

PPP IP Unique Address and Prefix Detection

The PPP IP Unique Address and Prefix Detection feature checks the uniqueness of IPv4 addresses and IPv6 prefixes on the broadband remote access server (BRAS). PPP disconnects the session if it detects a duplicate IPv4 address and IPv6 prefix.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see **Bug Search Tool** and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About PPP IP Unique Address and Prefix Detection

- IPv6 checks if the prefix is unique when it is installed on an interface. If the prefix installation fails, PPP disconnects the session.
- PPP also checks if the IPv4 address is unique. PPP disconnects the session if a duplicate IPv4 address is detected.

How to Configure PPP IP Unique Address and Prefix Detection

Perform this task to configure the PPP IP Unique Address and Prefix Detection feature.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. interface virtual-template interface-number
- 4. ppp ipcp address required
- 5. ppp ipcp address unique
- 6. ppp ipv6cp address unique
- 7. ppp timeout ncp seconds
- 8. exit
- 9. ppp ncp override local
- 10. end

DETAILED STEPS

| | Command or Action | Purpose |
|--------|---|---|
| Step 1 | enable | Enables privileged EXEC mode. |
| | Example: | • Enter your password if prompted. |
| | Router> enable | |
| Step 2 | configure terminal | Enters global configuration mode. |
| | Example: | |
| | Router# configure terminal | |
| Step 3 | interface virtual-template interface-number | Selects the Virtual Template interface and enters interface configuration mode. |
| | Example: | |
| | Router(config)# interface virtual-template 7 | |
| Step 4 | ppp ipcp address required | PPP disconnects the peer if no IP address is negotiated. |
| | Example: | |
| | Router(config-if) # ppp ipcp address required | |

| | Command or Action | Purpose |
|---------|--|--|
| Step 5 | ppp ipcp address unique | PPP disconnects the peer if the IP address is already in use. |
| | Example: | |
| | Router(config-if)# ppp ipcp address unique | |
| Step 6 | ppp ipv6cp address unique | PPP disconnects the peer if the IPv6 prefix is already in use. |
| | Example: | |
| | Router(config-if)# ppp ipv6cp address unique | |
| Step 7 | ppp timeout ncp seconds | PPP sets the maximum time in seconds to wait for the network layer to negotiate. |
| | Example: | |
| | Router(config-if) # ppp timeout ncp 30 | |
| Step 8 | exit | Exits interface configuration mode and returns to global configuration mode. |
| | Example: | |
| | Router(config-if)# exit | |
| Step 9 | ppp ncp override local | PPP overrides the local dual-stack configuration, checks the permitted Network Control Programs (NCP), and rejects |
| | Example: | user-initiated NCP negotiation. |
| | Router(config)# ppp ncp override local | |
| Step 10 | end | Exits global configuration mode and returns to privileged EXEC mode. |
| | Example: | |
| | Router(config)# end | |
| | | |

Configuration Examples for PPP IP Unique Address and Prefix Detection

Example PPP Unique Address and Prefix Detection

I

To enable the PPP IP Unique Address nd Prefix Detection feature, use the following configuration.

```
Router# configure terminal
Router(config)# interface virtual-template 7
```

1

Router(config-if)# ppp ipcp address required
Router(config-if)# ppp ipcp address unique
Router(config-if)# ppp ipv6cp address unique
Router(config-if)# ppp timeout ncp 30
Router(config-if)# exit
Router(config)# ppp ncp override local
Router(config)# end

Feature Information for PPP IP Unique Address and Prefix Detection

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

| Feature Name | Releases | Feature Information |
|---|---------------------------|---|
| PPP IP Unique Address and Prefix Detection | Cisco IOS XE Release 3.2S | The PPP IP Unique Address and Prefix Detection feature checks the uniqueness of IPv4 address and IPv6 prefix on the BRAS. PPP disconnects the session if it detects a duplicate IPv4 address and IPv6 prefix. |
| | | The following commands were introduced: ppp ipv6cp address unique , ppp ncp override local . |
