

Bidirectional Forwarding Detection

This document describes how to enable the Bidirectional Forwarding Detection (BFD) protocol. BFD is a detection protocol that is designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. It includes a description of how to configure multihop BFD sessions.

BFD provides a consistent failure detection method for network administrators, in addition to fast forwarding path failure detection. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol hello mechanisms, network profiling and planning will be easier, and reconvergence time will be consistent and predictable.

Note BFD packets carries precedence of 7, and get prioritized by default. If you are applying any policy-map to change the priority for precedence 7, then BFD packets will also get subjected for the change. Avoid BFD packets drops due to queue congestion.

- [Prerequisites for Bidirectional Forwarding Detection, on page 1](#)
- [Restrictions for Bidirectional Forwarding Detection, on page 1](#)
- [Information About Bidirectional Forwarding Detection, on page 2](#)
- [How to Configure Bidirectional Forwarding Detection, on page 9](#)
- [Configuration Examples for Bidirectional Forwarding Detection, on page 22](#)
- [Micro BFD, on page 36](#)

Prerequisites for Bidirectional Forwarding Detection

- Cisco Express Forwarding and IP routing must be enabled on all participating routers

Restrictions for Bidirectional Forwarding Detection

- BFD dampening feature is not supported on the Cisco ASR 900 Series Routers .
- Minimum value supported on **bfd interval** command is 50ms.
- BFD templates must be used to configure 3.3ms BFD. For more information, see [Creating and Configuring BFD Templates, on page 19](#).

- For BFD over IPv6 hardware offload and software based sessions, only async mode is supported on the RSP3 module. Echo mode is not supported.
- Starting with Cisco IOS XE Release 3.18SP, BFD over port-channel (PoCH) is supported on the RSP3 module in software offload mode only. The minimum timer value supported is 200 milliseconds.
- BFD for MPLS-TP is not supported on the RSP3 module in Cisco IOS XE Release 3.16.
- BFD Echo Mode is not supported on the RSP3 module in Cisco IOS XE Release 3.16.
Starting with Cisco IOS XE Fuji Release 16.9.1, BFD Echo mode is supported in the RSP3 module.
- Moving from echo to non-echo and non-echo to echo multiple times without any delay between each iteration may cause a few BFD sessions to flap. So multiple times echo to non-echo/non-echo to echo transition is not recommended and if this scenario is required then it should be done with a delay of at least 20 seconds at each step.
- The loopback packets are not prioritized for BFD echo sessions. Apply QoS policy to increase the priority of the packets.
- BFD packets for both, echo and non-echo sessions are not subjected to the Egress QoS. These packets are sent in the high-priority queue. This is applicable only on the Cisco ASR900 RSP1 and RSP2 modules.
- BFD with authentication is supported only in software. Hardware offload is not supported for BFD with authentication.
- The minimum timer value supported for the BFD software session is 200 ms.
- BFD over IPv4 unicast GRE tunnel is not supported.

Information About Bidirectional Forwarding Detection

BFD Operation

BFD provides a low-overhead, short-duration method of detecting failures in the forwarding path between two adjacent routers, including the interfaces, data links, and forwarding planes.

BFD is a detection protocol that is enabled at the interface and protocol levels. Cisco supports BFD asynchronous mode, which depends on the sending of BFD control packets between two systems to activate and maintain BFD neighbor sessions between routers. Therefore, in order for a BFD session to be created, BFD must be configured on both systems (or BFD peers). Once BFD has been enabled on the interfaces and at the router level for the appropriate protocols (NHRP and the routing protocol on overlay), a BFD session is created, BFD timers are negotiated, and the BFD peers will begin to send BFD control packets to each other at the negotiated interval.

Neighbor Relationships

BFD provides fast BFD peer failure detection times independently of all media types, encapsulations, topologies, and routing protocols BGP, EIGRP, IS-IS, and OSPF. By sending rapid failure detection notices to the routing protocols in the local router to initiate the routing table recalculation process, BFD contributes to greatly reduced overall network convergence time. The figure below shows a simple network with two routers running OSPF and BFD. When OSPF discovers a neighbor (1) it sends a request to the local BFD process to initiate

a BFD neighbor session with the OSPF neighbor router (2). The BFD neighbor session with the OSPF neighbor router is established (3).

The figure below shows what happens when a failure occurs in the network (1). The BFD neighbor session with the OSPF neighbor router is torn down (2). BFD notifies the local OSPF process that the BFD neighbor is no longer reachable (3). The local OSPF process tears down the OSPF neighbor relationship (4). If an alternative path is available, the routers will immediately start converging on it.

A routing protocol needs to register with BFD for every neighbor it acquires. Once a neighbor is registered, BFD initiates a session with the neighbor if a session does not already exist.

OSPF registers with BFD when:

- A neighbor finite state machine (FSM) transitions to full state.
- Both OSPF BFD and BFD are enabled.

On broadcast interfaces, OSPF establishes a BFD session only with the designated router (DR) and backup designated router (BDR), but not between any two routers in DROTHER state.

Note A single BFD session notifies all protocols. For example, if OSPF and PIM neighbors exist, then a single BFD session notifies both the protocols.

BFD Detection of Failures

Once a BFD session has been established and timer negotiations are complete, BFD peers send BFD control packets that act in the same manner as an IGP hello protocol to detect liveness, except at a more accelerated rate. The following information should be noted:

- BFD is a forwarding path failure detection protocol. BFD detects a failure, but the routing protocol must take action to bypass a failed peer.
- Cisco devices will use one BFD session for multiple client protocols in the Cisco implementation of BFD for Cisco IOS Releases 12.2(18)SX, 12.0(31)S, and 12.4(4)T. For example, if a network is running OSPF and EIGRP across the same link to the same peer, only one BFD session will be established, and BFD will share session information with both routing protocols.

BFD Version Interoperability

Cisco IOS Release 12.2EY and Cisco IOS Release 15.S support BFD Version 1 and BFD Version 0.

All BFD sessions come up as Version 1 by default and will be interoperable with Version 0. The system automatically performs BFD version detection, and BFD sessions between neighbors will run in the highest common BFD version between neighbors. For example, if one BFD neighbor is running BFD Version 0 and the other BFD neighbor is running Version 1, the session will run BFD Version 0. The output from the **show bfd neighbors [details]** command will verify which BFD version a BFD neighbor is running.

Note RSP3 supports only Version 1 and do not support BFD version interoperability.

See the Example Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default for an example of BFD version detection.

BFD Process on the RP

Client Interaction

The BFD process on the RP will handle the interaction with clients, which create and delete BFD sessions.

Session Management for the BFD Process on the RP

The BFD RP process will primarily own all BFD sessions on the router. It will pass the session creation and deletion requests to the BFD processes on all LCs. BFD LC sessions will have no knowledge of sessions being added or deleted by the clients. Only the BFD RP process will send session addition and deletion commands to the BFD LC process.

Session Database Management

The BFD RP process will maintain a database of all the BFD sessions on the router. This database will contain only the minimum required information.

Process EXEC Commands

The BFD RP process services the BFD **show** commands.

BFD Support for Nonstop Forwarding with Stateful Switchover

Typically, when a networking device restarts, all routing peers of that device detect that the device went down and then came back up. This transition results in a routing flap, which could spread across multiple routing domains. Routing flaps caused by routing restarts create routing instabilities, which are detrimental to the overall network performance. Nonstop forwarding (NSF) helps to suppress routing flaps in devices that are enabled with stateful switchover (SSO), thereby reducing network instability.

NSF allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored after a switchover. With NSF, peer networking devices do not experience routing flaps. Data traffic is forwarded through intelligent line cards or dual forwarding processors while the standby RP assumes control from the failed active RP during a switchover. The ability of line cards and forwarding processors to remain up through a switchover and to be kept current with the Forwarding Information Base (FIB) on the active RP is key to NSF operation.

In devices that support dual RPs, SSO establishes one of the RPs as the active processor; the other RP is designated as the standby processor, and then synchronizes information between them. A switchover from the active to the standby processor occurs when the active RP fails, when it is removed from the networking device, or when it is manually taken down for maintenance.

BFD Support for Stateful Switchover

The BFD protocol provides short-duration detection of failures in the path between adjacent forwarding engines. In network deployments that use dual RP routers or switches (to provide redundancy), the routers have a graceful restart mechanism that protects the forwarding state during a switchover between the active RP and the standby RP.

The dual RPs have variable switchover times that depend on the ability of the hardware to detect a communication failure. When BFD is running on the RP, some platforms are not able to detect a switchover before the BFD protocol times out; these platforms are referred to as slow switchover platforms.

Stateful BFD on the Standby RP

To ensure a successful switchover to the standby RP, the BFD protocol uses checkpoint messages to send session information from the active RP Cisco IOS instance to the standby RP Cisco IOS instance. The session information includes local and remote discriminators, adjacent router timer information, BFD setup information, and session-specific information such as the type of session and the session version. In addition, the BFD protocol sends session creation and deletion checkpoint messages to create or delete a session on the standby RP.

The BFD sessions on the standby RP do not receive or send packets and do not process expired timers. These sessions wait for a switchover to occur and then send packets for any active sessions so that sessions do not time out on adjacent routers.

When the BFD protocol on the standby RP is notified of a switchover it changes its state to active, registers itself with Cisco Express Forwarding so that it can receive packets, and then sends packets for any elements that have expired.

BFD also uses checkpoint messages to ensure that sessions created by clients on the active RP are maintained during a switchover. When a switchover occurs, BFD starts an SSO reclaim timer. Clients must reclaim their sessions within the duration specified by the reclaim timer or else the session is deleted.

BFD Timer Values

Table 1: BFD Timer Values on Cisco A900-RSP1A-55, Cisco A900-RSP1B-55

Maximum Number of BFD Sessions	Chassis Type	BFD Session Type	Minimum Timer Value (ms) ¹	Clients	Comments
511	RSP1	Async	3.3	BGP, OSFP, ISIS, EIGRP, MPLS-TP	NA
255	RSP1	Echo	3.3	BGP, OSFP, ISIS, EIGRP,	NA

¹ For Port-Channel, the minimum timer value is 750 multiplier 3.

Table 2: BFD Timer Values on Cisco A900-RSP2A-128, A900-RSP2A-64

Maximum Number of BFD Sessions	Chassis Type	BFD Session Type	Minimum Timer Value (ms) ²	Clients	Comments
1023	RSP2	Async	3.3	BGP, OSFP, ISIS, EIGRP, MPLS-TP	NA
1023	RSP2	Echo	3.3	BGP, OSFP, ISIS, EIGRP,	NA

² For Port-Channel, the minimum timer value is 750 multiplier 3.

Table 3: BFD Timer Values on Cisco RSP3C-400-S

Maximum Number of BFD Sessions	Chassis Type	BFD Session Type	Minimum Timer Value (ms) ³	Clients	Comments
1023 (IPv4) 64 (IPv6)	RSP3	Async	3.3	BGP, OSFP, ISIS, EIGRP	NA
64 (Software)	RSP3	Async	200	BGP, OSFP, ISIS, EIGRP	NA
511 (Hardware) (no client) 64 (Software)	RSP3	BFD echo	3.3	NA	NA
255 (Hardware) Scale 64 (Software)	RSP3	BFD echo	3.3	BGP, OSFP, ISIS, EIGRP	NA

³ Port Channel is supported on RSP3 module in software. Minimum timer value for BFD over Port Channel is 200 ms. Hardware offload is not supported.

Note On Cisco RSP3C-400-S, software BFD sessions may be impacted by CPU spikes.

Note When BFD over IPv6 is configured, the maximum scale of BFD over IPv4 reduces to 64.

Note Whenever BFD discriminators are exhausted an error message “BFD discriminators exhausted. No more sessions can be created” with traceback will be printed.

Note Effective from the Cisco IOS XE Fuji 16.9.x onwards, Port-channel BFD (Micro-BFD as per RFC7130) on RSP3 is supported in both hardware offloaded and software offloaded.

Hardware offloaded session timers are supported from **3.3 ms to 200 ms** and software offloaded session timers are from **200 ms to 999 ms**.

BFD Support for Static Routing

Unlike dynamic routing protocols, such as OSPF and BGP, static routing has no method of peer discovery. Therefore, when BFD is configured, the reachability of the gateway is completely dependent on the state of the BFD session to the specified neighbor. Unless the BFD session is up, the gateway for the static route is considered unreachable, and therefore the affected routes will not be installed in the appropriate Routing Information Base (RIB).

For a BFD session to be successfully established, BFD must be configured on the interface on the peer and there must be a BFD client registered on the peer for the address of the BFD neighbor. When an interface is used by dynamic routing protocols, the latter requirement is usually met by configuring the routing protocol instances on each neighbor for BFD. When an interface is used exclusively for static routing, this requirement must be met by configuring static routes on the peers.

If a BFD configuration is removed from the remote peer while the BFD session is in the up state, the updated state of the BFD session is not signaled to IPv4 static. This will cause the static route to remain in the RIB. The only workaround is to remove the IPv4 static BFD neighbor configuration so that the static route no longer tracks BFD session state. Also, if you change the encapsulation type on a serial interface to one that is unsupported by BFD, BFD will be in a down state on that interface. The workaround is to shut down the interface, change to a supported encapsulation type, and then reconfigure BFD.

A single BFD session can be used by an IPv4 static client to track the reachability of next hops through a specific interface. You can assign a BFD group for a set of BFD-tracked static routes. Each group must have one active static BFD configuration, one or more passive BFD configurations, and the corresponding static routes to be BFD-tracked. Nongroup entries are BFD-tracked static routes for which a BFD group is not assigned. A BFD group must accommodate static BFD configurations that can be part of different VRFs. Effectively, the passive static BFD configurations need not be in the same VRF as that of the active configuration.

For each BFD group, there can be only one active static BFD session. You can configure the active BFD session by adding a static BFD configuration and a corresponding static route that uses the BFD configuration. The BFD session in a group is created only when there is an active static BFD configuration and the static route that uses the static BFD configuration. When the active static BFD configuration or the active static route is removed from a BFD group, all the passive static routes are withdrawn from the RIB. Effectively, all the passive static routes are inactive until an active static BFD configuration and a static route to be tracked by the active BFD session are configured in the group.

Similarly, for each BFD group, there can be one or more passive static BFD configurations and their corresponding static routes to be BFD-tracked. Passive static session routes take effect only when the active BFD session state is reachable. Though the active BFD session state of the group is reachable, the passive static route is added to the RIB only if the corresponding interface state is up. When a passive BFD session is removed from a group, it will not affect the active BFD session if one existed, or the BFD group reachability status.

BFD on Multiple Hops

Cisco IOS Release 15.1(3)S and later releases support BFD on arbitrary paths, which might span multiple network hops. The BFD Multihop feature provides subsecond forwarding failure detection for a destination more than one hop, and up to 255 hops, away.

A BFD multihop session is set up between a unique source-destination address pair provided by the client. A session can be set up between two endpoints that have IP connectivity.

You must configure the **bfd-template** and **bfd map** commands to create a multihop template and associate it with one or more maps of destinations and associated BFD timers. You can enable authentication and configure a key chain for BFD multihop sessions.

Multi-hop BFD over IPv6 is supported in software mode only.

BFD over Routed Pseudowire

Starting Cisco IOS XE Gibraltar Release 16.11.1, BFD over Routed Pseudowire is supported on the router.

Routed VPLS is the ability to route or bridge frames to and from the pseudowire. Routed VPLS is configured by assigning the IP address under a bridge domain interface (BDI), in addition to the configuring the **vfi** command. Multi-Point (VPLS) is supported.

Both the virtual forwarding interface (VFI) and the IP address is configured under the BDI. This configuration makes the BDI multi-functional and unique to other previously possible interfaces.

Following configurations are supported on the BDI:

- MPLS configuration
- LDP configuration

Routed pseudowire supports Layer3 routing in addition to Layer2 bridging of frames to, and from the pseudowire.

Restrictions for Routed Pseudowire on the RSP3 Module

- Routed pseudowire does not support IPv6 BFD sessions.
- Routed pseudowire does not support point to multipoint sessions.
- Ensure that the minimum timer configuration is greater than the convergence time of the core network to avoid unnecessary flaps. For example, if the core network convergence time is 50 ms, BFD timer that is configured must be 50 ms *3.

Caution A session flap may be seen while moving from explicit null to implicit null configuration or vice versa.

Benefits of Using BFD for Failure Detection

When you deploy any feature, it is important to consider all the alternatives and be aware of any trade-offs being made.

The closest alternative to BFD in conventional EIGRP, IS-IS, and OSPF deployments is the use of modified failure detection mechanisms for EIGRP, IS-IS, and OSPF routing protocols.

If you set EIGRP hello and hold timers to their absolute minimums, the failure detection rate for EIGRP falls to within a one- to two-second range.

If you use fast hellos for either IS-IS or OSPF, these Interior Gateway Protocol (IGP) protocols reduce their failure detection mechanisms to a minimum of one second.

There are several advantages to implementing BFD over reduced timer mechanisms for routing protocols:

- BFD on the CPU operates under interrupt like CEF switched traffic. EIGRP, IS-IS and OSPF protocol hellos are handled in the process switching path. This provides BFD greater scalability and reliability over protocol hellos.
- Although reducing the EIGRP, IS-IS, and OSPF timers can result in minimum detection timer of one to two seconds, BFD can provide failure detection in less than one second.
- Because BFD is not tied to any particular routing protocol, it can be used as a generic and consistent failure detection mechanism for EIGRP, IS-IS, and OSPF.
- Because some parts of BFD can be distributed to the data plane, it can be less CPU-intensive than the reduced EIGRP, IS-IS, and OSPF timers, which exist wholly at the control plane.

How to Configure Bidirectional Forwarding Detection

Configuring BFD Session Parameters on the Interface

The steps in this procedure show how to configure BFD on the interface by setting the baseline BFD session parameters on an interface. Repeat the steps in this procedure for each interface over which you want to run BFD sessions to BFD neighbors.

**Note**

RSP3 Module supports only the following BFD interval timers:

3.3ms, 6.6ms, 10ms, 20ms, 50ms, 100ms, 200ms, 999ms. It is recommended that peer should also configure the same timer values.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **bfd-template single-hop** *template-name*
4. **interval min-tx** *milliseconds* **min-rx** *milliseconds* **multiplier** *multiplier-value*
5. **interface gigabitethernet** *number*
6. Perform one of the following steps:
 - **ip address** *ipv4-address mask*
 - **ipv6 address** *ipv6-address/mask*
7. **bfd template** *template name*

8. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	bfd-template single-hop <i>template-name</i> Example: Router(config)# bfd-template single-hop bfdtemplate1	Creates a single-hop BFD template and enters BFD configuration mode.
Step 4	interval min-tx <i>milliseconds</i> min-rx <i>milliseconds</i> multiplier <i>multiplier-value</i> Example: Router(bfd-config)# interval min-tx 120 min-rx 100 multiplier 3	Configures the transmit and receive intervals between BFD packets, and specifies the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.
Step 5	interface gigabitethernet <i>number</i> Example: Device(config)# interface gigabitethernet 0/0/0	Specifies the Gigabit Ethernet interface and enters interface configuration mode.
Step 6	Perform one of the following steps: • ip address <i>ipv4-address mask</i> • ipv6 address <i>ipv6-address/mask</i> Example: Configuring an IPv4 address for the interface: Device(config-if)# ip address 10.201.201.1 255.255.255.0 Configuring an IPv6 address for the interface: Device(config-if)# ipv6 address 2001:db8:1:1::1/32	Configures an IP address for the interface.
Step 7	bfd template <i>template name</i>	Enables the BFD template.

	Command or Action	Purpose
Step 8	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring BFD Support for Static Routing

Perform this task to configure BFD support for static routing. Repeat the steps in this procedure on each BFD neighbor. For more information, see the "Example: Configuring BFD Support for Static Routing" section.

SUMMARY STEPS

- enable**
- configure terminal**
- bfd-template single-hop** *template-name*
- interval min-tx** *milliseconds* **min-rx** *milliseconds* **multiplier** *multiplier-value*
- interface** *type number*
- Perform one of the following steps:
 - ip address** *ipv4-address mask*
 - ipv6 address** *ipv6-address/mask*
- bfd template** *template name*
- exit**
- Perform one of the following steps:
 - ip route static bfd** *interface-type interface-number ip-address* [**group** *group-name* [**passive**]]
 - ipv6 route static bfd** *interface-type interface-number ip-address* [**unaassociated**]
- Perform one of the following steps:
 - ip route** [**vrf** *vrf-name*] *prefix mask* {*ip-address* | *interface-type interface-number* [*ip-address*]} [**dhcp**] [*distance*] [**name** *next-hop-name*] [**permanent** | **track** *number*] [**tag** *tag*]
 - ipv6 route** [**vrf** *vrf-name*] *ipv6 prefix/mask* {*ipv6-address* | *interface-type interface-number* [*ipv6-address*]} [**name** *next-hop-name*] [**track** *number*] [**tag** *tag*]
- exit**
- Perform one of the following steps:
 - show ip static route**
 - show ipv6 static**
- Perform one of the following steps:
 - show ip static route bfd**
 - show ipv6 static bfd**
- exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	bfd-template single-hop <i>template-name</i> Example: Router(config)# bfd-template single-hop bfdtemplate1	Creates a single-hop BFD template and enters BFD configuration mode.
Step 4	interval <i>min-tx milliseconds</i> <i>min-rx milliseconds</i> multiplier <i>multiplier-value</i> Example: Router(bfd-config)# interval min-tx 120 min-rx 100 multiplier 3	Configures the transmit and receive intervals between BFD packets, and specifies the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.
Step 5	interface <i>type number</i> Example: Device(config)# interface serial 2/0	Configures an interface and enters interface configuration mode.
Step 6	Perform one of the following steps: <ul style="list-style-type: none"> • ip address <i>ipv4-address mask</i> • ipv6 address <i>ipv6-address/mask</i> Example: Configuring an IPv4 address for the interface: Device(config-if)# ip address 10.201.201.1 255.255.255.0 Configuring an IPv6 address for the interface: Device(config-if)# ipv6 address 2001:db8:1:1::1/32	Configures an IP address for the interface.
Step 7	bfd template <i>template name</i>	Enables the BFD template.
Step 8	exit Example:	Exits interface configuration mode and returns to global configuration mode.

	Command or Action	Purpose
	Device(config-if)# exit	
Step 9	Perform one of the following steps: <ul style="list-style-type: none"> • ip route static bfd <i>interface-type interface-number ip-address</i> [group <i>group-name</i>] [passive] • ipv6 route static bfd <i>interface-type interface-number ip-address</i> [unaasosiated] Example: Device(config)# ip route static bfd serial 2/0 10.1.1.1 group group1 passive Device(config)# ipv6 route static bfd TenGigabitEthernet 0/0/7 19:1:1::2	Specifies a static route BFD neighbor. <ul style="list-style-type: none"> • The <i>interface-type</i>, <i>interface-number</i>, and <i>ip-address</i> arguments are required because BFD support exists only for directly connected neighbors.
Step 10	Perform one of the following steps: <ul style="list-style-type: none"> • ip route [vrf <i>vrf-name</i>] <i>prefix mask {ip-address interface-type interface-number [ip-address]}</i> [dhcp] [<i>distance</i>] [name <i>next-hop-name</i>] [permanent track <i>number</i>] [tag <i>tag</i>] • ipv6 route [vrf <i>vrf-name</i>] <i>ipv6 prefix/mask {ipv6-address interface-type interface-number [ipv6-address]}</i> [name <i>next-hop-name</i>] [track <i>number</i>] [tag <i>tag</i>] Example: Device(config)# ip route 10.0.0.0 255.0.0.0 Device(config)# ipv6 route 19:1:1::/64 TenGigabitEthernet0/0/7 19:1:1::2	Specifies a static route BFD neighbor.
Step 11	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.
Step 12	Perform one of the following steps: <ul style="list-style-type: none"> • show ip static route • show ipv6 static Example: Device# show ip static route Device# show ipv6 static route	(Optional) Displays static route database information.

	Command or Action	Purpose
Step 13	Perform one of the following steps: <ul style="list-style-type: none"> • show ip static route bfd • show ipv6 static bfd Example: <pre>Device# show ip static route bfd Device# show ipv6 static route bfd</pre>	(Optional) Displays information about the static BFD configuration from the configured BFD groups and nongroup entries.
Step 14	exit Example: <pre>Device# exit</pre>	Exits privileged EXEC mode and returns to user EXEC mode.

Configuring BFD Echo Mode

BFD echo mode is enabled by default, but you can disable it such that it can run independently in each direction.

BFD echo mode works with asynchronous BFD. Echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection--the BFD session at the other end does not participate in the actual forwarding of the echo packets. The echo function and the forwarding engine are responsible for the detection process; therefore, the number of BFD control packets that are sent out between two BFD neighbors is reduced. In addition, because the forwarding engine is testing the forwarding path on the remote (neighbor) system without involving the remote system, there is an opportunity to improve the interpacket delay variance, thereby achieving quicker failure detection times than when using BFD Version 0 with BFD control packets for the BFD session.

Echo mode is described as without asymmetry when it is running on both sides (both BFD neighbors are running echo mode).

BFD Slow Timer

BFD can use the slow timer to slow down the asynchronous session when the echo mode is enabled, and reduce the number of BFD control packets that are sent between two BFD neighbors. Also, the forwarding engine tests the forwarding path on the remote (neighbor) system without involving the remote system, so there is less interpacket delay variability and faster failure detection times.

Prerequisites

BFD must be running on all participating routers.

Before using BFD echo mode, you must disable the sending of Internet Control Message Protocol (ICMP) redirect messages by entering the **no ip icmp redirects** command, in order to avoid high CPU utilization.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the Configuring BFD Session Parameters on the Interface section for more information.

Restrictions

- BFD echo mode is supported only on single hop. Multi-hop is not supported.
- BFD Echo mode is not supported on the RSP3 module in releases before Cisco IOS Fuji Release 16.9.1. The below restrictions apply if you bring up an echo BFD session. The following error message is displayed:

BFD template model:

```
Please remove bfd template <template name> from the
interface
add no echo to template
reapply bfd template <template name> on interface
```

BFD legacy configuration:

```
removal bfd interval <value> min_rx <value> multiplier
<value> or no bfd interval will also suffice
Now remove the bfd client configurations also i.e
Ex the client is ospf remove bfd all-interfaces under
ospf
Apply the  bfd interval <value> min_rx <value>
multiplier <value>
add no bfd echo
add back the bfd client configuration
```

If you configure BFD in non-echo mode and then move to echo RSP3, following error message is displayed:

```
"Echo Mode for ld = 0x%x not supported on RSP3\n"
  "add no echo to template name if configured via template\n"
  "or add no bfd echo to interface if configured\n"
  "via legacy(i.e bfd interval on the interface)
```

- All BFD sessions use a single timer value for the echo interval.
- BFD echo is supported onl on IPv4.
- Minimum Timer value supported in 3.3ms.
- BFD interval timer (Tx) values supported are (in ms) are 3.3, 6.6, 9.9, 20, 100, 200.
- Maximum number of BFD echo sessions supported is 511, however the recommended scale per client is 255 (for example, 255 OSPF and 255 ISIS).
- The BFD Clients supported are static route, OSPF/OSPFv3, BGP, EIGRP, ISIS, and HSRP.
- When the session is in the UP state, use the **shutdown** and the **no shutdown** command on both sides to move BFD session from non echo mode to echo mode or vice versa.

Configuring the BFD Slow Timer

The steps in this procedure show how to change the value of the BFD slow timer. Repeat the steps in this procedure for each BFD router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **bfd slow-timer** *milliseconds*
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 3	bfd slow-timer <i>milliseconds</i> Example: Switch(config)# bfd slow-timer 12000	Configures the BFD slow timer.
Step 4	end Example: Switch(config)# end	Exits global configuration mode and returns the router to privileged EXEC mode.

Disabling BFD Echo Mode Without Asymmetry

The steps in this procedure show how to disable BFD echo mode without asymmetry—no echo packets will be sent by the router, and the router will not forward BFD echo packets that are received from any neighbor routers.

Repeat the steps in this procedure for each BFD router.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no bfd echo**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	no bfd echo Example: Router(config)# no bfd echo	Disables BFD echo mode. • Use the no form to disable BFD echo mode. This command is not applicable for Cisco RSP3 module.
Step 4	end Example: Router(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

Configuring BFD on Routed Pseudowire on the RSP3 Module

Topology and Configuration

The Core consists of the PE1 and PE2 nodes where PE1 is the Routed pseudowire, and the CE node is the customer Layer3 interface. The BFD session is configured between the PE1 and CE node. VPLS is configured between PE1 and PE2.

Note The BFD session can also be configured between the two PE nodes.

Configuration on the PE1 node

```

VPLS Configuration:
    ethernet evc EVC10
interface TenGigabitEthernet0/3/0
    service instance 10 ethernet EVC10
    encapsulation dot1q 10
    rewrite ingress tag pop 1 symmetric
    bridge-domain 10
        12 vfi VPLS10 manual EVC10
        vpn id 10

    neighbor 192.168.10.1 encapsulation mpls
  
```

```

ROUTED PSEUDOWIRE configuration:
interface BDI10
    ip address 192.0.2.1 255.255.255.0
    ip ospf 4 area 0
    bfd template BFD_HW-50ms
  
```

```
BFD TEMPLATE Configuration:
  router ospf 4
    bfd all-interfaces
  bfd-template single-hop BFD_HW-50ms
    interval min-tx 50 min-rx 50 multiplier 3
```

Configuration on the PE2 node

```
VPLS Configuration:
  l2 vfi VPLS10 manual EVC10
    vpn id 10
    bridge-domain 10
    neighbor 192.168.10.11 encapsulation mpls

ACCESS INTERFACE Configuration:
  interface te0/0/0
    service instance 10 ethernet
    encapsulation dot1q 10
    rewrite ingress tag pop 1 symmetric
    bridge-domain 10
```

Configuration on the CE node

```
INTERFACE Configuration connected to PE2:
  interface te0/02/0
    service instance 10 ethernet
    encapsulation dot1q 10
    rewrite ingress tag pop 1 symmetric
    bridge-domain 10

BDI Configuration:
  interface BDI10
    ip address 192.0.2.2 255.255.255.0
    ip ospf 12 area 0
    bfd template BFD_HW-50ms

BFD Template Configuration:
  bfd-template single-hop BFD_HW-50ms
    interval min-tx 50 min-rx 50 multiplier 3
  router ospf 12
    bfd all-interfaces
```

Verifying BFD on Routed Pseudowire

Use the **show bfd neighbors** command to verify the BFD over routed pseudowire configuration.

```
Router# show bfd neighbors details
```

```
IPv4 Sessions
NeighAddr LD/RD RH/RS State Int
192.0.2.1 1/1 Up Up BD10
Session state is UP and not using echo function.

```

Creating and Configuring BFD Templates

You can configure a single-hop template to specify a set of BFD interval values. BFD interval values specified as part of the BFD template are not specific to a single interface. You can configure a multihop template to associate these values with one or more maps of destinations and associated BFD timers. You can enable authentication and configure a key chain for BFD multihop sessions.

Note ASR 900 RSP3 Module for Cisco IOS XE Release 3.16 supports only the following BFD interval timers: 3.3ms, 6.6ms, 10ms, 20ms, 50ms, 100ms, 200ms ,999ms.

Configuring a Single-Hop Template

Perform this task to create a BFD single-hop template and configure BFD interval timers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **bfd-template single-hop** *template-name*
4. **interval min-tx** *milliseconds* **min-rx** *milliseconds* **multiplier** *multiplier-value*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	bfd-template single-hop <i>template-name</i> Example:	Creates a single-hop BFD template and enters BFD configuration mode.

	Command or Action	Purpose
	Router(config)# bfd-template single-hop bfdtemplate1	
Step 4	interval min-tx milliseconds min-rx milliseconds multiplier multiplier-value Example: Router(bfd-config)# interval min-tx 120 min-rx 100 multiplier 3	Configures the transmit and receive intervals between BFD packets, and specifies the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.
Step 5	end Example: Router(bfd-config)# end	Exits BFD configuration mode and returns the router to privileged EXEC mode.

Configuring a Multihop Template

Perform this task to create a BFD multihop template and configure BFD interval timers, authentication, and key chain.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **bfd-template multi-hop** *template-name*
4. **interval min-tx milliseconds min-rx milliseconds multiplier multiplier-value**
5. **authentication** *authentication-type* **keychain** *keychain-name*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	bfd-template multi-hop <i>template-name</i> Example: Router(config)# bfd-template multi-hop mh-template1	Creates a BFD multihop BFD template and enters BFD configuration mode.

	Command or Action	Purpose
Step 4	interval <i>min-tx milliseconds min-rx milliseconds multiplier multiplier-value</i> Example: <pre>Router(bfd-config)# interval min-tx 120 min-rx 100 multiplier 3</pre>	Configures the transmit and receive intervals between BFD packets, and specifies the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.
Step 5	authentication <i>authentication-type keychain keychain-name</i> Example: <pre>Router(bfd-config)# authentication keyed-sha-1 keychain bfd-multihop</pre>	Configures authentication for the multihop template and specifies the authentication type.
Step 6	end Example: <pre>Router(bfd-config)# end</pre>	Exits BFD configuration mode and returns the router to privileged EXEC mode.

Configuring a BFD Map

Perform this task to configure a BFD map that associates the interval timers and authentication configured in a template with unique source-destination address pairs for multihop BFD sessions.

Before you begin

You must configure a BFD multihop template before you associate it with a map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Perform one of the following steps:
 - **bfd map ipv4** *destination length source-address length template-name*
 - **bfd map ipv4 vrf** *vrf-name destination length vrf vrfname source-address length template-name*
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	Perform one of the following steps: <ul style="list-style-type: none"> • bfd map ipv4 destination length source-address length template-name • bfd map ipv4 vrf vrf-name destination length vrf vrfname source-address length template-name Example: <pre>Router(config)# bfd map ipv4 192.168.0.0/24 192.168.42.5/32 mh-template1 Router(config)# bfd map ipv4 vrf vpn1 192.168.0.0/24 vrf vpn2 192.168.42.5/32 BFD_RPW_MH</pre>	Configures a BFD map and associates it with the template. Mention the VRF name for the source-address as well, if source address is part of a VRF.
Step 4	end Example: <pre>Router(config)# end</pre>	Exits BFD configuration mode and returns the router to privileged EXEC mode.

Configuration Examples for Bidirectional Forwarding Detection

Example: Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default

In the following example, the EIGRP network contains RouterA, RouterB, and RouterC. The Gigabit Ethernet interface 0/0/1 on RouterA is connected to the same network as Gigabit Ethernet interface 0/0/1 on Router B. The Gigabit Ethernet interface 0/0/1 on RouterB is connected to the same network as Gigabit Ethernet interface 0/0/1 on RouterC.

RouterA and RouterB are running BFD Version 1, which supports echo mode, and RouterC is running BFD Version 0, which does not support echo mode. The BFD sessions between RouterC and its BFD neighbors are said to be running echo mode with asymmetry because echo mode will run on the forwarding path for RouterA and RouterB, and their echo packets will return along the same path for BFD sessions and failure detections, while their BFD neighbor RouterC runs BFD Version 0 and uses BFD control packets for BFD sessions and failure detections.

The example, starting in global configuration mode, shows the configuration of BFD.

Note The following configurations are in legacy mode. Legacy mode is not supported on Cisco RSP3. To configure on Cisco RSP3, use the template mode configuration as shown in [Configuring BFD Session Parameters on the Interface, on page 9](#) section.

Configuration for RouterA

```
interface GigabitEthernet0/0/0
  no shutdown
  ip address 10.4.9.14 255.255.255.0
  duplex auto
  speed auto
!
interface GigabitEthernet0/0/1
  ip address 172.16.1.1 255.255.255.0
  bfd interval 50 min_rx 50 multiplier 3
  no shutdown
  duplex auto
  speed auto
!
router eigrp 11
  network 172.16.0.0
  bfd all-interfaces
  auto-summary
!
```

Configuration for RouterB

```
!
interface GigabitEthernet0/0/0
  no shutdown
  ip address 10.4.9.34 255.255.255.0
  duplex auto
  speed auto
!
interface GigabitEthernet0/0/1
  ip address 172.16.1.2 255.255.255.0
  bfd interval 50 min_rx 50 multiplier 3
  no shutdown
  duplex auto
  speed auto
!
router eigrp 11
  network 172.16.0.0

  ip address 172.16.1.3 255.255.255.0
  bfd interval 50 min_rx 50 multiplier 3
  no shutdown
  duplex auto
  speed auto
!
router eigrp 11
```

Example: Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default

```

network 172.16.0.0
bfd all-interfaces
auto-summary
!

```

The output from the **show bfd neighbors details** command from RouterA verifies that BFD sessions have been created among all three routers and that EIGRP is registered for BFD support. The first group of output shows that RouterC with the IP address 172.16.1.3 runs BFD Version 0 and therefore does not use the echo mode. The second group of output shows that RouterB with the IP address 172.16.1.2 does run BFD Version 1, and the 50 millisecond BFD interval parameter had been adopted. The relevant command output is shown in bold in the output.

```

When Gigabit ethernet interface 0/0/1 on RouterB fails, BFD will no longer detect Router B as a BFD neighbor for RouterA or for RouterC. In this example, Gigabit Ethernet interface 0/0/1 has been administratively shut down on RouterB.

The following output from the **show bfd neighbors** command on RouterA now shows only one BFD neighbor for RouterA in the EIGRP network. The relevant command output is shown in bold in the output.

```
RouterA# show bfd neighbors
OurAddr      NeighAddr
```

```

          LD/RD  RH/RS  Holdown(mult)  State  Int
172.16.1.1    172.16.1.3
          5/3    1(RH)    134 (3 )  Up      Gig0/0/1

```

The following output from the **show bfd neighbors** command on RouterC also now shows only one BFD neighbor for RouterC in the EIGRP network. The relevant command output is shown in bold in the output.

```

RouterC# show bfd neighbors

OurAddr          NeighAddr
          LD/RD  RH  Holdown(mult)  State  Int
172.16.1.3    172.16.1.1
          3/5  1  114 (3 )      Up      Gig0/0/1

```

Example: Configuring BFD in an OSPF Network

In the following example, the simple OSPF network consists of Router A and Router B. Gigabit Ethernet interface 0/0/1 on Router A is connected to the same network as Gigabit Ethernet interface 0/0/1 in Router B. The example, starting in global configuration mode, shows the configuration of BFD. For both Routers A and B, BFD is configured globally for all interfaces associated with the OSPF process.

Note The following configurations are in legacy mode. Legacy mode is not supported on Cisco RSP3. To configure on Cisco RSP3, use the template mode configuration as shown in [Configuring BFD Session Parameters on the Interface, on page 9](#) section.

Configuration for Router A

```

!
interface GigabitEthernet 0/0/1
 ip address 172.16.10.1 255.255.255.0
 bfd interval 50 min_rx 50 multiplier 3
!
interface GigabitEthernet 0/0/0
 ip address 172.17.0.1 255.255.255.0
!
router ospf 123
 log-adjacency-changes detail
 network 172.16.10.0 0.0.0.255 area 0
 network 172.17.10.0 0.0.0.255 area 0
 bfd all-interfaces

```

Configuration for Router B

```

!
interface GigabitEthernet 0/0/1
 ip address 172.16.10.2 255.255.255.0
 bfd interval 50 min_rx 50 multiplier 3
!
interface GigabitEthernet 0/0/0
 ip address 172.18.0.1 255.255.255.0

```

```

!
router ospf 123
 log-adjacency-changes detail
 network 172.16.10.0 0.0.0.255 area 0
 network 172.18.10.0 0.0.0.255 area 0
 bfd all-interfaces

```

The output from the **show bfd neighbors details** command verifies that a BFD session has been created and that OSPF is registered for BFD support. The relevant command output is shown in bold in the output.

Router A

```

RouterA# show bfd neighbors details
OurAddr      NeighAddr    LD/RD RH  Holdown(mult)  State      Int

The output of the **show ip ospf** command verifies that BFD has been enabled for OSPF. The relevant command output is shown in bold in the output.

Router A

```
RouterA# show ip ospf
```

```
Routing Process "ospf 123" with ID 172.16.10.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
BFD is enabled
```

```
Area BACKBONE(0)
Number of interfaces in this area is 2 (1 loopback)
Area has no authentication

Example: Configuring BFD in a BGP Network

In the following example, the simple BGP network consists of Router A and Router B. The Gigabit Ethernet interface 0/0/1 on Router A is connected to the same network as Gigabit Ethernet interface 0/0/1 in Router B. The example, starting in global configuration mode, shows the configuration of BFD.

Note The following configurations are in legacy mode. Legacy mode is not supported on Cisco RSP3. To configure on Cisco RSP3, use the template mode configuration as shown in [Configuring BFD Session Parameters on the Interface, on page 9](#) section.

Configuration for Router A

```

!
interface GigabitEthernet 0/0/1
 ip address 172.16.10.1 255.255.255.0
 bfd interval 50 min_rx 50 multiplier 3
!
interface GigabitEthernet 0/0/0
 ip address 172.17.0.1 255.255.255.0
!
!
router bgp 40000
 bgp log-neighbor-changes
 neighbor 172.16.10.2 remote-as 45000
 neighbor 172.16.10.2 fall-over bfd
!
 address-family ipv4
 neighbor 172.16.10.2 activate
 no auto-summary
 no synchronization
 network 172.18.0.0 mask 255.255.255.0
 exit-address-family
!

```

Configuration for Router B

```

!
interface GigabitEthernet 0/0/1
 ip address 172.16.10.2 255.255.255.0
 bfd interval 50 min_rx 50 multiplier 3
!
interface GigabitEthernet 0/0/0
 ip address 172.18.0.1 255.255.255.0
!
router bgp 45000
 bgp log-neighbor-changes
 neighbor 172.16.10.1 remote-as 40000
 neighbor 172.16.10.1 fall-over bfd

```

```

!
address-family ipv4
neighbor 172.16.10.1 activate
no auto-summary
no synchronization
network 172.17.0.0 mask 255.255.255.0
exit-address-family
!

```

The output from the **show bfd neighbors details** command from Router A verifies that a BFD session has been created and that BGP is registered for BFD support. The relevant command output is shown in bold in the output.

Router A

```
RouterA# show bfd neighbors details
```

```

OurAddr      NeighAddr    LD/RD RH  Holdown(mult)  State   Int

The output of the **show ip bgp neighbors** command verifies that BFD has been enabled for the BGP neighbors:

Router A

```
RouterA# show ip bgp neighbors
BGP neighbor is 172.16.10.2, remote AS 45000, external link
  Using BFD to detect fast fallover
.
.
.
```

Router B

```
RouterB# show ip bgp neighbors
BGP neighbor is 172.16.10.1, remote AS 40000, external link
  Using BFD to detect fast fallover
.
.
.
```

Example: Configuring BFD in an IS-IS Network

In the following example, the simple IS-IS network consists of Router A and Router B. The Gigabit Ethernet interface 0/0/1 on Router A is connected to the same network as Gigabit Ethernet interface 0/0/0 for Router B. The example, starting in global configuration mode, shows the configuration of BFD.

Note The following configurations are in legacy mode. Legacy mode is not supported on Cisco RSP3. To configure on Cisco RSP3, use the template mode configuration as shown in [Configuring BFD Session Parameters on the Interface, on page 9](#) section.

Configuration for Router A

```
!
interface GigabitEthernet 0/0/1
 ip address 172.16.10.1 255.255.255.0
 ip router isis
  bfd interval 50 min_rx 50 multiplier 3
!
interface GigabitEthernet 0/0/0
 ip address 172.17.0.1 255.255.255.0
 ip router isis
!
router isis
 net 49.0001.1720.1600.1001.00
 bfd all-interfaces
!
```

Configuration for Router B

```

!
interface GigabitEthernet 0/0/0
 ip address 172.16.10.2 255.255.255.0
 ip router isis
  bfd interval 50 min_rx 50 multiplier 3
!
interface GigabitEthernet 0/0/1
 ip address 172.18.0.1 255.255.255.0
 ip router isis
!
router isis
 net 49.0000.0000.0002.00
  bfd all-interfaces
!

```

The output from the **show bfd neighbors details** command from Router A verifies that a BFD session has been created and that IS-IS is registered for BFD support:

```
RouterA# show bfd neighbors details
```

```

OurAddr      NeighAddr      LD/RD RH  Holdown(mult)  State      Int
172.16.10.1  172.16.10.2    1/8  1    536 (3 )      Up         Gig0/0/1

```

Example: Configuring BFD in an HSRP Network

In the following example, the HSRP network consists of Router A and Router B. The Gigabit Ethernet interface 2/0 on Router A is connected to the same network as Gigabit Ethernet interface 2/0 on Router B. The example, starting in global configuration mode, shows the configuration of BFD.

Note In the following example, the **standby bfd** and the **standby bfd all-interfaces** commands are not displayed. HSRP support for BFD peering is enabled by default when BFD is configured on the router or interface using the **bfd interval** command. The **standby bfd** and **standby bfd all-interfaces** commands are needed only if BFD has been manually disabled on a router or interface.

Note The following configurations are in legacy mode. Legacy mode is not supported on Cisco RSP3. To configure on Cisco RSP3, use the template mode configuration as shown in [Configuring BFD Session Parameters on the Interface, on page 9](#) section.

Router A

```
interface GigabitEthernet0/0/1
no shutdown
ip address 10.0.0.1 255.0.0.0
bfd interval 200 min_rx 200 multiplier 3
standby 1 ip 10.0.0.11
standby 1 preempt
standby 1 priority 110

standby 2 ip 10.0.0.12
standby 2 preempt
standby 2 priority 110
```

Router B

```
interface GigabitEthernet0/0/1
ip address 10.1.0.22 255.255.0.0
no shutdown
bfd interval 200 min_rx 200 multiplier 3
standby 1 ip 10.0.0.11
standby 1 preempt
standby 1 priority 90
standby 2 ip 10.0.0.12
standby 2 preempt
standby 2 priority 80
```

The output from the **show standby neighbors** command verifies that a BFD session has been created:

```

RouterA#show standby neighbors

HSRP neighbors on GigabitEthernet0/0/0
 10.1.0.22
   No active groups
   Standby groups: 1
   BFD enabled !
RouterB# show standby neighbors

HSRP neighbors on GigabitEthernet0/0/1
 10.0.0.2
   Active groups: 1
   No standby groups
   BFD enabled !

```

Example: Configuring BFD Support for Static Routing

In the following example, the network consists of Device A and Device B. Serial interface 2/0 on Device A is connected to the same network as serial interface 2/0 on Device B. In order for the BFD session to come up, Device B must be configured.

Note The following configurations are in legacy mode. Legacy mode is not supported on Cisco RSP3. To configure on Cisco RSP3, use the template mode configuration as shown in [Configuring BFD Session Parameters on the Interface, on page 9](#) section.

Device A

```

configure terminal
interface Serial 2/0
ip address 10.201.201.1 255.255.255.0
bfd interval 500 min_rx 500 multiplier 5
ip route static bfd Serial 2/0 10.201.201.2
ip route 10.0.0.0 255.0.0.0 Serial 2/0 10.201.201.2

```

Device B

```

configure terminal
interface Serial 2/0
ip address 10.201.201.2 255.255.255.0
bfd interval 500 min_rx 500 multiplier 5
ip route static bfd Serial 2/0 10.201.201.1
ip route 10.1.1.1 255.255.255.255 Serial 2/0 10.201.201.1

```

Note that the static route on Device B exists solely to enable the BFD session between 10.201.201.1 and 10.201.201.2. If there is no useful static route that needs to be configured, select a prefix that will not affect packet forwarding, for example, the address of a locally configured loopback interface.

In the following example, there is an active static BFD configuration to reach 209.165.200.225 through Gigabit Ethernet interface 0/0/0 in the BFD group testgroup. As soon as the static route is configured that is tracked by the configured static BFD, a single hop BFD session is initiated to 209.165.200.225 through Ethernet interface 0/0. The prefix 10.0.0.0/8 is added to the RIB if a BFD session is successfully established.

```
configure terminal
ip route static bfd GigabitEthernet 0/0/0 209.165.200.225 group testgroup
ip route 10.0.0.0 255.255.255.224 Ethernet 0/0 209.165.200.225
```

In the following example, a BFD session to 209.165.200.226 through Ethernet interface 0/0.1001 is marked to use the group testgroup. That is, this configuration is a passive static BFD. Though there are static routes to be tracked by the second static BFD configuration, a BFD session is not triggered for 209.165.200.226 through Gigabit Ethernet interface 0/0/0. The existence of the prefixes 10.1.1.1/8 and 10.2.2.2/8 is controlled by the active static BFD session (Gigabit Ethernet interface 0/0/0 209.165.200.225).

```
configure terminal
ip route static bfd GigabitEthernet 0/0/0 209.165.200.225 group testgroup
ip route 10.0.0.0 255.255.255.224 GigabitEthernet 0/0/0 209.165.200.225
ip route static bfd Ethernet 0/0.1001 209.165.200.226 group testgroup passive
ip route 10.1.1.1 255.255.255.224 GigabitEthernet 0/0/0 209.165.200.226
ip route 10.2.2.2 255.255.255.224 GigabitEthernet 0/0/0 209.165.200.226
```

Micro BFD

The BFD feature on ASR 900 RSP3 supports micro BFD sessions on individual port channel member links to monitor Layer 3 connectivity on those links. With micro BFD feature, BFD is able to verify the ability of each member link to be able to forward Layer 3 packets and appropriately update the load balance.

Features of Micro BFD

- Micro BFD is supported both in hardware offloaded and software offloaded.
- Timers supported on micro BFD hardware offloaded session are from 3.3 ms to 200 ms.
- Timers supported on micro BFD software offloaded session are from 200 ms to 999 ms.
- Micro BFD supports Active/Active SDM template for port-channel.
-
- Interior gateway protocol is not necessary for the micro BFD sessions to be up between the LAG.
- The client for micro BFD sessions is port-channel.
- Micro BFD is supported on port-channel with member links from different ASICs.
- Micro BFD is supported with LACP minimum links and LACP maximum links enabled on the port-channel.
- Minimum convergence time tested for interval 3.3 ms, with multiplier value as 3 is 56 ms.

Functions of Micro BFD

- Runs BFD session over each Link Aggregation Group (LAG) member link.
- Verifies link continuity for every member link.

- Makes BFD to control the LAG member link to be part of the Layer 2 load-balancing table of the LAG interface in the presence or the absence of Link Aggregation Control Protocol (LACP).
- Offloads the continuity check messages.
- Provides a sub 50 millisecond convergence for LAG failures.

Restrictions for Micro BFD

- Micro BFD supports single hop only.
- Micro BFD works only with IPv4.
- Micro BFD is only supported on L3 port-channel; it is not supported on sub-interfaces or EVC of port-channel.
- Micro BFD does not support ECHO mode.
- Maximum tested scale is 46 sessions .
-

Steps to Configure Micro BFD

Perform the following steps to configure micro BFD:

1. Configure port channel. See [Configure Port-Channel, on page 37](#).
2. If Micro BFD needs to be enabled on an Active/Active SDM template, enable port channel, then enable the SDM template for the port channel ID before configuring the port-channel. See [Configuring QoS Support on Port Channel Active Active](#) and [Selecting the SDM template](#).
3. Configure BFD template. See [Configure Micro BFD on Port Channel, on page 39](#).
4. Configure Micro BFD over port-channel with the template configured. See [Configure Micro BFD on Port Channel, on page 39](#).

Configure Port-Channel

SUMMARY STEPS

1. enable
2. configure terminal
3. **Interface** port channel *number*
4. **ip address** *ip-address mask*
5. **Interface** *interface type* *interface name*
6. **channel group** *channel group number* **mode** *mode name*
7. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters the global configuration mode.
Step 3	Interface port channel <i>number</i> Example: Router(config)#interface port channel 48	Configures the port channel and enters the interface mode.
Step 4	ip address <i>ip-address mask</i> Example: Router(config-if)# ip address 10.201.201.1 255.255.255.0	Configures an IP address for the interface.
Step 5	Interface <i>interface type</i> interface name Example: Router(config)#interface gigabitethernet 0/0/0-6	Specifies the ethernet interface.
Step 6	channel group <i>channel group number mode mode name</i> Example: Router(config)#channel group 48 mode active	The following types of port channel modes can be configured: <ul style="list-style-type: none"> • active • passive • on
Step 7	end	Exits the interface range configuration mode and returns to the configuration mode.

Verify Port Channel

Use the commands below to verify the port channel summary details:

```
Device#show etherchannel summary
Flags:  D - down          P/bndl - bundled in port-channel
        I - stand-alone  s/susp - suspended
        H - Hot-standby (LACP only)
        R - Layer3       S - Layer2
        U - in use       f - failed to allocate aggregator

        M - not in use, minimum links not met
        u - unsuitable for bundling
        w - waiting to be aggregated
        d - default port
```

```

Number of channel-groups in use: 1
Number of aggregators:          1

Group  Port-channel  Protocol    Ports
-----+-----+-----+-----
10     Po10 (RU)         LACP        Te0/4/0 (bndl)

```

Configure Micro BFD on Port Channel

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **bfd-template single-hop** *MicroBFD_template name*
4. **interval min-tx** *milliseconds* **min-rx** *milliseconds* **multiplier** *multiplier-value*
5. **end**
6. **configure terminal**
7. **Interface port channel** *number*
8. **port channel bfd destination ipv4** *ip address* **MicroBFD_template**
9. **End**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	bfd-template single-hop <i>MicroBFD_template name</i> Example: Router(config)#bfd-template single-hop MicroBFD_template	Configures the BFD template and enters BFD configuration mode.
Step 4	interval min-tx <i>milliseconds</i> min-rx <i>milliseconds</i> multiplier <i>multiplier-value</i> Example: Router(bfd-config)#interval min-tx 100 min-rx 100 multiplier 3	Configures the transmit and receive intervals between BFD packets, and specifies the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.
Step 5	end Example: Router(bfd-config)# end	Exits BFD configuration mode and returns the router to privileged EXEC mode.

	Command or Action	Purpose
Step 6	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 7	Interface port channel <i>number</i> Example: Router(config)#interface port channel 48	Configures the port channel and enters the interface mode.
Step 8	port channel bfd destination ipv4 <i>ip address</i> MicroBFD_template Example: Router(config-if)#port channel bfd destination ipv4 48.48.48.2 MicroBFD_template	Configures micro BFD under the port channel. Use the no form of the command to delete the Micro BFD session from the port channel.
Step 9	End	Exits interface configuration mode and returns to global configuration mode.

Verify Micro BFD Session

Use the following commands to verify that the BFD sessions established are in UP state.

```

router#show etherchannel summary
Flags: D - down          P/bndl - bundled in port-channel
       I - stand-alone  s/susp - suspended
       H - Hot-standby (LACP only)
       R - Layer3       S - Layer2
       U - in use       f - failed to allocate aggregator

       M - not in use, minimum links not met
       u - unsuitable for bundling
       w - waiting to be aggregated
       d - default port

Number of channel-groups in use: 1
Number of aggregators:          1

Group  Port-channel  Protocol    Ports
-----+-----+-----+-----
1      Po1(RU)         LACP        Gi0/3/2(bndl) Gi0/3/3(bndl)

RU - L3 port-channel UP State
SU - L2 port-channel UP state
P/bndl - Bundled
S/susp - Suspended

router#show bfd summary
Session      Up          Down
