Network Address Translation Overview

Network Address Translation (NAT) enables private IP internetworks that use nonregistered IP addresses to connect to the Internet. NAT operates on a device, usually connecting two networks, and translates private (not globally unique) IP addresses in the internal network into legal IP addresses before packets are forwarded to another network. You can configure NAT to advertise only one IP address for the entire network to the outside world. This ability provides additional security, effectively hiding the entire internal network behind one IP address.

A device configured with NAT has at least one interface to the inside network and one to the outside network. In a typical environment, NAT is configured at the exit router between a stub domain and a backbone. When a packet leaves the domain, NAT translates the locally significant source IP address into a globally unique IP address. When a packet enters the domain, NAT translates the globally unique destination IP address into a local IP address. If more than one exit point exists, NAT configured at each point must have the same translation table.

NAT is described in RFC 1631.

Information About Static NAT

Static Network Address Translation (NAT) allows the user to configure one-to-one translations of the inside local IP addresses to inside global IP addresses. It allows both IP addresses and port number translations from the inside to the outside traffic and the outside to the inside traffic. The Cisco Nexus[®] device supports Hitless

NAT, which means that you can add or remove a NAT translation in the NAT configuration without affecting the existing NAT traffic flows.

Static NAT creates a fixed translation of private addresses to public addresses. Because static NAT assigns addresses on a one-to-one basis, you need an equal number of public addresses as private addresses. Because the public address is the same for each consecutive connection with static NAT, and a persistent translation rule exists, static NAT enables hosts on the destination network to initiate traffic to a translated host if an access list exists that allows it .

The main difference between static and dynamic NAT is that for dynamic NAT, translations do not exist in the NAT translation table until a device receives traffic that requires translation. Dynamic translations are cleared or timed out when not in use to make space for new entries based on configured and applicable NAT timeouts. Static entries exist all the time irrespective of the device receiving traffic. However, for both static and dynamic NAT, each host can use different address or port for each subsequent translation based on different configurations, like overload.

The figure shows a typical static NAT scenario. The translation is always active so both translated and remote hosts can originate connections, and the mapped address is statically assigned by the **static** command.

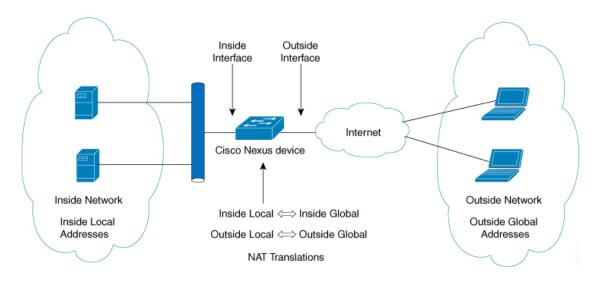

Figure 1: Static NAT

These are key terms to help you understand static NAT:

- NAT inside interface—The Layer 3 interface that faces the private network.
- NAT outside interface—The Layer 3 interface that faces the public network.
- Local address—Any address that appears on the inside (private) portion of the network.
- Global address—Any address that appears on the outside (public) portion of the network.
- Legitimate IP address—An address that is assigned by the Network Information Center (NIC) or service provider.
- Inside local address—The IP address assigned to a host on the inside network. This address does not need to be a legitimate IP address.

- Outside local address—The IP address of an outside host as it appears to the inside network. It does not have to be a legitimate address, because it is allocated from an address space that can be routed on the inside network.
- Inside global address—A legitimate IP address that represents one or more inside local IP addresses to the outside world.
- Outside global address—The IP address that the host owner assigns to a host on the outside network. The address is a legitimate address that is allocated from an address or network space that can be routed.

Dynamic NAT Overview

Dynamic Network Address Translation (NAT) translates a group of real IP addresses into mapped IP addresses that are routable on a destination network. Dynamic NAT establishes a one-to-one mapping between unregistered and registered IP addresses; however, the mapping can vary depending on the registered IP address that is available at the time of communication.

A dynamic NAT configuration automatically creates a firewall between your internal network and outside networks or the Internet. Dynamic NAT allows only connections that originate inside the stub domain—a device on an external network cannot connect to devices in your network, unless your device has initiated the contact.

Dynamic NAT translations do not exist in the NAT translation table until a device receives traffic that requires translation. Dynamic translations are cleared or timed out when not in use to make space for new entries based on configured and applicable NAT timeouts. Usually, NAT translation entries are cleared based on timers. The default minimum timeout for dynamic NAT translations is 3600 seconds.

Note The **ip nat translation sampling-timeout** command is not supported. Statistics are collected every 60 seconds for the installed NAT policies. These statistics are used to determine if the flow is active or not.

Dynamic NAT supports Port Address Translation (PAT) and access control lists (ACLs). PAT, also known as overloading, is a form of dynamic NAT that maps multiple unregistered IP addresses to a single registered IP address by using different ports.

Timeout Mechanisms

After dynamic NAT translations are created, they must be cleared when not in use so that newer translations can be created, especially because the number of TCAM entries is limited. This release supports syn-timeout and finrst-timeout. The following NAT translation timeout timers are supported on the switch:

The following NAT translation timeout timers are supported on the switch:

- syn-timeout —Timeout value for TCP data packets that send the SYN request, but do not receive a SYN-ACK reply. The timeout value ranges from 1 second to 172800 seconds. The default value is 60 seconds.
- finrst-timeout —Timeout value for the flow entries when a connection is terminated by receiving RST or FIN packets. Use the same keyword to configure the behavior for both RST and FIN packets. The timeout value ranges from 1 second to 172800 seconds. The default value is 60 seconds.

If a FIN packet is received after the connection is established, SYN >SYN-ACK >FIN, the finrst timer starts.

If a FIN-ACK is received from the other side, the translation entry is cleared immediately, else it clears after the timeout value completes.

If an RST packet is received after the connection is established, SYN>SYN-ACK>RST, the translation entry is cleared immediately.

 tcp-timeout —Timeout value for TCP translations for which connections have been established after a three-way handshake (SYN, SYN-ACK, ACK). If no active flow occurs after the connection has been established, the translations expire as per the configured timeout value.

The timeout value ranges from 60 seconds to 172800 seconds; default is 3600 seconds.

• udp-timeout —Timeout value for all NAT UDP packets.

The timeout value ranges from 60 seconds to 172800 seconds; default is 3600 seconds.

timeout—Timeout value for dynamic NAT translations.

The timeout value ranges from 60 seconds to 172800 seconds; default is 3600 seconds.

icmp-timeout— Timeout value for ICMP packets.

The timeout value ranges from 60 seconds to 172800 seconds; default is 3600 seconds.

Note

When you create dynamic entries without timeouts configured, they take the default timeout of 3600 seconds. After you change the default timeout values to the new values, the translation entries created after will pick up the latest timeout values.

NAT Inside and Outside Addresses

NAT inside refers to networks owned by an organization that must be translated. When NAT is configured, hosts within this network will have addresses in one space (known as the local address space) that will appear to those outside the network as being in another space (known as the global address space).

Similarly, NAT outside refers to those networks to which the stub network connects. They are not generally under the control of the organization. Hosts in outside networks can be subject to translation and can have local and global addresses.

NAT uses the following definitions:

- Local address—A local IP address that appears on the inside of a network.
- Global address—A global IP address that appears on the outside of a network.
- Inside local address—The IP address that is assigned to a host on the inside network. The address is probably not a legitimate IP address assigned by the Internet Network Information Center (InterNIC) or a service provider.
- Inside global address—A legitimate IP address (assigned by InterNIC or a service provider) that represents
 one or more inside local IP addresses to the outside world.

- Outside local address—The IP address of an outside host as it appears to the inside network. The address is not necessarily legitimate; it was allocated from the address space that is routable on the inside.
- Outside global address—The IP address that is assigned to a host on the outside network by the owner of the host. The address was allocated from a globally routable address or a network space.

Pool Support for Dynamic NAT

Cisco NX-OS provides pool support for dynamic NAT. Dynamic NAT allows the configuration of a pool of global addresses that can be used to dynamically allocate a global address from the pool for every new translation. The addresses are returned to the pool after the session ages out or is closed. This allows for a more efficient use of addresses based on requirements.

Support for PAT includes the use of the global address pool. This further optimizes IP address utilization. PAT exhausts one IP address at a time with the use of port numbers. If no port is available from the appropriate group and more than one IP address is configured, PAT moves to the next IP address and gets the allocation based on the user defined pool (ignoring the source port or attempting to preserve it).

With dynamic NAT and PAT, each host uses a different address or port for each subsequent translation. The main difference between dynamic NAT and static NAT is that static NAT allows a remote host to initiate a connection to a translated host if an access list exists that allows it, while dynamic NAT does not.

Guidelines and Limitations for Static and Dynamic NAT

Static NAT has the following configuration guidelines and limitations:

- NAT is supported for IPv4 Unicast only.
- If the translated IP is part of the outside interface subnet, then use the **ip proxy-arp** command on the NAT outside interface. If the **add-route** keyword is used, **ip proxy-arp** should be enabled.
- The Cisco Nexus device supports NAT on the following interface types:
 - Switch Virtual Interfaces (SVIs)
 - Physical layer 3 interfaces
 - Port channel layer 3 interfaces
- Non-TCP/ UDP packets are always software translated.
- show commands with the internal keyword are not supported.
- If an IP address is used for Static NAT or PAT translations, it cannot be used for any other purpose. For example, it cannot be assigned to an interface.
- When configuring a large number of translations (more than 100), it is faster to configure the translations before configuring the NAT interfaces.
- Twice NAT is not supported.
- Configuring NAT inside and outside rules together is not supported.
- NAT configurations such as IP NAT inside or IP NAT outside are not supported on loopback interfaces.

Restrictions for Dynamic NAT

The following restrictions apply to dynamic Network Address Translation (NAT):

- show commands with the internal keyword are not supported.
- VXLAN routing is not supported on Cisco Nexus devices.
- · Fragmented packets are not supported.
- Application layer gateway (ALG) translations are not supported. ALG, also known as application-level gateway, is an application that translates IP address information inside the payload of an application packet.
- Egress ACLs are not applied to translated packets.
- MIBs are not supported.
- Cisco Data Center Network Manager (DCNM) is not supported.
- Multiple global virtual device contexts (VDCs) are not supported on Cisco Nexus devices.
- Dynamic NAT translations are not synchronized with active and standby devices.
- Stateful NAT is not supported. However, NAT and Hot Standby Router Protocol (HSRP) can coexist.
- The timeout value for take up to the configured time-out + 119 seconds.
- For dynamic NAT, pool overload and interface overload are not supported for the outside NAT.
- The Cisco Nexus devices does not support NAT and VLAN Access Control Lists (VACLs) that are configured on an interface at the same time.
- NAT configurations such as ip nat inside or ip nat outside are not supported on loopback interfaces.

Configuring Static NAT

Enabling Static NAT

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# feature nat	Enables the static NAT feature on the device.
Step 3	switch(config)# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Configuring NAT on an Interface

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	<pre>switch(config)# interface type slot/port</pre>	Specifies an interface to configure, and enters interface configuration mode.
Step 3	<pre>switch(config-if)# ip nat {inside outside}</pre>	Specifies the interface as inside or outside. Note Only packets that arrive on a marked interface can be translated.
Step 4	(Optional) switch(config)# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Example

The following two examples show how to configure NAT from the inside:

```
switch# configure terminal
switch(config)# interface ethernet 1/4
switch(config-if)# ip nat inside
```

```
switch# configure terminal
switch(config)# interface vlan 100
switch(config-if)# ip nat inside
```

The following two examples show how to configure NAT from the outside:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# ip nat outside
```

```
switch# configure terminal
switch(config)# interface vlan 102
switch(config-if)# ip nat ouside
```

Enabling Static NAT for an Inside Source Address

For inside source translation, the source address of the packet gets translated from the inside to the outside interface. On the return traffic, the destination inside global IP address gets translated back to the inside local IP address.

Note

When the Cisco Nexus device is configured to translate an inside source IP address (Src:ip1) to an outside source IP address (newSrc:ip2), the Cisco Nexus device implicitly adds a translation for an outside destination IP address (Dst: ip2) to an inside destination IP address (newDst: ip1).

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	<pre>switch(config)# ip nat inside source static local-ip-address global-ip-address [vrf vrf-name] [match-in-vrf] [add-route][group group-id]</pre>	Configures static NAT to translate the inside local address to the inside global address or to translate the opposite (the inside global traffic to the inside local traffic).
Step 3	(Optional) switch(config)# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Example

This example shows how to configure static NAT for an inside source address:

```
switch# configure terminal
switch(config)# ip nat inside source static 1.1.1.1 5.5.5.5
switch(config)# copy running-config startup-config
```

Enabling Static NAT for an Outside Source Address

For outside source translation, the destination address gets translated from inside to outside interfaces. On the return traffic, the destination outside global IP address gets translated back to the outside local IP address.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	<pre>switch(config)# ip nat outside source static outsideGlobalIP outsideLocalIP [vrf vrf-name [match-in-vrf] [add-route]]</pre>	Configures static NAT to translate the outside global address to the outside local address or to translate the opposite (the outside local traffic to the outside global traffic). When an inside

	Command or Action	Purpose
		translation without ports is configured, an implicit add route is performed. The original add route functionality is an option while configuring an outside translation.
Step 3	(Optional) switch(config)# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Example

This example show how to configure static NAT for an outside source address:

```
switch# configure terminal
switch(config)# ip nat outside source static 2.2.2.2 6.6.6.6
switch(config)# copy running-config startup-config
```

Configuring Static PAT for an Inside Source Address

You can map services to specific inside hosts using Port Address Translation (PAT).

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	<pre>switch(config)# ip nat inside source static {inside-local-address inside-global-address {tcp udp} inside-local-address {local-tcp-port local-udp-port} inside-global-address {global-tcp-port global-udp-port}} {vrf-name {match-in-vrf} }</pre>	Maps static NAT to an inside local port to an inside global port.
Step 3	(Optional) switch(config)# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Example

This example shows how to map UDP services to a specific inside source address and UDP port:

```
switch# configure terminal
switch(config)# ip nat inside source static udp 20.1.9.2 63 35.48.35.48 130
switch(config)# copy running-config startup-config
```

Configuring Static PAT for an Outside Source Address

You can map services to specific outside hosts using Port Address Translation (PAT).

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	<pre>switch(config)# ip nat outside source static {outside-global-address outside-local-address {tcp udp} outside-global-address {global-tcp-port global-udp-port} outside-local-address {global-tcp-port global-udp-port}} {add-route} {vrf vrf-name {match-in-vrf}}</pre>	Maps static NAT to an outside global port to an outside local port.
Step 3	(Optional) switch(config)# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Example

This example shows how to map TCP services to a specific outside source address and TCP port:

```
switch# configure terminal
switch(config)# ip nat outside source static tcp 20.1.9.2 63 35.48.35.48 130
switch(config)# copy running-config startup-config
```

Enabling and Disabling no-alias Configuration

NAT devices own Inside Global (IG) and Outside Local (OL) addresses and they are responsible for responding to any ARP requests directed to these addresses. When the IG/OL address subnet matches with the local interface subnet, NAT installs an IP alias and an ARP entry, in this case the device uses local-proxy-arp to respond to ARP requests.

The *no-alias* feature responds to ARP requests of all the translated IPs from a given NAT pool address range if the address range is in same subnet of the outside interface.

If no-alias is enabled on an interface with NAT configuration, the outside interface will not respond to any ARP requests in its subnet. When no-alias is disabled, the ARP requests for IPs in same subnet as of outside interface are served.

Note

When you downgrade to any older releases that does not support this feature, configurations with *no-alias* option may be deleted.

Procedure

L

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# feature nat	Enables the static NAT feature on the device.
Step 3	switch(config)# show run nat	Displays NAT configuration.
Step 4	switch(config)# show ip nat-alias	Displays the information whether or not the alias is created. Note By default, alias is created. To disable the alias, you must append <i>no-alias</i> keyword to the command.
Step 5	switch(config)# clear ip nat-alias <i>ip address/all</i>	Removes entries from alias list. To remove a specific entry you must provide the IP address that you want to remove. To remove all entries, use the all keyword.

Example

This example shows the interface information:

```
switch# configure terminal
switch(config)# show ip int b
IP Interface Status for VRF "default"(1)
Interface IP Address Interface Status
Lo0 100.1.1.1 protocol-up/link-up/admin-up
Eth1/1 7.7.7.1 protocol-up/link-up/admin-up
Eth1/3 8.8.8.1 protocol-up/link-up/admin-up
```

This example shows the running configuration:

```
switch# configure terminal
switch(config)# show running-config nat
!Command: show running-config nat
!Running configuration last done at: Thu Aug 23 11:57:01 2018
!Time: Thu Aug 23 11:58:13 2018
version 9.2(2) Bios:version 07.64
```

```
feature nat
interface Ethernet1/1
ip nat inside
interface Ethernet1/3
ip nat outside
switch(config)#
```

This example shows how to configure alias:

```
switch# configure terminal
switch(config)# ip nat inside source static 1.1.1.2 8.8.8.3
switch(config)# ip nat outside source static 2.2.2.1 7.7.7.3
switch(config)# show ip nat-alias
Alias Information for Context: default
```

Address Interface 7.7.7.2 Ethernet1/1 8.8.8.2 Ethernet1/3 switch(config)#

This example shows the output of *show ip nat-alias*. By default, alias is enabled.

```
switch# configure terminal
switch(config)# show ip nat-alias
Alias Information for Context: default
Address Interface
7.7.7.2 Ethernet1/1
8.8.8.2 Ethernet1/3
switch(config)#
```

This example shows how to disable alias:

```
switch# configure terminal
switch(config)# ip nat inside source static 1.1.1.2 8.8.8.3 no-alias
switch(config)# ip nat outside source static 2.2.2.1 7.7.7.3 no-alias
switch(config)# show ip nat-alias
Alias Information for Context: default
Address Interface
7.7.7.2 Ethernet1/1
8.8.8.2 Ethernet1/3
switch(config)#
```

** None of the entry got appended as alias is disabled for above CLIs. switch(config)#

This example shows how to clear alias. Use *clear ip nat-alias* to remove an entry from alias list. You can remove a single entry by specifying the IP address or remove all the alias entries.

```
switch# configure terminal
switch(config)# clear ip nat-alias address 7.7.7.2
switch(config)# show ip nat-alias
Alias Information for Context: default
Address Interface
8.8.8.2 Ethernet1/3
switch(config)#
switch(config)# clear ip nat-alias all
switch(config)# show ip nat-alias
switch(config)#
```

Configuration Example for Static NAT and PAT

This example shows the configuration for static NAT:

ip nat inside source static 103.1.1.1 11.3.1.1 ip nat inside source static 139.1.1.1 11.39.1.1 ip nat inside source static 141.1.1.1 11.41.1.1 ip nat inside source static 149.1.1.1 95.1.1.1 ip nat inside source static 149.2.1.1 96.1.1.1 ip nat outside source static 95.3.1.1 95.4.1.1 ip nat outside source static 96.3.1.1 96.4.1.1 ip nat outside source static 102.1.2.1 51.1.2.1 ip nat outside source static 104.1.1.1 51.3.1.1 ip nat outside source static 140.1.1.1 51.40.1.1

This example shows the configuration for static PAT:

ip nat inside source static tcp 10.11.1.1 1 210.11.1.1 101

```
ip nat inside source static tcp 10.11.1.1 2 210.11.1.1 201
ip nat inside source static tcp 10.11.1.1 3 210.11.1.1 301
ip nat inside source static tcp 10.11.1.1 4 210.11.1.1 401
ip nat inside source static tcp 10.11.1.1 5 210.11.1.1 501
ip nat inside source static tcp 10.11.1.1 6 210.11.1.1 601
ip nat inside source static tcp 10.11.1.1 7 210.11.1.1 701
ip nat inside source static tcp 10.11.1.1 8 210.11.1.1 801
ip nat inside source static tcp 10.11.1.1 9 210.11.1.1 901
ip nat inside source static tcp 10.11.1.1 10 210.11.1.1 1001
ip nat inside source static tcp 10.11.1.1 11 210.11.1.1 1101
ip nat inside source static tcp 10.11.1.1 11 210.11.1.1 1201
```

Verifying the Static NAT Configuration

To display the static NAT configuration, perform this task:

Procedure

	Command or Action	Purpose
Step 1	switch# show ip nat translations	Shows the translations for the inside global, inside local, outside local, and outside global IP addresses.

Example

This example shows how to display the static NAT configuration:

swi	tch# sh ip nat tran	slations		
Pro	Inside global	Inside local	Outside local	Outside global
			51.3.1.1	104.1.1.1
			95.4.1.1	95.3.1.1
			96.4.1.1	96.3.1.1
			51.40.1.1	140.1.1.1
			51.42.1.1	142.1.2.1
			51.1.2.1	102.1.2.1
	11.1.1.1	101.1.1.1		
	11.3.1.1	103.1.1.1		
	11.39.1.1	139.1.1.1		
	11.41.1.1	141.1.1.1		
	95.1.1.1	149.1.1.1		
	96.1.1.1	149.2.1.1		
	130.1.1.1:590	30.1.1.100:5000		
	130.2.1.1:590	30.2.1.100:5000		
	130.3.1.1:590	30.3.1.100:5000		
	130.4.1.1:590	30.4.1.100:5000		
	130.1.1.1:591	30.1.1.101:5000		

swi	switch# sh ip nat translations verbose				
Pro	Inside global	Inside local	Outside local	Outside global

Configuring Dynamic NAT

Configuring Dynamic Translation and Translation Timeouts

Procedure

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Switch> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Switch# configure terminal		
Step 3	ip access-list access-list-name	Defines an access list and enters access-list	
	Example:	configuration mode.	
	Switch(config)# ip access-list acl1		
Step 4	permit protocol source source-wildcard any	Sets conditions in an IP access list that permi	
	Example:	traffic matching the conditions.	
	Switch(config-acl)# permit ip 10.111.11.0/24 any		
Step 5	deny protocol source source-wildcard any	Sets conditions which disallows NAT	
	Example:	translation.	
	Switch(config-acl)# deny udp 10.111.11.100/32 any		
Step 6	exit	Exits access-list configuration mode and	
	Example:	returns to global configuration mode.	
	Switch(config-acl)# exit		
Step 7	ip nat inside source list <i>access-list-name</i> interface <i>type number</i> [vrf <i>vrf-name</i> [match-in-vrf] [add-route] [overload]	Establishes dynamic source translation by specifying the access list defined in Step 3.	

	Command or Action	Purpose
	Example:	
	Switch(config)# ip nat inside source list acl1 interface ethernet 1/1 overload	
Step 8	interface type number	Configures an interface and enters interface
	Example:	configuration mode.
	Switch(config)# interface ethernet 1/4	
Step 9	ip address ip-address mask	Sets a primary IP address for the interface.
	Example:	
	Switch(config-if)# ip address 10.111.11.39 255.255.255.0	
Step 10	ip nat inside	Connects the interface to an inside network,
	Example:	which is subject to NAT.
	Switch(config-if)# ip nat inside	Note Configuration not supported on loopback interface.
Step 11	exit	Exits interface configuration mode and returns
	Example:	to global configuration mode.
	Switch(config-if)# exit	
Step 12	interface type number	Configures an interface and enters interface
	Example:	configuration mode.
	Switch(config)# interface ethernet 1/1	
Step 13	ip address ip-address mask	Sets a primary IP address for an interface.
	Example:	
	Switch(config-if)# ip address 172.16.232.182 255.255.255.240	
Step 14	ip nat outside	Connects the interface to an outside network.
	Example:	Note
	<pre>Switch(config-if)# ip nat outside</pre>	Configuration not supported on loopback interface.
Step 15	exit	Exits interface configuration mode and returns
	Example:	to global configuration mode.
	Switch(config-if)# exit	
Step 16	ip nat translation max-entries	Specifies the maximum number of dynamic
	number-of-entries	NAT translations. The number of entries can be between 1 and 1023.
	Example:	

	Command or Action	Purpose	
	Switch(config)# ip nat translation max-entries 300		
Step 17	ip nat translation timeout seconds	Specifies the timeout value for dynamic NAT translations.	
	Example:		
	<pre>switch(config)# ip nat translation timeout 13000</pre>		
Step 18	end	Exits global configuration mode and returns	
	Example:	to privileged EXEC mode.	
	Switch(config)# end		

Configuring Dynamic NAT Pool

You can create a NAT pool by either defining the range of IP addresses in a single **ip nat pool** command or by using the **ip nat pool** and **address** commands.

Procedure

	Command or Action	Purpose	
Step 1	switch# configure terminal	Enters global configuration mode.	
Step 2	switch (config)# feature nat	Enables the NAT feature on the device.	
Step 3	<pre>switch (config)# ip nat pool pool-name [startip endip] {prefix prefix-length netmask network-mask}</pre>	<i>p</i> Creates a NAT pool with a range of global II addresses. The IP addresses are filtered by usine ither a prefix length or a network mask.	
Step 4	(Optional) switch (config-ipnat-pool)# address startip endip	Specifies the range of global IP addresses if they were not specified during creation of the pool.	
Step 5	(Optional) switch (config)# no ip nat pool pool-name	Deletes the specified NAT pool.	

Example

This example shows how to create a NAT pool with a prefix length:

```
switch# configure terminal
switch(config)# ip nat pool pool1 30.1.1.1 30.1.1.2 prefix-length 24
switch(config)#
```

This example shows how to create a NAT pool with a network mask:

```
switch# configure terminal
switch(config)# ip nat pool pool5 20.1.1.1 20.1.1.5 netmask 255.255.255.0
switch(config)#
```

L

This example shows how to create a NAT pool and define the range of global IP addresses using the **ip nat pool** and **address** commands:

```
switch# configure terminal
switch(config)# ip nat pool pool7 netmask 255.255.0.0
switch(config-ipnat-pool)# address 40.1.1.1 40.1.1.5
switch(config-ipnat-pool)#
```

This example shows how to delete a NAT pool:

```
switch# configure terminal
switch(config)# no ip nat pool pool4
switch(config)#
```

Configuring Source Lists

You can configure a source list of IP addresses for the inside interface and the outside interface.

Before you begin

Ensure that you configure a pool before configuring the source list for the pool.

Procedure

	Command or Action	Purpose	
Step 1	switch# configure terminal	Enters global configuration mode.	
Step 2	(Optional) switch# ip nat inside source list <i>list-name</i> pool <i>pool-name</i> [overload]	Creates a NAT inside source list with pool wi or without overloading.	
Step 3	(Optional) switch# ip nat outside source list <i>list-name</i> pool <i>pool-name</i> [add-route]		

Example

This example shows how to create a NAT inside source list with pool without overloading:

```
switch# configure terminal
switch(config)# ip nat inside source list list1 pool pool1
switch(config)#
```

This example shows how to create a NAT inside source list with pool with overloading:

```
switch# configure terminal
switch(config)# ip nat inside source list list2 pool pool2 overload
switch(config)#
```

This example shows how to create a NAT outside source list with pool without overloading:

```
switch# configure terminal
switch(config)# ip nat outside source list list3 pool pool3
switch(config)#
```

Clearing Dynamic NAT Translations

To clear dynamic translations, perform the following task:

Command	Purpose
clear ip nat translation [all inside global-ip-address local-ip-address [outside local-ip-address global-ip-address] outside local-ip-address global-ip-address]	Deletes all or specific dynamic NAT translations.

Example

This example shows how to clear all dynamic translations:

```
switch# clear ip nat translation all
```

This example shows how to clear dynamic translations for inside and outside addresses:

switch# clear ip nat translation inside 2.2.2.2 4.4.4.4 outside 5.5.5.5 7.7.7.7

Verifying Dynamic NAT Configuration

To display dynamic NAT configuration, perform the following tasks:

Command	Purpose	
show ip nat translations	Displays active Network Address Translation (NAT) translations.	
	Displays additional information for each translation table entry, including when an entry was created and used.	
show run nat	Displays NAT configuration.	
show ip nat max	Displays active Network Address Translation (NAT) maximum values.	
show ip nat statistics	Monitor NAT statistics.	

Example

This example shows how to display IP NAT Max values:

L

switch# show ip nat max

This example shows how to display NAT Statistics:

switch# show ip nat statistics

```
IP NAT Statistics
______
Stats Collected since: Mon Feb 24 18:27:34 2020
    _____
Total active translations: 1
No.Static: 0
No.Dyn:
       1
No.Dyn-ICMP:
         1

                      0
_____
Total TCP session established: 0
Total TCP session closed: 0
_____
NAT Inside Interfaces: 1
Ethernet1/34
NAT Outside Interfaces: 1
Ethernet1/32
_____
Inside source list:
Access list: T2
RefCount: 1
Pool: T2 Overload
Total addresses: 10
```

```
Allocated: 1
      percentage: 10%
Missed: 0
Outside source list:
_____
Switch(config)#
Switch(config)#
```

**No.Dyn-ICMP field is to display the no of icmp dynamic translations , its a subset of "No.Dyn" field.

Note Beginning with Cisco NX-OS Release 10.2(3u), the No.Dyn-ICMP field is a subset of No.Dyn field and it displays the number of ICMP dynamic translations.

This example shows how to display running configuration for NAT:

```
switch# show run nat
```

```
!Command: show running-config nat
!Time: Wed Apr 23 11:17:43 2014
version 6.0(2)A3(1)
feature nat
ip nat inside source list list1 pool pool1
ip nat inside source list list2 pool pool2 overload
ip nat inside source list list7 pool pool7 overload
ip nat outside source list list3 pool pool3
ip nat pool pool1 30.1.1.1 30.1.1.2 prefix-length 24
ip nat pool pool2 10.1.1.1 10.1.1.2 netmask 255.0.255.0
ip nat pool pool3 30.1.1.1 30.1.1.8 prefix-length 24
ip nat pool pool5 20.1.1.1 20.1.1.5 netmask 255.0.255.0
ip nat pool pool7 netmask 255.255.0.0
  address 40.1.1.1 40.1.1.5
```

This example shows how to display active NAT translations:

Inside pool with overload

switch# show ip nat translation

Pro	Inside global	Inside local	Outside local	Outside global
icmp	20.1.1.3:64762	10.1.1.2:133	20.1.1.1:0	20.1.1.1:0
icmp	20.1.1.3:64763	10.1.1.2:134	20.1.1.1:0	20.1.1.1:0

Outside pool without overload .

switch# show ip nat translation				
Pro	Inside global	Inside local	Outside local	Outside global
any			177.7.1.1:0	77.7.1.64:0
any			40.146.1.1:0	40.46.1.64:0
any			10.4.146.1:0	10.4.46.64:0

L

Example: Configuring Dynamic Translation and Translation Timeouts

The following example shows how to configure dynamic overload Network Address Translation (NAT) by specifying an access list:

```
Switch> enable
Switch# configure terminal
Switch(config) # ip access-list acl1
Switch(config-acl) # permit ip 10.111.11.0/24 any
Switch(config-acl) # deny udp 10.111.11.100/32 any
Switch(config-acl)# exit
Switch (config) # ip nat inside source list acl1 interface ethernet 1/1 overload
Switch(config) # interface ethernet 1/4
Switch(config-if)# ip address 10.111.11.39 255.255.255.0
Switch(config-if) # ip nat inside
Switch(config-if)# exit
Switch(config)# interface ethernet 1/1
Switch(config-if) # ip address 172.16.232.182 255.255.255.240
Switch(config-if) # ip nat outside
Switch(config-if)# exit
Switch(config) # ip nat translation max-entries 300
Switch(config) # ip nat translation timeout 13000
Switch(config) # end
```
