## Y.1564 - Ethernet Service Activation Test

With the deployment of Ethernet in service provider networks, ethernet services have evolved significantly. Not only is ethernet found at the User Network Interface (UNI) but can also be deployed anywhere in the network, creating a Network-to-Network Interface (NNI). With the capability to prioritize traffic, high availability, and its built-in resiliency, service providers are now using this technology to deliver advanced services. In the absence of any standardized test methodologies that can measure delay, jitter, loss, and throughput at a port, the ITU-T recommendation Y.1564 addresses the gap

Y.1564 - Ethernet Service Activation Test (or performance test methodology) is a testing procedure which tests service turn-up, installation, and troubleshooting of Ethernet-based services. This test methodology was created to have a standard way of measuring Ethernet-based services in the industry.

Cisco implementation of ITU-T Y.1564 has three key objectives:

- To serve as a network SLA validation tool, ensuring that a service meets its guaranteed performance settings in a controlled test time.
- To ensure that all services carried by the network meet their SLA objectives at their maximum committed rate, thus proving that under maximum load, network devices and paths can support all traffic as designed.
- To perform medium-term and long-term service testing, confirming that network elements can properly carry all services while under stress during a soaking period.

The following Key Performance Indicators (KPI) metrics are collected to ensure that the configured SLAs are met for the service or stream.

- Frame Transfer Delay (FTD) or latency—Measures the round-trip time (RTT) taken by a test frame to travel through a network device, or across the network and back to the test port.
- Frame Loss Ratio (FLR)—Measures the number of packets lost from the total number of packets sent. Frame loss can be due to a number of issues such as network congestion or errors during transmissions.

## Supported Modes

The mode of operation that is supported for Y.1564 is the Two-way statistics collection mode. In the two-way mode, the sender generates the test traffic used to perform the test, which is then looped back by the remote node. The statistics are measured and collected locally on the sender

The following encapsulations are supported by Y.1564 SADT feature:

- dot1q
- dot1q + second dot1q
- dot1ad
- dot1ad + second dot1q
- priority tagged
- untagged
- default

---

**Note** Before Cisco IOS XR Software Release 24.2.1, default encapsulation is supported if there are no other subinterfaces configured with untagged encapsulation. Starting Cisco IOS XR Software Release 24.2.1, default encapsulation is supported.

---

## Usage Guideline and Limitations

- Rewrite with POP option is supported with Color Blind mode with Outer-Cos value of 0.
- Rewrite Push and Translate on Encapsulation Untagged is not supported.
- Y.1564 doesn't support L1 loopback.
- Y.1564 over bundle with members from multiple NPU is not supported.
- Y.1564 doesn't support measuring and analyzing jitter.
- When utilizing the SAT engine received bytes statistics feature, there can be potential inaccuracies in the following conditions:
  - During tests incorporating EMIX sequences that encounter packet drops.
  - When handling LMM packets originating from TGEN, Y.1731 protocols, or any unidentified sources.
- SAT supports a scale of four parallel sessions per system. However, all four sessions can not operate as color aware sessions simultaneously due to limitations in Class of Service (CoS) combinations.
- SAT over bundle interface functions by selecting one of its members for transmission. Therefore, at least one member must be in the 'UP' state to initiate an SAT session. For modular chassis, bundle member from the different LCs is not supported.
- For optimal performance, it's recommended to use the Ethernet Data Plane Loopback functionality (EDPL) on the peer side for SAT. EDPL loops back and swaps the MAC addresses of Layer 2 packets generated. If the peer node doesn't support EDPL functionality, you can configure SAT to generate Layer

2 packets with the destination MAC address equal to the source MAC address. In such cases, the peer can perform an L1 loopback.

- Packets generated by SAT with PRBS payload at certain packet sizes may have PRBS errors. When configuring GTF packet using `bcm_sat_gtf_packet_config_set`, this is verified. If the `payload_type` is `bcmSatPayloadPRBS` and packets generated at the configured `packet_length` have PRBS error, this API now returns `BCM_E_PARAM` to the caller. The user is informed about the PRBS error through the test abort reason.
  - On BCM8869X, packets have PRBS errors, if  $(\text{packet\_length} + 63) / 64$  is one of [4, 6, 10, 12, 13, 14] or  $\geq 18$ .
  - On BCM8880X, packets have PRBS errors, if  $(\text{packet\_length} + 63) / 64$  equals to 6 or  $\geq 33$ .
- Use unique CoS values for CIR and EIR in parallel tests.

### Platform GTF Rate

The following table includes the GTF rate for different platforms.

Platform (PID)	GTF Rate
NCS540	19.2 Gbps
NCS560	19.2 Gbps
NCS540L	19.2 Gbps
NCS4K	23 Gbps
NCS5501	19.2 Gbps
NCS-5501-SE	19.2 Gbps
NCS55A1-48Q6H	23 Gbps
NCS55A2_MOD_S_SE	23 Gbps
NCS-55A1-36H-SE-S	23 Gbps
NCS-55A1-36H-S	23 Gbps
NCS-55A1-24Q6H-S	23 Gbps
NCS-55A1-24Q6H-SS	23 Gbps
NCS-55A1-24H	23 Gbps
NCS-5502-SE	23 Gbps
N540X-6Z18G-SYS-A	8 Gbps
N540X-4Z14G2Q-D	8 Gbps
N540X-8Z16G-SYS-D	8 Gbps
N540-6Z14S-SYS-D	8 Gbps
NCS-57C1-48Q6-SYS	300 or 400 Gbps
NCS-57C3-MODS-SYS	400 Gbps

NCS-57B1-5DSE-SYS	400 Gbps
N540-24Q8L2DD-SYS	300 Gbps
NCS-57D2-18DD-SYS	400 Gbps

## CoS DEI Support Matrix

*Table 1: Class of Service (CoS) and Discard Eligibility Identifier (DEI) Matrix*

		CoS							
		0	1	2	3	4	5	6	7
DEI	0	Ö	Ö	Ö	Ö	Ö	X	Ö	X
	1	Ö	Ö	X	X	X	X	X	X

Ö - Supported

X- Not Supported

## Supported Bandwidth Parameters

Bandwidth Parameters	Internal Direction	External Direction
Committed Information Rate	Y	Y
Exceeded Information Rate	Y	Y

## Service Activation Test Target Matrix

Target	Internal Direction	External Direction
L2 Interface over physical main/sub interfaces	Y	Y
L2 Interface over bundle main/sub interfaces	Y	Y
L2 PW VPWS over physical main/sub interfaces	Y	Y
L2 PW VPWS over bundle main/sub interfaces	Y	Y
L2 EVPN/XConnect over physical main/sub interfaces	Y	Y

Target	Internal Direction	External Direction
L2 EVPN/XConnect over bundle main/sub interfaces	Y	Y
L2 VPLS PW	N	N
L2 EVPN Bridge-Domain	N	N
L3 Interfaces	N	N

## Configuration Examples

The following example shows how to start service-activation test on an interface with external direction:

```
RP/0/RP0/CPU0:router ethernet service-activation-test start interface TenGigE 10/0/0/1
profile test destination 00ab.6009.9c3c direction external
```

The following example shows how to start service-activation test on an interface with internal direction:

```
RP/0/RP0/CPU0:router ethernet service-activation-test start interface TenGigE 10/0/0/1
profile test destination 00ab.6009.9c3c direction internal
```

The following example shows how to stop service-activation-test on an interface:

```
RP/0/RP0/CPU0:router ethernet service-activation-test stop interface TenGigE 10/0/0/1
```

The following example shows how to stop all service-activation-tests:

```
RP/0/RP0/CPU0:router ethernet service-activation-test stop all
```

## Configuring Ethernet Service Activation Test Color Profile

The following example shows how to configure a color-blind profile for ethernet service activation test:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)# ethernet service-activation-test
RP/0/RP0/CPU0:router(config-ethsat)#profile sattest1
RP/0/RP0/CPU0:router(config-ethsat-prf)#outer-cos 4
RP/0/RP0/CPU0:router(config-ethsat-prf)#duration 8 minutes
RP/0/RP0/CPU0:router(config-ethsat-prf)#information-rate 11800 mbps
RP/0/RP0/CPU0:router(config-ethsat-prf)#packet-size 1000
```

The following example shows how to configure a color-aware profile for ethernet service activation test:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)# ethernet service-activation-test
RP/0/RP0/CPU0:router(config-ethsat)#profile sattest3
RP/0/RP0/CPU0:router(config-ethsat-prf)#outer-cos 4
RP/0/RP0/CPU0:router(config-ethsat-prf)#duration 1 minutes
RP/0/RP0/CPU0:router(config-ethsat-prf)#color-aware cir 7 gbps eir-color cos 1
RP/0/RP0/CPU0:router(config-ethsat-prf)#information-rate 8 gbps
RP/0/RP0/CPU0:router(config-ethsat-prf)#packet-size 1000
```

# Verification

To verify the interfaces on which Y.1564 (ethernet service activation test) is enabled, use the **show ethernet service-activation-test brief** command. The following is a sample output of an enabled device:

```
RP/0/RP0/CPU0:router#show ethernet service-activation-test brief
```

```
Interface TenGigE0/0/0/14.1
```

```
Service activation tests permitted (external only)
```

```
Test completed:
```

```
Duration 1 minute(s)
```

```
Information rate 1 Gbps
```

```
Color-aware, CIR: 900 Mbps, EIR: DEI set, CoS 1
```

```
External, Two-way, Destination 00:11:00:22:00:33
```

```
Packet size EMIX, Sequence 'abcege', Pattern hex 0x00
```

```
Packet format: SAT MEF-49
```

```
Outer CoS 2
```

```
Results:
```

```
Step 1, Information Rate 1 Gbps
```

```
CIR packets:
```

```
Tx packets: 11276845, bytes: 6743553310
```

```
Rx packets: 11276845, bytes: 6743553310
```

```
FL: 0, FLR: 0%
```

```
FD: Min 5.144us, Mean 6.681us, Max 9.576us
```

```
IFDV: Not supported
```

```
Out of order packets: 0 (0%)
```

```
Error packets: 0 (0%)
```

```
EIR packets:
```

```
Tx packets: 1252895, bytes: 749231210
```

```
Rx packets: 1252895, bytes: 749231210
```

```
FL: 0, FLR: 0%
```

```
FD: Min 5.160us, Mean 6.679us, Max 8.800us
```

```
IFDV: Not supported
```

```
Out of order packets: 0 (0%)
```

```
Error packets: 0 (0%)
```
