

# **Administering Kubernetes Clusters**

You can create, modify, or delete Kubernetes clusters using the Cisco Container Platform web interface.

This chapter contains the following topics:

- Creating Kubernetes Clusters, on page 1
- Upgrading Kubernetes Clusters, on page 2
- Scaling Kubernetes Clusters, on page 2
- Deleting Kubernetes Clusters, on page 3
- Managing Users and RBAC, on page 3
- Monitoring Health of Cluster Deployments, on page 4
- Monitoring Logs from Cluster Deployments, on page 5

# **Creating Kubernetes Clusters**

#### **Step 1** From the left pane, click **Clusters**, and then click **NEW CLUSTER**.

- **Step 2** In the **Basic Information** screen, specify the following information, and then click **NEXT**:
  - The infrastructure provider where the cluster needs to be created.

For more information, see Adding Provider Profile.

- The name, version of Kubernetes, SSH public key, and description to be used for creating the cluster.
- If you are using ACI CNI, specify the ACI CNI profile, see Adding ACI-CNI Profile.
- **Step 3** In the **Provider Settings** screen, specify the data center, cluster, resource pool, network, HyperFlex local network, datastore, and VM template that you have configured on vSphere, and then click **NEXT**.
  - Ensure that DRA and HA are enabled on the cluster that you choose in this step. For more information on enabling DRS and HA on clusters, refer to the *Cisco Container Platform 1.0 Installation Guide*.
    - Ensure that the datastore that you choose in this step is accessible to the hosts in the cluster.
- **Step 4** In the Node Configuration screen, specify the following information, and then click NEXT:
  - The number of worker and master nodes, and their VCPU and memory configurations.

- The VM username that you want to use as the login for the VM.
- The VIP pool that you want to use for this cluster.
- The IP addresses in CIDR notation that you want to use as the pod subnet.
- **Step 5** In the **Summary** screen, verify the configuration, and then click **FINISH**.

The cluster deployment takes few minutes to complete. The newly created cluster is displayed on the **Clusters** page. For more information on deploying applications on clusters, see Deploying Applications on Kubernetes Clusters.

### **Upgrading Kubernetes Clusters**

#### Before you begin

Ensure that you have imported the latest tenant cluster OVA to the vSphere environment. For more information on importing the tenant cluster OVA, refer to the *Installation Guide*.

**Step 1** From the left pane, click **Clusters**.

Note When an upgrade is available for a Kubernetes cluster, a **Refresh** icon is displayed under the **Kubernetes** Version column.

- Step 2 Click the Refresh icon corresponding to the cluster that you want to upgrade.
- **Step 3** In the **Kubernetes Update** dialog box, choose a template for the VM, and then click **Update Now**. It may take a few minutes for the Kuberenetes cluster upgrade to complete.

### **Scaling Kubernetes Clusters**

You can scale clusters by adding or removing nodes to them based on the demands of the workloads you want to run.

- **Step 1** From the left pane, click **Clusters**.
- **Step 2** From the drop-down list displayed under the ACTIONS column, choose Edit and modify the number of worker nodes, and then click UPDATE.

Alternatively, follow these steps to scale the cluster:

- a) Click the name of the cluster that you want to scale.
- b) Click the Nodes tab.
- c) From the right pane, click EDIT, modify the number of worker nodes, and then click UPDATE.

# **Deleting Kubernetes Clusters**

#### Before you begin

Ensure that the cluster you want to delete is not currently in use, as deleting a cluster removes the containers and data associated with it.

- **Step 1** From the left pane, click **Clusters**.
- **Step 2** From the drop-down list displayed under the **ACTIONS** column, choose **Delete** for the cluster that you want to delete.
- **Step 3** Click **DELETE** in the confirmation dialog box.

## **Managing Users and RBAC**

Cisco Container Platform provides Role-based Access Control (RBAC) through built-in static roles, namely the *Administrator* and *User* roles. Role-based access allows you to use local accounts and LDAP for authentication and authorization.

### **Configuring Local Users**

Cisco Container Platform allows you to manage local users. An administrator can add a user, and assign an appropriate role and cluster(s) to the user.

- **Step 1** From the left pane, click User Management, and then click the Users tab.
- Step 2 Click NEW USER.
- **Step 3** Specify information such as first name, last name, username, password, and role for the user.
- Step 4 Click SUBMIT.

The new user is displayed on the User Management page.

**Note** You can edit or delete a user by using the options available under the **ACTIONS** column.

### **Changing Login Password**

Step 1	From the left pane, click User Management, and then click the Users tab.		
Step 2	From the drop-down list displayed under the ACTIONS column, choose Edit corresponding to your name		
	Note	Administrators can change password and role for other users as well.	
Step 3	Change the password and role assigned as necessary, and click SUBMIT.		

### **Configuring AD Servers**

LDAP authentication is performed using a service account that can access the LDAP database and query for user accounts. You will need to configure the AD server and service account in Cisco Container Platform.

Step 1	From the left pane, click User Management, click the Active Directory tab, and then click EDIT.
Step 2	In the SERVER IP ADDRESS field, type the IP address of the AD server.
Step 3	In the <b>PORT</b> field, type the port number for the AD server.
Step 4	For improved security, we recommend that you check STARTTLS.
Step 5	In the BASE DN field, specify the domain name of the AD server for all the accounts that you have.
Step 6	In the ACCOUNT USERNAME field, specify the service account name that is used for accessing the LDAP server.
Step 7	In the <b>PASSWORD</b> field, type the password of the AD account.
Step 8	Click SUBMIT.

### **Configuring AD Groups**

Cisco Container Platform allows you to manage users using AD groups. An administrator can add users to AD groups, and then assign appropriate roles and clusters to the groups.

#### Before you begin

Ensure that you have configured the AD server that you want to use.

For more information on configuring AD servers, see Configuring AD Servers, on page 4.

- **Step 1** From the left pane, click User Management, and then click the Groups tab.
- Step 2 Click ADD GROUP.
- **Step 3** Specify information such as the name of the AD group and the role you want to assign to the group.
  - **Note** If the AD group is associated with the *Administrator* role, by default, access is provided to all clusters. But, if the AD group is associated with the *User* role, you need to assign a cluster.
- **Step 4** From the **CLUSTERS** drop-down list, choose the names of the cluster that you want to assign to the AD group.
- Step 5 Click SUBMIT.

# **Monitoring Health of Cluster Deployments**

It is recommended to continuously monitor the health of your cluster deployment to improve the probability of early detection of failures and avoid any significant impact from a cluster failure.

Cisco Container Platform is deployed with Prometheus and Grafana configured to start monitoring and logging services automatically when a Kubernetes cluster is created.

Prometheus is an open-source systems monitoring and alerting toolkit and Grafana is an open source metric analytics and visualization suite.

Prometheus collects the data from the cluster deployment, and Grafana provides a general purpose dashboard for displaying the collected data. Grafana offers a highly customizable and user-friendly dashboard for monitoring purposes.

**Note** A user with *Administrator* role can view all the cluster deployments, but a user with *User* role can view only those clusters for which the user has permission to view.

**Step 1** Access the Kubernetes cluster master node using ssh.

ssh -1 <username> <IP address of master node>

- **Note** Once you create a Kubernetes cluster, it may take a few minutes for the necessary services to start. If ssh to a cluster fails, we recommend that you try again after a few minutes.
- **Step 2** Obtain the password for Grafana, which is stored as a Kubernetes secret.

kubectl get secrets ccp-addons-grafana -o yaml | grep grafana-admin-password | awk '{print 2' | base64 --decode

**Step 3** Access the Grafana UI using a web browser.

<IP address of worker node>:<Node port>/login

- **Step 4** Log in to the Grafana UI of your Kubernetes cluster using your username, and the password that you obtained in Step 2.
  - **Note** It is important to either change or retain the original login credentials since the secret that was used to initialize the Grafana login may be lost or changed with future upgrades.
- **Step 5** Add Prometheus as the data source and configure the Grafana dashboard to monitor the health of your cluster deployments.

# **Monitoring Logs from Cluster Deployments**

The Elasticsearch, Fluentd, and Kibana (EFK) stack enables you to collect and monitor log data from containerized applications for troubleshooting or compliance purposes. These components are automatically installed when you install Cisco Container Platform.

Fluentd is an open source data collector. It works at the backend to collect and forward the log data to Elasticsearch.

Kibana is an open source analytics and visualization platform designed to work with Elasticsearch. It allows you to create rich visualizations and dashboards with the aggregated data.

Note

A user with the *Administrator* role can view all logs, but a user with *User* role can view logs for only those clusters for which the user has permission to view.

### Viewing EFK Logs Using Kibana (Tenant Cluster)

Step 1	Download the Kubeconfig file of the cluster whose logs you want to view, see Downloading Kubeconfig File.		
Step 2	Copy the contents of the downloaded Kubeconfig file to:		
	• Your local host ~/.kube/config		
	• A local file and export KUBECONFIG= <downloaded file="" kubeconfig=""></downloaded>		
Step 3	Create a port-forward using kubectl to access Kibana from outside a cluster.		
	a) Determine the pod.		
	kubectl -n kube-system get pods		
	For example, kibana-logging-7db596d7f6-g9pxv		
	b) Open a port-forward.		
	kubectl port-forward -n kube-system		
	For example, kibana-logging-7db596d7f6-g9pxv 5601:5601		
Step 4	Access the Kibana UI and view the data from the target tenant cluster using a web browser.		
	http://localhost:5601/app/kibana		
	For more information on customizing the Kibana UI, refer to the latest Kibana documentation.		

### Viewing EFK Logs Using Kibana (Control Plane Cluster)

Step 1	Access the Kubernetes cluster master node using ssh.		
	ssh ccpuser@control plane master node sudo cat /etc/kubernetes/admin.conf		
Step 2	Copy the contents of the downloaded Kubeconfig file to:		
	• Your local host ~/.kube/config		
	• A local file and export KUBECONFIG= <full file="" kubeconfig="" local="" of="" path="" the=""></full>		
	For more information on setting Kubeconfig, see Configure Access to Multiple Clusters.		
Step 3	Create a port-forward using kubectl to access Kibana from outside a cluster.		
	a) Determine the pod.		
	kubectl -n kube-system get pods		
	For example, kibana-logging-7db596d7f6-g9pxv		
	b) Open a port-forward.		
	kubectl port-forward -n kube-system		
	For example, kibana-logging-7db596d7f6-g9pxv 5601:5601		

# Step 4Access the Kibana UI and view the data from the target tenant cluster using a web browser.<br/>http://localhost:5601/app/kibana<br/>For more information on customizing the Kibana UI, refer to the latest Kibana documentation.

Step 5

What to do next

### Forwarding Logs to External Elasticsearch Server

Use the following Curl commands to configure forwarding of logs to an external Elasticsearch server:

- **Step 1** Open a terminal that has a curl client installed.
- **Step 2** Configure Cisco Container Platform login credentials.

export MGMT\_HOST=https://<Cisco Container Platform IP address>:<Port>
export CCP\_USER=<Username>
export CCP\_PASSWORD=<Password>

#### **Step 3** Login to Cisco Container Platform and save the session cookie for future requests into the cookies.txt local file.

curl -k -j -c cookies.txt -X POST -H "Content-Type:application/x-www-form-urlencoded" -d
"username=\$CCP USER&password=\$CCP\_PASSWORD" \$MGMT\_HOST/2/system/login/

#### **Step 4** Get the list of cluster names.

curl -s -k -b cookies.txt -H "Content-Type: application/json"
\$MGMT\_HOST/2/clusters/ | jq -r '.[].name'

#### **Step 5** Set the CLUSTER\_NAME environment variable to the cluster that you are working on.

export CLUSTER NAME="<A cluster name from Step 2>"

#### **Step 6** Configure the cluster UUID.

export CLUSTER\_UUID=\$(curl -s -k -b cookies.txt -H "Content-Type: application/json"
\$MGMT\_HOST/2/clusters/\$CLUSTER\_NAME | jq -r '.uuid')

#### **Step 7** Configure the Elasticsearch server IP address and port number.

export EFK\_SERVER=<IP address of Elasticsearch server>
export EFK\_PORT=<Port number of Elasticsearch server>

#### **Step 8** Install the helm chart to configure the custom Elasticsearch server.

curl -s -k -b cookies.txt -X POST --header 'Content-Type: application/json' --header 'Accept: application/json' -d '{"chart url": "/opt/ccp/charts/ccp-agent.tgz", "name": "ccpagent", "options":

"apefk.loallogForwarding.enabled=Falæ, apefk.loallogForwarding.elasticsearchHost='\$FK\_BERF', apefk.loallogForwarding.elasticsearchPort='FFK\_PRT'''}' \$MGMT\_HOST/2/clusters/\$CLUSTER\_UUID/helmcharts
