly, **ios_xe_Ext_VRF_Lite_Jython** can be used for IOS-XE switch to be an edge router to establish eBGP peering with border.

Creating a vPC Setup

You can create a vPC setup for a pair of switches in the external fabric. Ensure that the switches are of the same role and connected to each other.

Procedure

Step 1 Right-click one of the two designated **vPC switches** and choose **vPC Pairing**.

The **Select vPC peer** dialog box comes up. It contains a list of potential peer switches. Ensure that the **Recommended** column for the vPC peer switch is updated as **true**.

Note Alternatively, you can also navigate to the **Tabular view** from the **Actions** pane. Choose a switch in the **Switches** tab and click **vPC Pairing** to create, edit, or unpair a vPC pair. However, you can use this option only when you choose a Cisco Nexus switch.

Step 2 Click the radio button next to the vPC peer switch and choose **vpc_pair** from the **vPC Pair Template** drop-down list. Only templates with the **VPC_PAIR** template sub type are listed here.

The **vPC Domain** and **vPC Peerlink** tabs appear. You must fill up the fields in the tabs to create the vPC setup. The description for each field is displayed at the extreme right.

vPC Domain tab: Enter the vPC domain details.

vPC+: If the switch is part of a FabricPath vPC + setup, enable this check box and enter the **FabricPath switch ID** field.

Configure VTEPs: Check this check box to enter the source loopback IP addresses for the two vPC peer VTEPs and the loopback interface secondary IP address for NVE configuration.

NVE interface: Enter the NVE interface. vPC pairing will configure only the source loopback interface. Use the freeform interface manager for additional configuration.

NVE loopback configuration: Enter the IP address with the mask. vPC pairing will only configure primary and secondary IP address for loopback interface. Use the freeform interface manager for additional configuration.

vPC Peerlink tab: Enter the vPC peer-link details.

Switch Port Mode: Choose **trunk** or **access** or **fabricpath**.

If you select trunk, then corresponding fields (**Trunk Allowed VLANs** and **Native VLAN**) are enabled. If you select **access**, then the **Access VLAN** field is enabled. If you select **fabricpath**, then the trunk and access port related fields are disabled.

Step 3 Click **Save**.

The **vPC setup** is created.

To update vPC setup details, do the following:

a. Right-click a vPC switch and choose vPC Pairing.

The **vPC peer** dialog box comes up.

b. Update the field(s) as needed.

When you update a field, the **Unpair** icon changes to **Save**.

c. Click **Save** to complete the update.

After creating a vPC pair, you can view vPC details in **vPC Overview** window.

Undeploying a vPC Setup

Procedure

Step 1 Right-click a **vPC** switch and choose **vPC Pairing**.

The vPC peer screen comes up.

Step 2 Click **Unpair** at the bottom right part of the screen.

The vPC pair is deleted and the fabric topology window appears.

Step 3 Click **Deploy Config**.

Step 4 (Optional) Click the value under the **Recalculate Config** column.

View the pending configuration in the **Config Preview** dialog box. The following configuration details are deleted on the switch when you unpair: vPC feature, vPC domain, vPC peerlink, vPC peerlink member ports, loopback secondary IPs, and host vPCs. However, the host vPCs and port channels are not removed. Delete these port channels from the **Interfaces** window if required.

Note Resync the fabric if it is out of sync.

When you unpair, only PTIs are deleted for following features, but the configuration is not cleared on the switch during **Deploy Config**: NVE configuration, LACP feature, fabricpath feature, nv overlay feature, loopback primary ID. In case of host vPCs, port channels and their member ports are not cleared. You can delete these port channels from the **Interfaces** window if required. You can continue using these features on the switch even after unpairing.

If you are migrating from fabricpath to VXLAN, you need to clear the configuration on the device before deploying the VXLAN configuration.

IPFM Fabrics

This section describes how to configure fabrics related to IP Fabric for Media (IPFM). The IPFM fabric feature is a part of LAN fabric. To enable the IPFM fabrics feature, you must have enabled the following features on the LAN Fabric in **Settings > Feature Management**:

- IP Fabric for Media – Starts microservices corresponding to media controller.
- PTP Monitoring – Enable if required. However, PTP monitoring is used for IPFM though it is independent of IPFM.
- Performance Monitoring – Provides for base interface monitoring.

Beginning from Nexus Dashboard Fabric Controller version 12.0.1a, the IPFM fabric templates are of the following types:

- IPFM Classic Fabric – Use the IPFM_Classic fabric template to bring in switches from an existing IPFM fabric. This template works like an external or LAN Classic Fabric where only basic switch configuration such as management VRF/interface, and hostname can be imported. You can set the attribute of the fabric to Read/Write or Read-only. For the Read-only fabric, enable the monitor mode. This template supports IPFM_Classic and Generic_Multicast technologies.
- IPFM Easy Fabric – Use the Easy_Fabric_IPFM template to create a new IPFM fabric with Easy Fabric management and build an underlay network for the IPFM fabric.

Note IPFM Easy Fabric supports only Greenfield deployments.

We recommend that you deploy a 3-node cluster if you've more than 35 switches in your NDFC deployment. If you are using a Virtual Nexus Dashboard Cluster before you begin, ensure that the Persistent IP address and required settings are enabled for telemetry. Refer to [Cisco Nexus Dashboard Fabric Controller Deployment Guide](#).

For a fresh installation, you can choose either IPFM Easy Fabric or IPFM Classic Fabric, based on your requirement.

Creating IPFM Fabrics

Perform the following procedures to create IPFM fabrics:

1. Create the required IPFM Fabric using the appropriate templates and set the parameters. For more information about IPFM_Classic template, see [Creating an IPFM Classic Fabric, on page 80](#). For more information about Easy_Fabric_IPFM template, see [Creating an IPFM Easy Fabric, on page 83](#).
2. Add switches to the fabric and set the switch roles (only spine and leaf are supported for IPFM Fabric). For more information about adding switches, discovering existing and new switches, assigning roles, and deploying switches, see [Switches](#).

Note IPFM Easy Fabric supports only Greenfield deployments.

3. In the **Fabric Overview** window of your fabric, choose **Recalculate Config** from the **Actions** drop-down list. Then, in the **Deploy Configuration** window, click the **Deploy** button to deploy the configuration. For more information, see [Fabric Overview, on page 118](#).

IPFM Easy Fabric: The underlay config of each switch is calculated based on the fabric settings, switch role, and switch platform.

IPFM Classic Fabric: If you choose to have Nexus Dashboard Fabric Controller manage the interfaces for your fabric, perform `host_port_resync/Interface Config Resync` to complete the migration process for the switch. For more information about host port resync, see [Sync up Out-of-Band Switch Interface Configurations, on page 33](#).

If you want to edit or delete an IPFM fabric, see [Editing an IPFM Fabric, on page 90](#) or [Deleting an IPFM Fabric, on page 90](#) respectively.

4. Edit the existing interfaces as required. For more information, see [Editing an Interface for IPFM Fabrics, on page 93](#). For more information about any new logical interfaces, see [Creating an Interface for IPFM Fabrics, on page 91](#).

Creating an IPFM Classic Fabric

This section describes the procedure to create an IPFM classic fabric from the **IPFM_Classic fabric** template.

Procedure

-
- Step 1** In the **LAN Fabrics** window, from the **Actions** drop-down list, choose **Create Fabric**.
The **Create Fabric** window appears.
- Note** When you log in for the first time, the **Lan Fabrics** window displays no entries for IPFM fabrics. After you create a fabric, it is displayed in the **Lan Fabrics** window.
- Step 2** In the **Create Fabric** window, enter a fabric name and click **Choose Template**.
The **Select Fabric Template** window appears.
- Step 3** Either search or scroll and choose the **IPFM_Classic** fabric template. Click **Select**.
The **Create Fabric** window displays the following elements:
- Fabric Name** - Displays the fabric name you entered.
 - Pick Template** - Displays the template type that you selected. If you want to change the template, click it. The **Select Fabric Template** window appears. Repeat the current step.
 - General Parameters, Advanced, and Bootstrap** tabs - Display the fabric settings for creating an IPFM classic fabric.
- Step 4** The **General Parameters** tab is displayed by default. The fields in this tab are:
- Fabric Technology** - Choose one of the following technologies from the drop-down list:
 - **IPFM_Classic**
 - **Generic_Multicast**
 - Fabric Monitor Mode** - Select this check box to only monitor the fabric, but not deploy the configuration.

Enable Performance Monitoring - Select this check box to monitor the performance of the fabric.

Step 5 Click the **Advanced** tab. The fields in this tab are:

Power Supply Mode - Choose the appropriate power supply mode.

Enable AAA IP Authorization - Enables AAA IP authorization, when IP Authorization is enabled in the AAA Server.

Enable NDFC as Trap Host - Select this check box to enable Nexus Dashboard Fabric Controller as a trap host.

Enable CDP for Bootstrapped Switch - Enables CDP on management interface.

Inband Mgmt - For External and Classic LAN Fabrics, this knob enables Nexus Dashboard Fabric Controller to import and manage of switches with inband connectivity (reachable over switch loopback, routed, or SVI interfaces), in addition to management of switches with out-of-band connectivity (that is, reachable over switch mgmt0 interface). The only requirement is that for Inband managed switches, there should be IP reachability from Nexus Dashboard Fabric Controller to the switches through the eth2, that is, the inband interface. After enabling Inband management, during discovery, provide the IPs of all the switches to be imported using Inband Management and set maximum hops to 0. Nexus Dashboard Fabric Controller has a pre-check that validates that the Inband managed switch IPs are reachable over the eth2 interface. Once the pre-check has passed, Nexus Dashboard Fabric Controller then discovers and learns about the interface on that switch that has the specified discovery IP in addition to the VRF that the interface belongs to. As part of the process of switch import/discovery, this information is captured in the baseline intent that is populated on the Nexus Dashboard Fabric Controller. For more information, see [Inband Management in External Fabrics and LAN Classic Fabrics, on page 98](#).

Note Bootstrap or POAP is only supported for switches that are reachable over out-of-band connectivity, that is, over switch mgmt0. The various POAP services on the Nexus Dashboard Fabric Controller are typically bound to the eth1 or out-of-band interface. In scenarios, where the Nexus Dashboard Fabric Controller eth0/eth1 interfaces reside in the same IP subnet, the POAP services are bound to both interfaces.

Fabric Freeform - You can apply configurations globally across all the devices discovered in the external fabric using this freeform field.

AAA Freeform Config - Specifies the AAA freeform configurations.

Step 6 Click the **Bootstrap** tab. The fields in this tab are:

Enable Bootstrap (For NX-OS Switches Only) - Select this check box to enable the bootstrap feature for only Cisco Nexus switches. When this check box is selected, automatic IP assignment for POAP is enabled.

After you enable bootstrap, you can enable the DHCP server for automatic IP address assignment for POAP using the following method:

- **External DHCP Server** - Enter information about the external DHCP server in the **Switch Mgmt Default Gateway** and **Switch Mgmt IP Subnet Prefix** fields.
- **Local DHCP Server** - Enable the **Local DHCP Server** check box and enter details for the remaining mandatory fields.

Enable Local DHCP Server – Select this check box to initiate enabling of automatic IP address assignment through the local DHCP server. When you select this check box, all the remaining fields become editable.

DHCP Version - Select either DHCPv4 or DHCPv6 from the drop-down list. When you select DHCPv4, the **Switch Mgmt IPv6 Subnet Prefix** field is disabled. If you select DHCPv6, the **Switch Mgmt IP Subnet Prefix** is disabled.

Note Cisco Nexus Dashboard Fabric Controller IPv6 POAP is not supported with Cisco Nexus 7000 Series Switches. Cisco Nexus 9000 and 3000 Series Switches support IPv6 POAP only when switches are either L2 adjacent (eth1 or out-of-band subnet must be a /64) or they are L3 adjacent residing in some IPv6 /64 subnet. Subnet prefixes except /64 are not supported.

If you don't select this check box, Nexus Dashboard Fabric Controller uses the remote or external DHCP server for automatic IP address assignment.

DHCP Scope Start Address and **DHCP Scope End Address** – Specifies the first and the last IP addresses of the IP address range to be used for the switch out of band POAP.

Switch Mgmt Default Gateway– Specifies the default gateway for the management VRF on the switch.

Switch Mgmt IP Subnet Prefix – Specifies the prefix for the Mgmt0 interface on the switch. The prefix should be between 8 and 30.

DHCP scope and management default gateway IP address specification - If you specify the management default gateway IP address 10.0.1.1 and subnet mask 24, ensure that the DHCP scope is within the specified subnet, between 10.0.1.2 and 10.0.1.254.

Switch Mgmt IPv6 Subnet Prefix – Specifies the IPv6 prefix for the Mgmt0 interface on the switch. The prefix should be between 64 and 126. This field is editable if you enable IPv6 for DHCP.

Bootstrap Freeform Config – (Optional) Enter extra commands as needed. For example, if you are using AAA or remote authentication related configurations, you need to add these configurations in this field to save the intent. After the devices boot up, they contain the intent defined in the **Bootstrap Freeform Config** field.

Copy-paste the running-config to a **freeform config** field with correct indentation, as seen in the running configuration on the NX-OS switches. The freeform config must match the running-config. For more information about *Resolving Freeform Config Errors in Switches*, see [Enabling Freeform Configurations on Fabric Switches](#), on page 43.

DHCPv4/DHCPv6 Multi Subnet Scope – Specifies the field to enter one subnet scope per line. This field is editable after you select the **Enable Local DHCP Server** check box.

The format of the scope should be defined as:

DHCP Scope Start Address,DHCP Scope End Address,Switch Management Default Gateway,Switch Management Subnet Prefix

For example, 10.6.0.2,10.6.0.9,10.6.0.1,24.

Step 7 Click **Save**.

The IPFM classic fabric is created and displayed in the table in the **Lan Fabrics** window.

What to do next

After creating the fabric, perform Recalculate Config and deploy the configuration to the switches. For more information, see [Fabric Overview](#), on page 118.

Then, edit or create an interface as appropriate. For more information, see [Interface Configuration for IPFM Fabrics](#).

Creating an IPFM Easy Fabric

This section describes the procedure to create an IPFM Easy Fabric from the Easy_Fabric_IPFM fabric template.

Procedure

- Step 1** In the **LAN Fabrics** window, from the **Actions** drop-down list, choose **Create Fabric**.
The **Create Fabric** window appears.
- Note** When you log in for the first time, the Lan Fabrics table has no entries. After you create a fabric, it is displayed in the **Lan Fabrics** window.
- Step 2** In the **Create Fabric** window, enter a fabric name and click **Choose Template**.
The **Select Fabric Template** window appears.
- Step 3** Either search or scroll and choose the **Easy_Fabric_IPFM** template. Click **Select**.
The **Create Fabric** window displays the following elements:
- Fabric Name** - Displays the fabric name you entered.
 - Pick Template** - Displays the template type that you selected. If you want to change the template, click it. The **Select Fabric Template** screen appears. Repeat the current step.
 - General Parameters, Multicast, Protocols, Advanced, Manageability, and Bootstrap** tabs - Display the fabric settings for creating an IPFM easy fabric.
- Step 4** The **General Parameters** tab is displayed by default. The fields in this tab are:
- Fabric Interface Numbering** - Supports only numbered (point-to-point, that is, **p2p**) networks.
 - Fabric Subnet IP Mask** - Specifies the subnet mask for the fabric interface IP addresses.
 - Fabric Routing Protocol** - The IGP used in the fabric, OSPF, or IS-IS.
 - Fabric Routing Loopback Id**: The loopback interface ID is populated as 0 since loopback0 is usually used for fabric underlay IGP peering purposes. The valid value ranges from 0 to 1023.
 - Manual Fabric IP Address Allocation** - Select this check box to disable dynamic allocation of fabric IP address.
 - By default, Nexus Dashboard Fabric Controller allocates the underlay IP address resources (for loopbacks, fabric interfaces, and so on) dynamically from the defined pools. If you select the check box, the allocation scheme switches to static, and some of the dynamic IP address range fields are disabled.
 - For static allocation, the underlay IP address resources must be populated into the Resource Manager (RM) using REST APIs.
 - Refer the *Cisco Nexus Dashboard Fabric Controller REST API Reference Guide, Release 12.0.1a* for more details. The REST APIs must be invoked after the switches are added to the fabric, and before you use the **Save & Deploy** option.

- Changing from static to dynamic allocation keeps the current IP resource usage intact. Only future IP address allocation requests are taken from dynamic pools.

Fabric Routing Loopback IP Range - Specifies the range of loopback IP addresses for the protocol peering.

Fabric Subnet IP Range - IP addresses for underlay P2P routing traffic between interfaces.

Enable Performance Monitoring - Select this check box to monitor the performance of the fabric.

Step 5

Click the **Multicast** tab. The fields in this tab are:

Enable NBM Passive Mode - Select this check box to enable NBM mode to pim-passive. If you enable NBM passive mode, the switch ignores all RP and MSDP configurations. This is a mandatory check box. If you select this check box, the remaining fields and check boxes are disabled. For more information, refer to the [Configuring an NBM VRF for Static Flow Provisioning](#) section of the *Cisco Nexus 9000 Series NX-OS IP Fabric for Media Solution Guide, Release 10.2(x)*.

Enable ASM - Select this check box to enable groups with receivers sending (*,G) joins. If you select this check box, the ASM-related section is enabled.

NBM Flow ASM Groups for default VRF (w/wo SPT-Threshold Infinity) - This section comprises ASM-related information.

- Click the expander arrow next to the title of this section to collapse or expand the section.
- Use the **Actions** drop-down list to add, edit, or delete the ASM groups in the table.
 - **Add** - Choose this option to open the **Add Item** window. In the **Add Item** window, perform the following steps:
 - a. Enter the appropriate values in the fields and check or clear the check box as follows:
 - **Group_Address** - Specify the IP address for the NBM flow ASM group subnet.
 - **Prefix** - Specify the subnet mask length for the ASM group subnet. The valid value for the subnet mask length ranges from 4 to 32. For example, 239.1.1.0/25 is the group address with the prefix.
 - **Enable_SPT_Threshold** - Check this check box to enable SPT threshold infinity.
 - b. Click **Save** to add the configured NBM flow ASM groups to the table or click **Cancel** to discard the values.
 - **Edit** - Select the check box next to the group address and then choose this option to open the **Edit Item** window. Open the edit item and edit the ASM group parameters. Click **Save** to update the values in the table or click **Cancel** to discard the values.
 - **Delete** - Select the check box next to the group address and then choose this option to delete the ASM group from the table.
- The table displays the values for group address, prefix, and enable SPT threshold.

RP Loopback Id - The loopback ID used for the rendezvous point (RP), for multicast protocol peering purposes in the fabric underlay. The valid values range from 0 to 1023.

Fabric RP Loopback IP Range - Specifies the RP Loopback IP address range.

Step 6

Click the **Protocols** tab. The fields in this tab are:

Fabric Routing Protocol Tag - Specifies the routing process tag for the fabric.

OSPF Area Id - The OSPF area ID, if OSPF is used as the IGP within the fabric.

Note The OSPF or IS-IS authentication fields are enabled based on your selection in the **Fabric Routing Protocol** field in the **General Parameters** tab.

Enable OSPF Authentication - Select the check box to enable OSPF authentication. Clear the check box to disable it. If you enable this field, the OSPF Authentication Key ID and OSPF Authentication Key fields get enabled.

OSPF Authentication Key ID - The key ID is populated.

OSPF Authentication Key - The OSPF authentication key must be the 3DES key from the switch.

Note Plain text passwords are not supported. Log in to the switch, retrieve the encrypted key and enter it in this field. Refer the [Retrieving the Authentication Key](#) , on page 88 section for details.

IS-IS Level - Select the IS-IS level from this drop-down list.

Enable IS-IS Network Point-to-Point - Select the check box to enable network point-to-point on fabric interfaces which are numbered.

Enable IS-IS Authentication - Select the check box to enable IS-IS authentication. Clear the check box to disable it. If you enable this field, the IS-IS authentication fields are enabled.

IS-IS Authentication Keychain Name - Enter the Keychain name, for example, CiscoisisAuth.

IS-IS Authentication Key ID - The Key ID is populated.

IS-IS Authentication Key - Enter the Cisco Type 7 encrypted key.

Note Plain text passwords are not supported. Log in to the switch, retrieve the encrypted key and enter it in this field. Refer the [Retrieving the Authentication Key](#) , on page 88 section for details.

Enable PIM Hello Authentication - Enables the PIM hello authentication.

PIM Hello Authentication Key - Specifies the PIM hello authentication key.

Step 7

Click the **Advanced** tab. The fields in this tab are:

Intra Fabric Interface MTU - Specifies the MTU for the intra fabric interface. This value must be an even number. The valid values range from 576 to 9216. This is a mandatory field.

Layer 2 Host Interface MTU - Specifies the MTU for the layer 2 host interface. This value must be an even number. The valid values range from 1500 to 9216.

Power Supply Mode - Choose the appropriate power supply mode that will be the default mode for the fabric from the drop-down list. This is a mandatory field.

Enable CDP for Bootstrapped Switch - Select this check box to enable CDP on management (mgmt0) interface for bootstrapped switch. By default, for bootstrapped switches, CDP is disabled on the mgmt0 interface.

Enable AAA IP Authorization - Enables AAA IP authorization, when IP Authorization is enabled in the remote authentication server. This is required to support Nexus Dashboard Fabric Controller in scenarios where customers have strict control of which IP addresses can have access to the switches.

Enable NDFC as Trap Host - Select this check box to enable Nexus Dashboard Fabric Controller as an SNMP trap destination. Typically, for a native HA Nexus Dashboard Fabric Controller deployment, the eth1

VIP IP address will be configured as SNMP trap destination on the switches. By default, this check box is enabled.

Enable Precision Time Protocol (PTP) - Enables PTP across a fabric. When you select this check box, PTP is enabled globally and on intra-fabric interfaces. Additionally, the **PTP Source Loopback Id** and **PTP Domain Id** fields are editable. For more information, see [Precision Time Protocol for Easy Fabric, on page 28](#).

PTP Source Loopback Id - Specifies the loopback interface ID Loopback that is used as the Source IP Address for all PTP packets. The valid values range from 0 to 1023. The PTP loopback ID cannot be the same as RP loopback ID. Otherwise, an error appears. The PTP loopback ID can be the same as BGP loopback or user-defined loopback which is created from Nexus Dashboard Fabric Controller. The PTP loopback will be created automatically if it is not created.

PTP Domain Id - Specifies the PTP domain ID on a single network. The valid values range from 0 to 127.

PTP Profile - Select a PTP profile from the list. PTP profile is enabled only on ISL links. The supported PTP Profiles are IEEE-1588v2, SMPTE-2059-2, and AES67-2015.

Leaf Freeform Config - Add CLIs that should be added to switches that have the Leaf, Border, and Border Gateway roles.

Spine Freeform Config - Add CLIs that should be added to switches with a Spine, Border Spine, Border Gateway Spine, and Super Spine roles.

Intra-fabric Links Additional Config - Add CLIs that should be added to the intra-fabric links.

Step 8

Click the **Manageability** tab. The fields in this tab are:

DNS Server IPs - Specifies the comma separated list of IP addresses (v4/v6) of the DNS servers.

DNS Server VRFs - Specifies one VRF for all DNS servers or a comma separated list of VRFs, one per DNS server.

NTP Server IPs - Specifies comma separated list of IP addresses (v4/v6) of the NTP server.

NTP Server VRFs - Specifies one VRF for all NTP servers or a comma separated list of VRFs, one per NTP server.

Syslog Server IPs - Specifies the comma separated list of IP addresses (v4/v6) IP address of the syslog servers, if used.

Syslog Server Severity - Specifies the comma separated list of syslog severity values, one per syslog server. The minimum value is 0 and the maximum value is 7. To specify a higher severity, enter a higher number.

Syslog Server VRFs - Specifies one VRF for all syslog servers or a comma separated list of VRFs, one per syslog server.

AAA Freeform Config - Specifies the AAA freeform Configurations.

If AAA configurations are specified in the fabric settings, **switch_freeform** PTI with source as **UNDERLAY_AAA** and description as **AAAConfigurations** will be created.

Step 9

Click the **Bootstrap** tab. The fields in this tab are:

Enable Bootstrap - Select this check box to enable the bootstrap feature. Bootstrap allows easy day-0 import and bring-up of new devices into an existing fabric. Bootstrap leverages the NX- OS POAP functionality.

After you enable bootstrap, you can enable the DHCP server for automatic IP address assignment for POAP using one of the following methods:

- **External DHCP Server** - Enter information about the external DHCP server in the **Switch Mgmt Default Gateway** and **Switch Mgmt IP Subnet Prefix** fields.
- **Local DHCP Server** - Enable the **Local DHCP Server** check box and enter details for the remaining mandatory fields.

Enable Local DHCP Server - Select this check box to initiate enabling of automatic IP address assignment through the local DHCP server. When you select this check box, the **DHCP Scope Start Address** and **DHCP Scope End Address** fields become editable.

If you do not select this check box, Nexus Dashboard Fabric Controller uses the remote or external DHCP server for automatic IP address assignment.

DHCP Version - Select DHCPv4 or DHCPv6 from this drop-down list. When you select DHCPv4, the **Switch Mgmt IPv6 Subnet Prefix** field is disabled. If you select DHCPv6, the **Switch Mgmt IP Subnet Prefix** field is disabled.

Note Cisco Nexus 9000 and 3000 Series Switches support IPv6 POAP only when switches are either L2 adjacent (eth1 or out-of-band subnet must be a /64) or they are L3 adjacent residing in some IPv6 /64 subnet. Subnet prefixes except /64 are not supported.

DHCP Scope Start Address - Specifies the first IP address in the IP address range to be used for the switch out-of-band POAP.

DHCP Scope End Address - Specifies the last IP address in the IP address range to be used for the switch out-of-band POAP.

Switch Mgmt Default Gateway - Specifies the default gateway for the management VRF on the switch.

Switch Mgmt IP Subnet Prefix - Specifies the prefix for the Mgmt0 interface on the switch. The prefix should be between 8 and 30.

DHCP scope and management default gateway IP address specification - If you specify the management default gateway IP address 10.0.1.1 and subnet mask 24, ensure that the DHCP scope is within the specified subnet, between 10.0.1.2 and 10.0.1.254.

Switch Mgmt IPv6 Subnet Prefix - Specifies the IPv6 prefix for the Mgmt0 interface on the switch. The prefix should be between 64 and 126. This field is editable if you enable IPv6 for DHCP.

Enable AAA Config - Select this check box to include AAA configurations from the **Manageability** tab as part of the device startup config post bootstrap.

Bootstrap Freeform Config - (Optional) Enter additional commands as needed. For example, if you require some additional configurations to be pushed to the device and be available post device bootstrap, they can be captured in this field, to save the desired intent. After the devices boot up, they will contain the configuration defined in the **Bootstrap Freeform Config** field.

Copy-paste the running-config to a **freeform config** field with correct indentation, as seen in the running configuration on the NX-OS switches. The freeform config must match the running-config. For more information about *Resolving Freeform Config Errors in Switches*, see [Enabling Freeform Configurations on Fabric Switches](#), on page 43.

DHCPv4/DHCPv6 Multi Subnet Scope - Specifies the field to enter one subnet scope per line. This field is editable after you check the **Enable Local DHCP Server** check box.

The format of the scope should be defined as:

DHCP Scope Start Address, DHCP Scope End Address, Switch Management Default Gateway, Switch Management Subnet Prefix

For example, 10.6.0.2,10.6.0.9,10.6.0.1,24

Step 10

Click **Save**.

The Easy Fabric IPFM is created and displayed in the table in the **Lan Fabrics** window.

What to do next

After creating the fabric, perform Recalculate Config and deploy the configuration to the switches. For more information, see [Fabric Overview, on page 118](#).

Then, edit or create an interface as appropriate. For more information, see [Interface Configuration for IPFM Fabrics](#).

Retrieving the Authentication Key**Retrieving the 3DES Encrypted OSPF Authentication Key**

1. SSH into the switch.
2. On an unused switch interface, enable the following:

```
config terminal
  feature ospf
  interface Ethernet1/1
    no switchport
    ip ospf message-digest-key 127 md5 ospfAuth
```

In the example, **ospfAuth** is the unencrypted password.

Note This Step 2 is needed when you want to configure a new key.

3. Enter the **show run interface Ethernet1/1** command to retrieve the password.

```
Switch # show run interface Ethernet1/1
interface Ethernet1/1
  no switchport
  ip ospf message-digest key 127 md5 3 sd8478f4fsw4f4w34sd8478fsdfw
  no shutdown
```

The sequence of characters after **md5 3** is the encrypted password.

4. Update the encrypted password into the **OSPF Authentication Key** field.

Retrieving the Encrypted IS-IS Authentication Key

To get the key, you must have access to the switch.

1. SSH into the switch.
2. Create a temporary keychain.

```
config terminal
  key chain isis
  key 127
  key-string isisAuth
```

In the example, **isisAuth** is the plaintext password. This will get converted to a Cisco type 7 password after the CLI is accepted.

3. Enter the **show run | section “key chain”** command to retrieve the password.

```
key chain isis
  key 127
    key-string 7 071b245f5a
```

The sequence of characters after key-string 7 is the encrypted password. Save it.

4. Update the encrypted password into the ISIS Authentication Key field.
5. Remove any unwanted configuration made in Step 2.

Retrieving the 3DES Encrypted BGP Authentication Key

1. SSH into the switch and enable BGP configuration for a non-existent neighbor.

Note Non-existent neighbor configuration is a temporary BGP neighbor configuration for retrieving the password.

```
router bgp
  neighbor 10.2.0.2 remote-as 65000
  password bgpAuth
```

In the example, **bgpAuth** is the unencrypted password.

2. Enter the **show run bgp** command to retrieve the password. A sample output:

```
neighbor 10.2.0.2
  remote-as 65000
  password 3 sd8478fswerdfw3434fsw4f4w34sdsd8478fswerdfw3434fsw4f4w3
```

The sequence of characters after password 3 is the encrypted password.

3. Update the encrypted password into the **BGP Authentication Key** field.
4. Remove the BGP neighbor configuration.

Retrieving the Encrypted BFD Authentication Key

1. SSH into the switch.
2. On an unused switch interface, enable the following:

```
switch# config terminal
switch(config)# int e1/1
switch(config-if)# bfd authentication keyed-SHA1 key-id 100 key cisco123
```

In the example, **cisco123** is the unencrypted password and the key ID is **100**.

Note This Step 2 is needed when you want to configure a new key.

3. Enter the **show running-config interface** command to retrieve the key.

```

switch# show running-config interface Ethernet1/1

interface Ethernet1/1
description connected-to- switch-Ethernet1/1
no switchport
mtu 9216
bfd authentication Keyed-SHA1 key-id 100 hex-key 636973636F313233
no ip redirects
ip address 10.4.0.6/30
no ipv6 redirects
ip ospf network point-to-point
ip router ospf 100 area 0.0.0.0
no shutdown

```

The BFD key ID is **100** and the encrypted key is **636973636F313233**.

4. Update the key ID and key in the **BFD Authentication Key ID** and **BFD Authentication Key** fields.

Editing an IPFM Fabric

In the **LAN Fabrics** window, select the fabric that you want to edit. From the **Actions** drop-down list, choose **Edit Fabric**. Edit the fields in the template as required. Click **Save**.

Note After the fabric settings are changed, perform Recalculate Config, and deploy the configuration to the switches.

Deleting an IPFM Fabric

In the **LAN Fabrics** window, select the fabric that you want to delete. From the **Actions** drop-down list, choose **Delete Fabric**. When a message appears asking whether you want to delete the fabric, click **Confirm**.

Interface Configuration for IPFM Fabrics

Cisco Nexus Dashboard Fabric Controller Web UI allows you to configure IPFM External-Links for each switch in your fabric. The external device can connect to the network through this interface by marking it as IPFM External-Link.

Note A user with the network operator role in Nexus Dashboard Fabric Controller cannot save, deploy, undeploy, or edit interface configs.

Beginning with Nexus Dashboard Fabric Controller Release 12.0.1a, Interfaces in IPFM fabrics are managed by the Nexus Dashboard Fabric Controller Interface Manager.

The default interface policy for IPFM is `int_ipfm_l3_port`.

The non-fabric ethernet interface policy templates for IPFM fabrics are `int_ipfm_l3_port`, `int_ipfm_access_host`, and `int_ipfm_trunk_host`.

The port channel interface policy templates for IPFM fabrics are `int_ipfm_port_channel_access_host`, `int_ipfm_port_channel_trunk_host`, `int_ipfm_port_channel_access_member`, and `int_ipfm_port_channel_trunk_member`.

The Switch Virtual Interface (SVI) template for IPFM fabrics is `int_ipfm_vlan`.

Creating an Interface for IPFM Fabrics

This section describes the procedure to create a new interface for an IPFM fabric based on the template that you have selected from the available IPFM fabric interface templates.

Note IPFM fabrics do not support V6 underlay.

Procedure

- Step 1** Navigate to the **Fabric Overview** window for your fabric and click the **Interfaces** tab.
- Step 2** Choose **Create new interface** from the **Actions** drop-down list.
The **Create new interface** window appears.
- Step 3** Select either Port Channel, Loopback, or SVI as the interface type for IPFM.
- Step 4** Select a device from the drop-down list. The switches (spine and leaf) that are a part of the fabric are displayed in the drop-down list.
- Step 5** Enter the Port Channel ID, Loopback ID, or VLAN ID, based on your choice of the interface type.
- Step 6** Click the **No Policy Selected** link to select a policy that is specific to IPFM. In the **Select Attached Policy Template** dialog box, choose the required interface policy template and click **Save**.
- Step 7** Enter the appropriate values in the **Policy Options** area. Note that the appropriate Policy Options fields are displayed based on the policy.
- **Type - Port Channel**
 - Port Channel Member Interfaces** - Specify a list of member interfaces, for example, e1/5,eth1/7-9.
 - Port Channel Mode** - Select one of the following channel mode options: on, active, or passive.
 - Enable BPDU Guard** - Select one of the following options for spanning-tree Bridge Protocol Data Unit (BPDU) guard:
 - true - enables bdpuguard
 - false - disables bdpuguard
 - no - returns to default settings
 - Enable Port Type Fast** - Select this check box to enable spanning-tree edge port behavior.
 - MTU** - Specify the maximum transmission unit (MTU) for the Port Channel or the MTU for the interface. The valid value range for MTU for the interface is from 576 to 9216.
 - SPEED** - Specify the port channel speed or the interface speed.
 - Access Vlan** - Specify the VLAN for the access port.
 - Trunk Allowed Vlans** - Enter one of the following values:
 - none
 - all
 - vlan ranges, for example, 1-200, 500-2000, 3000)

Enable PTP - Select this check box to enable Precision Time Protocol (PTP) for the host interface for the IPFM fabric. For more information about PTP, see [PTP Configuration for IPFM Fabrics, on page 93](#).

PTP Profile - Select a PTP profile from the drop-down list: **IEEE-1588v2**, **SMPTE-2059-2**, or **AES67-2015**.

PTP Vlan - Specifies the PTP vlan for member interface when PTP is enabled.

Port Channel Description - Enter description for the port channel.

Freeform Config - Enter additional CLI for the port channel if required.

Enable Port Channel - Select this check box to enable the port channel.

• **Type - Loopback**

Interface VRF - Enter the name of the interface VRF. Enter **default** for default VRF.

Loopback IP - Enter an IPv4 address for the loopback interface.

Loopback IPv6 address - Enter an IPv6 address for the loopback interface if the VRF is non-default. For default VRF add the IPv6 address in the freeform.

Route-Map TAG - Enter the Route-Map tag associated with the interface IP.

Interface Description - Enter description for the interface. The maximum size limit is 254 characters.

Freeform Config - Enter additional CLI for the loopback interface if required.

Enable Interface - Select this check box to enable the interface.

• **Type - SVI**

Interface VRF - Enter the name of the interface VRF. Enter **default** for default VRF.

VLAN Interface IP - Enter IP address of the VLAN interface.

IP Netmask Length - Specify the IP netmask length used with the IP address. The valid value range is from 1 to 31.

Routing TAG - Enter the routing tag associated with the interface IP.

MTU - Specify the maximum transmission unit (MTU) for the Port Channel or the MTU for the interface. The valid value range for MTU for the interface is from 576 to 9216.

Disable IP redirects - Select this check box to disable both IPv4 and IPv6 redirects on the interface.

IPFM External-Link - Select this check box to specify that the interface is connected to an external router.

Interface Description - Enter description for the interface. The maximum size limit is 254 characters.

Freeform Config - Enter additional CLI for the VLAN interface if required.

Interface Admin State - Select this check box to enable admin state for the interface.

Step 8 Based on your requirements, click one of the following buttons:

- Save - Click **Save** to save the configuration changes.
- Preview - Click **Preview** to open the **Preview interfaces configuration** window and view the details.

- Deploy - Click **Deploy** to configure the interfaces.

What to do next

If you want to edit the interface, see [Editing an Interface for IPFM Fabrics, on page 93](#).

If your interface is ready, add a policy for configuring the IPFM fabric. For more information, see [Adding a Policy for Configuring an IPFM Fabric, on page 94](#)

PTP Configuration for IPFM Fabrics

The Precision Time Protocol (PTP) is a protocol used to synchronize clocks throughout a computer network. When creating an interface, if you enable the **Enable PTP** check box, PTP is enabled across the fabric and on all the intrafabric interfaces. The supported PTP profiles for IPFM fabrics are **IEEE-1588v2**, **SMPTE-2059-2**, and **AES67-2015**.

A few things to note about the per-interface PTP profile for nonfabric ethernet interfaces are as follows:

- You must enable PTP and select PTP profile on each nonfabric ethernet interface.
- PTP profile can be different from the fabric level one.
- PTP must be enabled in the fabric settings before PTP can be configured on a nonfabric ethernet interface.

If PTP is disabled from the fabric settings, the PTP config will be removed from all the interfaces, that is, both the fabric and nonfabric interfaces.

For more information about PTP monitoring for IPFM fabrics, see [PTP \(Monitoring\)](#).

Editing an Interface for IPFM Fabrics

This section describes the procedure to edit an existing IPFM fabric interface template. You can either change a template or edit the values for any of the editable parameters in the **Policy Options** area.

Procedure

- Step 1** Navigate to the **Fabric Overview** window for your fabric and click the **Interfaces** tab.
- Step 2** Choose **Edit interface** from the **Actions** drop-down list.
The **Edit interface** window appears.
- Step 3** This step is optional. To change a policy, click the policy link and select a policy that is specific to IPFM.
In the **Select Attached Policy Template** dialog box, choose the required interface policy template and click **Save**.
- Step 4** Edit the required values in the **Policy Options** area. Note that the appropriate Policy Options fields are displayed based on the policy. For more information about the parameters, see [Creating an Interface for IPFM Fabrics, on page 91](#).

Note that the following fields are specific to the int_ipfm_13_port policy:

IPFM Unicast Bandwidth Percentage - Specifies the dedicated percentage of bandwidth to the unicast traffic. The remaining percentage is automatically reserved for the multicast traffic. If this field is left blank, Global Unicast Bandwidth reservation is used.

IPFM External-Link - Select this check box to specify that the interface is connected to an external router.

Border Router - Select this check box to enables the border router configuration on the interface. The interface is a boundary of a PIM domain.

Interface Description - Enter description for the interface. The maximum size limit is 254 characters.

Step 5 Based on your requirements, click one of the following buttons:

- Save - Click **Save** to save the configuration changes.
- Preview - Click **Preview** to open the **Preview interfaces configuration** window and view the details.
- Deploy - Click **Deploy** to configure the interfaces.

What to do next

Add a policy for configuring the IPFM fabric. For more information, see [Adding a Policy for Configuring an IPFM Fabric, on page 94](#).

Adding a Policy for Configuring an IPFM Fabric

For configuration that is not uniform for all leafs or spines, additional templates are provided to help you complete the configuration of an IPFM fabric.

For example, if you enable NAT on a 9300 switch, you can create an **ipfm_tcam_nat_9300** policy to configure the required NAT TCAM for the switch.

Use the **ipfm_telemetry** policy for telemetry and **ipfm_vrf** policy for VRF config (routing, pim, asm).

Procedure

Step 1 Navigate to the **Fabric Overview** window for your fabric and click the **Policies** tab.

Step 2 Choose **Add Policy** from the **Actions** drop-down list.

The **Create Policy** window appears.

Step 3 Click the right arrow in the **Select Switches** field.

The **Select Switches** dialog box appears.

Step 4 Select one or more switches and click **Select**.

Step 5 In the **Create Policy** window, click **Choose Template**.

Step 6 In the **Select a Policy Template** dialog box, select the required template for IPFM fabric, for example, **ipfm_tcam_nat_9300**. Click **Select**.

Step 7 Enter a priority for the template. The valid value ranges from 1 to 1000.

- Step 8** Enter the values in the TCAM-related fields. Make sure that you enter the TCAM size in increments of 256 and click **Save**.
-

Editing a Policy for an IPFM Fabric

You can edit a policy for any switch in the IPFM fabric.

Procedure

- Step 1** Navigate to the **Fabric Overview** window for your fabric and click the **Policies** tab.
- Step 2** Search for the policy template.
- Step 3** Select the policy and choose **Edit Policy** from the **Actions** drop-down list.
The **Edit Policy** window appears.
- Step 4** Make the required changes and click **Save**.
-

Netflow Support

Configuring Netflow at the fabric level allows you to collect, record, export, and monitor network flow and data to determine network traffic flow and volume for further analysis and troubleshooting. From Cisco NDFC Release 12.0.2, you can configure Netflow for Easy Fabrics, Easy Fabric eBGP, External Fabric, and LAN Classic templates.

After netflow is enabled for fabric, you can configure netflow on a network, or an interface (VLAN, SVI, physical interface, sub-interface, or port-channel). Before enabling netflow on the interface or network, ensure that the specified monitor name is defined in the fabric settings.

When Netflow is enabled at the Fabric level, the configuration is generated for netflow capable switches (FX/GX/EX) in the fabric except for spine/super-spine or switches with **no_netflow** policy. In a Multi-Site domain configuration, netflow is configured per Easy Fabric and not for the entire Multi-Site domain.

Note NDFC does not validate the **Netflow Monitor** name.

The following are the guidelines for Netflow configuration on other networks elements:

- For VRF Lite IFC, the netflow configuration is not inside the configuration profile, regardless of overlay mode.
- For networks, netflow configurations are not inside the configuration profile, regardless of overlay mode.
- You can configure netflow for Layer 2 Interface on trunk ports, access ports, dot1q tunnels, Layer2 port-channel, and VPC ports.
- You can configure netflow for the Layer 3 interface on SVI, Routed host, L3 Port-Channel, and sub-interfaces.

- Netflow configuration for VLANs uses **vlan_netflow** Record Template. In Brownfield deployment, the netflow configuration for VLANs is in switch freeform.
- You can enable Netflow under SVI (for routed traffic) or Vlan Configuration (for switched traffic).
- To configure IPv6 flow monitoring, use **switch_freeform** or **interface freeform**.
- Netflow configuration under the trunk or routed port is in **interface freeform**.
- For Host port resync, netflow configuration is captured in interface freeform.
- There is no explicit support for netflow in Intra-Fabric link or Multisite Underlay IFC. Note that you can use freeform configuration.

Netflow Support for Brownfield deployments

For Brownfield deployments, global netflow configuration for export, record, and monitor are not captured due to the telemetry use case. After brownfield import, to avoid global level netflow command being removed, you can perform the following actions:

- Do not turn on strict CC.
- Include the netflow global configuration in **switch freeform**.
- Enable Netflow in the fabric setting matching with the switch configuration.
Interface and VLAN level netflow configuration on the switch will be captured in **freeform**.
- SVI netflow config is captured in **switch_freeform** tied to the network.
- Netflow configuration for trunk or routed ports is in the **interface freeform**.
- Netflow configuration for VLANs is in the **switch_freeform**.
- The sub-interface configuration for VRF-Lite extensions is in **int_freeform**.

Precision Time Protocol for External Fabrics and LAN Classic Fabrics

In the Fabric settings for the **External_Fabric** or **LAN_Classic** template, select the **Enable Precision Time Protocol (PTP)** check box to enable PTP across a fabric. When you select this check box, PTP is enabled globally and on core-facing interfaces. Additionally, the **PTP Loopback Id** and **PTP Domain Id** fields are editable.

The PTP feature is supported with Cisco Nexus 9000 Series cloud-scale switches, with NX-OS version 7.0(3)I7(1) or later. Warnings are displayed if there are non-cloud scale devices in the fabric, and PTP is not enabled. Examples of the cloud-scale devices are Cisco Nexus 93180YC-EX, Cisco Nexus 93180YC-FX, Cisco Nexus 93240YC-FX2, and Cisco Nexus 93360YC-FX2 switches. For more information, refer to <https://www.cisco.com/c/en/us/products/switches/nexus-9000-series-switches/index.html>.

Note PTP global configuration is supported with Cisco Nexus 3000 Series switches; however, PTP and ttag configurations are not supported.

For more information, see the *Configuring PTP* chapter in *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide* and *Cisco Nexus Insights for Cisco Nexus Dashboard Fabric Controller User Guide*.

For External and LAN Classic fabric deployments, you have to enable PTP globally, and also enable PTP on core-facing interfaces. The interfaces could be configured to the external PTP server like a VM or Linux-based machine. Therefore, the interface should be edited to have a connection with the grandmaster clock. For PTP and TTAG configurations to be operational on External and LAN Classic Fabrics, you must sync up of Switch Configs to Nexus Dashboard Fabric Controller using the **host_port_resync** policy. For more information, see [Sync up Out-of-Band Switch Interface Configurations, on page 33](#).

It is recommended that the grandmaster clock should be configured outside of Easy Fabric and it is IP reachable. The interfaces toward the grandmaster clock need to be enabled with PTP via the interface freeform config.

All core-facing interfaces are auto-enabled with the PTP configuration after you click **Deploy Config**. This action ensures that all devices are PTP synced to the grandmaster clock. Additionally, for any interfaces that are not core-facing, such as interfaces on the border devices and leafs that are connected to hosts, firewalls, service-nodes, or other routers, the ttag related CLI must be added. The ttag is added for all traffic entering the VXLAN EVPN fabric and the ttag must be stripped when traffic is exiting this fabric.

Here is the sample PTP configuration: `feature ptp`

```
feature ptp

ptp source 100.100.100.10 -> IP address of the loopback interface (loopback0)
that is already created, or user-created loopback interface in the fabric settings

ptp domain 1 -> PTP domain ID specified in fabric settings

interface Ethernet1/59 -> Core facing interface
  ptp

interface Ethernet1/50 -> Host facing interface
  ttag
  ttag-strip
```

The following guidelines are applicable for PTP:

- The PTP feature can be enabled in a fabric when all the switches in the fabric have Cisco NX-OS Release 7.0(3)I7(1) or a higher version. Otherwise, the following error message is displayed:

```
PTP feature can be enabled in the fabric, when all the switches have
NX-OS Release 7.0(3)I7(1) or higher version. Please upgrade switches to
NX-OS Release 7.0(3)I7(1) or higher version to enable PTP in this fabric.
```

- For hardware telemetry support in NIR, the PTP configuration is a prerequisite.
- If you are adding a non-cloud scale device to an existing fabric which contains PTP configuration, the following warning is displayed:

```
TTAG is enabled fabric wide, when all devices are cloud-scale switches
so it cannot be enabled for newly added non cloud-scale device(s).
```

- If a fabric contains both cloud-scale and non-cloud scale devices, the following warning is displayed when you try to enable PTP:

```
TTAG is enabled fabric wide when all devices are cloud-scale switches
and is not enabled due to non cloud-scale device(s).
```

- TTAG configuration is generated for all the devices if host configuration sync up is performed on all the devices. Ttag configuration will not be generated for any newly added devices if host configuration sync up is not performed on all newly added devices.

If the configuration is not synced, the following warning is displayed:

TTAG on interfaces with PTP feature can only be configured for cloud-scale devices. It will not be enabled on any newly added switches due to the presence of non cloud-scale devices.

- PTP and TTAG configurations are deployed on host interfaces.
- PTP and TTAG Configurations are supported between switches in the same fabric (intra-fabric links). PTP is created for inter-fabric links, and ttag is created for the inter-fabric link if the other fabric (Switch) is not managed by Nexus Dashboard Fabric Controller. Inter-fabric links do not support PTP or ttag configurations if both fabrics are managed by Nexus Dashboard Fabric Controller.
- TTAG configuration is configured by default after the breakout. After the links are discovered and connected post breakout, perform **Deploy Config** to generate the correct configuration based on the type of port (host, intra-fabric link, or inter fabric link).

Brownfield Deployment-Transitioning VXLAN Fabric Management to Nexus Dashboard Fabric Controller

Nexus Dashboard Fabric Controller supports Brownfield deployments, wherein you transition your VXLAN BGP EVPN fabric management to Nexus Dashboard Fabric Controller. The transition involves migrating existing network configurations to Nexus Dashboard Fabric Controller. For information, see *Managing a Brownfield VXLAN BGP EVPN Fabric*.

Inband Management in External Fabrics and LAN Classic Fabrics

You can import or discover switches with inband connectivity for External and LAN Classic fabrics in Brownfield deployments only. Enable inband management, per fabric, while configuring or editing the Fabric settings. You cannot import or discover switches with inband connectivity using POAP.

After configuration, the Fabric tries to discover switches based on the VRF of the inband management. The fabric template determines the VRF of inband switch using seed IP. If there are multiple VRFs for same seed IP, then no intent will be learnt for seed interfaces. You must create intent/configuration manually.

After configuring/editing the Fabric settings, you must **Deploy Config**. You cannot change the Inband Mgmt settings after you import inband managed switches to the Fabric. If you uncheck the checkbox, the following error message is generated.

```
Inband IP <<IP Address>> cannot be used to import the switch,
please enable Inband Mgmt in fabric settings and retry.
```

After the switches are imported to the Fabric, you must manage the interfaces to create intent. Create the intent for the interfaces that you're importing the switch. Edit/update the Interface configuration. When you try to change the Interface IP, for this inband managed switch, an error message is generated:

```
Interface <<interface_name>> is used as seed or next-hop egress interface
for switch import in inband mode.
IP/Netmask Length/VRF changes are not allowed for this interface.
```

While managing the interfaces, for switches imported using inband management, you cannot change the seed IP for the switch. The following error will be generated:

```
<<switch-name>>: Mgmt0 IP Address (<ip-address>) cannot be changed,
when is it used as seed IP to discover the switch.
```

Create a policy for next-hop interfaces. Routes to Nexus Dashboard Fabric Controller from 3rd party devices may contain multiple interfaces, known as ECMP routes. Find the next-hop interface and create an intent for the switch. Interface IP and VRF changes are not allowed.

If inband management is enabled, during Image management, eth2 IP address is used to copy images on the switch, in ISSU, EPLD, RPM & SMU installations flows.

If you imported the switches using inband connectivity in the fabric, and later disable the inband Mgmt in the Fabric settings after deployment, the following error message is generated:

```
The fabric <<fabric name>> was updated with below message:  
Fabric Settings cannot be changed for Inband Mgmt, when switches are already imported  
using inband Ip. Please remove the existing switches imported using Inband Ip from the  
fabric,  
then change the Fabric Settings.
```

However, the same fabric can contain switches imported using both inband and out-of-band connectivity.

Inband POAP Management in External Fabrics and LAN Classic Fabrics

Power On Auto Provisioning (POAP) automates the process of upgrading software images and installing configuration files on devices which are deployed on the network for the first time. POAP allows devices to bring up without performing any manual configuration.

When a POAP feature enabled device boots and does not find the startup configuration, the device enters POAP mode, locates a DHCP server, and bootstraps itself with its interface IP address, gateway, and DNS server IP addresses. The device obtains the IP address of a TFTP server and downloads a configuration script that enables the switch to download and install the appropriate software image and configuration file.

By using POAP (Power On Auto Provisioning) feature of Nexus switches, NDFC (Nexus Dashboard Fabric Controller) can automate the deployment of new datacenters reducing overall time and effort.

Starting NDFC 12.1.1e, External Fabrics and LAN Classic fabrics support adding switches through POAP from inband interfaces.

The Inband POAP is supported for all the roles for fabrics with **External** and **LAN Classic** templates.

The following are the prerequisites for using Inband POAP Management:

- On NDFC Web UI, navigate to **Server settings > Admin** and choose **Data** from **LAN Device Management Connectivity** drop-down to manage easy fabrics through inband management, or an error message is displayed. If you choose **Data**, ensure that the required 'Data Service IPs' are available in the Nexus Dashboard **External Service Pools** tab.
- Configure appropriate Data Network Routes for reachability to the switch Inband interfaces on Cisco Nexus Dashboard. On Nexus Dashboard, choose **Admin Console > Infrastructure > Cluster Configuration**. On **General** tab, enter route IP addresses.
- Each subnet for defined DHCP subnet scope mentioned in fabric settings must have a valid route for reverse traffic.
- Ensure that the DHCP relay functionality is set on intermediate routers. The following are the guidelines and limitations for Inband POAP Management:
 - Inband POAP is supported for NX-OS switches only.
 - Inband POAP on **Bootstrap** tab is supported only when **Inband Management** is enabled on **Advanced** tab in the Fabric settings.

- You can enable Inband POAP with NDFC as Local DHCP Server or on External DHCP Servers.
- Inband POAP supports Multi Subnet scope.

Adding Switches through Inband POAP

Ensure that the prerequisites and guidelines are followed, before adding switches through Inband POAP.

Procedure

- Step 1** Create an External or LAN Classic Fabric. See [Creating an External Fabric, on page 60](#).
- Step 2** On **Advanced** tab, check **Inband Mgmt** check box.
- Step 3** On **Bootstrap** tab, do the following:
 - a. For NX-OS switches only, check **Enable Bootstrap** check box on **Bootstrap** tab.
 - b. Check **Enable Inband POAP** check box.
 - c. If local DHCP server is required, check **Enable Local DHCP Server** check box. Enter required DHCP scopes. If disabled, external DHCP server must be available for switches to Bootstrap.
- Step 4** To add switches to the fabric, refer to [Pre-provisioning a Device](#).

Note Ensure that the required details for all the switches are added such as Inband interface, routing IPs, hostname.

Inband Management and Inband POAP in Easy Fabrics

Starting from Cisco NDFC Release 12.1.1e, you can manage switches with Inband connectivity and Inband POAP for Easy Fabrics. For Inband Management, Loopback0 interface of the devices is used in the Fabric Settings.

You can add switches with Inband Management enabled for easy fabrics either in Greenfield or brownfield deployment with Inband POAP or pre-provision and Inband POAP.

- For Brownfield deployment, check **Preserve Config** check box.
- For Greenfield deployment, uncheck **Preserve Config** check box.

The seed switches connect the external routers, and it provides management connectivity to the other switches in the fabric. Switches connected to external routers to provide connectivity to the fabrics are termed as seed switches. The interfaces on the seed switches which connects to the external routers are termed as bootstrap interfaces.

Prerequisites for Inband Management

On NDFC Web UI, navigate to **Server settings > Admin** and choose **Data** from **LAN Device ManagementConnectivity** to manage easy fabrics through Inband management. If you choose **Data**, ensure that the required **Data Service IPs** are available in the Nexus Dashboard **External Service Pools** tab. This server setting is required for both Inband and out-of-band connectivity. Configure below static routes over data interface in Cisco Nexus Dashboard:

Enter static routes IP address required for external route and route over data interface in Cisco Nexus Dashboard.

Inband POAP requires the external router IP address connected to the seed switches to have the following capabilities:

- Routes for External router

- Route for Routing Loopback subnet range for Easy Fabric
- Route for Underlay Routing subnet range for Easy Fabric

Inband POAP requires the external router connected seed switches to have the following capabilities:

- DHCP relay functionality
- eBGP peering

To add switches for Inband Management and Inband POAP, see [Discovering New Switches](#).

Guidelines and Limitations

The following are the guidelines and limitations for Inband Management:

- Ensure that the **Inband Management** is enabled for Inband interface. Both Inband and out-of-band switches for a same fabric is not supported.
- It is supported only for IPv4 underlay and OSPF routing protocol.
- You can change switch management from Inband to out-of-band and conversely after creating a fabric.
- For the Inband managed switches, the following roles are supported:
 - Spine
 - Leaf
 - Border
 - Border Spine
 - Border Gateway
 - Border Gateway Spine
- Inband management is supported for both numbered and unnumbered fabric interface numbering
- Ensure that the same role switches are assigned as seed switches. If spine role switch is assigned as a seed switch, all the spine role switches in that fabric must be assigned as seed switches. It is recommended to assign switch as seed switches.
- When you add switches to fabric, ensure that the switches are not in maintenance mode.
- You can add switches in Brownfield deployment (check **Preserve Config** check box) only when the fabric is created. To add more switches, use Inband POAP with import switches option.
- Set **vPC Peer Keep Alive** option to loopback if the vPC switches mgmt0 interfaces are not configured.

The following are the guidelines and limitations for Inband POAP:

- Inband POAP for a fabric can be enabled only if Inband Management is enabled.
- Inband POAP requires the fabric or core facing interfaces to be cabled consistently for seed switches and spine switches.
- All spine switches in fabric must use same set of fabric interface numbers.

- If a fabric has set of leaf switches which are seed switches, then the switches must use same fabric interface number.
- The seed switches must have eBGP peering with the external router. Therefore, the external router must have the required eBGP route peering capabilities and display the configuration for External router for DHCP relay and Static routes configured for the Subnets used in Easy Fabrics.
- DHCP relay must be configured on external routers interface which connects the seed switch in Inband interfaces. Ensure that the DHCP relay destination configured is same for all cluster node data interface on Cisco Nexus Dashboard.
- DHCP server can be internal NDFC or the external server.

Enabling Inband POAP on Easy Fabrics

To enable Inband POAP on Easy Fabrics, perform the following steps:

Procedure

Step 1 On the **Manageability** tab check **Inband Management** check box.

Step 2 On **Bootstrap** tab, do the following:

- a) Check **Enable Bootstrap** check box.
- b) Check **Enable Local DHCP Server** checkbox to assign NDFC as DHCP Server and enter the DHCP scopes for all the fabric seed switches bootstrap interfaces.

If you choose **Enable Local DHCP Server**, and choose unnumbered in Fabric Interface Numbering drop-down list in the General Parameters tab, add details for:

- Bootstrap Seed Switch Loopback Interface ID
- Switch Loopback DHCP Scope Start Address
- Switch Loopback DHCP Scope End Address

- c) Check External DHCP Server IP Addresses check box to provide connectivity to NDFC from the external router.

If you choose **External DHCP Server IP Addresses**, you can add a maximum of three IPv4 addresses with a comma separated list.

Note To have eBGP peering between seeds and an external router, add bootstrap seed switch loopback interface IP address, this IP must be a subset of the loopback id range.

- d) Enter Seed Switch interface in **Seed Switch Fabric Interfaces** text field.
- e) Enter Spine Switch interface in **Spine Switch Fabric Interfaces** text field.

Note If the Spine switches are the seed switches, then the lists must be consistent in **Seed Switch Fabric Interfaces** text field.

Step 3 For fabrics with unnumbered interface, do the following:

- a) On **General Parameters**, choose **unnumbered** from **Fabric Interface Numbering** drop-down list.
- b) On **Bootstrap** tab:

Bootstrap Seed Switch Loopback Interface ID the loopback ID is the default router IP for the fabric. This loopback ID must not overlap with any of the existing fabric loopback IDs.

Switch Loopback DHCP Scope Start Address this IP address is start address of the DHCP pool of the routing loopback addresses range to assign to the bootstrapping switch. This IP address must not overlap with any of the existing IP addresses of **Underlay Routing Loopback IP Range**.

Switch Loopback DHCP Scope End Address is the end address of the DHCP pool.

Importing Switches for Brownfield Deployment

Before you begin

Make sure that you follow prerequisites procedure before adding switches.

Procedure

- Step 1** Create a fabric using a template **Easy_Fabric**. For instructions, see [Create a Fabric, on page 5](#).
Ensure that you add switches in the order of Seed switches, Spine switches, and other switches. You can add spine switches as the seed switches.
- Step 2** In Brownfield deployment for each fabric, enable **Inband Management** on the **Manageability** tab and import the fabric.
- Step 3** Add the switches to the fabric with the **Preserve Config** check box.
- Step 4** Enter **hostname**, **Role**, enable **Seed Switch**, and enter appropriate IP address.
- Step 5** Enter the IP addresses for all the seed switches, click **Import Selected Switches** to add them to the fabric.
- Step 6** Navigate to **Policy** tab, click **Actions > Add Policy**. Choose **ext_bgp_neighbor** policy so the seed switches establish eBGP peering. Enter the required details, and click **Save**.
- Step 7** Assign the appropriate switch roles.
For more instructions, see [Adding Switches Using Bootstrap Mechanism](#).

Pre-provisioning switches through Inband POAP

Procedure

- Step 1** On **Switches** tab, choose **Actions > Add Switches**.
The **Add Switches** window appears.

- Step 2** Choose **Pre-provision** radio button.
- Step 3** On **Switches to Pre-provision** table, click **Actions**> **Add**.
The **Pre-provision a switch** window appears.
- Step 4** Enter appropriate details such as Serial Number, Model, IP Address, and click **Add**.
- Step 5** Enter single switch at once and enter the required information. If you have multiple switches.
- Step 6** Click **Import Switches to Fabric** to add switches.

Adding policy for Easy Fabric

Procedure

- Step 1** Navigate to **LAN > Fabrics** window, double-click on appropriate easy fabric to add policy.
The **Fabric Overview** window appears.
- Step 2** On **Fabric Overview** tab, click on **Policy** tab.
- Step 3** Choose appropriate switch from **Switch** window and click Choose **Template**.
- Step 4** Choose **ext_bgp_neighbor policy** and click **Select**.
The **Create Policy** window appears.
- Step 5** Click **Actions > Add Policy**.
The **Create Policy** window appears.
- Step 6** Enter the appropriate details in the window and click **Save**.
- Step 7** On **Fabric Overview** window, click **Actions > Recalculate and Deploy**.

Changing Fabric Management Mode

You can change the fabric from out-of-band to Inband Management and conversely.

Procedure

- Step 1** To change fabric management from out-of-band to Inband Management, perform the following steps:
- Ensure that you follow prerequisite procedure for Inband Management.
 - In **Edit Fabric** window, enable **Inband Mgmt** on the **Advanced** tab and click **Save**.
 - On **Fabric Overview > Switches** tab, choose switch and choose **Actions > Change Mode**, the mode column display **Migration**.
 - Choose switches. Click **Actions > Recalculate and Deploy**.
The discovery IP address of the switches changes to the BGP routing loopback IP.
The discovery VRF displays default and discovery interface is updated to BGP routing loopback interface.
 - Ensure that the **Discovery Status** column display status **OK**, then click **Actions > Recalculate and Deploy**.
- Step 2** To change fabric management from Inband Management to out-of-band, perform the following steps:
- Ensure that you follow prerequisite procedure for out-of-band.
 - Configure out-of-band IP addresses on the switch and this IP must be reachable from NDFC data or Management interface.
 - Choose fabric, click **Actions > Edit Fabric**.
 - On **Advanced** tab, uncheck **Inband Management** check box and click **Save**.
 - On **Fabric Overview > Switches** tab, choose switch and choose **Actions > Change Mode**, the mode column displays **Migration**.
 - Choose switches. Click **Actions > Recalculate and Deploy**.
The discovery IP address of the switches will be changed to the mgmt0 IP.
The discovery VRF displays management and discovery interface will be updated to mgmt0.
 - Ensure that the **Discovery Status** column displays status **OK**, then click **Actions > Recalculate and Deploy**.
-

Enhanced Role-based Access Control

Starting from Cisco Nexus Dashboard Fabric Controller Release 12.0.1(a), all RBAC is in Nexus Dashboard. User-roles and access are defined from Nexus Dashboard for fabrics on NDFC.

Nexus Dashboard admin role is considered as Network-admin role in NDFC.

DCNM had five roles to perform various access and operations. If a user is access a fabric with network stage role has access to all other fabrics as a network stage role. Therefore, a username is restricted with their role in DCNM.

Cisco NDFC Release 12.0.1(a) has same five roles but you can do granular RBAC with integration of Nexus Dashboard. If a user accesses a fabric as a network stage role, the same user can access different fabric with

other user role such as admin or operator role. Therefore, a user can have different access on the different fabrics in NDFC.

NDFC RBAC supports following roles:

- NDFC Access Admin
- NDFC Device Upgrade Admin
- NDFC Network Admin
- NDFC Network Operator
- NDFC Network Stager

The following table describes the user roles and their privileges in NDFC.

Roles	Privileges
NDFC Access Admin	Read/Write See
NDFC Device Upgrade Admin	Read/Write
NDFC Network Admin	Read/Write
NDFC Network Operator	Read
NDFC Network Stager	Read/Write

The following roles are supported on DCNM for backward compatibility:

- Global-admin (mapped to network-admin)
- Server-admin (mapped to network-admin)

Note In any window, the actions that are restricted by the user role that is logged in are grayed out.

NDFC Network Admin

A user with the **NDFC Network Admin** role can perform all the operations in Cisco Nexus Dashboard Fabric Controller.

From Cisco Nexus Dashboard Fabric Controller Release 12.1.1e, a user with this role can perform all operations for MSD fabrics in Networks and VRFs.

You can freeze a particular fabric or all fabrics in Cisco Nexus Dashboard Fabric Controller if you are a user with the **NDFC Network Admin** role.

Note Make sure that the switch user role for discovery or add switches or LAN credentials for NDFC must have the network-admin role.

NDFC Device Upgrade Admin

A user with the **NDFC Device Upgrade Admin** role can perform operations only in **Image Management** window.

See the [Image Management](#) section for more information.

NDFC Access Admin

A user with the **NDFC Access Admin** role can perform operations only in **Interface Manager** window for all fabrics.

An NDFC access admin can perform the following actions:

- Add, edit, delete and deploy layer 2 port channels, and vPC.
- Edit host vPC, and ethernet interfaces.
- Save, preview, and deploy from management interfaces.
- Edit interfaces for LAN classic, and IPFM fabrics.

Apart from nve, management, tunnel, subinterface, SVI, interface grouping, and loopback interfaces

However, a user with the Cisco Nexus Dashboard Fabric Controller access admin role can't perform the following actions:

- Cannot edit layer 3 port channels, ST FEX, AA FEX, loopback interfaces, nve interfaces, and subinterfaces.
- Cannot edit member interfaces and port channels of Layer 3, ST FEX, AA FEX.
- Cannot edit interfaces with policy associated from underlay and link for easy fabrics.
- Cannot edit peer link port channel.
- Cannot edit management interface.
- Cannot edit tunnel.

Note The icons and buttons are grayed out for this role when the fabric or Cisco Nexus Dashboard Fabric Controller is in deployment-freeze mode.

NDFC Network Stager

A user with the **NDFC Network Stager** role can make configuration changes on Cisco Nexus Dashboard Fabric Controller. A user with the **NDFC Network Admin** role can deploy these changes later. A network stager can perform the following actions:

- Edit interface configurations
- View or edit policies
- Create interfaces
- Change fabric settings
- Edit or create templates

However, a network stager cannot perform the following actions:

- Cannot make any configuration deployments to switches.
- Cannot perform deployment-related actions from the Cisco Nexus Dashboard Fabric Controller Web UI or the REST APIs.
- Cannot access the administration options like licensing, creating more users, and so on.
- Cannot move switches in and out of maintenance mode.
- Cannot move fabrics in and out of deployment-freeze mode.
- Cannot install patches.
- Cannot upgrade switches.
- Cannot create or delete fabrics.
- Cannot import or delete switches.

NDFC Network Operator

A network operator can view fabric builder, fabric settings, preview configurations, policies, and templates. However, a network operator cannot perform the following actions:

- Cannot change expected configurations of any switch within any fabric.
- Cannot deploy any configurations to switches.
- Cannot access the administration options like licensing, creating more users, and so on.

The difference between a network operator and a network stager is that, as a network stager you can only define intent for existing fabrics, but cannot deploy those configurations.

Only a network admin can deploy the changes and edits that are staged by a user with the network stager role.

Choosing Default Authentication Domain

By default login screen on Nexus Dashboard chooses the local domain for authentication. You can change domain at login time by choosing available domains from drop-down list.

Nexus Dashboard supports local and remote authentication. The remote authentication providers for Nexus Dashboard include RADIUS, and TACACS. For more information on authentication support, refer <https://www.cisco.com/c/en/us/td/docs/dcn/nd/2x/user-guide/cisco-nexus-dashboard-user-guide-211.pdf>.

The following table describes RBAC comparison between DCNM and NDFC access:

DCNM 11.5(x)	NDFC 12.0.x and 12.1.x
<ul style="list-style-type: none"> • User has a single role. • All APIs and resources are accessed with this single role. 	<ul style="list-style-type: none"> • User can have a different role in different Nexus Dashboard for security domains. • Security domain contains single Nexus Dashboard, and each Nexus Dashboard contains single NDFC Fabric.

DCNM 11.5(x)	NDFC 12.0.x and 12.1.x
A single role is associated with the user by disabling or restricting the access to options in DCNM.	A single role displays only privileged resources on the selected page and restricted access are grayed out based on security domain associated with selected resource on further options on NDFC.
DCNM AV Pair format with shells, roles, and optional access constraints.	Nexus Dashboard AV Pair format with shells, domains.
Supported roles based on deployment type LAN, SAN, or PMN.	Supported roles such as network-admin, network-operator, device-upg-admin, network-stager, access-admin are in NDFC. Support for legacy roles for backward compatibility. Nexus Dashboard admin role as network-admin of DCNM.

The following table describes DCNM 11.5(x) AV Pair format:

Cisco DCNM Role	RADIUS Cisco-AV-Pair Value	TACACS+ Shell Cisco-AV-Pair Value
Network-Operator	shell:roles = "network-operator" dcnm-access="group1 group2 group5"	cisco-av-pair=shell:roles="network-operator" dcnm-access="group1 group2 group5"
Network-Admin	shell:roles = "network-admin" dcnm-access="group1group2 group5"	cisco-av-pair=shell:roles="network-admin" dcnm-access="group1 group2 group5"

The following table describes NDFC 12.x AV Pair format:

User Role	AVPair Value
NDFC Access Admin	Access-admin
NDFC Device Upgrade Admin	Device-upg-admin
NDFC Network Admin	Network-admin
NDFC Network Operator	Network-operator
NDFC Network Stager	Network-stager

The AV pair string format differs when configuring a read/write role, read-only role, or a combination of read/write and read-only roles for a specific user. A typical string includes the domain, followed by the read-write roles separated from the read-only roles using the slash (/) character; individual roles are separated by the pipe (|) character:

```
shell:domains=<domain>/<writeRole1>|<writeRole2>/<readRole1>|<readRole2>
```

Enhanced RBAC Use-Cases

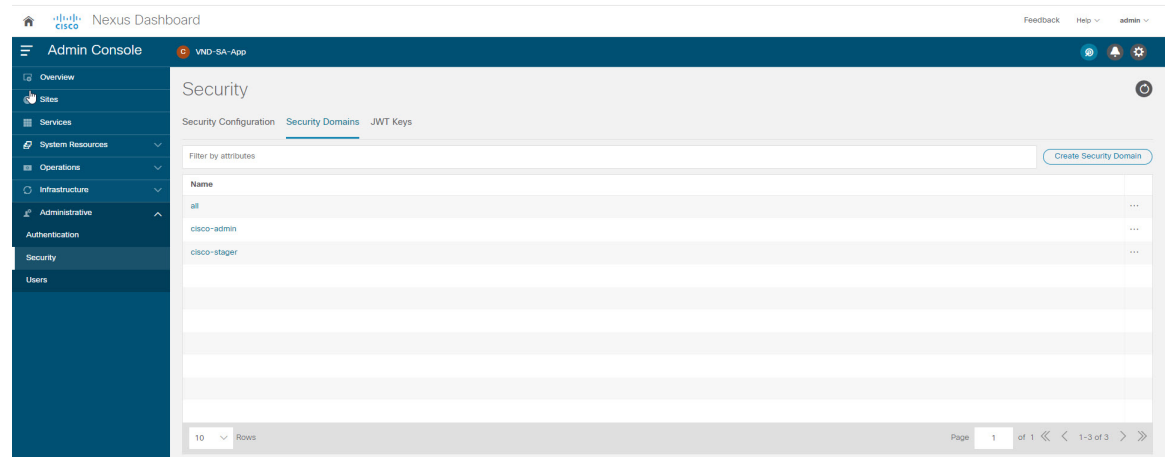

There are various fabrics in NDFC. By default a user is an admin for all the fabrics. For an example, a username **Cisco** can have admin role access to a Fabric-A and stager role access to another Fabric-B.

On Nexus Dashboard, all security policies are part of security domains. You can create the user and give access to these security domains.

To create a user and define specific roles, perform the following steps:

Procedure

Step 1 To create user in security domains:

- Log in to Nexus Dashboard with admin role and navigate to **Administrative** tab.
- On **Security Domain** tab, click **Create Security Domain** and create the following security domains:
 - all** - Similar to network-admin role. This domain has administrative access to Nexus Dashboard and NDFC service application.
 - cisco-admin** - full network-admin access to Fabric-A
 - cisco-stager** - network-stager only access to Fabric-B

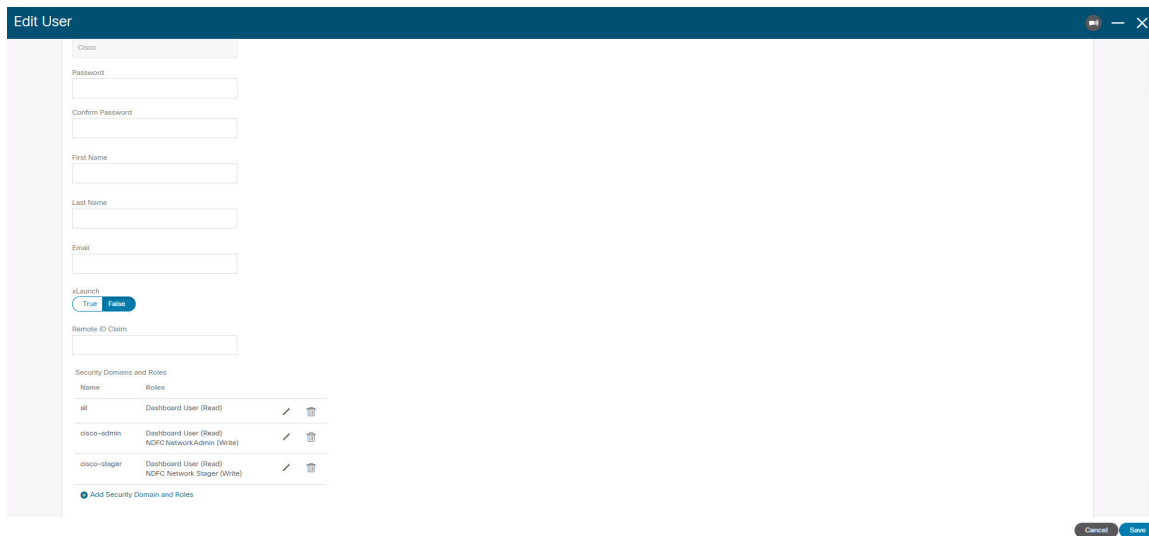

Step 2 To create a local user **Cisco**.

- Navigate to **Users > Local**.
- On **Local** tab, click **Create Local User**.
The **Create Local User** window appears.
- Enter **Cisco** in User ID text field, provide appropriate passwords in respective fields.
- After you create a Cisco user, navigate to **Local** window, click on **ellipses** icon in **Cisco** username row and then click **Edit User**.

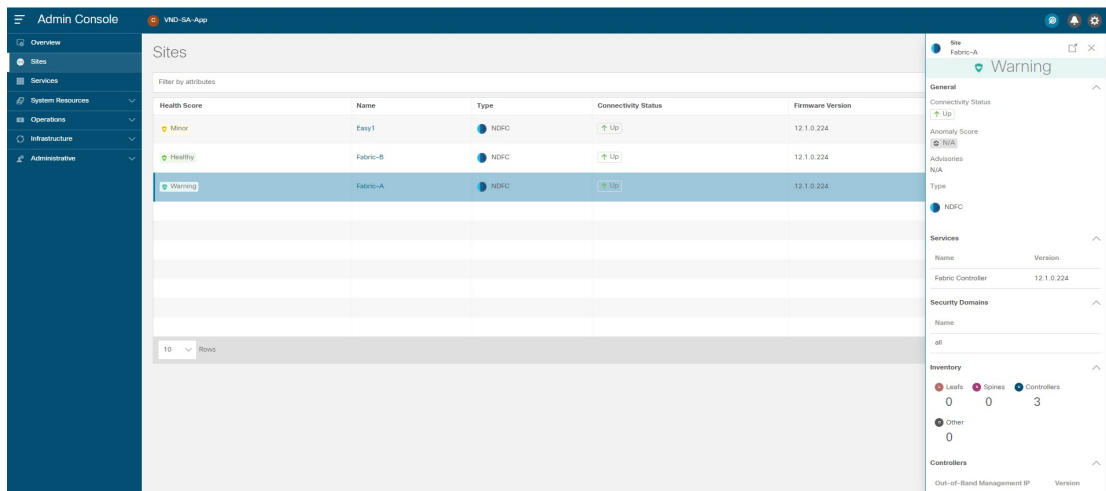

The **Edit User** window appears.

Step 3 On **Edit User** window, by default, **all** security domain exists. Click **Add Security Domain** and **Roles** to add other security domains.

The **Add Security Domain and Roles** window appears.

- Choose **cisco-admin** domain from option drop-down list and choose **NDFC Access Admin** check box and then click **Save**.
- Repeat step **a** to add **cisco-stager** domain for **NDFC Network Stager** role.
- To associate security domains to respective fabric sites, do the following:

On Nexus Dashboard, navigate to **Sites** window. Click on **Fabric-A** site name.

A slide-in pane appears. You can view **all** security domain for the Fabric-A site.

- To add the Cisco user as network-admin for Fabric-A, click **Elipse** icon and **Edit Site**.
- Delete **all** security domain and add **network-admin** domain and save the changes. Similarly you can add for network-stager domain.

- f. Log out from Nexus Dashboard and log in back as **Cisco** user.

Note The user role Cisco can view only NDFC related options on Nexus Dashboard based on the permissions. The user access restricted to Nexus Dashboard services.

- g. Naviage to NDFC application.

The user Cisco can perform operations on two sites on NDFC, as the user is assigned as network-admin role for Fabric-A and network-stager role for Fabric-B.

Note Network-admin role can create an interface for Fabric-A and deploy it. Whereas network-stager role can create interface for Fabric-B, but access restricted to deploy.

Nexus Dashboard Security Domains

Access control information about a user login contains authentication data like user-ID, password, and so on. Based on the authorization data, you can access resources accordingly. Admins in Nexus Dashboard can create security domains and group various resource types, resource instance, and map them into a security domain. The admins define an AV-pair for each user, which defines the access privileges for users to different resources in Nexus Dashboard. When you create a fabric, a site is created in Nexus Dashboard with the same fabric name. You can create and view these sites from **Nexus Dashboard > Sites**.

The Cisco Nexus Dashboard Fabric Controller REST APIs use this information to perform any action by checking the authorization.

When you upgrade from Cisco Nexus Dashboard Fabric Controller Release 11.x, each fabric is mapped to an auto-generated site of the same name. All these sites are mapped into the **all** security domain in Nexus Dashboard.

All resources are placed in **all** domain before they are assigned or mapped to other domains. The all security domain does not include all the available security domains in Nexus Dashboard.

AV-Pairs

A group of security domains along with read and write roles for each domain are specified using AV-pairs. Administrators define AV-pair for each user. The AV-pair defines the access privileges to users across various resources in Nexus Dashboard.

The AV-pair format is as follows:

```
"avpair":
"shell:domains=security-domain/write-role-1|write-role-2,security-domain/write-role-1|write-role2/read-role-1|read-role-2"
```

For example: "avpair":

```
"shell:domains=all/network-admin/app-user|network-operator". "all/admin/" makes user
super-user and it's best to avoid examples with all/admin/"
```

The write role is inclusive of read role as well. Hence, `all/network-admin/` and `all/network-admin/network-admin` are the same.

Note From Cisco Nexus Dashboard Fabric Controller Release 12.0.1a supports the existing AV-pair format you created in Cisco Nexus Dashboard Fabric Controller Release 11.x. However, if you are creating a new AV-pair, use the format mentioned above. Ensure that the shell:domains should not have any spaces.

Specifying Cisco NX-OS User Roles and SNMPv3 Parameters on AAA Servers

You can use the VSA cisco-AV-pair on AAA servers to specify user role mapping for the Cisco NX-OS device using this format:

```
shell:roles="roleA roleB ..."
```

If you do not specify the role option in the cisco-AV-pair attribute, the default user role is network-operator.

You can also specify your SNMPv3 authentication and privacy protocol attributes as follows:

```
shell:roles="roleA roleB..." snmpv3:auth=SHA priv=AES-128
```

The SNMPv3 authentication protocol options are SHA and MD5. The privacy protocol options are AES-128 and DES. If you do not specify these options in the cisco-AV-pair attribute, MD5 and DES are the default authentication protocols.

Creating a Security Domain

To create a security domain from Cisco Nexus Dashboard, perform the following steps:

1. Log into Cisco Nexus Dashboard.
2. Choose **Administrative > Security**.
3. Navigate to **Security Domains** tab.
4. Click **Create Security Domain**.
5. Enter the required details and click **Create**.

Creating a User

To create a user from Cisco Nexus Dashboard, perform the following steps:

1. Log into Cisco Nexus Dashboard.
2. Choose **Administrative > Users**.
3. Click **Create Local User**.
4. Enter the required details and click **Add Security Domain**.
5. Choose a domain from the drop-down list.
6. Assign a Cisco Nexus Dashboard Fabric Controller service read or write role by checking the appropriate check box.
7. Click **Save**.

Backup Fabric

You can configure backup for selected fabric, from Fabric window, similarly you can configure backup on **Fabric Overview** window. Choose **Fabric Overview > Actions** on main window, click **Backup Fabric**.

You can back up all fabric configurations and intents automatically or manually. You can save configurations in Cisco Nexus Dashboard Fabric Controller, which are the intents. The intent may or may not be pushed on to the switches.

Cisco Nexus Dashboard Fabric Controller doesn't back up the following fabrics:

- External fabrics in monitor-only mode: You can take a backup of external fabrics in monitor-only mode, but can't restore them. You can restore this backup when the external fabric isn't in monitor-only mode.
- Parent MSD fabric: You can take backups of MSD fabrics. When you initiate a backup from the parent fabric, the backup process is applicable for the member fabrics as well. However, Cisco Nexus Dashboard Fabric Controller stores all the backed-up information of the member fabrics and the MSD fabric together in a single directory.

The backed-up configuration files can be found in the corresponding directory with the fabric name. Each backup of a fabric is treated as a different version, regardless if it is backed up manually or automatically. You can find all versions of the backup in the corresponding fabric directories.

You can enable scheduled backup for fabric configurations and intents.

The backup has the information related to intent and fabric configurations in addition to associated state of the resource manager in terms of used resources on fabrics. Cisco Nexus Dashboard Fabric Controller backs up only when there's a configuration push. Cisco Nexus Dashboard Fabric Controller triggers the automatic backup only if you didn't trigger any manual backup after the last configuration push.

Golden Backup

You can now mark the backups that you don't want to delete even after you reach the archiving limit. These backups are the golden backups. You can't delete golden backups of fabrics. However, Cisco Nexus Dashboard Fabric Controller archives only up to 10 golden backups. You can mark a backup as golden backup while restoring the fabric. To mark a backup as golden backup, perform the following steps from the Web UI:

Procedure

Step 1 Choose a fabric and choose **Fabrics > Fabric Overview > More > Backup Fabric**.

The **Backup** tab appears.

Step 2 On main window, choose **Actions > Configure Backup**.

The **Scheduled Archive** window appears.

Step 3 Choose the time period from where you want to choose the backup.

Valid values are **1m**, **3m**, **6m**, **YTD**, **1y**, and **All**. You can zoom into the graph. By default the backup information for **1m**, which is one month, appears. You can also choose a custom date range. The backup information includes the following information:

- Backup date
- Total number of devices
- Number of devices in sync
- Number of devices out of sync

Step 4 Choose the backup you want to mark as golden by clicking the backup.

You can choose the automatic or manual backup. These backups are color-coded. Automatic backups are indicated in blue color. Manual backups are indicated in midnight blue color. Golden backups are indicated in orange color. The automatic backups have only the versions in their names. Whereas the manual backups have tag names, which you gave when you initiated a manual backup, along with the version in the backup name. Hover over a backup to see the name. The automatic backup is initiated from the **Backup** tab in the **Fabric Overview** window. The manual backup is initiated by clicking **Backup Now** from the **Actions** pane in the backup tab.

Step 5 Navigate to switch window, choose check box for required switch name, choose **Switch > Switch Overview > Backup > Actions > Mark as golden backup** to mark golden backup.

A confirmation dialog box appears.

Step 6 Click **Yes**.

Step 7 Continue with rest of the fabric restore procedure as mentioned in the *Restoring Fabrics* section or exit the window.

Restoring Fabric

The following table describes the columns that appears on **Restore Backup** tab.

Fields	Descriptions
Backup Date	Specifies the backup date.
Backup Version	Specifies the version of backup.
Backup Tag	Specifies the backup name.
NDFC Version	Specifies the version of NDFC.
Backup Type	Specifies the backup type, whether it is a golden backup.

The following table describes the fields and descriptions that appears on **Action** tab.

Actions	Descriptions
Mark as golden	To mark existing backup as golden backup, choose Mark as golden , a confirmation window appears, click Confirm . Refer to <i>Golden Backup</i> section for more details.
Remove as golden	To remove existing backup from golden backup, choose Remove as golden , a confirmation window appears, click Confirm .

VXLAN OAM

In Nexus Dashboard Fabric Controller, VXLAN OAM is supported on VXLAN Fabric, eBGP VXLAN Fabric, External, and Lan Classic fabric technologies. You can track details such as reachability and actual path of the flows in a VXLAN EVPN based-fabric topology.

Guidelines

- OAM must be enabled on the switches before using the OAM trace.

Note VXLAN OAM IPv6 is supported from Irvine release onwards.

- NX-API and NX-API on HTTP port must be enabled.
- vPC advertise-pip must be enabled.
- For switch-to-switch OAM, ensure that the VRFs are configured along with loopback interfaces with IPv4 and IPv6 addresses under those VRF's.
- For host-to-host OAM, ensure that the Networks with VLAN are configured along with IPv6 configuration.
- From Cisco NDFC Release 12.1.1e, IPv6 underlay is supported with VXLAN OAM. To enable the VXLAN OAM support over IPv6 underlay, perform any one of the following steps:
 - On the **Topology** window:
 - Choose **Actions > Add Fabric**.
 - On the **General Parameters** tab, check the **Enable IPv6 Underlay** check box.
 - On the **LAN Fabrics** window:
 - Choose **Actions > Create Fabric**.
 - On the **General Parameters** tab, check the **Enable IPv6 Underlay** check box.

Note Changing of IPv4 to IPv6 underlay is not supported for existing fabric settings

To change the fabric settings from IPv4 to IPv6 underlay, delete the existing fabric and create new fabric with Underlay IPV6 enabled.

UI Navigation

- In the **Topology** window: Click **Actions**. Choose **VXLAN OAM** option from the drop-down list.
- From **LAN Fabrics** window: Choose **LAN > Fabrics**. Navigate to the fabric overview window of a fabric. Click **Actions**. Choose **VXLAN OAM** option from the drop-down list.

The VXLAN OAM window appears. The **Path Trace Settings** pane on the left displays the **Switch to Switch** and **Host to Host** tabs. Nexus Dashboard Fabric Controller highlights the route on the topology between the source and destination switch for these two options.

The **Switch to Switch** option provides the VXLAN OAM ping and traceroute test results for the VTEP-to-VTEP use-case. Provide the following values to enable search by using the **Switch to Switch** option:

- In the **Source Switch** drop-down list, choose the source switch.
- In the **Destination Switch** drop-down list, choose the destination switch.
- From the **VRF** drop-down list, choose or enter the VRF details.
- Check the **All paths included** check box to include all the paths in the search results.

The **Host to Host** option provides the VXLAN OAM path trace results for the exact path that is taken by a given flow from the VTEP or switch that is connected to the source host to VTEP or switch that is connected to the destination host. For the **Host to Host** use-case, there are two options:

- VRF or SVI for a network is instantiated on the switches in the VXLAN EVPN fabric. In such a scenario, the IP address information of the end hosts is required.
- Layer 2 configuration for a given network is instantiated on the switches in the VXLAN EVPN fabric. In such a scenario, both the MAC and IP address information of the end hosts are required.

Provide the following values to enable search using the **Host to Host** option:

- From the **Source Host IP** field, enter the IPv4/IPv6 address of the source host.
- From the **Destination Host IP** field, enter the IPv4/IPv6 address of the destination host.
- In the **VRF** field, choose VRF from the drop-down list or enter the VRF name that is associated with the hosts.
- In the **Source Port** field, choose Layer 4 source port number from the drop-down list or enter its value.
- In the **Destination Port** field, choose destination port number or enter its value.
- In the **Protocol** field, choose the protocol value from the drop-down list or enter its value. This is the Layer 4 protocol, usually TCP or UDP.
- Check the **Layer 2 only** check box to search the VXLAN-EVPN fabric that is deployed in Layer 2 only mode for some networks, that is, Layer 2 VNIs. No SVIs or VRFs should be instantiated in the fabric for these networks when you use this search option. When you check this option, you have to enter details of the source MAC address, destination MAC address, and VNI too.

Click **Run Path Trace** to view the path trace from switch to switch or host to host.

You can view the forward path and reverse path as well in the topology. The summary of the path trace appears in the **Summary** tab. You can view the details of the forward and reverse paths as well under **Forward Path** or **Reverse Path** tabs. Filter the results by attributes, if needed.

Fabric Overview

The **Actions** drop-down list at the Fabric level allows you to perform the following:

Actions	Description
Edit Fabric	<ul style="list-style-type: none"> To edit a fabric, choose Actions > Edit Fabric. The Edit fabric window appears, do necessary changes and click Save.
Add Switches	Refer to section Add Switches for more information.
Recalculate Config	Refer to section Recalculating and Deploying Configurations for more information.
Preview Config	Refer to section Preview Config for more information.
Deploy Config	<ul style="list-style-type: none"> To deploy configuration changes, choose Actions > Deploy Config. A progress window appears and confirmation message is displayed.
More	
Deployment Enable	<ul style="list-style-type: none"> From Fabrics Overview, choose Actions on main tab, choose More > Deployment Enable. A confirmation window appears, click OK.
Deployment Disable	<ul style="list-style-type: none"> From Fabrics Overview, choose Actions on main tab, choose More > Deployment Disable. A confirmation window appears, click OK.
Backup Fabric	Refer to Backup Fabric section for more information.
Restore Fabric	Refer to Restoring Fabric section for more information.
VXLAN OAM	Refer to VXLAN OAM, on page 117 section for more information. Note This feature appears in the Actions drop-down list only for VXLAN Fabric, eBGP VXLAN Fabric, External, and Lan Classic fabric technologies, which support VXLAN OAM.
Configure End Point Locator	The Endpoint Locator (EPL) feature allows real-time tracking of endpoints within a data center. For more information, see Endpoint Locator , on page 208 .

Fabric Overview contains tabs that allows you view and perform all the operations on the fabric.

Overview

The **Overview** tab displays the following information as cards.

- Fabric Information
- Fabrics

Displayed if there are child fabrics. For example: Multi-Site Fabrics

- Event Analytics
- Switches Configuration
- Switches
 - Switch Health
 - Switch Configuration
 - Switch Roles
 - Switch Hardware Version

- VXLAN

Displayed only for VXLAN Fabrics

- Routing Loopback
- VTEP Loopback
- Multisite Loopback
- NVE Int Status
- Networks/VRFs Definition
- Extended Networks/VRFs

- [Hosts](#)

This tab is displayed only in you've configured IPFM fabric.

- [Flows](#)

This tab is displayed only in you've configured IPFM fabric.

- Reports

Hosts

The **Hosts** card displays the following details:

- **Pie chart** - Each slice has a unique color and displays a host role and count, for example, Sender, Receiver, and ARP. Click a host type, for example, Sender, to hide or unhide the slice, for the selected IPFM fabric.
To view more information, choose **Fabric Overview > Hosts > Discovered Hosts**.
- **Faults** - If faults exist, displays the number of faults including policer drops. To view more information, click **Faults** which opens the **Hosts > Discovered Hosts** tab.

For more information about hosts, see [Hosts, on page 156](#).

Flows

The **Flows** card displays the following details:

- **Pie chart** - Each slice has a unique color and displays a multicast flow class and count, for example, Active, Inactive, Sender Only, and Receiver Only. Click a flow class, for example, Active, to hide or unhide the slice.

To view more information, choose **Fabric Overview > Flows > Flow Status**.

- **Groups** - Displays the number of multicast flow groups. This information is also displayed on the IPFM fabric topology.

For more information about flows, see [Flows, on page 167](#).

Switches

You can manage switch operations in this tab. Each row represents a switch in the fabric, and displays switch details, including its serial number.

Some of the actions that you can perform from this tab are also available when you right-click a switch in the fabric topology window. However, the **Switches** tab enables you to provision configurations on multiple switches, like deploying policies, simultaneously.

Note For all non-nexus device only MD5 protocol option is supported for SNMPv3 authentication.

The Switches tab has following information of every switch you discover in the fabric:

- Name: Specifies the switch name.
- IP Address: Specifies the IP address of the switch.
- Role: Specifies the role of the switch.
- Serial Number: Specifies the serial number of the switch.
- Fabric Name: Specifies the name of the fabric, where the switch is discovered.
- Fabric Status: Specifies the status of the fabric, where the switch is discovered.
- Discover Status: Specifies the discovery status of the switch.
- Model: Specifies the switch model.
- Software Version: Specifies the software version of the switch.
- Last Updated: Specifies when the switch was last updated.
- Mode: Specifies the current mode of the switch.
- vPC Role: Specifies the vPC role of the switch.
- vPC Peer: Specifies the vPC peer of the switch.

The **Switches** tab has the following operations on the Action drop-down list:

- **Add switches**: Click this icon to discover existing or new switches to the fabric. The Inventory Management dialog box appears.

This option is also available in the fabric topology window. Click **Add switches** in the **Actions** pane.

Refer the following sections for more information:

- [Adding Switches to a Fabric](#): Provides information on adding switches to easy fabrics.
- [Discovering New Switches](#): Provide information on adding Cisco Nexus switches to external fabrics.
- [Adding non-Nexus Devices to External Fabrics](#): Provide information on adding non-Nexus switches to external fabrics.
- **Preview**: You can preview the pending configurations and the side-by-side comparison of running configurations and expected configurations.
- **Deploy**: Deploy switch configurations. From Cisco Nexus Dashboard Fabric Controller Release 11.3(1), you can deploy configurations for multiple devices using the Deploy button.

Note

- This option grays out if the fabric is in freeze mode, that is, if you have disabled deployments on the fabric.
 - In an MSD fabric, you can deploy configurations only on the Border Gateway, Border Gateway Spine, Border Gateway Super-Spine, or External Fabric switches.
-

- **Discovery**: You can perform the following operations.
 - **Update discovery credentials**: Update device credentials such as authentication protocol, username and password.
 - **Rediscover switch**: Initiate the switch discovery process by Nexus Dashboard Fabric Controller afresh.
- **Set Role**: Choose one or more devices of the same device type and click Set Role to set roles for devices. The device types are:
 - NX-OS
 - IOS XE
 - IOS XR
 - Other

Ensure that you have moved switches from maintenance mode to active mode or operational mode before setting roles. See the [Switch Operations](#) section for more information on setting roles.

- **vPC Pairing**: Choose a switch and click vPC Pairing to create, edit, or unpair a vPC pair. However, you can use this option only when you choose a Cisco Nexus switch. Refer the following sections for more information:
 - [Creating a vPC Setup in the External Fabric](#): Provides information on how to create a vPC pair in external fabrics.
 - **vPC Fabric Peering**: Provides information on how to create a vPC pair in easy fabrics.

Note Note: NDFC 12 does not allow you to create vPC pairing on Spine, Border Spine, Border Gateway Spine, Super Spine, Border Super Spine, and Border Gateway Super Spine roles.

- vPC Overview
- More: Further operations are provided under More.
- Show Commands: Execute Show commands on the selected Switch. Select the Commands from the drop-down list. Enter appropriate values in the Variables fields, and click **Execute**. The right column execute the show command and displays the output.
- Exec Commands: When you first log in, the Cisco NX-OS software places you in the EXEC mode. The commands available in the EXEC mode include the show commands that display the device status and configuration information, the clear commands, and other commands that perform actions that you do not save in the device configuration.
- Provision RMA: Allows you to replace a physical switch in a Fabric when using Cisco Nexus Dashboard Fabric Controller Easy Fabric mode.
- **Change Serial Number**: Allows you to change switch serial number if the switches are pre-provisioned.

While pre-provisioning devices, you can provide dummy values for the Serial number of the switch. After configuring network for preprovision devices in form of policies, or links, or interfaces, or vrfs, or networks dummy serial number can be changed with the required appropriate serial number. Before changing the serial number of switches, on main window, click **Actions > Recalculate and deploy** to save the latest data on switch.

Note Change of serial number allowed only for Nexus 9000 Series switches.

- Copy Run Start: You can perform an on-demand copy running-configuration to startup-configuration operation for one or more switches.

Note This option will be grayed out if the fabric is in freeze mode, that is, if you have disabled deployments on the fabric.

- Reload: Reload the selected switch.

Note This option is grayed out if the fabric is in freeze mode, that is, if you have disabled deployments on the fabric.

- Delete switches: Remove the switch from the fabric.

This option will be grayed out if the fabric is in freeze mode, that is, if you have disabled deployments on the fabric.

- **Restore Switches:** The information you restore at switch-level is extracted from the fabric-level backups. The switch-level restoring doesn't restore fabric-level intents and other configurations applied using the fabric settings. Only switch-level intents are restored. Therefore, after you restore a switch, it might go out-of-sync because the fabric-level intents aren't restored. Perform a fabric-level restore to restore the intents as well. You can restore only one switch at a time. You can't restore a switch if the fabric where it's discovered is part of an MSD fabric.
- **Change Mode:** You can change the mode of the switch from Normal to Managed and vice versa. You can choose to save the settings and deploy immediately, or schedule it for later.

Guidelines and Limitations for changing discovery IP Address

From Cisco Nexus Dashboard Fabric Controller Release 12.0.1a, you can change the Discovery IP address of a device that is existing in a fabric.

Guidelines and Limitations

The following are the guidelines and limitations for changing discovery IP address.

- Changing discovery IP address is supported for NX-OS switches and devices that are discovered over their management interface.
- Changing discovery IP address is supported for templates such as:
 - Easy_Fabric
 - Easy_Fabric_eBGP
 - External
 - LAN_Classic
 - LAN_Monitor
- Changing discovery IP address is supported in both managed and monitored modes.
- Only users with the **network-admin** role can change the discovery IP address on Cisco Fabric Controller UI.
- The discovery IP address must not be used on other devices, and it must be reachable when the change is done.
- While changing the discovery IP address for a device in a managed fabric, switches are placed in migration mode.
- When you change the IP address of a switch that is linked to vPC Peer, corresponding changes such as vPC peer, domain configuration will be updated accordingly.
- Fabric configuration restores the original IP address, it reports out of sync post restore and the configuration intent for the device must be updated manually to get the in-sync status.
- Fabric controllers restore that had the original device discovery IP reports the switch as Unreachable post restore. The discovery IP address change procedure must be repeated after the restore.
- Device Alarms associated with the original discovery IP address will be purged after the change of IP address.

Changing Discovery IP Address

Before you begin

You must make the management IP address and route related changes on the device and ensure that the reachability of the device from Nexus Dashboard Fabric Controller.

To change the discovery IP address from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Choose **LAN > Fabrics**.
- Step 2** Click on fabric names to view the required switch.
The **Fabric summary** slide-in pane appears.
- Step 3** Click **Launch** icon to view **Fabric Overview** window.
- Step 4** On the **Switches** tab, click **Refresh** icon adjacent to the **Action** button on the main window.
Switch with a changed IP address will be in **Unreachable** state in **Discovery Status** column.
- Step 5** Click the check box next to the **Switch** column and select the switch.
Note You can change the IP address for individual switch and not for multiple switches.
- Step 6** Choose **Actions > Change Discovery IP** on the switches tab area.
The **Change Discovery IP** window appears.
Similarly, you can navigate from **LAN > Switches** tab. Choose a required switch, click **Actions > Discovery > Change Discovery IP**.
- Step 7** Enter the appropriate IP address in the **New IP Address** text field and click **OK**.
a) The new IP address must be reachable from Nexus Dashboard Fabric Controller to update successfully.
b) Repeat the above procedures for the devices where the discovery IP address must be changed before proceeding with further steps.
c) If the fabric is in managed mode, the device mode will be updated to migration mode.
- Step 8** From the fabric **Actions** drop-down list, click **Recalculate Config** to initiate the process of updating Nexus Dashboard Fabric Controller configuration intent for the devices. Similarly, you can recalculate configuration on topology window. Choose **Topology**, tab right-click on the switch, click **Recalculate Config**.
The Nexus Dashboard Fabric Controller configuration intent for the device management related configuration will be updated and the device mode status for the switch is changed to normal mode. The switch configuration status is displayed as **In-Sync**.
Note The PM records associated with the old switch IP address will be purged and new record collections take an hour to initiate after the changes.
-

Links

You can add links between border switches of different fabrics (inter-fabric links) or between switches in the same fabric (intra-fabric links). You can only create an inter-fabric connection (IFC) for a switch that is managed by Nexus Dashboard Fabric Controller.

There are scenarios where you might want to define links between switches before connecting them physically. The links could be inter-fabric or intra-fabric links. Doing so, you can express and represent your intent to add links. The links with intent are displayed in a different color till they are actually converted to functional links. Once you physically connect the links, they are displayed as connected.

Management links might show up in the fabric topology as red colored links. To remove such links, right-click the link and click **Delete Link**.

The Border Spine and Border Gateway Spine roles are added to switch roles for border switches.

You can create links between existing and pre-provisioned devices as well by selecting the pre-provisioned device as the destination device.

The following table describes the fields that appear on **Links** tab.

Field	Description
Fabric Name	Specifies the name of the Fabric.
Name	Specifies the name of the link. The list of previously created links is displayed. The list contains intra-fabric links, which are between switches within a fabric, and inter-fabric links, which are between border switches in this fabric and switches in other fabrics.
Policy	Specifies the link policy.
Info	Provides more information about the link.
Admin State	Displays the administrative state of the link.
Oper State	Displays the operational state of the link.

The following table describes the action items, in the Actions menu drop-down list, that appear on **Fabric Overview > Links > Links**.

Action Item	Description
Create	Allows you to create the following links: <ul style="list-style-type: none"> • Creating Inter-Fabric Links, on page 129 • Creating Intra-Fabric Links, on page 127
Edit	Allows you to edit the selected fabric.
Delete	Allows you to delete the selected fabric.

Action Item	Description
Import	<p>You can import a CSV file containing details of links to add new links to the fabric. The CSV file should have the following details of links: link template, source fabric, destination fabric, source device, destination device, source switch name, destination switch name, source interface, destination interface, and nvPairs.</p> <p>Note</p> <ul style="list-style-type: none"> You cannot update existing links. The Import Links icon is disabled for external fabric.
Export	<p>Choose the link and select Export to export the links in a CSV file.</p> <p>The following details of links are exported: link template, source fabric, destination fabric, source device, destination device, source switch name, destination switch name, source interface, destination interface, and nvPairs. The nvPairs field consists JSON object.</p>

Creating Intra-Fabric Links

Click the Links tab. You can see a list of links. The list is empty when you are yet to create a link.

To create Intra-Fabric links, perform the following steps:

Procedure

-
- Step 1** From the Actions drop-down list, select **Create**.
The **Link Management - Create Link** page appears.
- Step 2** From the Link Type drop-down box, choose **Intra-Fabric** since you are creating an IFC. The screen changes correspondingly.
The fields are:
- Link Type** – Choose Intra-Fabric to create a link between two switches in a fabric.
- Link Sub-Type** – This field populates Fabric indicating that this is a link within the fabric.
- Link Template:** You can choose any of the following link templates.
- int_intra_fabric_num_link:** If the link is between two ethernet interfaces assigned with IP addresses, choose int_intra_fabric_num_link.
 - int_intra_fabric_unnum_link:** If the link is between two IP unnumbered interfaces, choose int_intra_fabric_unnum_link.
 - int_intra_vpc_peer_keep_alive_link:** If the link is a vPC peer keep-alive link, choose int_intra_vpc_peer_keep_alive_link.

- **int_pre_provision_intra_fabric_link**: If the link is between two pre-provisioned devices, choose **int_pre_provision_intra_fabric_link**. After you click Save & Deploy, an IP address is picked from the underlay subnet IP pool.

Correspondingly, the Link Profile section fields is updated.

Source Fabric – The fabric name populates this field since the source fabric is known.

Destination Fabric – Choose the destination fabric. For an intra-fabric link, source and destination fabrics are the same.

Source Device and Source Interface – Choose the source device and interface.

Destination Device and Destination Interface – Choose the destination device and interface.

Note Select the pre-provisioned device as the destination device if you are creating a link between an existing device and a pre-provisioned device.

General tab in the Link Profile section

Interface VRF – Name of a non-default VRF for this interface.

Source IP and Destination IP – Specify the source and destination IP addresses of the source and destination interfaces, respectively.

Note The Source IP and Destination IP fields do not appear if you choose **int_pre_provision_intra_fabric_link** template.

Interface Admin State – Check or uncheck the check box to enable or disable the admin state of the interface.

MTU – Specify the maximum transmission unit (MTU) through the two interfaces.

Source Interface Description and Destination Interface Description – Describe the links for later use. For example, if the link is between a leaf switch and a route reflector device, you can enter the information in these fields (Link from leaf switch to RR 1 and Link from RR 1 to leaf switch). This description will be converted into a config, but will not be pushed into the switch. After Save & Deploy, it will reflect in the running configuration.

Disable BFD Echo on Source Interface and Disable BFD Echo on Destination Interface – Select the check box to disable BFD echo packets on source and destination interface.

Note that the BFD echo fields are applicable only when you have enabled BFD in the fabric settings.

Source Interface Freeform CLIs and Destination Interface Freeform CLIs: Enter the freeform configurations specific to the source and destination interfaces. You should add the configurations as displayed in the running configuration of the switch, without indentation. For more information, refer [Enabling Freeform Configurations on Fabric Switches](#).

Step 3 Click **Save** at the bottom right part of the screen.

You can see that the IFC is created and displayed in the list of links.

Step 4 On the Fabric Overview Actions drop-down list, select **Recalculate Config**.

The Deploy Configuration screen comes up.

It displays the configuration status on the switches. You can also view the pending configurations by clicking the respective link in the **Pending Config** column. It lists the pending configurations on the switch. The Side-by-side Comparison tab displays the running configuration and expected configuration side-by-side.

Close the **Pending Config** screen.

Step 5 From **Fabric Overview Actions** drop-down list, select **Deploy Config**.

The pending configurations are deployed.

After ensuring that the progress is 100% in all the rows, click **Close** at the bottom part of the screen. The Links screen comes up again. In the fabric topology, you can see that the link between the two devices is displayed.

Creating Inter-Fabric Links

Click the Links tab. You can see a list of links. The list is empty when you are yet to create a link.

Note In external fabrics, inter fabric links support BGW, Border Leaf/Spine, and edge router switches.

To create Inter-Fabric links, perform the following steps:

Procedure

Step 1 From the Actions drop-down list, select **Create**.

The **Link Management - Create Link** page appears.

Step 2 From the Link Type drop-down box, choose **Inter-Fabric** since you are creating an IFC. The screen changes correspondingly.

The fields for inter-fabric link creation are explained:

Link Type – Choose Inter-Fabric to create an inter-fabric connection between two fabrics, via their border switches.

Link Sub-Type – This field populates the IFC type. Choose VRF_LITE, MULTISITE_UNDERLAY, or MULTISITE_OVERLAY from the drop-down list.

The Multi-Site options are explained in the Multi-Site use case.

For information about VXLAN MPLS interconnection, see the [MPLS SR and LDP Handoff](#) chapter.

For information about routed fabric interconnection, see the *Creating Inter-Fabric Links Between a Routed Fabric and an External Fabric* section in the *Configuring a Fabric with eBGP Underlay* chapter.

Link Template: The link template is populated.

The templates are autopopulated with corresponding pre-packaged default templates that are based on your selection.

Note You can add, edit, or delete user-defined templates. See [Templates](#) section in the Control chapter for more details.

Source Fabric - This field is prepopulated with the source fabric name.

Destination Fabric - Choose the destination fabric from this drop-down box.

Source Device and Source Interface - Choose the source device and Ethernet interface that connects to the destination device.

Destination Device and Destination Interface—Choose the destination device and Ethernet interface that connects to the source device.

Based on the selection of the source device and source interface, the destination information is autopopulated based on Cisco Discovery Protocol information, if available. There is an extra validation performed to ensure that the destination external device is indeed part of the destination fabric.

General tab in the Link Profile section.

Local BGP AS# - In this field, the AS number of the source fabric is autopopulated.

IP_MASK—Fill up this field with the IP address of the source interface that connects to the destination device.

NEIGHBOR_IP—Fill up this field with the IP address of the destination interface.

NEIGHBOR_ASN—In this field, the AS number of the destination device is autopopulated.

Step 3 Click **Save** at the bottom right part of the screen.

You can see that the IFC is created and displayed in the list of links.

Step 4 On the Fabric Overview Actions drop-down list, select **Recalculate Config**.

The Deploy Configuration screen comes up.

It displays the configuration status on the switches. You can also view the pending configurations by clicking the respective link in the **Pending Config** column. It lists the pending configurations on the switch. The Side-by-side Comparison tab displays the running configuration and expected configuration side-by-side.

Close the **Pending Config** screen.

Step 5 From **Fabric Overview Actions** drop-down list, select **Deploy Config**.

The pending configurations are deployed.

After ensuring that the progress is 100% in all the rows, click **Close** at the bottom part of the screen. The Links screen comes up again. In the fabric topology, you can see that the link between the two devices is displayed.

If the two fabrics are member fabric of an MSD, then you can see the link in the MSD topology too.

What to do next

If the two fabrics are member fabric of an MSD, then you can see the link in the MSD topology too.

When you enable the VRF Lite function using the ToExternalOnly method or Multisite function via MSD fabric, IFCs are automatically created between the (VXLAN fabric) border/BGW device and connected (external fabric) edge router/core device. When you remove the ER/core/border/BGW device, the corresponding IFCs (link PTIs) to/from that switch are deleted on Nexus Dashboard Fabric Controller. Subsequently, Nexus Dashboard Fabric Controller removes the corresponding IFC configurations, if any, from the remaining devices on the next Save & Deploy operation. Also, if you want to remove a device that has an IFCs and overlay extensions over those IFCs, you should undeploy all overlay extensions corresponding to those IFCs for switch delete to be possible.

To undeploy VRF extensions, select the VXLAN fabric and the extended VRFs, and undeploy the VRFs in the VRF deployment screen.

To delete the IFCs, delete the IFCs from the Links tab.

Ensure that the fabric switch names are unique. If you deploy VRF extensions on switches with the same name, it leads to erroneous configuration.

The new fabric is created, the fabric switches are discovered in Nexus Dashboard Fabric Controller, the underlay networks provisioned on those switches, and the configurations between Nexus Dashboard Fabric Controller and the switches are synced. The remaining tasks are:

- Provision interface configurations such as vPCs, loopback interface, and subinterface configurations. Refer [Interfaces](#).
- Create overlay networks and VRFs and deploy them on the switches. Refer [Creating and Deploying Networks and VRFs](#).

Protocol View

This tab displays the protocols for the links in the selected Fabric.

The following table describes the fields that appear on **Protocol View** tab.

Field	Description
Fabric Name	Specifies the name of the fabric.
Name	Specifies the name of the link.
Is Present	Specifies if the link is present.
Link Type	Specifies the type of link.
Link State	Specifies the state of link.
UpTime	Specifies the time duration from when the link was up.

Interfaces

This section contains the following topics:

- [Interfaces](#)
- [Interface Groups](#)

Policies

Nexus Dashboard Fabric Controller provides the ability to group a set of switches, and allows you to push a set of underlay configurations to the group.

Choose **LAN > Policies** to display the list of policies.

The following table describes the fields that appear on **LAN > Policies**.

Field	Description
Policy ID	Specifies the policy ID.
Switch	Specifies the switch name.
IP Address	Specifies the IP address of the switch.
Template	Specifies the name of the template.
Description	Specifies the description. Note From Cisco NDFC Release 12.1.1e, change of serial number for the switch is allowed, both old and new serial numbers can be viewed in this column.
Entity Name	Specifies the entity name.
Entity Type	Specifies the entity type.
Source	Specifies the source.
Priority	Specifies the priority.
Content Type	Species for the content type.
Fabric Name	Specifies the fabric name.
Serial Number	Specifies the serial number of the switch.
Editable	Specifies a Boolean value to indicate if the policy is editable.
Mark Deleted	Specifies a Boolean value to indicate if the policy is marked to be deleted.

The following table describes the action items, in the **Actions** menu drop-down list, that appear on **LAN > Policies**.

Action Item	Description
Add Policy	To add a policy, see Add Policy

Action Item	Description
Edit Policy	<p>Choose a policy from the table and choose Edit Policy to modify the policy.</p> <p>Note</p> <ul style="list-style-type: none"> • The policies in the italics font cannot be edited. The value under the Editable and Mark Deleted columns for these policies is false. • A warning appears when you edit a policy whose Mark Deleted value is set to <i>true</i>. The switch freeform child policies of Mark Deleted policies appears in the Policies dialog box. You can edit only Python switch_freeform policies. You cannot edit Template_CLI switch_freeform_config policies.
Delete Policy	<p>Choose policies from the table and choose Delete Policy to delete the policies.</p> <p>Note A warning appears when you delete policies whose Mark Deleted values are set to <i>true</i>.</p>
Generated Config	<p>Choose policies from the table and choose Generated Config to view the delta of configuration changes made by every user.</p>
Push Config	<p>Choose policies from the table and choose Push Config to push the policy configuration to the device.</p> <p>Note</p> <ul style="list-style-type: none"> • This option will be grayed out if the fabric is in freeze mode, that is, if you have disabled deployments on the fabric. • A warning appears if you push configuration for a Python policy. • A warning appears when you push configurations for policies whose Mark Deleted values are set to <i>true</i>.

Event Analytics

Event Analytics includes the following topics:

Alarms

This tab displays the alarms that are generated for various categories. This tab displays information such as ID (optional), Severity, Failure Source, Name, Category, Acknowledged, Creation Time, Last Updated (optional), Policy, and Message. You can specify the Refresh Interval in this tab. You can select one or more alarms and then acknowledge or unacknowledge their status using the Change Status drop-down list. In addition, you can select one or more alarms and then click the Delete button to delete them.

Events

This tab displays the events that are generated for the switches. This tab displays information such as Ack, Acknowledged user, Group, Switch, Severity, Facility, Type, Count, Last Seen, and Description. You can select one or more events and then acknowledge or unacknowledge their status using the Change Status drop-down list. In addition, you can select one or more alarms and then click the Delete button to delete them. If you want to delete all events, click the Delete All button.

The following table describes the fields that appear on **Operations > Event Analytics > Events**.

Field	Description
Group	Specifies the Fabric
Switch	Specifies the hostname of the switch
Severity	Specifies the severity of the event
Facility	Specifies the process that creates the events. The event facility includes two categories: NDFC and syslog facility. Nexus Dashboard Fabric Controller facility represents events generated by Nexus Dashboard Fabric Controller internal services and SNMP traps generated by switches. Syslog facility represents the machine process that created the syslog messages.
Type	Specifies how the switch/fabric are managed
Count	Specifies the number of times the event has occurred
Creation Time	Specifies the time when the event was created
Last Seen	Specifies the time when the event was run last
Description	Specifies the description provided for the event
Ack	Specifies if the event is acknowledged or not

The following table describes the action items, in the **Actions** menu drop-down list, that appear on **Operations > Event Analytics > Events**.

Action Item	Description
Acknowledge	Select one or more events from the table and choose Acknowledge icon to acknowledge the event information for the fabric. After you acknowledge the event for a fabric, the acknowledge icon is displayed in the Ack column next to the Group.

Action Item	Description
Unacknowledge	Select one or more events from the table and choose Unacknowledge icon to acknowledge the event information for the fabric.
Delete	Select an event and choose Delete to delete the event.
Event Setup	Allows you to setup new event. For more information, see Event Setup .

Accounting

You can view the accounting information on Cisco Nexus Dashboard Fabric Controller Web UI.

The following table describes the fields that appear on **Operations > Event Analytics > Accounting**.

Field	Description
Source	Specifies the source
User Name	Specifies the user name.
Time	Specifies the time when the event was created
Description	Displays the description.
Group	Specifies the name of the group.

The following table describes the action items, in the **Actions** menu drop-down list, that appear on **Operations > Event Analytics > Accounting**.

Action Item	Description
Delete	Select a row and choose Delete to delete accounting information from the list.

Recent Tasks

UI Path: **LAN > Fabric > Fabric Overview > Event Analytics > Recent Tasks**

On **Recent Tasks** tab you can view the changes made for the event analytics.

Note When the device is rebooted, the recent task details will be erased.

The following table describes the fields that appear on the **Recent Tasks** tab.

Field	Description
Fabric	Specifies the name of the fabric.
Task Name	Specifies the name of operation done on fabric recently.
Task Description	Specifies the description of task done on fabric.
Duration	Specifies the time duration of the task.

Field	Description
Completed/Progress	Specifies the progress details, whether the task is completed 100% or still in progress.

VRFs

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics.

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > VRFs**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > VRFs**.

Note Overlay-mode CLI is available only for Easy and eBGP Vxlan Fabrics.

To create overlay VRFs, create VRFs for the fabric and deploy them on the fabric switches. Before attaching or deploying the VRFs, set the overlay mode. For more information on how to choose the overlay mode, refer the [Overlay Mode, on page 32](#) section.

You can view the VRF details in the **VRFs** horizontal tab and VRF attachment details in the **VRF Attachments** horizontal tab.

This section contains the following:

VRFs

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics.

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > VRFs > VRFs**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > VRFs > VRFs**.

Use this tab to create, edit, delete, import, and export VRFs. You can create networks only after creating VRFs except when you use Layer 2 to create networks.

Table 1: VRF Table Fields and Description

Field	Description
VRF Name	Specifies the name of the VRF.
VRF Status	Specifies whether the status of the VRF deployment as NA, out-of-sync, pending, deployed, and so on.
VRF ID	Specifies the ID of the VRF.

Click the table header to sort the entries in alphabetical order of that parameter.

The following table describes the action items, in the **Actions** drop-down list, that appears on the **VRFs** horizontal tab of the **VRFs** tab in the **Fabric Overview** window.

Table 2: VRFs Actions and Description

Action Item	Description
Create	Allows you to create a new VRF. For more information, see Creating VRF, on page 137 .
Edit	Allows you to edit the selected VRF. To edit a VRF, select the check box next to the VRF that you want to edit and choose Edit . In the Edit VRF window, you can edit the parameters and click Save to retain the changes or click Cancel to discard the changes.
Import	Allows you to import VRF information for the fabric. To import VRF information, choose Import . Browse the directory and select the <code>.csv</code> file that contains the VRF information. Click Open . The VRF information is imported and displayed in the VRFs tab of the Fabric Overview window.
Export	Allows you to export VRF information to a <code>.csv</code> file. The exported file contains information pertaining to each VRF, including the configuration details that you saved during the creation of VRFs. To export VRF information, choose Export . Select a location on your local system directory to store the VRF information from Nexus Dashboard Fabric Controller and click Save . The VRF information file is exported to your local directory. The file name is appended with the date and time at which the file was exported. Note You can use the exported <code>.csv</code> file for reference or use it as a template for creating new VRFs.
Delete	Allows you to delete a selected VRF. To delete a VRF, select the check box next to the VRF that you want to delete and choose Delete . You can select multiple VRF entries and delete them at the same instance. A warning message appears asking whether you want to delete the VRF(s). Click Confirm to delete or click Cancel to retain the VRF. A message appears that the selected VRFs are deleted successfully.

Creating VRF

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics.

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > VRFs > VRFs**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > VRFs > VRFs**.

To create VRF from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

Step 1 Click **Actions** and choose **Create**.

The **Create VRF** window appears.

Step 2 Enter the required details in the mandatory fields. The available fields vary slightly based on the fabric type.

The fields in this window are:

VRF Name - Specifies a VRF name automatically or allows you to enter a name for Virtual Routing and Forwarding (VRF). The VRF name should not contain any white spaces or special characters except underscore (_), hyphen (-), and colon (:).

Note For MSD Fabrics, the values for VRF or Network is same for the fabric.

VRF ID - Specifies the ID for the VRF or allows you to enter an ID for the VRF.

VLAN ID - Specifies the corresponding tenant VLAN ID for the network or allows you to enter an ID for the VLAN. If you want to propose a new VLAN for the network, click **Propose Vlan**.

VRF Template - A universal template is autopopulated. This is only applicable for leaf switches.

VRF Extension Template - A universal extension template is autopopulated. This allows you to extend this network to another fabric. The methods are VRF Lite, Multi Site, and so on. The template is applicable for border leaf switches and BGWs.

The VRF profile section contains the **General Parameters**, **Advanced**, and **Route Target** tabs.

a) The fields on the **General** tab are:

VRF Vlan Name - Enter the VLAN name for the VRF.

VRF Description - Enter a description for the VRF.

VRF Intf Description - Enter a description for the VRF interface.

b) Click the **Advanced** tab to optionally specify the advanced profile settings. The fields on this tab are autopopulated. The fields on the **Advanced** tab are:

VRF Intf MTU - Specifies VRF interface MTU.

Loopback Routing Tag – If a VLAN is associated with multiple subnets, then this tag is associated with the IP prefix of each subnet. Note that this routing tag is associated with overlay network creation too.

Redistribute Direct Route Map - Specifies the redistribute direct route map name.

Max BGP Paths - Specifies the maximum BGP paths. The valid value range is between 1 and 64.

Max iBGP Paths - Specifies the maximum iBGP paths. The valid value range is between 1 and 64.

TRM Enable – Select the check box to enable TRM.

If you enable TRM, then the RP address, and the underlay multicast address must be entered.

NO RP - Select the check box to disable RP fields.

If you enable NO RP, then the RP External, RP address, RP loopback ID, and Overlay Mcast Groups are disabled on VRF attachment.

Is RP External – Enable this checkbox if the RP is external to the fabric. If this field is unchecked, RP is distributed in every VTEP.

RP Address – Specifies the IP address of the RP.

RP Loopback ID – Specifies the loopback ID of the RP, if **Is RP External** is not enabled.

Underlay Multicast Address – Specifies the multicast address associated with the VRF. The multicast address is used for transporting multicast traffic in the fabric underlay.

Note The multicast address in the **Default MDT Address for TRM VRFs** field in the fabric settings screen is auto-populated in this field. You can override this field if a different multicast group address should be used for this VRF.

Overlay Multicast Groups – Specifies the multicast group subnet for the specified RP. The value is the group range in “ip pim rp-address” command. If the field is empty, 224.0.0.0/24 is used as default.

Enable IPv6 link-local Option - Select the check box to enable the IPv6 link-local option under the VRF SVI. If this check box is unchecked, IPv6 forward is enabled.

Enable TRM BGW MSite - Select the check box to enable TRM on Border Gateway Multisite.

Advertise Host Routes - Enable this check box to control advertisement of /32 and /128 routes to Edge routers.

Advertise Default Route - Enable this check box to control advertisement of default route internally.

To allow inter-subnet communication between end hosts in different VXLAN fabrics, where the subnets are present in both fabrics, you must disable the **Advertise Default Route** feature (clear the **Advertise Default Route** checkbox) for the associated VRF. This will result in /32 routes for hosts being seen in both fabrics. For example, Host1 (VNI 30000, VRF 50001) in Fabric1 can send traffic to Host2 (VNI 30001, VRF 50001) in Fabric2 only if the host route is present in both fabrics. When a subnet is present in only one fabric then default route is sufficient for inter-subnet communication.

Config Static 0/0 Route - Enable this check box to control configuration of static default route.

BGP Neighbor Password - Specifies the VRF Lite BGP neighbor password.

BGP Password Key Encryption Type - Select the encryption type from this drop-down list.

Enable Netflow – Allows you to enable netflow monitoring on the VRF-Lite sub-interface. Note that this is supported only if netflow is enabled on fabric.

Netflow Monitor – Specifies the monitor for the VRF-lite netflow configuration.

To enable netflow on a VRF-Lite sub-interface, you must enable netflow at VRF level and VRF extension level. Check the **Enable_IFC_Netflow** checkbox in the VRF attachment when editing an extension to enable netflow monitoring.

For information about Netflow support for Cisco NDFC, refer to [Netflow Support, on page 95](#).

c) The fields on the Route Target tab are:

Disable RT Auto-Generate – Choose check box to disable RT Auto-Generate for IPv4, IPv6 VPN/EVPN/MVPN.

Import – Specifies comma separated list of VPN Route-Target to Import.

Export – Specifies comma separated list of VPN Route-Target to Export.

Import EVPN – Specifies comma separated list of EVPN Route-Target to Import.

Export EVPN – Specifies comma separated list of EVPN Route-Target to Export.

Import MVPN – Specifies comma separated list of MVPN Route-Target to Import.

Export MVPN – Specifies comma separated list of MVPN Route-Target to Export.

Note By default, Import MVPN and Export MVPN text fields are grayed out, to enable these text fields, you must enable by choosing **TRM Enable** check box on **Advanced** tab.

Step 3 Click **Create** to create the VRF or click **Cancel** to discard the VRF.

A message appears indicating that the VRF is created.

The new VRF appears on the **VRFs** horizontal tab. The status is **NA** as the VRF is created but not yet deployed. Now that the VRF is created, you can create and deploy networks on the devices in the fabric.

VRF Attachments

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics.

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > VRFs > VRF Attachments**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > VRFs > VRF Attachments**.

Use this window to attach or detach attachments to or from a VRF respectively. You can also import or export the attachments for a VRF.

Table 3: VRF Attachments Table Fields and Description

Field	Description
VRF Name	Specifies the name of the VRF.
VRF ID	Specifies the ID of the VRF.
VLAN ID	Specifies the VLAN Id.
Switch	Specifies the switch name.
Status	Specifies the status of the VRF attachments, for example, pending, NA, deployed, out-of-sync, and so on.
Attachment	Specifies whether the VRF attachment is attached or detached.
Switch Role	Specifies the switch role. For example, for the fabric created using the Easy Fabric IOS XE fabric template, the switch role is specified as either leaf, spine, or border.

Field	Description
Fabric Name	Specifies the name of the fabric to which the VRF is attached or detached.
Loopback ID	Specifies the loopback ID.
Loopback IPV4 Address	Specifies the loopback IPV4 address.
Loopback IPV6 Address	Specifies the loopback IPV6 address. Note The IPV6 address is not supported for underlay.

Click the table header to sort the entries in alphabetical order of that parameter.

The following table describes the action items, in the **Actions** drop-down list, that appears on the **VRF Attachments** horizontal tab of the **VRFs** tab in the **Fabric Overview** window.

Table 4: VRF Attachments Actions and Description

Action Item	Description
History	<p>Allows you to view the deployment and policy change history of the selected VRF.</p> <p>You can view the deployment history details of a VRF attachment such as hostname, VRF name, commands, status, status description, user, and completed time on the Deployment History tab.</p> <p>You can view the policy change history details such as policy ID, template, description, PTI operation, generated configuration, entity name and type, created date, serial number, user, and source of the policy on the Policy Change History tab.</p> <p>To view the history of a VRF attachment, select the check box next to the VRF name and choose the History action. The History window appears. Click the Deployment History or Policy Change History tabs as required. You can also click the Detailed History link in the Commands column of the Deployment History tab to view the command execution details (comprising configuration, status, and CLI response) for the host.</p>
Edit	<p>Allows you to view or edit the VRF attachment parameters such as interfaces that you want to attach to the selected VRF.</p> <p>To edit the VRF attachment information, select the check box next to the VRF name that you want to edit and choose the Edit action. In the Edit VRF Attachment window, edit the required values, attach or detach the VRF attachment, click the Edit link to edit the CLI freeform config for the switch, and click Save to apply the changes or click Cancel to discard the changes. The edited VRF attachment is shown in the table on the VRF Attachments horizontal tab of the VRFs tab in the Fabric Overview window.</p>

Action Item	Description
Preview	<p>Allows you to preview the configuration of the VRF attachments for the selected VRF.</p> <p>Note This action is not allowed for attachments that are in deployed or NA status.</p> <p>To preview the VRF, select the check box next to the VRF name and choose the Preview action. The Preview Configuration window for the fabric appears.</p> <p>You can preview the VRF attachment details such as the VRF name; fabric name; switch name, serial number, IP address, and role; the VRF status, pending configuration, and progress of the configuration. You can also click the lines link in the Pending Config column to view the lines for which the configuration is pending. Click Close.</p>
Deploy	<p>Allows you to deploy the pending configuration of the VRF attachments, for example, interfaces, for the selected VRF.</p> <p>Note This action is not allowed for attachments that are in deployed or NA status.</p> <p>To deploy a VRF, select the check box next to the VRF name and choose the Deploy action. The Deploy Configuration window for the fabric appears.</p> <p>You can view the details such as the VRF name; fabric name; switch name, serial number, IP address, and role; the VRF status, pending configuration, and progress of the configuration. You can also click the lines link in the Pending Config column to view the lines for which the configuration is pending. Click the Deploy button. The status and progress of the deployment is displayed in the VRF Status and Progress columns. After the deployment is completed successfully, close the window.</p>
Import	<p>Allows you to import information about VRF attachments for the selected fabric.</p> <p>To import the VRF attachments information, choose Import. Browse the directory and select the <code>.csv</code> file that contains the VRF attachments information. Click Open and then click OK. The VRF information is imported and displayed in the VRF Attachments horizontal tab on the VRFs tab in the Fabric Overview window.</p>

Action Item	Description
Export	<p>Allows you to export the information about VRF attachments to a .csv file. The exported file contains information pertaining to each VRF, including the fabric it belongs to, whether the LAN is attached, the associated VLAN, serial number, interfaces, and freeform configuration details that you saved for VRF attachments.</p> <p>To export VRF attachments information, choose the Export action. Select a location on your local system directory to store the VRF information from Nexus Dashboard Fabric Controller and click Save. The VRF information file is exported to your local directory. The file name is appended with the date and time at which the file was exported.</p>
Quick Attach	<p>Allows you to immediately attach an attachment to the selected VRF. You can select multiple entries and attach them to a VRF at the same instance.</p> <p>To quickly attach any attachment to a VRF, choose the Quick Attach action. A message appears to inform you that the attach action was successful.</p>
Quick Detach	<p>Allows you to detach the selected VRF immediately from an attachment, for example, a fabric. You can select multiple entries and detach them from an attachment at the same instance.</p> <p>To attach any attachment to a VRF quickly, choose the Quick Detach action. A message appears to inform you that the detach action was successful.</p>

Networks

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics:

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Networks**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Networks**.

Note Before creating networks, ensure that you have created a VRF for the fabric. However, if you have chosen Layer 2, you do not require a VRF. For more information about VRFs, see [VRFs, on page 136](#).

To create overlay networks, create networks for the fabric and deploy them on the fabric switches. Before deploying the networks, set the overlay mode. For more information on how to choose the overlay mode, refer the [Overlay Mode, on page 32](#) section.

For information about creating interface groups and attaching networks, see [Interface Groups](#).

You can view the network details in the **Networks** horizontal tab and network attachment details in the **Network Attachments** horizontal tab.

This section contains the following:

Networks

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Networks** window.

Table 5: Networks Actions and Description

Action Item	Description
Create	Allows you to create a new network for the fabric. For instructions about creating a new network, see Creating Networks for the Standalone Fabric, on page 146 .
Edit	Allows you to view or edit the selected network parameters. To edit the network information, select the check box next to the network name that you want to edit and choose Edit . In the Edit Network window, edit the required values and click Submit to apply the changes or click Cancel to discard the host alias. The edited network is shown in the table in the Networks tab of the Fabric Overview window.
Import	Allows you to import network information for the fabric. To import network information, choose Import . Browse the directory and select the <code>.csv</code> file that contains the host IP address and corresponding unique network information. Click Open . The host aliases are imported and displayed in the Networks tab of the Fabric Overview window.
Export	Allows you to export network information to a <code>.csv</code> file. The exported file contains information pertaining to each network, including the fabric it belongs to, the associated VRF, the network templates used to create the network, and all other configuration details that you saved during network creation. To export network information, choose Export . Select a location on your local system directory to store the network information from Nexus Dashboard Fabric Controller and click Save . The network information file is exported to your local directory. The file name is appended with the date and time at which the file was exported. Note You can use the exported <code>.csv</code> file for reference or use it as a template for creating new networks. Before importing the file, update new records in the <code>.csv</code> file. Ensure that the <code>networkTemplateConfig</code> field contains the JSON Object. A message at the bottom right part of the screen displays errors and success messages.

Action Item	Description
Delete	<p>Allows you to delete the network.</p> <p>To delete a network for the fabric, select the check box next to the network name that you want to delete and choose Delete. You can select multiple network entries and delete them at the same instance.</p>
Add to interface group	<p>Allows you to add the network to an interface group. You can select multiple network entries and add them to an interface group at the same instance.</p> <p>To add the selected networks to the interface group that you want, click Add to interface group action.</p> <p>In the Add to interface group window, click the networks link and verify whether the selected networks are present in the Selected Networks window and then close the window. Either select an interface group from the drop-down list or click Create new interface group.</p> <p>In the Create new interface group window, provide the interface group name, select the interface type, and then click Save to save the changes and close the window or click Cancel to discard the changes.</p> <p>In the Add to interface group window, click Save to save the changes and close the window or click Cancel to discard the changes.</p> <p>The interface group is displayed in a column in the Networks tab of the Fabric Overview window.</p>
Remove from interface group	<p>Allows you to remove the network from an interface group. You can select multiple network entries and remove them from an interface group at the same instance.</p> <p>To remove the selected networks to the interface group that you want, click Remove from interface group action.</p> <p>In the Remove from interface group window, click the networks link and verify whether the selected networks are present in the Selected Networks window and then close the window.</p> <p>In the Remove from interface group window, click Remove to remove the networks from the interface group and close the window or click Cancel to discard the changes.</p> <p>The interface group are removed from the column in the Networks tab of the Fabric Overview window.</p>

Table 6: Networks Table Fields and Description

Field	Description
Network Name	Specifies the name of the network.
Network Id	Specifies the Layer 2 VNI of the network.

Field	Description
VRF Name	Specifies the name of the Virtual Routing and Forwarding (VRF).
IPv4 Gateway/Suffix	Specifies the IPv4 address with subnet.
IPv6 Gateway/Suffix	Specifies the IPv6 address with subnet.
Network Status	Displays the status of the network.
Vlan Id	Specifies the VLAN Id.
Interface Group	Specifies the interface group.

Creating Networks for the Standalone Fabric

To create network from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Before you begin

Before creating networks, ensure that you have created a VRF for the fabric. However, if you have chosen Layer 2, you do not require a VRF. For more information about VRFs, see [VRFs, on page 136](#).

Procedure

Step 1 Click **Actions** and choose **Create**.

The **Create Network** window appears.

Step 2 Enter the required details in the mandatory fields. The available fields vary slightly based on the fabric type.

The fields in this window are:

Network ID and **Network Name** - Specifies the Layer 2 VNI and name of the network. The network name should not contain any white spaces or special characters except underscore (_) and hyphen (-). The corresponding Layer 3 VNI (or VRF VNI) is generated along with VRF creation.

Layer 2 Only - Specifies whether the network is Layer 2 only.

VRF Name - Allows you to select the Virtual Routing and Forwarding (VRF).

When no VRF is created, this field appears blank. If you want to create a new VRF, click **Create VRF**. The VRF name should not contain any white spaces or special characters except underscore (_), hyphen (-), and colon (:).

VLAN ID: Specifies the corresponding tenant VLAN ID for the network. If you want to propose a new VLAN for the network, click **Propose VLAN**.

Network Template: A universal template is autopopulated. This is only applicable for leaf switches.

Network Extension Template: A universal extension template is autopopulated. This allows you to extend this network to another fabric. The methods are VRF Lite, Multi Site, and so on. The template is applicable for border leaf switches and BGWs.

Generate Multicast IP: If you want to generate a new multicast group address and override the default value, click **Generate Multicast IP**.

The network profile section contains the **General** and **Advanced** tabs.

a) The fields on the **General** tab are:

Note If the network is a non Layer 2 network, then it is mandatory to provide the gateway IP address.

IPv4 Gateway/NetMask: Specifies the IPv4 address with subnet.

Specify the anycast gateway IP address for transporting the L3 traffic from a server belonging to MyNetwork_30000 and a server from another virtual network. The anycast gateway IP address is the same for MyNetwork_30000 on all switches of the fabric that have the presence of the network.

Note If the same IP address is configured in the IPv4 Gateway and IPv4 Secondary GW1 or GW2 fields of the network template, Nexus Dashboard Fabric Controller does not show an error, and you will be able to save this configuration.

However, after the network configuration is pushed to the switch, it would result in a failure as the configuration is not allowed by the switch.

IPv6 Gateway/Prefix List: Specifies the IPv6 address with subnet.

Vlan Name: Enter the VLAN name.

Interface Description: Specifies the description for the interface. This interface is a switch virtual interface (SVI).

MTU for L3 interface - Enter the MTU for Layer 3 interfaces.

IPv4 Secondary GW1: Enter the gateway IP address for the additional subnet.

IPv4 Secondary GW2: Enter the gateway IP address for the additional subnet.

IPv4 Secondary GW3: Enter the gateway IP address for the additional subnet.

IPv4 Secondary GW4: Enter the gateway IP address for the additional subnet.

b) Click the **Advanced** tab to optionally specify the advanced profile settings. The fields on the **Advanced** tab are:

ARP Suppression: Select the check box to enable the ARP Suppression function.

Ingress Replication: The check box is selected if the replication mode is Ingress replication.

Note Ingress Replication is a read only option in the **Advanced** tab. Changing the fabric setting updates the field.

Multicast Group Address: The multicast IP address for the network is autopopulated.

Multicast group address is a per fabric instance variable. The number of underlay multicast groups supported is only 128. If all networks are deployed on all switches, you need not use a different multicast group per L2 VNI or a network. Therefore, multicast group for all networks in a fabric remains same. If a new multicast group address is required, you can generate it by clicking the **Generate Multicast IP** button.

DHCPv4 Server 1: Enter the DHCP relay IP address of the first DHCP server.

DHCPv4 Server VRF: Enter the DHCP server VRF ID.

DHCPv4 Server 2: Enter the DHCP relay IP address of the next DHCP server.

DHCPv4 Server2 VRF: Enter the DHCP server VRF ID.

DHCPv4 Server 3: Enter the DHCP relay IP address of the next DHCP server.

DHCPv4 Server3 VRF: Enter the DHCP server VRF ID.

Loopback ID for DHCP Relay interface (Min:0, Max:1023): Specifies the loopback ID for DHCP relay interface.

Routing Tag: The routing tag is autopopulated. This tag is associated with each gateway IP address prefix.

TRM enable: Select the check box to enable TRM.

For more information, see [Overview of Tenant Routed Multicast](#).

L2 VNI Route Target Both Enable: Select the check box to enable automatic importing and exporting of route targets for all L2 virtual networks.

Enable Netflow – Enables netflow monitoring on the network. This is supported only if netflow is already enabled on fabric.

Interface Vlan Netflow Monitor – Specifies the netflow monitor specified for Layer 3 record for the VLAN interface. This is applicable only if **Is Layer 2 Record** is not enabled in the **Netflow Record** for the fabric.

Vlan Netflow Monitor – Specifies the monitor name defined in the fabric setting for Layer 3 **Netflow Record**.

Enable L3 Gateway on Border: Select the check box to enable a Layer 3 gateway on the border switches.

Step 3

Click **Create**.

A message appears indicating that the network is created.

The new network appears on the **Networks** page that comes up.

The Status is **NA** since the network is created but not yet deployed on the switches. Now that the network is created, you can create more networks if needed and deploy the networks on the devices in the fabric.

Network Attachments

UI Navigation

The following options are applicable only for switch fabrics, easy fabrics, and MSD fabrics:

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Networks > Network Attachments**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Networks > Network Attachments**.

Use this window to attach attachments such as fabrics and interfaces to a network.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Network Attachments** horizontal tab on the **Networks** tab in the **Fabric Overview** window.

Table 7: Network Attachments Actions and Description

Action Item	Description
History	<p>Allows you to view the deployment and policy change history of the selected network.</p> <p>You can view the deployment history details of a network attachment such as hostname, network name, VRF name, commands, status, status description, user and completed time on the Deployment History tab.</p> <p>You can view the policy change history details such as policy ID, template, description, PTI operation, generated configuration, entity name and type, created date, serial number, user, and source of the policy on the Policy Change History tab.</p> <p>To view the history of a network attachment, select the check box next to the network name and choose the History action. The History window appears. Click the Deployment History or Policy Change History tabs as required. You can also click the Detailed History link in the Commands column of the Deployment History tab to view the command execution details (comprising configuration, status, and CLI response) for the host.</p>
Edit	<p>Allows you to view or edit the network attachment parameters such as interfaces that you want to attach to the selected network.</p> <p>To edit the network attachment information, select the check box next to the network name that you want to edit and choose the Edit action. In the Edit Network Attachment window, edit the required values, attach or detach the network attachment, click the Edit link to edit the CLI freeform config for the switch, and click Save to apply the changes or click Cancel to discard the changes. The edited network attachment is shown in the table on the Network Attachments horizontal tab of the Networks tab in the Fabric Overview window.</p>
Preview	<p>Allows you to preview the configuration of the network attachments for the selected network.</p> <p>Note This action is not allowed for attachments that are in deployed or NA status.</p> <p>To preview the network, select the check box next to the network name and choose the Preview action. The Preview Configuration window for the fabric appears.</p> <p>You can preview the network attachment details such as the network name; fabric name; switch name, serial number, IP address, and role; the network status, pending configuration, and progress of the configuration. You can also click the lines link in the Pending Config column to view the lines for which the configuration is pending. Click Close.</p>

Action Item	Description
Deploy	<p>Allows you to deploy the pending configuration of the network attachments, for example, interfaces, for the selected network.</p> <p>Note This action is not allowed for attachments that are in deployed or NA status.</p> <p>To deploy a network, select the check box next to the network name and choose the Deploy action. The Deploy Configuration window for the fabric appears.</p> <p>You can view the details such as the network name; fabric name; switch name, serial number, IP address, and role; the network status, pending configuration, and progress of the configuration. You can also click the lines link in the Pending Config column to view the lines for which the configuration is pending. Click the Deploy button. The status and progress of the deployment is displayed in the Network Status and Progress columns. After the deployment is completed successfully, close the window.</p>
Import	<p>Allows you to import information about network attachments for the selected fabric.</p> <p>To import the network attachments information, choose Import. Browse the directory and select the <code>.csv</code> file that contains the network attachments information. Click Open and then click OK. The network information is imported and displayed in the Network Attachments horizontal tab on the Networks tab in the Fabric Overview window.</p>
Export	<p>Allows you to export the information about network attachments to a <code>.csv</code> file. The exported file contains information pertaining to each network, including the fabric it belongs to, whether the LAN is attached, the associated VLAN, serial number, interfaces, and freeform configuration details that you saved for network attachments.</p> <p>To export network attachments information, choose the Export action. Select a location on your local system directory to store the network information from Nexus Dashboard Fabric Controller and click Save. The network information file is exported to your local directory. The file name is appended with the date and time at which the file was exported.</p>

Action Item	Description
Quick Attach	<p>Allows you to immediately attach an attachment to the selected network. You can select multiple entries and attach them to a network at the same instance.</p> <p>Note Interfaces cannot be attached to a network using this action.</p> <p>To quickly attach any attachment to a network, choose the Quick Attach action. A message appears to inform you that the attach action was successful.</p>
Quick Detach	<p>Allows you to immediately detach the selected network from an attachment, for example, a fabric. You can select multiple entries and detach them from an attachment at the same instance.</p> <p>To quickly attach any attachment to a network, choose the Quick Detach action. A message appears to inform you that the detach action was successful.</p>

Table 8: Network Attachments Table Fields and Description

Field	Description
Network Name	Specifies the name of the network.
Network ID	Specifies the Layer 2 VNI of the network.
VLAN ID	Specifies the VLAN Id.
Switch	Specifies the switch name.
Ports	Specifies the ports for the interfaces.
Status	Specifies the status of the network attachments, for example, pending, NA, and so on.
Attachment	Specifies whether the network attachment is attached or detached.
Switch Role	Specifies the switch role. For example, for the fabric created using the Easy Fabric IOS XE fabric template, the switch role is specified as either leaf, spine, or border.
Fabric Name	Specifies the name of the fabric to which the network is attached or detached.

History

The history tab displays information about the deployment and policy change history. Choose **LAN > Fabrics**. Double-click a fabric name to open the **Fabric Overview** window and then click the **History** tab.

Viewing Deployment History

Deployment history of the switches and networks that are involved in the selected service policy or route peering are displayed in the **Deployment History** tab. The deployment history captures the changes that are pushed or deployed from Nexus Dashboard Fabric Controller to switches. The deployment history captures the changes that are pushed or deployed from Nexus Dashboard Fabric Controller to switches.

The following table describes the fields that appear on this page.

Field	Description
Hostname(Serial Number)	Specifies the host name.
Entity Name	Specifies the entity name.
Entity Type	Specifies the entity type.
Source	Specifies the source.
Commands	Specifies the commands.
Status	Specifies the status of the host.
Status Description	Specifies the status description.
User	Specifies the user.
Time of Completion	Specifies the timestamp of the deployment.

Viewing Policy Change History

Different users can simultaneously change expected configuration of switches in the Nexus Dashboard Fabric Controller. You can view the history of policy changes in the **Policy Change History** tab.

The following table describes the fields that appear on this page.

Field	Description
Policy ID	Specifies the policy ID.
Template	Specifies the template that is used.
Description	Specifies the description.
PTI Operation	Specifies the Policy Template Instances (PTIs).
Generated Config	Specifies the configuration history. Click Detailed History to view the configuration history.
Entity Name	Specifies the entity name.
Entity Type	Specifies the entity type.
Created On	Specifies that date on which the policy was created.
Priority	Specifies the priority value.

Field	Description
Serial Number	Specifies the serial number.
Content Type	Specifies the content type.
User	Specifies the user.
Source	Specifies the source.

Resources

Cisco Nexus Dashboard Fabric Controller allows you to manage the resources. The following table describes the fields that appear on this page.

Field	Description
Scope Type	Specifies the scope level at which the resources are managed. The scope types can be Fabric , Device , Device Interface , Device Pair , and Link .
Scope	Specifies the resource usage scope. Valid values are the switch serial numbers or fabric names. Resources with serial numbers are unique and can be used on the serial number of the switch only.
Device Name	Specifies the name of the device.
Device IP	Specifies the IP address of the device.
Allocated Resource	Specifies if the resources are managed with device, device interface, or fabric. Valid values are ID type, subnet, or IP addresses.
Allocated To	Specifies the entity name for which the resource is allocated.
Resource Type	Specifies the resource type. The valid values are TOP_DOWN_VRF_LAN , TOP_DOWN_NETWORK_VLAN , LOOPBACK_ID , VPC_ID , and so on.
Is Allocated?	Specifies if the resource is allocated or not. The value is set to True if the resource is permanently allocated to the given entity. The value is set to False if the resource is reserved for an entity and not permanently allocated.
Allocated On	Specifies the date and time of the resource allocation.
ID	Specifies the ID.

Allocating a Resource

To allocate a resource from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Choose **LAN > Fabrics**.
- Step 2** Double-click a fabric name.
The **Fabric Overview** window appears.
- Step 3** Click the **Resources** tab.
- Step 4** Click **Actions > Allocate Resource** to allocate the resource.
The **Allocate Resource** window appears.
- Step 5** Choose the pool type, pool name, and scope type from the drop-down lists accordingly.
The options for pool type are **ID_POOL**, **SUBNET_POOL**, and **IP_POOL**. Based on the pool type you choose, the values in the **Pool Name** drop-down list changes.
- Step 6** Enter the entity name in the **Entity Name** field.
The embedded help gives example names for different scope types.
- Step 7** Enter the ID, IP address, or the subnet in the **Resource** field based on what pool type you chose in *Step 3*.
- Step 8** Click **Save** to allocate the resource.
-

Examples to Allocate Resources

Example 1: Assigning an IP to loopback 0 and loopback 1

```
#loopback 0 and 1
  L0_1: #BL-3
    pool_type: IP
    pool_name: LOOPBACK0_IP_POOL
    scope_type: Device Interface
    serial_number: BL-3(FDO2045073G)
    entity_name: FDO2045073G~loopback0
    resource : 10.7.0.1

# L1_1: #BL-3
#   pool_type: IP
#   pool_name: LOOPBACK1_IP_POOL
#   scope_type: Device Interface
#   serial_number: BL-3(FDO2045073G)
#   entity_name: FDO2045073G~loopback1
#   resource : 10.8.0.3
```

Example 2: Assigning a Subnet

```
#Link subnet
  Link0_1:
    pool_type: SUBNET
    pool_name: SUBNET
    scope_type: Link
    serial_number: F3-LEAF(FDO21440AS4)
    entity_name: FDO21440AS4~Ethernet1/1~FDO21510YPL~Ethernet1/3
    resource : 10.9.0.0/30
```

Example 3: Assigning an IP to an Interface

```
#Interface IP
INT1_1: #BL-3
  pool_type: IP
  pool_name: 10.9.0.8/30
  scope_type: Device Interface
  serial_number: BL-3 (FDO2045073G)
  entity_name: FDO2045073G-Ethernet1/17
  resource : 10.9.0.9
```

Example 4: Assigning an Anycast IP

```
#ANY CAST IP
ANYCAST_IP:
  pool_type: IP
  pool_name: ANYCAST_RP_IP_POOL
  scope_type: Fabric
  entity_name: ANYCAST_RP
  resource : 10.253.253.1
```

Example 5: Assigning a Loopback ID

```
#LOOPBACK ID
LID0_1: #BL-3
  pool_type: ID
  pool_name: LOOPBACK_ID
  scope_type: Device
  serial_number: BL-3 (FDO2045073G)
  entity_name: loopback0
  resource : 0
```

Releasing a Resource

To release a resource from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Choose **LAN > Fabrics**.
 - Step 2** Double-click a fabric name.
The **Fabric Overview** window appears.
 - Step 3** Click the **Resources** tab.
 - Step 4** Choose a resource that you want to delete.
Note You can delete multiple resources at the same time by choosing multiple resources.
 - Step 5** Click **Actions > Release Resource(s)** to release the resource.
A confirmation dialog box appears.
 - Step 6** Click **Confirm** to release the resource.
-

Hosts

Note This tab is only available on IPFM fabric when you have deployed IPFM on Nexus Dashboard Fabric Controller.

Nexus Dashboard Fabric Controller UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts**.

Information about hosts is also displayed as a card on the **Overview** tab in the **Fabric Overview** window. For more information about these cards, see [Hosts, on page 120](#).

The **Hosts** tab includes the following tabs:

Discovered Hosts Summary

Nexus Dashboard Fabric Controller UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Discovered Hosts Summary**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Discovered Hosts Summary**.

You can view a summary of all the hosts that are populated through telemetry in this window.

Table 9: Discovered Hosts Summary Table Fields and Description

Field	Description
VRF	Specifies the VRF for the host.
Host	Specifies the IP address for the host.
Senders/Receivers	Specifies the number of times the host device plays its role as a sender or a receiver. Click the count to view where it was used.

Click the table header to sort the entries in alphabetical order of that parameter.

Discovered Hosts

Nexus Dashboard Fabric Controller UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Discovered Hosts**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Discovered Hosts**.

You can view all the hosts that are populated through telemetry on this screen. After the switches are discovered, all the switches in the fabric will push data to the Nexus Dashboard Fabric Controller server at regular intervals

using telemetry. Cisco Nexus Dashboard Fabric Controller server displays the received Events and Flow statistics for each active flow.

Table 10: Discovered Hosts Table Fields and Description

Field	Description
VRF	Specifies the VRF for the host.
Host	Specifies the IP address for the host.
Role	Specifies the role of the host device. The role of the host can be one of the following: <ul style="list-style-type: none"> • Sender • External Sender • Dynamic Receiver • External Receiver • Static Receiver
Multicast Group	Specifies the multicast address of the flow in which the host participates.
Source	Specifies the source of the flow which the discovered host participates in.
Switch	Specifies the name of the switch.
Interface	Specifies the interface to which the host is connected to on the sender or receiver switch.
MAC Address	Specifies the MAC address of a physical host, if the switch has ARP entry for that host).
Host Discovered Time	Specifies the date and time at which the switch discovered the host.
Fault Reason	Specifies the failure reason for the flow that the discovered host has participates in.

Click the table header to sort the entries in alphabetical order of that parameter.

Host Policies

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric name to open the **Fabric** slide-in pane. Click the Launch icon. Choose **Fabric Overview > Hosts > Host Policies**.
- Choose **LAN > Fabrics**. Double-click on a fabric name to open **Fabric Overview > Hosts > Host Policies**.

You can add policies to the host devices. Navigate to **Host Policies** to configure the host policies.

Note Switches must be deployed with default host policies. You can edit the default host policies to permit or deny. From the Deployment drop-down list, select **Deploy Selected Policies** to deploy the default policies to the switches. You can also deploy all the default policies to all the managed switches by selecting **Deploy All Default Policies** even without selecting any default policies.

By default, the sequence numbers for policies are auto-generated by Nexus Dashboard Fabric Controller and Multicast mask/prefix is taken as /32. If you want to enter the required values for the sequence number and the multicast mask/prefix in the appropriate fields, ensure that the **Enable mask/prefix for the multicast range in Host Policy** check box under **Settings > Server Settings > IPFM** tab is enabled. Then, you can enter the sequence number and the multicast mask/prefix in the appropriate fields available in the **Create Host Policy** and **Edit Host Policy** options available in the **Actions** drop-down list in the **Host Policies** window.

The default host policies must be deployed successfully to the switch before you deploy the custom host policies on that switch. Otherwise, the custom policies will fail to deploy. Ensure that you deploy all default policies successfully to all the switches before you create, edit, import, or deploy custom policies.

Note When a user logs in to Nexus Dashboard Fabric Controller with a network operator role, all the buttons or options to create, delete, edit, import, export, or deploy policies are disabled. This user can only view policies, and deployment status or history.

Policies are automatically deployed to switches whenever they are created, edited, or imported. You can choose to undeploy or redeploy the policies, by selecting one or more check boxes next to the policies and choosing the appropriate actions in the **Actions** drop-down list. The policies will not be deployed correctly if the device is rebooting while the policy was deployed. In such case, the Failed message appears in the **Deployment Status** column in the **Host Policies** window.

Note If you have created a custom or non-default VRF, although the host and flow policies are automatically created for the VRF, use the action options in this window to manually deploy the host policies to the switches in the fabric.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Host Policies** window.

Table 11: Host Policies Actions and Description

Action Item	Description
Create Host Policy	Allows you to create a new host policy. For instructions about creating a host policy, see Create Host Policy, on page 163 .

Action Item	Description
Edit Host Policy	<p>Allows you to view or edit the selected host policy parameters.</p> <p>To edit the host policy, select the check box next to the host policy that you want to delete and choose Edit Host Policy. In the Edit Host Policy window, edit the required values and click Save & Deploy to configure and deploy the policy or click Cancel to discard the host policy. The edited host policy is shown in the table in the Host Policies window.</p> <p>Note The changes made to host policy are applied immediately. If the policy is already applied to any device, the changes may impact the existing flows.</p>
Delete Host Policy	<p>Allows you to delete user-defined host policies.</p> <p>Note</p> <ul style="list-style-type: none"> • Undeploy policies from all the switches before deleting them from Nexus Dashboard Fabric Controller. • Default policy can be undeployed from the switches on which it is deployed. However, Custom policy can be deleted and undeployed. • When you undeploy the default policies, all default policies are reset to have default permission (Allow). <p>To delete a host policy, select the check box next to the host policy that you want to delete and choose Delete Host Policy. You can select multiple host policy entries and delete them at the same instance.</p> <p>A delete host policy successful message appears at the bottom of the page.</p>
Purge	<p>Allows you to delete all custom policies without selecting any policy check box.</p> <p>Note</p> <ul style="list-style-type: none"> • Undeploy policies from all switches before deleting them from Nexus Dashboard Fabric Controller. • You can undeploy the default policy, but you cannot delete the default policy. You can delete and undeploy only the custom policies.

Action Item	Description
Import	<p>Allows you to import host policies from a CSV file to Nexus Dashboard Fabric Controller.</p> <p>Note After import, all policies imported from a CSV file are applied to all managed switches automatically.</p> <p>To import a host policies, choose Import. Browse the directory and select the <code>.csv</code> file that contains the host policy configuration information. The policy will not be imported if the format in the <code>.csv</code> file is incorrect. Click Open. The imported policies are automatically deployed to all the switches in the fabric.</p>
Export	<p>Allows you to export host policies from Nexus Dashboard Fabric Controller to a <code>.csv</code> file.</p> <p>To export host policies, choose Export. Select a location on your local system directory to store the host policy details file. Click Save. The host policy file is exported to your local directory. The filename is appended with the date on which the file is exported. The format of the exported file is <code>.csv</code>.</p>
Deploy Selected Policies	Select this option to deploy only the selected policies to the switch.
Deploy All Custom Policies	Select this option to deploy all the custom or user-defined policies to the switch in a single instance. If the policies are deployed when the switch is rebooting, the deployment fails and a failed status message appears.
Deploy All Default Policies	Select this option to deploy all default policies to the switch.
Undeploy Selected Policies	<p>Select this option to undeploy the selected policies.</p> <p>Select one or more check boxes next to the policy name. Select this option from the drop-down list to undeploy the selected policies.</p>
Undeploy All Custom Policies	Select this option to undeploy all the custom or user-defined policies in a single instance.
Undeploy All Default Policies	Select this option to undeploy the default policies.
Redo All Failed Policies	<p>The deployment of policies may fail due to various reasons. Select this option to deploy or undeploy all failed policies.</p> <p>All the deployments that failed on switches previously will be deployed again to only those switches. All the undeployments that failed on switches previously will be undeployed again from only those switches.</p>

Action Item	Description
Deployment History	<p>Select one policy from the drop-down list. Select this option to view the deployment history of the selected policy in the Deployment History pane.</p> <p>The policy name is shown in the Policy Name field. From the drop-down list, choose the switch on which this policy was deployed.</p> <p>The Deployment History pane displays the following fields.</p> <ul style="list-style-type: none"> • Policy Name - Specifies the selected policy name. • VRF - Specifies the VRF for the selected policy. • Switch Name - Specifies the name of the switch that the policy was deployed to. • Deployment Status - Displays the status of deployment. It shows if the deployment was a success, failed, or not deployed. Click on the deployment status, for example, Success, to see more details. For more information about the deployment status, see Deployment Status, on page 162. • Action - Specifies the action that is performed on the switch for that host policy. Create implies that the policy has been deployed on the switch. Delete implies that the policy has been undeployed from the switch. • Deployment Date/Time - Specifies the date and time at which the host policy was last updated. The format is <i>Day MMM DD YYYY HH:MM:SS Timezone</i>. • Failed Reason - Specifies why the policy was not successfully deployed.

Table 12: Host Policies Table Field and Description

Field	Description
VRF	Specifies the VRF for the host. The fields—Deployment, Undeployment, Status, and History—are based on VRF.
Policy Name	Specifies the policy name for the host, as defined by the user.
Receiver	Specifies the IP address of the receiving device.
Multicast IP/Mask	Specifies the multicast IP address for the host.
Sender	Specifies the IP Address of the transmitting device.

Field	Description
Host Role	Specifies the host device role. The host device role is either one of the following: <ul style="list-style-type: none"> • Sender • Receiver • Receiver-External • Receiver-Local
Operation	Specifies if the operation of the host policy. The policy has the following operations: <ul style="list-style-type: none"> • Permit • Deny
Sequence Number	Specifies the sequence number of the custom policy when the multicast range is selected.
Deployment Action	Specifies the action performed on the switch for that host policy. <ul style="list-style-type: none"> • Create - The policy is deployed on the switch. • Delete - The policy is undeployed from the switch.
Deployment Status	Specifies if the deployment is successful, failed, or the policy is not deployed.
Last Updated	Specifies the date and time at which the host policy was last updated. The format is <i>Day MMM DD YYYY HH:MM:SS Timezone</i> .

Deployment Status

The following table describes the fields that appear on the Deployment Status.

Table 13: Deployment Status Field and Description

Field	Description
Policy Name	Specifies the name of the host policy.
VRF	Specifies the name of the VRF.
Switch Name	Specifies the switch on which the VRF is deployed.
IP Address	Specifies the IP address of the switch.
Deployment Status	Displays the status of the deployment. It shows if the deployment was a Success or Failed along with the reason why the deployment failed.

Field	Description
Action	Specifies the action that is performed on the switch, for example, Create .
Deployment Date/Time	Displays the date and time when the deployment was initialized.

This section contains the following:

Create Host Policy

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Host Policies**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Host Policies**.

The default host policies must be deployed successfully to the switch before you deploy the custom host policies on that switch. Otherwise, the custom policies will fail to deploy. Ensure that you deploy all default policies successfully to all the switches before you add custom policies.

To create a host policy from the Cisco Nexus Dashboard Fabric Controller, perform the following steps:

Procedure

Step 1 In the **Host Policies** window, from the **Actions** drop-down list, choose **Create Host Policy**.

Step 2 In the **Create Host Policy** window, specify the parameters in the following fields.

- **VRF** - Click the **Select a VRF** link to open the **Select a VRF** window. The default VRF is also listed in the window. Search and select a VRF for the host and click **Save**.

- Note**
- Policy names can be repeated across VRFs, that is, they are unique only within a VRF.
 - Across the VRF, host policies may be same or different.

- **Policy Name** - Specifies a unique policy name for the host policy.
- **Host Role** - Specifies the host as a multicast sender or receiver. Select one of the following:
 - Sender
 - Receiver-Local
 - Receiver-External

- **Sender Host Name** - Specifies the sender host to which the policy is applied.

Note Hosts that are discovered as remote senders can be used for creating sender host policies.

- **Sender IP** - Specifies the IP address of the Sender host. Note that you can specify wildcard for this IP address by specifying the * (asterisk) symbol or **0.0.0.0** in this field.

- **Receiver Host Name** - Specifies the receiver host to which the policy is applied. If a destination host is detected, you can choose the hostname from the drop-down list.

Note Do not select hosts that are discovered as remote receivers to create receiver or sender host policies. However, hosts that are discovered as remote senders can be used for creating sender host policies.

- **Receiver IP** - Specifies the IP address of the receiver host. This field is visible and is applicable only if the Host Role is set to **Receiver-Local**. Note that you can specify wildcard for this IP address by specifying the * (asterisk) symbol or **0.0.0.0** in this field.

Note When **Receiver IP** in a receiver host policy is a wildcard (* or **0.0.0.0**), **Sender IP** also has to be a wildcard (* or **0.0.0.0**).

- **Multicast** - Specifies the multicast IP Address for the host policy. Note that you can specify wildcard for this IP address by specifying the * (asterisk) symbol in this field. This will translate to **224.0.0.0/4**. If you specify a wildcard IP address for **Sender IP** and **Receiver IP** fields, the Multicast Group is always required, that is, you cannot specify multicast as * or **0.0.0.0**.

- **Permit/Deny** - Click **Permit** if the policy must allow the traffic flow. Click **Deny** if the policy must not allow the traffic flow.

Step 3 Click **Save & Deploy** to configure and deploy the Policy. Click **Cancel** to discard the new policy. The deployment completed message appears at the bottom of the window. You can click **Refresh** to refresh the current deployment status in the window or click **View Details** to verify the deployment details.

Host Alias

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Host Alias**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Host Alias**.

Note This section is applicable for both the IPFM and Generic Multicast modes in Nexus Dashboard Fabric Controller.

Cisco Nexus Dashboard Fabric Controller allows you to create host aliases for sender and receiver hosts for IPFM fabrics. The active multicast traffic transmitting and receiving devices are termed as hosts. You can add a host-alias name to your sender and receiver hosts, to help you identify the hosts by a name. You can also import many Host Alias to Cisco Nexus Dashboard Fabric Controller with IPFM deployment.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Host Alias** window.

Table 14: Host Alias Actions and Description

Action Item	Description
Create Host Alias	Allows you to create a new host alias. For instructions about creating a new host alias, see Create Host Alias, on page 165 .
Edit Host Alias	Allows you to view or edit the selected host alias parameters. To edit the host alias, select the check box next to the host alias that you want to delete and choose Edit Host Alias . In the Edit Host Alias window, edit the required values and click Submit to apply the changes or click Cancel to discard the host alias. The edited host alias is shown in the table in the Host Alias window.
Delete Host Alias	Allows you to delete the host alias. To delete a host alias, select the check box next to the host alias that you want to delete and choose Delete Host Alias . You can select multiple host alias entries and delete them at the same instance.
Import	Allows you to import host aliases for devices in the fabric. To import host aliases, choose Import . Browse the directory and select the <code>.csv</code> file that contains the host IP address and corresponding unique host name information. Click Open . The host aliases are imported and displayed in the Host Alias window.
Export	Allows you to export host aliases for devices in the fabric. To export a host alias, choose Export . Select a location on your local system directory to store the host aliases configuration from Nexus Dashboard Fabric Controller and click Save . The host alias configuration file is exported to your local directory. The file name is appended with the date and time at which the file was exported. The format of the exported file is <code>.csv</code> .

Table 15: Host Alias Table Field and Description

Field	Description
VRF	Specifies the VRF for the host.
Host Alias	Specifies the host name that is configured to identify the host.
IP Address	Specifies the IP address of the host connecting to the switch, which you want to refer with an alias name.
Last Updated At	Specifies the date and time at which the host alias was last updated.

This section contains the following:

Create Host Alias

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Host Alias**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Host Alias**.

Perform the following task to create new host aliases to devices in the fabric discovered by Cisco Nexus Dashboard Fabric Controller.

To create a host alias from the Cisco Nexus Dashboard Fabric Controller, perform the following steps:

Procedure

Step 1 In the **Host Alias** window, from the **Actions** drop-down list, choose **Create Host Alias**.

Step 2 In the **Create Host Alias** window, enter the following:

Note All the fields are mandatory.

- **VRF** - Select the VRF from this drop-down list. The default value is **default**.

Note Host and IP Address are unique per VRF, that is, same host name with the same IP Address can exist in multiple VRFs.

- **Host Name** - Enter a fully qualified unified hostname for identification.

- **IP Address** - Enter the IP address of the host that is part of a flow.

Note You can also create host alias before a host sends any data to its directly connected sender or receiver leaf.

Step 3 Click **Submit** to apply the changes.

Click **Cancel** to discard the host alias.

The new host alias is shown in the table in the **Host Alias** window.

Applied Host Policies

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Applied Host Policies**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Applied Host Policies**.

You can view the policies that you have applied in the entire network on this tab.

The table displays default PIM policy, local receiver policy, and sender policy. IPFM does not display user-defined PIM Policies or Receiver External Policies.

Table 16: Applied Host Policies Table Fields and Description

Column Name	Description
VRF	Specifies the VRF for the host.
Policy Name/Sequence #	Specifies the name of the policy applied.
Host Role	Specifies the role of the host. The host device role is either one of the following: <ul style="list-style-type: none"> • PIM • Sender • Receiver
Switch	Specifies the name of the switch to which the policy is applied.
Interface	Specifies the interface to which the policy is applied.
Active	Specifies if the policy is active or not.
Time Stamp	Specifies the date and time at which the policy was created\deployed. The format is Day, MMM DD YYYY HH:MM:SS (Timezone).

Flows

Note This tab is only available on IPFM fabric when you have deployed IPFM on Nexus Dashboard Fabric Controller.

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric Summary** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts**.

Information about flows is also displayed as a card on the **Overview** tab in the **Fabric Overview** window. For more information about these cards, see [Flows, on page 120](#).

The **Flows** tab comprises the following horizontal tabs:

Flow Status

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Flow Status**.

- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Flow Status**.

Note This section is applicable for both the IPFM and Generic Multicast modes in Nexus Dashboard Fabric Controller.

Cisco Nexus Dashboard Fabric Controller allows you to view the flow status pictorially and statistically.

In the generic multicast mode, switch reports the receiver interface IP address instead of the receiver endpoint IP address. This IP is displayed in the **Flow Status** and **Topology** windows as a host. In the Sender and Receiver fields, the IPs are suffixed with a blue dot and the word **Remote** to indicate that those IPs are remote hosts. Also, as there's no policing of the traffic, switch reports only "allowed bytes/packets" and not "denied bytes/packets".

From Release 12.1.1e, NAT type "Egress" is renamed as ENAT, and NAT type "Ingress" is renamed as INAT. Cisco NDFC also displays the NAT direction in the **Flow Status** table.

- **MUNAT** – indicates that the multicast traffic at the egress interface is converted into unicast traffic at receiver interface.
- **UMNAT** – indicates that the received multicast traffic at the egress interface is converted into unicast traffic at the sender interface.

Click **Unicast** or **Multicast** link in the Receiver/Sender Interface column to view the IP route table at this interface.

Note To view details for a given flow such as all pre/post multicast and source IP-Addresses, post group, post S/DST ports, pre/post NAT policy ID, starting and destination node details, as well as view the topology, click the **active** hyperlink in **Flow Link State** for a particular multicast IP. From Release 12.1.1e, a table shows further information about the NAT interface transition type.

Click on **Telemetry Sync Status** link above the table on the top-right corner. The **Telemetry Sync Status** screen displays the sync status and the IP address of the Telemetry collector for each switch, along with the timestamp at the last sync. To view the load on each Telemetry collector, use the **Telemetry Collector == <<IP Address of the collector>>** filter. You can balance the collector performance based on the flows it is currently handling.

Multicast NAT Visualization

Nexus Dashboard Fabric Controller follows the existing flow classification for multicast flows, that is, active, inactive, sender only, or receiver only. With ingress and egress NAT multiple, input and output addresses can be translated to same group. Nexus Dashboard Fabric Controller aggregates these flows per sender and receiver combination and provides visibility into NAT rules through topology. For more information about flow topology for active flows, see [RTP/EDI Flow Monitor, on page 197](#).

Multicast NAT is supported in the IPFM network, and it is not supported for regular or generic multicast.

You can use the **NAT Search** field to search for NAT flows. All pre/post multicast and source IP-Addresses are not visible in the **Flow Status** window. You can view these details for a given flow in a pop-up by clicking the active flow hyperlink. The **NAT Search** feature allows you to enter the IP address of either pre or post

source/multicast group and filter relevant entries. Note that searched IP address may not be visible in main table on filtering as it may be part of pre or post entry that can be seen on corresponding pop-up window.

For NAT flow with NAT type containing Ingress, the source and group will be the post NAT source and post NAT group. For NAT type containing Egress, the source and group will be pre-NAT source and pre-NAT group. NAT rules are displayed on the **Sender Only** and **Receiver Only** tabs.

For a NAT flow, the topology graph path tracing shows the **NAT** badge on the switch which has ingress NAT and shows **NAT** label on the link to the receiver for egress NAT.

For NAT flow, there is an extra table shown below the topology graph panel to show all the relevant Ingress NAT or Egress NAT information. The NAT Flow information is also available on the **Topology** window. This information is available when you click the links in the **Flow Link State** column.

The VRF name is also shown in the slide-in pane for the host and the switch.

For example, **sanjose-vrf:2.2.2.2** indicates that the VRF is sanjose-vrf and the host is 2.2.2.2.

The flows carry the VRF name as prefix. If the VRF is **default**, it will not be displayed.

The following table provides information about the NAT fields and their descriptions:

Table 17: NAT Field and Description

Field	Description
NAT	Specifies the NAT mode, that is, Ingress, Egress, or Ingress and Egress. For the Ingress NAT type, the following information is displayed: Ingress (S) – Specifies that ingress NAT is performed on the Sender Switch, also known as First Hop Router (FHR). Ingress (R) - Specifies that ingress NAT is performed on the Receiver Switch (also known as Last Hop Router (LHR)). Ingress (S, R) - Specifies that ingress NAT is performed on both the Sender and Receiver Switch.
Pre-Source	Specifies the source IP address before NAT.
Post-Source	Specifies the source IP address after NAT.
Pre-Group	Specifies the multicast group before NAT.
Post-Group	Specifies the multicast group after NAT.
Post S Port	Specifies the source port after NAT.
Post DST Port	Specifies the destination port after NAT.

The following table describes the fields that appear on the **Active** tab.

Table 18: Active Tab Fields and Descriptions

Field	Description
Common Fields for IPFM and Generic Multicast Modes	
VRF	Specifies the name of the VRF for the flow.

Multicast IP	Specifies the multicast IP address for the flow. Note You can click the wave link next to the Multicast IP address to view the pictorial representation of flow statistics.
Flow Alias	Specifies the name of the Flow Alias.
Flow Link State	Specifies the state of the flow link. Click the active link to view the network diagram or topology of the Sender and Receiver. The dotted line displays the direction of the flow of traffic. You can hover over the nodes to view information. The table on the right side shows information about the Sender and Receiver. The flows in the network diagram or topology show the multicast IP as well as the VRF. If the VRF is default , then the VRF will not be shown along with the multicast IP.
Sender	Specifies the IP Address or the Host alias of the sender for the multicast group.
NAT	Specifies whether the flow is ingress, egress, or both ingress and egress.
Sender Switch	Specifies if the Sender switch is a leaf or spine.
Sender Interface	Specifies the interface to which the sender is connected to.
Receiver Switch	Specifies if the Receiver switch is a leaf or spine.
Receiver Interface	Specifies the interface to which the receiver is connected to.
Sender Start Time	Displays the time from when the sender joined.
Receiver Join Time	Specifies the time at which the receiver joined.
Fields Specific for IPFM Mode	
Priority	Specifies the flow priority for flows.
Policed	Specifies whether a flow is policed or not policed.
Receiver	Specifies the IP Address or the Host alias of the receiver joining the group.
Bandwidth	Specifies the bandwidth that is allotted for the traffic.
QOS/DSCP	Specifies the Switch-defined QoS Policy.
Policy ID	Specifies the policy ID applied to the multicast IP.
Field Specific for Generic Multicast Mode	
Receiver Interface IP	Specifies the IP address of the receiver interface joining the group.

The following table describes the fields that appear on the **Inactive** tab.

Table 19: Inactive Tab Fields and Descriptions

Field	Description
Common Fields for IPFM and Generic Multicast Modes	

VRF	Specifies the name of the VRF for the flow.
Multicast IP	Specifies the multicast IP address for the flow. Note You can click the chart link next to the Multicast IP address to view the pictorial representation of flow statistics.
Flow Alias	Specifies the name of the Flow Alias.
NAT	Specifies whether the flow is ingress, egress, or both ingress and egress.
Sender	Specifies the IP Address or the Host alias of the sender for the multicast group.
Sender Start Time	Displays the time from when the sender joined.
Receiver Join Time	Specifies the time at which the receiver joined.
Fields Specific for IPFM Mode	
Priority	Specifies the flow priority for flows.
Policed	Specifies whether a flow is policed or not policed.
Receiver	Specifies the IP Address or the Host alias of the receiver joining the group.
Bandwidth	Specifies the bandwidth that is allotted for the traffic.
QOS/DSCP	Specifies the Switch-defined QoS Policy.
Policy ID	Specifies the policy ID applied to the multicast IP.
Fault Reason	Specifies reason for the inactive flow. Cisco Nexus Dashboard Fabric Controller determines the inactive flow if both the sender and receiver mroute exists with any of the following combinations. <ul style="list-style-type: none"> • Receiver IIF is null • Receiver OIF is null • Sender IIF is null • Sender OIF is null <p>In this scenario, the switch will not have any fault reason. Therefore, there is no fault reason for such inactive flows.</p>
Field Specific for Generic Multicast Mode	
Receiver Interface IP	Specifies the IP address of the receiver interface joining the group.

The following table describes the fields that appear on the **Sender Only** tab.

Table 20: Sender Only Tab Field and Description

Field	Description
Common Fields for IPFM and Generic Multicast Modes	
VRF	Specifies the name of the VRF for the flow.
Multicast IP	Specifies the multicast IP address for the flow.

Field	Description
Common Fields for IPFM and Generic Multicast Modes	
Flow Alias	Specifies the name of the Flow Alias.
Flow Link State	<p>Specifies the flow link state, if it's allow or deny.</p> <p>Click the senderonly link to view the network diagram or topology of the Sender and Receiver.</p> <p>The dotted line displays the direction of the flow of traffic. You can hover over the nodes to view information. The table on the right side shows information about the Sender and Receiver.</p> <p>The flows in the network diagram or topology show the multicast IP as well as the VRF. If the VRF is default, then the VRF will not be shown along with the multicast IP.</p>
Sender	Specifies the name of the sender.
NAT	Specifies whether the flow is ingress, egress, or both ingress and egress.
Sender Switch	Specifies the IP address of the sender switch.
Sender Ingress Interface	Specifies the name of the sender ingress interface.
Sender Start Time	Displays the time from when the sender switch is transmitting information.
Fields Specific for IPFM Mode	
Policed	Specifies whether a flow is policed or not policed.
Policy ID	Specifies the policy ID applied to the multicast IP.
Bandwidth	Specifies the bandwidth that is allotted for the traffic.
QOS/DSCP	Specifies the Switch-defined QoS Policy.
Priority	Specifies the flow priority for flows.

The following table describes the fields that appear on the **Receiver Only** tab.

Table 21: Receiver Only Tab Field and Description

Field	Description
Common Fields for IPFM and Generic Multicast Modes	
VRF	Specifies the name of the VRF for the flow.
Multicast IP	Specifies the multicast IP address for the flow.
Flow Alias	Specifies the name of the Flow Alias.

Field	Description
Common Fields for IPFM and Generic Multicast Modes	
Flow Link State	<p>Specifies the flow link state, if it's allow or deny.</p> <p>Click the receiveronly link to view the network diagram or topology of the Sender and Receiver.</p> <p>The dotted line displays the direction of the flow of traffic. You can hover over the nodes to view information. The table on the right side shows information about the Sender and Receiver.</p> <p>The flows in the network diagram or topology show the multicast IP as well as the VRF. If the VRF is default, then the VRF will not be shown along with the multicast IP.</p>
Source Specific Sender	Specifies the IP address of the multicast sender.
Receiver	Specifies the receiver ID. If the multicast receiver is remote, the Remote label can be seen next to its name.
NAT	Specifies whether the flow is ingress, egress, or both ingress and egress.
Receiver Switch	Specifies the IP address of the receiver switch.
Receiver Interface	Specifies the name of the destination switch interface.
Receiver Join Time	Specifies the time at which the receiver joined.
Fields Specific for IPFM Mode	
Bandwidth	Specifies the bandwidth that is allotted for the traffic.
Policy ID	Specifies the policy ID applied to the multicast IP.
Priority	Specifies the flow priority for flows.
QOS/DSCP	Specifies the Switch-defined QoS Policy.

Note If stats are enabled on switches, only then they can be seen in Nexus Dashboard Fabric Controller.

Click the **Show** drop-down list in the statistical representation area to display the statistical data in various formats.

Click the arrow to export the statistical data. You can export it in `.csv` or `.pdf` formats.

Note Cisco Nexus Dashboard Fabric Controller holds the Flow statistics values in the Nexus Dashboard Fabric Controller server internal memory. Therefore, after a Nexus Dashboard Fabric Controller Restart or HA switch over, the Flow statistics won't show previously collected values. However, you can see the Flow statistics that are collected after the server Restart or HA switch over.

If the new flow joins before the uplinks between the switches that are detected in Nexus Dashboard Fabric Controller, a message `BW_UNAVAIL` appears. This is resolved after the uplinks between the switches are detected by Nexus Dashboard Fabric Controller after discovery of the devices.

Flow Policies

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Flow Policies**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Flow Policies**.

Use this window to configure the flow policies.

Note When a user logs in to Nexus Dashboard Fabric Controller with a network operator role, all the buttons or options to add, delete, modify, import, export, or deploy policies are disabled. This user can only view policies, and deployment status or history.

The default policies are displayed on the **Flow Policies** tab. By default, the bandwidth of these policies is 0. You can configure the bandwidth such that any flow that matches the default flow policy will accordingly use the bandwidth and QOS/DSCP parameters. The policy is deployed to all the devices when you save the configuration.

Note When you undeploy a default policy, it will be reset to default values, that is, Bandwidth:0gbps, DSCP:Best Effort, and Policer:Enabled.

Policies are automatically deployed to switches whenever they are created, edited, or imported. You can choose to undeploy or redeploy the policies, by choosing the appropriate actions in the **Actions** drop-down list. The policies will not be deployed correctly if the device is rebooting while the policy was deployed. In such case, the **Failed** message appears in the **Deployment Status** column.

The default flow policies must be deployed successfully to the switch before you deploy the custom flow policies on that switch. Otherwise, the custom policies will fail to deploy. Ensure that you deploy all default policies successfully to all the switches before you add, edit, import, or deploy custom policies.

Note If you have created a custom or non-default VRF, although the host and flow policies are automatically created for the VRF, use the action options in this window to manually deploy the flow policies to the switches in the fabric.

The following table describes the fields that appear on this page.

Table 22: Flow Policies Table Field and Description

Field	Description
VRF	Specifies the name of the VRF for the flow policy.
Policy Name	Specifies the flow policy name.

Field	Description
Multicast IP Range	Specifies the multicast IP address for the traffic. Click view to view the details such as starting and ending IP addresses of the multicast range as well as the flow priority in the Multicast Range List box.
Bandwidth	Specifies the bandwidth that is allotted for the traffic.
QoS/DSCP	Specifies the Switch-defined QoS Policy.
Deployment Action	Specifies the action that is performed on the switch for that host policy. <ul style="list-style-type: none"> • Create - The policy is deployed on the switch. • Delete - The policy is undeployed from the switch.
Deployment Status	Specifies if the flow policy is deployed successfully, not deployed, or failed.
In Use	Specifies if the flow policy is in use or not.
Policer	Specifies whether the policer for a flow policy is enabled or disabled. <p>Note In adding or editing a flow policy, the default policer state is Enabled.</p>
Last Updated	Specifies the date and time at which the flow policy was last updated. <p>The format is <i>Day MMM DD YYYY HH:MM:SS Timezone</i>.</p>

Click the table header to sort the entries in alphabetical order of that parameter.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Flow Policies** horizontal tab on the **Flows** tab in the **Fabric Overview** window.

- Note** A new flow policy or an edited flow policy is effective only under the following circumstances:
- If the new flow matches the existing flow policy.
 - If the flow expires and reforms, while the new policy is already created or edited, that matches with the flow policy.

Table 23: Flow Policies Actions and Description

Field	Description
Create Flow Policy	Allows you to create a new flow policy. For more information, see Creating a Flow Policy, on page 179 .
Edit Flow Policy	<p>Allows you to view or edit the selected flow policy parameters.</p> <p>Note The default flow policies must be deployed successfully to the switch before you deploy the custom flow policies on that switch. Otherwise, the custom policies will fail to deploy. Ensure that you deploy all default policies successfully to all the switches before you edit custom policies.</p> <p>To edit a flow policy for a VRF, select the check box next to the VRF and choose Edit Flow Policy action. In the Edit Flow Policy window, you can make the required changes and click Save & Deploy to deploy the changes or click Cancel to discard the changes.</p> <p>The deployment completed message appears at the bottom of the window. You can click Refresh to refresh the current deployment status in the window or click View Details to verify the deployment details.</p>
Delete Flow Policy	<p>Allows you to delete the user-defined flow policy.</p> <p>Note</p> <ul style="list-style-type: none"> • You cannot delete the default flow policies. • Undeploy policies from all switches before deleting them from Nexus Dashboard Fabric Controller. • You can select more than one flow policy to delete. <p>To delete a flow policy, select the check box next to that VRF and choose the Delete Flow Policy action. A warning message appears asking you to undeploy policies from the switches. Click Confirm to proceed with deletion and leave the policies on the switches or click Cancel to discard the delete operation.</p>
Purge	<p>Allows you to delete all the flow policies at a single instance.</p> <p>Note Undeploy policies from all switches before deleting them from Nexus Dashboard Fabric Controller.</p> <p>To delete all flow policies, choose the Purge action. A warning message appears asking you to undeploy policies from all the switches. Click Confirm to proceed with deletion and leave the policies on the switches or click Cancel to discard the delete operation.</p>

Field	Description
Import	<p>Allows you to import flow policies from a csv file.</p> <p>Note The default flow policies must be deployed successfully to the switch before you deploy the custom flow policies on that switch. Otherwise, the custom policies will fail to deploy. Ensure that you deploy all default policies successfully to all the switches before you import custom policies.</p> <p>After import, all policies imported from a csv file are applied to all managed switches automatically.</p> <p>To import the flow policies, choose the Import action. Browse the directory and select the .csv file that contains the flow policy configuration information. The policy will not be imported if the format in the .csv file is incorrect. Click Open. The imported policies are automatically deployed to all the switches in the fabric.</p>
Export	<p>Allows you to export flow policies to a csv file.</p> <p>To export the flow policies, choose the Export action. Select a location on your local system directory to store the flow policy details file. Click Save. The flow policy file is exported to your local directory. The file name is appended with the date on which the file is exported. The format of the exported file is .csv.</p>
Deploy Selected Policies	<p>Select this option to deploy only the selected policies to the devices. You can deploy other policies when required.</p> <p>Select one or more check boxes next to the policy name. Select this option to deploy selected policies to the switch.</p>
Deploy All Custom Policies	<p>Select this option to deploy all the custom or user-defined policies at a single instance. The policies are deployed even if the switch is rebooting. In such case, the deployment fails and a status message Failed appears in the Deployment Status column.</p>
Deploy All Default Policies	<p>Select this option to deploy all default policies to the switch.</p>
Undeploy Selected Policies	<p>Select this option to undeploy the selected policies.</p> <p>To undeploy the selected policies, select one or more check boxes next to the VRFs. Select this option from the drop-down list to undeploy the selected policies.</p>
Undeploy All Custom Policies	<p>Select this option to undeploy all the custom or user-defined policies at a single instance.</p>
Undeploy All Default Policies	<p>Select this option to undeploy all the default policies at a single instance.</p>
Redo All Failed Policies	<p>The deployment or undeployment of policies may fail due to various reasons. Select this option to deploy all the failed policies.</p> <p>All the deployments that failed on switches previously will be deployed again to only those switches. All the undeployments that failed on switches previously will be undeployed again from only those switches.</p>

Field	Description
Deployment History	<p>Select this option to view the deployment history of the selected policy for the switch in the Deployment History pane.</p> <p>The Deployment History pane displays the following fields:</p> <ul style="list-style-type: none"> • Policy Name - Specifies the selected policy name. • VRF - Specifies the VRF for the selected policy. • Switch Name - Specifies the name of the switch that the policy was deployed to. • Deployment Status - Displays the status of deployment. It shows if the deployment was a success, failed, or not deployed. Click on the deployment status, for example, Success, to see more details. For more information about the deployment status, see Deployment Status, on page 178. • Action - Specifies the action that is performed on the switch for that flow policy. <ul style="list-style-type: none"> • Create - Implies that the policy has been deployed on the switch. • Delete - Implies that the policy has been undeployed from the switch. • Deployment Date/Time - Specifies the date and time at which the host policy was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone . • Failed Reason - Species why the policy was not successfully deployed.

Deployment Status

The following table describes the fields that appear on the Deployment Status.

Table 24: Deployment Status Field and Description

Field	Description
Policy Name	Specifies the name of the flow policy.
VRF	Specifies the name of the VRF.
Switch Name	Specifies the switch on which the VRF is deployed.
IP Address	Specifies the IP address of the switch.
Deployment Status	Displays the status of the deployment. It shows if the deployment was a Success or Failed along with the reason why the deployment failed.
Action	Specifies the action that is performed on the switch, for example, Create .
Deployment Date/Time	Displays the date and time when the deployment was initialized.

This section contains the following:

Creating a Flow Policy

Note The default host policies must be deployed successfully to the switch before you deploy the custom host policies on that switch. Otherwise, the custom policies will fail to deploy. Ensure that you deploy all the default policies successfully to all the switches before you add custom policies.

To create a flow policy from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Click **Actions** and choose **Create Flow Policy**.
The **Create Flow Policy** window is displayed.
- Step 2** In the **Create Flow Policy** window, specify the parameters in the following fields.
- **VRF** - Click the **Select a VRF** link to open the **Select a VRF** window. The default VRF is also listed in the window. Search and select a VRF for the host and click **Save**.
 - Note**
 - Policy names can be repeated across VRFs, that is, they are unique only within a VRF.
 - Across the VRF, host policies may be same or different.
 - Sequence number for the host policies is per VRF.
 - **Policy Name** - Specify a unique policy name for the flow policy.
 - **Bandwidth** - Specifies the bandwidth that is allocated for the flow policy. Select of the radio buttons to choose **Gbps**, **Mbps**, or **Kbps**.
- Step 3** From the **QoS/DSCP** drop-down list, choose an appropriate ENUM value.
- Step 4** Click the **Policer** check box to enable or disable policer for a flow.
- Step 5** In **Multicast IP Range**, enter the beginning IP and ending IP Address for the multicast range in the **From** and **To** fields. The valid range is between 224.0.0.0 and 239.255.255.255.
- From the **Flow Priority** drop-down list, choose the priority for the flow. You can choose either **Default** or **Critical**. The default value is **Default**.
- The flow priority is used during the following scenarios:
- Error Recovery - Unicast Routing Information Base (URIB) reachability changes on flows, and a re-Reverse-path forwarding (RPF) is being performed. When a set of existing flows is retried, the recovery starts from the flows with **Critical** priority.
 - Flow Retry - When pending flows are retried, the **Critical** priority flows are retried first.
- Actions** - Actions has a variety of icons to perform various actions. Click the tick mark icon if you have entered the correct details; if not, click the check mark icon to add the multicast range to the policy. Click the edit icon if you want to modify the details or click the bin icon to delete the row. Click the Plus (+) mark to add another row.

- Step 6** Click **Save & Deploy** to deploy the new policy or click **Cancel** to discard the changes. The deployment completed message appears at the bottom of the window. You can click **Refresh** to refresh the current deployment status in the window or click **View Details** to verify the deployment details.

Flow Alias

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Flows > Flow Alias**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Flows > Flow Alias**.

Use this tab to configure flow alias.

Note This section is applicable for both the IPFM and Generic Multicast modes in Nexus Dashboard Fabric Controller.

Using the Flow Alias feature, you can specify names for multicast groups. The multicast IP addresses are difficult to remember, thus by assigning a name to the multicast IP address, you can search and add policies based on the name.

The following table describes the fields that appear in this window.

Table 25: Flow Alias Table Field and Description

Field	Description
VRF	Specifies the VRF for the flow alias.
Policy Name	Specifies the policy name.
Multicast IP Range	Specifies the multicast IP address for the traffic.
Description	Description added to the flow alias.
Last Updated	Specifies the date on which the flow alias was last updated.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Flow Alias** horizontal tab on the **Flows** tab of the **Fabric Overview** window.

Table 26: Flow Alias Actions and Description

Action Item	Description
Create Flow Alias	Allows you to create a new flow alias. For instructions about creating a new flow alias, see Creating Flow Alias, on page 181 .

Action Item	Description
Edit Flow Alias	Allows you to view or edit the selected flow alias parameters. To edit the flow alias, select the check box next to the flow alias that you want to delete and choose Edit Flow Alias . In the Edit Flow Alias window, edit the required values and click Submit to apply the changes or click Cancel to discard the flow alias. The edited flow alias is shown in the table in the Flow Alias window.
Delete Flow Alias	Allows you to delete the flow alias. To delete a flow alias, select the check box next to the flow alias that you want to delete and choose Delete Flow Alias . You can select multiple flow alias entries and delete them at the same instance.
Import	Allows you to import flow aliases for devices in the fabric. To import flow aliases, choose Import . Browse the directory and select the <code>.csv</code> file that contains the flow IP address and corresponding unique flow name information. Click Open . The flow aliases are imported and displayed in the Flow Alias window.
Export	Allows you to export flow aliases for devices in the fabric. To export a flow alias, choose Export . Select a location on your local system directory to store the flow aliases configuration from Nexus Dashboard Fabric Controller and click Save . The flow alias configuration file is exported to your local directory. The file name is appended with the date and time at which the file was exported. The format of the exported file is <code>.csv</code> .

This section contains the following:

Creating Flow Alias

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Flows > Flow Alias**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Flows > Flow Alias**.

To create a flow alias from the Cisco Nexus Dashboard Fabric Controller, perform the following steps:

Procedure

Step 1 In the **Flow Alias** window, from the **Actions** drop-down list, choose **Create Flow Alias**.

Step 2 In the **Create Flow Alias** window, enter the following:

Note All the fields are mandatory.

- **VRF** - Select the VRF from this drop-down list. The default value is **default**.

Note Host and IP Address are unique per VRF, that is, same host name with the same IP Address can exist in multiple VRFs.

- **Flow Name** - Enter a fully qualified unique flow name for identification of the flow alias.
- **Multicast IP Address** - Enter the multicast IP address for the flow alias.
- **Description** - Enter a description for the flow alias.

Step 3 Click **Submit** to apply the changes.

Click **Cancel** to discard the flow alias.

The new flow alias is shown in the table in the **Flow Alias** window.

Static Flow

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Hosts > Static Flow**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Hosts > Static Flow**.

You configure a static receiver using the **Static Flow** window. Use the **Select an Option** field to select a switch before creating a static flow for it.

Table 27: Static Flow Actions and Description

Field	Description
Create Static Flow	Allows you to create a static flow. For more information, see Creating a Static Flow, on page 183 .
Delete Static Flow	Allows you to delete the static flow. Select a static flow that you need to delete and click the Delete Static Flow action to delete the selected static flow.

Table 28: Static Flow Table Field and Description

Field	Description
VRF	Specifies the VRF for a static flow.
Group	Specifies the group for a static flow.
Source	Specifies the source IP address for the static flow.
Interface Name	Specifies the interface name for the static flow. If it is not specified while creating the static flow, it is displayed as N/A .
Deployment Action	Specifies the action that is performed on the switch for the rule. Create implies that the static flow has been deployed on the switch. Delete implies that the static flow has been undeployed from the switch.

Field	Description
Deployment Status	Specifies if the static flow is deployed or not. If there is a deployment failure, hover over the information icon to view the failure reason.
Last Updated	Specifies the date and time at which the static flow was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone.

Creating a Static Flow

To create a static flow for the selected switch, perform the following steps:

Before you begin

Select a switch in the **Static Flow** tab of the **Fabric Overview** window before creating a static flow for it.

Procedure

-
- Step 1** Click **Actions** and choose **Create Static Flow**.
The **Create Static Flow** window is displayed.
- Step 2** In the **Create Static Flow** window, specify the parameters in the following fields.
- Switch** - Specifies the switch name. This field is read-only, and it is based on the switch selected in the **Static Flow** window.
- Group** - Specifies the multicast group.
- Source** - Specifies the source IP address.
- Interface Name** - Specify the interface name for the static flow. This field is optional. If you do not specify an interface name, the host IP 0.0.0.0 is passed to the API and config is created using Null0 interface.
- Step 3** Click **Save & Deploy** to save the static flow.
Click **Cancel** to discard it.
-

Metrics

The Metric tab displays the infrastructure health and status. You can view CPU utilization, Memory utilization, Traffic, Temperature, Interface, and Links details.

The following table describes the columns that appears on **CPU** and **Memory** tab.

Fields	Descriptions
Switch Name	Specifies the name of switch.
IP Address	Specifies the switch IP address.
Low Value (%)	Specifies the lowest CPU utilization value on the switch.
Avg. Value (%)	Specifies the average CPU utilization value on the switch.

Fields	Descriptions
High Value (%)	Specifies the high CPU utilization value on the switch.
Range Preview	Specifies the linear range preview.
Last Update Time	Specifies the last updated time on the switch.
Show last day	Click Show last day to view data for selected day, week, month, and year.

The following table describes the columns that appears on **Traffic** tab.

Fields	Descriptions
Switch Name	Specifies the name of switch.
Avg. Rx	Specifies the average Rx value.
Peak Rx	Specifies the peak Rx value.
Avg. Tx	Specifies the average Tx value.
Peak Tx	Specifies the peak Tx value.
Avg. Rx+Tx	Specifies the average of Rx and Tx value.
Avg. Errors	Specifies the average error value.
Peak Errors	Specifies the peak error value.
Avg. Discards	Specifies the average discard value.
Peak Discards	Specifies the peak discard value.
Last Update Time	Specifies the last updated time.
Show last day	Click Show last day to view data for selected day, week, month, and year.

The following table describes the columns that appears on **Temperature** tab.

Fields	Descriptions
Switch Name	Specifies the name of switch.
IP Address	Specifies the average Rx value.
Temperature Module	Specifies the peak Rx value.
Low Value (C)	Specifies the lowest temperature value.
Avg. Value (C)	Specifies the average temperature value.
High Value (C)	Specifies the high temperature value.
Show last day	Click Show last day to view data for selected day, week, month, and year.

The following table describes the columns that appears on **Interface** tab.

Fields	Descriptions
Switch	Specifies the name of switch.
Interface	Specifies the name of interface
Description	Specifies the description of interface.
Speed	Specifies the speed of the interface.
Status	Specifies the status of switch link.
Rx.	
Avg.	Specifies the average Rx value.
Avg%	Specifies the average percentage of Rx value.
Peak	Specifies the peak Rx value.
Peak%	Specifies the peak percentage Rx value.
Tx.	
Avg.	Specifies the average Tx value.
Avg%	Specifies the average percentage of Tx value.
Peak	Specifies the peak Tx value.
Peak%	Specifies the peak percentage Tx value.
Rx+Tx	Specifies the sum value of Rx and Tx.
Errors	
In Avg.	Specifies the in average error value.
Out Avg.	Specifies the out peak error value.
In Peak	Specifies the in peak error value.
Out Peak	Specifies the out peak error value.
Discards	
In Avg.	Specifies the average discard value.
Out Avg.	Specifies the peak discard value.
In Peak	Specifies the in peak discard value.
Out Peak	Specifies the out peak discard value.
Show last day	Click Show last day to view data for selected day, week, month, and year.

The following table describes the columns that appears on **Link** tab.

Fields	Descriptions
Switch	Specifies the name of switch.
Vlans	Specifies the VLAN name.

Fields	Descriptions
Speed	Specifies the speed of switch.
Status	Specifies the status of switch.
Speed	Specifies the speed of the interface.
Rx.	
Avg.	Specifies the average Rx value.
Avg%	Specifies the average percentage of Rx value.
Peak	Specifies the peak Rx value.
Peak%	Specifies the peak percentage Rx value.
Tx.	
Avg.	Specifies the average Tx value.
Avg%	Specifies the average percentage of Tx value.
Peak	Specifies the peak Tx value.
Peak%	Specifies the peak percentage Tx value.
Rx+Tx	Specifies the sum value of Rx and Tx.
Errors	
In Avg.	Specifies the in average error value.
Out Avg.	Specifies the out peak error value.
In Peak	Specifies the in peak error value.
Out Peak	Specifies the out peak error value.
Discards	
In Avg.	Specifies the average discard value.
Out Avg.	Specifies the peak discard value.
In Peak	Specifies the in peak discard value.
Out Peak	Specifies the out peak discard value.
Show last day	Click Show last day to view data for selected day, week, month, and year.

Multicast NAT

Multicast NAT translation of UDP stream is supported on the Nexus Dashboard Fabric Controller IPFM mode. You can apply NAT for the incoming traffic (ingress), or on the egress link or interface. The scope of ingress NAT is entire switch, whereas egress NAT is for a specific interface. The same switch can have both ingress and egress NAT. However, it can't be on the same flow for a given switch. Egress NAT has capability

to replicate the same flow up to 40 times. To achieve this function, the service-reflect interface is defined on the switch. It serves for multiple or single egress port.

Note Ingress and/or Egress NAT translation is supported only on the sender switch, also known as First Hop Router (FHR), and receiver switch, also known as Last Hop Router (LHR). It is not supported on intermediate nodes such as spine switches.

For more information about NAT, see *Cisco Nexus 9000 Series NX-OS IP Fabric for Media Solution Guide*.

Prerequisites

- Set up loopback interface with PIM sparse mode. When flow is translated, post-translated source needs to be secondary IP address on this loopback to make sure RPF check won't fail. This loopback is configured as service reflect interface for NAT purpose. You need to set up loopback per VRF.

Here is an example to configure the loopback interface:

```
interface loopback10
ip router ospf 1 area 0
ip pim sparse-mode
ip address 192.168.1.1/32
ip address 172.16.1.10/32 secondary

ip service-reflect source-interface loopback10
```

- TCAM memory carving must be completed.

The command to configure the TCAM for Multicast NAT is as follows:

```
hardware access-list tcam region mcast-nat tcam-size
```

For information about switch models that support multicast NAT, see [Configuring Multicast Service Reflection with NBM in Cisco Nexus 9000 Series NX-OS IP Fabric for Media Solution Guide](#).

NAT Modes

NAT Mode objects are created per switch and VRF. The switches are populated in the drop-down based on the scope. You should select the switch to list and operate on the corresponding NAT Mode objects.

Choose **LAN > Fabrics**. Double-click a fabric name and click **Multicast NAT > NAT Modes** to configure NAT modes.

The following table describes the fields that appear on the **NAT Modes** tab.

Field	Description
VRF	Specifies the VRF for the multicast NAT. VRF support is not applicable for eNAT, however, it is applicable for iNAT.
Group	Specifies the multicast address of the NAT mode.
Mode	Specifies the multicast NAT mode, that is, ingress or egress.
Deployment Action	Specifies the action that is performed on the switch for that mode. Create implies that the mode has been deployed on the switch. Delete implies that the mode has been undeployed from the switch.

Deployment Status	Specifies if the mode is deployed or not. If there's deployment failure, hover over the information icon to view the failure reason.
Last Updated	Specifies the date and time at which the mode was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone.

The following table describes the action items, in the **Actions** menu drop-down list, that appear on the **NAT Modes** tab.

Action Item	Description
Create NAT Mode	Choose Create NAT Mode to add a NAT mode.
Delete NAT Mode	Select a mode from the table and choose Delete NAT Mode to delete the mode.
Import	Allows you to import NAT modes from a CSV file to Nexus Dashboard Fabric Controller.
Export	Allows you to export NAT modes from Nexus Dashboard Fabric Controller to a CSV file.
Deploy Selected NAT Modes	Select modes from the table and choose Deploy Selected NAT Modes to deploy selected modes to the switch.
Deploy All NAT Modes	Choose Deploy All NAT Modes to deploy all modes to the switch.
Undeploy Selected NAT Modes	Select modes from the table and choose Undeploy Selected NAT Modes to undeploy selected modes from the switch.
Undeploy All NAT Modes	Choose Undeploy All NAT Modes to undeploy all modes from the switch.
Redo All Failed NAT Modes	Choose Redo All Failed NAT Modes to deploy all failed modes.

Action Item	Description
Deployment History	<p>Select a mode from the table and choose Deployment History to view the deployment history of the selected mode.</p> <p>Deployment History shows the following fields.</p> <ul style="list-style-type: none"> • Switch Name—Specifies the name of the switch that the mode was deployed to. • VRF—Specifies the name of the VRF that mode was deployed to. • Group—Specifies the multicast group of the NAT mode. • Mode—Specifies the NAT mode, that is, ingress or egress. • Deployment Status—Displays the status of deployment. It shows if the deployment was Success or Failed. • Action—Specifies the action that is performed on the switch for that mode. Create implies that the mode has been deployed on the switch. Delete implies that the mode has been undeployed from the switch. • Deployment Date/Time—Specifies the date and time at which the mode was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone. • Failed Reason—Specifies why the mode wasn't successfully deployed.

Adding a NAT Mode

Procedure

-
- Step 1** Choose **LAN > Fabrics**.
- Step 2** Double-click a fabric name.
The **Fabric Overview** window appears.
- Step 3** Click the **Multicast NAT** tab.
- Step 4** Click the **NAT Modes** tab.
- Step 5** Click **Actions > Create NAT Mode** to add a NAT mode.
The **Add NAT Mode** window appears.

- Step 6** In the **Add NAT Mode** window, specify the following information:
- Mode:** Select the multicast NAT mode, that is, **Ingress** or **Egress**.
- Selected Switch:** Specifies the switch name. This field is read-only, and it's based on the switch selected in the **NAT Modes** tab.
- VRF:** Select the VRF to which the NAT mode should belong to.
- Group / Mask:** Specify the multicast group with the mask. The same group can't be ingress as well as egress NAT on a given switch. You need to identify whether particular group or mask would be ingress or egress.
- Step 7** Click **Save & Deploy** to save the NAT mode and deploy it.
-

Deleting a NAT Mode

Procedure

- Step 1** Choose **LAN > Fabrics**.
- Step 2** Double-click a fabric name.
The **Fabric Overview** window appears.
- Step 3** Click the **Multicast NAT** tab.
- Step 4** Click the **NAT Modes** tab.
- Step 5** Select the NAT mode that you need to delete and click **Actions > Delete NAT Mode** to delete a NAT mode.
If the NAT mode isn't deployed or failed, you can skip this step.
- Step 6** Click **Confirm** to delete the selected NAT mode.
-

Recirc Mappings

NDFC allows you to map recirculation packets across ports for ingress or egress interfaces. From Release 12.1.1e, you can configure recirc mappings for the following translation types:

- Multicast-to-Multicast
- Multicast-to-Unicast
- Unicast-to-Multicast

Choose **LAN > Fabrics**. Double-click a fabric name and click **Multicast NAT > Recirc Mappings** to configure recirc mappings.

The following table describes the fields that appear on the **Recirc Mappings** tab.

Field	Description
VRF	Specifies the VRF over which the recirc mapping is routed.
Egress Interfaces	Specifies the egress interfaces for the mapping.

Field	Description
Destination/Prefix	Specifies the IP address of the destination unicast interface
Map Interface	Specifies the map interface. Egress interfaces and map interface have Many to One relationship. When there are more than one Egress Interfaces for a mapping, it is shown as a hyperlink. You can click on the hyperlink to see the complete list of interfaces.
Max Replications	Specifies the max replications for the map interface.
Deployment Action	Specifies the action that is performed on the switch for that egress interface mapping. Create implies that the egress interface mapping has been deployed on the switch. Delete implies that the egress interface mapping has been undeployed from the switch.
Deployment Status	Specifies if the egress interface mapping is deployed or not. If there's deployment failure, hover over the information icon to view the failure reason.
Last Updated	Specifies the date and time at which the egress interface mapping was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone.

The following table describes the action items, in the **Actions** menu drop-down list, that appear on the **Recirc Mappings** tab.

Action Item	Description
Create NAT Recirc Mapping	Choose Create NAT Recirc Mapping to add an Recirc mapping.
Edit NAT Recirc Mapping	Select a mode from the table and choose Edit NAT Recirc Mapping to edit an Recirc mapping.
Delete NAT Recirc Mapping	Select a mode from the table and choose Delete NAT Recirc Mapping to delete an Recirc mapping.
Import	Allows you to import NAT egress interface mappings from a CSV file to Nexus Dashboard Fabric Controller.
Export	Allows you to export NAT Recirc mappings from Nexus Dashboard Fabric Controller to a CSV file.
Deploy Selected NAT Recirc Mappings	Select modes from the table and choose Deploy Selected NAT Recirc Mappings to deploy selected Recirc mapping to the switch.
Deploy All NAT Recirc Mappings	Choose Deploy All NAT Recirc Mappings to deploy all Recirc mappings to the switch.
Undeploy Selected NAT Recirc Mappings	Select modes from the table and choose Undeploy Selected NAT Recirc Mappings to undeploy selected Recirc mappings from the switch.

Action Item	Description
Undeploy All NAT Recirc Mappings	Choose Undeploy All NAT Recirc Mappings to undeploy all Recirc mapping from the switch.
Redo All Failed NAT Recirc Mappings	Choose Redo All Failed NAT Recirc Mappings to deploy all failed Recirc mappings.
Deployment History	<p>Select a Recirc Mapping from the table and choose Deployment History to view the deployment history of the selected Recirc mapping.</p> <p>Deployment History shows the following fields.</p> <ul style="list-style-type: none"> • Switch Name—Specifies the name of the switch that the mode was deployed to. • VRF—Specifies the VRF used to configure the selected recirc mapping. • Map Interface—Specifies the map interface for the Recirc mappings. • Max Replications—Specifies the maximum replications for the Recirc mappings. • Egress Interfaces or Destination/Prefix—Specifies the interface over which Recirc mapping is configured. • Deployment Status—Displays the status of deployment. It shows if the deployment was Success or Failed. If failed, the reason is displayed. • Action—Specifies the action that is performed on the switch for that Recirc mapping. Create implies that the mapping has been deployed on the switch. Delete implies that the mapping has been undeployed from the switch. • Deployment Date/Time—Specifies the date and time at which the mapping was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone.

Adding Recirc Mapping

Procedure

-
- Step 1** Choose **LAN > Fabrics**.
- Step 2** Double-click a fabric name.

The **Fabric Overview** window appears.

Step 3 Click the **Multicast NAT > Recirc Mappings** tab.

Step 4 From the **Selected Switch** drop-down list, select switch on which you want to create recirc mappings.

Step 5 Click **Actions > Create Recirc Mapping** to add a recirculation mapping for the selected switch.

The **Add Recirc Mappings** window appears.

Step 6 In the **Add Recirc Mappings** window, **Selected Switch** field specifies the switch name.

This field is read-only, and it's based on the switch selected in the Recirc Mappings window.

Step 7 From the **VRF** drop-down list, select the vrf over which the recirc is routed.

Step 8 In the Translation Type, select one of the translation types:

- Multicast-to-Multicast
- Multicast-to-Unicast
- Unicast-to-Multicast

Step 9 If you selected **Multicast-to-Multicast** transition type, in the **Egress Interfaces** area, select one of the following:

- All – Choose All to select all the interfaces
- Select one or more – You can select multiple Egress Interfaces by selecting the **Select one or more** option and click the **Select** option to choose the interfaces. The Select window shows the interfaces that are available, that is, the interfaces that are already defined in other mappings are filtered out. To select all the interfaces, you can select All. When All is selected, the option to select individual egress interfaces is disabled.

Step 10 Based on the transition type, do the following:

- If you selected **Multicast-to-Unicast** transition type, enter the IP address of the destination unicast interface in the **Destination/Prefix** field.
- If you selected **Unicast-to-Multicast** transition type, enter the IP address of the destination multicast interface in the **Destination/Prefix** field.

Step 11 From the **Map Interface** drop-down list, select an interface to start recirc mapping.

An interface can either be an Egress Interface or a Map Interface and can't be both. An error is displayed if you select a map interface that is already selected as an Egress Interface.

Step 12 In the **Max Replications** field, enter the maximum replications for the map interface. The range for this field is 1–40. The default value is 40.

Step 13 Click **Save & Deploy** to save the NAT mode and deploy it.

NAT Rules

NAT rules are identical for ingress and egress NAT except you need to also specify receiver OIF for egress NAT.

Choose **LAN > Fabrics**. Double-click a fabric name and click **Multicast NAT > NAT Rules** to configure NAT rules.

The following table describes the fields that appear on the **NAT Rules** tab.

Field	Description
VRF	Specifies the VRF for the multicast NAT.
Mode	Specifies the NAT mode, that is, ingress or egress.
Pre-Translation Group	Specifies the multicast group before NAT.
Post-Translation Group	Specifies the multicast group after NAT.
Group Mask	Specifies the group mask.
Pre-Translation Source	Specifies the source IP address before NAT.
Post-Translation Source	Specifies the source IP address after NAT.
Source Mask	Specifies the source mask.
Post-Translation Source Port	Specifies the source port after NAT. The range is 0–65535. The value 0 means that there's no translation of UDP source port.
Post-Translation Destination Port	Specifies the destination port after NAT. The value 0 means that there's no translation of UDP destination port.
Static Oif	Specifies the static outgoing interface to bind the Egress NAT rule to. This drop-down is populated with Egress Interfaces defined in the Egress Interface Mappings window. This field is disabled for Ingress mode.
Deployment Action	Specifies the action that is performed on the switch for the rule. Create implies that the rule has been deployed on the switch. Delete implies that the rule has been undeployed from the switch.
Deployment Status	Specifies if the rule is deployed or not. If there's a deployment failure, hover over the information icon to view the failure reason.
Last Updated	Specifies the date and time at which the rule was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone.

The following table describes the action items, in the **Actions** menu drop-down list, that appear on the **NAT Rules** tab.

Action Item	Description
Create NAT Rule	Choose Create NAT Rule to add a NAT rule.
Delete NAT Rule	Select a mode from the table and choose Delete NAT Rule to delete the rule.
Import	Allows you to import NAT rules from a CSV file to Nexus Dashboard Fabric Controller.
Export	Allows you to export NAT rules from Nexus Dashboard Fabric Controller to a CSV file.

Action Item	Description
Deploy Selected NAT Rules	Select rules from the table and choose Deploy Selected NAT Rules to deploy selected rules to the switch.
Deploy All NAT Rules	Choose Deploy All NAT Rules to deploy all rules to the switch.
Undeploy Selected NAT Rules	Select rules from the table and choose Undeploy Selected NAT Rules to undeploy selected rules to the switch.
Undeploy All NAT Rules	Choose Undeploy All NAT Rules to undeploy all rules from the switch.
Redo All Failed NAT Rules	Choose Redo All Failed NAT Rules to deploy all failed rules.
Deployment History	<p>Select a rule from the table and choose Deployment History to view the deployment history of the selected rule.</p> <p>Deployment History shows the following fields.</p> <ul style="list-style-type: none"> • Switch Name—Specifies the name of the switch that the rule was deployed to. • VRF—Specifies the VRF that the mapping belongs to. • Deployment Status—Displays the status of deployment. It shows if the deployment was Success or Failed. • Action—Specifies the action that is performed on the switch for that rule. Create implies that the rule has been deployed on the switch. Delete implies that the rule has been undeployed from the switch. • Deployment Date/Time—Specifies the date and time at which the rule was last updated. The format is Day MMM DD YYYY HH:MM:SS Timezone. • Failed Reason — Specifies why the rule wasn't successfully deployed.

Adding NAT Rule

Procedure

- Step 1** Choose **LAN > Fabrics**.
- Step 2** Double-click a fabric name.
The **Fabric Overview** window appears.
- Step 3** Click the **Multicast NAT** tab.
- Step 4** Click the **NAT Rules** tab.
- Step 5** Click **Actions > Create NAT Rule** to add a NAT rule.
The **Add NAT Rule** window appears.
- Step 6** In the **Add NAT Rule** window, specify the following information:

Translation Type: Select one of the translation types:

- Multicast-to-Multicast
- Multicast-to-Unicast
- Unicast-to-Multicast

Mode: Select the NAT mode, that is, **Ingress** or **Egress**.

This mode is not visible for Multicast-to-Unicast and Unicast-to-Multicast translation types.

Selected Switch: Specifies the switch name. This field is read-only, and it's based on the switch selected in the **NAT Rules** tab.

VRF: Select the VRF for the NAT rule. By default, it's the **default** VRF.

Pre-Translation Group/Unicast IP: Specifies the multicast or unicast group before NAT.

Post-Translation Group: Specifies the multicast or unicast group after NAT.

Group Mask: Specifies the mask value for the NAT rule. By default, it's 32.

Pre-Translation Source: Specifies the source IP address before NAT.

Post-Translation Source: Specifies the source IP address after NAT.

Note The Post-Translation Source IP needs to be the secondary IP address on the loopback interface to make sure RPF check won't fail. However, the switch maintains separate records for Pre- and Post-NAT records, and NDFC merges unicast-multicast pre-post entries as single flow.

Source Mask: Specifies the source mask value for the NAT rule. By default, it's 32.

Post-Translation Source Port: Source Port is 0 by default. The value 0 means no translation.

Post-Translation Destination Port: Destination Port is 0 by default. The value 0 means no translation.

Static Oif: This field is not visible for Ingress mode. In Egress mode, this field displays **Egress Interfaces** defined in the Recirc Mappings screen. The field is empty if there are no mappings defined.

Step 7 Click **Save & Deploy** to save the NAT rule and deploy it.

Deleting NAT Rule

Procedure

- Step 1** Choose **LAN > Fabrics**.
- Step 2** Double-click a fabric name.
The **Fabric Overview** window appears.
- Step 3** Click the **Multicast NAT** tab.
- Step 4** Click the **NAT Rules** tab.
- Step 5** Select the NAT mode that you need to delete and click **Actions > Delete NAT Rule** to delete a NAT rule.
If the NAT rule isn't deployed or failed, you can skip this step.
- Step 6** Click **Confirm** to delete the selected NAT rule.
-

RTP/EDI Flow Monitor

Note This tab is only available on IPFM fabric when you have deployed IPFM on Nexus Dashboard Fabric Controller.

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > RTP/EDI Flow Monitor**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > RTP/EDI Flow Monitor**.

Note This section is applicable for both the IPFM and Generic Multicast modes in Nexus Dashboard Fabric Controller.

Cisco Nexus Dashboard Fabric Controller provides a view of all the active RTP and EDI streams. It also lists out active flows that have RTP and EDI drops and historical records for the same. For active IPFM flow, Nexus Dashboard Fabric Controller provides RTP and EDI topology to pinpoint the loss in network.

Note You need to enable telemetry in the switches to view RTP/EDI Flow Monitor. For more information, refer your respective platform documentation.

The description of the fields in these tabs are:

Field	Description
Switch	Specifies the name of the switch.
Interface	Specifies the interface from which the flows are detected.
Source IP	Specifies the source IP address of the flow.
Source Port	Specifies the source port of the flow.
Destination IP	Specifies the destination IP address of the flow.
Destination Port	Specifies the destination port of the flow.
Bit Rate	Specifies the bit rate of the flow, in bps, kbps, mbps, gbps, or tbp.
Packet Count	Specifies the number of packets in the flow.
Packet Loss	Specifies the number of lost packets.
Loss Start	Specifies the time at which the packet loss started.
Loss End	Specifies the time at which the packet loss stopped.
Start Time	Specifies the time at which the flow started.
Protocol	Specifies the protocol that is being used for the flow.

You can click the **Telemetry Switch Sync Status** link to check whether the switches are in sync. The **Telemetry Sync Status** window displays the status of the switches in the **Sync Status** field and the last time that the sync occurred in the **Last Sync Time** field.

The RTP/EDI Flow monitor window has the following tabs:

- **Active Flows**
- **Packet Drop**
- **Drop History**

Active Flows

The **Active Flows** tab displays the current active flows. You can also view these flows by navigating to **Flows > Flow Status**. You can click a switch link to view the end-to-end flow topology.

Flow Topology

The flow topology is displayed for the active flows that are displayed in the **Flow Status** window. For more information about multicast NAT visualization, see [Flow Status](#).

Click a switch link to display the end-to-end flow topology.

The flow topology displays the direction of the flows. The arrows in the icon indicate the direction of the flow from the sender to the receiver. The IP addresses suffixed with **(S)** and **(R)** indicate the sender and receiver host respectively. If there are multiple receivers for a given flow, you can choose a receiver from the **Select Receiver** drop-down list.

The switches experiencing packet drops are circled in red.

Hover your cursor over a switch to display the following details:

- Name
- IP address
- Model
- Packet loss, if any

Click the **file** icon next to the links between the switches to view the interface counters errors for the interfaces connecting the two switches.

When you click the file icon, the **show interface <interface name> counters errors** command is run for the interface where the flow is participating between these switches, and the results are displayed in a pop-in.

Packet Drop

The **Packet Drop** tab shows the packet drops for active flows.

Drop History

When active RTP packet drop is not observed, records from the **Packet Drop** tab are moved to the **Drop History** tab. By default, the RTP drop history is maintained for 7 days. You can customize this setting by entering the required value in the **IPFM history retention days** field in **Settings > Server Settings > IPFM** and saving it.

Note The **Drop History** tab displays only the last 100,000 records at the maximum.

Global Config

Note This tab is only available on IPFM fabrics when you have deployed IPFM on Nexus Dashboard Fabric Controller. However, the IPFM fabric with generic multicast fabric technology is an exception (as the IPFM VRF created here is used for defining host/flow aliases for both IPFM and Generic Multicast Fabric).

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Global Config**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Global Config**.

Nexus Dashboard Fabric Controller allows two major operations.

- Monitor the network.
- Configure host and flow policies.

Nexus Dashboard Fabric Controller monitors the Flow Status, Discovered Host, Applied Host Policies, and other operations using Telemetry. For any operations triggered by the switch and received through telemetry

(for example, Flow Established), Nexus Dashboard Fabric Controller periodically checks for new events and generate appropriate notification.

If `pmn.deploy-on-import-reload.enabled` server property is set to true during a switch reload, when Nexus Dashboard Fabric Controller receives switch coldStartSNMPtrap, it deploys Global Config, and Host and Flow policies that are showing 'Deployment Status=Successes' to the switch automatically. Deploy the switch telemetry and SNMP configuration can be deployed on demand by using Nexus Dashboard Fabric Controller packaged `pmn_telemetry_snmp` CLI template available in **Templates**.

Navigate to **Global Config** to set or modify Switch Global configuration and VRFs.

When you install Nexus Dashboard Fabric Controller with IPFM Deployment, you can deploy policies, the unicast bandwidth, Any Source Multicast (ASM) range, and VRFs using **Global Config**.

After you deploy the Nexus Dashboard Fabric Controller with IPFM, configure the bandwidth and ASM. The remaining percentage of the bandwidth is utilized by the multicast traffic. Nexus Dashboard Fabric Controller acts like a Master Controller, and deploy the bandwidth and ASM configurations to all the switches in the fabric.

As Cisco Nexus Dashboard Fabric Controller uses Telemetry to fetch data from the Fabric, the flow status and Kafka notifications may not reflect the current state in real time. It periodically checks new events and generates appropriate notification. For more information, refer to the *Kafka Notifications for Cisco Nexus Dashboard Fabric Controller, Release 12.0.1a*.

This section contains the following:

Switch Global Config

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Global Config > Switch Global Config**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Global Config > Switch Global Config**.

Navigate to **Switch Global Config** to configure the global parameters.

Note A user with the network operator role in Nexus Dashboard Fabric Controller cannot save, deploy, undeploy, add or delete ASM, or edit the unicast bandwidth reservation percentage.

After you configure the Unicast Bandwidth Reservation and ASM range, you can perform the following operations to deploy these configurations to the switches.

After deploying the global configurations, configure the WAN for each switch in your network.

Table 29: Switch Global Config Table Fields and Description

Field	Description
VRF	Specifies the name of the VRF. This VRF is used to associate IPFM Host/Flow policies as well as Host/Flow aliases for both IPFM and Generic Multicast fabrics.

Field	Description
Unicast Bandwidth Reservation %	<p>Displays a numeric value that indicates the unicast bandwidth configuration percentage, and the status specifies if the bandwidth deployment was success, or failed or not deployed.</p> <p>You can configure the server to allot a dedicated percentage of bandwidth to unicast traffic. The remaining percentage is automatically reserved for multicast traffic.</p> <p>Click the numerical value link to view the details of the deployment history for the Unicast Bandwidth for the selected VRF and switch in the Deployment History pane. For more information, see Deployment History, on page 203.</p> <p>Click the Failed or Success link to view the details of the deployment status for the Unicast Bandwidth for the selected VRF and switch in the Deployment Status pane. For more information, see Deployment Status, on page 203.</p>
Reserve Bandwidth to Receiver Only	<p>Bandwidth reservation status specifies if the bandwidth deployment was success, or failed or not deployed.</p> <p>The Enabled status indicates that the ASM traffic is pushed to the spine only if there is a receiver. This feature is applicable for switches with the Cisco NX-OS Release 9.3(5) and later.</p> <p>Click the Enabled link to view the details of the deployment history for the Reserve Bandwidth for the selected VRF and switch in the Deployment History pane. For more information, see Deployment History, on page 203.</p> <p>Click the Failed link to view the details of the deployment status for the Reserve Bandwidth for the selected VRF and switch in the Deployment Status pane. For more information, see Deployment Status, on page 203.</p>

Field	Description
ASM/MASK	<p>Displays the number of Any Source Multicast (ASM) groups enabled for the selected VRF and the status indicates whether the ASM and Mask configuration was deployed successfully, or failed or not deployed.</p> <p>The ASM is a PIM tree building mode that uses shared trees to discover new sources and receivers as well as source trees to form shortest paths from receivers to sources. ASM provides discovery of multicast sources.</p> <p>The IP address and subnet mask in the ASM/MASK field define the multicast source.</p> <p>The ASM range is configured by specifying the IP address and the subnet mask.</p> <p>Click the numerical value link to view the details of the deployment history for the ASM/mask for the selected VRF and switch in the Deployment History pane. For more information, see Deployment History, on page 203.</p> <p>Click the Failed link to view the details of the deployment status for the ASM/mask for the selected VRF and switch in the Deployment Status pane. For more information, see Deployment Status, on page 203.</p>

Click the table header to sort the entries in alphabetical order of that parameter.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **Switch Global Config** window.

Table 30: Switch Global Config Actions and Description

Action Item	Description
Edit NBM VRF Config	<p>Allows you to edit the NBM VRF configuration.</p> <p>To perform an edit, choose this option. The Edit NBM VRF Config window opens. Edit the required values and click Deploy.</p>
Undeploy All	Undeploys ASM, unicast bandwidth, and reserved bandwidth configuration to all switches.
Undeploy Unicast BW	Undeploys only unicast bandwidth configuration.
Undeploy Reserve BW	Undeploys only the reserve bandwidth configuration.
Undeploy ASM/Mask	Undeploys only the ASM configuration.
Redo All Failed	Redeploys the selected failed configurations.

Deployment History

The following table describes the fields that appear on the Deployment History.

Table 31: Deployment History Field and Description

Field	Description
Type	Specifies whether the type is Unicast Bandwidth Reservation %, Reserve Bandwidth to Receiver Only, or ASM/MASK.
VRF	Specifies the name of the VRF.
Switch Name	Specifies the switch name in the fabric on which the configuration was deployed.
Deployment Status	Displays the status of deployment. It shows if the deployment was Success or Failed along with the reason why the deployment failed.
Action	Specifies the action that is performed on the switch, such as Create or Delete .
Deployment Date/Time	Displays the date and time when the deployment was initialized.

Deployment Status

The following table describes the fields that appear on the Deployment Status.

Table 32: Deployment Status Field and Description

Field	Description
Type	Specifies whether the type is Unicast Bandwidth Reservation %, Reserve Bandwidth to Receiver Only, or ASM/MASK.
VRF	Specifies the name of the VRF.
Switch Name	Specifies the switch name in the fabric on which the configuration was deployed.
IP Address	Specifies the IP address of the switch.
Deployment Status	Displays the status of deployment. It shows if the deployment was Success or Failed along with the reason why the VRF deployment failed.
Action	Specifies the action that is performed on the switch, for example, Create .
Deployment Date/Time	Displays the date and time when the deployment was initialized.

IPFM VRF

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > Global Config > IPFM VRF**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > Global Config > IPFM VRF**.

Use the **IPFM VRF** window to create, edit, delete, and redeploy VRFs. You can view the deployment status and history of each VRF.

Table 33: IPFM VRF Table Fields and Description

Field	Description
Name	Specifies the name of the VRF.
Deployment Status	Specifies whether the VRF deployment is successful, failed, or the VRF is not deployed. For default VRFs, the deployment status is displayed as Not Applicable . Click the Failed status to view more information about the Deployment Status, on page 203 .
Deployment History	Specifies the deployment history of the VRF. For default VRFs, the deployment history is displayed as Not Applicable . Click View in Deployment History to view more information about the Deployment History .
Description	Specifies the description of the VRF.

Click the table header to sort the entries in alphabetical order of that parameter.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **IPFM VRF** horizontal tab on the **Global Config** tab in the **Fabric Overview** window.

Table 34: IPFM VRF Actions and Description

Action Item	Description
Create VRF	<p>Allows you to create a new VRF.</p> <p>To create a VRF, choose Create VRF from the Action drop-down list of the IPFM VRF horizontal tab on the Global Config tab in the Fabric Overview window. In the Create VRF window, enter the VRF name and description, and click Save & Deploy to retain the changes and deploy or click Cancel to discard the changes.</p> <p>Note When you create a custom or non-default VRF, although the default host and flow policies are automatically created for that VRF, you must manually deploy the policies to the switches in the fabric. For more information about deploying the policies manually, see Host Policies, on page 157 and Flow Policies.</p>
Edit VRF	<p>Allows you to edit a selected VRF.</p> <p>To edit a VRF, select the check box next to the VRF that you want to edit and choose Edit VRF. In the Edit VRF window, you can edit only the description and click Save to retain the changes or click Cancel to discard the changes.</p>
Delete VRF	<p>Allows you to delete one or more VRFs, which deletes the data from the database and cancels the deployment on the switch.</p> <p>To delete a VRF, select the check box next to the VRF that you want to delete and choose Delete VRF. You can select multiple VRF entries and delete them at the same instance.</p>
Redeploy	<p>Allows you to select and redeploy the VRFs with failed status.</p> <p>To redeploy a VRF to the switch, select the check box next to the VRF that you want to deploy again and choose Redeploy. You can select multiple VRF entries and redeploy them at the same instance.</p>

Deployment History

The following table describes the fields that appear in the **Deployment History** pane.

Table 35: Deployment History Field and Description

Field	Description
Type	Specifies the type of VRF.
VRF	Specifies the name of the VRF.
Switch Name	Specifies the switch on which the VRF is deployed.

Field	Description
Deployment Status	Displays the status of the deployment. It shows if the deployment was a Success , Failed along with the reason why the VRF deployment failed, or Not Applicable .
Action	Specifies the action that is performed on the switch, such as Create or Delete .
Deployment Date/Time	Displays the date and time when the deployment was initialized.

Deployment Status

The following table describes the fields that appear in the **Deployment Status** pane.

Table 36: Deployment Status Field and Description

Field	Description
Type	Specifies the type of VRF.
VRF	Specifies the name of the VRF.
Switch Name	Specifies the switch on which the VRF is deployed.
IP Address	Specifies the IP address of the switch.
Deployment Status	Displays the status of the deployment. It shows if the deployment was a Success or Failed along with the reason why the deployment failed.
Action	Specifies the action that is performed on the switch, for example, Create .
Deployment Date/Time	Displays the date and time when the deployment was initialized.

VRF (Generic Multicast)

Note This tab is only available on IPFM fabric when you have deployed IPFM on Nexus Dashboard Fabric Controller and when the fabric technology is generic multicast.

UI Navigation

- Choose **LAN > Fabrics**. Click on a fabric to open the **Fabric** slide-in pane. Click the **Launch** icon. Choose **Fabric Overview > VRF**.
- Choose **LAN > Fabrics**. Double-click on a fabric to open **Fabric Overview > VRF**.

Use the **VRF** window to create, edit, and delete VRFs.

Table 37: VRF Table Fields and Description

Field	Description
Name	Specifies the name of the VRF.
Deployment Status	For generic multicast VRFs, the deployment status is displayed as Not Applicable .
Deployment History	For generic multicast VRFs, the deployment status is displayed as Not Applicable .
Description	Specifies the description of the VRF.

Click the table header to sort the entries in alphabetical order of that parameter.

The following table describes the action items, in the **Actions** drop-down list, that appears in the **VRF** window.

Table 38: VRF Actions and Description

Action Item	Description
Create VRF	Allows you to create a new VRF. To create a VRF, choose Create VRF from the Action drop-down list on the VRF tab in the Fabric Overview window. In the Add VRF window, enter the VRF name and description, and click Save to retain the changes or click Cancel to discard the changes.
Edit VRF	Allows you to edit a selected VRF. To edit a VRF, select the check box next to the VRF that you want to edit and choose Edit VRF . In the Edit VRF window, you can edit only the description and click Save to retain the changes or click Cancel to discard the changes.
Delete VRF	Allows you to delete a selected VRF. To delete a VRF, select the check box next to the VRF that you want to delete and choose Delete VRF . You can select multiple VRF entries and delete them at the same instance.

Virtual Infrastructure

Viewing OpenStack VMs

The following table describes the fields and description on the window.

Field	Description
VM Name	Specifies the name of the Kubernetes pod.
Compute Name	Displays the IP address of the Kubernetes pod.

Field	Description
Fabric Name	Specifies the phase (state) of the pod.
IP Address	Specifies the reason.
MAC Address	Specifies the applications of the pod.
Physical NIC	Specifies the namespace of the pod.
Port Channel	Specifies the node name of the pod.
Switch Interface	Specifies the switch interface connected to pod.
Switch Name	Specifies the name of the switch.
Switch IP	Specifies the IP address of the switch.
VLAN	Specifies the VLAN.
Locked	Specifies the whether the cluster is in locked state.
Power State	Specifies whether the openstack cluster power state.
Network State	Specifies whether the openstack cluster network state.
State	Specifies the state of openstack cluster.

Endpoint Locator

The Endpoint Locator (EPL) feature allows real-time tracking of endpoints within a data center. The tracking includes tracing the network life history of an endpoint and getting insights into the trends that are associated with endpoint additions, removals, moves, and so on. An endpoint is anything with at least one IP address (IPv4 and/or IPv6) and MAC address. EPL feature is also capable of displaying MAC-Only endpoints. By default, MAC-Only endpoints are not displayed. An endpoint can be a virtual machine (VM), container, bare-metal server, service appliance and so on.

Note

- EPL is supported for VXLAN BGP EVPN fabric deployments only in the Nexus Dashboard Fabric Controller LAN fabric installation mode. The VXLAN BGP EVPN fabric can be deployed as Easy fabric, Easy eBGP fabric, or an External fabric (managed or monitored mode). EPL is not supported for 3-tier access-aggregation-core based network deployments.
- EPL displays endpoints that have at least one IP address (IPv4 and/or IPv6). EPL is also capable of displaying MAC-Only endpoints. Select the **Process MAC-Only Advertisements** checkbox while configuring EPL to enable processing of EVPN Route-type 2 advertisements having a MAC address only. L2VNI:MAC is the unique endpoint identifier for all such endpoints. EPL can now track endpoints in Layer-2 only network deployments where the Layer-3 gateway is on a firewall, load-balancer, or other such nodes.

EPL relies on BGP updates to track endpoint information. Hence, typically the Nexus Dashboard Fabric Controller needs to peer with the BGP Route-Reflector (RR) to get these updates. For this purpose, IP reachability from the Nexus Dashboard Fabric Controller to the RR is required. This can be achieved over in-band network connection to the Nexus Dashboard Fabric Controller Data Network interface.

Some key highlights of the Endpoint Locator are:

- Support for dual-homed and dual-stacked (IPv4 + IPv6) endpoints
- Support for up to two BGP Route Reflectors or Route Servers
- Support real-time and historical search for all endpoints across various search filters such as VRF, Network, Layer-2 VNI, Layer-3 VNI, Switch, IP, MAC, port, VLAN, and so on.
- Support for real-time and historical dashboards for insights such as endpoint lifetime, network, endpoint, VRF daily views, and operational heat map.
- Support for iBGP and eBGP based VXLAN EVPN fabrics. The fabrics may be created as Easy Fabrics or External Fabrics. EPL can be enabled with an option to automatically configure the spine or RRs with the appropriate BGP configuration.
- You can enable the EPL feature for upto 4 fabrics.
- EPL is supported on Multi-Site Domain (MSD).
- IPv6 underlay is not supported.
- Support for high availability
- Support for endpoint data that is stored for up to 60 days, amounting to a maximum of 100 GB storage space.
- Support for optional flush of the endpoint data in order to start afresh.
- Supported scale: Maximum of 50K unique endpoints per fabric. A maximum of 4 fabrics is supported. However, the maximum total number of endpoints across all fabrics should not exceed 50K.

If the total number of endpoints across all fabrics exceeds 50K, an alarm is generated and is listed under the **Alarms** icon at the top right of the window. This icon starts flashing whenever a new alarm is generated.

- From NDFC Release 12.0.1a, Persistent or External IP addresses are required to enable EPL. For each VXLAN fabric, a specific container is spawned running a BGP instance to peer with the spines of the fabric. This container must have a persistent IP associated that is then configured as a iBGP neighbor on the spines. A different container is used for each fabric, so the number of fabrics managed by NDFC where EPL is enabled decides how many persistent IP addresses need to be distributed for EPL. Also, the EPL establishes iBGP sessions only over the Nexus Dashboard Data interface.
- For Virtual Nexus Dashboard deployments, enable/accept promiscuous mode on the port-groups associated with the Nexus Dashboard Management and/or Data vNICs where IP stickiness is required. The Persistent IP addresses are given to the pods (e.g., SNMP Trap/Syslog receiver, Endpoint Locator instance per Fabric, SAN Insights receiver, etc.). Every POD in Kubernetes can have multiple virtual interfaces. Specifically for IP stickiness an extra virtual interface is associated with the POD that is allocated an appropriate free IP from the external service IP pool. The vNIC has its own unique MAC address that is different from the MAC addresses associated with the vND virtual vNICs. Moreover, all communication to and from the PODs towards an external switch goes out of the same bond interface for North-to-South traffic flows. The EPL container uses Nexus Dashboard Data Interface. The Data vNIC maps to bond0 (also known as bond0br) interface. By default, the VMware system checks if the traffic flows out of a

particular vNIC is matched with the Source-MAC associated with the vNIC. In the case of NDFC, the traffic flows are sourced with the Persistent IP addresses of the given PODs. Therefore, we need to enable the required settings on the VMware side.

If you are using a Virtual Nexus Dashboard Cluster before you begin, ensure that the Persistent IP address, EPL feature, and required settings are enabled. Refer to below links:

[Cisco Nexus Dashboard Fabric Controller Deployment Guide](#)

[Cisco Nexus Dashboard Fabric Controller Installation and Upgrade Guide](#)

EPL Connectivity Options

Sample topologies for the various EPL connectivity options are as given below.

NDFC Cluster Mode: Physical Server to VM Mapping

Refer to [Cisco Nexus Dashboard Fabric Controller Verified Scalability Guide](#) for more information.

Configuring Endpoint Locator

The Nexus Dashboard Fabric Controller OVA or the ISO installation comes with two interfaces:

- Management
- Data

(Out-of-band or OOO) connectivity of switches via switch mgmt0 interface can be through data or Management interface. For more information refer to [NDFC Installation and Upgrade Guide](#).

The Management interface provides reachability to the devices via the mgmt0 interface either Layer-2 or Layer-3 adjacent. This allows Nexus Dashboard Fabric Controller to manage and monitor these devices including POAP. EPL requires BGP peering between the Nexus Dashboard Fabric Controller and the Route-Reflector. Since the BGP process on Nexus devices typically runs on the default VRF, in-band IP connectivity from the Nexus Dashboard Fabric Controller to the fabric is required. The data network interface can be configured during Nexus Dashboard installation. You can't modify the configured in-band network configurations.

Note The setup of Data network interface on the Nexus Dashboard Fabric Controller is a prerequisite of any application that requires the in-band connectivity to the devices within fabric. This includes EPL and Network Insights Resources (NIR).

On the fabric side, for a standalone Nexus Dashboard Fabric Controller deployment, if the Nexus Dashboard data network port is directly connected to one of the front-end interfaces on a leaf, then that interface can be configured using the **epl_routed_intf** template. An example scenario of how this can be done when IS-IS or OSPF is employed as the IGP in the fabric, is depicted below:

Switch List:
Topo-4-EX-Leaf-1

Priority*
500
1-1000

Close Save

However, for redundancy purposes, it is always advisable to have the server on which the Nexus Dashboard Fabric Controller is installed to be dual-homed or dual-attached. With the OVA Nexus Dashboard Fabric Controller deployment, the server can be connected to the switches via a port-channel. This provides link-level redundancy. To also have node-level redundancy on the network side, the server may be attached to a vPC pair of Leaf switches. In this scenario, the switches must be configured such that the HSRP VIP serves as the default gateway of the Data Network interface on the Nexus Dashboard Fabric Controller.

Enable Config Mirroring

Save Preview Deploy

For the HSRP configuration on terry-leaf3, the **switch_freeform** policy may be employed as shown in the following image:

You can deploy a similar configuration on terry-leaf3 while using IP address 10.3.7.2/24 for SVI 596. This establishes an in-band connectivity from the Nexus Dashboard Fabric Controller to the fabrics over the Data Network interface with the default gateway set to 10.3.7.3.

After you establish the in-band connectivity between the physical or virtual Nexus Dashboard Fabric Controller and the fabric, you can establish BGP peering.

During the EPL configuration, the route reflectors (RRs) are configured to accept Nexus Dashboard Fabric Controller as a BGP peer. During the same configuration, the Nexus Dashboard Fabric Controller is also configured by adding routes to the BGP loopback IP on the spines/RRs via the Data Network Interface gateway.

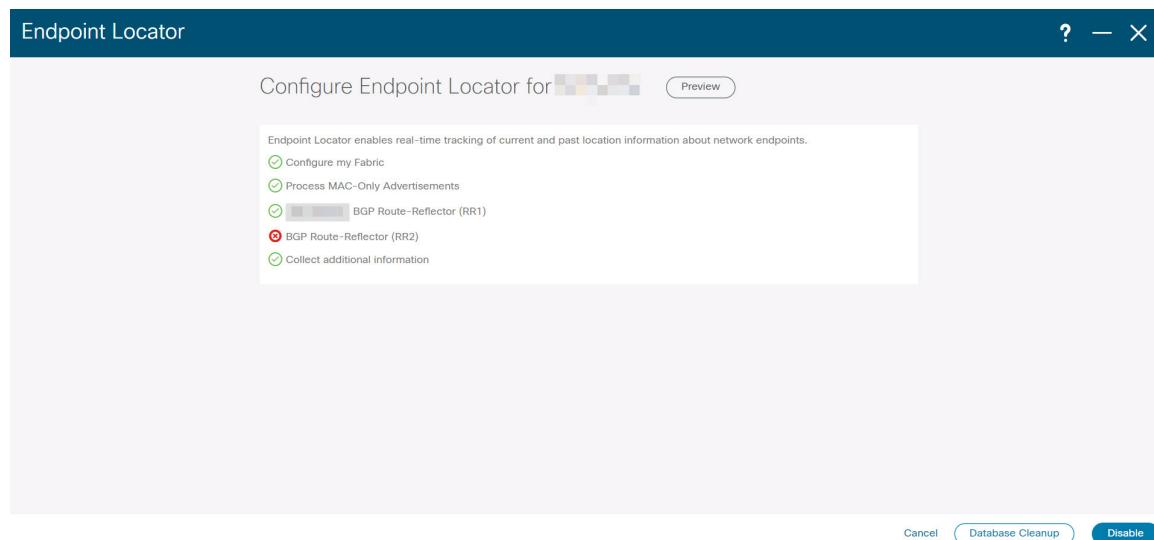

Note Ensure that you have enabled EPL feature for Cisco Nexus Dashboard Fabric Controller. Choose **Settings > Feature Management > Fabric Controller** choose check box **Endpoint Locator**. You can view the added EPL details on dashboard.

Note Cisco Nexus Dashboard Fabric Controller queries the BGP RR to glean information for establishment of the peering, like ASN, RR, IP, and so on.

To configure Endpoint Locator from the Cisco Nexus Dashboard Fabric Controller Web UI, On Fabric Overview page, choose **Actions > More > Configure Endpoint Locator**. Similarly, you can configure EPL on Topology page, right-click on required fabric, click **More > Configure Endpoint Locator**. The **Endpoint Locator** window appears.

You can enable EPL for one fabric at a time.

Select the switches on the fabric hosting the RRs from the drop-down list. Cisco Nexus Dashboard Fabric Controller will peer with the RRs.

By default, the **Configure My Fabric** option is selected. This knob controls whether BGP configuration will be pushed to the selected spines/RRs as part of the enablement of the EPL feature. If the spine/RR needs to be configured manually with a custom policy for the EPL BGP neighborhood, then this option should be unchecked. For external fabrics that are only monitored and not configured by Nexus Dashboard Fabric Controller, this option is greyed out as these fabrics are not configured by Nexus Dashboard Fabric Controller.

Select the **Process MAC-Only Advertisements** option to enable processing of MAC-Only advertisements while configuring the EPL feature.

Note If EPL is enabled on a fabric with or without selecting the **Process Mac-Only Advertisements** checkbox and you want to toggle this selection later, then you have to first disable EPL and then click **Database Clean-up** to delete endpoint data before re-enabling EPL with the desired **Process Mac-Only Advertisements** setting.

Select **Yes** under **Collect Additional Information** to enable collection of additional information such as PORT, VLAN, VRF etc. while enabling the EPL feature. To gather additional information, NX-API must be supported and enabled on the switches, ToRs, and leafs. If the **No** option is selected, this information will not be collected and reported by EPL.

Note For all fabrics except external fabrics, NX-API is enabled by default. For external fabrics, you have to enable NX-API in the external fabric settings by selecting the **Enable NX-API** checkbox in the **Advanced** tab of the External_Fabric_11_1 fabric template.

Click the **i** icon to view a template of the configuration that is pushed to the switches while enabling EPL. This configuration can be copied and pasted on spines or border gateway devices to enable EPL on external monitored fabrics.

Once the appropriate selections are made and various inputs have been reviewed, click **Submit** to enable EPL. If there are any errors while you enable EPL, the enable process aborts and the appropriate error message is displayed. Otherwise, EPL is successfully enabled.

The Nexus Dashboard Data Service IP is used as BGP neighbor.

When the Endpoint Locator feature is enabled, there are a number of steps that occur in the background. Nexus Dashboard Fabric Controller contacts the selected RRs and determines the ASN. It also determines the interface IP that is bound to the BGP process. Also, appropriate BGP neighbor statements are added on the RRs or spines in case of eBGP underlay, to get them ready to accept the BGP connection that will be initiated from the Nexus Dashboard Fabric Controller. The external Nexus Dashboard Data Service IP address that is assigned to the EPL pod will be added as the BGP neighbor. Once EPL is successfully enabled, the user is automatically redirected to the EPL dashboard that depicts operational and exploratory insights into the endpoints that are present in the fabric.

For more information about the EPL dashboard, refer [Monitoring Endpoint Locator, on page 222](#).

Flushing the Endpoint Database

After you enable the Endpoint Locator feature, you can clean up or flush all the Endpoint information. This allows starting from a clean-slate with respect to ensuring no stale information about any endpoint is present in the database. After the database is clean, the BGP client re-populates all the endpoint information learnt from the BGP RR. You can flush the endpoint database even if you have not re-enabled the EPL feature on a fabric on which the EPL feature was previously disabled.

To flush all the Endpoint Locator information from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

-
- Step 1** Choose **Endpoint Locator > Configure**, and click **Database Clean-Up**.
 - Step 2** Click **Delete** to continue or **Cancel** to abort.
-

Configuring Endpoint Locator for Single VXLAN EVPN Site

To configure endpoint locator for single VXLAN EVPN site, perform the following steps:

Before you begin

In the below figure, the NDFC service application is attached to the VPC pair of Leaf switches as it provides the link and node-level redundancy. The BGP instance running on EPL container establishes iBGP peering with the fabric spines. The iBGP peering is between Spine loopback addresses (loopback0) and EPL container persistent IP addresses. The loopback0 address of Spines is reachable via VXLAN Underlay, therefore, EPL container IP must have IP reachability towards the spines. We can configure an SVI on Leaf switches that can provide IP connectivity. The SVI will be a non-VXLAN enabled VLAN and will only participate in the underlay.

Procedure

-
- Step 1** You must configure persistent IP addresses on Cisco Nexus Dashboard. On Nexus Dashboard, choose **Admin Console > Infrastructure > Cluster Configuration**.
- Step 2** On **General** tab, in **External Service Pools** card, click **Edit** icon.
The **External Service Pools** window appears.

Step 3 Enter Persistent IP addresses in **Data Service IP's** and click **check** icon.

Note The IP address must be associated with Nexus Dashboard Data Pool. A single persistent IP address is required to visualize and track EPs for a single site.

External Service Pools
✕

Management Service IP's

	Not In Use			
	Not In Use			

[+ Add IP Address](#)

Save

Step 4 Configure SVI using FHRP for ND Data Interface and Underlay IP connectivity.

You can use **switch_freeform** policy on fabric Leaf 1.

To create a freeform policy, perform the following steps:

a) Choose **LAN> Fabrics**, double-click on required fabric.

The **Fabric Overview** page appears.

b) Click **Policy** tab, choose **Actions> Add Policy**.

The **Add Policy** window appears.

c) Choose appropriate Leaf1 switch from the **Switch List** drop-down list and click **Choose Template**.

d) On **Select Policy Template** window, choose **switch_freeform** template and click **Select**.

Apply FHRP configurations and save the template.

Deploy the template configuration.

In this example, SVI 100 with HSRP gateway created on fabric Leaf 1. Similarly, repeat the steps for fabric Leaf 2.

Below mentioned configuration example:

```

feature hsrp
vlan 100
name EPL-Inband
interface Vlan100
  no shutdown
  no ip redirects
  ip address 192.168.100.252/24
  no ipv6 redirects
  ip router ospf 100 area 0.0.0.0
  hsrp 100
    ip 192.168.100.254

```

Step 5 Verify IP reachability between Nexus Dashboard Data Interface and fabric switches.

```

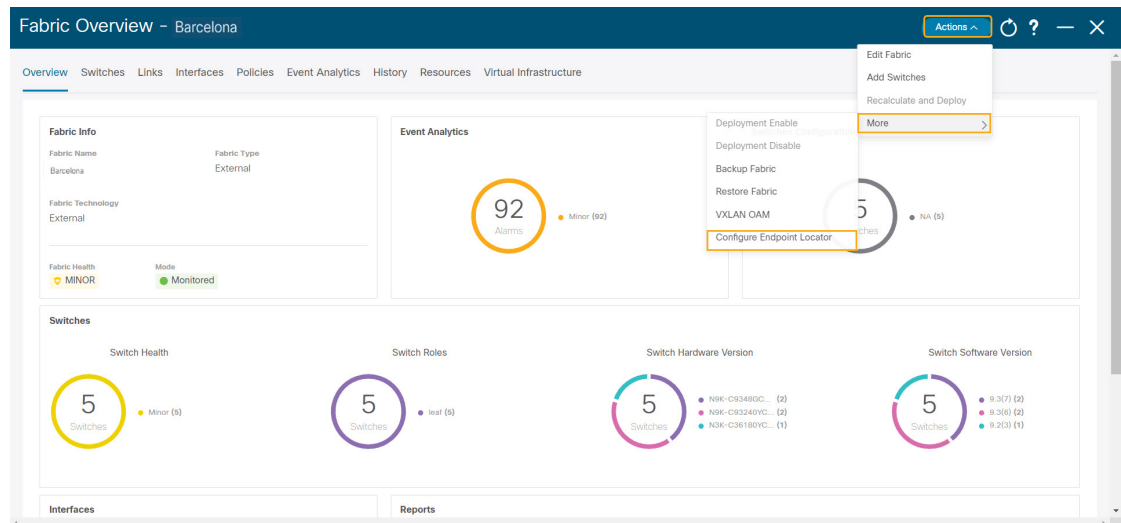

[rescue-user@ndfc-12-parth ~]$ ping 192.168.100.254 -c 2
PING 192.168.100.254 (192.168.100.254) 56(84) bytes of data.
64 bytes from 192.168.100.254: icmp_seq=1 ttl=255 time=1.95 ms
64 bytes from 192.168.100.254: icmp_seq=2 ttl=255 time=2.09 ms

--- 192.168.100.254 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 100ms
rtt min/avg/max/mdev = 1.950/2.021/2.093/0.084 ms
[rescue-user@ndfc-12-parth ~]$

```

Step 6 Enable EPL at fabric level.

- To configure EPL, choose **LAN > Fabrics > Fabric Overview**.
- On **Fabric Overview** window, choose **Actions > More > Configure EndPoint Locator**.

- Choose the appropriate switches on the fabric hosting the Spine/Route Reflector RRs from the drop-down list.

Choose **Configure my Fabric** option for knob controls.

Whether BGP configuration will be pushed to the selected Spines/RRs as part of the enablement of the EPL feature. If the Spine/RR needs to be configured manually with a custom policy for the EPL BGP neighborship, then this option should be unchecked. For external fabrics that are only monitored and not configured on NDFC this option is grayed out. As these fabrics are not configured on NDFC.

Choose **Process MAC-Only Advertisements** option to enable processing of MAC-Only advertisements while configuring the EPL feature.

Note If EPL is enabled on a fabric with or without choosing the **Process Mac-Only Advertisements** checkbox and if you want to toggle this selection later, then you must disable EPL and click **Database Clean-up** to delete endpoint data before re-enabling EPL with the desired **Process Mac-Only Advertisements** setting.

Choose **Yes** in **Collect Additional Information** to enable collection of additional information such as PORT, VLAN, and VRF while enabling the EPL feature. To access additional information, NX-API must be supported and enabled on the switches, ToRs, and leafs. If you choose **No** option, this information won't be collected and reported by EPL.

Note For all fabrics except external fabrics, NX-API is enabled by default. For external fabrics, you must enable NX-API in the external fabric settings, choose **Enable NX-API** checkbox in the **Advanced** tab of the External_Fabric_11_1 fabric template.

Click on **Preview** icon to view a template of the configuration that is pushed to the switches enabling EPL. This configuration can be copied and pasted on spines or border gateway devices to enable EPL on external monitored fabrics.

Once the appropriate selections are made and various inputs have been reviewed, click **Save Config** to enable EPL. If there are any errors while you enable EPL, the enable process aborts and the appropriate error message are displayed. Otherwise, EPL is successfully enabled. Once the EPL is enabled the Persistent IP will be in-use.

Configuring Endpoint Locator for Multi-Fabric using VXLAN EVPN Multisite

To configure endpoint locator for multi-fabric VXLAN EVPN multisite, perform the following steps:

Before you begin

The below figure enables EPL for Multi-Fabric using VXLAN EVPN Multisite. The BGP peering's are established between the Spines/RRs of each VXLAN EVPN Site and NDFC EPL Container. The Persistent IPs are required based on the number of VXLAN EVPN Sites. The NDFC application hosted on Cisco ND Cluster is located on Site 1. The routing information to reach the Spines/RRs deployed in the remote site must be exchanged across the Multisite. Once the BGP session is formed, local EPs of Fabric 2 can be visualized and tracked.

By default, Nexus Dashboard data Interface and Site 2 Spines/RRs loopback prefixes are not advertised across the BGWs. Therefore, prefixes must be exchanged using custom route maps and prefix lists across the sites. At the same time, route redistribution between OSPF and BGP is required as Spines/RRs loopback prefixes are part of OSPF protocol while BGWs peer with each other using BGP.

Procedure

Step 1 You must configure persistent IP addresses on Cisco Nexus Dashboard. On Nexus Dashboard, choose **Admin Console > Infrastructure > Cluster Configuration**.

Step 2 On **General** tab, in **External Service Pools** card, click **Edit** icon.

The **External Service Pools** window appears.

Step 3 Enter Persistent IP addresses in **Data Service IP's** and click **check** icon.

Note Ensure that the IP addresses are associated with Nexus Dashboard Data Pool. Two persistent IP addresses are required to visualize and track EPs for a multisite with two member fabrics. One Persistent Data IP address is used as EPL container IP to establish BGP session with Site 1 fabric. A new Persistent IP address is configured that can be used to peer with Site 2 fabric.

Step 4 Configure Route Redistribution for VXLAN EVPN Fabrics.

Route Redistribution for Fabric 1

The following `switch_freeform` policy can be used on Fabric 1 BGWs. To create a new `switch_freeform` policy, refer to the above examples.

Below the example of sample configuration

```
ip prefix-list site-2-rr seq 5 permit 20.2.0.1/32 >> Site 2 RR
ip prefix-list site-2-rr seq 6 permit 20.2.0.2/32 >> Site 2 RR
ip prefix-list epl-subnet seq 5 permit 192.168.100.0/24 >> EPL Subnet
```

```

route-map bgp-to-ospf permit 10
  match ip address prefix-list site-2-rr
route-map ospf-to-bgp permit 10
  match ip address prefix-list epl-subnet

router ospf 100
  redistribute bgp 100 route-map bgp-to-ospf

router bgp 100
  address-family ipv4 unicast
  redistribute ospf 100 route-map ospf-to-bgp

```

Route Redistribution for Fabric 2

The following switch_freeform policy can be used on Fabric 2 BGWs. To create a new **switch_freeform** policy, refer to the above examples.

Below the example of sample configuration

```

ip prefix-list site-2-rr seq 5 permit 20.2.0.1/32 >> Site 2 RR
ip prefix-list site-2-rr seq 6 permit 20.2.0.2/32 >> Site 2 RR
ip prefix-list epl-subnet seq 5 permit 192.168.100.0/24 >> EPL Subnet

route-map bgp-to-ospf permit 10
  match ip address prefix-list epl-subnet
route-map ospf-to-bgp permit 10
  match ip address prefix-list site-2-rr

router ospf 200
  redistribute bgp 200 route-map bgp-to-ospf

router bgp 200
  address-family ipv4 unicast
  redistribute ospf 200 route-map ospf-to-bgp

```

Step 5 To configure EPL, choose **LAN> Fabrics> Fabric Overview**.

Step 6 On **Fabric Overview** window, choose **Actions> More> Configure EndPoint Locator**.

Step 7 Choose the appropriate switches on the fabric hosting the Spine/Route Reflector RRs from the drop-down list.

Once the appropriate selections are made and various inputs have been reviewed, click **Save Config** to enable EPL. If there are any errors while you enable EPL, the enable process aborts and the appropriate error message is displayed. Otherwise, EPL is successfully enabled. Once the EPL is enabled the Persistent IP will be in-use.

You can view EPL enabled for fabric-1 and fabric-2 successfully. To view and track EPs, Refer the [Monitoring Endpoint Locator](#) section.

Configuring Endpoint Locator for vPC Fabric Peering Switches

Networks Administrator can create vPC between a pair of switches using a Physical Peer Link or Virtual Peer link. vPC Fabric Peering provides an enhanced dual-homing access solution without the overhead of wasting physical ports for vPC Peer Link. For Virtual Peer link, EPL can still be connected to vPC pair of Leaf switches for the link and node-level redundancy. However, VXLAN VLAN (Anycast Gateway) as the First hop for EPL will be used. The loopback0 address of Spines/RRs is reachable only via VXLAN Underlay, while VXLAN VLAN will be part of a Tenant VRF. Therefore, to establish IP communication, route-leaking is configured between Tenant VRF and Default VRF. For more information, refer to vPC Fabric Peering section.

To configure endpoint locator for vPC Fabric Peering switches perform the following steps:

Procedure

Step 1 You must configure persistent IP addresses on Cisco Nexus Dashboard. On Nexus Dashboard, choose **Admin Console > Infrastructure > Cluster Configuration**.

Step 2 On **General** tab, in **External Service Pools** card, click **Edit** icon.

The **External Service Pools** window appears.

Step 3 Enter Persistent IP addresses in **Data Service IP's** and click **check** icon.

Step 4 Create a Tenant VRF and Anycast Gateway on the vPC fabric peering switches.

add two images

Step 5 Configure Route-leaking between Tenant VRF and Default VRF.

Advertise from Tenant VRF to Default VRF.

The following switch_freeform policy can be used on fabric Leaf where ND is connected.

```
ip prefix-list vrf-to-default seq 5 permit 192.168.100.0/24 >> EPL subnet
route-map vrf-to-default permit 10
  match ip address prefix-list vrf-to-default
vrf context epl_inband
  address-family ipv4 unicast
    export vrf default map vrf-to-default allow-vpn
router ospf UNDERLAY
  redistribute bgp 200 route-map vrf-to-default
```

Advertise from Default VRF to Tenant VRF.

The following switch_freeform policy can be used on fabric Leaf where ND is connected.

```
ip prefix-list default-to-vrf seq 5 permit 20.2.0.3/32 >> Spine loopback IP
ip prefix-list default-to-vrf seq 6 permit 20.2.0.4/32 >> Spine loopback IP
route-map default-to-vrf permit 10
  match ip address prefix-list default-to-vrf
vrf context epl_inband
  address-family ipv4 unicast
    import vrf default map default-to-vrf
    router bgp 200
  address-family ipv4 unicast
    redistribute ospf UNDERLAY route-map default-to-vrf
```

Step 6 Enable EPL at fabric level.

- a) To configure EPL, choose **LAN > Fabrics > Fabric Overview**.
- b) On **Fabric Overview** window, choose **Actions > More > Configure EndPoint Locator**.
- c) Choose the appropriate switches on the fabric hosting the Spine/Route Reflector RRs from the drop-down list.

Once the appropriate selections are made and various inputs have been reviewed, click **Save Config** to enable EPL. If there are any errors while you enable EPL, the enable process aborts and the appropriate error message is displayed. Otherwise, EPL is successfully enabled. Once the EPL is enabled the Persistent IP will be in-use.

Configuring Endpoint Locator for External Fabrics

In addition to Easy fabrics, Nexus Dashboard Fabric Controller allows you to enable EPL for VXLAN EVPN fabrics comprising of switches that are imported into the external fabric. The external fabric can be in managed mode or monitored mode, based on the selection of **Fabric Monitor Mode** flag in the **External Fabric Settings**. For external fabrics that are only monitored and not configured by Nexus Dashboard Fabric Controller, this flag is disabled. Therefore, you must configure BGP sessions on the Spine(s) via OOB or using the CLI. To check the sample template, click  to view the configurations required while enabling EPL.

In case the **Fabric Monitor Mode** checkbox in the External Fabric settings is unchecked, then EPL can still configure the spines/RRs with the default **Configure my fabric** option. However, disabling EPL would wipe out the router bgp config block on the spines/RRs. To prevent this, the BGP policies must be manually created and pushed onto the selected spines/RRs.

Configuring Endpoint Locator for eBGP EVPN Fabrics

You can enable EPL for VXLAN EVPN fabrics, where eBGP is employed as the underlay routing protocol. Note that with an eBGP EVPN fabric deployment, there is no traditional RR similar to iBGP. The reachability of the in-band subnet must be advertised to the spines that behave as Route Servers. To configure EPL for eBGP EVPN fabrics from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

Step 1 Choose **LAN > Fabrics**.

Select the fabric to configure eBGP on or create eBGP fabric with the **Easy_Fabric_eBGP** template.

Step 2 Use the **leaf_bgp_asn** policy to configure unique ASNs on all leaves.

Step 3 Add the **ebgp_overlay_leaf_all_neighbor** policy to each leaf.

Fill **Spine IP List** with the spines' BGP interface IP addresses, typically the loopback0 IP addresses.

Fill **BGP Update-Source Interface** with the leaf's BGP interface, typically loopback0.

Step 4 Add the **ebgp_overlay_spine_all_neighbor** policy to each spine.

Fill **Leaf IP List** with the leaves' BGP interface IPs, typically the loopback0 IPs.

Fill **Leaf BGP ASN** with the leaves' ASNs in the same order as in **Leaf IP List**.

Fill **BGP Update-Source Interface** with the spine's BGP interface, typically loopback0.

After the in-band connectivity is established, the enablement of the EPL feature remains identical to what is listed so far. EPL becomes a iBGP neighbor to the Route Servers running on the spines.

Monitoring Endpoint Locator

Information about the Endpoint Locator is displayed on a single landing page or dashboard. The dashboard displays an almost real-time view of data (refreshed every 30 seconds) pertaining to all the active endpoints on a single pane. The data that is displayed on this dashboard depends on the scope selected by you from the

SCOPE drop-down list. The Nexus Dashboard Fabric Controller scope hierarchy starts with the fabrics. Fabrics can be grouped into a Multi-Site Domain (MSD). A group of MSDs constitute a Data Center. The data that is displayed on the Endpoint Locator dashboard is aggregated based on the selected scope. From this dashboard, you can access Endpoint History, Endpoint Search, and Endpoint Life.

Disabling Endpoint Locator

To disable endpoint locator from the Cisco Nexus Dashboard Fabric Controller Web UI, perform the following steps:

Procedure

- Step 1** Choose **Endpoint Locator > Configure**.
- The **Endpoint Locator** window appears. Select the required fabric from the **SCOPE** dropdown list. The fabric configuration details are then displayed for the selected fabric.
- Step 2** Click **Disable**.
-
