

BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) Using L2VPN VPLS

The BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) feature enables using L2VPN VPLS provider edge (PE) routers to maintain Border Gateway Protocol (BGP) state with customer edge (CE) routers and ensure continuous packet forwarding during a Route Processor (RP) switchover or during a planned In-Service Software Upgrade (ISSU) for a PE router. CE routers do not need to be Nonstop Forwarding (NSF)-capable or NSF-aware to benefit from BGP NSR capabilities on PE routers. Only PE routers need to be upgraded to support BGP NSR--no CE router upgrades are required. BGP NSR with SSO, thus, enables service providers to provide the benefits NSF with the additional benefits of NSR without requiring CE routers to be upgraded to support BGP graceful restart.

- Prerequisites for BGP Support for NSR with SSO, on page 1
- Information About BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO), on page 2
- How to Configure BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO), on page
- Configuration Examples for BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) using L2VPN VPLS, on page 11

Prerequisites for BGP Support for NSR with SSO

- Your network must be configured to run BGP.
- Multiprotocol Layer Switching (MPLS) Layer 3 VPNs must be configured.
- You must be familiar with NSF and SSO concepts and tasks.

Information About BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO)

Overview of BGP NSR with SSO

Prior to the introduction of BGP NSR with SSO in Cisco IOS Release 12.2(28)SB, BGP required that all neighboring devices participating in BGP NSF be configured to be either NSF-capable or NSF-aware (by configuring the devices to support the BGP graceful restart mechanism). BGP NSF, thus, required that all neighboring devices be upgraded to a version of Cisco IOS software that supports BGP graceful restart. However, in many MPLS VPN deployments, there are situations where PE routers engage in exterior BGP (eBGP) peering sessions with CE routers that do not support BGP graceful restart and cannot be upgraded to a software version that supports BGP graceful restart in the same time frame as the provider (P) routers.

BGP NSR with SSO provides a high availability (HA) solution to service providers whose PE routers engage in eBGP peering relationships with CE routers that do not support BGP graceful restart. BGP NSR works with SSO to synchronize BGP state information between the active and standby RP. SSO minimizes the amount of time a network is unavailable to its users following a switchover. When the BGP NSR with SSO feature is configured, in the event of an RP switchover, the PE router uses BGP NSR with SSO to maintain BGP state for eBGP peering sessions with CEs that are not NSF-aware (see the figure below). Additionally, the BGP NSR with SSO feature dynamically detects NSF-aware peers and runs graceful restart with those CE routers. For eBGP peering sessions with NSF-aware peers and for internal BGP (iBGP) sessions with BGP Route Reflectors (RRs) in the service provider core, the PE uses NSF to maintain BGP state. BGP NSR with SSO, thus, enables service providers to provide the benefits of NSF with the additional benefits of NSR without requiring CE routers to be upgraded to support BGP graceful restart.

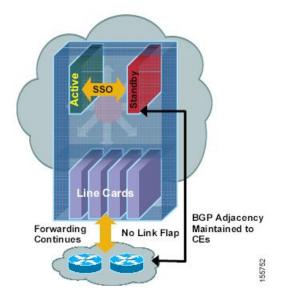

Figure 1: BGP NSR with SSO Operations During an RP Switchover

BGP NSR with SSO is supported in BGP peer, BGP peer group, and BGP session template configurations. To configure support for BGP NSR with SSO in BGP peer and BGP peer group configurations, use the **neighbor ha-mode sso** command in address family configuration mode for IPv4 VRF address family BGP

peer sessions. To include support for Cisco BGP NSR with SSO in a peer session template, use the **ha-mode sso** command in session-template configuration mode.

Benefits of BGP NSR with SSO

- Minimizes services disruptions--Border Gateway Protocol (BGP) Nonstop Routing (NSR) with Stateful Switchover (SSO) reduces impact on customer traffic during route processor (RP) switchovers (scheduled or unscheduled events), extending high availability (HA) deployments and benefits at the edge.
- Enhances high-availability Nonstop Forwarding (NSF) and SSO deployment at the edge--BGP NSR
 with SSO allows incremental deployment by upgrading the provider edge device with the NSR capability
 so that customer-facing edge devices are synchronized automatically and no coordination or NSF awareness
 is needed with the customer side Cisco or third-party customer edge devices. The BGP NSR feature
 dynamically detects NSF-aware peers and runs graceful restart with those CE devices.
- Provides transparent route convergence--BGP NSR with SSO eliminates route flaps by keeping BGP state on both active and standby RPs and ensures continuous packet forwarding with minimal packet loss during RP failovers.

How to Configure BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO)

Configuring a PE Device to Support BGP NSR with SSO

Perform this task to enable a provider edge (PE) device to maintain BGP state with customer edge (CE) devices and ensure continuous packet forwarding during a route processor (RP) switchover or during a planned ISSU. Border Gateway Protocol (BGP) Nonstop Routing (NSR) with Stateful Switchover (SSO) enables service providers to provide the benefits Nonstop Forwarding (NSF) with the additional benefits of NSR without requiring CE devices to be upgraded to support BGP graceful restart.

BGP NSR with SSO is supported in BGP peer, BGP peer group, and BGP session template configurations. Perform one of the following tasks in this section on a PE device, depending on whether you want to configure support for BGP NSR with SSO in a peer, a peer group, or a session template configuration:

Prerequisites

- These tasks assume that you are familiar with BGP peer, BGP peer group, and BGP session template concepts. For more information, see the "Configuring a Basic BGP Network" module.
- The active and standby RP must be in SSO mode. For information about configuring SSO mode, see the "Configuring Stateful Switchover" module in the *High Availability Configuration Guide*.
- Graceful restart should be enabled on the PE device. We recommend that you enable graceful restart on all BGP peers in the provider core that participate in BGP NSF. For more information about configuring graceful restart, see the "Configuring Advanced BGP Features" module.
- CE devices must support the route refresh capability. For more information, see the "Configuring a Basic BGP Network" module.

Configuring a Peer to Support BGP NSR with SSO

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. router bgp** *autonomous-system-number*
- 4. **bgp graceful-restart [restart-time** seconds] [stalepath-time seconds]
- 5. address-family l2vpn vpls
- **6. neighbor** *ip-address* **remote-as** *autonomous-system-number*
- 7. **neighbor** *ip-address* **ha-mode sso**
- 8. neighbor ip-address activate
- 9. end
- 10. show ip bgp vpnv4 all sso summary

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	router bgp autonomous-system-number	Enters router configuration mode for the specified routing
	Example:	process.
	Device(config)# router bgp 40000	
Step 4	bgp graceful-restart [restart-time seconds] [stalepath-time seconds]	Enables the Border Gateway Protocol (BGP) graceful restart capability and BGP Nonstop Forwarding (NSF)
	Example:	awareness.
	Device(config-router)# bgp graceful-restart	• If you enter this command after the BGP session has been established, you must restart the session for the capability to be exchanged with the BGP neighbor.
		Use this command on the restarting device and all of its peers (NSF-capable and NSF-aware).
Step 5	address-family l2vpn vpls	Specifies activation of L2VPN VPLS peering.
	Example:	
	Device(config-router)# address-family 12vpn vpls	

	Command or Action	Purpose	
Step 6	neighbor ip-address remote-as autonomous-system-number Example:	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local router.	
	Device(config-router-af) # neighbor 192.168.1.1 remote-as 45000		
Step 7	<pre>neighbor ip-address ha-mode sso Example: Device(config-router-af) # neighbor 192.168.1.1</pre>	Configures the neighbor to support BGP Nonstop Routing (NSR) with Stateful Switchover (SSO).	
Step 8	neighbor ip-address activate Example:	Enables the neighbor to exchange prefixes for the IPv4 address family with the local router.	
	Device(config-router-af)# neighbor testgroup activate	Note By default, neighbors that are defined using the neighbor remote-as command in router configuration mode exchange only unicast address prefixes.	
Step 9	<pre>end Example: Device(config-router-af)# end</pre>	Exits address family configuration mode and enters privileged EXEC mode.	
Step 10	show ip bgp vpnv4 all sso summary Example:	(Optional) Displays the number of BGP neighbors that are in SSO mode.	

Configuring a Peer Group to Support BGP NSR with SSO

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. router bgp** *autonomous-system-number*
- 4. **bgp graceful-restart [restart-time** seconds] [stalepath-time seconds]
- 5. neighbor peer-group-name peer-group
- **6. neighbor** *ip-address* **remote-as** *autonomous-system-number*
- 7. **neighbor** *ip-address* **peer-group** *peer-group-name*
- 8. neighbor peer-group-name ha-mode sso
- 9. address-family l2vpn vpls
- 10. neighbor peer-group-name activate
- **11**. end
- 12. show ip bgp l2vpn vpls all sso summary

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:		
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	router bgp autonomous-system-number	Enters router configuration mode for the specified routing	
	Example:	process.	
	Device(config)# router bgp 40000		
Step 4	bgp graceful-restart [restart-time seconds]	Enables the Border Gateway Protocol (BGP) graceful	
	[stalepath-time seconds]	restart capability and BGP Nonstop Forwarding (NSF awareness.	
	Example:	• If you enter this command after the BGP session has	
	Device(config-router)# bgp graceful-restart	been established, you must restart the session for the capability to be exchanged with the BGP neighbor.	
		Use this command on the restarting device and all of its peers (NSF-capable and NSF-aware).	
Step 5	neighbor peer-group-name peer-group	Creates a BGP peer group.	
	Example:		
	Device(config-router-af)# neighbor testgroup peer-group		
Step 6	neighbor ip-address remote-as autonomous-system-number	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.	
	Example:		
	Example.		
	Device(config-router-af)# neighbor 192.168.1.1 remote-as 45000		
Step 7	neighbor ip-address peer-group peer-group-name	Assigns the IP address of a BGP neighbor to a BGP peer	
	Example:	group.	
	Device(config-router-af)# neighbor 192.168.1.1 peer-group testgroup		
Step 8	neighbor peer-group-name ha-mode sso	Configures the BGP peer group to support BGP Nonstop	
	Example:	Routing (NSR) with Stateful Switchover (SSO).	

	Command or Action	Purpose
	Device(config-router-af)# neighbor 192.168.1.1 ha-mode sso	
Step 9	address-family l2vpn vpls	Specifies activation of L2VPN VPLS peering.
	Example:	
	Device(config-router)# address-family 12vpn vpls	
Step 10	neighbor peer-group-name activate	Enables the neighbor to exchange prefixes for the IPv4
	Example:	address family with the local device.
	Device(config-router-af)# neighbor testgroup activate	
Step 11	end	Exits address family configuration mode and returns to
	Example:	global configuration mode.
	Device(config-router-af)# end	
Step 12	show ip bgp l2vpn vpls all sso summary	Optional) Displays the number of BGP neighbors that are
	Example:	in SSO mode.
	Device# show ip bgp 12vpn vpls all sso summary	

Configuring Support for BGP NSR with SSO in a Peer Session Template

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3.** router bgp autonomous-system-number
- **4. template peer-session** *session-template-name*
- 5. ha-mode sso
- 6. exit-peer-session
- **7.** end
- **8. show ip bgp template peer-session** [session-template-name]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	
	Device> enable	

	Command or Action	Purpose	
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	router bgp autonomous-system-number Example:	Enters router configuration mode and creates a Border Gateway Protocol (BGP) routing process.	
	Device(config)# router bgp 101		
Step 4	template peer-session session-template-name Example:	Enters session-template configuration mode and creates a peer session template.	
	Device(config-router)# template peer-session CORE1		
Step 5	ha-mode sso	Configures the neighbor to support BGP Nonstop Routi (NSR) with Stateful Switchover (SSO).	
	Example:		
	Device(config-router-stmp)# ha-mode sso		
Step 6	exit-peer-session	Exits session-template configuration mode and returns to	
	Example:	router configuration mode.	
	Device(config-router-stmp)# exit-peer-session		
Step 7	end	Exits router configuration mode and returns to privileged	
	Example:	EXEC mode.	
	Device(config-router)# end		
Step 8	show ip bgp template peer-session [session-template-name]	(Optional) Displays locally configured peer session templates.	
	Example: Device# show ip bgp template peer-session	• The output can be filtered to display a single peer policy template with the <i>session-template-name</i> argument. This command also supports all standard output modifiers.	

What to Do Next

After the peer session template is created, the configuration of the peer session template can be inherited by or applied to another peer session template with the **inherit peer-session** or **neighbor inherit peer-session** command.

For more information about configuring peer session templates, see the "Configuring a Basic BGP Network" chapter in the *Cisco IOS IP Routing: BGP Configuration Guide*.

Verifying BGP Support for NSR with SSO

SUMMARY STEPS

- 1. enable
- 2. show ip bgpl2vpnvpls all sso summary
- 3. show ip bgpl2vpnvpls all neighbors

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

Example:

Device> enable

Step 2 show ip bgpl2vpnvpls all sso summary

This command is used to display the number of Border Gateway Protocol (BGP) neighbors that are in Stateful Switchover (SSO) mode.

The following is sample output from the **show ip bgp l2vpnvpls all sso summary** command:

Example:

```
Device# show ip bgp 12vpn vpls all sso summary

Stateful switchover support enabled for 40 neighbors
```

Step 3 show ip bgpl2vpnvpls all neighbors

This command displays VPN address information from the BGP table.

The following is sample output from the **show ip bgp l2vpnvpls all neighbors** command. The "Stateful switchover support" field indicates whether SSO is enabled or disabled. The "SSO Last Disable Reason" field displays information about the last BGP session that lost SSO capability.

Example:

```
Device# show ip bgp 12vpn vpls all neighbors 10.3.3.3
BGP neighbor is 10.3.3.3, vrf vrf1, remote AS 3, external link
  Inherits from template 10vrf-session for session parameters
   BGP version 4, remote router ID 10.1.105.12
   BGP state = Established, up for 04:21:39
   Last read 00:00:05, last write 00:00:09, hold time is 30, keepalive interval is 10 seconds
   Configured hold time is 30, keepalive interval is 10 seconds
   Minimum holdtime from neighbor is 0 seconds
   Neighbor capabilities:
    Route refresh: advertised and received (new)
    Address family IPv4 Unicast: advertised and received
     Stateful switchover support enabled
   Message statistics:
     InQ depth is 0
     OutQ depth is 0
                          Sent
                                     Rcvd
     Opens:
                                        1
```

```
Notifications:
                        0
                                      0
                          1
                                      4
    Undates:
    Keepalives:
                       1534
                                   1532
    Route Refresh:
                         0
                                     0
                        1536
                                   1537
    Total:
   Default minimum time between advertisement runs is 30 seconds
  For address family: L2VPN VPLS
  BGP table version 25161, neighbor version 25161/0
   Output queue size : 0
   Index 7, Offset 0, Mask 0x80
   7 update-group member
   Inherits from template 10vrf-policy
   Overrides the neighbor AS with my AS before sending updates
   Outbound path policy configured
   Route map for outgoing advertisements is Deny-CE-prefixes
                               Sent Rcvd
   Prefix activity:
                                 1.0
                                            50 (Consumes 3400 bytes)

Troubleshooting Tips

To troubleshoot BGP NSR with SSO, use the following commands in privileged EXEC mode, as needed:

- **debug ip bgp sso** --Displays BGP-related SSO events or debugging information for BGP-related interactions between the active RP and the standby RP. This command is useful for monitoring or troubleshooting BGP sessions on a PE router during an RP switchover or during a planned ISSU.
- **debug ip tcp ha** --Displays TCP HA events or debugging information for TCP stack interactions between the active RP and the standby RP. This is command is useful for troubleshooting SSO-aware TCP connections.
- **show tcp** --Displays the status of TCP connections. The display output will display the SSO capability flag and will indicate the reason that the SSO property failed on a TCP connection.
- show tcp ha connections -- Displays connection-ID-to-TCP mapping data.

Configuration Examples for BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) using L2VPN VPLS

Example: Configuring BGP NSR with SSO Using L2VPN VPLS

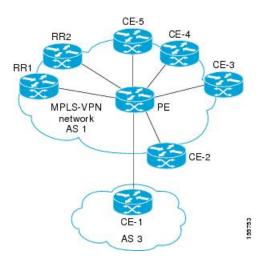

The illustration below illustrates a sample Border Gateway Protocol (BGP) Nonstop Routing (NSR) with Stateful Switchful (SSO) network topology using L2VPN VPLS technology, and the configuration examples that follow show configurations from two devices in the topology: the RR1 device and the provider edge (PE) device.

Note

The configuration examples omit some of the configuration required for Multiprotocol Label Switching (MPLS) VPNs because the purpose of these examples is to illustrate the configuration of BGP NSR with SSO.

Figure 2: BGP NSR with SSO Example Topology

RR1 Configuration

The following example shows the BGP configuration for RR1 in the illustration above. RR1 is configured as a Nonstop Forwarding (NSF)-aware route reflector (RR). In the event of an route processor (RP) switchover, the PE device uses NSF to maintain the BGP state of the internal peering session with RR1.

PE Configuration

The following example shows the BGP NSR with SSO configuration for the PE device in the illustration above. The PE device is configured to support both NSF-awareness and the BGP NSR with SSO capability. In the event of an RP switchover, the PE device uses BGP NSR with SSO to maintain BGP state for the external BGP (eBGP) peering session and uses NSF to maintain BGP state for the internal BGP (iBGP) session with RR1.

Feature Information for BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) Using L2VPN VPLS

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO)

Feature Name	Releases	Feature Information
BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) Using L2VPN VPLS	Cisco IOS XE Fuji 16.7.1	The BGP Support for Nonstop Routing (NSR) with Stateful Switchover (SSO) using L2VPN VPLS feature enables provider edge (PE) routers to maintain Border Gateway Protocol (BGP) state with customer edge (CE) routers and ensure continuous packet forwarding during a Route Processor (RP) switchover or during a planned In-Service Software Upgrade (ISSU) for a PE router. CE routers do not need to be Nonstop Forwarding (NSF)-capable or NSF-aware to benefit from BGP NSR capabilities on PE routers. Only PE routers need to be upgraded to support BGP NSRno CE router upgrades are required. BGP NSR with SSO, thus, enables service providers to provide the benefits NSF with the additional benefits of NSR without requiring CE routers to be upgraded to support BGP graceful restart. The following commands were modified: • debug ip bgp sso • show ip bgp l2vpn
