

Get Started with Network Analysis Policies

This chapter provides an insight into network analysis policy basics, prerequisites, and how to manage network analysis policies. It also provides information on custom network analysis policy creation and network analysis policy settings.

- [Overview of Network Analysis Policies, on page 1](#)
- [Manage Network Analysis Policies, on page 2](#)
- [Snort 3 Definitions and Terminologies for Network Analysis Policy, on page 3](#)
- [Prerequisites for Network Analysis and Intrusion Policies, on page 5](#)
- [Custom Network Analysis Policy Creation for Snort 3, on page 5](#)
- [Network Analysis Policy Settings and Cached Changes, on page 28](#)

Overview of Network Analysis Policies

Network analysis policies govern many traffic preprocessing options, and are invoked by advanced settings in your access control policy. Network analysis-related preprocessing occurs after Security Intelligence matching and SSL decryption, but before intrusion or file inspection begins.

By default, the system uses the *Balanced Security and Connectivity* network analysis policy to preprocess all traffic handled by an access control policy. However, you can choose a different default network analysis policy to perform this preprocessing. For your convenience, the system provides a choice of several non-modifiable network analysis policies, which are tuned for a specific balance of security and connectivity by the Cisco Talos Intelligence Group (Talos). You can also create a custom network analysis policy with custom preprocessing settings.

Tip System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules. Network analysis and intrusion policies work together to examine your traffic.

You can also tailor traffic preprocessing options to specific security zones, networks, and VLANs by creating multiple custom network analysis policies, then assigning them to preprocess different traffic. (Note that ASA FirePOWER cannot restrict preprocessing by VLAN.)

Manage Network Analysis Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Under your user name in the toolbar, the system displays a tree of available domains. To switch domains, choose the domain you want to access.

Step 1 Choose one of the following paths to access the network analysis policy.

- **Policies > Access Control**, then click **Network Analysis Policy**
- **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**
- **Policies > Intrusion > Network Analysis Policies**

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

Step 2 Manage your network analysis policy:

- **Compare**—Click **Compare Policies**; see *Comparing Policies* in the *Firepower Management Center Configuration Guide*.

Note You can compare Snort 2 policies only.

- **Create**—If you want to create a new network analysis policy, click **Create Policy**.

Two versions of the network analysis policy are created, a **Snort 2 Version** and a **Snort 3 Version**.

- For the Snort 2 version, see *Custom Network Analysis Policy Creation for Snort 2* in the *Firepower Management Center Configuration Guide*.
- For the Snort 3 version, see [Custom Network Analysis Policy Creation for Snort 3, on page 5](#).
- **Delete**—If you want to delete a network analysis policy, click the **Delete** icon, then confirm that you want to delete the policy. You cannot delete a network analysis policy if an access control policy references it.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Edit**—If you want to edit an existing network analysis policy, click the **Edit** icon.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Report**—Click the **Report** icon; see *Generating Current Policy Reports* in the *Firepower Management Center Configuration Guide*.

Snort 3 Definitions and Terminologies for Network Analysis Policy

The following table lists the Snort 3 concepts and terms used in the Network Analysis Policy.

Table 1: Snort 3 Definitions and Terminologies for Network Analysis Policy

Term	Description
Inspectors	Inspectors are plugins that process packets (similar to the Snort 2 preprocessor).
Binder inspector	<p>Binder inspector defines the flow when a particular inspector has to be accessed and taken into consideration.</p> <p>When the traffic matches the conditions defined in the binder inspector, only then do the values/configurations for that inspector come into effect.</p> <p>For more information, see <i>Binder Inspector</i> in Custom Network Analysis Policy Creation for Snort 3, on page 5.</p>
Singleton inspectors	<p>Singleton inspectors contain one instance. These inspectors do not support adding more instances like multiton inspectors. Settings of singleton inspector are applied to the entire traffic matching that inspector and not to a specific traffic segment.</p> <p>For more information, see <i>Singleton Inspectors</i> in Custom Network Analysis Policy Creation for Snort 3, on page 5.</p>
Multiton inspectors	<p>Multiton inspectors contain multiple instances which you can configure as needed. These inspectors support configuring settings based on specific conditions, such as network, port, and VLAN. One set of supported settings is called an instance.</p> <p>For more information, see <i>Multiton Inspectors</i> in Custom Network Analysis Policy Creation for Snort 3, on page 5.</p>

Term	Description
Schema	<p>The schema file is based on the OpenAPI JSON specification, and it validates the content that you upload or download. You can download the schema file and open it using any third-party JSON editor, such as Swagger editor. The schema file helps you to identify what parameters can be configured for inspectors with their corresponding allowed values, range, and accepted patterns to be used.</p> <p>For more information, see Customize the Network Analysis Policy, on page 11.</p>
Sample file	<p>It is a pre-existing template that contains example configurations to help you with configuring the inspectors.</p> <p>You can refer to the example configurations included in the sample file and make any changes that you may require.</p> <p>For more information, see Customize the Network Analysis Policy, on page 11.</p>
Full configuration	<p>You can download the entire inspector configurations in a single file.</p> <p>All information regarding the inspector configuration is available in this file.</p> <p>The full configuration is a merged configuration of the default configuration (rolled out as a part of the LSP updates by Cisco Talos) and the custom NAP inspector configurations.</p> <p>For more information, see Customize the Network Analysis Policy, on page 11.</p>

Term	Description
Overridden configuration	<p>In the Snort 3 Version of the network analysis policy page:</p> <ul style="list-style-type: none"> • Under Actions > Upload, you can click Overridden Configuration to upload the JSON file that contains the overridden configuration. • Under Actions > Download, you can click Overridden Configuration to download the inspector configuration that has been overridden. <p>If you have not overridden any inspector configuration, then this option is disabled. When you override the inspector configuration, then this option is enabled automatically to allow you to download.</p> <p>For more information, see Customize the Network Analysis Policy, on page 11.</p>

[Network Analysis Policy Mapping](#), on page 9

Prerequisites for Network Analysis and Intrusion Policies

To allow the Snort inspection engine to process traffic for intrusion and malware analysis, you must have the IPS license enabled for the FTD device.

You must be an Admin user to manage network analysis, intrusion policies, and perform migration tasks.

Custom Network Analysis Policy Creation for Snort 3

The default network analysis policy is tuned for typical network requirements and optimal performance. Usually, the default network analysis policy suffices most network requirements and you might not need to customize the policy. However, when you have a specific network requirement or when you are facing performance issues, the default network analysis policy can be customized. Note that customizing the network analysis policy is an advanced configuration that should be done only by advanced users or Cisco support.

Network analysis policy configuration for Snort 3 is a data-driven model, which is based on JSON and JSON Schema. Schema is based on the OpenAPI specification, and it helps you get a view of the supported inspectors, settings, settings type, and valid values. The Snort 3 inspectors are plugins that process packets (similar to the Snort 2 preprocessor). Network analysis policy configuration is available to download in the JSON format.

In Snort 3, the list of inspectors and settings are not in a one-to-one mapping with the Snort 2 list of preprocessors and settings. Also, the number of inspectors and settings available in FMC is a subset of the inspectors and settings that Snort 3 supports. See <https://snort.org/snort3> for more information on Snort 3. See <https://www.cisco.com/go/snort3-inspectors> for more information on the inspectors available in FMC.

**Note**

- While upgrading the FMC to the 7.0 release, the changes that were done in the Snort 2 version of the network analysis policy are not migrated to Snort 3 after the upgrade.
- Unlike the intrusion policy, there is no option to synchronize Snort 2 network analysis policy settings to Snort 3.

Default Inspector Updates

Lightweight Security Package (LSP) updates may contain new inspectors or modifications to integer ranges for existing inspector configurations. Following the installation of an LSP, new inspectors and/or updated ranges will be available under **Inspectors** in the **Snort 3 Version** of your network analysis policy.

Binder Inspector

Binder inspector defines the flow when a particular inspector has to be accessed and taken into consideration. When the traffic matches the conditions defined in the binder inspector, only then the values/configurations for that inspector come into effect. For example:

For the *imap* inspector, the binder defines the following condition when it has to be accessed. That is when:

- Service is equal to imap.
- Role is equal to any.

If these conditions are met, then use the type *imap*.

```
▼ binder
185 {
186   "when": {
187     "service": "imap",
188     "role": "any"
189   },
190   "use": {
191     "type": "imap"
192   }
193 },
```

Singleton Inspectors

Singleton inspectors contain a single instance. These inspectors do not support adding more instances like multiton inspectors. Settings of singleton inspector are applied to the entire traffic and not to a specific traffic segment.

For example:

```
{
  "normalizer":{
    "enabled":true,
    "type":"singleton",
    "data":{
      "ip4":{
        "df":true
      }
    }
  }
}
```

Multiton Inspectors

Multiton inspectors contain multiple instances which you can configure as needed. These inspectors support configuring settings based on specific conditions, such as network, port, and VLAN. One set of supported

settings is called an instance. There is a default instance, and you can also add additional instances based on specific conditions. If the traffic matches that condition, the settings from that instance are applied. Otherwise, the settings from the default instance are applied. Also, the name of the default instance is the same as the inspector's name.

For a multiton inspector, when you upload the overridden inspector configuration, you also need to include/define a matching binder condition (conditions under when the inspector has to be accessed or used) for each instance in the JSON file, otherwise, the upload will result in an error. You can also create new instances, but make sure that you include a binder condition for every new instance that you create to avoid errors.

For example:

- Multiton inspector where the default instance is modified.

```
{
  "http_inspect":{
    "enabled":true,
    "type":"multiton",
    "instances":[
      {
        "name":"http_inspect",
        "data":{
          "response_depth":5000
        }
      }
    ]
  }
}
```

- Multiton inspector where the default instance and default binder is modified.

```
{
  "http_inspect":{
    "enabled":true,
    "type":"multiton",
    "instances":[
      {
        "name":"http_inspect",
        "data":{
          "response_depth":5000
        }
      }
    ]
  },
  "binder":{
    "type":"binder",
    "enabled":true,
    "rules":[
      {
        "use":{
          "type":"http_inspect"
        },
        "when":{
          "role":"any",
          "ports":"8080",
          "proto":"tcp",
          "service":"http"
        }
      }
    ]
  }
}
```

- Multiton inspector where a custom instance and a custom binder is added.

```
{
  "http_inspect":{
    "enabled":true,
    "type":"multiton",
    "instances":[
      {
        "name":"http_inspect1",
        "data":{
          "response_depth":5000
        }
      }
    ]
  },
  "binder":{
    "type":"binder",
    "enabled":true,
    "rules":[
      {
        "use":{
          "type":"http_inspect",
          "name":"http_inspect1"
        },
        "when":{
          "role":"any",
          "ports":"8080",
          "proto":"tcp",
          "service":"http"
        }
      }
    ]
  }
}
```

Network Analysis Policy Mapping

For network analysis policies, Cisco Talos provides mapping information, which is used to find the corresponding Snort 2 version of the policies for the Snort 3 version.

This mapping ensures that the Snort 3 version of policies has its equivalent Snort 2 version.

View Network Analysis Policy Mapping

Step 1 Go to **Policies > Intrusion > Network Analysis Policies**.

Step 2 Click **NAP Mapping**.

Step 3 Expand the arrow for **View Mappings**.

The Snort 3 network analysis policies that are automatically mapped to a Snort 2 equivalent policy are displayed.

Step 4 Click **OK**.

Create a Network Analysis Policy

All the existing network analysis policies are available in FMC with their corresponding Snort 2 and Snort 3 versions. When you create a new network analysis policy, it is created with both the Snort 2 version and the Snort 3 version.

Step 1 Go to **Policies > Intrusion > Network Analysis Policies**.

Step 2 Click **Create Policy**.

Step 3 Enter the **Name** and **Description**.

Step 4 Choose the **Inspection Mode** from the available choices.

- **Detection**
- **Prevention**

Step 5 Select a **Base Policy** and click **Save**.

Note Configure Network Analysis Policy (NAP) in **Prevention** mode if you are using Snort 3 and SSL Decryption or TLS Server Identity.

The new network analysis policy is created with its corresponding **Snort 2 Version** and **Snort 3 Version**.

Modify the Network Analysis Policy

You can modify the network analysis policy to change its name, description, or the base policy.

Step 1 Go to **Policies > Intrusion > Network Analysis Policies**.

Step 2 Click **Edit** to change the name, description, inspection mode, or the base policy.

Note If you edit the network analysis policy name, description, base policy, and inspection mode, the edits are applied to both the Snort 2 and Snort 3 versions. If you want to change the inspection mode for a specific version, then you can do that from within the network analysis policy page for that respective version.

Step 3 Click **Save**.

Search for an Inspector on the Network Analysis Policy Page

On the Snort 3 version of the network analysis policy page, you may need to search for an inspector by entering any relevant text in the search bar.

Step 1 Go to **Policies > Intrusion > Network Analysis Policies**.

Step 2 Go to the **Snort 3 Version** of the network analysis policy.

Step 3 Enter an inspector's name or any relevant text to search for in the **Search** bar.

All the inspectors matching the text you search for are displayed.

For example, if you enter **pop**, then the pop inspector and the binder inspector are shown as matching results on the screen.

- [Customize the Network Analysis Policy](#), on page 11
- [Make Inline Edit for an Inspector to Override Configuration](#), on page 14

Copy the Inspector Configuration

You can copy the inspector configuration for the Snort 3 version of the network analysis policy according to your requirements.

-
- Step 1** Go to **Policies > Intrusion > Network Analysis Policies**.
 - Step 2** Go to the **Snort 3 Version** of the network analysis policy.
 - Step 3** Under **Inspectors**, expand the required inspector for which you want to copy the configuration.
The default configuration is displayed on the left column and the overridden configuration is displayed on the right column under the inspector.
 - Step 4** Click the **Copy to clipboard** icon to copy the inspector configuration to the clipboard for one or both of the following.
 - **Default Configuration** in the left column
 - **Overridden Configuration** in the right column
 - Step 5** Paste the copied inspector configuration to a JSON editor to make any edits you may require.

Related Topics

- [Customize the Network Analysis Policy](#), on page 11

Customize the Network Analysis Policy

You can customize the Snort 3 version of the network analysis policy according to your requirements.

-
- Step 1** Go to **Policies > Intrusion > Network Analysis Policies**.
 - Step 2** Go to the **Snort 3 Version** of the network analysis policy.
 - Step 3** Click the **Actions** drop-down menu.
The following options are displayed:
 - Step 4** Click **View Schema** to open the schema file directly in a browser.

Step 5 You can download the schema file, sample file / template, full configuration, or overridden configuration as needed. These options provide you an insight about the allowed values, range, and patterns, existing and default inspector configurations, and overridden inspector configurations.

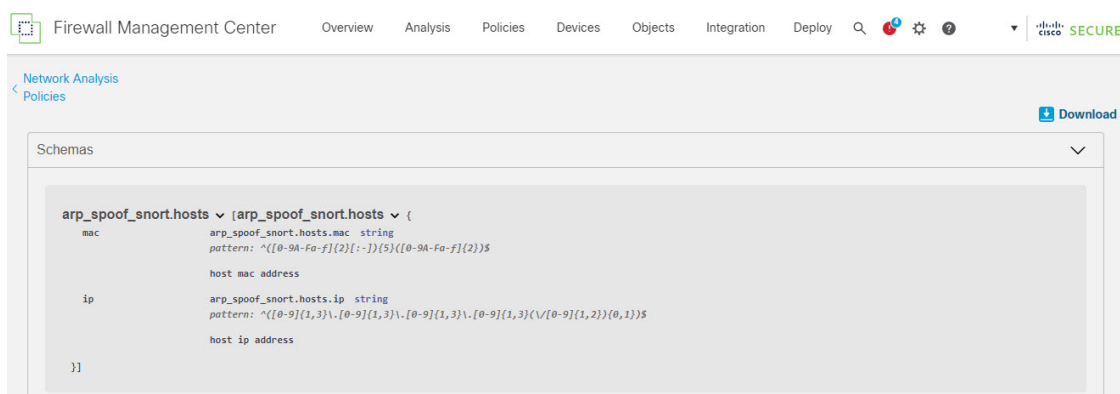

a) Click to download the schema file.

The schema file validates the content that you upload or download. You can download the schema file and open it using any third-party JSON editor. The schema file helps you to identify what parameters can be configured for inspectors with their corresponding allowed values, range, and accepted patterns to be used.

For example, for the *arp_spoof_snort* inspector, you can configure the hosts. The hosts include the *mac* and *ip* address values. The schema file shows the following accepted pattern for these values.

- **mac – pattern:** `^([0-9A-Fa-f]{2}[:-]){5}([0-9A-Fa-f]{2})$`

- **ip – pattern:** `^([0-9]{1,3}\. [0-9]{1,3}\. [0-9]{1,3}\. [0-9]{1,3})(\/[0-9]{1,2}){0,1}$`

You must provide the values, range, patterns according to the accepted ones in the schema file to be able to successfully override the inspector configuration, otherwise, you get an error message.

b) Click to use a pre-existing template that contains example configurations to help you with configuring the inspectors. You can refer to the example configurations included in the sample file and make any changes that you may require.

- c) Click to download the entire inspector configurations in a single JSON file.

Instead of expanding the inspectors separately, you can download the full configuration to look out for the information you need. All information regarding the inspector configuration is available in this file.

- d) Click to download the inspector configuration that has been overridden.

Step 6

To override the existing configuration, follow the steps.

You can choose to override an inspector configuration using the following ways.

- Make inline edits for an inspector directly on the FMC. See the topic **Make Inline Edit for an Inspector to Override Configuration** in the **Getting Started with Network Analysis Policies** chapter of the *Cisco Secure Firewall Management Center Snort 3 Configuration Guide*.
- Continue to follow the current procedure of using the **Actions** drop-down menu to upload the overridden configuration file.

If you chose to make inline edits directly in the FMC, then you don't need to follow the current procedure further. Otherwise, you must follow this procedure completely.

- a) Under **Inspectors**, expand the required inspector for which you want to override the default configuration.

The default configuration is displayed on the left column and the overridden configuration is displayed on the right column under the inspector.

You may need to search for an inspector by entering any relevant text in in the search bar.

- b) Click the **Copy to clipboard** icon to copy the default inspector configuration to the clipboard.
- c) Create a JSON file and paste the default configuration in it.
- d) Keep the inspector configuration that you want to override, and remove all the other configuration and instances from the JSON file.

You can also use the **Sample File / Template** to understand how to override the default configuration. This is a sample file that includes JSON snippets explaining how you can customize the network analysis policy for Snort 3.

- e) Make changes to the inspector configuration as needed.

Validate the changes and make sure they conform to the schema file. For multiton inspectors, make sure that the binder conditions for all instances are included in the JSON file. See *Multiton Inspectors* in the topic **Custom Network Analysis Policy Creation for Snort 3** in the *Cisco Secure Firewall Management Center Snort 3 Configuration Guide* for more information.

- f) If you are copying any further default inspector configurations, append that inspector configuration to the existing file that contains the overridden configuration.

Note The copied inspector configuration must comply with the JSON standards.

- g) Save the overridden configuration file to your system.

Step 7

to upload the JSON file that contains the overridden configuration.

Caution Upload only the changes that you require. You should not upload the entire configuration as it makes the overrides sticky in nature and therefore, any subsequent changes to the default configuration as part of the LSP updates would not be applied.

You can drag and drop a file or click to browse to the JSON file saved in your system that contains the overridden inspector configuration.

- **Merge inspector overrides** – Content in the uploaded file is merged with the existing configuration if there is no common inspector. If there are common inspectors, then the content in the uploaded file (for common inspectors) takes precedence over the previous content, and it replaces the previous configuration for those inspectors.
- **Replace inspector overrides** – Removes all previous overrides and replaces them with the new content in the uploaded file.

Attention Choosing this option deletes all the previous overrides. Make an informed decision before you override the configuration using this option.

If any error occurs while uploading the overridden inspectors, you see the error in the **Upload Overridden Configuration File** pop-up window. You can also download the file with the error, fix the error, and reupload the file.

Step 8 In the **Upload Overridden Configuration File** pop-up window, click **Import** to upload the overridden inspector configuration.

After you upload the overridden inspector configuration, you will see an orange icon next to the inspector that signifies that it is an overridden inspector.

Also, the **Overridden Configuration** column under the inspector shows the overridden value.

You can also view all the overridden inspectors using the **Show Overrides Only** checkbox adjacent to the Search bar.

Note Make sure that you always download the overridden configuration, open the JSON file, and append any new changes/overrides to the inspector configurations to this file. This action is needed so that you do not lose the old overridden configurations.

Step 9 (Optional) Take a backup of the overridden configuration file on your system before making any new inspector configuration changes.

Tip We recommend that you take the backup from time to time as you override the inspector configuration.

Make Inline Edit for an Inspector to Override Configuration

For the Snort 3 version of the network analysis policy, you can make an inline edit for the inspector configuration to override the configuration according to your requirements.

Alternatively, you can also use the **Actions** drop-down menu to upload the overridden configuration file. See [Customize the Network Analysis Policy, on page 11](#) for more information.

Step 1 Go to **Policies > Intrusion > Network Analysis Policies**.

Step 2 Go to the **Snort 3 Version** of the network analysis policy.

Step 3 Under **Inspectors**, expand the required inspector for which you want to override the default setting.

The default configuration is displayed on the left column and the overridden configuration is displayed on the right column under the inspector.

Step 4 Under the **Overridden Configuration** in the right column, click **Edit Inspector** (Pencil) icon to make changes to the inspector configuration.

The Override Configuration pop-up appears where you can make the required edits.

- Note**
- Make sure that you keep only those settings that you want to override. If you leave a setting with the same value, that field becomes sticky. This means if that setting is changed in the future by Talos, the current value will be retained.
 - If you are adding or deleting any custom instance, make sure that you add or delete a binder rule for that instance in the binder inspector as well.

Step 5 Click **OK**.

If there are any errors according to the JSON standards, it shows you an error message.

Step 6 Click **Save** to save the changes.

If the changes conform to the OpenAPI schema specification, the FMC allows you to save the configuration, otherwise, the **Error saving overridden configuration** pop-up appears that shows the errors. You can also download the file with the errors.

[Revert Overridden Configuration to Default Configuration](#), on page 16

[Examples of Custom Network Analysis Policy Configuration](#), on page 17

Revert Unsaved Changes during Inline Edits

While making inline edits to override the configuration for an inspector, you can revert any unsaved changes. Note that this action reverts all unsaved changes to the most recently saved value, but does not revert the configuration to the default configuration for an inspector.

Step 1 Go to **Policies > Intrusion > Network Analysis Policies**.

Step 2 Go to the **Snort 3 Version** of the network analysis policy.

Step 3 Under **Inspectors**, expand the required inspector for which you want to revert the unsaved changes.

The default configuration is displayed in the left column and the overridden configuration is displayed in the right column under the inspector.

Step 4 Under the **Overridden Configuration** on the right column, click the **Cross (X)** icon to revert any unsaved changes for the inspector.

Alternatively, you can click **Cancel** to cancel the changes.

If you do not have any unsaved changes to the inspector configuration, then this option is not visible.

- [Customize the Network Analysis Policy](#), on page 11

Revert Overridden Configuration to Default Configuration

You can revert any changes that you made to override the default configuration for an inspector. This action reverts the overridden configuration to the default configuration for an inspector.

-
- Step 1** Go to **Policies > Intrusion > Network Analysis Policies**.
 - Step 2** Go to the **Snort 3 Version** of the network analysis policy.
 - Step 3** Under **Inspectors**, expand the required inspector for which you want to revert the overridden configuration.

The overridden inspectors are shown with the orange icon next to their name.

The default configuration is displayed on the left column and the overridden configuration is displayed on the right column under the inspector. Under the **Overridden Configuration** on the right column, click **Revert to default configuration** (back arrow) icon to revert the overridden configuration for the inspector to the default configuration.

If you did not make any changes to the default configuration for the inspector, then this option is disabled.

- Step 4** Click **Revert** to confirm the decision.
- Step 5** Click **Save** to save the changes.

If you do not want to save the changes, you can click **Cancel** or the **Cross (X)** icon.

Related Topics

[Customize the Network Analysis Policy](#), on page 11

[Make Inline Edit for an Inspector to Override Configuration](#), on page 14

[Examples of Custom Network Analysis Policy Configuration](#), on page 17

Examples of Custom Network Analysis Policy Configuration

This is a sample file that includes JSON snippets explaining how you can customize the network analysis policy for Snort 3. You can choose to override an inspector configuration using the following ways:

- Make inline edits for an inspector directly on the FMC. See [Make Inline Edit for an Inspector to Override Configuration](#), on page 14.
- Use the **Actions** drop-down menu to upload the overridden configuration file. See [Customize the Network Analysis Policy](#), on page 11.

Before you choose any of these options, review all the following details and examples that will help you in defining the network analysis policy overrides successfully. You must read and understand the examples for various scenarios explained here to avoid any risks and errors.

If you choose to override an inspector configuration from the **Actions** drop-down menu, you need to construct a JSON file for the network analysis policy overrides and upload the file.

For overriding an inspector configuration in the network analysis policy, you must upload only the changes that you require. You should not upload the entire configuration because it makes the overrides sticky in nature and therefore, any subsequent changes to the default values or configuration as part of the LSP updates would not be applied.

Here are the examples for various scenarios:

Enabling a Singleton Inspector when the Default State in the Base Policy is Disabled

```
{
  "rate_filter": {
    "enabled": true,
    "type": "singleton",
    "data": []
  }
}
```

Disabling a Singleton Inspector when the Default State in the Base Policy is Enabled

```
{
  "rate_filter": {
    "enabled": false,
    "type": "singleton",
    "data": []
  }
}
```

Enabling a Multiton Inspector when the Default State in the Base Policy is Disabled

```
{
  "ssh": {
    "enabled": true,
    "type": "multiton",
    "instances": []
  }
}
```

Disabling a Multiton Inspector when the Default State in the Base Policy is Enabled

```
{
  "ssh": {
    "enabled": false,
    "type": "multiton",
    "instances": []
  },
  "iec104": {
    "type": "multiton",
    "enabled": false,
    "instances": []
  }
}
```

Overriding the Default Value of Specific Setting(s) for Singleton Inspector

```
{
  "normalizer": {
    "enabled": true,
    "type": "singleton",
    "data": {
      "tcp": {
        "block": true
      },
      "ip6": true
    }
  }
}
```

Overriding Specific Setting(s) of a Default Instance (where Instance Name Matches with Inspector Type) in Multiton Inspector

```
{
  "http_inspect": {
    "enabled": true,
    "type": "multiton",
    "instances": [
      {
        "data": {
          "unzip": false
        },
        "name": "http_inspect"
      }
    ]
  }
}
```

Adding Binder Rule for a Default Instance with Required Changes

Note Default binder rules can't be edited, they are always appended at the end.

```
{
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "use": {
```

```

        "type": "http_inspect"
    },
    "when": {
        "role": "server",
        "service": "http",
        "dst_nets": "10.1.1.0/24"
    }
}
]
}
}

```

Adding a New Custom Instance

Note Corresponding binder rule entry must be defined in the binder inspector.

```

{
  "telnet": {
    "enabled": true,
    "type": "multiton",
    "instances": [
      {
        "name": "telnet_my_instance",
        "data": {
          "encrypted_traffic": true
        }
      }
    ]
  },
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "when": {
          "role": "any",
          "service": "telnet"
        },
        "use": {
          "type": "telnet",
          "name": "telnet_my_instance"
        }
      }
    ]
  }
}

```

Overriding a Singleton Instance, Multiton Default Instance, and Creating a New Multiton Instance in a Single JSON Override

Example to show the following in a single JSON override:

- Overriding a Singleton instance (**normalizer** inspector)
- Overriding a Multiton default instance (**http_inspect** inspector)
- Creating a new Multiton instance (**telnet** inspector)

```

{
  "normalizer": {
    "enabled": true,
    "type": "singleton",
    "data": {
      "tcp": {
        "block": true
      },
      "ip6": true
    }
  },
  "http_inspect": {
    "enabled": true,
    "type": "multiton",
    "instances": [
      {
        "data": {
          "unzip": false,
          "xff_headers": "x-forwarded-for true-client-ip x-another-forwarding-header"
        },
        "name": "http_inspect"
      }
    ]
  },
  "telnet": {
    "enabled": true,
    "type": "multiton",
    "instances": [
      {
        "name": "telnet_my_instance",
        "data": {
          "encrypted_traffic": true
        }
      }
    ]
  },
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "when": {
          "role": "any",
          "service": "telnet"
        },
        "use": {
          "type": "telnet",
          "name": "telnet_my_instance"
        }
      },
      {
        "use": {
          "type": "http_inspect"
        },
        "when": {
          "role": "server",
          "service": "http",
          "dst_nets": "10.1.1.0/24"
        }
      }
    ]
  }
}

```

Note You don't need to give the **name** attribute for the default instance in binder rules.

Configuring arp_spoof

Example for configuring **arp_spoof**:

The **arp_spoof** inspector does not have any default configurations for any attributes. This demonstrates the case where you can provide the overrides.

```
{
  "arp_spoof": {
    "type": "singleton",
    "data": {
      "hosts": [
        {
          "ip": "1.1.1.1",
          "mac": "ff:0f:f1:0f:0f:ff"
        },
        {
          "ip": "2.2.2.2",
          "mac": "ff:0f:f2:0f:0f:ff"
        }
      ]
    },
    "enabled": true
  }
}
```

Configuring rate_filter

```
{
  "rate_filter": {
    "data": [
      {
        "apply_to": "[10.1.2.100, 10.1.2.101]",
        "count": 5,
        "gid": 135,
        "new_action": "alert",
        "seconds": 1,
        "sid": 1,
        "timeout": 5,
        "track": "by_src"
      }
    ],
    "enabled": true,
    "type": "singleton"
  }
}
```

Configuring Binder Rules when Multi-Hierarchy Network Analysis Policy is Used

This example illustrates adding a new custom instance in child policy and the way binder rules should be written. Binder rules are defined as a list and therefore, it is important to pick up the rules defined in the parent policy and build the new rules on top of it as rules will not be merged automatically. The binder rules available in child policy are a source of truth in totality.

On the Firepower Threat Defense, the default Cisco Talos policy rules are appended on these user-defined overrides.

Parent Policy:

We have defined a custom instance by the name **telnet_parent_instance** and the corresponding binder rule.

```
{
  "telnet": {
    "type": "multiton",
    "instances": [
      {
        "data": {
          "normalize": true,
          "encrypted_traffic": true
        },
        "name": "telnet_parent_instance"
      }
    ],
    "enabled": true
  },
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "when": {
          "role": "any",
          "service": "telnet"
        },
        "use": {
          "type": "telnet",
          "name": "telnet_parent_instance"
        }
      }
    ]
  }
}
```

Child Policy:

This network analysis policy has the aforementioned policy as its base policy. We have defined a custom instance by the name **telnet_child_instance** and have also defined the binder rules for this instance. The binder rules from parent policy need to be copied here, and then child policy binder rules can be prepended or appended on top of it based on the nature of the rule.

```
{
  "telnet": {
    "type": "multiton",
    "instances": [
      {
        "data": {
          "normalize": true,
          "encrypted_traffic": false
        },
        "name": "telnet_child_instance"
      }
    ],
    "enabled": true
  },
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "when": {
```

```

        "role": "any",
        "service": "telnet",
        "nets": "10.2.2.0/24"
    },
    "use": {
        "type": "telnet",
        "name": "telnet_child_instance"
    }
},
{
    "when": {
        "role": "any",
        "service": "telnet"
    },
    "use": {
        "type": "telnet",
        "name": "telnet_parent_instance"
    }
}
]
}
}

```

Configuring List Inspector Attribute in General

While changing overrides for any attribute of type list, it is important to pass the full contents rather than partial override. This means if a base policy attributes are defined as:

```

{
  "list-attribute": [
    {
      "entry1": {
        "key1": "value1"
      }
    },
    {
      "entry2": {
        "key2": "value2"
      }
    }
  ]
}

```

If you want to modify **value1** to **value1-new**, the override payload must look like the following:

Correct Way:

```

{
  "list-attribute": [
    {
      "entry1": {
        "key1": "value1-new"
      }
    },
    {
      "entry2": {
        "key2": "value2"
      }
    }
  ]
}

```

Incorrect Way:

```
{
  "list-attribute": [
    {
      "entry1": {
        "key1": "value1-new"
      }
    }
  ]
}
```

You can understand this configuration by taking the trimmed values of the `alt_max_command_line_len` attribute in the `smtp` inspector. Suppose the default (base) policy configuration for `smtp` inspector is as follows:

```
{
  "smtp": {
    "type": "multiton",
    "instances": [
      {
        "name": "smtp",
        "data": {
          "decompress_zip": false,
          "normalize_cmds": "ATRN AUTH BDAT CHUNKING DATA DEBUG EHLO
EMAL ESAM ESND ESOM ETRN EVFY EXPN HELO HELP IDENT MAIL
NOOP ONEX QUEU QUIT RCPT RSET SAML SEND SOML STARTTLS TICK
TIME TURN TURNME VERB VRFY X-ADAT XADR XAUTH XCIR X-DRCP X-
ERCP XEXCH50 X-EXCH50 X-EXPS XGEN XLICENSE X-LINK2STATE XQUE
XSTA XTRN XUSR",
          "ignore_data": false,
          "max_command_line_len": 512,
          "max_header_line_len": 1000,
          "log_rcptto": false,
          "decompress_swf": false,
          "max_response_line_len": 512,
          "b64_decode_depth": -1,
          "max_auth_command_line_len": 1000,
          "log_email_hdrs": false,
          "xlink2state": "alert",
          "binary_data_cmds": "BDAT XEXCH50",
          "auth_cmds": "AUTH XAUTH X-EXPS",
          "log_filename": false,
          "uu_decode_depth": -1,
          "ignore_tls_data": false,
          "data_cmds": "DATA",
          "bitenc_decode_depth": -1,
          "alt_max_command_line_len": [
            {
              "length": 255,
              "command": "ATRN"
            },
            {
              "command": "AUTH",
              "length": 246
            },
            {
              "length": 255,
              "command": "BDAT"
            },
            {
              "length": 246,
              "command": "DATA"
            }
          ],
          "log_mailfrom": false,

```

```

        "decompress_pdf": false,
        "normalize": "none",
        "email_hdrs_log_depth": 1464,
        "valid_cmds": "ATRN AUTH BDAT CHUNKING DATA DEBUG EHLO
        EMAL ESAM ESND ESOM ETRN EVFY EXPN HELO HELP IDENT MAIL
        NOOP ONEX QUEU QUIT RCPT RSET SAML SEND SOML STARTTLS TICK
        TIME TURN TURNME VERB VRFY X-ADAT XADR XAUTH XCIR X-DRCP X-
        ERCP XEXCH50 X-EXCH50 X-EXPS XGEN XLICENSE X-LINK2STATE XQUE
        XSTA XTRN XUSR",
        "qp_decode_depth": -1
    }
}
],
"enabled": true
}
}

```

Now, if you want to add two more objects to the `alt_max_command_line_len` list:

```

{
  "length": 246,
  "command": "XEXCH50"
},
{
  "length": 246,
  "command": "X-EXPS"
}

```

Then the custom network analysis policy override JSON would look like the following:

```

{
  "smtp": {
    "type": "multiton",
    "instances": [
      {
        "name": "smtp",
        "data": {
          "alt_max_command_line_len": [
            {
              "length": 255,
              "command": "ATRN"
            },
            {
              "command": "AUTH",
              "length": 246
            },
            {
              "length": 255,
              "command": "BDAT"
            },
            {
              "length": 246,
              "command": "DATA"
            },
            {
              "length": 246,
              "command": "XEXCH50"
            },
            {
              "length": 246,
              "command": "X-EXPS"
            }
          ]
        }
      }
    ]
  }
}

```

```

    ],
    "enabled": true
  }
}

```

Configuring Overrides when Multi-Hierarchy Network Analysis Policy is used in Multiton Inspector

This example illustrates overriding attributes in child policy and how the merged configuration will be used in the child policy for any instance. Any overrides defined in the child policy will be merged with the parent policy. Thus, if attribute1 and attribute2 are overridden in parent policy and attribute2 and attribute3 are overridden in the child policy, the merged configurations are for child policy. This means that attribute1 (defined in parent policy), attribute2 (defined in child policy), and attribute3 (defined in child policy) will be configured on the device.

Parent Policy:

Here we have defined a custom instance by the name **telnet_parent_instance** and overridden 2 attributes namely, **normalize** and **encrypted_traffic** in the custom instance.

```

{
  "telnet": {
    "type": "multiton",
    "instances": [
      {
        "data": {
          "normalize": true,
          "encrypted_traffic": false
        },
        "name": "telnet_parent_instance"
      }
    ],
    "enabled": true
  },
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "when": {
          "role": "any",
          "service": "telnet"
        },
        "use": {
          "type": "telnet",
          "name": "telnet_parent_instance"
        }
      }
    ]
  }
}

```

Child Policy:

This network analysis policy has the aforementioned policy as its base policy. We have overridden attribute **encrypted_traffic** from parent policy and also overridden new attribute **ayt_attack_thresh**.

```

{
  "telnet": {
    "type": "multiton",
    "instances": [
      {
        "data": {
          "encrypted_traffic": true,

```

```

        "ayt_attack_thresh": 1
      },
      "name": "telnet_parent_instance"
    }
  ],
  "enabled": true
}

```

With the above policy JSON, when you deploy the network analysis policy the following merged JSON will be configured on the device.

```

{
  "telnet": {
    "type": "multiton",
    "instances": [
      {
        "data": {
          "normalize": true,
          "encrypted_traffic": true,
          "ayt_attack_thresh": 1
        },
        "name": "telnet_parent_instance"
      }
    ],
    "enabled": true
  },
  "binder": {
    "enabled": true,
    "type": "binder",
    "rules": [
      {
        "when": {
          "role": "any",
          "service": "telnet"
        },
        "use": {
          "type": "telnet",
          "name": "telnet_parent_instance"
        }
      }
    ]
  }
}

```

This example illustrates details for the custom network analysis policy. The same behavior is also exhibited in the default instance. Also, a similar merging would be done for Singleton inspectors.

Removing all the Inspector Overrides for the Network Analysis Policy:

Whenever you want to remove all the overrides for a specific network analysis policy, you can upload an empty JSON. While uploading the overrides, choose the option **Replace inspector overrides**.

```

{
}

```

Network Analysis Policy Settings and Cached Changes

When you create a new network analysis policy, it has the same settings as its base policy.

When tailoring a network analysis policy, especially when disabling inspectors, keep in mind that some inspectors and intrusion rules require that traffic first be decoded or preprocessed in a certain way. If you disable a required inspector, the system automatically uses it with its current settings, although the inspector remains disabled in the network analysis policy web interface.

Note Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet **must** complement each other. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task.

The system caches one network analysis policy per user. While editing a network analysis policy, if you select any menu or other path to another page, your changes stay in the system cache even if you leave the page.
