

# **Configure a Basic Policy**

Configure a basic security policy with the following settings:

- Inside and outside interfaces—Assign a static IP address to the inside interface, and use DHCP for the outside interface.
- DHCP server—Use a DHCP server on the inside interface for clients.
- Default route—Add a default route through the outside interface.
- NAT—Use interface PAT on the outside interface.
- Access control—Allow traffic from inside to outside.

You can also ccustomize your security policy to include more advanced inspections.

- Configure Interfaces, on page 1
- Configure the DHCP Server, on page 6
- Configure NAT, on page 7
- Configure an Access Control Rule, on page 10
- Enable SSH on the Outside Interface, on page 13
- Deploy the Configuration, on page 14

# **Configure Interfaces**

When you use zero-touch provisioning or the device manager for initial setup, the following interfaces are preconfigured:

- Ethernet 1/1—outside, IP address from DHCP, IPv6 autoconfiguration
- Ethernet 1/2—inside, 192.168.95.1/24
- Default route—Obtained through DHCP on the outside interface

If you performed additional interface-specific configuration within device manager before registering with the management center, then that configuration is preserved.

The following example configures a routed-mode inside interface with a static address and a routed-mode outside interface using DHCP. It also adds a DMZ interface for an internal web server.

## Procedure

**Step 1** Choose **Devices** > **Device Management**, and click **Edit** () for the firewall.

## Step 2

Figure 1: Interfaces

Device

Click Interfaces.

Routing	Interfaces	Inline Sets	DHCP	VTEP

						Q Search by name	Sync D	Add In	terfaces 🔻
Interface	Logical Name	Туре	Security Zones	MAC Address (Active/Standby)	IP Ad	dress	Path Monitorin	Virtual Router

1500 (64 - 9000) Priority:				

a) From the **Security Zone** drop-down list, choose an existing inside security zone or add a new one by clicking **New**.

For example, add a zone called **inside\_zone**. You apply your security policy based on zones or groups. For example, configure your access control policy to enable traffic to go from the inside zone to the outside zone, but not from outside to inside.

If the inside interface was preconfigured, the rest of these fields are optional.

b) Enter a Name up to 48 characters in length.

For example, name the interface inside.

- c) Check the Enabled check box.
- d) Leave the Mode set to None.
- e) Click the IPv4 and/or IPv6 tab.
  - IPv4—Choose Use Static IP from the drop-down list, and enter an IP address and subnet mask in slash notation.

For example, enter 192.168.1.1/24

### Figure 3: IPv4 Tab

NVE Only:				

a) From the **Security Zone** drop-down list, choose an existing outside security zone or add a new one by clicking **New**.

For example, add a zone called **outside\_zone**.

You should not alter any other basic settings because doing so will disrupt the management center management connection.

- b) Click OK.
- **Step 5** Configure a DMZ interface to host a web server, for example.
  - a) Click **Edit** (*I*) for the interface you want to use.
  - b) From the Security Zone drop-down list, choose an existing DMZ security zone or add a new one by clicking New.
     For example, add a zone called dmz\_zone.
  - c) Enter a Name up to 48 characters in length.

For example, name the interface **dmz**.

- d) Check the Enabled check box.
- e) Leave the Mode set to None.
- f) Click the IPv4 and/or IPv6 tab and configure the IP address as desired.
- g) Click OK.

Step 6 Click Save.

# **Configure the DHCP Server**

Enable the DHCP server if you want clients to use DHCP to obtain IP addresses from the firewall.

Procedure

- **Step 1** Choose **Devices** > **Device Management**, and click **Edit** () for the device.
- Step 2 Choose DHCP > DHCP Server.

### Figure 6: DHCP Server

Device Routing Interface	s Inline Sets DHCP VTEP	SNMP	
DHCP Server	Ping Timeout	(10 - 10000 ms)	
DHCP Relay DDNS	Lease Length 3600 Auto-Configuration Interface	(300 - 10,48,575 sec)	
	Override Auto Configured Sett	J	
	Primary DNS Server	Primary WINS Server	
	Secondary DNS Server	Secondary WINS Server	
[	Server Advanced		+ Add
	Interface	Address Pool	Enable DHCP Server
		No records to display	

**Step 3** In the **Server** area, click **Add** and configure the following options.

Figure 7: Add Server

Add Server			?
Interface*			
inside	~		
Address Pool*			
192.168.1.2-192.168.1.55			
(2.2.2.10-2.2.2.20)			
Enable DHCP Server			
		Cancel	ок

- Interface—Choose the interface name from the drop-down list.
- Address Pool—Set the range of IP addresses. The IP addresses must be on the same subnet as the selected interface and cannot include the IP address of the interface itself.
- Enable DHCP Server—Enable the DHCP server on the selected interface.

Step 4Click OK.Step 5Click Save.

# **Configure NAT**

This procedure creates a NAT rule for internal clients to convert the internal addresses to a port on the outside interface IP address. This type of NAT rule is called *interface Port Address Translation (PAT)*.

### Procedure

- **Step 1** Choose **Devices** > **NAT**, and click **New Policy**.
- **Step 2** Name the policy, select the devices that you want to use the policy, and click **Save**.

### Figure 8: New Policy

New Policy				?
Name: FTD_policy				
Description:				
Targeted Devices Select devices to which you want to apply t	his policy.			_
Available Devices and Templates		Selected Devices an	nd Templates	ā
192.168.0.124		192.168.0.124		Ū
192.168.0.155	· · · ·			
	Add to Policy			
			Cancel	ave

The policy is added the management center. You still have to add rules to the policy.

## Figure 9: NAT Policy

							Show Warning	s Save	Cancel

	-					

**Step 6** On the **Translation** page, configure the following options:

### Figure 12: Translation

Interface Objects	Translation	PAT Pool	Advanced
Original Packet			Translated Packet
Original Source:* all-ipv4	~ +		Translated Source: Destination Interface IP  The values selected for
Original Port: TCP	~		Destination Interface Objects in 'Interface Objects' tab will be used
			Translated Port:

• Original Source—Click Add (+) to add a network object for all IPv4 traffic (0.0.0.0/0).

#### Figure 13: New Network Object

New Network Object		(?)
Name all-ipv4		
Description		
Network Range Network	O FQDN	
0.0.0/0		
Allow Overrides		
	Cancel	Save

**Note** You cannot use the system-defined **any-ipv4** object, because Auto NAT rules add NAT as part of the object definition, and you cannot edit system-defined objects.

- Translated Source—Choose Destination Interface IP.
- **Step 7** Click **Save** to add the rule.

The rule is saved to the **Rules** table.

**Step 8** Click **Save** on the **NAT** page to save your changes.

## **Configure an Access Control Rule**

If you created a basic **Block all traffic** access control policy when you registered the device, then you need to add rules to the policy to allow traffic through the device. The access control policy can include multiple rules that are evaluated in order.

This procedure creates an access control rule to allow all traffic from the inside zone to the outside zone.

### Procedure

Step 1 Choose Policy > Access Policy > Access Policy, and click Edit ( ) for the access control policy assigned to the device.
 Step 2 Click Add Rule, and set the following parameters.

L

### Figure 14: Source Zone

1	0 Add Rule	•

	4 inside
	Any
+ Create Security Zone Object	Add Source Zone 5 Add Destination Zone

4. Select the outside zone from Zones.

### 5. Click Add Destination Zone.

Leave the other settings as is.

**Step 3** (Optional) Customize associated policies by clicking on the policy type in the packet flow diagram.

Prefilter, Decryption, Security Intelligence, and Identity policies are applied before an access control rule. Customizing these policies is not required, but after you know your network's needs, they let you improve network performance by either fastpathing trusted traffic (bypassing processing) or blocking traffic so no further processing is required.

Figure 16: Policies Applied Before Access Control

₽ Packets →	0	Prefilter Rules	→ C	Decryption →	Ø	Security Intelligence	→ (	🔵 ldentity → 🄇	Access Control
-------------	---	-----------------	-----	--------------	---	-----------------------	-----	----------------	----------------

• **Prefilter Rules**—The Default Prefilter Policy passes all traffic for the other rules to act on (analyzes). The only change to the default policy you can make is to **block** tunnel traffic. Otherwise, you can create a new prefilter policy to associate with the access control policy that can analyze (pass on), fastpath (bypass further checks) or block.

Prefiltering lets you improve performance by dealing with traffic before it gets any further, by either blocking or fastpathing. In a new policy, you can add *tunnel* rules and *prefilter* rules. A tunnel rule lets you fastpath, block, or rezone plaintext (non-encrypted), passthrough tunnels. A prefilter rule lets you fastpath or block non-tunneled traffic identified by IP address, port, and protocol.

For example, if you know you want to block all FTP traffic on your network, but fastpath SSH traffic from an administrator, you can add a new prefilter policy.

- **Decryption**—Decryption is not applied by default. Decryption is a way to expose network traffic to deep inspection. In most cases, you don't want to decrypt traffic, and can only do so if it is legally allowed. For maximum network protection, a decryption policy might be a good idea for traffic going to critical servers or coming from untrusted network segments.
- Security Intelligence—(Requires the IPS license) Security Intelligence is enabled by default. Security Intelligence is another early defense against malicious activity applied before passing connections to the access control policy for further processing. Security Intelligence uses reputation intelligence to quickly block connections to or from IP addresses, URLs, and domain names provided by Talos, the threat intelligence organization at Cisco. You can add or delete additional IP addresses, URLs, or domains if desired.
- **Note** If you do not have the IPS license, this policy will not be deployed even though it shows in your access control policy as enabled.
- **Identity**—Identity is not applied by default. You can require a user to authenticate before allowing traffic to be processed by the access control policy.
- **Step 4** (Optional) Add an Intrusion policy that is applied after the access control rule.

The Intrusion policy is a defined set of intrusion detection and prevention configurations that inspects traffic for security violations. The management center includes many system-provided policies you can enable as-is or that you can customize. This step enables a system-provided policy.

a) Click the Intrusion Policy drop-down list.

Figure 17: System-Provided Intrusion Policies

Int	rusion Policy	None ^
ags		System-Provided Policies
Selected Sources: 1		Balanced Security and Conne
Collapse	e All	Connectivity Over Security
ZONE	🗸 1 Object	Maximum Detection
	📫 inside_	Security Over Connectivity
		User-Created Policies

- b) Choose one of the system-provided policies from the list.
- **Step 5** (Optional) Add a File policy that is applied after the access control rule.

a) Click the **File Policy** drop-down list and choose either an existing policy or add one by choosing the **Open File Policy** List.

Figure 18: File Policy

🖶 File Policy	None	^
	No options	
ns and Applicatio	Open File Policy List <sup>↗</sup>	

For a new policy, the **Policies** > **Malware & File** page opens in a separate tab.

- b) See the Cisco Secure Firewall Device Manager Configuration Guide for details on creating the policy.
- c) Return to the Add Rule page and select the newly created policy from the drop-down list.

### Step 6 Click Apply.

The rule is added to the **Rules** table.

Step 7 Click Save.

## Enable SSH on the Outside Interface

This section describes how to enable SSH connections to the outside interface.

By default, you can use the **admin** user for which you configured the password during initial setup.

## Procedure

Step 3

- Step 2 Select SSH Access.
  - Identify the outside interface and IP addresses that allow SSH connections.
    - a) Click Add to add a new rule, or click Edit to edit an existing rule.
    - b) Configure the rule properties:
      - **IP** Address—The network object or group that identifies the hosts or networks you are allowing to make SSH connections. Choose an object from the drop-down menu, or click + to add a new network object.
      - Available Zones/Interfaces—Add the outside zone or type the outside interface name into the field below the Selected Zones/Interfaces list and click Add.

Figure 19: Enable SSH on the Outside Interface
