| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fetch user name from certificate settings (contd..) | <ul style="list-style-type: none"> <li>• Specify individual DN fields as the username—Choose from the Primary DN Field and Secondary DN Field drop-down values to specify which attributes and additional attributes to use to derive the username. This option is enabled by default.               <ul style="list-style-type: none"> <li>- C—Country: the two-letter country abbreviation which conforms to the ISO 3166 country abbreviations.</li> <li>- CN—Common Name: the name of a person, system, or other entity. Not available as a secondary attribute.</li> <li>- DNQ—Domain Name Qualifier.</li> <li>- EA—Email address.</li> <li>- GENQ—Generational qualifier.</li> <li>- GN—Given name.</li> <li>- I—Initials.</li> <li>- L—Locality: the city or town where the organization is located.</li> <li>- N—Name.</li> <li>- O—Organization: the name of the company, institution, agency, association, or other entity.</li> <li>- OU—Organizational Unit: the subgroup within the organization (O).</li> <li>- SER—Serial number.</li> <li>- SN—Surname.</li> <li>- SP—State/Province: the state or province where the organization is located.</li> <li>- T—Title.</li> <li>- UID—User Identifier.</li> <li>- UPN—User Principal Name.</li> </ul> </li> <li>• Use LUA Script generated by ASDM—Choose this option if you want to use the LUA script that is generated by ASDM. This option is disabled by default.</li> </ul> |
| Enable HTTP Server                                  | Enables or disables the HTTP server on the device. When enabled, you can specify a communications <b>Port</b> for the server. The Port range is 1 to 65535; the default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## HTTP Configuration Dialog Box

Use the HTTP Configuration dialog box to add or edit a host or network that will be allowed to access the HTTP server on the device via a specific interface; you also can enable and disable HTTP redirect.

**Navigation Path**

You can access the HTTP Configuration dialog box from the [HTTP Page, page 49-2](#).

**Field Reference****Table 49-2 HTTP Configuration Dialog Box**

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                    | Enter or Select the interface on which access to the HTTP server on the device is allowed.<br><br><b>Note</b> Beginning with Cisco Security Manager version 4.17, you can configure BVI interface for HTTP on ASA 9.9.2 devices and above. However, in multi-context, “Transparent” mode security context only supports BVI interface.                                                                                                                        |
| IP Address/Netmask                | Enter the IP address and netmask, separated by a forward slash (“/”) of the host or network that is permitted to establish an HTTP connection with the device. Alternately, you can click Select to select a Networks/Hosts object.<br><br><b>Note</b> Beginning with version 4.13, Cisco Security Manager supports policies—Groups, Hosts, Address Range, and Network for IPv6 devices.                                                                      |
| Enable Authentication Certificate | Select this option to require user certificate authentication in order to establish an HTTP connection. On ASA and PIX 8.0(2)+ devices, you can specify the authentication <b>Port</b> .                                                                                                                                                                                                                                                                      |
| Certificate Maps                  | Select the Certificate Map name that you configured in Remote Access VPN > certificate to Connection Profile Maps > Rules. For more information, see <a href="#">Map Rule Dialog Box (Upper Table), page 31-39</a> . None is selected by default.<br><br>This feature is available beginning with Security Manager version 4.12 for ASA 9.6(2) or later devices. This option is supported for single, multi, routed and transparent contexts for ASA devices. |
| Redirect port                     | The port on which the security appliance listens for HTTP requests, which it then redirects to HTTPS. To disable HTTP redirect, ensure that this field is blank.                                                                                                                                                                                                                                                                                              |

## Configuring ICMP

Use the table on the ICMP page to manage Internet Control Message Protocol (ICMP) rules, which specify the addresses of all hosts or networks that are allowed or denied ICMP access to specific interfaces on the security device.

**Note**

Starting from ASA 8.2(1) ICMP IPv6 was supported in the transparent firewall mode.

The ICMP rules control ICMP traffic that terminates on any device interface. If no ICMP control list is configured, the device accepts all ICMP traffic that terminates at any interface, including the outside interface. However, by default, the device does not respond to ICMP echo requests directed to a broadcast address.

It is recommended that permission is always granted for the ICMP Unreachable message (type 3). Denying ICMP Unreachable messages disables ICMP Path MTU discovery, which can halt IPsec and PPTP traffic. See RFC 1195 and RFC 1435 for details about Path MTU Discovery.

If an ICMP control list is configured, the device uses a first match to the ICMP traffic, followed by an implicit deny all. That is, if the first matched entry is a permit entry, the processing of the ICMP packet continues. If the first matched entry is a deny entry, or an entry is not matched, the device discards the ICMP packet and generates a syslog message. If an ICMP control list is not configured, a permit rule is assumed in all cases.

#### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > ICMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > ICMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

#### Note

ICMP IPv6 support is not available for PIX and FWSM devices.

#### Field Reference

**Table 49-3** ICMP Page

| Element                            | Description                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ICMP Rules Table                   | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage ICMP rules. Add Row opens the Add ICMP dialog box, while Edit Row opens the Edit ICMP dialog box. See <a href="#">Add and Edit ICMP Dialog Boxes, page 49-5</a> for information about these dialog boxes. |
| <b>ICMP Unreachable Parameters</b> |                                                                                                                                                                                                                                                                                        |
| Rate Limit                         | For ICMP traffic that terminates at an interface on this device, the maximum number of ICMP Unreachable messages the device can transmit per second. This value can be between 1 and 100 messages per second; the default is 1 message per second.                                     |
| Burst Size                         | The burst size for ICMP Unreachable messages; this can be a value between 1 and 10.<br><b>Note</b> This parameter is not currently used by the system, so you can choose any value.                                                                                                    |

## Add and Edit ICMP Dialog Boxes

Use the Add ICMP dialog box to add an ICMP rule, which specifies a host/network that is allowed or denied the specified ICMP access on the specified device interface.

#### Note

The Edit ICMP dialog box is virtually identical to the Add ICMP dialog box, and is used to modify existing ICMP rules. The following descriptions apply to both dialog boxes.

**Navigation Path**

You can access the Add or Edit ICMP dialog boxes from the [Configuring ICMP, page 49-4](#).

**Note**

While adding an ICMP policy, make sure that the network and service is of the same type i.e. IPv6 networks support IPv6 services.

**Field Reference**

**Table 49-4 Add and ICMP Dialog Boxes**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action       | Whether this rule permits or denies the selected ICMP Service message from the specified Network on the specified Interface. Choose: <ul style="list-style-type: none"> <li>• <b>Permit</b> – ICMP messages from the specified networks/hosts are allowed to the specified interface.</li> <li>• <b>Deny</b> – ICMP messages from the specified networks/hosts to the specified interface are dropped.</li> </ul> |
| ICMP Service | Enter or Select the specific ICMP service message to which the rule applies.                                                                                                                                                                                                                                                                                                                                      |
| Interface    | Enter or Select the device interface to which these ICMP messages are directed.                                                                                                                                                                                                                                                                                                                                   |
| Network      | Enter a host name, IPv4 or IPv6 address, or Select a Networks/Hosts object, to define the specified ICMP message source.                                                                                                                                                                                                                                                                                          |

# Configuring Management Access

Use the Management Access page to enable or disable access on a high-security interface so you can perform management functions on the device. You can enable this feature on an internal interface to allow management functions to be performed on the interface over an IPsec VPN tunnel. You can enable the Management Access feature on only one interface at a time.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > Management Access** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Management Access** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Enabling and Disabling Management Access**

In the **Management Access Interface** field, enter the name of the device interface that is to permit management access connections. You can click Select to select the interface from a list of interface objects.

You can enable the Management Access feature on only one interface at a time.

Clear the Management Access Interface field to disable management access.

# Configuring Management Session Quota Limits

Beginning with 4.19, Cisco Security Manager allows you to configure enforcement of limits for the maximum number of admin sessions across all connection types and usernames, and for maximum number of concurrent sessions per username as well as per protocol limits on ASA 9.12(1) devices or later. The configured session concurrence limits is enforced prior to authenticating the incoming administrative session.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Management Session Quota** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Management Session Quota** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Note

The sequence of enforcement on the session limits would be—user limit followed by aggregate limit, and then by protocol limit.

## Field Reference

**Table 49-5 Add and ICMP Dialog Boxes**

| Element   | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| Aggregate | The maximum number of admin sessions across all connection types. The default is 15. You can configure the limit between 1 and 15. |
| HTTP      | Enter management session quota limit for HTTP between 1 and 5. The default value is 5.                                             |
| SSH       | Enter management session quota limit for SSH between 1 and 5. The default value is 5.                                              |
| Telnet    | Enter management session quota limit for Telnet between 1 and 5. The default value is 5.                                           |
| User      | Enter management session quota limit for the user between 1 and 5. There is no default value specified for user limit.             |

# Configuring Secure Shell Access

Use the Secure Shell page to configure rules that permit administrative access to a security device using the SSH protocol. The rules restrict SSH access to a specific IP address and netmask. Any SSH connection attempts that comply with these rules must then be authenticated by an AAA server or Telnet password.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSH Version         | Specify the SSH version(s) accepted by the device: choose <b>1, 2, or 1 and 2</b> . By default, SSH Version 1 and SSH Version 2 connections are accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Timeout             | Enter the number of minutes, 1 to 60, the Secure Shell session can remain idle before the device closes it. The default value is 5 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Allowed Hosts table | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage the hosts allowed to connect to the security device via SSH. Add Row opens the Add Host dialog box, while Edit Row opens the Edit Host dialog box. See <a href="#">Add and Edit SSH Host Dialog Boxes, page 49-8</a> for information about these dialog boxes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Secure Copy  | <p>Check this box to enable the secure copy (SCP) server on the security appliance. This allows the appliance to function as an SCP server for transferring files from/to the device. Only clients that are allowed to access the security appliance using SSH can establish a secure copy connection.</p> <p>This implementation of the secure copy server has the following limitations:</p> <ul style="list-style-type: none"> <li>• The server can accept and terminate connections for secure copy, but cannot initiate them.</li> <li>• The server does not have directory support. The lack of directory support limits remote client access to the security appliance internal files.</li> <li>• The server does not support banners.</li> <li>• The server does not support wildcards.</li> <li>• The security appliance license must have the VPN-3DES-AES feature to support SSH version 2 connections.</li> </ul> |

## Add and Edit SSH Host Dialog Boxes

Use the Add Host dialog box to add an SSH access rule.

### Note

The Edit Host dialog box is virtually identical to the Add Host dialog box, and is used to modify existing SSH access rules. The following descriptions apply to both dialog boxes.

### Navigation Path

You can access the Add and Edit Host dialog boxes from the [Configuring Secure Shell Access, page 49-7](#).

**Field Reference****Table 49-7 Add and Edit Host Dialog Boxes**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | Enter or Select the name of the device interface on which SSH connections are permitted.<br><br><b>Note</b> Beginning with Cisco Security Manager version 4.17, you can configure BVI interface for SSH connections on ASA 9.9.2 devices and above. However, in multi-context, “Transparent” mode security context only supports BVI interface.                                                                                   |
| IP Addresses | Enter the name or IP address for each host or network that is permitted to establish an SSH connection with the security device on the specified interface; use commas to separate multiple entries. You also can click Select to select Networks/Hosts objects from a list.<br><br><b>Note</b> Beginning with version 4.13, Cisco Security Manager supports policies—Groups, Hosts, Address Range, and Network for IPv6 devices. |

## Configuring SSL - Basic and Advanced tabs

Beginning from version 4.8, Security Manager provides enhanced security features using Secure Sockets Layer (SSL).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > SSL** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > SSL** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 49-8 SSL Page Basic Tab**

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate Authentication</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| FCA Timeout                       | Enter a value in the range of 1 to 120.<br><br><b>Note</b> FCA Timeout is applicable for devices running the ASA software version 9.1(2) or later.                                                                                                                                                                                                                                                                                                           |
| Interface                         | Use the Add Row, Edit Row, and Delete Row buttons below the Interface table to manage the interfaces and their port numbers allowed to connect to the security device via SSL. Add Row opens the Add Interface and Port dialog box, while Edit Row opens the Edit Interface and Port dialog box. You can select the interface from the available entries in the Interface Selector dialog box. Enter a value in the range of 1 to 65535 for the port number. |

Table 49-8 SSL Page Basic Tab (continued)

| Element                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level              | <p>Select one of the following versions:</p> <ul style="list-style-type: none"> <li>• ALL - It includes all ciphers including NULL-SHA.</li> <li>• LOW - It includes all ciphers except NULL-SHA.</li> <li>• MEDIUM - It includes all ciphers except NULL-SHA:DES-CBC-SHA:RC4-SHA:RC4-MD5.</li> <li>• FIPS - It includes all FIPS-compliant ciphers (that is, not NULL-SHA:DES-CBC-SHA:RC4-MD5:RC4-SHA:DES-CBC3-SHA)</li> <li>• HIGH - It includes only AES-256 with SHA-2 ciphers, so it only applies to TLSV1.2.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Custom String      | <p>Use the CUSTOM keyword for Security Manager to exercise full control over the cipher suite using OpenSSL cipher definition strings.</p> <p><b>Note</b> Beginning with version 4.9, Security Manager provides support for the following new TLSV1.2 ciphers for devices running the ASA software version 9.4(1) or later.</p> <ul style="list-style-type: none"> <li>• ECDHE_RSA_AES128_SHA256</li> <li>• ECDHE_RSA_AES256_SHA384</li> <li>• ECDHE_ECDSA_AES128_SHA256</li> <li>• ECDHE_ECDSA_AES256_SHA384</li> </ul> <p><b>Note</b> Beginning with version 4.16, Security Manager provides support for the following new TLSV1.2 ciphers in addition to the above mentioned ciphers for devices running the ASA software version 9.4(1) or later.</p> <ul style="list-style-type: none"> <li>• ECDHE-ECDSA-AES256-GCM-SHA384</li> <li>• ECDHE-RSA-AES256-GCM-SHA384</li> <li>• DHE-RSA-AES256-GCM-SHA384</li> <li>• AES256-GCM-SHA384</li> <li>• ECDHE-ECDSA-AES128-GCM-SHA256</li> <li>• ECDHE-RSA-AES128-GCM-SHA256</li> <li>• DHE-RSA-AES128-GCM-SHA256</li> <li>• AES128-GCM-SHA256</li> </ul> |
| ECDH Configuration | <p>Select from one of the options (19,20,21,none) in the ECDH Group. This feature is available from Security Manager version 4.9 onwards for ASA devices version 9.4(1) or later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Note**

Due to import regulations in some countries the Oracle implementation provides a default cryptographic jurisdiction policy file that limits the strength of cryptographic algorithms. If stronger algorithms need to be configured or are already configured on the device (for example, AES with 256-bit keys, DH group with 5,14,24), follow these steps:

1. Download the Java 7 unlimited strength cryptography policy .jar files from <http://www.oracle.com>. Cisco recommends to search for the following on the Oracle website:  
Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files Java 7

(Click the download button to download the files by accepting the license agreement.)

2. Replace local\_policy.jar and US\_export\_policy.jar on your Security Manager server in the folder CSCOpX\MDC\vmS\jre\lib\security.
3. Restart your Security Manager server.

## Reference Identities

Beginning with version 4.12, Security Manager enables you to configure Reference Identity policy objects for Secure Syslog Server connections on devices running the ASA software version 9.6(2) or later. This object enables support for Common Criteria requirements.

Reference identities are configured as one or more identifiers to be compared to the presented identifiers in the server certificate. Identifiers are specific instances of the four identifier types specified in RFC 6125.

## Add/Edit Reference Identity Dialog Box

Use the Add/Edit Reference Identity Dialog Box to create a new Reference Identity policy object or to edit existing policy objects.

### Navigation Path

Select **Manage > Policy Objects**, then select **Reference Identity** from the Object Type Selector. Right-click inside the work area, then select **New Object** or click the + button to add a new object, or right-click a row, then select **Edit Object**.

### Field Reference

**Table 49-10 Add/Edit Reference Identity Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | Name of the Reference Identity policy object. Note that each Reference Identifier can have multi line values.                                                                                                                                                                                                                                    |
| Description     | Description of the Reference Identity policy object.                                                                                                                                                                                                                                                                                             |
| Common Name ID  | A Relative Distinguished Name (RDN) in a certificate subject field that contains only one attribute-type-and-value pair of type Common Name (CN), where the value matches the overall form of a domain name. The CN value can be free text. A CN-ID reference identifier does not identify an application service.                               |
| Domain Name ID  | A subjectAltName entry of type dNSName. This is a DNS domain name. A DNS-ID reference identifier does not identify an application service.                                                                                                                                                                                                       |
| Service Name ID | A subjectAltName entry of type otherName whose name form is SRVName as defined in RFC 4985. A SRV-ID identifier may contain both a domain name and an application service type. For example, a SRV-ID of “_imaps.example.net” would be split into a DNS domain name portion of “example.net” and an application service type portion of “imaps.” |

**Table 49-10 Add/Edit Reference Identity Dialog Box (continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Uniform Resource Identifier ID  | A subjectAltName entry of type uniformResourceIdentifier whose value includes both (i) a “scheme” and (ii) a “host” component (or its equivalent) that matches the “reg-name” rule specified in RFC 3986. A URI-ID identifier must contain the DNS domain name, not the IP address, and not just the hostname. For example, a URI-ID of “sip:voice.example.edu” would be split into a DNS domain name portion of “voice.example.edu” and an application service type of “sip.” |
| Category                        | (Optional) Select a category between CAT-A and CAT-J.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                                                                         |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Edit button                     | If you allow device overrides, you can click the Edit button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                 |

**Note**

A reference identity is created when configuring one with a previously unused name. Once a reference identity has been created, the four identifier types and their associated values can be added or deleted from the reference identity. The reference identifiers MAY contain information identifying the application service and MUST contain information identifying the DNS domain name.

## Configuring SNMP

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers, and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1, 2c, and 3, as well as traps and SNMP read access; SNMP write access is not supported.

You can configure a security appliance to send “traps” (event notifications) to a network management station (NMS), or you can use the NMS to browse the management information bases (MIBs) on the security appliance. Use CiscoWorks for Windows or any other SNMP MIB-II-compliant browser to receive SNMP traps and browse a MIB.

The security appliance has an SNMP agent that notifies designated management stations if specified events occur, for example, when a link in the network goes up or down. The notification includes an SNMP system object ID (OID), identifying the device to the management stations. The security appliance SNMP agent also replies when a management station asks for information.

### SNMP MIBs and OIDs

An SNMP trap reports significant events occurring on a network device, most often errors or failures. SNMP traps are defined in Management Information Bases (MIBs), which can be either standard or enterprise-specific.

Standard traps and MIBs are created by the Internet Engineering Task Force (IETF) and documented in various RFCs. Standard traps are compiled into the security appliance software. If needed, you can also download RFCs, standard MIBs, and standard traps from the IETF website: <http://www.ietf.org/>.

For Cisco MIB files and OIDs, refer to:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>. OIDs may be downloaded from this FTP site: <ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>.

- [SNMP Version 3, page 49-15](#)
- [SNMP Page, page 49-17](#)

## SNMP Terminology

Here are definitions for some common SNMP terms:

- **Agent** – The SNMP server running on the security appliance. The agent responds to requests for information and action from the management station. The agent also controls access to its management information base (MIB), the collection of data objects that can be viewed or changed by the SNMP manager.
- **Management stations** – The PCs or workstations set up to monitor SNMP events and manage devices such as the security appliance. Management stations can also receive messages about events which require attention, such as hardware failures.
- **MIBs** – The agent maintains standardized data structures called Management Information Bases (MIBs), used to collect information, such as packet, connection and error counters, and buffer usage and failover status. A number of MIBs are defined for specific products, and for the common protocols and hardware standards used by most network devices. SNMP management stations can browse MIBs, or request only specific fields. In some applications, MIB data can be modified for administrative purposes.
- **OID** – The SNMP standard assigns a system object ID (OID) so that a management station can uniquely identify network devices with SNMP agents, and indicate to users the source of information monitored and displayed.
- **Traps** – Specified events that generate a message from the SNMP agent to the management station. Events include alarm conditions such as linkup, linkdown, coldstart, warmstart, authentication, or syslog events.

## SNMP Version 3

SNMP Version 3 provides security enhancements that are not available in SNMP Version 1 or SNMP Version 2c. SNMP Versions 1 and 2c transmit data between the SNMP server and SNMP agent in clear text. SNMP Version 3 adds authentication and privacy options to secure protocol operations. In addition, this version controls access to the SNMP agent and MIB objects through the User-based Security Model

(USM) and View-based Access Control Model (VACM). The ASA and ASASM also support the creation of SNMP groups and users, as well as hosts, which is required to enable transport authentication and encryption for secure SNMP communications.

**Note**

SNMP Version 3 is supported on ASA devices running 8.2(1) or later and on ASASM devices running 8.5(1) or later.

**Security Models**

For configuration purposes, the authentication and privacy options are grouped together into security models. Security models apply to users and groups, which are divided into the following three types:

- NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.
- Auth—Authentication but No Privacy, which means that messages are authenticated.
- Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.

**SNMP Groups**

An SNMP group is an access control policy to which users can be added. Each SNMP group is configured with a security model, and is associated with an SNMP view. A user within an SNMP group must match the security model of the SNMP group. These parameters specify what type of authentication and privacy a user within an SNMP group uses. Each SNMP group name and security model pair must be unique.

**SNMP Users**

SNMP users have a specified username, a group to which the user belongs, authentication password, encryption password, and authentication and encryption algorithms to use. The authentication algorithm options are MD5 and SHA. The encryption algorithm options are DES, 3DES, and AES (which is available in 128, 192, and 256 versions). When you create a user, you must associate it with an SNMP group. The user then inherits the security model of the group.

**SNMP Hosts**

An SNMP host is an IP address to which SNMP notifications and traps are sent. To configure SNMP Version 3 hosts, along with the target IP address, you must configure a username, because traps are only sent to a configured user. SNMP target IP addresses and target parameter names must be unique on the ASA and ASA Services Module. Each SNMP host can have only one username associated with it. To receive SNMP traps, configure the SNMP NMS, and make sure that you configure the user credentials on the NMS to match the credentials for the ASA and ASASM.

**Implementation Differences Between the ASA, ASA Services Module, and the Cisco IOS Software**

The SNMP Version 3 implementation in the ASA and ASASM differs from the SNMP Version 3 implementation in the Cisco IOS software in the following ways:

- The local-engine and remote-engine IDs are not configurable. The local engine ID is generated when the ASA or ASASM starts or when a context is created.
- No support exists for view-based access control, which results in unrestricted MIB browsing.
- Support is restricted to the following MIBs: USM, VACM, FRAMEWORK, and TARGET.
- You must create users and groups with the correct security model.
- You must remove users, groups, and hosts in the correct sequence.

- Use of the **snmp-server host** command creates an ASA or ASASM rule to allow incoming SNMP traffic.

## SNMP Page

Use the SNMP page to configure the security appliance for monitoring by Simple Network Management Protocol (SNMP) management stations.

### Note

For SNMP Version 3, configuration must occur in the following order: group, user, host.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Administrator Name             | Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Location                              | Describe the location of this security device (for example, <b>Building 42, Sector 54</b> ). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.                                                                                                                                                                                                                                                                                                                                                                                      |
| Port (PIX 7.x, ASA and FWSM 3.x only) | Specify the port on which incoming requests will be accepted. The default is 161.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Configure SNMP Traps                  | Click this button to configure SNMP traps in the <a href="#">SNMP Trap Configuration Dialog Box</a> , page 49-19.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SNMP Engine ID                        | Shows the ID of the SNMP engine configured on the device. Click <b>Get SNMP Engine ID</b> to retrieve the engine ID from the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SNMP Hosts table                      | <p>This table lists the SNMP management stations that can access the security appliance. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, as described in <a href="#">Using Tables</a>, page 1-48.</p> <p>The Add Row and Edit Row buttons open the <a href="#">Add/Edit SNMP Host Access Entry Dialog Box</a>, page 49-22, used to add and edit management station host entries.</p> <p><b>Note</b> For ASA devices running 9.1(5) or later, you can configure up to 129 SNMP hosts. For other devices and earlier ASA versions, you can only configure up to 32 SNMP hosts.</p> |
| SNMP Host Group table                 | Beginning with version 4.12, Security Manager enables you to add and edit the Host Group entries for SNMP Users. See <a href="#">Add/Edit SNMP Host Group Entry Dialog Box</a> , page 49-23 for more information.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>SNMPv3 Configuration</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SNMP Group tab                        | <p>Lists the SNMP groups that have been configured. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, as described in <a href="#">Using Tables</a>, page 1-48.</p> <p>The Add Row and Edit Row buttons open the <a href="#">Add/Edit SNMP Group Entry Dialog Box</a>, page 49-24, used to add and edit SNMP groups.</p>                                                                                                                                                                                                                                                            |
| SNMP User tab                         | <p>Lists the SNMP users that have been configured. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, as described in <a href="#">Using Tables</a>, page 1-48.</p> <p>The Add Row and Edit Row buttons open the <a href="#">Add/Edit SNMP User Entry Dialog Box</a>, page 49-25, used to add and edit SNMP users.</p>                                                                                                                                                                                                                                                               |
| SNMP User List tab                    | Beginning with version 4.12, Security Manager enables you to add a user list containing multiple SNMP users. See <a href="#">Add/Edit SNMP User List Entry Dialog Box</a> , page 49-27 for more information.                                                                                                                                                                                                                                                                                                                                                                                                               |

## SNMP Trap Configuration Dialog Box

Use the SNMP Trap Configuration dialog box to configure SNMP traps (event notifications) for the selected security device.

Traps are different than browsing; they are unsolicited “comments” from the managed device to the management station for certain events, such as *linkup*, *linkdown*, and *syslog event generated*.

An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device. The SNMP service running on a security device performs two functions:

- Replies to SNMP requests from management stations.
- Sends traps to management stations or other devices that are registered to receive them from the security appliance.

Cisco security devices support three types of traps:

- firewall
- generic
- syslog

In the SNMP Trap Configuration dialog box, available traps are presented on four tabbed panels: Standard, Entity MIB, Resource, and Other.

### Navigation Path

You can access the SNMP Trap Configuration dialog box from the [SNMP Page, page 49-17](#).

### Field Reference

**Table 49-12** *SNMP Trap Configuration Dialog Box*

| Element               | Description                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable All SNMP Traps | Check this box to quickly select all traps on all four tabbed panels.                                                                                                                  |
| Enable Syslog Traps   | Check this box to enable transmission of trap-related syslog messages. The severity level for syslog messages trapped is set on the <a href="#">Logging Filters Page, page 54-12</a> . |

Select the desired event-notification traps on the following four tabbed panels. Note that only the traps applicable to the selected device are displayed in the dialog box.

Valid values range from 10 to 100; default is 70%.</li> <li><b>Period</b> – Specify the length of time, in seconds, that the specified Percentage can be exceeded before notification is triggered. Valid values range from 60 to 3600.</li> </ul> </li> </ul> |

## Add/Edit SNMP Host Access Entry Dialog Box

Use the Add/Edit SNMP Host Access Entry dialog box to add and edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the security device.

For ASA devices running any software version between 9.1(5) and 9.3(2), you can configure 129 SNMP hosts. For ASA devices running the software version lower than 9.1(5) you can configure only 32 SNMP hosts.

Beginning with version 4.9, Security Manager enables you to configure up to 4096 SNMP hosts for ASA devices running the software version 9.4(1) or later. However, only 129 of this number can be for traps. You cannot configure more than 129 trap configured SNMP hosts.

### Navigation Path

You can access the Add/Edit SNMP Host Access Entry dialog box from the [SNMP Page, page 49-17](#).

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name              | Enter or Select the interface on which this SNMP management station contacts the device.                                                                                                                                                                                                                                                                                                                                                                                |
| IP Address                  | Enter the IP address, or Select a Networks/Hosts object, representing the SNMP management station.<br><br><b>Note</b> Beginning with Cisco Security Manager version 4.17, IPv6 Address for SNMP policy is supported on ASA 9.9.2 devices and above.                                                                                                                                                                                                                     |
| UDP Port                    | (Optional) Enter a UDP port for requests from the SNMP host. You can use this field to override the global value specified on the SNMP page.                                                                                                                                                                                                                                                                                                                            |
| Community String<br>Confirm | Enter the password used by the SNMP management station when sending requests to the security device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. Thus, the password is used to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces are not permitted.<br><br>Repeat the password in the <b>Confirm</b> field. |
| SNMP Version                | Choose the version of SNMP used by this management station: <b>1</b> , <b>2c</b> , or <b>3</b> .                                                                                                                                                                                                                                                                                                                                                                        |
| SNMP User Name              | If SNMP version 3 is selected, select the SNMP user. For information on SNMP users, see <a href="#">Add/Edit SNMP User Entry Dialog Box, page 49-25</a> .                                                                                                                                                                                                                                                                                                               |

**Table 49-13 Add/Edit SNMP Host Access Entry Dialog Box (continued)**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Poll/Trap Specification | Specify the type(s) of communication with this management station: poll only, trap only, or both trap and poll. Check either or both: <ul style="list-style-type: none"> <li>• Poll – The security device waits for periodic requests from the management station.</li> <li>• Trap – The device sends trap events when they occur.</li> </ul> |

## Add/Edit SNMP Host Group Entry Dialog Box

Beginning with Security Manager version 4.12, you can use the Add/Edit SNMP Host Group Entry dialog box to add and edit entries in the SNMP Host Group table on the SNMP page. These entries represent SNMP management stations allowed to access the security device.

For ASA devices running any software version between 9.1(5) and 9.4, you can configure 129 SNMP hosts. For ASA devices running the software version lower than 9.1(5) you can configure only 32 SNMP hosts.

Beginning with version 4.9, Security Manager enables you to configure up to 4096 SNMP hosts for ASA devices running the software version 9.4(1) or later. However, only 129 of this number can be for traps. You cannot configure more than 129 trap configured SNMP hosts.

### Note

If you edit a used Address Range or Network object in the Networks/Host Policy Object Manager after adding or editing SNMP Host or Host Group entries in the Add/ Edit SNMP Host Group entry page, Cisco Security Manager will not validate for the total number of SNMP traps. Thus, if the trap entries exceed 129, it will result in a deployment failure.

### Navigation Path

You can access the Add/Edit SNMP Host Access Entry dialog box from the [SNMP Page, page 49-17](#).

| SNMP Version                      | Choose the version of SNMP used by this management station: <b>1</b> , <b>2c</b> , or <b>3</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Server Poll/Trap<br>Specification | Specify the type(s) of communication with this management station: poll only, trap only, or both trap and poll. Check either or both: <ul style="list-style-type: none"> <li>• Poll – The security device waits for periodic requests from the management station.</li> <li>• Trap – The device sends trap events when they occur.</li> </ul> <p><b>Note</b> You cannot enable both traps and polling for the same SNMP Host Group. If you need to enable this, Cisco recommends that you use the <b>snmp-server host</b> command for the relevant hosts.</p> |

## Add/Edit SNMP Group Entry Dialog Box

Use the Add/Edit SNMP Group Entry dialog box to add and edit entries in the SNMP Groups table on the SNMP page. An SNMP group is an access control policy to which users can be added. Each SNMP group is configured with a security model, and is associated with an SNMP view. A user within an SNMP group must match the security model of the SNMP group. These parameters specify what type of authentication and privacy a user within an SNMP group uses. Each SNMP group name and security model pair must be unique.

For configuration purposes, the authentication and privacy options are grouped together into security models. Security models apply to users and groups, which are divided into the following three types:

- NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.
- Auth—Authentication but No Privacy, which means that messages are authenticated.
- Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.

### Notes

- Before a group can be deleted, you must ensure that all users associated with that group are deleted. If any hosts are associated with a user that needs to be deleted, you must delete those hosts before you can delete the user.
- If users have been configured to belong to a particular group with a certain security model, you must do the following to change the security level of that group:
  - a. Remove all host entries associated with any users belonging to the group.
  - b. Remove the users from the group.
  - c. Deploy the changes to the device.
  - d. Change the group security level.

- e. Add users that belong to the group.
- f. Add hosts belonging to the users that were added for the group.
- g. Deploy the changes to the device.

### Navigation Path

You can access the Add/Edit SNMP Group Entry dialog box from the [SNMP Page, page 49-17](#).

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Name     | Enter the name of the SNMP group. Group names must be 32 characters or less.                                                                                                                                                                                                                                                                                                                   |
| Security Level | Specify the security level for the group: <ul style="list-style-type: none"> <li>• NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.</li> <li>• Auth—Authentication but No Privacy, which means that messages are authenticated.</li> <li>• Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.</li> </ul> |

## Add/Edit SNMP User Entry Dialog Box

Use the Add/Edit SNMP User Entry dialog box to add a user to an SNMP group or to edit entries in the SNMP User table on the SNMP page. SNMP users inherit the security model of the group to which they are assigned.

### Notes

- After a user has been created, you cannot change the group to which the user belongs.
- Before a user can be deleted, you must ensure that no hosts are configured that are associated with that username.

### Navigation Path

You can access the Add/Edit SNMP User Entry dialog box from the [SNMP Page, page 49-17](#).

| Group Name                          | Select the SNMP group to which this user belongs. For information on SNMP groups, see <a href="#">Add/Edit SNMP Group Entry Dialog Box, page 49-24</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Security Level                      | Shows the security level for the selected group: <ul style="list-style-type: none"> <li>• NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.</li> <li>• Auth—Authentication but No Privacy, which means that messages are authenticated.</li> <li>• Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| User Name                           | Enter the name of the SNMP user. Usernames must be 32 characters or less and must be unique for the SNMP server group selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Engine ID<br>(SNMP version v3 only) | <p>The SNMP EngineID identifier used for authentication in v3.</p> <p>You can enter comma separated multiple Engine IDs. The Engine ID identifier must be valid, and each Engine ID must be within the range of 1 to 257 characters.</p> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• If you configure EngineID for an SNMP user with MD5 algorithm, the EngineID must be a valid one. If the EngineID is not valid, the preview config would fail with an error "failed to generate raw config". For example, the preview config fails if the EngineID entered is 111.</li> <li>• For an SNMP group with a security level of NoAuth, do not provide an EngineID identifier because on deployment, the ASA will ignore this engine ID and take the default local engine ID.</li> <li>• The following dynamic behaviors of the device cannot be handled in Security Manager: <ul style="list-style-type: none"> <li>– If you upgrade a failover ASA device from version 8.x or 9.x to version 9.6(2), the device will automatically create multiple SNMP User commands for multiple SNMP Engine IDs. You must copy the Engine ID by retrieving it from the device into this Engine ID text box. For information about retrieving Engine ID from the device see <a href="#">SNMP Page, page 49-17</a>.</li> <li>– If you add or remove an ASA device to or from a failover configuration, you must manually enter the Engine ID because the ASA device automatically removes or creates new SNMP User commands for the existing Engine IDs.</li> </ul> </li> </ul> |

| Encrypt Password Type              | Specify the type of password you want to use: Clear Text or Encrypted.<br>If the password type is Clear Text, Security Manager will encrypt the password when deploying to the device. If the password type is Encrypted, Security Manager will directly deploy the encrypted password. Security Manager will never directly deploy the clear text password to device.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Auth Algorithm Type                | Specify the type of authentication you want to use: MD5 or SHA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Authentication Password<br>Confirm | Enter the password to use for authentication. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as <i>xx:xx:xx...</i> , where <i>xx</i> are hexadecimal values.<br><br><b>Note</b> The length of the password will depend on the authentication algorithm selected. For all passwords, the length must be 256 characters or less.<br><br>If you selected Clear Text as the Encrypt Password Type, repeat the password in the <b>Confirm</b> field.                                                                                                                                                                                                                                                                                                             |
| Encryption Type                    | Specify the type of encryption you want to use: AES128, AES192, AES256, 3DES, DES.<br><br><b>Note</b> To use AES or 3DES encryption, you must have the appropriate license installed on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Encryption Password<br>Confirm     | Enter the password to use for encryption. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as <i>xx:xx:xx...</i> , where <i>xx</i> are hexadecimal values.<br><br>For encrypted passwords, the length of the password depends on the encryption type selected. The password sizes are as follows (where each <i>xx</i> is one octal): <ul style="list-style-type: none"> <li>• AES 128 requires 16 octals</li> <li>• AES 192 requires 24 octals</li> <li>• AES 256 requires 32 octals</li> <li>• 3DES requires 32 octals</li> <li>• DES can be any size</li> </ul> <b>Note</b> For all passwords, the length must be 256 characters or less.<br><br>If you selected Clear Text as the Encrypt Password Type, repeat the password in the <b>Confirm</b> field. |

## Add/Edit SNMP User List Entry Dialog Box

Beginning with version 4.12, Security Manager enables you to use the Add/Edit SNMP User List Entry dialog box to add a user list containing multiple SNMP users.

### Notes

- You cannot delete a user list if the list is used by a particular host group.

- You cannot delete an SNMP user if that user is referred to in a particular user list..

### Navigation Path

You can access the Add/Edit SNMP User List Entry dialog box from the [SNMP Page, page 49-17](#).

### Field Reference

**Table 49-17 Add/Edit SNMP User List Entry Dialog Box**

| Element        | Description                                                                         |
|----------------|-------------------------------------------------------------------------------------|
| User List Name | Enter the name of the User List. User List names must be 1-33 characters in length. |
| User Names     | Select the user names from the drop-down list.                                      |

# Telnet Page

Use the Telnet page to configure rules that permit only specific hosts or networks to connect to the firewall device using the Telnet protocol.

The rules restrict administrative Telnet access through a firewall device interface to a specific IP address and netmask. Connection attempts that comply with the rules must then be authenticated by a preconfigured AAA server or the Telnet password. You can monitor Telnet sessions using Monitoring > Telnet Sessions.

## Note

Only five Telnet sessions can be active at the same time in single-context mode. In multiple-context mode on ASAs, there can be only five Telnet sessions active per context, 100 Telnet sessions active per blade. With resource class, the administrator can further tune this parameter.

## Related Topics

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Telnet** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Telnet** from the Policy Type selector. Right-click **Telnet** to create a policy, or select an existing policy from the Shared Policy selector.

## Related Topics

- [Telnet Configuration Dialog Box, page 49-29](#)

## Field Reference

**Table 49-18** *Telnet Page*

| Element                    | Description                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Timeout                    | Number of minutes a Telnet session can remain idle before the firewall device closes it. Values can range from 1 to 1440 minutes. |
| <b>Telnet Access Table</b> |                                                                                                                                   |
| Interface                  | Interface that receives Telnet packets from the client.                                                                           |
| IP Addresses               | The IP address and network mask of each host or network that can access the Telnet console through the specified interface.       |

## Telnet Configuration Dialog Box

Use the Telnet Configuration dialog box to configure Telnet options for an interface.

### Navigation Path

You can access the Telnet Configuration dialog box from the [Telnet Page, page 49-29](#).

## Field Reference

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name       | <p>Enter or Select an interface that can receive Telnet packets from a client.</p> <p><b>Note</b> Beginning with Cisco Security Manager version 4.17, you can configure BVI interface for Telnet on ASA 9.9.2 devices and above. However, in multi-context, “Transparent” mode security context only supports BVI interface.</p>                                                                                                                                                                                                                    |
| IP Addresses/Netmask | <p>Enter or Select the IP address and netmask, separated by a “/”, of each host or network permitted to access the firewall device’s Telnet console through the specified interface. Use commas to separate multiple entries.</p> <p><b>Note</b> To limit access to a single IP address, use 255.255.255.255 or 32 as the netmask. Do not use the subnetwork mask of the internal network.</p> <p><b>Note</b> Beginning with version 4.13, Cisco Security Manager supports policies—Groups, Hosts, Address Range, and Network for IPv6 devices.</p> |

## Configuring Failover

---

The Failover page provides access to failover settings for the selected security appliance. The available settings and the overall appearance of the Failover page may change slightly, depending upon the type of device selected, its mode of operation (routed or transparent), and its context mode (single or multiple).

In other words, how you configure failover depends upon both the operating mode and the security context of the security appliance.

Please note the following caveats when assigning an interface as a failover link:

- You can define the interface in the Add/Edit Interface dialog box, but do not configure it. In particular, **do not specify an interface Name**, as this parameter disqualifies the interface from being used as the failover link. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#) for more information.
- IPv6 addresses are not supported for failover links.
- On an ASA 5505, an interface assigned as the backup for another interface cannot be used as a failover link (although no checking is performed to prevent this).
- Do not assign a PPPoE-enabled interface as a failover link. PPPoE and Failover should not be configured on the same device interface (although no checking is performed to prevent this).
- A failover interface cannot use the same IP address as another interface, especially the Management IP address (although no checking is performed to prevent this).

Note also that after you assign an interface as a failover link, the interface is listed on the Interfaces page, but you cannot edit or delete the interface from that page. The only exception is if you set a physical interface to be the stateful failover link—you can configure its speed and duplex.

This chapter contains the following topics:

- [Understanding Failover, page 50-1](#)
- [Basic Failover Configuration, page 50-5](#)
- [Additional Steps for an Active/Standby Failover Configuration, page 50-9](#)
- [Failover Policies, page 50-10](#)

## Understanding Failover

Failover lets you configure two identical security appliances such that one will take over firewall operations if the other fails. Using a pair of security appliances, you can provide high system availability without operator intervention.

The linked security appliances communicate failover information over a dedicated link. This failover link can be either a LAN-based connection or, on PIX security appliances, a dedicated serial failover cable. The following information is communicated over the failover link:

- Current failover state (active or standby)
- “Hello” messages (also called “keep-alives”)
- Network link status
- MAC address exchange
- Configuration replication
- Per-connection state information, in the case of Stateful failover

**Caution**

---

All information sent over the failover link is sent in clear text unless you secure the communication with a failover key. If the security appliance is used to terminate VPN tunnels, this information includes any user names, passwords, and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing failover communications with a failover key, particularly if you are using the security appliance to terminate VPN tunnels.

---

Cisco security appliances support two types of failover:

- **Active/Standby** – The *active* security appliance inspects all network traffic, while the *standby* security appliance remains idle until a failure occurs on the active appliance. Changes to the configuration of the active security appliance are transmitted over the failover link to the standby security appliance.

When failover occurs, the standby security appliance becomes the active unit, and it assumes the IP and MAC addresses of the previously active unit. Because other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time-out anywhere on the network.

Active/Standby failover is available to security appliances operating in single- or multiple-context mode. In single-context mode, only Active/Standby failover is available, and all failover configuration is by means of the Failover page.

**Note**

---

When using Active/Standby failover, you must make all configuration changes on the active unit. The active unit automatically replicates the changes to the standby unit. The standby unit should not be imported or added to the Security Manager device list.

Also, you must manually copy the authentication certificate from the active device to the standby device. See [Additional Steps for an Active/Standby Failover Configuration, page 50-9](#) for additional information.

---

- **Active/Active** – Both security appliances inspect network traffic by alternating their roles—such that one is active and one is standby—on a per context basis. This means Active/Active failover is available only on security appliances operating in multiple-context mode.

However, Active/Active failover is not required in multiple-context mode. That is, on a device operating in multiple-context mode, you can configure Active/Standby or Active/Active failover. In either case, you provide system-level failover settings in the system context, and context-level failover settings in the individual security contexts.

See [Active/Active Failover, page 50-3](#) for additional information about this topic.

In addition, failover can be stateless or stateful:

- **Stateless** – Also referred to as “regular” failover. With stateless failover, all active connections are dropped when failover occurs. Clients need to re-establish connections when the new active unit takes over.
- **Stateful** – The active unit in the failover pair continually passes per-connection state information to the standby unit. When failover occurs, the same connection information is available on the new active unit. Supported end-user applications are not required to reconnect to maintain the current communication session.

See [Stateful Failover, page 50-4](#) for more information.

## Active/Active Failover

Active/Active failover is available only on security appliances operating in multiple-context mode. In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.

The active and standby roles are assigned over the complete set of security contexts, more or less arbitrarily.

To enable Active/Active failover on the security appliance, you must assign the security contexts to one of two failover groups. A failover group is simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default.

As in Active/Standby failover, each unit in an Active/Active failover pair is given a primary or secondary designation. Unlike Active/Standby failover, this designation does not indicate which unit is active when both units start simultaneously. Each failover group in the configuration is given a primary or secondary role preference. This preference determines the unit on which the contexts in the failover group appear in the active state when both units start simultaneously. You can have both failover groups be in the active state on a single unit in the pair, with the other unit containing the failover groups in the standby state. However, a more typical configuration is to assign each failover group a different role preference to make each one active on a different unit, balancing the traffic across the devices.

#### Note

---

To reliably manage security contexts in Active/Active failover mode, Cisco Security Manager requires an IP address for the management interface of each context so that it can communicate directly with the active security context of a failover pair.

---

Initial configuration synchronization occurs when one or both units start. This synchronization occurs as follows:

- When both units start simultaneously, the configuration is synchronized from the primary unit to the secondary unit.
- When one unit starts while the other unit is already active, the unit that is starting up receives the configuration from the already active unit.

After both units are running, commands are replicated from one unit to the other as follows:

- Commands entered within a security context are replicated from the unit on which the security context is in the active state to the peer unit.

---

**Note** A context is considered in the active state on a unit if the failover group to which it belongs is in the active state on that unit.

---

- Commands entered in the system execution space are replicated from the unit on which failover group 1 is in the active state to the unit on which failover group 1 is in the standby state.
- Commands entered in the admin context are replicated from the unit on which failover group 1 is in the active state to the unit on which failover group 1 is in the standby state.

Failure to enter the commands on the appropriate unit for command replication to occur will cause the configurations to be out of synchronization. Those changes may be lost the next time the initial configuration synchronization occurs.

**Note**

---

When bootstrapping the peer devices in an Active/Active Failover configuration, the bootstrap configurations are only applied to the system contexts of the respective failover peer devices.

---

In an Active/Active failover configuration, failover occurs on a failover group basis, not a system basis. For example, if you designate both failover groups as active on the primary unit, and failover group 1 fails, failover group 2 remains active on the primary unit, while failover group 1 becomes active on the secondary unit.

**Note**

---

When configuring Active/Active failover, make sure that the combined traffic for both units is within the capacity of each unit.

---

## Stateful Failover

**Note**

---

Stateful failover is not supported on the ASA 5505 appliance.

---

When stateful failover is enabled, the active unit in the failover pair continually updates the current connection-state information on the standby unit. When failover occurs, supported end-user applications are not required to reconnect to maintain the current communication session.

**Note**

---

The IP and MAC addresses for the state and LAN failover links do not change at failover.

---

To employ stateful failover, you must configure a link to pass all state information to the standby unit. If you are using a LAN failover connection rather than the serial failover interface (which is available only on the PIX platform), you can use the same interface for the state link and the failover link. However, we recommend that you use a dedicated interface for passing state information to the standby unit.

The following information is passed to the standby unit when stateful failover is enabled:

- NAT translation table

- TCP connection table (except for HTTP), including the timeout connection
- HTTP connection states (if HTTP replication is enabled)
- H.323, SIP and MGCP UDP media connections
- The system clock
- The ISAKMP and IPsec SA table

The following information is not copied to the standby unit when stateful failover is enabled:

- HTTP connection table (unless HTTP replication is enabled)
- The user authentication (UAUTH) table
- The ARP table
- Routing tables

## Basic Failover Configuration

The following steps describe basic failover configuration. Please note the following caveats when assigning an interface as a failover link:

- You can define the interface in the Add/Edit Interface dialog box, but do not configure it. In particular, **do not specify an interface Name**, as this parameter disqualifies the interface from being used as the failover link.
- On an ASA 5505, an interface assigned as the backup for another interface cannot be used as a failover link (although no checking is performed to prevent this).
- Do not assign a PPPoE-enabled interface as a failover link. PPPoE and Failover should not be configured on the same device interface (although no checking is performed to prevent this).
- A Failover interface cannot use the same IP address as another interface, especially the Management IP address (although no checking is performed to prevent this).

### Note

When you save a failover configuration, it is applied to both the security appliance and the failover peer.

### Before You Begin

Licenses installed on the device must allow failover configurations. On ASA 5505 and 5510 devices, this failover license is an optional license. You must install the failover license outside of Security Manager, using ASDM or the device CLI, and ensure that the **License Supports Failover** option is selected in the General page of the device properties (right-click the device and select **Device Properties**). If the license is installed when you add the device to the inventory, or you install the license and then rediscover device policies, Security Manager can identify the license and set this option appropriately.

If the option is selected and the license is not in fact installed, you will see deployment failures. If the option is not selected, Security Manager will not deploy the failover policy to the device even if you configure the policy.

### Related Topics

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#)
- [Understanding Failover, page 50-1](#)
- [Additional Steps for an Active/Standby Failover Configuration, page 50-9](#)

- [Failover Policies, page 50-10](#)

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

**Note** For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager, page 5-30](#).

**Step 2** Select the appliance you want to configure.

**Step 3** Expand the **Platform** entry in the Device Policy selector, then expand **Device Admin** and select **Failover**.

The Failover page is displayed.

**Step 4** (PIX only) Choose the **Failover Method: Serial Cable** or **LAN Based**. If you choose Serial Cable, the LAN Failover settings are disabled; be sure the cable connecting the two devices is in place.

**Step 5** Select **Enable Failover** to enable failover on this appliance.

**Step 6** (Optional) Click the Settings button to open the Settings dialog box for the selected device. The contents of the Settings dialog box depend on the type of device, and whether it is operating in single or multiple mode—some options may not be available. Refer to the following sections:

- [Settings Dialog Box, page 50-21](#) (ASA/PIX 7+)
- [Advanced Settings Dialog Box, page 50-16](#) (FWSM)

**Step 7** Click the **Bootstrap** button to open the Bootstrap configuration for LAN failover dialog box, which provides bootstrap configurations that can be applied to the primary and secondary devices in a LAN failover configuration. See [Bootstrap Configuration for LAN Failover Dialog Box, page 50-26](#) for more information.

**Step 8** (Multiple-context devices only) In the Configuration section, select the failover mode: **Active/Active** or **Active/Standby**.

**Step 9** (Optional) Follow these steps to configure an interface for **LAN Failover** communications between the two devices:

- Assign a device **Interface** for LAN-based communications, and then press the Tab key on your keyboard to update the page.

On PIX and ASA devices, this drop-down list displays the interfaces defined on the device. You can type in a port ID (e.g., *gigabitethernet1*), or you can choose the port if you have already defined the interface.

On an FWSM, the Interface list is not populated with VLAN IDs; you must enter the numeric ID of the VLAN you wish to use.

**Note** In both cases, this cannot be a Named interface, nor can the interface be configured for PPPoE.

- Provide a **Logical Name** for this failover interface.
- Enter the **Active IP** address for failover communications.
- Enter a **Standby IP** address for failover communications. The Standby IP address is used on the security appliance that is currently the standby unit.
- Enter the **Subnet Mask** for both IP addresses. Both must be on the same subnet.

**Step 10** (Optional) Follow these steps to enable and configure an interface for **Stateful Failover** communications between the two devices:

- a. Assign a device **Interface** for update communications, and then press the Tab key on your keyboard to update the page.

You can type in a port ID (e.g., *gigabitethernet1*), or you can choose the port if you have already defined the interface; note that this cannot be a Named interface.

---

**Note** On an FWSM, this is a **VLAN** interface.

---

- b. Provide a **Logical Name** for this interface.
- c. Enter the **Active IP** address for connection updates.
- d. Enter a **Standby IP** address for update communications.
- e. Enter the **Subnet Mask** for both IP addresses. Both must be on the same subnet.
- f. Select **Enable HTTP Replication** to preserve HTTP connection information.

Connection information is communicated to the standby unit for all TCP protocols except HTTP, because HTTP connections are generally short-lived. Select this option to maintain HTTP connections during failover.

**Step 11** Provide a communications-encryption key: enter a **Shared Key** and then repeat it in the **Confirm** field. Be sure to enter the same key on both devices. (Not available on FWSM versions prior to 3.1)

The Shared Key can be any arbitrary string of up to 63 alphanumeric characters. If **HEX** is checked, the Shared Key is an arbitrary string of exactly 32 hexadecimal characters. (The HEX option is available only on PIX/ASA version 7.0.5 and later, and FWSM versions 3.1.3 and later.)

---

**Note** This step is optional, but we strongly recommend encrypting failover communications.

---

**Step 12** To specify a failover reconnect timeout value for asymmetrically routed sessions, enter a length of time in the **Timeout** field, in the form hh:mm:ss (the minutes and seconds values are optional). If the field is blank (the default), or contains a zero, reconnections are prevented. Setting this value to -1 disables the timeout, allowing connections to reconnect after any amount of time.

**Step 13** (Optional) You can configure Bidirectional Forwarding Detection (BFD), to communicate with a failover pair and this can be used to monitor the health of the failover unit. Create or select a **BFD template** from the **Health-Check Monitoring** section.

---

**Note** This is applicable only for Firepower failover devices running ASA 9.7.1 and above.

---

---

**Tip** BFD failover commands are supported only in the Active/Standby mode. In a multi-context device, BFD failover commands are supported only in the system context. BFD Failover commands are not supported in the transparent mode.

---

**Step 14** (FWSM only) – Configured interfaces are listed in the Interface Configuration table. To edit the failover configuration for a listed interface, select it and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box](#), page 50-23.

---

## Adding A Security Context to Failover Group 2

To add a new security context to an existing failover group 2, you must save the new context configuration to a deployment file and then manually add it to the appropriate device. Otherwise, until the first successful deployment, Security Manager will attempt to communicate with the new context through the device's Admin context. This will fail since group 2 cannot be reached through the Admin context (unless both group 1 and 2 are active on the same device).

The following steps outline creating a new security context and adding it to failover group 2.

1. Create the new security context.

Be sure to define: context Name, Configuration URL, assign an Interface, choose Failover Group 2, and provide a Management IP Address. See [Managing Security Contexts, page 59-7](#) for more information.

2. Save and submit these changes.

3. Provide the following context-configuration information, saving each change as you go:

- On the Credentials page of the Device Properties window for the new context, provide Username and Password. See [Viewing or Changing Device Properties, page 3-41](#) for additional information.
- On the context's Interfaces page, edit the assigned interface, providing a Name, IP address and Subnet Mask. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#) for additional information.
- On the context's Failover Page (ASA/PIX 7.0+), page 50-17, edit the interface configuration to provide a Standby IP Address.
- On the HTTP Page, page 49-2, check Enable HTTP Server and then define HTTP access.
- On the Credentials page, provide the Username and Password to be used when contacting the context. See [Configuring Device Credentials, page 48-17](#) for additional information.

4. Choose **Deploy** from the Configuration Manager's File menu. Submit your changes, and then in the Deploy Saved Changes dialog box, be sure only this new context is selected, and then click Edit Deploy method. In the Edit Deploy Method dialog box, change the Method to File and then specify the Destination and a file name. Click OK to close the Edit Deploy Method dialog box, and then click Deploy the Deploy Saved Changes dialog box.

The context configuration is saved to the specified file. See [Deploying to a File, page 8-11](#) for more information about this step.

5. After uploading the configuration file to the device, use the CLI to enable HTTP access for the context. For example:

```
ciscoasa/group2(config-if)# int g3/0
ciscoasa/group2(config-if)# nameif man
ciscoasa/group2(config-if)# security-level 100
ciscoasa/group2(config-if)# ip add 203.0.113.176 255.255.254.0 st 203.0.113.177
ciscoasa/group2(config-if)# exit
ciscoasa/group2(config)# http serv ena
ciscoasa/group2(config)# http 0.0.0.0 0.0.0.0 man
ciscoasa/group2(config)# username cisco pass cisco
ciscoasa/group2(config)#wr
```

Following this process, any new changes to the context can be successfully deployed to the context with Security Manager (attempts to reach the context will not go through the Admin context's management IP address).

### Alternative

Another approach to this issue is to add the new context to failover group 1 first, and then perform the configuration via Security Manager. However, in order to then move this context to failover group 2, both groups (1 and 2) must be active on the same device. Otherwise, this error will be reported:

```
"join-failover-group 2
```

```
ERROR: Command requires failover-group 2 and 1 to be in the same state or no nameif comand for all interfaces in this context"
```

## Additional Steps for an Active/Standby Failover Configuration

Cisco Security Manager lets you authenticate a PIX/ASA/FWSM device by validating the certificate installed on the device. When configuring firewalls in an active/standby failover configuration, you must manually copy the certificate from the active device to the standby device so that Security Manager can communicate with the standby device after a failover occurs.

The following procedures describe how to export or display the identity certificate, CA certificate, and keys for a security appliances in your network using ASDM, and then import that information onto a standby device using ASDM.

- [Exporting the Certificate to a File or PKCS12 data, page 50-9](#)
- [Importing the Certificate onto the Standby Device, page 50-9](#)

### Exporting the Certificate to a File or PKCS12 data

To export a trustpoint configuration, follow these steps using ASDM:

- 
- Step 1** Go to Configuration > Features > Device Administration > Certificate > Trustpoint > Export.
  - Step 2** Fill in the Trustpoint Name, Encryption Passphrase, and Confirm Passphrase fields. For information on these fields, click Help.
  - Step 3** Select a method for exporting the trustpoint configuration.
    - Export to a File—Type the filename or browse for the file.
    - Display the trustpoint configuration in PKCS12 format—Display the entire trustpoint configuration in a text box and then copy it for importing. For more information, click Help.
  - Step 4** Click **Export**.
- 

### Importing the Certificate onto the Standby Device

To import a trustpoint configuration, follow these steps using ASDM:

- 
- Step 1** Go to Configuration > Features > Device Administration > Certificate > Trustpoint > Import.
  - Step 2** Fill in the Trustpoint Name, Decryption Passphrase, and Confirm Passphrase fields. For information on these fields, click Help. The decryption passphrase is the same as the encryption passphrase used when the trustpoint configuration was exported.
  - Step 3** Select a method for importing the trustpoint configuration.

- Import from a File—Type the filename or browse for the file.
- Enter the trustpoint configuration in PKCS12 format—Paste the entire trustpoint configuration from the exported source into a text box. For more information, click Help.

## Failover Policies

This section lists the pages that describe configuring failover on various types of security appliances; the pages are organized by device type.

### PIX 6.x Firewalls

- [Failover Page \(PIX 6.3\), page 50-10](#)
  - [Edit Failover Interface Configuration Dialog Box \(PIX 6.3\), page 50-12](#)
  - [Bootstrap Configuration for LAN Failover Dialog Box, page 50-26](#)

### Firewall Services Modules

- [Failover Page \(FWSM\), page 50-13](#)
  - [Advanced Settings Dialog Box, page 50-16](#)
  - [Add/Edit Interface MAC Address Dialog Box, page 50-23](#)
  - [Edit Failover Interface Configuration Dialog Box, page 50-23](#)
  - [Bootstrap Configuration for LAN Failover Dialog Box, page 50-26](#)

### Adaptive Security Appliances and PIX 7.0 Firewalls

- [Failover Page \(ASA/PIX 7.0+\), page 50-17](#)
  - [Settings Dialog Box, page 50-21](#)
  - [Edit Failover Group Dialog Box, page 50-25](#)
  - [Edit Failover Interface Configuration Dialog Box, page 50-23](#)
  - [Add/Edit Interface MAC Address Dialog Box, page 50-23](#)
  - [Bootstrap Configuration for LAN Failover Dialog Box, page 50-26](#)

## Failover Page (PIX 6.3)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Use the Failover page to configure failover settings for a PIX 6.3.x Firewall.

### Navigation Path

Select a PIX 6.3.x device in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

| <b>Failover</b>    |                                                                                                                                                                                                                                                                                                                                         |
| Failover Method    | Choose the type of failover link: <b>Serial Cable</b> or <b>LAN Based</b> . If you choose Serial Cable, ensure the physical cable is connected to both devices.                                                                                                                                                                         |
| Enable Failover    | Check this box to enable failover on this device. Ensure that both devices have the same software version, activation key type, flash memory, and RAM.<br><br>On PIX devices with LAN Based chosen as the Failover Method, you must next configure the logical LAN Failover interface and, optionally, the stateful failover interface. |
| Bootstrap button   | Click to display the Bootstrap Configuration for LAN Failover dialog box. See <a href="#">Bootstrap Configuration for LAN Failover Dialog Box, page 50-26</a> for more information.                                                                                                                                                     |
| Failover Poll Time | Specify the amount of time between hello messages among units. Values can range from 3 to 15 seconds; default is 15.                                                                                                                                                                                                                    |

**LAN-Based Failover**

These fields are available when LAN Based is the chosen Failover Method.

|                    |                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface          | Choose the interface to be used for LAN-based failover. If “Not Selected” is chosen, LAN-based failover is disabled.                                               |
| Shared Key Confirm | Used to encrypt communications between the primary and standby devices. Value can be any alphanumeric string.<br><br>Re-enter the Shared Key in the Confirm field. |

**Stateful Failover**

(Optional) To configure [Stateful Failover, page 50-4](#), provide the following parameters.

|                         |                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface               | Choose the interface to be used for Stateful Failover. If “Not Selected” is chosen, Stateful Failover is disabled.<br><br><b>Note</b> You must choose a fast LAN link from the list (for example, 100full, 1000full, or 1000sxfull). |
| Enable HTTP Replication | When selected, active HTTP sessions are copied to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                        |

**Interface Configuration**

The table lists all available named interfaces. To define a Standby IP address and Active and Standby MAC addresses for an interface, select it in the list and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box \(PIX 6.3\), page 50-12](#).

## Edit Failover Interface Configuration Dialog Box (PIX 6.3)

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Use the Edit Failover Interface Configuration dialog box to configure failover interfaces for the selected PIX 6.3.x device.

**Note**

The failover interface cannot be configured for PPPoE.

### Navigation Path

You can access the Edit Failover Interface Configuration dialog box from the Interface Configuration table on the [Failover Page \(PIX 6.3\)](#), page 50-10.

### Field Reference

**Table 50-2** *Edit Failover Interface Configuration Dialog Box (PIX 6.3)*

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface          | The name of the interface; read-only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Active IP Address  | <p>Displays the IP address of the active interface. This address is used by the standby device to communicate with the active device. The address must be on the same network as the system IP address.</p> <p>The active IP address of this interface; read-only. This address is used by the standby device to communicate with the active device. This field is blank if an IP address has not been assigned to the interface.</p> <p><b>Tip</b> You can use this IP address with the ping tool to check the status of the active device.</p> |
| Netmask            | The subnet mask for the active IP address; read-only. This field is blank if an IP address has not been assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Standby IP Address | <p>Specify the IP address of the corresponding interface on the standby failover unit. This address is used by the active device to communicate with the standby device. The address must be on the same network as the system IP address.</p> <p>This field does not appear if an IP address has not been assigned to the interface.</p> <p><b>Tip</b> You can use this IP address with the ping tool to check the status of the standby device.</p>                                                                                            |

### Failover MAC Addresses

These parameters let you define virtual MAC addresses for a physical interface that is configured for failover; these addresses are optional.

**Table 50-2** *Edit Failover Interface Configuration Dialog Box (PIX 6.3) (continued)*

| Element             | Description                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------|
| Active MAC Address  | Specify a MAC address for the active interface in hexadecimal format (for example, 0123.4567.89ab).  |
| Standby MAC Address | Specify a MAC address for the standby interface in hexadecimal format (for example, 0123.4567.89ab). |

## Failover Page (FWSM)

### Note

From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

Use the Failover page to configure basic failover settings for the selected Firewall Services Module (FWSM).

### Navigation Path

To access this feature, select a FWSM in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

### Field Reference

**Table 50-3** *Failover Page (FWSM)*

| Element         | Description                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Failover | Check this box to enable failover on this device. Ensure that both devices have the same software version, activation key, flash memory, and RAM.<br><br>You must next configure the logical LAN Failover interface and, optionally, the stateful failover interface. |
| Settings button | Click to display the <a href="#">Advanced Settings Dialog Box, page 50-16</a> , used to define when failover should occur.                                                                                                                                            |

### Configuration

This section is presented only for FWSM 3.1.1+ devices operating in multiple-context mode.

**Table 50-3** Failover Page (FWSM) (continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active/Active       | <p>In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.</p> <p>To enable Active/Active failover on the device, you must assign the security contexts to one of two failover groups. A failover group is a simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default. See <a href="#">Add/Edit Security Context Dialog Box (FWSM)</a>, page 59-8 for information about assigning a context to a failover group.</p> |
| Active/Standby      | <p>In an Active/Standby configuration, the active security appliance handles all network traffic passing through the failover pair. The standby security appliance does not handle network traffic until a failure occurs on the active security appliance. Whenever the configuration of the active security appliance changes, it sends configuration information over the failover link to the standby security appliance.</p> <p>When a failover occurs, the standby security appliance becomes the active unit. It assumes the IP and MAC addresses of the previously active unit. Because the other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time out.</p>                                                                                                                             |
| <b>LAN Failover</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| VLAN                | <p>Enter the numeric ID of the VLAN interface you are using for the failover link; for example, 11. This list is not automatically populated with VLAN IDs—you must highlight “Not Selected” and type the desired VLAN ID number; press your keyboard’s Tab key to activate the related fields.</p> <p>When configured for failover, the interface is directly connected to the standby device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Logical Name        | Enter a logical name for the failover VLAN interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Active IP Address   | Specify the active IP address for this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Standby IP Address  | <p>Specify a standby IP address for this interface.</p> <p>To receive packets from both units in a failover pair, standby IP addresses need to be configured on all interfaces. The Standby IP address is used on the security appliance that is currently the standby unit, and it must be in the same subnet as the active IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Subnet Mask         | Enter the Subnet Netmask for the Active and Standby IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Bootstrap button    | Click to display the Bootstrap Configuration for LAN Failover dialog box. See <a href="#">Bootstrap Configuration for LAN Failover Dialog Box</a> , page 50-26 for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Stateful Failover</b>                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                              |
| (Optional) To configure <a href="#">Stateful Failover</a> , page 50-4, provide the following parameters. |                                                                                                                                                                                                                                                                                                                                                                                              |
| VLAN                                                                                                     | Enter the numeric ID of the VLAN interface you are using for the failover link; for example, 12. This list is not automatically populated with VLAN IDs—you must highlight “Not Selected” and type the desired VLAN ID number; press your keyboard’s Tab key to activate the related fields.<br><br>When configured for failover, the interface is directly connected to the standby device. |
| Logical Name                                                                                             | Enter a logical name for the Stateful failover VLAN interface.                                                                                                                                                                                                                                                                                                                               |
| Active IP Address                                                                                        | Specify the active IP address for this interface.                                                                                                                                                                                                                                                                                                                                            |
| Standby IP Address                                                                                       | Specify a standby IP address for this interface.<br><br>To receive packets from both units in a failover pair, standby IP addresses need to be configured on all interfaces. The Standby IP address is used on the security appliance that is currently the standby unit, and it must be in the same subnet as the active IP address.                                                        |
| Subnet Mask                                                                                              | Enter the Subnet Netmask for the Active and Standby IP addresses.                                                                                                                                                                                                                                                                                                                            |
| Enable HTTP Replication                                                                                  | When selected, allows stateful failover to copy active HTTP sessions to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                                                                                                                                                          |

**Shared Key (FWSM 3.1.1+ only)**

The options in this section let you encrypt the communications between the active and standby devices by providing a shared encryption key.

**Caution** All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If this device is used to terminate VPN tunnels, this information includes any user names, passwords and shared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communications with a shared key.

|            |                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shared Key | Enter any string of characters up to 63 numbers, letters and punctuation characters. This string is used to generate the encryption key.                                              |
| Confirm    | Re-enter this string the <b>Confirm</b> field.<br><br>If you select <b>HEX</b> , the entry in the Shared Key and Confirm fields must be exactly 32 hexadecimal characters (0-9, a-f). |

**Interface Configuration**

This table is presented on the Failover page for devices operating in single-context mode, or for individual security contexts only.

The table lists all available named interfaces. To enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box](#), page 50-23. Select or deselect **Monitor this interface for failure**.

## Advanced Settings Dialog Box

The Advanced Settings dialog box lets you configure additional failover settings for the selected FWSM.

### Note

The following reference table describes all fields that can be presented in the Advanced Settings dialog box. The fields actually presented depend on operating mode (routed or transparent) and whether the device is hosting single or multiple contexts.

### Navigation Path

You can access the Advanced Settings dialog box by clicking the Settings button on the [Failover Page \(FWSM\)](#), page 50-13.

| Select a failed-interfaces option and provide an appropriate value.                                                                                                     |                                                                                                                                                                                                                                     |
| Number of failed interfaces                                                                                                                                             | When the number of failed monitored interfaces exceeds this value, the security appliance fails over. Valid values range from 1 to 250.                                                                                             |
| Percentage of failed interfaces                                                                                                                                         | When the number of failed monitored interfaces exceeds this percentage, the security appliance fails over.                                                                                                                          |
| <b>Failover Poll Time</b>                                                                                                                                               |                                                                                                                                                                                                                                     |
| These fields define how often hello messages are sent on the failover link, and how long to wait before testing the peer for failure if no hello messages are received. |                                                                                                                                                                                                                                     |
| Unit Failover                                                                                                                                                           | The amount of time between hello messages between failover units. Enter a value between 1 and 15 seconds, or if <b>msec</b> is checked, between 500 and 999 milliseconds.                                                           |
| Unit Hold Time                                                                                                                                                          | The amount of time to wait for a hello message on the failover link, after which the unit begins testing for peer failure. Enter a value between 3 and 45 seconds. This value must be at least three times the Unit Failover value. |
| Monitored Interface                                                                                                                                                     | The amount of time between polls among interfaces. Enter a value between 3 and 15 seconds.                                                                                                                                          |

### MAC Address Mapping

In Active/Standby mode, this table lists interface-virtual MAC address mappings. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, which are described in [Using Tables](#), page 1-48.

To add or edit interface mappings, click the Add Row or Edit Row button to open the [Add/Edit Interface MAC Address Dialog Box](#), page 50-23.

**Table 50-4** *Advanced Settings Dialog Box (continued)*

| Element                                                                                                                                                                                                                                                                                                                                                                                     | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <b>Failover Groups</b>                                                                                                                                                                                                                                                                                                                                                                      |             |
| In Active/Active mode, this table lists both failover groups. To edit failover parameters for either group, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Group Dialog Box, page 50-25</a> .                                                                                                                                                    |             |
| <b>Bridge Group Configuration</b>                                                                                                                                                                                                                                                                                                                                                           |             |
| In single-context transparent mode, this table lists all currently defined bridge groups (see <a href="#">Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26</a> ). To add a standby IP address to a bridge group, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Bridge Group Configuration Dialog Box, page 50-17</a> . |             |

### Edit Failover Bridge Group Configuration Dialog Box

Use this dialog box to add a standby IP address to a failover bridge group.

#### Navigation Path

You can access the Edit Failover Bridge Group Configuration dialog box as follows:

- On the Failover page presented for an individual security context in transparent mode on an ASA.
- From the Bridge Group Configuration table in the [Advanced Settings Dialog Box, page 50-16](#) presented by an FWSM in transparent mode.

#### Field Reference

**Table 50-5** *Edit Failover Bridge Group Configuration Dialog Box*

| Element         | Description                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Name            | Identifies the bridge group; not editable.                                                                        |
| IP Address      | Identifies the IP address assigned to the bridge group; not editable.                                             |
| Network Mask    | Identifies the subnet mask for the IP Address; not editable.                                                      |
| Standby Address | Enter the IP address of the standby bridge group; this address must be on the same subnet as the primary address. |

## Failover Page (ASA/PIX 7.0+)

#### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Use the Failover page to configure basic failover settings for ASA and PIX 7.0+ security devices

**Note**

The features and options presented on the Failover page vary according to type of device selected, operating system version, firewall mode (routed or transparent), and security contexts (single or multiple). Thus, some of the elements described in the following table may not appear on the Failover page for your currently selected device.

**Navigation Path**

Select an ASA or PIX 7.0+ in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Failover Method  | Choose the type of failover link: <b>Serial Cable</b> or <b>LAN Based</b> . If you choose Serial Cable, ensure the physical cable is connected to both devices.<br><br><b>Note</b> This option is available only on PIX devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Failover  | Check this box to enable failover on this device. Ensure that both devices have the same software version, activation key type, flash memory, and RAM.<br><br>On PIX devices with LAN Based chosen as the Failover Method, and on all ASAs, you must next configure the logical LAN Failover interface and, optionally, the stateful failover interface.                                                                                                                                                                                                                                                                                                                                                                |
| Bootstrap button | Click to display the Bootstrap Configuration for LAN Failover dialog box. See <a href="#">Bootstrap Configuration for LAN Failover Dialog Box, page 50-26</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Settings button  | Click to display the <a href="#">Settings Dialog Box, page 50-21</a> , used to define when failover should occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Timeout          | The failover Timeout specifies the amount of time after a system boots or becomes active that “nailed” sessions are accepted; used in conjunction with static translation rules (see <a href="#">Static Rules Tab, page 24-27</a> for more information).<br><br>Enter a value in this field to specify the failover reconnect timeout value for asymmetrically routed sessions. The value is in the form hh:mm:ss (hours:minutes:seconds); both minutes and seconds are optional.<br><br>Valid values for the number of hours are -1 to 1193; the default value is 0, which means connections cannot be re-established. Setting this value to -1 disables the timeout, allowing reconnections after any amount of time. |

Table 50-6 Failover Page (ASA/PIX 7.0+) (continued)

| Element                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| This section is presented only for devices operating in multiple-context mode. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Active/Active                                                                  | <p>In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.</p> <p>To enable Active/Active failover on the security appliance, you must assign the security contexts to one of two failover groups. A failover group is a simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default. See <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA), page 59-9</a> for information about assigning a context to a failover group.</p> |
| Active/Standby                                                                 | <p>In an Active/Standby configuration, the active security appliance handles all network traffic passing through the failover pair. The standby security appliance does not handle network traffic until a failure occurs on the active security appliance. Whenever the configuration of the active security appliance changes, it sends configuration information over the failover link to the standby security appliance.</p> <p>When a failover occurs, the standby security appliance becomes the active unit. It assumes the IP and MAC addresses of the previously active unit. Because the other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time out.</p>                                                                                                                                            |

| (Optional) To configure <a href="#">Stateful Failover, page 50-4</a> , provide the following parameters.                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Interface                                                                                                                                                                                       | Choose the interface to use for the stateful failover link; all interfaces available on the device are listed.<br><br><b>Note</b> You can choose an EtherChannel interface as the stateful failover link. As with any other type of interface assigned as a failover link, the EtherChannel interface cannot be named, and none of the EtherChannel's member interfaces can be named. Further, while being used as an active failover link, changes to the interface configuration are not allowed. Refer to <a href="#">Configuring EtherChannels, page 46-9</a> for more information. |
| Logical Name                                                                                                                                                                                    | Enter the logical name of the interface on the active firewall device to communicate with standby device for failover. When configured for stateful failover, the interface is directly connected to the standby device.                                                                                                                                                                                                                                                                                                                                                                |
| Active IP Address                                                                                                                                                                               | Specify the IP address of the active interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Standby IP Address                                                                                                                                                                              | Specify the IP address of the standby interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Subnet Mask                                                                                                                                                                                     | Enter the Subnet Netmask for the active and standby IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable HTTP Replication                                                                                                                                                                         | When selected, active HTTP sessions are copied to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Key</b>                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| The options in this section let you encrypt the communications between the active and standby devices. Select the type and provide a string of characters to produce the shared encryption key. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Caution</b>                                                                                                                                                                                  | All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If this device is used to terminate VPN tunnels, this information includes any user names, passwords and shared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communications with a shared key.                                                                                                                   |
| Any string                                                                                                                                                                                      | If you select <b>Any string</b> , the entry in the Shared Key field can be any combination of up to 63 numbers, letters and punctuation characters.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| HEX                                                                                                                                                                                             | This string is used to generate the encryption key.<br><br>If you select <b>HEX</b> , the entry in the Shared Key and Confirm fields must be exactly 32 hexadecimal characters (0-9, a-f). This string is used as the encryption key.                                                                                                                                                                                                                                                                                                                                                   |

**Table 50-6** Failover Page (ASA/PIX 7.0+) (continued)

| Element            | Description                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Shared Key Confirm | Enter any string of characters appropriate to the selected key type: Any string or HEX.<br>Re-enter the string the <b>Confirm</b> field. |

**Interface Configuration**

(in some instances, labeled Monitor Interface Configuration)

This table is presented on the Failover page for ASA 8.4.1+ devices operating in single-context, transparent mode, and for individual contexts on PIX/ASA devices. Otherwise, it appears in the [Settings Dialog Box, page 50-21](#).

The table lists all available named interfaces. To enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box, page 50-23](#). Select or deselect **Monitor this interface for failure**.

## Settings Dialog Box

The Settings dialog box lets you define criteria for when failover should occur on the selected ASA or PIX 7.x appliance.

**Navigation Path**

You can access the Settings dialog box by clicking the Settings button on the [Failover Page \(ASA/PIX 7.0+\), page 50-17](#).

**Note**

The following reference table presents all fields that can be presented in the Settings dialog box. The fields actually presented depend on operating mode (routed or transparent) and whether the device is hosting single or multiple contexts.

| <b>Failover Poll Time</b>                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Unit Failover                                                                                                                                                                                                                                                                                                 | The amount of time between hello messages among units. The range is between 1 and 15 seconds, or between 200 and 999 milliseconds if the <b>Change units to msec</b> option is checked.                                                                                                                                                                                                                                                      |
| Unit Hold Time                                                                                                                                                                                                                                                                                                | Sets the time during which a unit must receive a hello message on the failover link, or the unit begins the testing process for peer failure. The range is between 3 and 45 seconds, or between 800 and 999 milliseconds if the <b>msec</b> option is checked. You cannot enter a value that is less than three times the Unit Failover value.                                                                                               |
| Monitored Interface                                                                                                                                                                                                                                                                                           | The amount of time between polls among interfaces. The range is between 3 and 15 seconds, or between 500 and 999 milliseconds if the msec option is checked.                                                                                                                                                                                                                                                                                 |
| Interface Hold Time                                                                                                                                                                                                                                                                                           | Sets the time during which a data interface must receive a hello message, after which the peer is declared failed. Valid values are from 5 to 75 seconds. This value must be at least five times the Unit Failover value.                                                                                                                                                                                                                    |
| Link State Interval                                                                                                                                                                                                                                                                                           | Sets the interval after which each ASA in a failover pair checks the link state of its interfaces. By default the link state interval value is 500msec. You can customize the polltime; for example, if you set the polltime to 300 msec, the ASA can detect an interface failure and trigger failover faster. Valid range is between 300 and 799 milliseconds.<br><b>Note</b> The Link State Interval is available for ASA 9.7.1 and later. |
| <b>Failover Groups</b>                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| In Active/Active mode, this table lists both failover groups. To edit failover parameters for either group, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Group Dialog Box</a> , page 50-25.                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>MAC Address Mapping</b>                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| In Active/Standby mode, this table lists interface-virtual MAC address mappings. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, which are described in <a href="#">Using Tables</a> , page 1-48.                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| To add or edit interface mappings, click the Add Row or Edit Row button to open the <a href="#">Add/Edit Interface MAC Address Dialog Box</a> , page 50-23.                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Monitor Interface Configuration</b>                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| In single-context mode, this table lists all available named interfaces. To define a Standby IP address for, and enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Interface Configuration Dialog Box</a> , page 50-23. |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Management IP Address</b>                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| In single-context transparent mode, this section presents the management IP address and netmask defined for the device (on the <a href="#">Management IP Page</a> , page 47-10); you cannot change these values.                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Standby                                                                                                                                                                                                                                                                                                       | Enter the management IP address of the standby unit; this address must be on the same subnet as the primary address.                                                                                                                                                                                                                                                                                                                         |

## Add/Edit Interface MAC Address Dialog Box

The Add/Edit Interface MAC Address dialog box lets you define virtual MAC addresses for a physical interface on ASA, FWSM 3.x and PIX 7.x security appliances that are configured for failover (not available on ASA 5505 devices).

In Active/Standby failover, the MAC addresses for the primary unit are always associated with the active IP addresses. If the secondary unit boots first and becomes active, it uses the burned-in MAC address for its interfaces. When the primary unit comes online, the secondary unit obtains the MAC addresses from the primary unit. This change can disrupt network traffic. You can configure virtual MAC addresses for each interface to ensure that the secondary unit uses the correct MAC addresses when it is the active unit, even if it comes online before the primary unit. If you do not specify virtual MAC addresses, the failover pair uses the burned-in MAC addresses.

### Note

You cannot configure a virtual MAC address for the failover or Stateful Failover links. The MAC and IP addresses for those links do not change during failover.

### Navigation Path

You can open the Add/Edit Interface MAC Address dialog box from the [Settings Dialog Box](#), page 50-21.

### Field Reference

**Table 50-8 Add/Edit Interface MAC Address Dialog Box**

| Element            | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| Physical Interface | Choose the physical interface on which failover virtual MAC addresses are to be configured.                |
| <b>MAC Address</b> |                                                                                                            |
| Active Interface   | Enter a virtual MAC address for the active interface in hexadecimal format (for example, 0023.4567.89ab).  |
| Standby Interface  | Enter a virtual MAC address for the standby interface in hexadecimal format (for example, 0023.4567.89ab). |

## Edit Failover Interface Configuration Dialog Box

Use the Edit Failover Interface Configuration dialog box to define a standby IP address for an interface, and to specify whether the status of the interface should be monitored.

### Note

A failover interface cannot be configured for PPPoE.

**Navigation Path**

You can access the Edit Failover Interface Configuration dialog box from the [Settings Dialog Box, page 50-21](#) (ASA/PIX 7.0+), [Advanced Settings Dialog Box, page 50-16](#) (FWSM), and from the Failover page itself for ASA 8.4.1+ devices operating in single-context transparent mode, and for individual ASA/PIX security contexts.

| Interface Name                     | The name of the interface; read-only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Active IP Address                  | The active IP address of this interface; read-only. This field is blank if an IP address has not been assigned to the interface; for example if DHCP is enabled on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Mask                               | The subnet mask for the active IP address; read-only. This field is blank if an IP address has not been assigned to the interface; for example, if DHCP is enabled on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Standby IP Address                 | Specify the IP address of the corresponding interface on the standby failover unit. This field does not appear if an IP address has not been assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Monitor this interface for failure | <p>Specifies whether this interface is monitored for failure: check this box to enable monitoring. The number of interfaces that can be monitored for the security appliance is 250.</p> <p>Hello messages are exchanged between the security appliance failover pair during every interface poll time period. The failover interface poll time is 3 to 15 seconds. For example, if the poll time is set to 5 seconds, testing begins on an interface if 5 consecutive hellos are not heard on that interface (25 seconds). Monitored failover interfaces can have the following status:</p> <ul style="list-style-type: none"> <li>• Unknown—Initial status. This status can also mean the status cannot be determined.</li> <li>• Normal—The interface is receiving traffic.</li> <li>• Testing—Hello messages are not heard on the interface for five poll times.</li> <li>• Link Down—The interface is administratively down.</li> <li>• No Link—The physical link for the interface is down.</li> <li>• Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.</li> </ul> |

**Table 50-9** *Edit Failover Interface Configuration Dialog Box (continued)*

| Element          | Description                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASR Group Number | If this interface is part of an asymmetric routing group, provide its ASR group number. Valid values for ASR group numbers are 1 through 32.<br><br>Stateful failover must be enabled for asymmetric routing support to function properly between units in failover configurations. |

### Edit Failover Group Dialog Box

Use the Edit Failover Group dialog box to configure failover parameters for groups of security contexts in an Active/Active failover configuration. See [Add/Edit Security Context Dialog Box \(PIX/ASA\)](#), page 59-9, or [Add/Edit Security Context Dialog Box \(FWSM\)](#), page 59-8, for information about assigning a context to a failover group.

#### Navigation Path

You can access the Add Failover Group dialog box from the PIX/ASA [Settings Dialog Box](#), page 50-21, or the FWSM [Advanced Settings Dialog Box](#), page 50-16.

#### Related Topics

- [Failover Policies](#), page 50-10

#### Field Reference

**Table 50-10** *Edit Failover Group Dialog Box*

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preferred Role                              | Specifies the unit in the failover pair, primary or secondary, on which this failover group appears in the active state when both units start up simultaneously, or when the Preempt option is selected. Choose <b>Primary</b> or <b>Secondary</b> .<br><br>You can have both failover groups in the active state on a single unit in the pair; however, a more typical configuration is to assign each failover group a different role to make each one active on a different unit, balancing the traffic across the devices. |
| Poll time interval for monitored interfaces | Specify the amount of time between polling of monitored interfaces. Valid values are from 3 to 15 seconds (or 500 to 999 milliseconds if <b>msec</b> is checked).                                                                                                                                                                                                                                                                                                                                                              |
| Hold Time                                   | Specify the time period within which the group must receive a hello message, after which the other group is declared failed. Valid values are from 5 to 75 seconds.                                                                                                                                                                                                                                                                                                                                                            |
| Preempt after Reboot                        | Specifies the number of seconds that the preferred failover device should wait after rebooting before taking over as the active unit for this failover group. Valid values are from 0 to 1200 seconds.                                                                                                                                                                                                                                                                                                                         |

**Table 50-10** Edit Failover Group Dialog Box (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable HTTP Replication | Indicates whether active HTTP sessions are copied to the standby device for this failover group as part of Stateful failover. If you do not allow HTTP replication, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link. This setting overrides the HTTP replication setting on the Failover page.                                                                                |
| Failover Criteria       | Select a failed-interfaces criterion for this group and specify the appropriate value: <ul style="list-style-type: none"> <li>• <b>Number of failed interfaces</b> – When this number of interfaces have failed, failover is triggered. Valid values are 1 to 250.</li> <li>• <b>Percentage of failed interfaces</b> – When this percentage of the total number of interfaces have failed, failover is triggered. Valid values are 1 to 100.</li> </ul> |

**MAC Address Mapping**

This table displays interfaces to which active and standby MAC addresses are mapped.

## Failover Page (Security Context)

The Failover page for individual ASA and PIX 7.0+ security contexts presents the **Interface Configuration** table, which lists all available named interfaces.

You can select an interface in the table and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box, page 50-23](#), where you can specify a standby IP address and an ASR group number, and enable or disable monitoring of the interface.

For individual transparent-mode contexts on ASA 8.4.1+ devices, the Failover page also presents the **Bridge Group Configuration** table, which lists all currently defined failover bridge groups.

You can select an entry in the table and click the Edit Row button to open the [Edit Failover Bridge Group Configuration Dialog Box, page 50-17](#), where you can specify a standby IP address for the selected bridge group.

**Navigation Path**

Select a security context in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

## Bootstrap Configuration for LAN Failover Dialog Box

The Bootstrap Configuration for LAN Failover dialog box provides you with bootstrap configuration that can be applied to the primary and secondary devices in a LAN failover configuration.

**Navigation Path**

You can access the Bootstrap Configuration for LAN Failover dialog box from the Failover page. For more information about the Failover page, see:

- [Failover Page \(PIX 6.3\), page 50-10](#)
- [Failover Page \(FWSM\), page 50-13](#)
- [Failover Page \(ASA/PIX 7.0+\), page 50-17](#)

**Related Topics**

- [Failover Policies, page 50-10](#)
- [Additional Steps for an Active/Standby Failover Configuration, page 50-9](#)

**Field Reference**

**Table 50-11** *Bootstrap Configuration for LAN Failover Dialog Box*

| Element   | Description                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary   | Contains the bootstrap configuration for the primary device. Open a console connection to the primary device and then paste this configuration to activate failover on the device.                                              |
| Secondary | Contains the bootstrap configuration for the secondary device. After the primary device becomes active, open a console connection to the secondary device and then paste this configuration to activate failover on the device. |

**Note**

For Active/Active Failover, the bootstrap configurations are only applied to the system contexts of the respective failover peer devices.

# Configuring Hostname, Resources, User Accounts, and SLAs

---

The following topics describe configuring the host name on a security appliance, defining and managing Resource classes on Firewall Services Modules (FWSMs) in multiple-context mode, managing user accounts in the Local user database, and monitoring service level agreements (SLAs) to perform route tracking.

This chapter contains the following topics:

- [Hostname Page, page 51-1](#)
- [Resource Management on Multi-context FWSMs, page 51-2](#)
- [Configuring User Accounts, page 51-7](#)
- [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 51-8](#)

## Hostname Page

You can use the Hostname page to specify a host name for your security device, and to specify a default domain. After the configuration file is deployed, the device uses this domain name when you do not enter a fully-qualified domain name in other commands. It also uses this domain name in RSA key generation.

The device appends this domain name to unqualified names. For example, if you set the domain name to “example.com,” and specify a syslog server by the unqualified name “jupiter,” the security appliance completes the name to “jupiter.example.com.”

When you set a host name for the security appliance, that name appears in the command line prompt. If you establish sessions to multiple devices, the host name helps you keep track of where you enter commands. The default host name depends on your platform.

In multiple-context mode, you can specify a domain name for each context, as well as the system execution space. The host name you specify in the system execution space appears in the command line prompt for all contexts. The host name that you optionally set within a context does not appear in the command line, but can be used by the banner command `$(hostname)` token.

### Navigation Path

In Device View, select a security device and then select **Platform > Device Admin > Hostname** from the Device Policy selector.

**Field Reference****Table 51-1** Hostname Page

| Element     | Description                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Name   | Enter a unique device name to help you differentiate among devices; for example, <i>PIX-510-A</i> .<br><br><b>Note</b> We recommend that you use a unique host name for each device you manage. The device name can be up to 63 alphanumeric (U.S. English) characters and can include any of the following special characters: ` ( ) + - , . / : =. |
| Domain Name | Optionally, enter a valid Domain Name System (DNS) domain name for the device; for example, <i>cisco.com</i> .                                                                                                                                                                                                                                       |

## Resource Management on Multi-context FWSMs

**Note**

From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

By default, all security contexts on a multiple-context Firewall Services Module (FWSM) have unlimited access to the resources of the FWSM, except where maximum limits per context are enforced. However, if you find that one or more contexts use too many resources, and they cause other contexts to be denied connections, for example, then you can configure resource management to limit the use of resources per context.

**Note**

The FWSM does not limit the bandwidth per context; however, the switch containing the FWSM can limit bandwidth per VLAN. See the switch documentation for more information.

The FWSM manages resources by assigning contexts to resource classes. Each context uses the resource limits set by its class. When you create a class, the FWSM does not set aside a portion of the resources for each context assigned to the class; rather, the FWSM sets the maximum limit for a context. If you oversubscribe resources, or allow some resources to be unlimited, a few contexts can “use up” those resources, potentially affecting service to other contexts.

You can set the limit for all resources together as a percentage of the total available for the device. Also, you can set the limit for individual resources as a percentage or as an absolute value.

You can oversubscribe the FWSM by assigning more than 100 percent of the resources across all contexts. For example, you can set up a class to limit connections to 20 percent per context, and then assign 10 contexts to the class for a total of 200 percent. If contexts concurrently use more than the system limit, then each context gets less than the 20 percent you intended.

The FWSM also lets you assign unlimited access to one or more resources in a class, instead of a percentage or absolute number. When a resource is unlimited, contexts can use as much of the resource as the system has available. For example, contexts A, B, and C are assigned to class “Onepercent,” which limits each class member to one percent of the system inspections per second, for a total of three percent; but the three contexts are currently only using two percent combined. On the other hand, class “Nolimit” has unlimited access to inspections. The contexts in Nolimit can use more than the 97 percent of “unassigned” inspections; they can also use the one percent of inspections not currently in use by

contexts A, B, and C, even if that means that contexts A, B, and C are unable to reach their three percent combined limit. Setting unlimited access is similar to oversubscribing the FWSM, except that you have less control over how much you oversubscribe the system.

### Default Class

All contexts belong to the default class if they are not assigned to another class; you do not have to actively assign a context to the default class.

If a context belongs to a class other than the default class, those class settings always override the default class settings. However, if the other class has any settings that are not defined, then the member context uses the default class for those limits. For example, if you create a class with a two percent limit for all concurrent connections, but no other limits, then all other limits are inherited from the default class. Conversely, if you create a class with a two percent limit for all resources, the class uses no settings from the default class.

As initially configured, the default class provides unlimited access to resources for all contexts, except for the following limits, which are by default set to the maximum allowed per context:

- Telnet sessions – 5 sessions
- SSH sessions – 5 sessions
- IPSec sessions – 5 sessions
- MAC addresses – 65,535 entries

Note that you can edit the default class.

## Resources Page

Use the Resources page to configure and manage resource-management classes.

The table on this page lists all currently defined resource classes. Use the buttons below the table to manage this list:

- Add Row – Opens the Add Resource dialog box, where you can define a new class, and assign it to security contexts. See [Add and Edit Resource Dialog Boxes, page 51-4](#) for more information.
- Edit Row – For the currently selected row, opens the Edit Resource dialog box, so you can edit that class and its context assignments. See [Add and Edit Resource Dialog Boxes, page 51-4](#) for more information.
- Delete Row – Deletes the currently selected row(s); confirmation may be required.

### Navigation Path

In Device View, select the system context of an ASA or FWSM in multiple-context mode, and then select **Platform > Device Admin > Resources** from the Device Policy selector.

## Add and Edit Resource Dialog Boxes

Use the Add Resource and Edit Resource dialog boxes to add or edit resource classes and assignments for FWSM and ASA security contexts.

Except for their titles, both dialog boxes are identical; the following descriptions apply to both.

### Navigation Path

You can access the Add Resource and Edit Resource dialog boxes from the [Resources Page, page 51-3](#).

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class Name             | Enter a name for this class; can be a string of up to 20 alphanumeric characters, and may include any of the following special characters: ` ( ) + - , . / : =.                                                                                                                                                                                                                                                              |
| <b>Limits Tab</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Note</b>            | For the following Limits, if you do not specify a value for a particular limit, the limit is inherited from the default class. If the default class does not set that limit, the limit inherits the system limit.<br><br>Also, any value you enter is considered to be that rate <i>per second</i> , unless you also check the related <b>percent</b> box, in which case the value is that percentage of the total resource. |
| TCP or UDP Connections | Sets a Rate Limit for TCP or UDP connections between any two hosts, including connections between one host and multiple other hosts. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 102400, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                 |
| Inspections (Fixups)   | Sets a Rate Limit for application inspections. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 10000 per second, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                             |
| Syslog Messages        | Sets a Rate Limit for system log messages. You can set the limit as an absolute value, or you can assign more than 100 percent if you want to oversubscribe the device.<br><br>The FWSM can support 30,000 messages per second for messages sent to the FWSM terminal or buffer. If you send messages to a syslog server, the FWSM supports 25,000 per second.                                                               |

**Table 51-2 Add and Edit Resource Dialog Boxes (continued)**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connections      | <p>Sets the Absolute Limit for concurrent TCP or UDP connections. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 999900, or you can assign more than 100 percent if you want to oversubscribe the device.</p> <p><b>Note</b> For concurrent connections, the FWSM allocates half of the limit to each of two network processors (NPs) that accept connections. Typically, the connections are divided evenly between the NPs. However, in some circumstances, the connections are not evenly divided, and the maximum connection limit could be reached on one NP before reaching the maximum on the other. In this case, the maximum connections allowed is less than the limit you set. The NP distribution is controlled by the switch, based on a distribution algorithm. You can adjust this algorithm on the switch (see <a href="#">Customizing the FWSM Internal Interface</a> on cisco.com), or you can adjust the connection limit upward to account for the inequity.</p> |
| Hosts            | <p>Sets the limit for concurrent hosts that can connect through the FWSM. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 262144, or you can assign more than 100 percent if you want to oversubscribe the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IPsec Sessions   | <p>Sets the limit for IPsec sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 10 concurrent sessions divided between all contexts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SSH Sessions     | <p>Sets the limit for SSH sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 100 concurrent sessions divided between all contexts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Telnet Sessions  | <p>Sets the limit for concurrent Telnet sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 100 concurrent sessions divided between all contexts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NAT Translations | <p>Sets the limit for concurrent address translations. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 266144, or you can assign more than 100 percent if you want to oversubscribe the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MAC Address      | <p>(Transparent mode only) Sets the limit for concurrent MAC address entries allowed in the MAC address table. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 65535, or you can assign more than 100 percent if you want to oversubscribe the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 51-2 Add and Edit Resource Dialog Boxes (continued)

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASDM                 | <p>Sets the limit for ASDM management sessions (the default is 5). You can set the limit as an absolute value by entering an integer between 1 and 5, or you can enter a percentage between 3.0 and 15.0. The system allows a maximum of 80 concurrent sessions divided between all contexts.</p> <p>ASDM sessions use two HTTPS connections: one for monitoring that is always present, and one for making configuration changes that is present only when you make changes. For example, the system limit of 80 ASDM sessions represents a limit of 160 HTTPS sessions, divided between all contexts.</p> |
| Other VPN            | Sets the limit for Site-to-site VPN sessions. You cannot oversubscribe this resource; all context assignments combined cannot exceed the model limit. The sessions you assign for this resource are guaranteed to the context.                                                                                                                                                                                                                                                                                                                                                                              |
| Other VPN Burst      | Sets the limit for the number of site-to-site VPN sessions allowed beyond the amount assigned to a context with <code>vpn other</code> . For example, if your model supports 5000 sessions, and you assign 4000 sessions across all contexts with <code>vpn other</code> , then the remaining 1000 sessions are available for other <code>vpn burst</code> . Unlike <code>other vpn</code> , which guarantees the sessions to the context, <code>other vpn burst</code> can be oversubscribed; the burst pool is available to all contexts on a first-come, first-served basis.                             |
| <b>Note</b>          | The maximum value for Anyconnect VPN and Anyconnect VPN Burst depends on ASA licenses. Cisco Security Manager cannot validate the values entered for Anyconnect VPN and Anyconnect VPN Burst. Therefore, the user should make sure that the values for Anyconnect VPN and Anyconnect VPN Burst are within the maximum values; else it results in a deployment error. To find the maximum value, telnet into ASA and execute the <b>show version</b> command. The Total VPN Peers value corresponds to the maximum value.                                                                                    |
| Anyconnect VPN       | AnyConnect peers. You cannot oversubscribe this resource; all context assignments combined cannot exceed the model limit. The peers you assign for this resource are guaranteed to the context.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Anyconnect VPN Burst | The number of AnyConnect sessions allowed beyond the amount assigned to a context with AnyConnect. For example, if your model supports 5000 peers, and you assign 4000 peers across all contexts with AnyConnect, then the remaining 1000 sessions are available for AnyConnect Burst. Unlike AnyConnect, which guarantees the sessions to the context, AnyConnect Burst can be oversubscribed; the burst pool is available to all contexts on a first-come, first-served basis.                                                                                                                            |
| Storage              | Beginning with version 4.12, Security Manager enables you to enter the storage size or select Default. This feature is available for ASA version 9.6(2) or later. The limit is set in MB. The default limit is 100% of the disk configured since this storage cannot span multiple disks.                                                                                                                                                                                                                                                                                                                   |
| All Resources Limit  | Sets a limit for all resources. If you also set the limit for a specific resource, then that limit overrides the limit you set here for all resources. You can set the limit as a percentage, or as unlimited by setting the value to <b>0</b> (when <b>percent</b> is not checked). You cannot set any other absolute value. You can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                 |

**Table 51-2 Add and Edit Resource Dialog Boxes (continued)**

| Element             | Description                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Contexts Tab</b> |                                                                                                                                                                                                                                    |
| Available Contexts  | Lists all contexts available for class assignments; contexts which already have class assignments are not displayed.<br><br>Select one or more contexts and click the >> button to add the contexts to the Selected Contexts list. |
| Selected Contexts   | Lists all contexts assigned to this class.<br><br>Select one or more contexts and click the << button to return the contexts to the Available Contexts list.                                                                       |

## Configuring User Accounts

The User Accounts page lets you manage the Local user database. User accounts in the Local database can be used in conjunction with the Authentication, Authorization, Accounting (AAA) functions to determine “who is allowed to do what” on a device. Refer to [About AAA on Security Devices, page 48-1](#) for more information.

The table on this page lists all currently defined Local user accounts, showing for each, the name of the user and the assigned privilege level. For a detailed explanation of these fields, see [Add/Edit User Account Dialog Boxes, page 51-7](#).

- To add a user account, click the Add Row button.
- To edit the settings for an account, select it and click the Edit Row button.
- To delete a user account, select it and click the Delete Row button.

### Navigation Path

- (Device view) Select **Platform > Device Admin > User Accounts** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > User Accounts** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit User Account Dialog Boxes

Use the Add and Edit User Account dialog boxes to add a local user account or to modify an existing user account.

### Navigation Path

You can access the Add and Edit User Account dialog boxes from the User Accounts page, as described in [Configuring User Accounts, page 51-7](#).

**Field Reference****Table 51-3 Add/Edit User Account Dialog Boxes**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username              | Enter a name for this user account: must be at least four characters; the maximum is 64 characters. Entries are case-sensitive.                                                                                                                                                                                                                                                                                    |
| Password              |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Password as encrypted | Select Plain Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                                                    |
| Password encrypt type | Select MD5 or PBKDF2.                                                                                                                                                                                                                                                                                                                                                                                              |
| Password              | Enter a unique password for this user account. Entries are case-sensitive.<br><br><b>Note</b> To protect security, we recommend a password length of at least 8 characters.<br><br><b>Note</b> For Plain Text passwords: <ul style="list-style-type: none"> <li>- The length of MD5 password should be three to 32 characters.</li> <li>- The length of PBKDF2 password should be 33 to 127 characters.</li> </ul> |
| Confirm               | Re-enter the user password to confirm it.                                                                                                                                                                                                                                                                                                                                                                          |
| Privilege Level       | Choose a privilege level for this user; defines local command authorization. The range is 0 (lowest) to 15 (highest). The default privilege level is 2.                                                                                                                                                                                                                                                            |

## Monitoring Service Level Agreements (SLAs) To Maintain Connectivity

You can configure ASA or PIX devices that run version 7.2 or later to perform route tracking by monitoring service level agreements. By monitoring the connectivity to a device on another network, you can track the availability of a primary route and install a backup route if the primary route fails. For example, you can define a default route to an Internet service provider (ISP) gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable. This technique, called Dual ISP, provides security appliances with a form of high availability, which is a vital part of providing customers with the services to which they are entitled.

Without route tracking, there is no inherent mechanism for determining if the route is up or down. A static route remains in the routing table even if the next hop gateway becomes unavailable, and is removed only if the associated interface on the security appliance goes down.

The security appliance performs route tracking by associating a route with a monitoring target that you define in an SLA monitor policy object. It monitors the target using ICMP echo requests, according to the parameters configured in the object. If an echo reply is not received within a specified time period, the SLA monitor is considered down and the associated route is removed from the routing table. A previously configured backup route is used in place of the removed route.

SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out).

**Related Topics**

- [Configuring Static Routes, page 56-131](#)
- [Configuring Firewall Device Interfaces, page 46-3](#)
- [Creating Policy Objects, page 6-9](#)

This section contains the following topics:

- [Creating Service Level Agreements, page 51-9](#)

## Creating Service Level Agreements

The following procedure explains how to configure SLA monitor objects and associate them with routes and interfaces in an ASA or PIX configuration.

**Related Topics**

- [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 51-8](#)
- [Configuring Static Routes, page 56-131](#)
- [Configuring Firewall Device Interfaces, page 46-3](#)
- [Creating Policy Objects, page 6-9](#)

**Step 1**

Create the SLA monitor policy object:

- a. Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)) and select **SLA Monitors** from the table of contents.

**Tip**

You can also create SLA monitor objects when defining policies that use this object type. For more information, see [Selecting Objects for Policies, page 6-2](#).

- b. Right-click in the work area and select **New Object** to open the Add SLA Monitor dialog box. For more information, see [Configuring SLA Monitor Objects, page 51-10](#).
- c. The monitoring options are appropriate for most connections, so you need only configure the following:
  - Name—The name of the object.
  - SLA Monitor ID—An identifying number for the monitoring process. The number must be unique within a device configuration.
  - Monitored Address—The address that you are monitoring. When you select a monitoring target, make sure that it can respond to ICMP echo requests (pings). The target can be any network address that you choose, but consider the use of:
    - The ISP gateway address.
    - The next hop gateway address (if you are concerned about the availability of the ISP gateway).
    - A server on the target network, such as an AAA server, with which the security appliance needs to communicate.
    - A persistent network device on the destination network. (A desktop or notebook computer that gets shut down at night is not a good choice.)

- **Interface**—The interface name, or interface role that identifies an interface, that will be the source of the ICMP messages. The device pings the monitored address from this interface's IP address.

d. Click **OK** to save the object.

**Step 2** Configure ASA/PIX policies to use the object to monitor routes. You can configure the following policies to monitor SLAs:

- **Platform > Routing > Static Route**—When you define a static route, you can select an SLA monitor object to do route tracking for the route. For more information, see [Configuring Static Routes, page 56-131](#) and [Add/Edit Static Route Dialog Box, page 56-133](#).
- **Interfaces**—When you define an interface that uses DHCP or PPPoE, you can configure the DHCP or PPPoE learned default routes to be tracked. For more information, see [Device Interface: IP Type \(PIX/ASA 7.0+\), page 46-62](#).

## Configuring SLA Monitor Objects

Use the Add or Edit SLA (Service Level Agreement) Monitor dialog box to create, edit, and copy SLA monitor objects. Each SLA monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route.

You can configure SLA monitors only for security appliances running PIX/ASA version 7.2 or later. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out).

For more information about configuring and using SLA monitor objects, see [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 51-8](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **SLA Monitors** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLA Monitor ID    | The ID number of the SLA operation. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.                                                                                                                                                                                                                                                                                                                                             |
| Monitored Address | The IP address that is being monitored for availability by the SLA operation. For recommendations on selecting an address to monitor, see <a href="#">Monitoring Service Level Agreements (SLAs) To Maintain Connectivity, page 51-8</a> .                                                                                                                                                                                                                                                                                                                |
| Interface         | The source interface for all ICMP echo requests sent to the monitored address to test its availability. Enter the name of an interface or interface role, or click <b>Select</b> to select an it from a list or to create a new interface role.                                                                                                                                                                                                                                                                                                           |
| Frequency         | The frequency of ICMP echo request transmissions, in seconds. Values range from 1 to 604800 seconds (7 days). The default is 60 seconds.<br><b>Note</b> The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.                                                                                                                                                                                                                                                                            |
| Threshold         | The amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds. Values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds.<br><br>The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.<br><b>Note</b> The threshold value should not exceed the timeout value.                                        |
| Time out          | The amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds.<br><br>If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.<br><b>Note</b> The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers).        |
| Request Data Size | The size of the ICMP request packet payload, in bytes. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU).<br><br>For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used. |

**Table 51-4** SLA Monitor Dialog Box (continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ToS               | <p>The type of service (ToS) defined in the IP header of the ICMP request packet. Values range from 0 to 255. The default is 0.</p> <p>This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.</p> |
| Number of Packets | <p>The number of packets that are sent. Values range from 1 to 100. The default is 1 packet.</p> <p><b>Tip</b> Increase the default number of packets if you are concerned that packet loss might falsely cause the security appliance to believe that the monitored address cannot be reached.</p>                                         |
| Category          | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a>.</p>                                                                                                                                                                             |

# Configuring Server Access Settings on Firewall Devices

The Server Access section contains pages for configuring server access on firewall devices; Server Access is under Device Admin in the Device or Policy selector.

This chapter contains the following topics:

- [AUS Page, page 52-1](#)
- [DHCP Relay Page, page 52-5](#)
- [DHCP Relay IPv6 Page, page 52-7](#)
- [Configuring DHCP Servers, page 52-10](#)
- [DNS Page, page 52-14](#)
- [Configuring DDNS, page 52-18](#)
- [NTP Page, page 52-21](#)
- [SMTP Server Page, page 52-22](#)
- [TFTP Server Page, page 52-23](#)

## AUS Page

The AUS page lets you configure remote updating of a security appliance from a server that supports the Auto Update specification. Auto Update applies configuration changes and software updates to the appliance automatically from the remote server.

### Note

The server you identify on this page must be the same server you identify in the Auto Update section of the Device Properties (from the Tools menu, choose Device Properties). The Device Properties information identifies the AUS server to which Security Manager sends configuration updates, whereas the information on this page defines for the server the device will contact for updates. Also, the Device Identity you provide in the Device Properties must match the Device ID on this page.

If you change AUS servers, note that the device will continue to use the AUS server defined in its current configuration until it receives a new configuration. Thus, you should change the AUS policy but deploy the configuration using the previous AUS server. After deployment is successful, change the Device Properties to point to the new server. For more information on deploying to AUS, see [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine, page 8-41](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > AUS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > AUS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

- [Add and Edit Auto Update Server Dialog Boxes, page 52-3](#)

**Field Reference****Table 52-1 AUS Page**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Update Servers table | <p>This table lists currently configured Auto Update servers. Use the buttons below the table to manage these entries.</p> <p>The entries are listed in order of precedence for contacting AUS servers. Use the Up and Down arrow buttons to change the ordering of the list by moving the selected entry up or down.</p> <p>Use the Add Row, Edit Row, and Delete Row buttons to add, edit or delete entries. Add Row opens the Add Auto Update Server dialog box, while Edit Row opens the Edit Auto Update Server dialog box for the selected row. See <a href="#">Add and Edit Auto Update Server Dialog Boxes, page 52-3</a> for information about these dialog boxes.</p> <p><b>Note</b> The URL for contacting this AUS server is produced by concatenating the <i>Protocol://Username:Password@IP IP Address(:Port)/Path</i> provided in the Add/Edit Auto Update Server dialog boxes. The Port is included only if you entered a port number other than the default 443.</p>                    |
| Device ID Type            | <p>Choose the method used for identifying this device to the AUS server:</p> <ul style="list-style-type: none"> <li>• <b>Host Name</b> – The host name of this device, as provided in the Device Properties window (Tools &gt; Device Properties).</li> <li>• <b>Serial Number</b> – The serial number of this device.</li> <li>• <b>IP Address</b> – The IP address of the specified interface. When you choose this option, an Interface field appears; enter or Select the desired device interface.</li> <li>• <b>MAC Address</b> – The MAC address of the specified interface. When you choose this option, an Interface field appears; enter or Select the desired device interface.</li> <li>• <b>User Defined</b> – A unique user-specified ID is used. When you choose this option, a User Defined field appears; enter any alphanumeric string. Note that this string must also appear in the Device Identity field in the Device Properties window (Tools &gt; Device Properties).</li> </ul> |

Table 52-1 AUS Page (continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Type             | <p>Choose the method defining how often the AUS server is polled for updates:</p> <ul style="list-style-type: none"> <li>• <b>At Specified Frequency</b> – If you choose this option, the Poll Period field is displayed: <ul style="list-style-type: none"> <li>– <b>Poll Period</b> – Specify the number of minutes the device waits between polls of the AUS server; valid values are 1 to 35791.</li> </ul> </li> <li>• <b>At Scheduled Time</b> – If you choose this option, the following fields are displayed (available only on ASA/PIX devices running version 7.2 or later): <ul style="list-style-type: none"> <li>– <b>Days of the week</b> – Select one or more days on which the device is to poll the AUS server.</li> <li>– <b>Polling Start Time in Hours</b> – The hour at which polling is to begin on the selected days; based on a 24-hour clock.</li> <li>– <b>Polling Start Time in Mins</b> – The minute within the chosen hour when polling is to begin.</li> <li>– <b>Enable Randomization of the Start Time</b> – Select this option to specify a random polling window; the Randomization Window field is enabled.</li> </ul> <p><b>Randomization Window</b> – The maximum number of minutes the device can use to randomize the specified polling time; valid values are 1 to 1439.</p> </li> </ul> |
| Retry Count           | The number of times the device will try to poll the AUS server for new information. Optional; if you enter zero or leave this field blank, the device will not retry after a failed poll attempt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Retry Period          | If Retry Count is not zero or blank, the number of minutes the device will wait to re-poll the AUS server if the previous attempt failed; valid values are 1 to 35791. If Retry Count is not zero or blank and you leave this field blank, the value defaults to five minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Disable Device After: | <p>Selecting this option ensures that if no response is received from the AUS server within the specified Timeout period, the security appliance will stop passing traffic.</p> <ul style="list-style-type: none"> <li>• <b>Timeout</b> – The number of minutes the firewall device will wait to timeout if no response is received from the AUS server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Add and Edit Auto Update Server Dialog Boxes

Use the Add Auto Update Server dialog box to configure a new AUS server definition. The security appliance will automatically poll this server for image and configuration updates.

The Auto Update specification allows the Auto Update server to either push configuration information and send requests for information to the security appliance, or to pull configuration information by causing the security appliance to periodically poll the Auto Update server. The Auto Update server can

also send a command to the security appliance to send an immediate polling request at any time. Communication between the Auto Update server and the security appliance requires a communications path and local CLI configuration on each security appliance.

**Note**

The URL for contacting this AUS server is produced by concatenating the `Protocol://Username:Password@IP IP Address(:Port)/Path` provided in these dialog boxes. The Port is included only if you entered a port number other than the default 443.

With the exception of the title, the Edit Auto Update Server dialog box is identical to the Add Auto Update Server dialog box. The following descriptions apply to both.

**Navigation Path**

You can access the Add and Edit Auto Update Server dialog boxes from the [AUS Page, page 52-1](#).

**Field Reference**

**Table 52-2 Add and Edit Auto Update Server Dialog Boxes**

| Element            | Description                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol           | The protocol used to communicate with the AUS server; choose <b>http</b> or <b>https</b> .<br><br><b>Note</b> If https is selected as the protocol to communicate with the Auto Update server, the security appliance will use SSL. This requires the security appliance to have a DES, 3DES, or AES license. |
| IP Address         | Enter the IP address or Select a Networks/Hosts object representing this AUS server.                                                                                                                                                                                                                          |
| Port               | Enter the number of the port on which communications with the AUS server take place. Defaults to 80 if http is chosen as the Protocol, and to 443 if https is chosen. If you enter an arbitrary port number, be sure the AUS server is configured to use the same port.                                       |
| Path               | The path to AUS services on the server. The standard path is <code>autoupdate/AutoUpdateServlet</code> ; change this to <code>admin/auto-update</code> only if the AUS server host is an ASA.                                                                                                                 |
| AUS Interface      | Enter or Select the interface to use when polling the Auto Update server.                                                                                                                                                                                                                                     |
| Verify Certificate | Select this option to require SSL verification from the AUS server. The certificate returned by the server will be checked against Certification Authority (CA) root certificates. This requires that the AUS Server and this device use the same Certification Authority.                                    |
| Username           | Enter a user name to be used for AUS authentication (optional).                                                                                                                                                                                                                                               |
| Password           | Enter the password to be used for AUS authentication (optional).                                                                                                                                                                                                                                              |
| Confirm            | Re-enter the password (optional).                                                                                                                                                                                                                                                                             |

# DHCP Relay Page

Use the DHCP Relay page to configure DHCP relay services for security devices. Dynamic Host Configuration Protocol (DHCP) relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface. To configure DHCP relay, you need to specify at least one DHCP relay server and then enable a DHCP relay agent on the interface receiving DHCP requests.

## Note

You cannot enable a DHCP relay agent on an interface where a DHCP relay server is configured. The DHCP relay agent works only with external DHCP servers; it will not forward DHCP requests to a security appliance interface configured as a DHCP server.

Beginning with Security Manager version 4.9, DHCP Relay IPv4 is supported for ASA cluster devices running the software version 9.4.0 or later.

For ASA-SM 9.1.2+ devices, you can configure DHCP relay servers per-interface, so requests that enter a given interface are relayed only to servers specified for that interface. When a DHCP request enters an interface that does not have interface-specific servers configured, the ASA relays the request to all global servers. If the interface has interface-specific servers, then the global servers are not used. IPv6 is not supported for per-interface DHCP relay. For more information, see [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), page 46-45.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Relay** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Relay** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout (seconds)      | Specify the amount of time, in seconds, allowed for DHCP address negotiation. Valid values range from 1 to 3600 seconds; the default value is 60 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Trust Info (Option 82) | <p>Specifies that you want to trust all DHCP client interfaces. You can configure interfaces as trusted interfaces to preserve DHCP Option 82.</p> <p><b>Note</b> You can also specify interfaces to trust individually. For more information, see <a href="#">Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+)</a>, page 46-45.</p> <p>DHCP Option 82 is used by downstream switches and routers for DHCP snooping and IP Source Guard. Normally, if the ASA DHCP relay agent receives a DHCP packet with Option 82 already set, but the giaddr field (which specifies the DHCP relay agent address that is set by the relay agent before it forwards the packet to the server) is set to 0, then the ASA will drop that packet by default. You can now preserve Option 82 and forward the packet by identifying an interface as a trusted interface.</p> |

## Add and Edit DHCP Relay Agent Configuration Dialog Boxes

Use the Add DHCP Relay Agent Configuration dialog box to configure and enable a DHCP relay agent on an interface. Use the Edit DHCP Relay Agent Configuration dialog box to update an existing interface relay agent.

### Note

You cannot enable a DHCP relay agent on an interface where a DHCP relay server is configured. The DHCP relay agent works only with external DHCP servers; it will not forward DHCP requests to a security appliance interface configured as a DHCP server.

The Add DHCP Relay Agent Configuration dialog box and the Edit DHCP Relay Agent Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay Agent Configuration dialog boxes from the [DHCP Relay Page](#), page 52-5.

### Related Topics

- [Add and Edit DHCP Relay Server Configuration Dialog Boxes](#), page 52-7

|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable DHCP Relay | When checked, the DHCP relay is enabled on the specified interface.                                                                                                                                                                                                                                                           |
| Set Route         | Check this box to configure the DHCP relay agent to modify the default router address in the information returned from the DHCP server. When this option is selected, the DHCP relay agent substitutes the address of the selected interface for the default router address in the information returned from the DHCP server. |

## Add and Edit DHCP Relay Server Configuration Dialog Boxes

Use the Add DHCP Relay Server Configuration dialog box to define a new DHCP relay server; use the Edit DHCP Relay Server Configuration dialog box to update existing server information. You can configure a maximum of 10 DHCPv4 relay servers in single mode and per context, global and interface-specific servers combined, with a maximum of 4 servers per interface.

### Note

PIX Firewalls running an OS earlier than 7.2 only support 4 DHCP relay servers.

The Add DHCP Relay Server Configuration dialog box and the Edit DHCP Relay Server Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay Server Configuration dialog boxes from the [DHCP Relay Page, page 52-5](#).

| Element   | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| Server    | Enter the IP address or Select a Networks/Hosts object representing the external DHCP server to which DHCP requests are forwarded. |
| Interface | Enter or Select the interface through which DHCP requests are forwarded to the external DHCP server.                               |

## DHCP Relay IPv6 Page

Use the DHCP Relay IPv6 page to configure DHCPv6 relay services for security devices. Dynamic Host Configuration Protocol v6 (DHCPv6) relay passes DHCPv6 requests received on one interface to an external DHCPv6 server located behind a different interface. To configure DHCPv6 relay, you need to specify at least one DHCPv6 relay server and then enable a DHCPv6 relay agent on the interface receiving DHCPv6 requests.

**Note**

You cannot enable a DHCPv6 relay agent on an interface where a DHCPv6 relay server is configured. The DHCPv6 relay agent works only with external DHCPv6 servers; it will not forward DHCPv6 requests to a security appliance interface configured as a DHCPv6 server. Beginning with Security Manager version 4.9, DHCP Relay IPv6 is supported for ASA cluster devices running the software version 9.4.0 or later.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Relay IPv6** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Relay IPv6** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Note**

Two new interface settings have been introduced for DHCPv6: "managed-config-flag" and "other-config-flag." For more information, refer to [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), page 46-51.

| Interface           | Enter or Select the name of the interface on which you want to configure a DHCPv6 relay agent.                                                                                                                                                                                                                                        |
| Enable DHCPv6 Relay | When checked, the DHCPv6 relay is enabled on the specified interface.                                                                                                                                                                                                                                                                 |
| Set Route           | Check this box to configure the DHCPv6 relay agent to modify the default router address in the information returned from the DHCPv6 server. When this option is selected, the DHCPv6 relay agent substitutes the address of the selected interface for the default router address in the information returned from the DHCPv6 server. |

## Add and Edit DHCP Relay IPv6 Server Configuration Dialog Boxes

Use the Add DHCP Relay IPv6 Server Configuration dialog box to define a new DHCPv6 relay server; use the Edit DHCP Relay IPv6 Server Configuration dialog box to update existing server information. You can define up to ten DHCPv6 relay servers.

### Note

The Add DHCP Relay IPv6 Server Configuration dialog box and the Edit DHCP Relay IPv6 Server Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay IPv6 Server Configuration dialog boxes from the [DHCP Relay IPv6 Page, page 52-7](#).

**Field Reference****Table 52-8 Add and Edit DHCP Relay IPv6 Server Configuration Dialog Boxes**

| Element   | Description                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------|
| Server    | Enter the IP address or Select a Networks/Hosts object representing the external DHCPv6 server to which DHCPv6 requests are forwarded. |
| Interface | Enter or Select the interface through which DHCPv6 requests are forwarded to the external DHCPv6 server.                               |

## Configuring DHCP Servers

A Dynamic Host Configuration Protocol (DHCP) server provides network configuration parameters, such as IP addresses, to DHCP clients. The security appliance can provide DHCP server or DHCP relay services to DHCP clients attached to the security appliance interfaces. The DHCP server provides network configuration parameters directly to DHCP clients: DHCP relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface. For more information about DHCP relay, see [DHCP Relay Page, page 52-5](#).

**Note**

The security appliance DHCP server does not support BOOTP requests.

In multiple-context mode, you cannot enable a DHCP server or DHCP relay on an interface that is used by more than one context.

You can configure a DHCP server on each interface of the security appliance, and each interface can have its own pool of addresses to draw from. However, the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.

You cannot configure a DHCP client or DHCP relay services on an interface on which the DHCP server is enabled. Additionally, DHCP clients must be directly connected to the interface on which the server is enabled.

If your firewall is also acting as a DHCP client on the outside interface, you can enable auto-negotiated IP configuration. This allows the firewall to pass the DNS, WINS and domain name parameters it gets from the outside interface (as a DHCP client) to hosts on its inside network. Alternatively, you can manually specify the DNS, WINS and domain name parameters. If you specify those parameters manually and auto-configuration is on, your values take precedence over auto-configuration.

Use the [DHCP Server Page, page 52-10](#) to manage DHCP server definitions.

## DHCP Server Page

Use the DHCP Server page to configure global DHCP server and dynamic DNS (DDNS) update options, to set up a DHCP server on one or more device interfaces, and to configure advanced server options.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ping Timeout                                 | Specify the amount of time, in milliseconds, that the firewall device waits to time out a DHCP ping attempt. To avoid address conflicts, firewall devices send two ICMP ping packets to an address before assigning that address to a DHCP client. Valid values range from 10 to 10000 milliseconds.                                                                                                                                         |
| Lease Length                                 | Specify the amount of time, in seconds, that the client can use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).                                                                                                                                                                                                                               |
| Enable auto-configuration (PIX and ASA only) | Select this option to enable DHCP auto configuration.<br><br>DHCP auto configuration causes the DHCP server to provide DHCP clients with DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. If any of the information obtained through auto configuration is also specified manually, the manually specified information takes precedence over the discovered information. |
| Interface                                    | If Enable auto-configuration is checked, this field is available. Enter or Select the interface running the DHCP client that supplies the DNS, WINS, and domain name parameters.                                                                                                                                                                                                                                                             |
| <b>Define settings (optional)</b>            |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Domain Name                                  | Specify the DNS domain name for DHCP clients. Enter a valid DNS domain name; for example, <code>example.com</code> .                                                                                                                                                                                                                                                                                                                         |
| Primary DNS Server                           | Enter the IP address or Select a Networks/Hosts object representing the primary DNS server for a DHCP client.                                                                                                                                                                                                                                                                                                                                |
| Primary WINS Server                          | Enter the IP address or Select a Networks/Hosts object representing the primary WINS server for a DHCP client.                                                                                                                                                                                                                                                                                                                               |
| Secondary DNS Server                         | Enter the IP address or Select a Networks/Hosts object representing the alternate DNS server for a DHCP client.                                                                                                                                                                                                                                                                                                                              |
| Secondary WINS Server                        | Enter the IP address or Select a Networks/Hosts object representing the alternate WINS server for a DHCP client.                                                                                                                                                                                                                                                                                                                             |

**Table 52-9 DHCP Server Page (continued)**

| Element                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Advanced button                                  | Opens the <a href="#">Add/Edit DHCP Server Advanced Configuration Dialog Box, page 52-13</a> .                                                                                                                                                                                                                                                                                                                                                                                |

## Add and Edit DHCP Server Interface Configuration Dialog Boxes

Use these dialog boxes to enable DHCP and specify a DHCP address pool for a specified interface, and to enable dynamic DNS (DDNS) updating on the interface.

**Note**

Other than the titles, the two dialog boxes are identical.

### Navigation Path

You can access the Add DHCP Server Interface Configuration and Edit DHCP Server Interface Configuration dialog boxes from the [DHCP Server Page, page 52-10](#).

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Address Pool         | Enter an IP address or a range of addresses, separated by a hyphen, that the DHCP server will use when assigning IP addresses. The beginning and ending addresses in the range must be in the same subnet, and the beginning address cannot be greater than the ending address.                                                                                  |
| Enable DHCP Server        | Check this box to enable a DHCP server on this interface.                                                                                                                                                                                                                                                                                                        |
| Enable Dynamic DNS Update | Check this box to enable DDNS updating by this DHCP server. Specify the record(s) to be updated: <ul style="list-style-type: none"> <li>• <b>PTR Record</b> only</li> <li>• <b>A Record and PTR Record</b></li> </ul> You also can select <b>Override DHCP Client Request</b> . If selected, DHCP server updates override any updates requested by DHCP clients. |

## Add/Edit DHCP Server Advanced Configuration Dialog Box

The Add/Edit DHCP Server Advanced Configuration dialog box lets you manage DHCP options configured for the DHCP server. These options provide additional information to DHCP clients. For example, DHCP option 150 and DHCP option 66 provide TFTP server information to Cisco IP Phones and Cisco IOS routers.

### Navigation Path

You can access the Add/Edit DHCP Server Advanced Configuration dialog box by clicking the Advanced button on the [DHCP Server Page, page 52-10](#).

| Type        | Choose the type of information the option returns to the DHCP client: <ul style="list-style-type: none"> <li>• <b>IP</b> – Choosing this type specifies that one or two IP addresses are returned to the DHCP client. Provide up to two IP addresses.</li> <li>• <b>ASCII</b> – Choosing this type specifies that an ASCII value is returned to the DHCP client. Provide the ASCII character string, which cannot include spaces.</li> <li>• <b>HEX</b> – Choosing this type specifies that a hexadecimal value is returned to the DHCP client. Provide the HEX string with an even number of digits and no spaces; you do not need to use a 0x prefix.</li> </ul> |

## DNS Page

Use the DNS page to configure DNS server groups. The firewall device uses these DNS servers to resolve fully-qualified domain names (host names) to IP addresses for SSL VPN, certificates, and FQDN network/host objects used in identity-aware firewall policies. Other features that define server names (such as AAA) do not support DNS resolution—you must enter the IP address or manually resolve the name to an IP address.

**Tip**

The DefaultDNS server group is predefined on the ASA and is used for FQDN network/host object resolution. If you use FQDN objects, ensure that you configure DNS servers for this group; otherwise, the names cannot be resolved. To enhance security, ensure that you specify DNS servers that are trusted and that are preferably inside your network. For more information, see [Requirements for Identity-Aware Firewall Policies](#), page 13-3.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DNS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Enable DNS Guard<br>(ASA/PIX 7.0(5), 7.2(x) and 8.x only) | <p>Check this box to enable DNS Guard for the selected device or shared policy. DNS Guard tears down the DNS session associated with a DNS query as soon as the DNS reply is forwarded by the security appliance. DNS Guard also monitors the message exchange to ensure that the ID of the DNS reply matches the ID of the DNS query.</p> <p>This command is effective only on interfaces for which DNS inspection is disabled. When DNS inspection is enabled, the DNS Guard function is always performed.</p> <p><b>Note</b> In releases prior to 7.0(5), the DNS Guard functions are always enabled regardless of the configuration of DNS inspection.</p> |

Table 52-13 DNS Page (continued)

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DefaultDNS Server Group (ASA 8.4(2)+) | <p>Additional settings that apply to the DefaultDNS server group only. These settings are used when resolving FQDN network/host objects to IP addresses.</p> <ul style="list-style-type: none"> <li> <b>Poll Timer</b>—The time, in minutes, of the polling cycle used to resolve FQDN network/host objects to IP addresses. FQDN objects are resolved only if they are used in a firewall policy. The timer determines the maximum time between resolutions; the DNS entry's time-to-live (TTL) value is also used to determine when to update to IP address resolution, so individual FQDNs might be resolved more frequently than the polling cycle.<br/>           The default is 240 (four hours). The range is 1 to 65535 minutes.         </li> <li> <b>Expire Entry Timer</b>—The number of minutes after a DNS entry expires (that is, the TTL has passed) that the entry is removed from the DNS lookup table. Removing an entry requires that the table be recompiled, so frequent removals can increase the processing load on the device. Because some DNS entries can have very short TTL (as short as three seconds), you can use this setting to virtually extend the TTL.<br/>           The default is 1 minute (that is, the entry is removed one minute after the TTL has passed). The range is 1 to 65535 minutes.         </li> </ul> |

## Add DNS Server Group Dialog Box

Use the Add DNS Server Group dialog box to define the DNS servers and settings for a DNS server group, used by security devices to resolve server names to IP addresses in policies that support name resolution.

### Note

With the exception of its title, the Edit DNS Server Group dialog box is identical to this one, and the following descriptions apply to both.

### Navigation Path

You can access the Add DNS Server Group and Edit DNS Server Group dialog boxes from the [DNS Page, page 52-14](#).

### Field Reference

Table 52-14 Add/Edit DNS Server Group Dialog Boxes

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Servers | <p>Lists the DNS servers in this group. You can specify up to six servers to which DNS requests can be forwarded. The security appliance tries each DNS server in top-to-bottom order until it receives a response.</p> <p><b>Note</b> You also must specify at least one interface on which DNS is enabled in the DNS Lookup section of the <a href="#">DNS Page, page 52-14</a>.</p> <p>Use the buttons next to this list to manage the entries; from the top down, they are:</p> <ul style="list-style-type: none"> <li>• Add a DNS server to the list; opens the <a href="#">Add DNS Server Dialog Box, page 52-17</a>.</li> <li>• Delete the currently selected DNS server entry from the list.</li> <li>• Move the currently selected entry up one row.</li> <li>• Move the currently selected entry down one row.</li> </ul> |
| Timeout     | Specify the number of seconds, from 1 to 30, to wait before trying the next DNS server; the default is 2 seconds. Each time the security device retries the list of servers, this timeout doubles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Retries     | Specify the number of times, from 0 to 10, to retry the list of DNS servers when the security device does not receive a response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Domain Name | Optionally, specify a valid DNS domain name for the server; for example, <b>dnsexample.com</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Add DNS Server Dialog Box

Use the Add DNS Server dialog box to add a DNS server to the DNS servers list in the Add DNS Server Group or Edit DNS Server Group dialog boxes.

### Navigation Path

You can access the Add DNS Server dialog box from the Add DNS Server Group or Edit DNS Server Group dialog boxes. For more information about these dialog boxes, see [Add DNS Server Group Dialog Box, page 52-16](#).

### Related Topics

- [DNS Page, page 52-14](#)

**Table 52-15 Add DNS Server Dialog Box**

| Element    | Description                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Server | The IP address, or the host network/host object that defines the address, of the DNS server. Enter the address or click <b>Select</b> to select the network/host object from a list or to create a new object. |

**Table 52-15 Add DNS Server Dialog Box (continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface (ASA 9.5(1) or later) | <p>Click select to choose an interface. The Interface selector dialog box lists only Interface Roles and not Physical Interfaces. Therefore you must add a Physical Interface to the Interface Role before selecting the Source Interface. There is no default value for the interface.</p> <p>This feature is available in Security Manager version 4.9 and later for devices running ASA version 9.5(1) or later.</p> |

## Configuring DDNS

Dynamic DNS (DDNS) provides IP-address and domain-name mapping updates so hosts can find each other even though their DHCP-assigned IP addresses may change frequently. Also, beginning with the version 7.2(3), Cisco security appliances can generate DDNS updates. The DDNS page is where you configure this feature.

The DDNS mappings are maintained on the DHCP server in two types of resource records (RRs): the address or A records contain the name-to-IP-address mappings, while the pointer or PTR records map addresses to host names.

By automatically recording the association between assigned addresses and host names at defined intervals, DDNS allows frequently changing address-host name associations to be updated frequently. Mobile hosts, for example, can then move freely on a network without user or administrator intervention.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DDNS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DDNS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 52-16 DDNS Page**

| Element                                            | Description                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic DNS Interface Settings                     | This table lists currently defined DDNS interface-update methods. Use the Add Row, Edit Row, and Delete Row buttons below the table to manage these methods; the Add Row and Edit Row buttons open the <a href="#">Add/Edit DDNS Interface Rule Dialog Box, page 52-19</a> .                                                              |
| DHCP Client requests DHCP Server to update records | The global setting on the appliance for DHCP client update requests. This option enables the client to send DDNS updates via the DHCP server, and specifies what is updated: the PTR resource record, both the A and PTR resource records, or neither. Choose <b>Not Selected, Only PTR Record, Both A and PTR Record, or No Update</b> . |
| DHCP Client ID Interface                           | Specify the interface(s) for global DHCP client update requests: enter an interface name or IP address, or Select an interface object.                                                                                                                                                                                                    |

**Table 52-16** DDNS Page (continued)

| Element                      | Description                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Enable DHCP Client Broadcast | Select this option to allow DHCP clients on the device to broadcast DDNS updates. Available on ASA/PIX 7.2(3)+ devices only. |

## Add/Edit DDNS Interface Rule Dialog Box

Use the Add/Edit DDNS Interface Rule dialog box to manage rules for dynamic DNS updates. These rules are defined on a per-interface basis.

### Navigation Path

You access the Add/Edit DDNS Interface Rule dialog box from the [Configuring DDNS, page 52-18](#).

**Field Reference****Table 52-19 Add/Edit DDNS Update Methods Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Method Name     | Provide an identifier for this method.                                                                                                                                                                                                                                           |
| Update Interval | Specify how often records are to be updated for this method: provide a number of days, hours, minutes, and seconds. Note that while zero is the default value for hours, minutes and seconds, there is no default Day value: you must enter a number for Day.                    |
| Update Records  | Specify the resource record(s) to be updated: select <b>Not Defined</b> , <b>A Records</b> , or <b>Both A and PTR Records</b> . Selecting A Records or Both A and PTR Records overrides the setting in the <a href="#">Add/Edit DDNS Interface Rule Dialog Box, page 52-19</a> . |

# NTP Page

Network Time Protocol (NTP) is used to implement a hierarchical system of servers that provide precisely synchronized timing for network systems. This kind of accuracy is required for time-sensitive operations, such as validating Certificate Revocation Lists (CRLs), which include a precise time stamp. You can configure multiple NTP servers. The security device chooses the server with the lowest stratum—a measure of how reliable the data is.

**Note**

This page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

Use the NTP page to enable NTP and manage the NTP servers used to dynamically set the time on a security device.

**Note**

Time derived from an NTP server overrides any time set manually on the Clock page.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > NTP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference**

**Table 52-20** NTP Page

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable NTP Authentication | Enables or disables authentication with an NTP server. Disabling authentication does not alter the list of configured servers.<br><br>If you enable authentication, the security appliance only communicates with an NTP server if it uses the correct trusted key in the packets. The security appliance also uses an authentication key to synchronize with the NTP server. |
| NTP Server Table          | Lists the currently configured NTP servers. Use the Add Row, Edit Row and Delete Row buttons to manage this list; the Add Row and Edit Row buttons open the <a href="#">NTP Server Configuration Dialog Box</a> , page 52-21.                                                                                                                                                 |

## NTP Server Configuration Dialog Box

Use the NTP Server Configuration dialog box to add or edit an NTP server definition.

**Navigation Path**

You can access the NTP Server Configuration dialog box from the [NTP Page](#), page 52-21.

**Note**

The NTP page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

**Field Reference****Table 52-21 NTP Server Configuration Dialog Box**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address          | Enter or Select the IP address of the NTP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Preferred           | If checked, this NTP server is the preferred server when multiple servers are similarly accurate.<br><br>NTP uses an algorithm to determine which server is the most accurate and synchronizes to that one. If multiple servers are of similar accuracy, then this option specifies which of those servers to use. However, if a server is significantly more accurate than the preferred one, the security appliance uses the more accurate server. For example, the security appliance uses a server of stratum 2 over a server of stratum 3 that is preferred. We recommend that you configure an NTP server as preferred only when multiple servers are likely to have the same stratum. |
| Interface           | Enter or Select the interface used for NTP traffic, if you want to override the default interface in to the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Authentication Type | Adding to MD5, the following authentication types are also supported in Cisco Security Manager starting from version 4.20 for ASA 9.13(1) and higher devices: <ul style="list-style-type: none"> <li>• sha1</li> <li>• sha256</li> <li>• sha512</li> <li>• cmac</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Key Number          | Enter the ID for this authentication key. The NTP server packets must also use this key ID. If you previously configured a key ID for another server, you can select it in the list; otherwise, type a number between 1 and 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Trusted             | Sets this key as a trusted key. You must select this option for authentication to work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Key Value           | Enter the authentication key as a string up to 32 characters in length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Confirm             | Re-enter the authentication key to verify it is correct.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## SMTP Server Page

Use the SMTP Server page to specify the IP address of an SMTP server and optionally, the IP address of a backup server, to which e-mail alerts and notifications are sent in response to specific events.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > SMTP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > SMTP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 52-22 SMTP Server Page**

| Element                     | Description                                              |
|-----------------------------|----------------------------------------------------------|
| Primary Server IP Address   | Enter or Select the IP address of the SMTP server.       |
| Secondary Server IP Address | Enter or Select the IP address of a back-up SMTP server. |

## TFTP Server Page

The Trivial File Transfer Protocol (TFTP) is a simple client/server file transfer protocol described in RFC783 and RFC1350 Rev. 2. You can use the TFTP Server page to configure the security appliance as a TFTP client so it can transfer a copy of its running configuration file to a TFTP server. In this way, you can back up and propagate configuration files to multiple security appliances. Only one server is supported.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > TFTP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > TFTP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 52-23 TFTP Server Page**

| Element    | Description                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | Enter or Select the name of interface on which the TFTP server is accessed.                                                                                                                             |
| IP Address | Enter or Select the IP address of the TFTP server.                                                                                                                                                      |
| Directory  | Enter the path on the TFTP server, beginning with a forward slash (/) and ending in the file name, to which the configuration files will be written (for example, <code>/tftpboot/asa/config3</code> ). |
|            | <b>Note</b> The path must begin with a forward slash (/).                                                                                                                                               |

# Configuring FXOS Server Access Settings on Firepower 2100 Series Devices

The FXOS Server Access section contains pages for configuring FXOS server access on Firepower 2100 Series devices; FXOS Server Access is under Device Admin in the Device or Policy selector.

**Note**

FXOS Server Access is not applicable for devices other than Firepower 2100 Series devices.

The Firepower 2100 Series devices supported by ASA and Cisco Security Manager are:

- Cisco FPR-2110 Adaptive Security Appliance
- Cisco FPR-2120 Adaptive Security Appliance
- Cisco FPR-2130 Adaptive Security Appliance
- Cisco FPR-2140 Adaptive Security Appliance

This chapter contains the following topics:

- [HTTPS Page, page 53-1](#)
- [SSH Page, page 53-2](#)
- [SNMP Page, page 53-4](#)

## HTTPS Page

The HTTPS page allows you to configure the device to access the FXOS server through HTTPS. When you deploy configurations with this protocol, Cisco Security Manager encrypts the configuration file before sending it to the device.

### Navigation Path

- (Device view) Select **Platform > Device Admin > FXOS Server Access > HTTPS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FXOS Server Access > HTTPS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

**Field Reference****Table 53-1** *HTTPS Page*

| Element    | Description                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Action     | The permit action allows configuring the Firepower 2100 Series device with IP address and port. It supports IPv4 and IPv6 addresses. |
| Interface  | The name of the device interface for which the HTTPS is configured. HTTPS cannot be configured on a Bridge Groups (BG) interface.    |
| IP Address | The IP address of the device. It can be an IPv4 or an IPv6 address.                                                                  |
| Port       | The port on which communications with the FXOS server take place.                                                                    |

## Add and Edit HTTPS Dialog Boxes

Use the Add HTTPS Configuration dialog box to create the HTTPS rules. The security appliance will automatically poll this server for image and configuration updates.

The Edit HTTPS Configuration dialog box is identical to the Add HTTPS Configuration dialog box. The following descriptions apply to both.

**Navigation Path**

You can access the Add and Edit HTTPS Configuration dialog boxes from the [HTTPS Page, page 53-1](#).

**Field Reference****Table 53-2** *Add and Edit HTTPS Configuration Dialog Boxes*

| Element    | Description                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Action     | Select Permit.                                                                                                                                  |
| Interface  | Click Select and choose the interface. The Bridge Groups (BG) interface cannot be configured with HTTPS.                                        |
| IP Address | Click Select and choose the IP address of the device that can access the FXOS server. It can be an IPv4 or an IPv6 address.                     |
| Port       | This value defaults to 3443 when you save the page. You can also enter the port on which communications with the FXOS server should take place. |

## SSH Page

Use the Secure Shell page to configure port that permit FXOS server access to a Firepower 2100 Series device using the SSH protocol. The rules permit SSH access to a specific IP address and netmask.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > FXOS Server Access > SSH** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FXOS Server Access > SSH** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element    | Description                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Action     | Select Permit.                                                                                                                                  |
| Interface  | Click Select and choose the interface. The Bridge Groups (BG) interface cannot be configured with SSH.                                          |
| IP Address | Click Select and choose the IP address of the device that can access the FXOS server. It can be an IPv4 or an IPv6 address.                     |
| Port       | This value defaults to 3022 when you save the page. You can also enter the port on which communications with the FXOS server should take place. |

# SNMP Page

SNMP is an application layer protocol that facilitates the exchange of management information between network devices. You can use the SNMP page to configure the Firepower 2100 Series devices for monitoring by SNMP.

## Navigation Path

- (Device view) Select **Platform > Device Admin > FXOS Server Access > SNMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FXOS Server Access > SNMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

# Configuring Logging Policies on Firewall Devices

---

The Logging feature lets you enable and manage NetFlow “collectors,” and enable system logging, set up logging parameters, configure event lists (syslog filters), apply the filters to a destination, set up syslog messages, configure syslog servers, and specify e-mail notification parameters.

After you enable logging and set up the logging parameters using the Logging Setup page, the Event Lists page lets you configure filters (for a set of syslogs) which can be sent to a logging destination. The Logging Filters page lets you specify a logging destination for the syslogs to be sent. Finally, the Syslog and E-Mail pages configure syslog and e-mail setup.

This chapter contains the following topics:

- [NetFlow Page, page 54-1](#)
- [Embedded Event Manager, page 54-3](#)
- [E-Mail Setup Page, page 54-8](#)
- [Event Lists Page, page 54-9](#)
- [Logging Filters Page, page 54-12](#)
- [Configuring Logging Setup, page 54-14](#)
- [Configuring Rate Limit Levels, page 54-17](#)
- [Configuring Syslog Server Setup, page 54-20](#)
- [Defining Syslog Servers, page 54-26](#)

## NetFlow Page

A device configured for NetFlow data export captures flow-based traffic statistics on the device. This information is periodically transmitted from the device to a NetFlow collection server, in the form of User Datagram Protocol (UDP) datagrams.

The NetFlow page lets you enable NetFlow export on the selected device, and define and manage NetFlow “collectors” to which collected flow information is transmitted.

### Navigation Path

- (Device view) Select **Platform > Logging > NetFlow** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > NetFlow** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 54-1** *NetFlow Page*

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Flow Export       | If checked, NetFlow data export is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Template Export Interval | Interval (in minutes) between transmissions of flow information to the collectors. The value can be from one to 3600 minutes; the default is 30.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Active Refresh Interval  | For active connections, specifies the time interval between flow-update events in minutes. Valid values are from 1 to 60 minutes. The default value is 1 minute.                                                                                                                                                                                                                                                                                                                                                                                       |
| Delay Flow Create        | Delays the sending of a flow-create event by the specified number of seconds. The value can be from one to 180 seconds.<br><br>If no value is entered, there is no delay, and the flow-create event is exported as soon as the flow is created. If the flow is torn down before the configured delay, the flow-create event is not sent; an extended flow teardown event is sent instead.                                                                                                                                                              |
| Collectors table         | Lists the currently defined NetFlow collectors. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries.<br><br>The Add Row and Edit Row buttons open the <a href="#">Add and Edit Collector Dialog Boxes (NetFlow), page 54-2</a> .<br><br><b>Note</b> Cisco Security Manager does not allow duplicate netflow collectors for ASA 9.6(4) to 9.7.0, and 9.8(2) and above devices. Change the current configuration or remove the duplicate or overlapping configuration (Platform> Logging > Netflow) for the device. |

## Add and Edit Collector Dialog Boxes (NetFlow)

Use the Add Collector and Edit Collector dialog boxes to define and edit NetFlow “collectors.” Except for the title, the two dialog boxes are identical; the following information applies to both.

**Navigation Path**

You can open the Add and Edit Collector dialog boxes from the [NetFlow Page, page 54-1](#).

**Field Reference****Table 54-2** *Add and Edit Collector Dialog Boxes*

| Element   | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| Interface | Enter or Select the name of the device interface through which the collector is contacted. |

**Table 54-2 Add and Edit Collector Dialog Boxes (continued)**

| Element   | Description                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Collector | Enter the IP address or the network name of the server to which NetFlow packets will be sent. You also can Select a Networks/Hosts object.    |
| UDP Port  | Specify the UDP port on the specified Collector to which NetFlow packets will be sent. Values can range from 1 to 65535; the default is 2055. |

## Embedded Event Manager

The Embedded Event Manager (EEM) enables you to debug problems and provides general purpose logging for troubleshooting. There are two components: events to which the EEM responds or listens, and event manager applets that define actions as well as the events to which the EEM responds. You may configure multiple event manager applets to respond to different events and perform different actions.

### Note

Embedded Event Manager is supported on ASA 9.2(1)+ only.

### Supported Events

The EEM supports the following events:

- Syslog—The ASA uses syslog message IDs to identify syslog messages that trigger an event manager applet. You may configure multiple syslog events, but the syslog message IDs may not overlap within a single event manager applet.
- Timers—You may use timers to trigger events. You may configure each timer only once for each event manager applet. Each event manager applet may have up to three timers. The three types of timers are the following:
  - Watchdog (periodic) timers trigger an event manager applet after the specified time period following the completion of the applet's actions and restart automatically.
  - Countdown (one-shot) timers trigger an event manager applet once after the specified time period and do not restart unless they are removed, then re-added.
  - Absolute (once-a-day) timers cause an event to occur once a day at a specified time, and restart automatically. The time-of-day format is in hh:mm:ss.

You may configure only one timer event of each type for each event manager applet.

- None—The none event is triggered when you run an event manager applet manually.
- Crash—The crash event is triggered when the ASA crashes. Regardless of the value of the output command, the action commands are directed to the crashinfo file. The output is generated before the show tech command.

### Note

Be careful when using a range of Syslog IDs and when using timers. Incorrect configuration can cause an ASA loop and prevent the applet from executing normally.

### Configuring Actions

When an event manager applet is triggered, the actions on the event manager applet are performed. Each action has a number that is used to specify the sequence of the actions. The sequence number must be unique within an event manager applet. You may configure multiple actions for an event manager applet. The commands are typical CLI commands, such as **show blocks**.

### Configuring Output Destinations

You may send the output of the action CLI commands to one of three locations:

- None, which is the default and discards the output
- Console, which sends the output to the ASA console
- File, which sends the output to a file. The following four file options are available:
  - new—creates a new, uniquely named file each time that an event manager applet is invoked.
  - overwrite—overwrites a specified file each time that an event manager applet is invoked.
  - append—appends to a specified file each time that an event manager applet is invoked. If the file does not yet exist, it is created.
  - rotate—creates a set of uniquely named files that are rotated each time that an event manager applet is invoked.

### Guidelines and Limitations

- Supported in single mode only. Not supported in multiple context mode.
- Supported in routed and transparent firewall modes.
- EEM will be enabled irrespective of whether logging functionality is enabled on the device or not.
- The EEM functionality on the ASA only contains a subset of the EEM functionality found on Cisco routers.
- During a crash, the state of the ASA is generally unknown. Some commands may not be safe to run during this condition.
- The name of an event manager applet may not contain spaces.
- You cannot modify the None event and Crashinfo event parameters.
- Performance may be affected because syslog messages are sent to the EEM for processing.
- The default output is none for each event manager applet. To change this setting, you must enter a different output value.
- You may have only one output option defined for each event manager applet.

The Embedded Event Manager table lists the currently defined event manager applets. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries. The Add Row and Edit Row buttons open the [Add and Edit Applet Dialog Boxes](#), page 54-5.

### Navigation Path

- (Device view) Select **Platform > Logging > Embedded Event Manager** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Embedded Event Manager** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add and Edit Applet Dialog Boxes

Use the Add Applet and Edit Applet dialog boxes to define and edit event manager applets. Except for the title, the two dialog boxes are identical; the following information applies to both.

**Navigation Path**

You can open the Add and Edit Applet dialog boxes from the [Embedded Event Manager, page 54-3](#).

**Field Reference**

**Table 54-3 Add and Edit Applet Dialog Boxes**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                     | Enter a unique name for the event manager applet. The name cannot contain spaces and must be less than 32 characters.                                                                                                                                                                                                                                                           |
| Description              | Enter a description for the event manager applet. The description may be up to 256 characters long.                                                                                                                                                                                                                                                                             |
| <b>Configuration Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                 |
| Crashinfo                | When selected, the event manager applet is triggered when the ASA crashes. Regardless of the value of the Output field, the action commands are directed to the crashinfo file. The output is generated before the show tech command.<br><b>Note</b> The state of the ASA is generally unknown when it crashes. Some CLI commands may not be safe to run during this condition. |
| None                     | When selected, you can trigger the event manager applet manually.<br><b>Note</b> Manual triggering of the EEM applet is not supported in Cisco Security Manager. To manually trigger an applet, you must use a FlexConfig. See <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.                                                                          |
| Syslog table             | The Syslog table lists the currently defined syslog message IDs for the selected applet. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries. The Add Row and Edit Row buttons open the <a href="#">Add and Edit Syslog Configuration Dialog Boxes, page 54-7</a> .                                                                        |
| Absolute                 | Configure an absolute (once-a-day) timer event. Absolute timers cause an event to occur once a day at a specified time, and restart automatically.<br>Use the fields provided to enter the time of day in hours, minutes, and seconds. The time range is from 00:00:00 (midnight) to 23:59:59.                                                                                  |
| Countdown                | Configures a countdown (one-shot) timer event. Countdown timers trigger an event manager applet once after the specified time period and do not restart unless they are removed, then re-added.<br>Enter the time period in seconds. The number of seconds may range from 1-604800.                                                                                             |

**Table 54-3 Add and Edit Applet Dialog Boxes (continued)**

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Watchdog      | <p>Configures a watchdog (periodic) timer event. Watchdog timers trigger an event manager applet after the specified time period following the completion of the applet's actions and restart automatically.</p> <p>Enter the time period in seconds. The number of seconds may range from 1-604800.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Output        | <p>To configure specific destinations for sending output from an action, choose one of the available output destination options:</p> <ul style="list-style-type: none"> <li>• none—(default) discards the output.</li> <li>• console—sends the output to the ASA console.</li> <li>• file—sends the output to a file. Select the file option in the Action list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Action        | <p>The following four file options are available:</p> <ul style="list-style-type: none"> <li>• new—creates a new, uniquely named file each time that an event manager applet is invoked. The filename has the format of eem-applet-timestamp.log, in which applet is the name of the event manager applet and timestamp is a dated timestamp in the format of YYYYMMDD-hhmmss.</li> <li>• overwrite—overwrites a specified file each time that an event manager applet is invoked. Specify the file details using the File Location and File Name fields.</li> <li>• append—appends to a specified file each time that an event manager applet is invoked. If the file does not yet exist, it is created. Specify the file details using the File Location and File Name fields.</li> <li>• rotate—creates a set of uniquely named files that are rotated each time that an event manager applet is invoked. Specify the number of files to be rotated in the File Count field (valid values range from 2 - 100).</li> </ul> <p>When a new file is to be written, the oldest file is deleted, and all subsequent files are renumbered before the first file is written. The newest file is indicated by 0, and the oldest file is indicated by the highest number. The filename format is eem-applet-x.log, in which applet is the name of the applet, and x is the file number.</p> |
| File Location | Specifies the location of the output file. The location may also use FTP, TFTP, and SMB targeted files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| File Name     | Specifies the filename of the output file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| File Count    | <p>Specify the number of files to be rotated when "rotate" is the selected Action.</p> <p>When a new file is to be written, the oldest file is deleted, and all subsequent files are renumbered before the first file is written. The newest file is indicated by 0, and the oldest file is indicated by the highest number. Valid values for the rotate value range from 2 - 100. The filename format is eem-applet-x.log, in which applet is the name of the applet, and x is the file number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 54-3 Add and Edit Applet Dialog Boxes (continued)**

| Element           | Description                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Action Tab</b> |                                                                                                                                                                                                                                                                                               |
| Action table      | The Action table lists the currently defined actions for the selected applet. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries. The Add Row and Edit Row buttons open the <a href="#">Add and Edit Action Configuration Dialog Boxes, page 54-7</a> . |

## Add and Edit Syslog Configuration Dialog Boxes

Use the Add Syslog Configuration and Edit Syslog Configuration dialog boxes to configure the syslog message IDs for an event manager applet. Except for the title, the two dialog boxes are identical; the following information applies to both.

### Navigation Path

You can open the Add and Edit Syslog Configuration dialog boxes from the [Add and Edit Applet Dialog Boxes, page 54-5](#).

### Field Reference

**Table 54-4 Add and Edit Syslog Configuration Dialog Boxes**

| Element | Description                                                                                                                                                                                                                                                                                                                     |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID      | Enter a single syslog message or a range of syslog messages. If a syslog message occurs that matches the specified individual syslog message or range of syslog messages, an event manager applet is triggered.<br><br><b>Note</b> Syslog message IDs may not be entered twice or overlap within a single event manager applet. |
| Occurs  | (Optional) In the occurrences field, enter the number of times that the syslog message must occur for an event manager applet to be invoked. The default is 1 occurrence every 0 seconds. Valid values are from 1 - 4294967295.                                                                                                 |
| Period  | (Optional) In the period field, enter the number of seconds within which the syslog messages must occur to invoke the action. This value limits how frequently an event manager applet is invoked to at most once in the configured period. Valid values are from 0 - 604800. A value of 0 means that no period is defined.     |

## Add and Edit Action Configuration Dialog Boxes

Use the Add Action Configuration and Edit Action Configuration dialog boxes to configure the actions for an event manager applet. Except for the title, the two dialog boxes are identical; the following information applies to both.

### Navigation Path

You can open the Add and Edit Action Configuration dialog boxes from the [Add and Edit Applet Dialog Boxes, page 54-5](#).

**Field Reference****Table 54-5 Add and Edit Action Configuration Dialog Boxes**

| Element    | Description                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ordinal ID | Enter the unique sequence number in the Ordinal ID field. Valid sequence numbers range from 0 - 4294967295. When adding an action configuration, the Ordinal ID will default to one greater than the highest Ordinal ID used. |
| CLI        | Enter the CLI command in the CLI field. The command runs in global configuration mode as a user with privilege level 15 (the highest). The command may not accept any input, because it is disabled.                          |

## E-Mail Setup Page

The E-Mail Setup page (PIX 7.0/ASA Only) lets you set up a source e-mail address, as well as a list of recipients for specified syslog messages to be sent as e-mails. You can filter the syslog messages sent to a destination e-mail address by severity. The table shows which entries have been set up.

The syslog severity filter used for the destination e-mail address will be the higher of the severity selected in this section and the global filter set for all e-mail recipients in the Logging Filters page.

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog > E-Mail Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > E-Mail Setup** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 54-6 E-Mail Setup Page**

| Element                   | Description                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Email Address      | Enter the email address to be used as the source address when syslogs are sent as emails.                                                                                                                                                                            |
| Destination Address table | Lists the currently defined email recipients of syslog messages.<br>Use the Add Row, Edit Row and Delete Row buttons below the table to manage this list; the Add Row and Edit Row buttons open the <a href="#">Add/Edit Email Recipient Dialog Box, page 54-8</a> . |

## Add/Edit Email Recipient Dialog Box

The Add/Edit Email Recipient dialog box lets you configure a destination address to be sent emails containing syslog messages; you can limit the messages sent according to severity.

The syslog severity filter used for the destination email address will be the higher of the severity selected in this section and the global filter set for all email recipients on the [Logging Filters Page, page 54-12](#).

**Navigation Path**

You can access the Add/Edit Email Recipient dialog box from the [E-Mail Setup Page, page 54-8](#).

**Field Reference****Table 54-7 Add/Edit Email Recipient Dialog Box**

| Element                   | Description                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Email Address | Enter the recipient email address for the chosen type of syslog messages.                                                                                                                                      |
| Syslog Severity list      | Choose the severity of the syslogs to be emailed to this recipient; messages of the chosen severity and higher are sent. Message severity levels are described in <a href="#">Logging Levels, page 54-24</a> . |

## Event Lists Page

The Event Lists page (PIX 7.0+/ASA only) lets you define a set of syslog message filters for logging. After you enable logging and set up global logging parameters on the Logging Setup page, use this page to configure event lists used to filter syslog messages sent to different logging destinations. (The [Logging Filters Page, page 54-12](#) lets you specify logging destinations for event lists.)

Use the Add Row, Edit Row and Delete Row buttons below the Event Lists table to manage the entries. Add Row and Edit Row open the [Add/Edit Event List Dialog Box, page 54-10](#).

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog > Event Lists** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Event Lists** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Message Classes and Associated Message ID Numbers

The following table lists the message classes and the range of message IDs in each class.

**Table 54-8 Message Classes and Associated Message ID Numbers**

| Class  | Definition                   | Message ID Numbers                |
|--------|------------------------------|-----------------------------------|
| auth   | User Authentication          | 109, 113                          |
| bridge | Transparent Firewall         | 110, 220                          |
| ca     | PKI Certification Authority  | 717                               |
| config | Command interface            | 111, 112, 208, 308                |
| e-mail | E-mail Proxy                 | 719                               |
| ha     | Failover (High Availability) | 101, 102, 103, 104, 210, 311, 709 |

**Table 54-8** Message Classes and Associated Message ID Numbers (continued)

| Class   | Definition                 | Message ID Numbers                                                                                           |
|---------|----------------------------|--------------------------------------------------------------------------------------------------------------|
| ids     | Intrusion Detection System | 400, 401, 415                                                                                                |

## Add/Edit Event List Dialog Box

The Add/Edit Event List dialog box lets you create or edit an event list, and specify which syslog messages to include in the event list filter.

You can use the following criteria to define an event list:

- Class and Severity
- Message ID

Class represents specific types of related syslog messages. For example, the class `auth` represents all syslog messages related to user authentication.

Severity classifies syslogs based on the relative importance of the event in the normal functioning of the network. The highest severity is Emergency, which means the resource is no longer available. The lowest severity is Debugging, which provides detailed information about every network event.

The message ID is a numeric value that uniquely identifies each individual message. You can specify a single message ID, or a range of IDs, in an event list.

### Navigation Path

You can access the Add/Edit Event List dialog box from the [Event Lists Page, page 54-9](#).

|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event List Name              | Enter a name that uniquely identifies this event list.                                                                                                                                                                                                                                |
| Event Class/Severity Filters | This table lists the event class and severity level filters defined for this event list.<br><br>Use the Add Row, Edit Row and Delete Row buttons below this table to manage the entries. Add Row and Edit Row open the <a href="#">Add/Edit Syslog Class Dialog Box, page 54-11</a> . |
| Message ID Filters           | This table list the message ID filters defined for this event list.<br><br>Use the Add Row, Edit Row and Delete Row buttons below this table to manage the entries. Add Row and Edit Row open the <a href="#">Add/Edit Syslog Message ID Filter Dialog Box, page 54-11</a> .          |

**Add/Edit Syslog Class Dialog Box**

The Add/Edit Syslog Class dialog box lets you specify an event class and a related severity level as an event list filter.

Class represents specific types of related syslog messages, so you do not have to select the syslogs individually. For example, the class `auth` represents all syslog messages related to user authentication.

Severity classifies syslogs based on the relative importance of the event in the normal functioning of the network. The highest severity is Emergency, which means the resource is no longer available. The lowest severity is Debugging, which provides detailed information about every network event.

**Navigation Path**

You access the Add/Edit Syslog Class dialog box from the [Add/Edit Event List Dialog Box, page 54-10](#).

FWSM

- [http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd\\_products\\_support\\_model\\_home.html](http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html)

## Logging Filters Page

The Logging Filters page lets you configure a logging destination for event lists (syslog filters) that have been configured using the Event Lists page, or for only the syslog messages that you specify using the Edit Logging Filters page. Syslog messages from specific or all event classes can be selected using the Edit Logging Filters page.

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog > Logging Filters** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Logging Filters** from the Policy Type selector. Right-click **Logging Filters** to create a policy, or select an existing policy from the Shared Policy selector.

| Filter on severity option                          | Filters on the severity of the logging messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Filter on severity list                            | Specifies the level of logging messages on which to filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Use event list option                              | Specifies to use an event list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Use event list                                     | Specifies the event list to use. Event lists are defined on the <a href="#">Event Lists Page, page 54-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Disable logging option                             | Disables all logging to the selected destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Syslog from Specific Event Classes (PIX7.0)</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Event Class                                        | Specifies the event class and severity. Event classes include one or all available items. Event classes are described in <a href="#">Table 54-8 on page 54-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Severity                                           | Specifies the level of logging messages. Severity levels are described in <a href="#">Table 54-18 on page 54-24</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring Logging Setup

The Logging Setup page lets you enable system logging on the security appliance and configure other logging options. These options include enabling logging on the security appliance and failover unit, specifying the base log format and detail, and logging to longer-term storage devices, FTP server or Flash, before purging the internal buffer.

### Related Topics

- [Logging Setup Page, page 54-15](#)

- 
- Step 1** Select **Platform > Logging > Syslog > Logging Setup** to display the Logging Setup page.
- Step 2** Check **Enable Logging**.
- This option enables logging on the security appliance.
- Step 3** To enable logging on the failover unit paired with this security appliance, select the **Enable logging on the standby failover unit** check box.
- Step 4** To enable EMBLEM format, or to send debug messages as part of the syslog messages, select the corresponding check boxes.
- If you enable EMBLEM, you must use the UDP protocol to publish syslog messages. It is not compatible with TCP.
- Step 5** To write the internal buffer data to an FTP server for future processing prior to clearing the buffer, do the following:
- Check **FTP Server Buffer wrap**.
  - Enter the IP address of the FTP server in the **IP Address** field.
  - Enter the user name of the account used to log into the FTP server in the **User Name** field.
  - Enter the path in the **Path** field, relative to the FTP root, where the file should be stored.
  - Enter and confirm the password used to authenticate the user name.
- Step 6** To write the internal buffer data to Flash for future processing prior to clearing the buffer, do the following:
- Check **Flash**.
  - Specify the maximum amount of memory to allocate to the storage of internal buffer data.
  - Specify the minimum memory that should remain free on the Flash drive. If this minimum value cannot be retained while writing out the data from the internal buffer, the messages will be pruned to meet the space requirements.
- Step 7** To specify the maximum queue size maintained on the appliance for viewing by an ASDM client, enter that value in the **Message Queue Size (Messages)** field.
- 

## Logging Setup Page

The Logging Setup page lets you enable system logging on the security appliance and configure other logging options.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Logging Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Logging Setup** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

Table 54-13 Logging Setup Page

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Logging                                                  | Turns on logging for the main security appliance.                                                                                                                                                                                                                                                                                                                                                      |
| Enable Logging on the Failover Standby Unit                     | Turns on logging for the standby security appliance, if available.                                                                                                                                                                                                                                                                                                                                     |
| Send syslogs in EMBLEM format (PIX7.x+, ASA, FWSM 3.x+)         | Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.<br><b>Note</b> This setting is not compatible with CS-MARS.                                                                                                                                                            |
| Send debug messages as syslogs (PIX7.x+, ASA, FWSM 3.x+)        | Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is 711011. Default logging level for this syslog is <i>debug</i> . |
| Memory Size of Internal Buffer (bytes)                          | Specify the size of the internal buffer to which syslogs is saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 1048576.                                                                                                                                                                                              |
| <b>Specify FTP Server Information (PIX7.x+, ASA, FWSM 3.x+)</b> |                                                                                                                                                                                                                                                                                                                                                                                                        |
| FTP Server Buffer Wrap                                          | To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.                                                                                                                                                                                 |
| IP Address                                                      | Enter the IP address of the FTP server.                                                                                                                                                                                                                                                                                                                                                                |
| User Name                                                       | Enter the user name to use when connecting to the FTP server.                                                                                                                                                                                                                                                                                                                                          |
| Path                                                            | Enter the path, relative to the FTP root, where the buffer contents should be saved.                                                                                                                                                                                                                                                                                                                   |
| Password/Confirm                                                | Enter and confirm the password used to authenticate the user name to the FTP server.                                                                                                                                                                                                                                                                                                                   |
| <b>Specify flash size</b>                                       |                                                                                                                                                                                                                                                                                                                                                                                                        |
| Flash                                                           | To save the buffer contents to the flash memory before it is overwritten, check this box. This option is only available in routed or transparent single mode.                                                                                                                                                                                                                                          |
| Maximum flash to be used by logging (KB)                        | Specify the maximum space to be used in the flash memory for logging (in KB). This option is available only in routed or transparent single mode.                                                                                                                                                                                                                                                      |
| Minimum free space to be preserved (KB)                         | Specifies the minimum free space to be preserved in flash memory (in KB). This option is available only in routed or transparent single mode.                                                                                                                                                                                                                                                          |
| <b>ASDM Logging (PIX7.x+, ASA, FWSM 3.x+)</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| Message Queue Size                                              | Specify the queue size for syslogs intended for viewing in ASDM.                                                                                                                                                                                                                                                                                                                                       |

# Configuring Rate Limit Levels

The Rate Limit page lets you specify the maximum number of log messages of specific types (e.g., “alert” or “critical”), and messages with specific Syslog IDs, that can be generated within given periods of time. You can specify individual limits for each logging level, and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

The [Add/Edit Rate Limited Syslog Message Dialog Box, page 54-19](#) is used to specify the maximum number of messages that can be generated for a particular Syslog message ID within a given period of time.

The [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 54-18](#) is used to specify the maximum number of messages that can be generated for a particular Syslog logging level within a given period of time.

## Related Topics

- [Rate Limit Page, page 54-18](#)

Follow these steps to manage rate limits for message logging:

- 
- Step 1** Access the Rate Limit page by doing one of the following:
- (Device view) Select **Platform > Logging > Syslog > Rate Limit** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Rate Limit** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new policy.
- Step 2** Add, edit and delete rate limits for Syslog logging levels:
- To specify the maximum number of messages that can be generated within a given period of time for particular logging level, click the **Add Row** button under the Rate Limits for Syslog Logging Levels table to open the [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 54-18](#). Choose a logging level and define a rate limit.
  - To edit the rate limit for a particular logging level, select the appropriate entry in the Rate Limits for Syslog Logging Levels table, and then click the **Edit Row** button under the table to open the [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 54-18](#). Alter the rate limit as necessary.
  - To delete a rate limit entry from the Rate Limits for Syslog Logging Levels table, select it and then click the **Delete Row** button under the table. A confirmation dialog box may be displayed; click OK to delete the entry.
- Step 3** Add, edit and delete limits for log messages according to message IDs:
- To specify the maximum number of messages that can be generated within a given period of time for particular message ID, click the **Add Row** button under the Individually Rate Limited Syslog Messages table to open the [Add/Edit Rate Limited Syslog Message Dialog Box, page 54-19](#). Choose a Syslog message ID and define a rate limit.
  - To edit the rate limit for a particular Syslog message ID, select the appropriate entry in the Individually Rate Limited Syslog Messages table, and then click the **Edit Row** button under the table to open the [Add/Edit Rate Limited Syslog Message Dialog Box, page 54-19](#). Alter the rate limit as necessary.

- To delete a message limit entry from the Individually Rate Limited Syslog Messages table, select it and then click the **Delete Row** button under the table. A confirmation dialog box may be displayed; click OK to delete the entry.

## Rate Limit Page

The Rate Limit page allows you to specify the maximum number of log messages of a particular type (for example, alert or critical) that should be generated within a given period of time. You can specify a limit for each logging level and Syslog message ID. If the settings differ, Syslog message ID limits take precedence.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Rate Limit** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Rate Limit** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new policy.

| Syslog ID                                              | Identification number of the Syslog message for which you are specifying a rate limit. |
| No. of Messages                                        | Maximum number of messages with the specified ID allowed in the specified time period. |
| Interval (seconds)                                     | Number of seconds before the rate limit counter resets.                                |

## Add/Edit Rate Limit for Syslog Logging Levels Dialog Box

Using the Add/Edit Rate Limit for Syslog Logging Levels dialog box, you can specify the maximum number of log messages for particular log level that should be generated within a given period of time. You can specify a limit for each logging level or syslog message ID (see [Add/Edit Rate Limited Syslog Message Dialog Box, page 54-19](#)). If the settings differ, the rate limited syslog message-level settings override rate limit logging level settings.

**Navigation Path**

You can access the Add/Edit Rate Limit for Syslog Logging Levels dialog box from the Rate Limit page. For more information, see [Rate Limit Page, page 54-18](#).

**Field Reference**

**Table 54-15 Add/Edit Rate Limit for Syslog Logging Levels Dialog Box**

| Element            | Description                                                                            |
|--------------------|----------------------------------------------------------------------------------------|
| Logging Level      | The syslog logging level for which you are specifying the rate limit.                  |
| Number of Messages | Maximum number of messages of the specified type allowed in the specified time period. |
| Interval (Seconds) | Number of seconds before the rate limit counter resets.                                |

**Add/Edit Rate Limited Syslog Message Dialog Box**

Using the Add/Edit Rate Limited Syslog Message dialog box you can specify the maximum number of log messages of a particular Syslog ID that can be generated within a given period of time. You can specify a limit for each syslog message ID or logging level (see [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 54-18](#)). If the settings differ, the rate limited syslog message-level settings override rate limit logging level settings.

**Navigation Path**

You can access the Add/Edit Rate Limited Syslog Message dialog box from the Rate Limit page. For more information, see [Rate Limit Page, page 54-18](#).

**Table 54-16 Add/Edit Rate Limited Syslog Message Dialog Box**

| Element            | Description                                                                            |
|--------------------|----------------------------------------------------------------------------------------|
| Syslog ID          | Identification number of the syslog message for which you are specifying a rate limit. |
| Number of Messages | Maximum number of messages with the specified ID allowed in the specified time period. |
| Interval (Seconds) | Number of seconds before the rate limit counter resets.                                |

# Configuring Syslog Server Setup

You can configure general syslog server settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

## Related Topics

- [Defining Syslog Servers, page 54-26](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Logging > Syslog > Server Setup** to open the [Server Setup Page, page 54-21](#).
  - (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Server Setup** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Change the basic message configuration as required:
- If your syslog server expects a different facility than the default, select the required facility in the **Facility** list.
  - If you want to include the date and time a message was generated in the message, select **Enable Timestamp on Each Syslog Message**.
    - If you want to configure logging timestamp in the rfc5424 format, select **Enable Timestamp Format(rfc5424)**. This option is applicable for ASA 9.12.1 devices and later. Example output of the timestamp:
 

```
2003-08-24T05:14:15.000003-07:00
```
  - If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), select **Enable Syslog Device ID** and then select the type of ID:

### Note

For an ASA cluster, each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID (Cluster ID option), syslog messages look as if they come from different units. You can also specify whether or not the interface IP address of the cluster Control unit should be used for all cluster devices.

- **Interface**—To use the IP address of the specified interface, regardless of the interface through which the appliance sends the message. Click **Select** to select the interface or the interface role that identifies the interface. Interface roles must map to a single interface.

For ASA clusters, to specify that the interface IP address of the Control unit should be used for all cluster devices, select the corresponding option under the Interface Name field.

- **User Defined ID**—To use a text string (up to 16 characters) of your choosing.
- **Host Name**—To use the hostname of the device.

- **Cluster ID**—To use the unique name in the boot configuration of an individual ASA unit in the cluster as the device ID.

**Step 3** Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can suppress (disable) the generation of a message.

- To add a rule, click the **Add Row** button and fill in the [Add/Edit Syslog Message Dialog Box](#), page 54-25.

You select the message number whose configuration you want to change, and then select the new severity level, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired. Click **OK** to add the rule to the table.

For a description of message severity levels, see [Logging Levels](#), page 54-24.

- To edit a rule, select it and click the **Edit Row** button, make the desired changes, and click **OK**.
- To delete a rule, select it and click the **Delete Row** button.
- If you are using NetFlow, you can easily disable the generation of syslog messages that have NetFlow equivalents by clicking the **Disable NetFlow Equivalent Syslogs** button. This adds the messages to the table as suppressed messages. Note that if any of these syslog equivalents are already in the table, your existing rules are not overwritten.

## Syslog Relay Configuration

In addition to events being received by the Cisco Security Manager server, they can be forwarded to a maximum of two external/remote controllers (syslog hosts). Syslog relay will forward the received messages to another syslog host using the UDP syslog protocol.

If you want the syslog messages that are forwarded from the Cisco Security Manager server to have the Cisco Security Manager server's IP address as the source IP address of the syslog message, you must enable it through CLI command:

1. Navigate to CSCOpX\MDC\logrelay and open the logrelay.properties file.
2. Set the values of ext1 and ext2 to false like this:

```
Source Preservation
#logrelay.dp.txring.ext0.preserve.source=true
logrelay.dp.txring.ext1.preserve.source=false
logrelay.dp.txring.ext2.preserve.source=false
```

**Note** By default the value is true for all collectors, by setting ext1 and ext2 as false, Cisco Security Manager will send the syslog messages with Cisco Security Manager IP. This modification can be done only for remote collectors and not for the local collector (ext0).

## Server Setup Page

The Server Setup page allows you to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog > Server Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Server Setup** from the Policy Type selector. Select an existing policy or create a new one.

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Facility                                | <p>The syslog facility code that the appliance includes in messages destined for syslog servers. The default is LOCAL4(20), which is what most UNIX systems expect. You can select a facility between LOCAL0(16) and LOCAL7(23).</p> <p>Syslog facility is useful when you have a central syslog monitoring system that needs to distinguish among the various network devices that generate syslog data streams. Because your network devices share the eight available facilities, you might need to change this value.</p> |
| Enable Timestamp on Each Syslog Message | Whether to include the date and time a message was generated in syslog messages. The default is to not include time stamps.                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 54-17 Server Setup Page (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Syslog Device ID | <p>Whether to configure a device ID in non-EMBLEM-format syslog messages. If you select this option, select one of the following to use as the device ID, which is placed at the start of all syslog messages:</p> <p><b>Note</b> For an ASA cluster, each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID (Cluster ID option), syslog messages look as if they come from different units. You can also specify whether or not the interface IP address of the Control unit should be used for all cluster devices.</p> <ul style="list-style-type: none"> <li>• <b>Interface</b>—The IP address of the selected interface. Enter the name of the interface or click <b>Select</b> to select it from a list (or to select an interface role that specifies the interface). Messages include the IP address of the interface specified, regardless of which interface the adaptive security appliance uses to send the log data to the external server.<br/><br/>If you select an interface role, that role must map to a single interface on the device.<br/><br/>For ASA clusters, to specify that the interface IP address of the Control unit should be used for all cluster devices, select the corresponding option under the Interface Name field.</li> <li>• <b>User Defined ID</b>—A text string you define as the device ID. This string can be up to 16 characters, but cannot contain any of the following special characters:<br/><br/>&amp; ' " &lt; &gt; ?</li> <li>• <b>Host Name</b>—The hostname of the security appliance.</li> <li>• <b>Cluster ID</b>—Use the unique name in the boot configuration of an individual ASA unit in the cluster as the device ID.</li> </ul> |

**Table 54-17** Server Setup Page (continued)

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog Message table                      | <p>Use this table to enable or disable the generation of specific syslog messages, or to change the severity level of a message. If you do not want to constrict which message types are generated, or change any message severity levels, you do not need to configure anything in this table. The table shows the messages you have configured with the message level and whether generation is suppressed (“true” in the table).</p> <ul style="list-style-type: none"> <li>To add a rule, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Syslog Message Dialog Box, page 54-25</a>.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Disable/Enable NetFlow Equivalent Syslogs | <p>If you are using NetFlow logging, you might want to disable the generation of syslog messages that duplicate NetFlow messages. If you click the Disable button, these duplicate syslog messages are added to the Syslog Message table as suppressed messages, and the button is renamed Enable NetFlow Equivalent Syslogs.</p> <p>Clicking the Enable button removes the duplicate syslog messages from the table, meaning that they will no longer be suppressed, and the device will start sending them again. However, if you manually edited any message that was added to the list by the Disable button, the Enable button does not remove them.</p>                                                                                                                  |

## Logging Levels

The following table describes logging levels.

**Table 54-18** Logging Levels

| Logging Level | Type          | Description                                                                                                                                      |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 0             | Emergency     | System unusable. Generates messages that identify system instabilities.                                                                          |
| 1             | Alerts        | Immediate action needed. Generates messages that identify system integrity issues that require immediate administrative action.                  |
| 2             | Critical      | Critical condition. Generates messages that identify critical system issues.                                                                     |
| 3             | Errors        | Error condition. Generates messages that identify system errors during operation.                                                                |
| 4             | Warnings      | Warning condition. Generates messages that identify system warnings. For example, device might be configured incorrectly.                        |
| 5             | Notifications | Normal but significant condition. Generates messages that identify normal operations that are typically considered significant events.           |
| 6             | Information   | Informational only. Generates messages that identify system information that is typical of day-to-day activity, such as network session records. |

**Table 54-18 Logging Levels (continued)**

| Logging Level | Type      | Description                                                                                                                                                                                                                                                                     |
|---------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7             | Debugging | Generates syslog messages that assist you in debugging. Also generates logs that identify the commands issued during FTP sessions and the URLs requested during HTTP sessions. Includes all emergency, alert, critical, error, warning, notification, and information messages. |
| -             | Disabled  | No logging.                                                                                                                                                                                                                                                                     |

## Add/Edit Syslog Message Dialog Box

The Add/Edit Syslog Message dialog box lets you modify the logging level or suppression setting for a syslog message.

### Navigation Path

You can access the Add/Edit Syslog Message dialog box from the [Server Setup Page, page 54-21](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog ID list     | <p>The message log ID of the message whose severity level or suppression setting you want to alter. These values and their corresponding messages are identified in the System Log Message guides for the appropriate product:</p> <p><b>PIX Firewall</b><br/> <a href="http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html">http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html</a></p> <p><b>ASA</b><br/> <a href="http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html">http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html</a></p> <p><b>FWSM</b><br/> <a href="http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html">http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html</a></p> <p><b>Note</b> Starting from Cisco Security Manager 4.10, you can enter a syslog message in the <b>Syslog ID</b> field. Make sure that you enter a valid syslog ID corresponding to the device; else the deployment may fail.</p> |
| Logging Level list | <p>The logging level that you want to assign to the message. For logging levels and descriptions, see <a href="#">Logging Levels, page 54-24</a>.</p> <p>Select (default) to use the default level assigned to the message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Suppressed         | Whether to suppress the generation of the syslog message. Suppressing a message disables its generation, so you will not see it in syslogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 54-19 Add/Edit Syslog Message Dialog Box (continued)**

| Element                    | Description                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable Syslogs on Standby | Whether to block specific syslog messages from being generated on standby ASA devices. This feature is available from ASA version 9.4(1) and Security Manager supports this feature starting from version 4.9. |

## Defining Syslog Servers

The Syslog Servers page lets you specify the syslog servers to which the security appliance will send syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

### Tip

If you want to view events from an ASA device using Security Manager Event Viewer, ensure that you define the Security Manager server as a syslog server. Also, if you use CS-MARS or other applications to manage syslog events, include those servers in this policy.

By directing syslog records generated by a security appliance to a syslog server, you can process and study the records.

### Before You Begin

Enable logging. See [Configuring Logging Setup, page 54-14](#).

### Related Topics

- [Syslog Servers Page, page 54-27](#)
- [Add/Edit Syslog Server Dialog Box, page 54-28](#)

- 
- Step 1** Select **Platform > Logging > Syslog > Syslog Servers** to display the Syslog Servers page.
- Step 2** Do one of the following:
- To add a new syslog target, click the **Add Row** button.
  - To edit an existing syslog target, select the check box for the row, then click the **Edit Row** button.
- Step 3** Enter or select the interface name in the **Interface** field.
- The list displays all interfaces defined at the current scope.
- Step 4** Enter or select the IP address of the syslog server in the **IP Address** field.
- Step 5** Determine whether to use UDP or TCP, then click the appropriate radio button under Protocol.
- Step 6** Enter the port from which the security appliance sends either UDP or TCP syslog messages. The port must be the same port on which the syslog server listens.
- TCP—1470 (Default). TCP ports work only with a security appliance syslog server.
  - UDP—514 (Default).
- Step 7** To generate syslog messages using the EMBLEM format, select the **Log messages in Cisco EMBLEM format** check box.
- To enable this option, you must select UDP protocol to publish messages to this syslog server.
- Step 8** Click **OK**.

The definition appears in the Syslog Servers table.

## Syslog Servers Page

The Syslog Servers page lets you specify the syslog servers to which the security appliance sends syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

### Tip

If you want to view events from an ASA device using Security Manager Event Viewer, ensure that you define the Security Manager server as a syslog server. Also, if you use CS-MARS or other applications to manage syslog events, include those servers in this policy.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Syslog Servers** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Syslog Servers** from the Policy Type selector. Select an existing policy or create a new one.

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog Servers table                                      | <p>The syslog servers to which this device sends syslog messages. The table shows the device interface that publishes messages to the server, the server's IP address, syslog protocol and port number, and whether the messages are in Cisco EMBLEM syslog format.</p> <p>There is a limit of four syslog servers that can be set up per context.</p> <ul style="list-style-type: none"> <li>• To add a server, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Syslog Server Dialog Box, page 54-28</a>.</li> <li>• To edit a server, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a server, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Queue Size                                                | Specifies the size of the queue for storing syslog messages on the security appliance when syslog server is busy. Minimum is 1 message. Default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow user traffic to pass when TCP syslog server is down | Whether to restrict all traffic if any syslog server that is using the TCP protocol is down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Add/Edit Syslog Server Dialog Box

The Add/Edit Syslog Servers dialog box lets you add or edit the syslog servers to which the security appliance will send syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

**Note**

There is a limit of four syslog servers that can be set up per context.

### Navigation Path

You can access the Add Syslog Servers dialog box from the Syslog Servers page. For more information about the Syslog Servers page, see [Syslog Servers Page, page 54-27](#).

|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The interface used to communicate with the syslog server. Enter the name of the interface or interface role object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IP Address | The IP address of syslog server. Enter the IP address or the name of the network/host policy object that defines the address, or click <b>Select</b> to select the network/host object.<br><b>Note</b> Starting with Cisco Security Manager 4.13, IPv6 addresses are supported for the syslog server.                                                                                                                                                                                                                                                                                                                                                                                |
| Protocol   | The protocol used by syslog server, either TCP or UDP. UDP is the default. TCP ports work only with a security appliance syslog server.<br><b>Note</b> You must select UDP if you intend to use the EMBLEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Port       | The TCP or UDP port from which the security appliance sends syslog messages and on which the syslog server receives them. The default ports for each protocol are: <ul style="list-style-type: none"> <li>• TCP—1470.</li> <li>• UDP—514.</li> </ul> <b>Tip</b> If you are defining the Security Manager server as a syslog server, you can find the port number on the Security Manager Administration <a href="#">Event Management Page, page 11-27</a> .<br><b>Note</b> During the installation or upgrade of Security Manager, the Common Services syslog service port is changed from 514 to 49514. Later, if Security Manager is uninstalled, the port is not reverted to 514. |

**Table 54-21 Add/Edit Syslog Server Dialog Box (continued)**

| <b>Element</b>                                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log messages in Cisco EMBLEM format (UDP only) | <p>Whether to log messages in Cisco EMBLEM format. The syslog server must use UDP.</p> <p><b>Note</b> If the syslog server is a Cisco Security MARS appliance, do not select this option. Cisco Security MARS does not process the EMBLEM format.</p>                                                                                  |
| Reference Identity                             | <p>Beginning with version 4.12, Security Manager enables you to select Reference Identity policy object name from the Policy Objects Selector.</p> <p>Reference Identity is enabled only if the Port is TCP and is disabled if the Port is UDP.</p> <p>For more information, see <a href="#">Reference Identities, page 49-13</a>.</p> |

# Configuring Multicast Policies on Firewall Devices

The Multicast section contains pages for defining IP multicast routing on security devices. Multicast routing is supported in single-context, routed mode only.

Enabling multicast routing enables IGMP and PIM on all interfaces by default. Internet Group Management Protocol (IGMP) is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. Protocol Independent Multicast (PIM) is used to maintain forwarding tables for multicast datagrams.

**Note**

---

Only the UDP transport layer is supported for multicast routing.

---

This chapter contains the following topics:

- [Enabling PIM and IGMP, page 55-1](#)
- [Configuring IGMP, page 55-2](#)
- [Configuring Multicast Routes, page 55-8](#)
- [Configuring Multicast Boundary Filters, page 55-9](#)
- [Configuring PIM, page 55-11](#)

## Enabling PIM and IGMP

The Enable PIM and IGMP page lets you enable or disable Internet Group Management Protocol (IGMP) and Protocol Independent Multicast (PIM) on all interfaces on the security appliance. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.

When **Enable PIM and IGMP** is checked on this page, PIM and IGMP are enabled on all interfaces on the security appliance. Deselect the option to disable PIM and IGMP on all interfaces.

**Note**

---

You can disable PIM and IGMP on a per-interface basis; see [IGMP Page - Protocol Tab, page 55-3](#) and [PIM Page - Protocol Tab, page 55-11](#) for more information.

---

**Navigation Path**

- (Device view) Select **Platform > Multicast > Enable PIM and IGMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Enable PIM and IGMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

## Configuring IGMP

Internet Protocol hosts use IGMP to report their group memberships to directly connected multicast routers. Internet Group Management Protocol (IGMP) uses group-address (Class D) IP addresses.

Host group addresses can be in the range 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

The IGMP page provides four tabbed panels, used to configure and manage IGMP in Security Manager:

- [IGMP Page - Protocol Tab, page 55-3](#) – This panel displays interface-specific IGMP parameters; you can disable IGMP and change IGMP parameters.
- [IGMP Page - Access Group Tab, page 55-5](#) – Lets you manage access groups that restrict the multicast sources allowed on an interface.
- [IGMP Page - Static Group Tab, page 55-6](#) – Sometimes, hosts on a network may have a configuration that prevents them from answering IGMP queries; however, you still want multicast traffic to be forwarded to that network segment. There are two methods to pull multicast traffic down to a network segment:
  - Use the Join Group tab to configure the interface as a member of the multicast group. With this method, the security appliance accepts the multicast packets in addition to forwarding them to the specified interface.
  - Use the Static Group tab to configure the security appliance to be a statically connected member of a group. With this method, the security appliance does not accept the packets itself, but only forwards them. Therefore, this method allows fast switching. The outgoing interface appears in the IGMP cache, but itself is not a member of the multicast group.

Use this tab to statically assign a multicast group to an interface, or change existing static group assignments.

- [IGMP Page - Join Group Tab, page 55-7](#) – Use this tab to manage the multicast groups to which the security appliance belongs.

**Note** If you simply want to forward multicast packets for a specific group to an interface without the security appliance accepting those packets as part of the group, see [IGMP Page - Static Group Tab, page 55-6](#).

**Navigation Path**

- (Device view) Select **Platform > Multicast > IGMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > IGMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## IGMP Page - Protocol Tab

Use the Protocol tab to configure IGMP parameters for an interface on the security appliance.

**Navigation Path**

You can access the Protocol tab from the IGMP page. For more information about the IGMP page, see [Configuring IGMP, page 55-2](#).

| <b>Protocol Table</b>    |                                                                                                                                                                                                                                                                                                                                                                                                           |
| Interface                | The name of the interface to which the IGMP settings apply.                                                                                                                                                                                                                                                                                                                                               |
| Enabled                  | Indicates whether IGMP is enabled on the interface.                                                                                                                                                                                                                                                                                                                                                       |
| Version                  | The version of IGMP enabled on the interface.                                                                                                                                                                                                                                                                                                                                                             |
| Query Interval           | The interval, in seconds, at which the designated router sends IGMP host-query messages. Valid values range from 1 to 3600 seconds. The default value is 125 seconds.                                                                                                                                                                                                                                     |
| Query Timeout            | The period of time, in seconds, before the security appliance takes over querying the interface, after the previous appliance has stopped doing so. Valid values range from 60 to 300 seconds. The default value is 255 seconds.                                                                                                                                                                          |
| Response Time            | The maximum response time, in seconds, advertised in IGMP queries. If the security appliance does not receive any host reports within the designated response time, the IGMP group is pruned. Decreasing this value lets the security appliance prune groups faster. Valid values range from 1 to 12 seconds. The default value is 10 seconds. Changing this value is only valid only for IGMP Version 2. |
| Group Limit              | The maximum number of hosts that can join on an interface. Valid values range from 1 to 500. The default value is 500.                                                                                                                                                                                                                                                                                    |
| Maximum Groups (PIX 6.3) | The maximum number of groups enabled for multicast. Valid values range from 0 to 2000.                                                                                                                                                                                                                                                                                                                    |

**Table 55-1 Protocol Tab (continued)**

| Element           | Description                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| Forward Interface | The name of the interface to which the selected interface forwards IGMP host reports if IGMP forwarding is enabled. |

## Configure IGMP Parameters Dialog Box

Use the Configure IGMP Parameters dialog box to configure IGMP parameters for an interface on the security appliance.

### Navigation Path

You can access the Configure IGMP Parameters dialog box from the IGMP Page - Protocol tab. For more information, see [IGMP Page - Protocol Tab, page 55-3](#).

|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                   | The name of the interface to which the IGMP settings apply.                                                                                                                                                                                                                                                                                                                                          |
| Forward Interface           | The name of the interface to which IGMP host reports are forwarded if IGMP forwarding is enabled.                                                                                                                                                                                                                                                                                                    |
| Version                     | The version of IGMP to enable on the interface. Choose 1 to enable IGMP Version 1, or 2 to enable IGMP Version 2. Some features require IGMP Version 2. By default, the security appliance uses IGMP Version 2.                                                                                                                                                                                      |
| Query Interval              | The interval, in seconds, at which the designated router sends IGMP host-query messages. Valid values range from 1 to 3600 seconds. The default value is 125 seconds.                                                                                                                                                                                                                                |
| Response Time               | The maximum response time, in seconds, advertised in IGMP queries. If the security appliance does not receive any host reports within the designated response time, the IGMP group is pruned. Decreasing this value lets the security appliance prune groups faster. Valid values range from 1 to 12 seconds. The default value is 10 seconds. Changing this value is valid only for IGMP Version 2. |
| Maximum Groups (PIX 6.3)    | The maximum number of groups enabled for multicast. Valid values range from 0 to 2000.                                                                                                                                                                                                                                                                                                               |
| <b>PIX 7.x and ASA Only</b> |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable IGMP                 | When selected, IGMP is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                           |
| Group Limit                 | The maximum number of hosts that can join on an interface. Valid values range from 1 to 500. The default value is 500.                                                                                                                                                                                                                                                                               |

**Table 55-2** *Configure IGMP Parameters Dialog Box (continued)*

| Element       | Description                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Query Timeout | The period of time, in seconds, before the security appliance takes over querying the interface, after the previous appliance has stopped doing so. Valid values range from 60 to 300 seconds. The default value is 255 seconds. |

## IGMP Page - Access Group Tab

Use the Access Group tab to control the multicast groups that are allowed on an interface.

The table on this page lists all currently defined multicast access groups, showing for each, the name of the interface or interface role for which the group is defined, the group network(s), and whether this group is permitted or denied. For a detailed explanation of these fields, see [Configure IGMP Access Group Parameters Dialog Box, page 55-5](#).

- To add a multicast access group to the table, click the Add Row button.
- To edit the settings for a group, select it and click the Edit Row button.
- To delete a group, select it and click the Delete Row button.

### Navigation Path

You can access the Access Group tab from the [Configuring IGMP, page 55-2](#).

### Related Topics

- [Enabling PIM and IGMP, page 55-1](#)

**Field Reference****Table 55-7** *Configure IGMP Join Group Parameters Dialog Box*

| Element    | Description                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------|
| Interface  | The name of the interface for which you are configuring multicast group membership.                                  |
| Join Group | The multicast group address to which this rule applies. The group address must be from 224.0.0.0 to 239.255.255.255. |

## Configuring Multicast Routes

Static multicast routes let you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them, sending the multicast packets over the tunnel.

Static multicast routes are local to the security appliance and are not advertised or redistributed.

Use the Multicast Routes page to manage static multicast routes—currently defined routes are listed, and you can add, edit and delete static multicast routes.

See [Add/Edit MRoute Configuration Dialog Box, page 55-8](#) for more information about the fields displayed in the table on this page.

**Navigation Path**

- (Device view) Select **Platform > Multicast > Multicast Routes** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Multicast Routes** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

## Add/Edit MRoute Configuration Dialog Box

Use the Add/Edit MRoute Configuration dialog box to add a static multicast route to the security appliance, or to change an existing route.

**Navigation Path**

You can access the Add/Edit MRoute Configuration dialog box from the Multicast Routing page. See [Configuring Multicast Routes, page 55-8](#) for more information.

**Field Reference****Table 55-8 Add/Edit MRoute Configuration Dialog Box**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Interface                 | Enter or Select the incoming interface for the multicast route.                                                                                                                                                                                                                                                                                      |
| Source Network                   | Enter the IP address and mask of the multicast source, or select a Networks/Hosts object.                                                                                                                                                                                                                                                            |
| Output Interface/Dense           | (Optional) Enter or Select the outgoing interface for the multicast route. If you specify the destination interface, the route is forwarded through the selected interface. If you do not specify a destination interface, then RPF is used to forward the route. You can specify the interface, or the RPF neighbor, but not both at the same time. |
| Multicast Network (PIX 6.3)      | Enter or Select the group that is to receive the multicast packets. This must be a multicast IP address in the range of 224.0.1.0 to 239.255.255.255.                                                                                                                                                                                                |
| Distance (PIX 7.x, ASA and FWSM) | Enter an administrative distance for the static multicast route. If the static multicast route has the same administrative distance as the unicast route, the static multicast route takes precedence.                                                                                                                                               |

## Configuring Multicast Boundary Filters

On an ASA running version 7.2(1) or later, you can use the Multicast Boundary Filter page to configure the appliance to act as a boundary between multicast domains. The ASA compares multicast group addresses to an access list, blocking all multicast traffic except that specifically permitted by the list.

The Multicast Boundary Filter page lists all currently defined per-interface boundary filter lists; you can add, edit and delete filter lists from this page.

Refer to [Add/Edit MBoundary Configuration Dialog Box, page 55-9](#) for a description of the fields on this page.

**Navigation Path**

- (Device view) Select **Platform > Multicast > Multicast Boundary Filter** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Multicast Boundary Filter** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

- [Add/Edit MBoundary Interface Configuration Dialog Box, page 55-10](#)

## Add/Edit MBoundary Configuration Dialog Box

Use the Add/Edit MBoundary Configuration dialog box to add, edit and delete multicast boundary filter lists for individual interfaces.

**Navigation Path**

You can access the Add/Edit MBoundary Configuration dialog box from the [Configuring Multicast Boundary Filters, page 55-9](#).

**Related Topics**

|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action          | Choose <b>permit</b> or <b>deny</b> to specify the action taken for this multicast group.                                                                                                                                                                                                                                                                                         |
| Multicast Group | Enter a single multicast address, or a multicast group address, to which this action applies. The address must be 0.0.0.0, or from 224.0.0.0 to 239.255.255.255. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |

# Configuring PIM

Protocol independent multicast (PIM) provides a scalable method for determining the best paths in a network for distributing a specific multicast transmission to each host that has registered using IGMP to receive the transmission. Routers and security devices use PIM to maintain tables for forwarding multicast datagrams.

With PIM sparse mode (PIM SM), which is the default for Cisco routers, when the source of a multicast transmission begins broadcasting, the traffic is forwarded from one multicast router to the next until the packets reach every registered host. If a more direct path to the traffic source exists, the last-hop router sends a join message to the source that causes the traffic to be rerouted along the better path.

**Note**

PIM is not supported with PAT—the PIM protocol does not use ports and PAT only works with protocols that use ports.

When you enable multicast routing on a security appliance, PIM and IGMP are enabled on all interfaces by default. You can disable PIM on a per-interface basis.

The PIM page provides up to six tabbed panels:

- [PIM Page - Protocol Tab, page 55-11](#) – Lets you manage interface-specific PIM properties.
- [PIM Page - Neighbor Filter Tab, page 55-12](#) – Lets you manage neighbor filters for individual interfaces; available only on ASA 7.2(1)+ devices.
- [PIM Page - Bidirectional Neighbor Filter Tab, page 55-13](#) – Lets you manage bidirectional neighbor filters for individual interfaces; available only on ASA 7.2(1)+ devices.
- [PIM Page - Rendezvous Points Tab, page 55-15](#) – When you configure PIM, you must choose one or more devices to operate as the rendezvous point (RP). An RP is a single, common root of a shared distribution tree and is statically configured on each device. First-hop routers use the RP to send registration packets on behalf of the source multicast hosts.
- [PIM Page - Route Tree Tab, page 55-17](#) – By default, PIM leaf routers join the shortest-path tree immediately after the first packet arrives from a new source. This reduces delay, but requires more memory than shared tree. You can configure whether the security appliance should join shortest-path tree, or use a shared tree, either for all multicast groups or only for specific multicast addresses.
- [PIM Page - Request Filter Tab, page 55-18](#) – When the security appliance is acting as an RP, you can restrict specific multicast sources from registering. This prevents unauthorized sources from registering with the RP. The Request Filter panel lets you define the multicast sources from which the security appliance will accept PIM registration messages.

## PIM Page - Protocol Tab

Use the Protocol tab to configure PIM properties for the interfaces on a security appliance (not available on PIX 6.3 devices). All currently configured interfaces are listed; you can add, edit and delete entries on this panel.

Refer to [Add/Edit PIM Protocol Dialog Box, page 55-12](#) for a description of the fields on this panel.

**Navigation Path**

You access the Protocol tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

**Related Topics**

- [PIM Page - Rendezvous Points Tab, page 55-15](#)
- [PIM Page - Route Tree Tab, page 55-17](#)
- [PIM Page - Request Filter Tab, page 55-18](#)

**Add/Edit PIM Protocol Dialog Box**

Use the Add/Edit PIM Protocol dialog box to configure PIM properties for an interface on a security appliance running PIX 7.x or later.

**About the Designated Router**

The DR is responsible for sending PIM register, join, and prune messages to the Rendezvous Point (RP). When there is more than one multicast routing device on a network segment, there is an election process to select the Designated Router based on DR priority. If multiple devices have the same DR priority, then the device with the highest IP address becomes the DR. By default, security appliances have a DR priority of 1.

**Navigation Path**

You can access the Add/Edit PIM Protocol dialog box from the [PIM Page - Protocol Tab, page 55-11](#).

**Field Reference**

| Element                       | Description                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                     | Enter or Select the interface on which you are configuring PIM.                                                                                                                                                                                                                                                            |
| Enable PIM                    | When checked, PIM is enabled on the selected interface. You can deselect this option to disable PIM on the interface without deleting this PIM Protocol entry from the table.                                                                                                                                              |
| DR Priority                   | The designated router (DR) priority for this interface. The router with the highest DR priority on subnet becomes the designated router. Valid values range from 0 to 4294967294. The default DR priority is 1. Setting this value to zero makes the security appliance interface ineligible to become the default router. |
| Hello Interval (seconds)      | The frequency, in seconds, at which the interface sends PIM hello messages. Valid values range from 1 to 3600 seconds; the default value is 30 seconds.                                                                                                                                                                    |
| Join-Prune Interval (seconds) | The frequency, in seconds, at which the interface sends PIM join and prune advertisements. Valid values range from 10 to 600 seconds; the default value is 60 seconds.                                                                                                                                                     |

**PIM Page - Neighbor Filter Tab**

A PIM neighbor filter is an access control list (ACL) that defines the neighbor devices that can participate in PIM. If a neighbor filter is not configured for an interface, then there are no restrictions. If a PIM neighbor filter is configured, only those neighbors permitted by the filter list can participate in PIM with the security appliance.

On an ASA running version 7.2(1) or later, you can use the Neighbor Filter tab to control the devices that can become PIM neighbors. This panel is used to define and manage the per-interface neighbor filter list. Refer to [Add/Edit PIM Neighbor Filter Dialog Box, page 55-13](#) for a description of the fields on this panel.

### Navigation Path

You access the Protocol tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface             | Enter or Select the interface to which this PIM Neighbor filter entry will be applied.                                                                                                                                                                                                                               |
| Neighbor Filter Group | Enter a single multicast address, or a multicast group address, to which the chosen Action applies. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |
| Action                | Choose <b>permit</b> to allow the specified neighbors to participate in PIM, or <b>deny</b> to prevent the specified neighbors from participating in PIM.                                                                                                                                                            |

## PIM Page - Bidirectional Neighbor Filter Tab

A PIM bidirectional neighbor filter is an access control list (ACL) that defines the neighbor devices that can participate in the bidirectional trees and designated forwarder (DF) election. If a PIM bidirectional neighbor filter is not configured for an interface, then there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in DF election process.

The PIM bidirectional neighbor filters enable the transition from a sparse-mode-only network to a “bidir” network by letting you specify the devices that should participate in DF election, while still allowing all devices to participate in the sparse-mode domain. The bidir-enabled devices can elect a DF from among themselves, even when there are non-bidir devices on the segment. Multicast boundaries on the non-bidir devices prevent PIM messages and data from the bidir groups from leaking in or out of the bidir subset cloud.

Bidirectional PIM allows multicast devices to maintain reduced state information. All of the multicast devices in a segment must be bidirectionally enabled for bidir to elect a DF.

When a PIM bidirectional neighbor filter is enabled, the routers and other devices that are permitted by the ACL are considered to be bidir-capable. Therefore:

- If a permitted neighbor does not support bidir, the DF election does not occur.
- If a denied neighbor supports bidir, then DF election does not occur.
- If a denied neighbor does not support bidir, the DF election can occur.

### Managing the Bidirectional Neighbor Filter List

On an ASA running version 7.2(1) or later, you can use this panel to define and manage the per-interface bidirectional neighbor filter list, permitting or denying multicast source addresses for specific interfaces. Refer to [Add/Edit PIM Bidirectional Neighbor Filter Dialog Box, page 55-14](#) for a description of the fields on this panel.

### Navigation Path

You access the Bidirectional Neighbor Filter tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor Filter Group | Enter a single multicast address, or a multicast group address, to which the chosen Action applies. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |
| Action                | Choose <b>permit</b> to allow the specified neighbors to participate in the DF election process, or <b>deny</b> to prevent the specified neighbors from participating in the process.                                                                                                                                |

## PIM Page - Rendezvous Points Tab

When you configure PIM, you must choose one or more routers or routing devices to operate as the RP. An RP is a single, common root of a shared distribution tree and is statically configured on each device. First hop routers use the RP to send register packets on behalf of the source multicast hosts.

You can configure a single RP to serve more than one group. If a specific group is not specified, the RP for the group is applied to the entire IP multicast group range (224.0.0.0/4).

Use the Rendezvous Points panel to define rendezvous points. You can configure more than one RP, but you cannot have more than one entry with the same RP.

### Navigation Path

You access the Rendezvous Points tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

### Related Topics

**Table 55-15 Add/Edit Rendezvous Point Dialog Box**

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rendezvous Point IP Address                             | Enter the IP address of the rendezvous point. This is a unicast address. You also can click Select to select a Networks/Hosts object.<br><br>When editing a rendezvous point entry, you cannot change this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Use bi-directional forwarding                           | Check this box if you want the specified Multicast Groups to operate in bidirectional mode. In bidirectional mode, if the security appliance receives a multicast packet and has no directly connected members or PIM neighbors present, it sends a Prune message back to the source. Deselect this option if you want the specified Multicast Groups to operate in Sparse Mode.<br><br><b>Note</b> The security appliance always advertises bidirectional capability in PIM hello messages regardless of the actual bidir configuration.                                                                                                                                                    |
| Use this RP for All Multicast Groups                    | Select this option to use the specified Rendezvous Point for all multicast groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Use this RP for the Multicast Groups as specified below | Select this option to define the multicast groups that are to use the specified Rendezvous Point; the Multicast Groups table is activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Multicast Groups table                                  | The multicast groups currently associated with the specified Rendezvous Point are listed.<br><br>Table entries are processed from the top down. For example, you can create an entry that includes a range of multicast groups, and then exclude specific groups within that range by placing deny rules for those specific groups at the top of the table. That is, the permit rule for the range of multicast groups follows the individual deny statements.<br><br>Use the buttons at the bottom of the table to open the <a href="#">Add/Edit Multicast Group Rules Dialog Box, page 55-17</a> to add or edit an entry; to delete an entry; and to move entries up or down in the table. |

## Add/Edit Multicast Group Rules Dialog Box

Use the Add/Edit Multicast Group Rules dialog box to create a multicast group rule, or modify a multicast group rule, for the Multicast Groups table in the Add/Edit Rendezvous Point dialog box. This dialog box is also used to specify individual multicast groups that use Shared Tree route filtering on the Route Tree tab

### Navigation Path

When defining Rendezvous Points, you access the Add/Edit Multicast Group Rules dialog box from the [Add/Edit Rendezvous Point Dialog Box, page 55-16](#). See [PIM Page - Rendezvous Points Tab, page 55-15](#) for more information.

When specifying how PIM register messages are filtered, you open this dialog box by clicking Add Row or Edit row buttons below the Multicast Groups table on the [PIM Page - Route Tree Tab, page 55-17](#).

### Field Reference

| Element                 | Description                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                  | Choose <b>permit</b> to create a group rule that allows the specified multicast addresses; choose <b>deny</b> to create a group rule that denies the specified multicast addresses. |
| Multicast Group Network | Enter the multicast address and network mask associated with the group, or Select the desired Networks/Hosts object.                                                                |

## PIM Page - Route Tree Tab

If the security appliance is acting as a Rendezvous Point, use the Route Tree tab to specify how the PIM register messages from various sources are filtered: shortest-path tree or shared tree, either for all multicast groups or only for specific multicast addresses.

### Navigation Path

You can access the Route Tree tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

## PIM Page - Request Filter Tab

When the security appliance acts as a rendezvous point, you can restrict specific multicast sources from registering with it. This prevents unauthorized sources from registering with the rendezvous point. You can use the Request Filter tab to define the multicast sources from which the security appliance accepts and denies PIM register messages.

### Navigation Path

You can access the Request Filter tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

## Add/Edit Multicast Group Rules Dialog Box

Use the Add/Edit Multicast Group Rules dialog box to define the multicast sources that are denied or permitted to register with the security appliance when the appliance acts as a rendezvous point. You create the filter rules based on the source IP address and the destination multicast address.

### Navigation Path

You can access the Add/Edit Multicast Group Rules dialog box from the [PIM Page - Request Filter Tab, page 55-18](#).

**Field Reference****Table 55-19 Add/Edit Multicast Group Rules Dialog Box**

| Element             | Description                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action              | Choose <b>permit</b> to create a rule that allows the specified Source of the specified Destination multicast traffic to register with the security appliance; choose <b>deny</b> to create a rule that denies registration to the specified Source/Destination multicast traffic. |
| Source Network      | Enter the IP address and network mask for the source of the register message, or Select the appropriate Networks/Hosts object.                                                                                                                                                     |
| Destination Network | Enter the IP address and network mask for the multicast destination, or Select the appropriate Networks/Hosts object.                                                                                                                                                              |

## PIM Page - Bootstrap Router Tab

PIM Bootstrap Router (BSR) is a dynamic Rendezvous Point (RP) selection model that uses candidate routers for Rendezvous Point function and for relaying the Rendezvous Point information for a group. The Rendezvous Point function includes RP discovery and provides a default route to the RP. It does this by configuring a set of devices as candidate BSRs (C-BSR) which participate in a BSR election process to choose a BSR amongst themselves. Once the BSR is chosen, devices that are configured as candidate Rendezvous Points (C-RP) will start sending their group mapping to the elected BSR. The BSR then distributes the group-to-RP mapping information to all the other devices down the multicast tree, through BSR messages that travel from PIM router to PIM router on a per-hop basis.

You can use the Boot Strap Router tab to configure a device as a PIM Bootstrap Router.

**Navigation Path**

You can access the Bootstrap Router tab from the PIM page. For more information, see [Configuring PIM, page 55-11](#).

| Element          | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface        | Select the interface from which the BSR address is derived, to make it a candidate BSR.                                                                                                                                                                                                                                                             |
| Hash Mask Length | Enter the length of a mask that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash (correspond) to the same Rendezvous Point (RP).<br><br>For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups. |

**Table 55-20 Bootstrap Router Tab (continued)**

| Element  | Description                                                                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority | Enter the priority of the candidate BSR. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. |

## Add/Edit Bootstrap Router Dialog Box

Use the Add/Edit Bootstrap Router dialog box to configure a Bootstrap Router as a Border BSR. BSR messages should not be exchanged between different domains, because routers in one domain may elect rendezvous points (RPs) in the other domain, resulting in protocol malfunction or loss of isolation between the domains.

A border interface in a PIM sparse mode (PIM-SM) domain is configured to avoid exchange of certain traffic with a neighboring domain reachable through that interface, especially if that domain is also running PIM-SM. Thus to prevent BSR messages from being sent or received through such an interface configure the interface as a border BSR.

### Navigation Path

You can access the Add/Edit Bootstrap Router dialog box from the [PIM Page - Bootstrap Router Tab, page 55-20](#)

### Field Reference

**Table 55-21 Add/Edit Bootstrap Router Dialog Box**

| Element                         | Description                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| (Optional) BSR Border table Add | Add an interface and configure it as a border BSR. No PIM BSR messages will be sent or received, when an interface is configured as a Border BSR. |

## Configuring Routing Policies on Firewall Devices

---

The Routing section in Security Manager contains pages for defining and managing routing settings for security appliances.

This chapter contains the following topics:

- [Configuring No Proxy ARP, page 56-1](#)
- [Configuring BGP, page 56-2](#)
- [Configuring EIGRP, page 56-32](#)
- [Configuring ISIS, page 56-49](#)
- [Configuring BFD Routing, page 56-66](#)
- [Configuring OSPF, page 56-75](#)
- [Configuring OSPFv3, page 56-103](#)
- [Configuring RIP, page 56-122](#)
- [Configuring Static Routes, page 56-131](#)
- [Configuring Policy Objects for ASA Routing Policies, page 56-135](#)

### Configuring No Proxy ARP

When a host sends IP traffic to another device on the same Ethernet network, the host needs to know the MAC address of the device. Address Resolution Protocol (ARP) is a Layer 2 protocol that resolves an IP address to a MAC address: a host sends an ARP request asking “Who is this IP address?” The device owning the IP address replies, “I own that IP address; here is my MAC address.”

With Proxy ARP, a device responds to an ARP request with its own MAC address, even though the device does not own the IP address. Serving as an ARP Proxy for another host effectively directs network traffic to the proxy, in this case your security appliance. Traffic that passes through the appliance is then routed to the appropriate destination.

For example, the security appliance uses proxy ARP when you configure NAT and specify a global address that is on the same network as the appliance interface. The only way traffic can reach the destination hosts is if the appliance claims and subsequently routes traffic to the destination global addresses.

By default, proxy ARP is enabled for all interfaces. Use the No Proxy ARP page to disable proxy ARP for global addresses:

- To disable proxy ARP for one or more interfaces, enter their names in the Interfaces field. Separate multiple interfaces with commas. You can click Select to choose the interfaces from a list of interfaces defined on the device, and interface roles defined in Security Manager.

**Note**

On ASA 8.4.2 and later devices operating in routed mode, you can disable Proxy ARP on the egress interface for a Manual NAT rule. See [Do not proxy ARP on Destination Interface](#) for more information.

**Navigation Path**

- (Device view) Select **Platform > Routing > No Proxy ARP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > No Proxy ARP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Configuring BGP

Border Gateway Protocol (BGP) is an inter autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

**Note**

BGP configuration is supported on ASA 9.2(1)+ only. Also, beginning with ASA 9.3(1), BGP is supported in L2 (EtherChannel Type) and L3 (Individual Interface Type) clustering modes.

**Navigation Path**

- (Device view) Select **Platform > Routing > BGP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > BGP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

The BGP page provides two tabbed panels for configuring BGP routing on a firewall device. This is the basic procedure for configuring the BGP process:

1. Enable the BGP routing process by checking the Enable BGP check box on the BGP page.
2. In the AS Number field, enter the autonomous system (AS) number for the BGP process. The AS number internally includes multiple autonomous numbers. The AS number can be from 1 to 4294967295 or from 1.0 to 65535.65535.
3. On the [General Tab, page 56-5](#):
  - (Optional) Check the Limit the number of AS numbers in AS\_PATH attribute of received routes check box to restrict the number of AS numbers in AS\_PATH attribute to a specific number. Valid values are from 1 to 254.
  - (Optional) Check the Log Neighbor Changes check box to enable logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability.

- (Optional) Check the Use TCP path MTU Discovery check box to use the Path MTU Discovery technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation.
  - (Optional) Check the Enable fast external failover check box to reset the external BGP session immediately upon link failure.
  - (Optional) Check the Enforce that the first AS is peer's AS for EBGP routes check box to discard incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS\_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system.
  - (Optional) Check the Use dot notation for AS numbers check box to split the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65533 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation.
  - Define the configuration related to the best path selection process for BGP routing (see [General Tab, page 56-5](#)).
  - Specify the timer information in the Neighbor timers area (see [General Tab, page 56-5](#)).
  - (Optional) Configure Graceful Restart (see [General Tab, page 56-5](#)).
4. On the IPv4 Family tab, select the Enable IPv4 Family check box and then use the tabs provided to configure IPv4 Address Family settings. For more information, see [IPv4 Family Tab, page 56-6](#).
  5. On the IPv6 Family tab, select the Enable IPv6 Family check box and then use the tabs provided to configure IPv6 Address Family settings. For more information, see [IPv6 Family Tab, page 56-20](#).

- [About BGP, page 56-3](#)

## About BGP

BGP is an inter autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

#### When to Use BGP

Customer networks, such as universities and corporations, usually employ an Interior Gateway Protocol (IGP) such as OSPF for the exchange of routing information within their networks. Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

#### Routing Table Changes

BGP neighbors exchange full routing information when the TCP connection between neighbors is first established. When changes to the routing table are detected, the BGP routers send to their neighbors only those routes that have changed. BGP routers do not send periodic routing updates, and BGP routing updates advertise only the optimal path to a destination network.

Routes learned via BGP have properties that are used to determine the best route to a destination, when multiple paths exist to a particular destination. These properties are referred to as BGP attributes and are used in the route selection process:

- **Weight** -- This is a Cisco-defined attribute that is local to a router. The weight attribute is not advertised to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred.
- **Local preference** -- The local preference attribute is used to select an exit point from the local AS. Unlike the weight attribute, the local preference attribute is propagated throughout the local AS. If there are multiple exit points from the AS, the exit point with the highest local preference attribute is used as an exit point for a specific route.
- **Multi-exit discriminator** -- The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS regarding the preferred route into the AS that is advertising the metric. It is referred to as a suggestion because the external AS that is receiving the MEDs may also be using other BGP attributes for route selection. The route with the lower MED metric is preferred.
- **Origin** -- The origin attribute indicates how BGP learned about a particular route. The origin attribute can have one of three possible values and is used in route selection.
  - **IGP**- The route is interior to the originating AS. This value is set when the network router configuration command is used to inject the route into BGP.
  - **EGP**-The route is learned via the Exterior Border Gateway Protocol (EBGP).
  - **Incomplete**- The origin of the route is unknown or learned in some other way. An origin of incomplete occurs when a route is redistributed into BGP.
- **AS\_path** -- When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed. Only the route with the shortest AS\_path list is installed in the IP routing table.
- **Next hop** -- The EBGP next-hop attribute is the IP address that is used to reach the advertising router. For EBGP peers, the next-hop address is the IP address of the connection between the peers. For IBGP, the EBGP next-hop address is carried into the local AS.
- **Community** -- The community attribute provides a way of grouping destinations, called communities, to which routing decisions (such as acceptance, preference, and redistribution) can be applied. Route maps are used to set the community attribute. The predefined community attributes are as follows:
  - **no-export**- Do not advertise this route to EBGP peers.
  - **no-advertise**- Do not advertise this route to any peer.
  - **internet**- Advertise this route to the Internet community; all routers in the network belong to it.

### BGP Path Selection

BGP may receive multiple advertisements for the same route from different sources. BGP selects only one path as the best path. When this path is selected, BGP puts the selected path in the IP routing table and propagates the path to its neighbors. BGP uses the following criteria, in the order presented, to select a path for a destination:

- If the path specifies a next hop that is inaccessible, drop the update.
- Prefer the path with the largest weight.
- If the weights are the same, prefer the path with the largest local preference.
- If the local preferences are the same, prefer the path that was originated by BGP running on this router.
- If no route was originated, prefer the route that has the shortest AS\_path.
- If all paths have the same AS\_path length, prefer the path with the lowest origin type (where IGP is lower than EGP, and EGP is lower than incomplete).

- If the origin codes are the same, prefer the path with the lowest MED attribute.
- If the paths have the same MED, prefer the external path over the internal path.
- If the paths are still the same, prefer the path through the closest IGP neighbor.
- If both paths are external, prefer the path that was received first (the oldest one).
- Prefer the path with the lowest IP address, as specified by the BGP router ID.
- If the originator or router ID is the same for multiple paths, prefer the path with the minimum cluster list length.
- Prefer the path that comes from the lowest neighbor address.

## General Tab

Use the General tab to configure BGP settings such as Best Path Selection, Neighbor Timers, and Graceful Restart.

### Navigation Path

You can access the Neighbors tab from the BGP page (see [Configuring BGP, page 56-2](#)).

| Element                                                                | Description                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of AS numbers in AS_PATH attribute of received routes | Restricts the number of AS numbers in AS_PATH attribute to a specific number. Valid values are from 1 to 254.                                                                                                                                                                                        |
| Log Neighbor Changes                                                   | Enables logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability.                                                                                                                                        |
| Use TCP path MTU Discovery                                             | Enables the use of the Path MTU Discovery technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation.                                                                                                                    |
| Enable fast external failover                                          | Resets the external BGP session immediately upon link failure.                                                                                                                                                                                                                                       |
| Enforce that the first AS is peer's AS for EBGp routes                 | Discards incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. |
| Use dot notation for AS numbers                                        | Splits the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65535 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation.                                                                      |

Table 56-1 General Tab (continued)

| Element                                                                                | Description                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Best Path Selection</b>                                                             |                                                                                                                                                                                                                                          |
| Default local preference                                                               | Specify a value between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.                                  |
| Allow comparing MED from different neighbors                                           | Allows the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.                                                                                                                        |
| Compare Router-id for identical EBGP paths                                             | Compares similar paths received from external BGP peers during the best path selection process and switches the best path to the route with the lowest router ID.                                                                        |
| Pick the best MED path among paths advertised from the neighboring AS                  | Enables MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path.                                                                   |
| Treat missing MED as the least preferred one                                           | Considers the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred.                                                                         |
| <b>Neighbor Timers</b>                                                                 |                                                                                                                                                                                                                                          |
| Keepalive Interval                                                                     | Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds. |
| Hold Time                                                                              | Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured. The default value is 180 seconds.                                                                            |
| Min Hold Time                                                                          | (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured. Specify a value from 0 to 65535.                                                          |
| <b>Graceful Restart</b> (Use in failover or spanned cluster mode)<br>(ASA 9.3.1+ only) |                                                                                                                                                                                                                                          |
| Enable Graceful Restart                                                                | Enables ASA peers to avoid a routing flap following a switchover.                                                                                                                                                                        |
| Restart Time                                                                           | Specify the time duration that ASA peers will wait to delete stale routes before a BGP open message is received. The default value is 120 seconds. Valid values are between 1 and 3600 seconds.                                          |
| Stalepath Time                                                                         | Enter the time duration that the ASA will wait before deleting stale routes after an end of record (EOR) message is received from the restarting ASA. The default value is 360 seconds. Valid values are between 1 and 3600 seconds.     |

## IPv4 Family Tab

Use the IPv4 Family tab on the BGP page to enable and configure IPv4 settings for BGP.

**Navigation Path**

You can access the IPv4 Family tab from the BGP page. For more information about the BGP page, see [Configuring BGP, page 56-2](#).

**Related Topics**

- [General Tab, page 56-5](#)

**Field Reference****Table 56-2 IPv4 Family - Aggregate Address Tab**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPv4 Family | Enables configuration of routing sessions that use standard IPv4 address prefixes.                                                                                                                                                                                                                                                                             |
| General            | Use this panel to configure general IPv4 settings such as Best Path Selection, Neighbor Timers, and Graceful Restart. See <a href="#">IPv4 Family - General Tab, page 56-7</a> for more about these definitions.                                                                                                                                               |
| Aggregate Address  | Use this panel to define the aggregation of specific routes into one route.<br><br>Specify a value for the aggregate timer (in seconds) in the Aggregate Timer field. Valid values are 0 or any value between 6 and 60. The default value is 30.<br><br>See <a href="#">Add/Edit Aggregate Address Dialog Box, page 56-9</a> for more about these definitions. |
| Filtering          | Use this panel to filter routes or networks received in incoming BGP updates. See <a href="#">Add/Edit Filter Dialog Box, page 56-10</a> for more about these definitions.                                                                                                                                                                                     |
| Neighbor           | Use this panel to define BGP neighbors and neighbor settings. See <a href="#">Add/Edit Neighbor Dialog Box, page 56-11</a> for more about these definitions.                                                                                                                                                                                                   |
| Networks           | Use this panel to define the networks to be advertised by the BGP routing process. See <a href="#">Add/Edit Network Dialog Box, page 56-17</a> for more about these definitions.                                                                                                                                                                               |
| Redistribution     | Use this panel to define the conditions for redistributing routes from another routing domain into BGP. See <a href="#">Add/Edit Redistribution Dialog Box, page 56-18</a> for more about these definitions.                                                                                                                                                   |
| Route Injection    | Use this panel to define the routes to be conditionally injected into the BGP routing table. See <a href="#">Add/Edit Route Injection Dialog Box, page 56-19</a> for more about these definitions.                                                                                                                                                             |

**IPv4 Family - General Tab**

Use the IPv4 Family - General tab to configure the general IPv4 settings.

**Navigation Path**

You can access the General tab from the IPv4 Family Tab on the BGP page. For more information about the IPv4 Family tab, see [IPv4 Family Tab, page 56-6](#).

| Element                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router ID                                                              | <p>On a single device, choose <b>Automatic</b> or <b>IP Address</b>. (An address field appears when you choose IP Address.)</p> <p>If you choose Automatic, the highest-level IP address on the security appliance is used as the router ID. To use a fixed router ID, choose IP Address and enter an IPv4 address in the Router ID field.</p> <p>On a device cluster, choose <b>Automatic</b> or <b>Cluster Pool</b>. (An IPv4 Pool object ID field appears when you choose Cluster Pool.)</p> <p>If you choose Cluster Pool, enter or Select the name of the IPv4 Pool object that is to supply the Router ID address. For more information, see <a href="#">Add or Edit IPv4 Pool Dialog Box, page 6-92</a>.</p>                                                |
| Learned Route Map                                                      | <p>Enter or Select the name of a route map object.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects, page 56-135</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| Scanning Interval                                                      | <p>Enter a scanning interval (in seconds) for BGP routers for next-hop validation. Valid values are from 5 to 60 seconds. The default value is 60.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Routes and Synchronization</b>                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Generate Default Route                                                 | <p>(Optional) Configures a BGP routing process to distribute a default route (network 0.0.0.0).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Summarize subnet routes into network-level routes                      | <p>(Optional) Configures automatic summarization of subnet routes into network-level routes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Advertise inactive routes                                              | <p>(Optional) Advertises routes that are not installed in the routing information base (RIB).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Synchronize between BGP and the Interior Gateway Protocol (IGP) system | <p>Enables synchronization between BGP and your Interior Gateway Protocol (IGP) system. To enable the Cisco IOS software to advertise a network route without waiting for the IGP, deselect this option.</p> <p>Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. By default, synchronization between BGP and the IGP is turned off to allow the Cisco IOS software to advertise a network route without waiting for route validation from the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems. Use synchronization if routers in the autonomous system do not speak BGP.</p> |

**Table 56-3 IPv4 Family - General Tab (continued)**

| Element                                    | Description                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Redistribute iBGP into an IGP              | (Optional) Configures iBGP redistribution into an interior gateway protocol (IGP), such as IS-IS or OSPF.                                                                                                                                                                                                                                |
| <b>Administrative Route Distances</b>      |                                                                                                                                                                                                                                                                                                                                          |
| External                                   | Specifies the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.                                                                                                                    |
| Internal                                   | Specifies administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.                                                                                                                 |
| Local                                      | Specifies administrative distance for local BGP routes. Local routes are those networks listed with a network router configuration command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200. |
| <b>Next Hop</b>                            |                                                                                                                                                                                                                                                                                                                                          |
| Enable address tracking                    | (Optional) Enables BGP next hop address tracking.                                                                                                                                                                                                                                                                                        |
| Delay Interval                             | Specify the delay interval between checks on updated next-hop routes installed in the routing table.                                                                                                                                                                                                                                     |
| <b>Forward packets over Multiple Paths</b> |                                                                                                                                                                                                                                                                                                                                          |
| Number of Paths                            | (Optional) Specify the maximum number of external BGP routes that can be installed to the routing table.                                                                                                                                                                                                                                 |
| iBGP Number of Paths                       | (Optional) Specify the maximum number of internal BGP routes that can be installed to the routing table.                                                                                                                                                                                                                                 |

## Add/Edit Aggregate Address Dialog Box

Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

### Navigation Path

You can access the Add/Edit Aggregate Address dialog box from the [IPv4 Family Tab, page 56-6](#).

You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects, page 56-135</a> . |
| Suppress Map                                 | (Optional) Enter or Select the route map used to select the routes to be suppressed.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects, page 56-135</a> .                    |
| Generate AS Set Path Information             | Enables generation of autonomous system set path information.                                                                                                                                                                                                                                                                                                                                            |
| Filter all more-specific routes from updates | Filters all more-specific routes from updates.                                                                                                                                                                                                                                                                                                                                                           |

## Add/Edit Filter Dialog Box

Use the Add/Edit Filter dialog box to filter routes or networks received in incoming BGP updates.

### Navigation Path

You can access the Add/Edit Filter dialog box from the [IPv4 Family Tab, page 56-6](#).

### Field Reference

**Table 56-5 Add/Edit Filter Dialog Box**

| Element    | Description                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACL        | Select an Access Control List that defines which networks are to be received and which are to be suppressed in routing updates.                           |
| Direction  | Choose a direction from the Direction drop-down list. The direction will specify if the filter should be applied to inbound updates or outbound updates.  |
| Protocol   | Select the routing process for which you want to filter: None, BGP, Connected, EIGRP, OSPF, RIP, or Static.                                               |
| AS Number  | Shows the autonomous system number of the BGP routing process. This value is specified on the BGP page (see <a href="#">Configuring BGP, page 56-2</a> ). |
| Process ID | Enter the identifier for the routing process. Applies to EIGRP and OSPF routing protocols.                                                                |

## Add/Edit Neighbor Dialog Box

Use the Add/Edit Neighbor dialog box to define BGP neighbors and neighbor settings.

### Navigation Path

You can access the Add/Edit Neighbor dialog box from the [IPv4 Family Tab, page 56-6](#).

| Enable Authentication                                          | <p>(Optional) Select to enable MD5 authentication on a TCP connection between two BGP peers.</p> <ul style="list-style-type: none"> <li>Choose an encryption type from the Enable Encryption drop-down list.</li> <li>Enter a password in the Password field. Reenter the password in the Confirm field.</li> </ul> <p>The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The first character cannot be a number. The string can contain any alphanumeric characters, including spaces.</p> <p><b>Note</b> You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.</p>                                                                                                                                         |
| Send Community attribute to this neighbor                      | (Optional) Specifies that communities attributes should be sent to the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use ASA as next hop for neighbor                               | (Optional) Select to configure the router as the next-hop for a BGP speaking neighbor or peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Disable connection verification                                | <p>(Optional) Select to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address.</p> <p>This command is required only when the neighbor ebgp-multihop command is configured with a TTL value of 1. The address of the single-hop eBGP peer must be reachable. The neighbor update-source command must be configured to allow the BGP routing process to use the loopback interface for the peering session.</p> <p>When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.</p> |
| Allow connections with neighbor that is not directly connected | <p>Select to accept and attempt BGP connections to external peers residing on networks that are not directly connected.</p> <p>(Optional) Enter the time-to-live in the TTL hops field. Valid values are between 1 and 255.</p> <p><b>Note</b> This feature should be used only under the guidance of Cisco technical support staff. To prevent the creation of loops through oscillating routes, the multihop will not be established if the only route to the multihop peer is the default route (0.0.0.0).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit number of TTL hops to neighbor | <p>Select this option to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the TTL hops field. Valid values are between 1 and 254.</p> <p>This feature provides a lightweight security mechanism to protect BGP peering sessions from CPU utilization-based attacks. These types of attacks are typically brute force Denial of Service (DoS) attacks that attempt to disable the network by flooding the network with IP packets that contain forged source and destination IP addresses in the packet headers.</p> <p>This feature leverages designed behavior of IP packets by accepting only IP packets with a TTL count that is equal to or greater than the locally configured value. Accurately forging the TTL count in an IP packet is generally considered to be impossible. Accurately forging a packet to match the TTL count from a trusted peer is not possible without internal access to the source or destination network.</p> <p>This feature should be configured on each participating router. It secures the BGP session in the incoming direction only and has no effect on outgoing IP packets or the remote router. When this feature is enabled, BGP will establish or maintain a session only if the TTL value in the IP packet header is equal to or greater than the TTL value configured for the peering session. This feature has no effect on the BGP peering session, and the peering session can still expire if keepalive packets are not received. If the TTL value in a received packet is less than the locally configured value, the packet is silently discarded and no Internet Control Message Protocol (ICMP) message is generated. This is designed behavior; a response to a forged packet is not necessary.</p> <p>To maximize the effectiveness of this feature, the hop-count value should be strictly configured to match the number of hops between the local and external network. However, you should also take path variation into account when configuring this feature for a multihop peering session.</p> <p>The following restrictions apply to the configuration of this command:</p> <ul style="list-style-type: none"> <li>• This feature is not supported for internal BGP (iBGP) peers.</li> <li>• The effectiveness of this feature is reduced in large-diameter multihop peerings. In the event of a CPU utilization-based attack against a BGP router that is configured for large-diameter peering, you may still need to shut down the affected peering sessions to handle the attack.</li> <li>• This feature is not effective against attacks from a peer that has been compromised inside of your network. This restriction also includes peers that are on the network segment between the source and destination network.</li> </ul> |
| Use TCP Path MTU Discovery           | (Optional) Select to enable a TCP transport session for a BGP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element                                                                                                                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP transport mode                                                                                                                                                                                                                                                          | Choose the TCP connection mode from the drop-down list. Options are Default, Active, or Passive.                                                                                                                                                                             |
| Weight                                                                                                                                                                                                                                                                      | (Optional) Enter a weight for the BGP neighbor connection.                                                                                                                                                                                                                   |
| BGP Version                                                                                                                                                                                                                                                                 | Choose the BGP version that the ASA will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested. |
| <b>Migration</b>                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                              |
| <b>Note</b> This customization should only be used for AS migration, and should be removed after the transition has been completed. The procedure should be attempted only by an experienced network operator. Routing loops can be created through improper configuration. |                                                                                                                                                                                                                                                                              |
| Customize the AS number for routes received from the neighbor                                                                                                                                                                                                               | (Optional) Select to customize the AS_PATH attribute for routes received from an eBGP neighbor.                                                                                                                                                                              |
| Local AS Number                                                                                                                                                                                                                                                             | Enter the local autonomous system number. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.                                                                                                                                    |
| Do not prepend local AS number to routes received from neighbor                                                                                                                                                                                                             | (Optional) Select to prevent the local AS number from being prepended to any routes received from eBGP peer.                                                                                                                                                                 |
| Replace real AS number with local AS number in routes received from neighbor                                                                                                                                                                                                | (Optional) Select to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.                                                                |
| Accept either real AS number or local AS number in routes received from neighbor                                                                                                                                                                                            | (Optional) Configures the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.                                                                          |

## Add/Edit Network Dialog Box

Use the Add/Edit Network dialog box to define the networks to be advertised by the BGP routing process.

### Navigation Path

You can access the Add/Edit Network dialog box from the [IPv4 Family Tab, page 56-6](#).

### Field Reference

**Table 56-7 Add/Edit Network Dialog Box**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network   | Specifies the network to be advertised by the BGP routing processes.                                                                                                                                                                                                                                                                                                                                                                                       |
| Route Map | (Optional) Enter or Select a route map that should be examined to filter the networks to be advertised. If not specified, all networks are redistributed.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects, page 56-135</a> . |

## Add/Edit Redistribution Dialog Box

Use the Add/Edit Redistribution dialog box to define the conditions for redistributing routes from another routing domain into BGP.

### Navigation Path

You can access the Add/Edit Redistribution dialog box from the [IPv4 Family Tab, page 56-6](#).

| Advertise inactive routes                                                                            | (Optional) Advertises routes that are not installed in the routing information base (RIB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Synchronize between BGP and the Interior Gateway Protocol (IGP) system                               | <p>Enables synchronization between BGP and your Interior Gateway Protocol (IGP) system. To enable the Cisco IOS software to advertise a network route without waiting for the IGP, deselect this option.</p> <p>Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. By default, synchronization between BGP and the IGP is turned off to allow the Cisco IOS software to advertise a network route without waiting for route validation from the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems. Use synchronization if routers in the autonomous system do not speak BGP.</p> |
| Redistribute iBGP into an IGP (use filtering to limit the number of prefixes that are redistributed) | (Optional) Configures iBGP redistribution into an interior gateway protocol (IGP), such as IS-IS or OSPF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Administrative Route Distances</b>                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| External                                                                                             | Specifies the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Internal                                                                                             | Specifies administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Local                                                                                                | Specifies administrative distance for local BGP routes. Local routes are those networks listed with a network router configuration command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Forward packets over Multiple Paths</b>                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Number of Paths                                                                                      | (Optional) Specify the maximum number of Border Gateway Protocol routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| iBGP Number of Paths                                                                                 | (Optional) Specify the maximum number of parallel internal Border Gateway Protocol (iBGP) routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Add/Edit Aggregate Address Dialog Box

Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

**Navigation Path**

You can access the Add/Edit Aggregate Address dialog box from the [IPv6 Family Tab](#), page 56-20. Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row (pencil)** button.

**Field Reference****Table 56-12 Add/Edit Aggregate Address Dialog Box**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aggregate Timer                  | Specify a value for the aggregate timer (in seconds). Valid values are 0 or any value between 6 and 60. This specifies the interval at which the routes will be aggregated. The default value is 30 seconds.                                                                                                                                                                                         |
| Network                          | Enter an IPv6 address, or enter or Select the desired Network/Hosts objects.                                                                                                                                                                                                                                                                                                                         |
| Attribute Map                    | (Optional) Enter or Select the route map used to set the attribute of the aggregate route.<br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , page 56-135.              |
| Advertise Map                    | (Optional) Enter or Select the route map used to select the routes to create AS_SET origin communities.<br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , page 56-135. |
| Suppress Map                     | (Optional) Enter or Select the route map used to select the routes to be suppressed.<br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , page 56-135.                    |
| Generate AS Set Path Information | Enables generation of autonomous system set path information.                                                                                                                                                                                                                                                                                                                                        |

**Table 56-12 Add/Edit Aggregate Address Dialog Box (continued)**

| Element                                      | Description                                    |
|----------------------------------------------|------------------------------------------------|
| Filter all more-specific routes from updates | Filters all more-specific routes from updates. |

## Add/Edit Neighbor Dialog Box

Use the Add/Edit Neighbor dialog box to define BGP neighbors and neighbor settings.

### Navigation Path

You can access the Add/Edit Neighbor dialog box from the [IPv6 Family Tab, page 56-20](#).

Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row (pencil)** button.

| Element                            | Description                                                                                                                                                                                                                                        |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>                     |                                                                                                                                                                                                                                                    |
| IP Address                         | Enter the BGP neighbor IPv6 address in one of the following formats: <ul style="list-style-type: none"> <li>• IPv6 address</li> <li>• &lt;IPv6 address&gt;%&lt;Interface name&gt;</li> </ul> This IPv6 address is added to the BGP neighbor table. |
| Remote AS                          | Enter the autonomous system to which the BGP neighbor belongs.                                                                                                                                                                                     |
| Enable Address Family              | (Optional) Enables communication with the BGP neighbor.                                                                                                                                                                                            |
| Shutdown neighbor administratively | (Optional) Disable a neighbor or peer group.                                                                                                                                                                                                       |
| Description                        | (Optional) Enter a description for the BGP neighbor.                                                                                                                                                                                               |
| fall-over BFD                      | (Optional) Enables BFD support for fall-over for the BGP neighbor.                                                                                                                                                                                 |
| BFD-Hop                            | (Optional) Specify if there is a single IP hop or multiple IP hops between a BFD source and destination.                                                                                                                                           |

Table 56-13 Add/Edit Neighbor Dialog Box (continued)

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filtering</b>                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Filter routes using route map                          | <p>(Optional) Enter or Select the appropriate incoming or outgoing route maps to apply a route map to incoming or outgoing routes.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a>, page 56-135.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Filter routes using a Prefix list                      | <p>(Optional) Enter or Select the appropriate incoming or outgoing prefix list to distribute BGP neighbor information.</p> <p><b>Tip</b> Click <b>Select</b> to open the Prefix List Object Selector from which you can select a prefix list object. You can also create new objects from the object Prefix List Object selector. For more information, see <a href="#">Add or Edit Prefix List Object Dialog Box</a>, page 56-149.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Filter routes using AS Path filter                     | <p>(Optional) Enter or Select the appropriate incoming or outgoing AS path filter to distribute BGP neighbor information.</p> <p><b>Tip</b> Click <b>Select</b> to open the AS Path Object Selector from which you can select an AS path object. You can also create new AS path objects from the AS Path Object Selector. For more information, see <a href="#">Add or Edit As Path Object Dialog Boxes</a>, page 56-154.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Limit the number of prefixes allowed from the neighbor | <p>(Optional) Select to control the number of prefixes that can be received from a neighbor.</p> <ul style="list-style-type: none"> <li>• Enter the maximum number of prefixes allowed from a specific neighbor in the <b>Maximum Prefixes</b> field.</li> <li>• Enter the percentage (of maximum) at which the router starts to generate a warning message in the <b>Threshold Level</b> field. Valid values are integers between 1 and 100. The default value is 75.</li> <li>• (Optional) Check the <b>Control prefixes received from the peer</b> check box to specify additional controls for the prefixes received from a peer. Do one of the following: <ul style="list-style-type: none"> <li>– Select <b>Terminate peering when prefix limit is exceeded</b> to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the Restart interval field.</li> <li>– Select <b>Give only warning message when prefix limit is exceeded</b> to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.</li> </ul> </li> </ul> |
| <b>Routes</b>                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Advertisement Interval                                 | Enter the minimum interval (in seconds) between the sending of BGP routing updates. Valid values are between 0 and 600.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Advanced</b>                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Authentication                                          | <p>(Optional) Select to enable MD5 authentication on a TCP connection between two BGP peers.</p> <ul style="list-style-type: none"> <li>Choose an encryption type from the Enable Encryption drop-down list.</li> <li>Enter a password in the Password field. Reenter the password in the Confirm field.</li> </ul> <p>The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The first character cannot be a number. The string can contain any alphanumeric characters, including spaces.</p> <p><b>Note</b> You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.</p>                                                                                                                                           |
| Send Community attribute to this neighbor                      | (Optional) Specifies that communities attributes should be sent to the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Use ASA as next hop for neighbor                               | (Optional) Select to configure the router as the next-hop for a BGP speaking neighbor or peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Disable connection verification                                | <p>(Optional) Select to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IPv6 address.</p> <p>This command is required only when the neighbor ebgp-multihop command is configured with a TTL value of 1. The address of the single-hop eBGP peer must be reachable. The neighbor update-source command must be configured to allow the BGP routing process to use the loopback interface for the peering session.</p> <p>When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.</p> |
| Allow connections with neighbor that is not directly connected | <p>Select to accept and attempt BGP connections to external peers residing on networks that are not directly connected.</p> <p>(Optional) Enter the time-to-live in the TTL hops field. Valid values are between 1 and 255.</p> <p><b>Note</b> This feature should be used only under the guidance of Cisco technical support staff. To prevent the creation of loops through oscillating routes, the multihop will not be established if the only route to the multihop peer is the default route (0.0.0.0).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit number of TTL hops to neighbor | <p>Select this option to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the TTL hops field. Valid values are between 1 and 254.</p> <p>This feature provides a lightweight security mechanism to protect BGP peering sessions from CPU utilization-based attacks. These types of attacks are typically brute force Denial of Service (DoS) attacks that attempt to disable the network by flooding the network with IP packets that contain forged source and destination IP addresses in the packet headers.</p> <p>This feature leverages designed behavior of IP packets by accepting only IP packets with a TTL count that is equal to or greater than the locally configured value. Accurately forging the TTL count in an IP packet is generally considered to be impossible. Accurately forging a packet to match the TTL count from a trusted peer is not possible without internal access to the source or destination network.</p> <p>This feature should be configured on each participating router. It secures the BGP session in the incoming direction only and has no effect on outgoing IP packets or the remote router. When this feature is enabled, BGP will establish or maintain a session only if the TTL value in the IP packet header is equal to or greater than the TTL value configured for the peering session. This feature has no effect on the BGP peering session, and the peering session can still expire if keepalive packets are not received. If the TTL value in a received packet is less than the locally configured value, the packet is silently discarded and no Internet Control Message Protocol (ICMP) message is generated. This is designed behavior; a response to a forged packet is not necessary.</p> <p>To maximize the effectiveness of this feature, the hop-count value should be strictly configured to match the number of hops between the local and external network. However, you should also take path variation into account when configuring this feature for a multihop peering session.</p> <p>The following restrictions apply to the configuration of this command:</p> <ul style="list-style-type: none"> <li>• This feature is not supported for internal BGP (iBGP) peers.</li> <li>• The effectiveness of this feature is reduced in large-diameter multihop peerings. In the event of a CPU utilization-based attack against a BGP router that is configured for large-diameter peering, you may still need to shut down the affected peering sessions to handle the attack.</li> <li>• This feature is not effective against attacks from a peer that has been compromised inside of your network. This restriction also includes peers that are on the network segment between the source and destination network.</li> </ul> |
| Use TCP Path MTU Discovery           | (Optional) Select to enable a TCP transport session for a BGP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element                                                                                                                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP transport mode                                                                                                                                                                                                                                                          | Choose the TCP connection mode from the drop-down list. Options are Default, Active, or Passive.                                                                                                                                                                             |
| Weight                                                                                                                                                                                                                                                                      | (Optional) Enter a weight for the BGP neighbor connection.                                                                                                                                                                                                                   |
| BGP Version                                                                                                                                                                                                                                                                 | Choose the BGP version that the ASA will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested. |
| <b>Migration</b>                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                              |
| <b>Note</b> This customization should only be used for AS migration, and should be removed after the transition has been completed. The procedure should be attempted only by an experienced network operator. Routing loops can be created through improper configuration. |                                                                                                                                                                                                                                                                              |
| Customize the AS number for routes received from the neighbor                                                                                                                                                                                                               | (Optional) Select to customize the AS_PATH attribute for routes received from an eBGP neighbor.                                                                                                                                                                              |
| Local AS Number                                                                                                                                                                                                                                                             | Enter the local autonomous system number. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.                                                                                                                                    |
| Do not prepend local AS number to routes received from neighbor                                                                                                                                                                                                             | (Optional) Select to prevent the local AS number from being prepended to any routes received from eBGP peer.                                                                                                                                                                 |
| Replace real AS number with local AS number in routes received from neighbor                                                                                                                                                                                                | (Optional) Select to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.                                                                |
| Accept either real AS number or local AS number in routes received from neighbor                                                                                                                                                                                            | (Optional) Configures the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.                                                                          |

## Add/Edit Network Dialog Box

Use the Add/Edit Network dialog box to define the networks to be advertised by the BGP routing process.

### Navigation Path

You can access the Add/Edit Network dialog box from the [IPv6 Family Tab](#), page 56-20.

Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row (pencil)** button.

**Table 56-14** *Add/Edit Network Dialog Box*

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefix Name | (Optional) Enter a name for the prefix and enable the DHCpv6 Prefix Delegation client. Valid values are a string not exceeding 200 characters.                                                                                                                                                                                                                                                                                                             |
| Network     | Specifies the network to be advertised by the BGP routing processes.                                                                                                                                                                                                                                                                                                                                                                                       |
| Route Map   | (Optional) Enter or Select a route map that should be examined to filter the networks to be advertised. If not specified, all networks are redistributed.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects, page 56-135</a> . |

## Add/Edit Redistribution Dialog Box

Use the Add/Edit Redistribution dialog box to define the conditions for redistributing routes from another routing domain into BGP.

### Navigation Path

You can access the Add/Edit Redistribution dialog box from the [IPv6 Family Tab, page 56-20](#).

Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row (pencil)** button.

## About EIGRP

EIGRP is an enhanced version of IGRP developed by Cisco. Unlike IGRP and RIP, EIGRP does not send out periodic route updates. EIGRP updates are sent out only when the network topology changes. Key capabilities that distinguish EIGRP from other routing protocols include fast convergence, support for variable-length subnet mask, support for partial updates, and support for multiple network layer protocols.

A router running EIGRP stores all the neighbor routing tables so that it can quickly adapt to alternate routes. If no appropriate route exists, EIGRP queries its neighbors to discover an alternate route. These queries propagate until an alternate route is found. Its support for variable-length subnet masks permits routes to be automatically summarized on a network number boundary. In addition, EIGRP can be configured to summarize on any bit boundary at any interface. EIGRP does not make periodic updates. Instead, it sends partial updates only when the metric for a route changes. Propagation of partial updates is automatically bounded so that only those routers that need the information are updated. As a result of these two capabilities, EIGRP consumes significantly less bandwidth than IGRP.

Neighbor discovery is the process that the ASA uses to dynamically learn of other routers on directly attached networks. EIGRP routers send out multicast hello packets to announce their presence on the network. When the ASA receives a hello packet from a new neighbor, it sends its topology table to the neighbor with an initialization bit set. When the neighbor receives the topology update with the initialization bit set, the neighbor sends its topology table back to the ASA.

The hello packets are sent out as multicast messages. No response is expected to a hello message. The exception to this is for statically defined neighbors. If you manually configure a neighbor, the hello messages sent to that neighbor are sent as unicast messages. Routing updates and acknowledgments are sent out as unicast messages.

Once this neighbor relationship is established, routing updates are not exchanged unless there is a change in the network topology. The neighbor relationship is maintained through the hello packets. Each hello packet received from a neighbor includes a hold time. This is the time in which the ASA can expect to receive a hello packet from that neighbor. If the ASA does not receive a hello packet from that neighbor within the hold time advertised by that neighbor, the ASA considers that neighbor to be unavailable.

The EIGRP protocol uses four key algorithm technologies, four key technologies, including neighbor discovery/recovery, Reliable Transport Protocol (RTP), and DUAL, which is important for route computations. DUAL saves all routes to a destination in the topology table, not just the least-cost route. The least-cost route is inserted into the routing table. The other routes remain in the topology table. If the main route fails, another route is chosen from the feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination. The feasibility calculation guarantees that the path is not part of a routing loop.

If a feasible successor is not found in the topology table, a route recomputation must occur. During route recomputation, DUAL queries the EIGRP neighbors for a route, who in turn query their neighbors. Routers that do not have a feasible successor for the route return an unreachable message.

During route recomputation, DUAL marks the route as active. By default, the ASA waits for three minutes to receive a response from its neighbors. If the ASA does not receive a response from a neighbor, the route is marked as stuck-in-active. All routes in the topology table that point to the unresponsive neighbor as a feasibility successor are removed.

**Note**

---

EIGRP neighbor relationships are not supported through the IPsec tunnel without a GRE tunnel.

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router ID | <p>The router ID is used to identify the originating router for external routes. If an external route is received with the local router ID, the route is discarded. To prevent this, specify a global address for the router ID. A unique value should be configured for each EIGRP router.</p> <p>On a single device, choose <b>Automatic</b> or <b>IP Address</b>. (An address field appears when you choose IP Address.)</p> <p>If you choose Automatic, the highest-level IP address on the security appliance is used as the router ID. To use a fixed router ID, choose IP Address and enter an IPv4 address in the Router ID field.</p> <p>On a device cluster, choose <b>Automatic</b> or <b>Cluster Pool</b>. (An IPv4 Pool object ID field appears when you choose Cluster Pool.)</p> <p>If you choose Cluster Pool, enter or Select the name of the IPv4 Pool object that is to supply the Router ID address. For more information, see <a href="#">Add or Edit IPv4 Pool Dialog Box, page 6-92</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Stub      | <p>You can enable, and configure the ASA as an EIGRP stub router. Stub routing decreases memory and processing requirements on the ASA. As a stub router, the ASA does not need to maintain a complete EIGRP routing table because it forwards all nonlocal traffic to a distribution router. Generally, the distribution router need not send anything more than a default route to the stub router.</p> <p>Only specified routes are propagated from the stub router to the distribution router. As a stub router, the ASA responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” When the ASA is configured as a stub, it sends a special peer information packet to all neighboring routers to report its status as a stub router. Any neighbor that receives a packet informing it of the stub status will not query the stub router for any routes, and a router that has a stub peer will not query that peer. The stub router depends on the distribution router to send the correct updates to all peers.</p> <p>To enable the ASA as an EIGRP stub routing process, choose one or more of the following EIGRP stub routing processes:</p> <ul style="list-style-type: none"> <li>• <b>Receive only</b>—Configures the EIGRP stub routing process to receive route information from the neighbor routers but does not send route information to the neighbors. If this option is selected, you cannot select any of the other stub routing options.</li> <li>• <b>Connected</b>—Advertises connected routes.</li> <li>• <b>Redistributed</b>—Advertises redistributed routes.</li> <li>• <b>Static</b>—Advertises static routes.</li> <li>• <b>Summary</b>—Advertises summary routes.</li> </ul> |

**Table 56-18** EIGRP Advanced Dialog Box (continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adjacency Changes | <p>These options specify the syslog messages sent when adjacency changes occur.</p> <ul style="list-style-type: none"> <li>Log Neighbor Changes – enables the logging of EIGRP neighbor adjacency changes. This option is selected by default.</li> <li>Log Neighbor Warnings – enables the logging of EIGRP neighbor warning messages. This option is selected by default.</li> </ul> <p>(Optional) The time interval (in seconds) between repeated neighbor warning messages. Valid values are from 1 to 65535. Repeated warnings are not logged if they occur during this interval.</p> |

## Setup Tab

Use the Setup tab on the EIGRP page to configure the networks used by the EIGRP routing process, passive interfaces, default route information, administrative distances, and default metrics.

### Navigation Path

You can access the Setup tab from the EIGRP Page; see [Configuring EIGRP, page 56-32](#) for more information.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Summary      | <p>Check this box to enable automatic route summarization. Auto summary is enabled by default for ASA versions earlier than 9.2.1 and is disabled by default for ASA 9.2(1) and later.</p> <p>When enabled, the EIGRP routing process summarizes on network number boundaries. This can cause routing problems if you have noncontiguous networks.</p> <p>For example, if you have a router with the networks 192.168.1.0, 192.168.2.0, and 192.168.3.0 connected to it, and those networks all participate in EIGRP, the EIGRP routing process creates the summary address 192.168.0.0 for those routes. If an additional router is added to the network with the networks 192.168.10.0 and 192.168.11.0, and those networks participate in EIGRP, they will also be summarized as 192.168.0.0. To prevent the possibility of traffic being routed to the wrong location, you should disable automatic route summarization on the routers creating the conflicting summary addresses.</p> |
| Networks          | <p>Enter the IP addresses of the networks to participate in the EIGRP routing process.</p> <p><b>Tip</b> You can click <b>Select</b> to select the networks from a list of network/host objects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Passive Interface | <p>You can configure one or more interfaces as passive interfaces. In EIGRP, a passive interface does not send or receive routing updates.</p> <p>By default, all interfaces are enabled for active routing (sending and receiving routing updates) when routing is enabled for that interface.</p> <p>To configure passive interfaces, do one of the following:</p> <ul style="list-style-type: none"> <li>• To enable all interfaces for active routing (sending and receiving routing updates) when routing is enabled for that interface, select <b>None</b>.</li> <li>• To configure all interfaces as passive, select <b>All Interfaces</b>.</li> <li>• To configure specific interfaces as passive, select <b>Specified Interfaces</b> and then enter or select the interfaces that you want to make passive.</li> </ul>                                                                                                                                                            |

Table 56-19 EIGRP - Setup Tab (continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Route Information | <p>You can control the sending and receiving of default route information in EIGRP updates. By default, default routes are sent and accepted. Configuring the ASA to disallow default information to be received causes the candidate default route bit to be blocked on received routes. Configuring the ASA to disallow default information to be sent disables the setting of the default route bit in advertised routes.</p> <ul style="list-style-type: none"> <li>• Accept Default Route Info—configures EIGRP to accept exterior default routing information. Optionally, you can specify a standard access list that define which networks are allowed and which are not when receiving default route information.</li> <li>• Send Default Route Info—configures EIGRP to advertise external routing information. Optionally, you can specify a standard access list that defines which networks are allowed and which are not when sending default route information.</li> </ul>                                                                                                                                                                                                                                                           |
| Administrative Distance   | <p>Because every routing protocol has metrics based on algorithms that are different from the other routing protocols, it is not always possible to determine the “best path” for two routes to the same destination that were generated by different routing protocols. Administrative distance is a route parameter that the ASA uses to select the best path when there are two or more different routes to the same destination from two different routing protocols.</p> <p>If you have more than one routing protocol running on the ASA, you can use the <code>distance eigrp</code> command to adjust the default administrative distances of routes discovered by the EIGRP routing protocol in relation to the other routing protocols.:</p> <p>Internal Distance—Administrative distance for EIGRP internal routes. Internal routes are those that are learned from another entity within the same autonomous system. Valid values are from 1 to 255. The default value is 90.</p> <p>External Distance—Administrative distance for EIGRP external routes. External routes are those for which the best path is learned from a neighbor external to the autonomous system. Valid values are from 1 to 255. The default value is 170.</p> |

**Table 56-19 EIGRP - Setup Tab (continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Metrics | <p>You can define the default metrics for routes redistributed into the EIGRP routing process:</p> <ul style="list-style-type: none"> <li>• <b>Bandwidth</b>—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• <b>Delay Time</b>—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.</li> <li>• <b>Reliability</b>—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.</li> <li>• <b>Loading</b>—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.</li> <li>• <b>MTU</b>—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.</li> </ul> |

## Filter Rules Tab

The Filter Rules tab contains the Filter Rules table which displays the route filtering rules configured for the EIGRP routing process. Filter rules let you control which routes are accepted or advertised by the EIGRP routing process.

### Navigation Path

You can access the Filter Rules tab from the EIGRP Page; see [Configuring EIGRP, page 56-32](#) for more information.

| Type    | <p>Specify the type of filter rule:</p> <ul style="list-style-type: none"> <li>(Optional) Interface—Specify the interface on which to apply the routing updates. Specifying an interface causes the access list to be applied only to routing updates for that interface. If no interface is specified, the access list will be applied to all updates.</li> <li>(Optional) Routing Protocol—For outbound EIGRP routing updates, select the routing protocol for which you want to filter: BGP, Connected, OSPF, RIP, or Static.</li> </ul> <p>Routing Protocol ID—Enter the identifier for the routing process. Applies to BGP and OSPF routing protocols.</p> |
| ACL     | Select an Access Control List that defines which networks are to be received and which are to be suppressed in routing updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Neighbors Tab

The Neighbors tab contains the Neighbors table, through which you can define static neighbors. When you manually define an EIGRP neighbor, hello packets are sent to that neighbor as unicast messages.

### Navigation Path

You can access the Neighbors tab from the EIGRP Page; see [Configuring EIGRP, page 56-32](#) for more information.

### Related Topics

### Field Reference

**Table 56-22 EIGRP - Neighbors Tab**

| Element   | Description                                            |
|-----------|--------------------------------------------------------|
| Interface | The interface through which the neighbor is available. |
| Neighbor  | The IP address of the static neighbor.                 |

## Add/Edit EIGRP Neighbor Dialog Box

EIGRP hello packets are sent as multicast packets. If an EIGRP neighbor is located across a non broadcast network, such as a tunnel, you must manually define that neighbor. When you manually define an EIGRP neighbor, hello packets are sent to that neighbor as unicast messages.

### Note

Configuring the passive-interface command for an interface suppresses all incoming and outgoing routing updates and hello messages on that interface. EIGRP neighbor adjacencies cannot be established or maintained over an interface that is configured as passive.

Use the Add/Edit EIGRP Neighbor dialog box to define a static neighbor or change information for an existing static neighbor.

### Navigation Path

You can access the Add/Edit EIGRP Neighbor dialog box from the [Neighbors Tab, page 56-41](#).

|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol    | <p>The source protocol from which the routes are being redistributed:</p> <ul style="list-style-type: none"> <li>• BGP—Redistribute routes discovered by the BGP routing process to EIGRP.</li> <li>• RIP—Redistributes routes discovered by the RIP routing process to EIGRP.</li> <li>• Static—Redistributes static routes to the EIGRP routing process. Static routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRP routing process. Connected routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• OSPF—Redistributes routes discovered by the OSPF routing process to EIGRP. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, RIP, or BGP routes.</li> </ul> |
| ID          | The autonomous system (AS) number for the BGP or OSPF routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Bandwidth   | The minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Delay Time  | The route delay in tens of microseconds. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Reliability | The likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Loading     | The effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MTU         | The smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Route Map   | The name of the route map object to apply to the redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Add/Edit EIGRP Redistribution Dialog Box

Use the Add/Edit Redistribution dialog box to add a redistribution rule or to edit an existing redistribution rule in the Redistribution table.

### Navigation Path

You can access the Add/Edit EIGRP Redistribution dialog box from the [Redistribution Tab, page 56-42](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol           | <p>Select the source protocol from which the routes are being redistributed. You can choose one of the following options:</p> <ul style="list-style-type: none"> <li>• BGP—Redistribute routes discovered by the BGP routing process to EIGRP.</li> <li>• RIP—Redistributes routes discovered by the RIP routing process to EIGRP.</li> <li>• Static—Redistributes static routes to the EIGRP routing process. Static routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRP routing process. Connected routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• OSPF—Redistributes routes discovered by the OSPF routing process to EIGRP. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, RIP, or BGP routes.</li> </ul> |
| Routing Process ID | The autonomous system (AS) number for the BGP or OSPF routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 56-25 Add/Edit EIGRP Redistribution Dialog Box (continued)

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Optional Metrics             | <p>You can define the following metrics for routes redistributed into the EIGRP routing process:</p> <ul style="list-style-type: none"> <li>• <b>Bandwidth</b>—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• <b>Delay Time</b>—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.</li> <li>• <b>Reliability</b>—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.</li> <li>• <b>Loading</b>—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.</li> <li>• <b>MTU</b>—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.</li> </ul>                                                                                  |
| Route Map                    | <p>Enter or Select a route map object to define which routes are redistributed into the EIGRP routing process.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a>, page 56-135.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Optional OSPF Redistribution | <p>If you have chosen OSPF as the Route Type, choose the conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions:</p> <ul style="list-style-type: none"> <li>• <b>Internal</b>—The route is internal to a specific AS.</li> <li>• <b>External 1</b>—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• <b>External 2</b>—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> <li>• <b>NSSA External 1</b>—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> <li>• <b>NSSA External 2</b>—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> </ul> |

## Summary Address Tab

Use the Summary Address tab to configure a summary for EIGRP on a specific interface. You can configure summary addresses on a per-interface basis. You need to manually define summary addresses if you want to create summary addresses that do not occur at a network number boundary or if you want to use summary addresses on an ASA with automatic route summarization disabled. If any more specific routes are in the routing table, EIGRP will advertise the summary address out the interface with a metric equal to the minimum of all more specific routes.

**Navigation Path**

You can access the Summary Address tab from the EIGRP Page; see [Configuring EIGRP, page 56-32](#) for more information.

|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                 | The name of the interface to which the configuration applies.                                                                                                                                                                                                                         |
| Hello Interval            | The interval, in seconds, between EIGRP hello packets sent on an interface. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                                                                               |
| Hold Time                 | The hold time advertised by the ASA in EIGRP hello packets. Valid values range from 1 to 65535 seconds. The default value is 15 seconds.                                                                                                                                              |
| Split Horizon             | Enable/disable EIGRP split-horizon on an interface.                                                                                                                                                                                                                                   |
| Delay Time                | The delay time in tens of microseconds. Valid values are from 1 to 16777215. This option is not supported for devices in multi-context mode and will be disabled.                                                                                                                     |
| Enable MD5 Authentication | Enables MD5 authentication of EIGRP packets.                                                                                                                                                                                                                                          |
| Key Type                  | Select Clear Text to indicate that the key you will be entering is in clear text. Select Encrypted to indicate that the key you will be entering is already encrypted.                                                                                                                |
| Key ID and Key            | Specify the key to authenticate EIGRP updates: <ul style="list-style-type: none"> <li>• Key ID—Enter a numerical key identifier. Valid values range from 0 to 255.</li> <li>• Key—An alphanumeric character string of up to 16 bytes.</li> <li>• Confirm—Re-enter the key.</li> </ul> |

# Configuring ISIS

The ISIS page provides nine tabbed panels for configuring ISIS (Intermediate System-to-Intermediate System) routing on a firewall device. ISIS routing protocol is supported from Security Manager version 4.11 for ASA devices running the software version 9.6(1) or later. The following topics provide detailed information about enabling and configuring ISIS:

## Navigation Path

- (Device view) Select **Platform > Routing > ISIS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > ISIS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

Select Enable ISIS to enable Intermediate System-to-Intermediate System routing protocol on the selected ASA device.

## About ISIS

Intermediate System-to-Intermediate System (ISIS) routing protocol is a link-state Interior Gateway Protocol (IGP). Link-state protocols are characterized by the propagation of the information required to build a complete network connectivity map on each participating router. That map is then used to calculate the shortest path to destinations. The IOS ISIS implementation supports CLNP, IPv4, and IPv6.

A routing domain may be divided into one or more sub-domains. Each sub-domain is referred to as an area and is assigned an area address. Routing within an area is referred to as Level-1 routing. Routing between Level-1 areas is referred to as Level-2 routing. A router in OSI terminology is referred to as an Intermediate System (IS). An IS may operate at Level 1, Level 2, or both. ISs that operate at Level 1 exchange routing information with other Level-1 ISs in the same area. ISs that operate at Level 2 exchange routing information with other Level-2 routers regardless of whether they are in the same Level-1 area. The set of Level-2 routers and the links that interconnect them form the Level-2 sub-domain, which must not be partitioned in order for routing to work properly.

## General Tab

### Field Reference

**Table 56-30** *ISIS General Tab*

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shutdown Protocol         | To enable or disable ISIS protocol on an interface so that it cannot form any adjacency on any interface and will clear the ISIS link-state packet (LSP) database.                                                                                                                                                                                                                                                                                                   |
| Use Dynamic Hostname      | To enable or disable ISIS dynamic hostname capability on the router.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Do not pad LAN Hello PDUs | Check this box to prevent ISIS from padding LAN hello PDUs. ISIS hellos are padded to the full maximum transmission unit (MTU) size. This allows for early detection of errors that result from transmission problems with large frames or errors that result from mismatched MTUs on adjacent interfaces. You can disable hello padding to avoid wasting network bandwidth in case the MTU of both interfaces is the same or in the case of translational bridging. |

**Table 56-30** *ISIS General Tab (continued)*

| <b>Element</b>                             | <b>Description</b>                                                                                                                                                                                              |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advertise Passive Only                     | To configure ISIS to advertise only prefixes that belong to passive interfaces. It excludes IP prefixes of connected networks from link-state packet (LSP) advertisements, which reduces ISIS convergence time. |
| Act as                                     | Choose whether to have your ASA act as station router, an area router, or both by clicking the appropriate radio button.                                                                                        |
| Topology Priority                          | To configure the priority of designated routers. Enter a value between 0 to 127. The default value is 64.                                                                                                       |
| Route Priority Tag                         | Enter a tag that indicates the ASA device's route priority.                                                                                                                                                     |
| Conditionally Advertise as L2              | Click ... to select from the available Route Map objects.                                                                                                                                                       |
| Adjacency                                  |                                                                                                                                                                                                                 |
| Log Changes in Adjacency                   | To configure the ASA to send a syslog message when an ISIS neighbor goes up or down.                                                                                                                            |
| Include changes generated by non IIH event | To enable logging of adjacency changes including changes generated by non-IIH events.                                                                                                                           |

## IPv4 Family Tab

The IPv4 Family Tab has three tabbed panels for configuring IPv4 ISIS.

### IPv4 Family Tab—General Tab

#### Field Reference

**Table 56-31** *ISIS IPv4 Family Tab—General Tab*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Perform Adjacency Check      | Check the ‘Perform adjacency check’ check box for the router to check on nearby IS routers.                                                                                                                                                                                                                                                                                                                                                                                |
| Distance                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Administrative Distance      | In the Administrative Distance field, enter a distance assigned to routes discovered by IS-IS protocol. Administrative distance is a parameter used to compare routes among different routing protocols. In general, the higher the value, the lower the trust rating. And administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. The range is 1 to 255. The default is 115.                             |
| Maximum No. of Forward Paths | Enter the maximum number of IS routes that can be installed in a routing table. The range is 1 to 8, the default is 4.                                                                                                                                                                                                                                                                                                                                                     |
| Distribute Default Route     | Check the Distribute default route check box to configure an IS routing process to distribute a default route, and then choose the default route from the Route Map Object selector.                                                                                                                                                                                                                                                                                       |
| ISIS Metrics                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Global ISIS Metric Level 1   | <p>Enter a number specifying the metric.</p> <p>The range depends on the TLV Style that you select. The default is 10.</p> <ul style="list-style-type: none"> <li>• If you select Use old style of TLVs with narrow metric, the range is 1 to 63.</li> <li>• If you select Use new style of TLVs to carry wider metric, the range is 1 to 16777214.</li> <li>• If you select Send and accept both styles of TLVs during transition, the range is 1 to 16777214.</li> </ul> |
| Global ISIS Metric Level 2   | <p>Enter a number specifying the metric.</p> <p>The range depends on the TLV Style that you select. The default is 10.</p> <ul style="list-style-type: none"> <li>• If you select Use old style of TLVs with narrow metric, the range is 1 to 63.</li> <li>• If you select Use new style of TLVs to carry wider metric, the range is 1 to 16777214.</li> <li>• If you select Send and accept both styles of TLVs during transition, the range is 1 to 16777214.</li> </ul> |

| Element                                      | Description                                                                                                                                                                                                                                                          |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TLV Style                                    | Select one of the following Type, Length, and Values: <ul style="list-style-type: none"> <li>Use old style of TLVs with narrow metric</li> <li>Use new style of TLVs to carry wider metric</li> <li>Send and accept both styles of TLVs during transition</li> </ul> |
| Accept both styles of TLVs during transition | If you selected one of the first two options in TLV Style, you can select this option,                                                                                                                                                                               |
| Apply metric style to                        | Select one of the following: <ul style="list-style-type: none"> <li>Level 1</li> <li>Level 2</li> <li>Both</li> </ul> <p>The default is Level 1.</p>                                                                                                                 |

## IPv4 Family Tab—SPF Tab

### Field Reference

**Table 56-32** *ISIS IPv4 FamilyTab—SPF Tab*

| Element                                                                                      | Description                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shortest Path First                                                                          |                                                                                                                                                                                                                                                                                                                 |
| Honour external metrics during SPF calculations                                              | Check this check box to have the SPF calculations include external metrics.                                                                                                                                                                                                                                     |
| Signal other routers to not use this router as an intermediate hop in their SPF calculations | Check this check box if you want to exclude this device, and configure the following:                                                                                                                                                                                                                           |
| Specify on-startup behavior                                                                  | If you select this element you must choose one of the following options: <ul style="list-style-type: none"> <li>Advertise overself as overloaded until BGP has converged</li> <li>Specify time to advertise overself as overloaded after reboot—Specify the time in the range of 5 to 86400 seconds.</li> </ul> |
| Don't advertise IP prefixes learned from other protocols when overload bit is set            | Check this check box to exclude IP prefixes.                                                                                                                                                                                                                                                                    |
| Don't advertise IP prefixes learned from another ISIS level when overload bit is set         | Check this check box to exclude IP prefixes.                                                                                                                                                                                                                                                                    |
| Minimum interval between partial route calculations                                          |                                                                                                                                                                                                                                                                                                                 |
| PRC Interval                                                                                 | Enter an amount of time for the router to wait between partial route calculations (PRCs). The range is 1 to 120 seconds. The default is 5 seconds.                                                                                                                                                              |

**Table 56-32** *ISIS IPv4 Family Tab—SPF Tab (continued)*

| Element                                               | Description                                                                                                                                                                   |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial wait for PRC                                  | Enter the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 120.000 milliseconds. The default is 2000 milliseconds.                  |
| Minimum wait between first and second PRC             | Enter the amount of time in milliseconds that you want the router to wait between PRCs. The range is 1 to 120,000 milliseconds. The default is 5000 milliseconds.             |
| Minimum interval between SPF calculations             |                                                                                                                                                                               |
| Configure parameters for level 1                      |                                                                                                                                                                               |
| SPF calculation interval                              | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                            |
| Initial wait for SPF calculation                      | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120.000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |
| Configure parameters for level 2                      |                                                                                                                                                                               |
| SPF calculation interval                              | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                            |
| Initial wait for SPF calculation                      | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120.000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |

## IPv4 Family Tab—Redistribution Tab

Use the Add/Edit button to add a new Redistribution route or edit an existing row.

### Field Reference

**Table 56-33** *ISIS IPv4 Family Tab—Redistribution Tab*

| Element         | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Protocol | From the Source Protocol drop-down list, choose the protocol (BGP, Connected, EIGRP, OSPF, RIP, or Static) from which you want to redistribute routes into the ISIS domain. |
| Process ID      | Enter the Process ID for the source protocol.                                                                                                                               |
| Route Level     | From the Route Level drop-down list, choose Level-1, Level- 2, or Level 1-2.                                                                                                |
| Metric          | In the Metric field, enter a metric for the redistributed route. The range is 1 to 4294967295.                                                                              |

**Table 56-33** *ISIS IPv4 Family Tab—Redistribution Tab (continued)*

| <b>Element</b>               | <b>Description</b>                                                                                                                                                                           |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metric Type                  | For the Metric Type, click the internal or external radio button.                                                                                                                            |
| ISIS Inter Area Route Levels |                                                                                                                                                                                              |
| Source ISIS Level            | Select Level 1 or Level 2. The default is Level 1.                                                                                                                                           |
| Destination ISIS Level       | Select Level 1 or Level 2. The default is Level 1.                                                                                                                                           |
| Distribution List            | Select from the available Access Control List or add new.                                                                                                                                    |
| Route Map                    | Choose a route map from the Route Map Object selector that should be examined to filter the networks to be redistributed, or click Add to add a new route map or edit an existing route map. |
| Match                        | Check one or more of the Match check boxes -Internal, External 1, External 2, NSSA External 1, and NSSA External 2 check boxes to redistribute routes from an OSPF network.                  |

## IPv6 Family Tab

The IPv6 Family Tab has three tabbed panels for configuring ISIS for IPv6 addresses.

Check the Enable IPv6 Family checkbox if you want to enable IPv6 for ISIS.

### IPv6 Family Tab—General Tab

#### Field Reference

**Table 56-34** *ISIS IPv6 Family Tab—General Tab*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Perform Adjacency Check      | Check the 'Perform adjacency check' check box for the router to check on nearby IS routers.                                                                                                                                                                                                                                                                                                                                                   |
| Distance                     |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Administrative Distance      | In the Administrative Distance field, enter a distance assigned to routes discovered by ISIS protocol. Administrative distance is a parameter used to compare routes among different routing protocols. In general, the higher the value, the lower the trust rating. And administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. The range is 1 to 255. The default is 115. |
| Maximum No. of Forward Paths | Enter the maximum number of IS routes that can be installed in a routing table. The range is 1 to 8. The default is 4.                                                                                                                                                                                                                                                                                                                        |
| Distribute Default Route     | Check the Distribute default route check box to configure an IS routing process to distribute a default route, and then choose the default route from the Route Map Object selector.                                                                                                                                                                                                                                                          |

### IPv6 Family Tab—SPF Tab

#### Field Reference

**Table 56-35** *ISIS IPv6 Family Tab—SPF Tab*

| Element                                                                                      | Description                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shortest Path First                                                                          |                                                                                                                                                                                                                                                                                                               |
| Signal other routers to not use this router as an intermediate hop in their SPF calculations | Check this check box if you want to exclude this device, and configure the following:                                                                                                                                                                                                                         |
| Specify on-startup behavior                                                                  | If you select this element you must choose one of the following options: <ul style="list-style-type: none"> <li>Advertise oneself as overloaded until BGP has converged</li> <li>Specify time to advertise oneself as overloaded after reboot—Specify the time in the range of 5 to 86400 seconds.</li> </ul> |

**Table 56-35** *ISIS IPv6 FamilyTab—SPF Tab (continued)*

| Element                                                                              | Description                                                                                                                                                                   |
|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Don't advertise IP prefixes learned from other protocols when overload bit is set    | Check this check box to exclude IP prefixes.                                                                                                                                  |
| Don't advertise IP prefixes learned from another ISIS level when overload bit is set | Check this check box to exclude IP prefixes.                                                                                                                                  |
| Minimum interval between partial route calculations                                  |                                                                                                                                                                               |
| PRC Interval                                                                         | Enter an amount of time for the router to wait between partial route calculations (PRCs). The range is 1 to 120 seconds. The default is 5 seconds.                            |
| Initial wait for PRC                                                                 | Enter the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 120.000 milliseconds. The default is 2000 milliseconds.                  |
| Minimum wait between first and second PRC                                            | Enter the amount of time in milliseconds that you want the router to wait between PRCs. The range is 1 to 120,000 milliseconds. The default is 5000 milliseconds.             |
| Minimum interval between SPF calculations                                            |                                                                                                                                                                               |
| Configure parameters for level 1                                                     |                                                                                                                                                                               |
| SPF calculation interval                                                             | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                            |
| Initial wait for SPF calculation                                                     | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120.000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation                                | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |
| Configure parameters for level 2                                                     |                                                                                                                                                                               |
| SPF calculation interval                                                             | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                            |
| Initial wait for SPF calculation                                                     | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120.000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation                                | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |

## IPv6 Family Tab—Redistribution Tab

Use the Add/Edit button to add or edit Redistribution routes.

### Field Reference

**Table 56-36** *ISIS IPv6 Family Tab—Redistribution Tab*

| Element                      | Description                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Protocol              | From the Source Protocol drop-down list, choose the protocol (BGP, Connected, EIGRP, OSPF, RIP, or Static) from which you want to redistribute routes into the ISIS domain.                  |
| Process ID                   | Enter the Process ID for the source protocol.                                                                                                                                                |
| Route Level                  | From the Route Level drop-down list, choose Level-1, Level- 2, or Level 1-2.                                                                                                                 |
| Metric                       | In the Metric field, enter a metric for the redistributed route. The range is 1 to 4294967295.                                                                                               |
| Metric Type                  | For the Metric Type, click the internal or external radio button.                                                                                                                            |
| ISIS Inter Area Route Levels |                                                                                                                                                                                              |
| Source ISIS Level            | Select Level 1 or Level 2. The default is Level 1.                                                                                                                                           |
| Destination ISIS Level       | Select Level 1 or Level 2. The default is Level 1.                                                                                                                                           |
| Distribution List            | Select from the available Access Control List or add new.                                                                                                                                    |
| Route Map                    | Choose a route map from the Route Map Object selector that should be examined to filter the networks to be redistributed, or click Add to add a new route map or edit an existing route map. |
| Match                        | Check one or more of the Match check boxes -Internal, External 1, External 2, NSSA External 1, and NSSA External 2 check boxes to redistribute routes from an OSPF network.                  |

## IPv6 Family Tab—Summary Prefix

You must configure at least one Network Entity Title entry to proceed.

See [Network Entity Title Tab, page 56-61](#) for more information.

Use the Add/Edit button to add or edit Summary Prefix.

**Table 56-37** *ISIS IPv6 Family Tab—Summary Prefix Tab*

| Element             | Description                              |
|---------------------|------------------------------------------|
| IPv6 Summary Prefix | IPv6 prefix in the form X.X.X.X::X/0-128 |

**Table 56-37** *ISIS IPv6 Family Tab—Summary Prefix Tab (continued)*

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Apply Summary Prefix into | <p>Select Level 1, Level 2, or Both.</p> <p>Level 1: Only routes redistributed into Level 1 are summarized with the configured address and mask value.</p> <p>Level 2: Routes learned by Level 1 routing are summarized into the Level 2 backbone with the configured address and mask value. Redistributed routes into Level 2 ISIS are also summarized.</p> <p>Both: Summary routes are applied when redistributing routes into Level 1 and Level2 ISIS and when Level 2 ISIS advertises Level 1 routes as reachable in it area.</p> |

## Authentication Tab

### Field Reference

**Table 56-38** *ISIS Authentication Tab*

| Element                                        | Description                                                                                       |
|------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Configure authentication parameter for level 1 |                                                                                                   |
| Type                                           | Select a Type from the drop-down list.                                                            |
| Key                                            | Enter the key to authenticate ISIS updates. The key can include up to 16 characters.              |
| Confirm                                        | Confirm the key.                                                                                  |
| Send only                                      | Click Enable or Disable depending on whether you want Send Only enabled.                          |
| Mode                                           | Choose the authentication mode by clicking either the Disabled, MD5, or Clear Text radio buttons. |
| Area password                                  | Enter the Area password and confirm the same in the next textbox.                                 |
| Configure authentication parameter for level 2 |                                                                                                   |
| Type                                           | Select a Type from the drop-down list.                                                            |
| Key                                            | Enter the key to authenticate ISIS updates. The key can include up to 16 characters.              |
| Confirm                                        | Confirm the key.                                                                                  |
| Send only                                      | Click Enable or Disable depending on whether you want Send Only enabled.                          |
| Mode                                           | Choose the authentication mode by clicking either the Disabled, MD5, or Clear Text radio buttons. |
| Domain password                                | Enter the Domain password and confirm the same.                                                   |

## Link State Packet Tab

### Field Reference

**Table 56-39** *ISIS Link State Packet Tab*

| Element                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ignore LSP Errors                                                                         | Check the Ignore LSP Errors check box to allow the ASA to ignore LSP packets that are received with internal checksum errors rather than purging the LSPs.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Flood LSPs before running SPF                                                             | <p>Check this box to fast-flood and fill LSPs before running SPF. If you select this option, enter the number of LSPs to be flooded in the range of 1 to 15.</p> <p>This parameter sends a specified number of LSPs from the ASA. If no LSP number is specified, the default of 5 is used. The LSPs invoke SPF before running SPF. Cisco recommends that you enable fast flooding, because then you speed up the LSP flooding process, which improves overall network convergence time. The default value is 5.</p>                                                          |
| Suppress IP prefixes                                                                      | <p>To suppress IP prefixes, check the Suppress IP prefixes check box, and then check one of the following.</p> <p>In networks where there is no limit placed on the number of redistributed routes into IS-IS, it is possible that the LSP can become full and routes will be dropped. Use these options to control which routes are suppressed when the PDU becomes full.</p>                                                                                                                                                                                               |
| Don't advertise IP prefixes learned from another ISIS level when ran out of LSP fragments | Suppresses any routes coming from another level. For example, if the Level-2 LSP becomes full, routes from Level 1 are suppressed.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Don't advertise IP prefixes learned from other protocols when ran out of LSP fragments    | Suppresses any redistributed routes on the ASA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP General Interval                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP Interval Parameters for level 1                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP Calculation Interval                                                                  | <p>Enter the interval of time in seconds between transmission of each LSP. The range is 1-120 seconds. The default is 5.</p> <p>The number should be greater than the expected round-trip delay between any two ASAs on the attached network. The number should be conservative or needless transmission results. Retransmissions occur only when LSPs are dropped. So setting the number to a higher value has little effect on reconvergence. The more neighbors the ASAs have, and the more paths over which LSPs can be flooded, the higher you can make this value.</p> |
| Initial wait for LSP calculation                                                          | Enter the time in milliseconds specifying the initial wait time before the first LSP is generated. The range is 1 to 120,000. The default is 50.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Minimum wait between first and second                                                     | Enter the time in milliseconds between the first and second LSP generation. The range is 1 to 120,000. The default is 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LSP Interval Parameters for level 2    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Use level 1 parameter also for level 2 | If you want the values you configured for Level 1 to also apply to Level 2, check the Use level 1 parameters also for level 2 check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP Calculation Interval               | <p>Enter the interval of time in seconds between transmission of each LSP. The range is 1-120 seconds. The default is 5.</p> <p>The number should be greater than the expected round-trip delay between any two ASAs on the attached network. The number should be conservative or needless transmission results. Retransmissions occur only when LSPs are dropped. So setting the number to a higher value has little effect on reconvergence. The more neighbors the ASAs have, and the more paths over which LSPs can be flooded, the higher you can make this value.</p>                                                                                                                                                                                                                          |
| Initial wait for LSP calculation       | Enter the time in milliseconds specifying the initial wait time before the first LSP is generated. The range is 1 to 120,000. The default is 50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Minimum wait between first and second  | Enter the time in milliseconds between the first and second LSP generation. The range is 1 to 120,000. The default is 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Maximum LSP size                       | In the Maximum LSP size field, enter the number of seconds. The range is 128 to 4352. The default is 1492.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LSP refresh interval                   | <p>In the LSP refresh interval field, enter the number of seconds at which LSPs are refreshed. The range is 1 to 65535. The default is 900.</p> <p>The refresh interval determines the rate at which the software periodically transmits in LSPs the route topology information that it originates. This is done to keep the database information from becoming too old.</p> <p>Reducing the refresh interval reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. (This is an extremely unlikely event, however, because there are other safeguards against corruption.) Increasing the interval reduces the link utilization caused by the flooding of refreshed packets (although this utilization is very small).</p> |
| Maximum LSP lifetime                   | <p>In the Maximum LSP lifetime field, enter the maximum number of seconds that LSPs can remain in a router's database without being refreshed. The range is 1 to 65535. The default is 1200 (20 minutes).</p> <p>You might need to adjust this parameter if you change the LSP refresh interval. LSPs must be periodically refreshed before their lifetimes expire. The value set for LSP refresh interval should be less than the value set for the maximum LSP lifetime; otherwise LSPs will time out before they are refreshed. If you make the LSP lifetime too low compared to the LSP refresh interval, the LSP refresh interval is automatically reduced to prevent the LSPs from timing out.</p>                                                                                              |

## Summary Address Tab

Use the Add/Edit button to add or edit Summary Addresses.

**Field Reference****Table 56-40** *ISIS Summary Address Tab*

| Element      | Description                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| IP address   | Enter the IP address of the summary route.                                                                                                   |
| Net Mask     | Choose or enter the network mask to apply to the IP address.                                                                                 |
| Select level | Select the Level 1, Level 2, or Level 1 and 2 radio button depending on which levels you want to receive summary addresses.                  |
| Tag          | In the Tag field, enter a number for the tag. The range is from 1 to 4294967295.                                                             |
| Metric       | In the Metric field, enter the metric that will be applied to the summary route. The range is from 1 to 4294967295. The default value is 10. |

## Network Entity Title Tab

Use the Add/Edit button to add to edit Network Entity Title.

**Field Reference****Table 56-41** *ISIS Network Entity Title Tab*

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network Entity Title (NET) | Enter a value in the address format 48.0000.1111.2222.00. The total length of NET address must be between 16 and 40 characters.                                                                                                                                                                                                                                                                                                        |
| NET Pool                   | Click Select to open the NET Pool Object Selector dialog box. You can add and edit NET Pool Objects using this dialog box. For more information about how to add or edit NET Pool Objects, see <a href="#">Add or Edit NET Pool Object Dialog Box, page 6-95</a> .<br><br>The NET Pool is applicable only for cluster devices in individual mode. Network Entity Title (NET) is not applicable for cluster devices in individual mode. |
| Maximum allowed NET        | Enter a NET value in the range of 3 to 254. The default value is 3.                                                                                                                                                                                                                                                                                                                                                                    |

| Element                            | Description                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                          | Select the interface from available interfaces.                                                                                                                                                                                                                                                                         |
| Shutdown ISIS on this interface    | Shutdown ISIS on this interface—Lets you disable the IS-IS protocol for this interface without removing the configuration parameters. The IS-IS protocol will not form any adjacencies on this interface and the IP address of this interface will be put into the LSP that is generated by the ASA.                    |
| Enable ISIS on this interface      | Enables IS-IS protocol on the selected interface.                                                                                                                                                                                                                                                                       |
| Enable IPv6 ISIS on this interface | Enables IPv6 IS-IS routing on the selected interface.                                                                                                                                                                                                                                                                   |
| Priority for level 1               | Lets you set a priority for Level 1. The priority is used to determine which router on a LAN will be the designated router or Designated Intermediate System (DIS). The priorities are advertised in the hello packets. The router with the highest priority becomes the DIS. The range is 0 to 127. The default is 64. |
| Priority for level 2               | Lets you set a priority for Level 2. The priority is used to determine which router on a LAN will be the designated router or Designated Intermediate System (DIS). The priorities are advertised in the hello packets. The router with the highest priority becomes the DIS. The range is 0 to 127. The default is 64. |
| Tag                                | Sets a tag on the IP address configured for an interface when this IP prefix is put into an ISIS LSP.                                                                                                                                                                                                                   |
| CSNP Interval for level 1          | Sets the Complete Sequence Number PDUs (CSNPs) interval in seconds between transmission of CSNPs on multiaccess networks for Level 1. This interval only applies for the designated router. The range is from 0 to 65535. The default is 10 seconds.                                                                    |
| CSNP Interval for level 2          | Sets the Complete Sequence Number PDUs (CSNPs) interval in seconds between transmission of CSNPs on multiaccess networks for Level 2. This interval only applies for the designated router. The range is from 0 to 65535. The default is 10 seconds.                                                                    |
| Adjacency filter                   | Filters the establishment of IS-IS adjacencies.                                                                                                                                                                                                                                                                         |
| Match all area addresses           | All NSAP addresses must match the filter to accept the adjacency.<br>If not specified (the default), only one address must match the filter for the adjacency to be accepted.                                                                                                                                           |

## Interface Tab—Authentication Tab

### Field Reference

**Table 56-43** *ISIS Interfaces Tab—Authentication Tab*

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level 1 parameters |                                                                                                                                                                                                                                                                                                                                                                                                          |
| Key Type           | Select Clear Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                                          |
| Key                | <p>Enter the key to authenticate IS-IS updates. The range is 0 to 8 characters.</p> <p>If no password is configured with the Key option, no key authentication is performed.</p> <p><b>Note</b> If you selected Key Type as Clear Text, you can enter a maximum of 17 characters in the Key field. If you selected Key Type as Encrypted, you can enter a maximum of 50 characters in the Key field.</p> |
| Send only          | <p>For Send only click the Enable or Disable radio button.</p> <p>Choosing Send only causes the system only to insert the password into the SNPs, but not check the password in SNPs that it receives. Use this keyword during a software upgrade to ease the transition. The default is disabled.</p>                                                                                                   |
| Mode               | Choose the authentication mode by checking the Mode check box and then choosing MD5 or Text from the drop-down list.                                                                                                                                                                                                                                                                                     |
| Password           | <p>Enter a password.</p> <p><b>Note</b> You can select either Mode or enter a password value.</p>                                                                                                                                                                                                                                                                                                        |
| Level 2 parameters |                                                                                                                                                                                                                                                                                                                                                                                                          |
| Key Type           | Select Clear Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                                          |
| Key                | <p>Enter the key to authenticate IS-IS updates. The range is 0 to 8 characters.</p> <p>If no password is configured with the Key option, no key authentication is performed.</p> <p><b>Note</b> If you selected Key Type as Clear Text, you can enter a maximum of 17 characters in the Key field. If you selected Key Type as Encrypted, you can enter a maximum of 50 characters in the Key field.</p> |
| Send only          | <p>For Send only click the Enable or Disable radio button.</p> <p>Choosing Send only causes the system only to insert the password into the SNPs, but not check the password in SNPs that it receives. Use this keyword during a software upgrade to ease the transition. The default is disabled.</p>                                                                                                   |
| Mode               | Choose the authentication mode by checking the Mode check box and then choosing MD5 or Text from the drop-down list.                                                                                                                                                                                                                                                                                     |
| Password           | <p>Enter a password.</p> <p><b>Note</b> You can select either Mode or enter a password value.</p>                                                                                                                                                                                                                                                                                                        |

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hello Padding                         | <p>Enables Hello Padding.</p> <p>IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS hellos to the full MTU allows for early detection of errors that result from transmission problems with large frames or errors that result from mismatched MTUs on adjacent interfaces.</p>                                                                                                                                                                                                                                                                                               |
| Minimal holdtime 1 second for level 1 | Enables the holdtime (in seconds) that the LSP remains valid for Level 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Hello interval for level 1            | Specifies the length of time in seconds between hello packets for Level 1. The range is 1 to 65535. The default is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Minimal holdtime 1 second for level 2 | Enables the holdtime (in seconds) that the LSP remains valid for Level 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Hello interval for level 2            | Specifies the length of time in seconds between hello packets for Level 2. The range is 1 to 65535. The default is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Hello multiplier for level 1          | <p>Specifies the number of IS-IS hello packets a neighbor must miss before the ASA declares the adjacency is down for Level 1.</p> <p>The advertised hold time in IS-IS hello packets will be set to the hello multiplier times the hello interval. Neighbors will declare an adjacency to this router down after not having received any IS-IS hello packets during the advertised hold time. The hold time (and thus the hello multiplier and the hello interval) can be set on a per-interface basis, and can be different between different routers in one area. The range is 3 to 1000. The default is 3.</p> |
| Hello multiplier for level 2          | <p>Specifies the number of IS-IS hello packets a neighbor must miss before the ASA declares the adjacency is down for Level 2.</p> <p>The advertised hold time in IS-IS hello packets will be set to the hello multiplier times the hello interval. Neighbors will declare an adjacency to this router down after not having received any IS-IS hello packets during the advertised hold time. The hold time (and thus the hello multiplier and the hello interval) can be set on a per-interface basis, and can be different between different routers in one area. The range is 3 to 1000. The default is 3.</p> |
| Configure Circuit Type                | Specifies whether the interface is configured for local routing (level 1), area routing (Level 2), or both local and area routing (Level 1-2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Interface Tab—LSP Settings Tab

### Field Reference

**Table 56-45** *ISIS Interfaces Tab—LSP Settings Tab*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advertise ISIS Prefix        | <p>Allows the advertising of IP prefixes of connected networks in the LSP advertisements per IS-IS interface.</p> <p>Disabling this option is an IS-IS mechanism to exclude IP prefixed of connected network from LSP advertisements thereby reducing IS-IS convergence time.</p>                                                                                                                                                      |
| Retransmit Interval          | <p>Specifies the amount of time in seconds between retransmission of each IS-IS LSP on a point-to-point link.</p> <p>The number should be greater than the expected round-trip delay between any two routers on the attached network. The range is 0 to 65535. The default is 5.</p>                                                                                                                                                   |
| Retransmit Throttle Interval | <p>Specifies the amount of time in milliseconds between retransmissions on each IS-IS LSP on a point-to-point interface.</p> <p>This option may be useful in very large networks with many LSPs and many interfaces as a way of controlling LSP retransmission traffic. This option controls the rate at which LSPs can be re-sent on the interface. The range is 0 to 65535. The default is 33.</p>                                   |
| LSP Interval                 | <p>Specifies the time delay in millisecond between successive IS-IS LSP transmissions.</p> <p>In topologies with a large number of IS-IS neighbors and interfaces, a router may have difficulty with the CPU load imposed by LSP transmission and reception. This option allows the LSP transmission rate (and by implication the reception rate of other systems) to be reduced. The range is 1 to 4294967295. The default is 33.</p> |

## Interface Tab—Metrics Tab

## Configuring BFD Routing

The BFD page provides two tabs for configuring BFD (Bidirectional Forwarding Detection) routing on a firewall device. The following topics provide detailed information on configuring BFD.

### Navigation Path

- (Device view) Select **Platform > Routing > BFD** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > BFD** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [Add/ Edit BFD Map Dialog Box, page 56-72](#)
- [Add/ Edit BFD Interface Dialog Box, page 56-73](#)

## About BFD

Bidirectional Forwarding Detection (BFD) is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. BFD operates in a unicast, point-to-point mode on top of any data protocol being forwarded between two systems. Packets are carried in the payload of the encapsulating protocol appropriate for the media and the network.

BFD provides a consistent failure detection method for network administrators in addition to fast forwarding path failure detection. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol hello mechanisms, network profiling and planning are easier and convergence time is consistent and predictable.

## BFD Asynchronous Mode and Echo Function

BFD can operate in asynchronous mode with or without the echo function enabled.

### Asynchronous Mode

In asynchronous mode, the systems periodically send BFD control packets to one another, and if a number of those packets in a row are not received by the other system, the session is declared to be down. Pure asynchronous mode (without the Echo function) is useful because it requires half as many packets to achieve a particular detection time as the Echo function requires.

### BFD Echo Function

The BFD echo function sends echo packets from the forwarding engine to the directly-connected single-hop BFD neighbor. The echo packets are sent by the forwarding engine and forwarded back along the same path to perform detection. The BFD session at the other end does not participate in the actual forwarding of the echo packets. Because the echo function and the forwarding engine are responsible for the detection process, the number of BFD control packets that are sent out between BFD neighbors is reduced. And also because the forwarding engine is testing the forwarding path on the remote neighbor system without involving the remote system, the inter-packet delay variance is improved. This results in quicker failure detection times.

When the echo function is enabled, BFD can use the slow timer to slow down the asynchronous session and reduce the number of BFD control packets that are sent between BFD neighbors, which reduces processing overhead while at the same time delivering faster failure detection.

**Note**

---

The echo function is not supported for IPv4 multi-hop or IPv6 single-hop BFD neighbors.

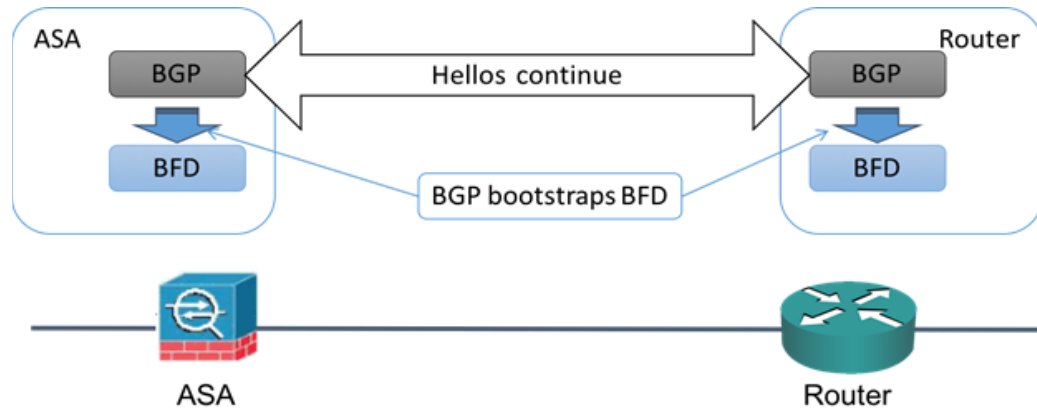

---

You can enable BFD at the interface and routing protocol levels. You must configure BFD on both systems (BFD peers). After you enable BFD on the interfaces and at the router level for the appropriate routing protocols, a BFD session is created, BFD timers are negotiated, and the BFD peers begin to send BFD control packets to each other at the negotiated level.

## BFD Session Establishment

The following example shows the ASA and a neighboring router running Border Gateway Protocol (BGP). At the time when both devices come up, there is no BFD session established between them.

Figure 56-1 BFD Session Initiated

After BGP identifies its BGP neighbor, it bootstraps the BFD process with the IP address of the neighbor. BFD does not discover its peers dynamically. It relies on the configured routing protocols to tell it which IP addresses to use and which peer relationships to form.

The BFD on the router and the BFD on the ASA form a BFD control packet and start sending the packets to each other at a one-second interval until the BFD session is established. The initial control packets from either system are very similar, for example, the Vers, Diag, H, D, P, and F bits are all set to zero, and the State is set to Down. The My Discriminator field is set to a value that is unique on the transmitting device. The Your Discriminator field is set to zero because the BFD session has not yet been established. The TX and RX timers are set to the values found in the configuration of the device.

After the remote BFD device receives a BFD control packet during the session initiation phase, it copies the value of the My Discriminator field into its own Your Discriminator field and the transition from Down state to Init state and then eventually to Up state occurs. Once both systems see their own Discriminators in each other's control packets, the session is officially established.

The following illustration shows the established BFD connection.

Figure 56-2 BFD Session Established

## BFD Timer Negotiation

BFD devices must negotiate the BFD timers to control and synchronize the send rate of BFD control packets.

A device needs to ensure the following before it can negotiate a BFD timer:

- That its peer device saw the packet containing the proposed timers of the local device
- That it never sends BFD control packets faster than the peer is configured to receive them
- That the peer never sends BFD control packets faster than the local system is configured to receive them

The setting of the Your Discriminator field and the H bit are sufficient to let the local device that the remote device has seen its packets during the initial timer exchange. After receiving a BFD control packet, each system takes the Required Min RX Interval and compares it to its own Desired Min TX Interval, and then takes the greater (slower) of the two values and uses it as the transmission rate for its BFD packets. The slower of the two systems determines the transmission rate.

When these timers have been negotiated, they can be renegotiated at any time during the session without causing a session reset. The device that changes its timers sets the P bit on all subsequent BFD control packets until it receives a BFD control packet with the F bit set from the remote system. This exchange of bits guards against packets that might otherwise be lost in transit.

### Note

The setting of the F bit by the remote system does not mean that it accepts the newly proposed timers. It indicates that the remote system has seen the packets in which the timers were changed.

## BFD Failure Detection

When the BFD session and timers have been negotiated, the BFD peers send BFD control packets to each other at the negotiated interval. These control packets act as a heartbeat that is very similar to IGP Hello protocol except that the rate is more accelerated.

As long as each BFD peer receives a BFD control packet within the configured detection interval (Required Minimum RX Interval), the BFD session stays up and any routing protocol associated with BFD maintains its adjacencies. If a BFD peer does not receive a control packet within this interval, it

informs any clients participating in that BFD session about the failure. The routing protocol determines the appropriate response to that information. The typical response is to terminate the routing protocol peering session and reconverge and thus bypass a failed peer.

Each time a BFD peer successfully receives a BFD control packet in a BFD session, the detection timer for that session is reset to zero. Thus the failure detection is dependent on received packets and NOT when the receiver last transmitted a packet.

## BFD Deployment Scenarios

The following describes how BFD operates in these specific scenarios.

### Failover

In a failover scenario, BFD sessions are established and maintained between the active unit and the neighbor unit. Standby units do not maintain any BFD sessions with the neighbors. When a failover happens, the new active unit must initiate session establishment with the neighbor because session information is not synched between active and standby units.

For a graceful restart/NSF scenario, the client (BGP IPv4/IPv6) is responsible for notifying its neighbor about the event. When the neighbor receives the information, it keeps the RIB table until failover is complete. During failover, the BFD and the BGP sessions go down on the device. When the failover is complete, a new BFD session between the neighbors is established when the BGP session comes up.

### Spanned EtherChannel and L2 Cluster

In a Spanned EtherChannel cluster scenario, the BFD session is established and maintained between the primary unit and its neighbor. Subordinate units do not maintain any BFD sessions with the neighbors. If a BFD packet is routed to the subordinate unit because of load balancing on the switch, the subordinate unit must forward this packet to the primary unit through the cluster link. When a cluster switchover happens, the new primary unit must initiate session establishment with the neighbor because session information is not synched between primary and subordinate units.

### Individual Interface Mode and L3 Cluster

In an individual interface mode cluster scenario, individual units maintain their BFD sessions with their neighbors.

## Create BFD Template

This section describes the steps required to create a BFD template policy object. The BFD template specifies a set of BFD interval values. BFD interval values as configured in the BFD template are not specific to a single interface. You can also configure authentication for single-hop and multi-hop sessions. You can enable Echo on single-hop only.

### Navigation Path

Select **Manage > Policy Objects**, then select **BFD Template** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 56-48 Add/Edit BFD Template**

| Element                                                     | Description                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                    |
| Description                                                 | An optional description of the object.                                                                                                                                                                                                                                                                    |
| Config Mode                                                 | Specify if there is a single IP hop or multiple IP hops between a BFD source and destination associated with an interface.                                                                                                                                                                                |
| Enable Echo                                                 | (Optional) Select to enable echo. When enabled, echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection.<br><b>Note</b> This is applicable only for single hop configuration mode.                                                            |
| <b>Interval tab (Optional)</b>                              |                                                                                                                                                                                                                                                                                                           |
| Interval Type                                               | Specify if you want to define the interval type in microseconds or milliseconds. The default interval type is None.                                                                                                                                                                                       |
| Transmit and Receive Values Interval Values in Microseconds | This section is enabled, if the Interval type is microseconds. Valid values are between 50000 and 999000 microseconds.<br>Minimum Transmit Value - Enter the minimum transmit interval capability in microseconds.<br>Minimum Receive Value - Enter the minimum receive interval capability microseconds. |
| Transmit and Receive Values Interval Values in Milliseconds | This section is enabled, if the Interval type is milliseconds. Valid values are between 50 and 999 milliseconds.<br>Minimum Transmit Value - Enter the minimum transmit interval capability in milliseconds.<br>Minimum Receive Value - Enter the minimum receive interval capability milliseconds.       |
| Multiplier Value                                            | Enter the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable. The default value is 3. Valid values are between 3 to 50.                                                                                                                         |
| <b>Authentication tab (Optional)</b>                        |                                                                                                                                                                                                                                                                                                           |
| Authentication Type                                         | Select to configure authentication for the BFD template and specify if you want to use an encrypted password or an unencrypted password, for the authentication.                                                                                                                                          |

**Table 56-48 Add/Edit BFD Template**

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Value                                             | Enter a BFD password and confirm it. <ul style="list-style-type: none"> <li>For <b>encrypted</b> BFD templates, the length of the Key value is between 17 and 66 characters.</li> <li>For <b>unencrypted</b> BFD templates of <b>sha-1</b> or <b>meticulous-sha-1</b> authentication type the length of the Key Value must be less than 29 characters.</li> <li>For <b>unencrypted</b> BFD templates of <b>md5</b> or <b>meticulous-md5</b> authentication type the length of the Key Value must be less than 25 characters.</li> </ul> |
| Key ID                                                | Enter an authentication key ID. This is a shared key ID, that matches the key string.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                               |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                  |

## Add/ Edit BFD Map Dialog Box

The Add/ Edit BFD Map dialog box lets you create a BFD map containing destinations that you can associate with a multi-hop template. You must have a multi-hop BFD template already configured. For more information see, [Create BFD Template, page 56-70](#)

### Navigation Path

You can access the Add/ Edit BFD Map dialog box from the Maps tab on the BFD page. Click the Add Row button to add a new BFD map; select an existing BFD map and click the Edit Row button to edit that map.

|--------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| BFD Template | Select a multi-hop BFD template or add a multi-hop BFD template. For more information see, <a href="#">Create BFD Template, page 56-70</a> |
| IP version   | Select the appropriate address format for the source and destination - IPv4 or IPv6.                                                       |

**Table 56-49 BFD Maps Tab (continued)**

| Element                                         | Description                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv4 Destination/Prefix,<br>IPv4 Source/Prefix  | Enter the IPv4 address for the destination and source in the appropriate fields in the <i>x.x.x.x/prefix</i> format.                                                                                                                                                                                |
| IPv6 Destination/ Prefix,<br>IPv6 Source/prefix | Enter the IPv6 address for the destination and source in the appropriate fields in the <i>x:x:x:x:x:x:x/prefix</i> format.                                                                                                                                                                          |
| Slow Timers                                     | This reduces the number of BFD control packets, that are sent between BFD neighbors. This slows down the asynchronous session, reduces the processing overhead and results in faster failure detection.<br><br>The default value for slow timers is 1000 and valid values are between 1000 - 30000. |

## Add/ Edit BFD Interface Dialog Box

The Add/ Edit BFD Interfaces dialog box lets you bind a BFD template to an interface, configure the baseline BFD session parameters per interface, and enable echo mode per interface.

### Navigation Path

You can access the Add/ Edit BFD Interface dialog box from the Interface tab on the BFD page. Click the Add Row button to add a new BFD interface; select an existing BFD interface and click the Edit Row button to edit that map.

|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface              | Enter an interface name, select an interface or add an interface role.                                                                                                                                                 |
| BFD Configuration      | Select BFD template to select an existing single-hop BFD template or add a single-hop BFD template. Alternately, select BFD interval.<br><br>For more information see, <a href="#">Create BFD Template, page 56-70</a> |
| <b>BFD Interval</b>    |                                                                                                                                                                                                                        |
| Minimum Transmit Value | Enter the minimum transmit interval capability in milliseconds. Valid values are between 50 and 999 milliseconds                                                                                                       |
| Minimum Receive Value  | Enter the minimum receive interval capability milliseconds. Valid values are between 50 and 999 milliseconds                                                                                                           |
| Multiplier             | Enter the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable. The default value is 3. Valid values are between 3 to 50.                                      |
| Echo                   | (Optional) Select to enable echo. When enabled, echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection.                                                   |

# Configuring OSPF

The OSPF page provides ten tabbed panels for configuring OSPF (Open Shortest Path First) routing on a firewall device. The following topics provide detailed information about enabling and configuring OSPF:

**Note**

---

Depending on the device version that you are configuring, some tabs might not be available.

---

**Note**

---

Beginning with ASA version 9.2(1), certain OSPF settings have changed. If you configure a shared policy that uses settings specific to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to a device whose version is earlier than 9.2(1). Likewise, if you configure a shared policy that uses settings that no longer apply to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to an 9.2(1)+ device.

**Navigation Path**

- (Device view) Select **Platform > Routing > OSPF** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPF** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## About OSPF

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements (LSAs) rather than routing table updates. Because only LSAs are exchanged, rather than entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF supports MD5 and clear-text neighbor authentication. Authentication should be used with all routing protocols whenever possible, because route redistribution between OSPF and other protocols (like RIP) can potentially be used by attackers to subvert routing information.

If NAT is used when OSPF is operating on public and private areas, and if address filtering is required, you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR type 3 LSA filtering, you can have separate private and public areas with the security appliance acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other. This lets you use NAT and OSPF together without advertising private networks.

**Note**

Only type 3 LSAs can be filtered. If you configure the security appliance as an ASBR in a private network, it will send type 5 LSAs describing private networks, which will be broadcast to the entire autonomous system (AS) including public areas.

If NAT is employed but OSPF is only running in public areas, routes to public networks can be redistributed inside the private network, either as default or type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the security appliance. Also, you should not mix public and private networks on the same security appliance interface.

## General Tab

Use the General panel on the OSPF page to enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks.

**Note**

You cannot enable OSPF if you have RIP enabled.

**Navigation Path**

You can access the General panel from the OSPF Page; see [Configuring OSPF, page 56-75](#) for more information.

| Element                                                                                                                                        | Description                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The General tab provides two identical sections; each is used to enable one OSPF process. The following options are available in each section. |                                                                                                                                                                                                                                                              |
| Enable this OSPF Process                                                                                                                       | Check this box to enable an OSPF process. You cannot enable an OSPF process if you have RIP enabled on the security appliance. Deselect this option to remove the OSPF process.                                                                              |
| OSPF Process ID                                                                                                                                | Enter a unique numeric identifier for the OSPF process. This process ID is used internally and does not need to match the OSPF process ID on any other OSPF devices. Valid values are from 1 to 65535.                                                       |
| Advanced button                                                                                                                                | Opens the <a href="#">OSPF Advanced Dialog Box, page 56-77</a> , in which you can configure additional process-related parameters, such as Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings. |

**OSPF Advanced Dialog Box**

Use the OSPF Advanced dialog box to configure settings such as the Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings for an OSPF process.

**Note**

Beginning with ASA version 9.2(1), certain OSPF settings have changed. If you configure a shared policy that uses settings specific to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to a device whose version is earlier than 9.2(1). Likewise, if you configure a shared policy that uses settings that no longer apply to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to an 9.2(1)+ device.

**Navigation Path**

You can access the OSPF Advanced dialog box from the [General Tab, page 56-76](#).

| Timers  | <p>Settings used to configure LSA arrival, LSA pacing, and throttling for ASA 9.2(1)+ devices:</p> <ul style="list-style-type: none"> <li>• LSA Arrival – The minimum delay in milliseconds that must pass between acceptance of the same LSA arriving from neighbors. The range is from 0 to 600,000 milliseconds. The default is 1000 milliseconds.</li> <li>• LSA Flood Pacing – The time in milliseconds at which LSAs in the flooding queue are paced in between updates. The configurable range is from 5 to 100 milliseconds. The default value is 33 milliseconds.</li> <li>• LSA Group Pacing – The interval at which LSAs are collected into a group and refreshed, checksummed, or aged. Valid values range from 10 to 1800; the default value is 240 seconds.</li> <li>• LSA Retransmission Pacing – The time in milliseconds at which LSAs in the retransmission queue are paced. The configurable range is from 5 to 200 milliseconds. The default value is 66 milliseconds.</li> <li>• LSA Throttle – The delay in milliseconds to generate the first occurrence of the LSA. Valid values range from 0 to 600000 milliseconds. When you enter a value in this field, the Min and Max fields are enabled: <ul style="list-style-type: none"> <li>– Min – The minimum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> <li>– Max – The maximum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> </ul> <p><b>Note</b> For LSA throttling, the first occurrence value must be equal to or less than the minimum value and the minimum value must be equal to or less than the maximum value.</p> <ul style="list-style-type: none"> <li>• SPF Throttle – The delay to receive a change to the SPF calculation. Valid values range from 1 to 600000 milliseconds. When you enter a value in this field, the Min and Max fields are enabled: <ul style="list-style-type: none"> <li>– Min – The delay between the first and second SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> <li>– Max – The maximum wait time for SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> </ul> <p><b>Note</b> For SPF throttling, the first occurrence value must be equal to or less than the minimum value and the minimum value must be equal to or less than the maximum value.</p> <p>Settings used to configure LSA pacing and SPF calculation timers for device versions earlier than 9.2(1):</p> <ul style="list-style-type: none"> <li>• SPF Delay – The time between receipt of a topology change and the start of shortest path first (SPF) calculations. Valid values range from 0 to 65535; the default value is 5 seconds.</li> <li>• SPF Hold – The hold time between consecutive SPF calculations. Valid values range from 1 to 65534; the default value is 10 seconds.</li> <li>• LSA Group Pacing – The interval at which LSAs are collected into a group and refreshed, checksummed, or aged. Valid values range</li> </ul> |

By default, the neighboring ASAs of the NSF-capable ASA will be NSF-aware and will operate in NSF helper mode. When the NSF-capable ASA is performing graceful restart, the helper ASAs assist in the nonstop forwarding recovery process.</p> <p>If you do not want the ASA to help the restarting neighbor with nonstop forwarding recovery, clear the Enable IETF Non Stop Forwarding Helper mode option.</p> |
| Enable Strict Link State advertisement checking                                                    | Enables strict link-state advertisement (LSA) checking for IETF NSF helper mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable IETF Non Stop Forwarding                                                                    | Enables IETF nonstop forwarding (NSF).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Length of graceful restart interval                                                                | <p>(Optional) Specifies the length of the graceful restart interval, in seconds. The range is from 1 to 1800. The default is 120.</p> <p><b>Note</b> For a restart interval below 30 seconds, graceful restart will be terminated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Area Tab

Use the Area tab on the OSPF page to configure OSPF areas and networks.

### Navigation Path

You can access the Area tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 56-75](#).

### Field Reference

**Table 56-53** *Area Tab*

| Element        | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| OSPF Process   | The OSPF process the area applies to.                                 |
| Area ID        | The area ID.                                                          |
| Area Type      | The area type (Normal, Stub, or NSSA).                                |
| Networks       | The area networks.                                                    |
| Options        | The options, if any, set for the area type.                           |
| Authentication | The type of authentication set for the area (None, Password, or MD5). |
| Cost           | The default cost for the area.                                        |

## Add/Edit Area/Area Networks Dialog Box

Use the Add/Edit Area/Area Networks dialog box to define area parameters, the networks contained by the area, and the OSPF process associated with the area.

### Navigation Path

You can access the Add/Edit Area/Area Networks dialog box from the [Area Tab, page 56-81](#).

### Field Reference

**Table 56-54** *Add/Edit Area/Area Networks Dialog Box*

| Element      | Description                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | When adding a new area, choose the OSPF process ID for the OSPF process for which the area is being added. If there is only one OSPF process enabled on the security appliance, that process is selected by default. When editing an existing area, you cannot change the OSPF process ID. |

**Table 56-54 Add/Edit Area/Area Networks Dialog Box (continued)**

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Area ID                                                   | When adding a new area, enter the area ID. You can specify the area ID as either a decimal number or an IP address. Valid decimal values range from 0 to 4294967295. You cannot change the area ID when editing an existing area.                                                                                                                |
| <b>Area Type</b>                                          |                                                                                                                                                                                                                                                                                                                                                  |
| Normal                                                    | Choose this option to make the area a standard OSPF area. This option is selected by default when you first create an area.                                                                                                                                                                                                                      |
| Stub                                                      | Choosing this option makes the area a stub area. Stub areas do not have any routers or areas beyond it. Stub areas prevent AS External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Type 3 and 4) from being flooded into the area by deselecting the Summary check box. |
| Summary (allows sending LSAs into the stub area)          | When the area being defined is a stub area, deselecting this check box prevents LSAs from being sent into the stub area. This check box is selected by default for stub areas.                                                                                                                                                                   |
| NSSA                                                      | Choose this option to make the area a not-so-stubby area. NSSAs accept Type 7 LSAs. When you create a NSSA, you can prevent summary LSAs from being flooded into the area by deselecting the Summary check box. You can also disable route redistribution by deselecting the Redistribute check box and enabling Default Information Originate.  |
| Redistribute (imports routes to normal and NSSA areas)    | Deselect this check box to prevent routes from being imported into the NSSA. This check box is selected by default.                                                                                                                                                                                                                              |
| Summary (allows sending LSAs into the NSSA area)          | When the area being defined is a NSSA, deselecting this check box prevents LSAs from being sent into the stub area. This check box is selected by default for NSSAs.                                                                                                                                                                             |
| Default Information Originate (generate a Type 7 default) | Select this check box to generate a Type 7 default into the NSSA. This check box is deselected by default.                                                                                                                                                                                                                                       |
| Metric Value                                              | Specifies the OSPF metric value for the default route. Valid values range from 0 to 16777214. The default value is 1.                                                                                                                                                                                                                            |
| Metric Type                                               | The OSPF metric type for the default route. The choices are 1 (Type 1) or 2 (Type 2). The default value is 2.                                                                                                                                                                                                                                    |
| Network                                                   | The IP address and network mask of the network or host to be added to the area. Use 0.0.0.0 with a netmask of 0.0.0.0 to create the default area. You can only use 0.0.0.0 in one area.<br><br><b>Tip</b> You can click <b>Select</b> to select the interfaces from a list of interface objects.                                                 |

**Table 56-54** Add/Edit Area/Area Networks Dialog Box (continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication | <p>Contains the settings for OSPF area authentication.</p> <ul style="list-style-type: none"> <li>None—Choose this option to disable OSPF area authentication. This is the default setting.</li> <li>Password—Choose this option to use a clear text password for area authentication. This option is not recommended where security is a concern.</li> <li>MD5—Choose this option to use MD5 authentication.</li> </ul> |
| Default Cost   | Specify a default cost for the area. Valid values range from 0 to 65535 for ASA devices earlier than 9.2(1) and from 0 to 16777214 for ASA 9.2(1)+. The default value is 1.                                                                                                                                                                                                                                              |

## Range Tab

Use the Range tab to summarize routes between areas.

### Navigation Path

You can access the Range tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 56-75](#).

### Field Reference

**Table 56-55** Range Tab

| Element    | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID | The ID of the OSPF process associated with the route summary.                                                                                                                       |
| Area ID    | The ID of the area associated with the route summary.                                                                                                                               |
| Network    | The summary IP address and network mask.                                                                                                                                            |
| Advertise  | Displays “true” if the route summaries are advertised when they match the address/mask pair or “false” if the route summaries are suppressed when they match the address/mask pair. |

## Add/Edit Area Range Network Dialog Box

Use the Add/Edit Area Range Network dialog box to add a new entry to the Route Summarization table or to change an existing entry.

### Navigation Path

You can access the Add/Edit Area Range Network dialog box from the [Range Tab, page 56-84](#).

### Related Topics

- [Configuring OSPF, page 56-75](#)

**Field Reference****Table 56-56 Add/Edit Area Range Network Dialog Box**

| Element      | Description                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Select the OSPF process to which the route summary applies. You cannot change this value when editing an existing route summary entry.                                                                        |
| Area         | Select the area ID of the area to which the route summary applies. You cannot change this value when editing an existing route summary entry.                                                                 |
| Network      | The IP address and mask of the network for the routes being summarized.<br><b>Tip</b> You can click <b>Select</b> to select the networks from a list of network objects.                                      |
| Advertise    | Select this check box to set the address range status to “advertise”. This causes Type 3 summary LSAs to be generated. Deselect this check box to suppress the Type 3 summary LSA for the specified networks. |

## Neighbors Tab

Use the Neighbors tab to define static neighbors. You need to define a static neighbor for each point-to-point, non-broadcast interface. You also need to define a static route for each static neighbor in the Neighbors table.

**Navigation Path**

You can access the Neighbors tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 56-75](#).

**Related Topics**

- [Add/Edit Static Neighbor Dialog Box, page 56-85](#)

**Field Reference****Table 56-57 Neighbors Tab**

| Element      | Description                                           |
|--------------|-------------------------------------------------------|
| OSPF Process | The OSPF process associated with the static neighbor. |
| Neighbor     | The IP address of the static neighbor.                |
| Interface    | The interface associated with the static neighbor.    |

## Add/Edit Static Neighbor Dialog Box

Use the Add/Edit Static Neighbor dialog box to define a static neighbor or change information for an existing static neighbor. You must define a static neighbor for each point-to-point, non-broadcast interface.

**Navigation Path**

You can access the Add/Edit Static Neighbor dialog box from the [Neighbors Tab, page 56-85](#).

| Element      | Description                                                      |
|--------------|------------------------------------------------------------------|
| OSPF Process | The OSPF process associated with the route redistribution entry. |

**Table 56-59** *Redistribution Tab (continued)*

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Type   | The source protocol the routes are being redistributed from. Valid entries are the following: <ul style="list-style-type: none"> <li>• BGP—Redistributes routes from the BGP routing process.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the AS.</li> <li>• EIGRP—Redistributes routes from the EIGRP routing process. Choose the autonomous system number of the EIGRP routing process from the list.</li> <li>• OSPF—Redistributes routes from another OSPF routing process.</li> <li>• RIP—Redistributes routes from the RIP routing process.</li> <li>• Static—Redistributes static routes to the OSPF routing process.</li> </ul> |
| Match        | The conditions used for redistributing routes from one routing protocol to another. These options are not available when redistributing static, connected, RIP, BGP, or EIGRP routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Subnets      | Displays “true” if subnetted routes are redistributed. Does not display anything if only routes that are not subnetted are redistributed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Metric Value | The metric that is used for the route. This column is blank for redistribution entries if the default metric is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric Type  | Displays “1” if the metric is a Type 1 external route, “2” if the metric is Type 2 external route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Tag Value    | A 32-bit decimal value attached to each external route. This value is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Route Map    | The name of the route map object to apply to the redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Redistribution Dialog Box

Use the Redistribution dialog box to add a redistribution rule or to edit an existing redistribution rule in the Redistribution table.

### Navigation Path

You can access the Redistribution dialog box from the [Redistribution Tab, page 56-86](#).

Table 56-60 OSPF Redistribution Settings Dialog Box

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process       | Select the OSPF process associated with the route redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Route Type         | Select the source protocol from which the routes are being redistributed. You can choose one of the following options: <ul style="list-style-type: none"> <li>• BGP—Redistribute routes from the BGP routing process.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the AS.</li> <li>• EIGRP—Redistributes routes from the EIGRP routing process. Choose the autonomous system number of the EIGRP routing process from the list.</li> <li>• OSPF—Redistributes routes from another OSPF routing process. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, RIP, BGP, or EIGRP routes.</li> <li>• RIP—Redistributes routes from the RIP routing process.</li> <li>• Static—Redistributes static routes to the OSPF routing process.</li> </ul> |
| Routing Process ID | The autonomous system (AS) number for the BGP or EIGRP routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Match              | If you have chosen OSPF as the Route Type, choose the conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions: <ul style="list-style-type: none"> <li>• Internal—The route is internal to a specific AS.</li> <li>• External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> <li>• NSSA External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> <li>• NSSA External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> </ul>                                                                                                                              |
| Metric Value       | The metric value for the routes being redistributed. Valid values range from 1 to 16777214. When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Metric Type        | Select “1” if the metric is a Type 1 external route, “2” if the metric is a Type 2 external route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 56-60** OSPF Redistribution Settings Dialog Box (continued)

| Element     | Description                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag Value   | The tag value is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295.                                                                                                                                                           |
| Use Subnets | When selected, redistribution of subnetted routes is enabled. Deselect this check box to cause only routes that are not subnetted to be redistributed.                                                                                                                                                                                                                |
| Route Map   | Enter or Select a route map object to apply to the redistribution entry.<br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , page 56-135. |

## Virtual Link Tab

Use the Virtual Link tab to create virtual links. If you add an area to an OSPF network, and it is not possible to connect the area directly to the backbone area, you need to create a virtual link. A virtual link connects two OSPF devices that have a common area, called the transit area. One of the OSPF devices must be connected to the backbone area.

### Navigation Path

You can access the Virtual Link tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#), page 56-75.

**Table 56-61** Virtual Link Tab

| Element        | Description                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process   | The OSPF process associated with the virtual link.                                                                                                                                                                                                                                                                     |
| Area ID        | The ID of the transit area.                                                                                                                                                                                                                                                                                            |
| Peer Router    | The IP address of the virtual link neighbor.                                                                                                                                                                                                                                                                           |
| Authentication | Displays the type of authentication used by the virtual link: <ul style="list-style-type: none"> <li>• None—No authentication is used.</li> <li>• Password—Clear text password authentication is used.</li> <li>• MD5—MD5 authentication is used.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |

## Add/Edit OSPF Virtual Link Configuration Dialog Box

Use the Add/Edit OSPF Virtual Link Configuration dialog box to define virtual links or change the properties of existing virtual links.

### Navigation Path

You can access the Add/Edit OSPF Virtual Link Configuration dialog box from the [Virtual Link Tab](#), page 56-89.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process        | Select the OSPF process associated with the virtual link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Area ID             | Select the area shared by the neighbor OSPF devices. The selected area cannot be an NSSA or a stub area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Peer Router         | Enter the IP address of the virtual link neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Hello Interval      | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value is 10 seconds.                                                                                                                                                                                                          |
| Retransmit Interval | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value is 5 seconds.                                                                          |
| Transmit Delay      | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value is 1 second. |

**Table 56-62 Add/Edit OSPF Virtual Link Configuration Dialog Box (continued)**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dead Interval           | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value of this field is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Authentication          | Contains the OSPF authentication options. <ul style="list-style-type: none"> <li>• None—Choose this option to disable OSPF authentication.</li> <li>• Area—Choose this option to use the authentication type specified for the area. See <a href="#">Add/Edit Area/Area Networks Dialog Box, page 56-82</a> for information about configuring area authentication. Area authentication is disabled by default. Therefore, unless you have previously specified an area authentication type, interfaces set to area authentication have authentication disabled until you configure this setting.</li> <li>• Password—Choose this option to use clear text password authentication. This is not recommended where security is a concern.</li> <li>• MD5—Choose this option to use MD5 authentication (recommended).</li> <li>• Key Chain—Choose this option to use key chain authentication.</li> </ul> |
| Key Chain               | This field appears when Key Chain authentication is enabled. Click <b>Select</b> and choose the configured key chain. To know the configuration steps, refer <a href="#">“Configuring Key Chain” section on page 56-101</a> . <p><b>Note</b> Use the same authentication type and key ID for the peers to establish a successful adjacency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Authentication Password | Contains the settings for entering the password when password authentication is enabled. <ul style="list-style-type: none"> <li>• Password—Enter a text string of up to 8 characters.</li> <li>• Confirm—Re-enter the password.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MD5 IDs and Keys        | Contains the settings for entering the MD5 keys and parameters when MD5 authentication is enabled. All devices on the interface using OSPF authentication must use the same MD5 key and ID. <ul style="list-style-type: none"> <li>• MD5 Key ID and MD5 Key Table <ul style="list-style-type: none"> <li>– MD5 Key ID—A numerical key identifier. Valid values range from 1 to 255.</li> <li>– MD5 Key—An alphanumeric character string of up to 16 bytes.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Add/Edit OSPF Virtual Link MD5 Configuration Dialog Box

Use the Add/Edit OSPF Virtual Link MD5 Configuration dialog box to define MD5 keys for authentication of virtual links.

**Navigation Path**

You can access the Add/Edit OSPF Virtual Link MD5 Configuration dialog box from the [Add/Edit OSPF Virtual Link Configuration Dialog Box](#), page 56-90.

**Related Topics**

- [Add/Edit OSPF Virtual Link Configuration Dialog Box](#), page 56-90
- [Virtual Link Tab](#), page 56-89
- [Configuring OSPF](#), page 56-75

**Field Reference**

**Table 56-63 Add/Edit OSPF Virtual Link MD5 Configuration Dialog Box**

| Element    | Description                                                   |
|------------|---------------------------------------------------------------|
| MD5 Key ID | A numerical key identifier. Valid values range from 1 to 255. |
| MD5 Key    | An alphanumeric character string of up to 16 bytes.           |
| Confirm    | Re-enter the MD5 key.                                         |

## Filtering Tab

Use the Filtering tab to configure the ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restricts all other prefixes. This type of area filtering can be applied out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF areas at the same time.

**Benefits**

OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

**Restrictions**

Only type-3 LSAs that originate from an ABR are filtered.

**Navigation Path**

You can access the Filtering tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#), page 56-75.

**Related Topics**

- [Add/Edit Filtering Dialog Box](#), page 56-93

**Field Reference**

**Table 56-64 Filtering Tab**

| Element          | Description                                            |
|------------------|--------------------------------------------------------|
| OSPF Process     | The OSPF process associated with the filter entry.     |
| Area ID          | The ID of the area associated with the filter entry.   |
| Prefix List Name | The name of the prefix list.                           |
| Filtered Network | The IP address and mask of the network being filtered. |

**Table 56-64** *Filtering Tab (continued)*

| Element           | Description                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Direction | Displays “Inbound” if the filter entry applies to LSAs coming in to an OSPF area or “Outbound” if it applies to LSAs going out of an OSPF area. |
| Sequence #        | The sequence number for the filter entry. When multiple filters apply to an LSA, the filter with the lowest sequence number is used.            |
| Action            | Displays “Permit” if LSAs matching the filter are allowed or “Deny” if LSAs matching the filter are denied.                                     |
| Lower Range       | The minimum prefix length to be matched.                                                                                                        |
| Upper Range       | The maximum prefix length to be matched.                                                                                                        |

## Add/Edit Filtering Dialog Box

Use the Add/Edit Filtering dialog box to add new filters to the Filter table or to modify an existing filter.

### Navigation Path

You can access the Add/Edit Filtering dialog box from the [Filtering Tab, page 56-92](#).

### Related Topics

### Field Reference

**Table 56-65** *Add/Edit Filtering Dialog Box*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process      | Select the OSPF process associated with the filter entry.                                                                                                                                                                                                                                                                                                     |
| Area ID           | Select the ID of the area associated with the filter entry.                                                                                                                                                                                                                                                                                                   |
| Prefix List Name  | Enter or Select the appropriate prefix list object.<br><b>Tip</b> Click <b>Select</b> to open the Prefix List Object Selector from which you can select a prefix list object. You can also create new objects from the object Prefix List Object selector. For more information, see <a href="#">Add or Edit Prefix List Object Dialog Box, page 56-149</a> . |
| Filtered Network  | Enter the IP address and mask of the network being filtered.                                                                                                                                                                                                                                                                                                  |
| Traffic Direction | Select the traffic direction to filter. Choose “Inbound” to filter LSAs coming into an OSPF area or “Outbound” to filter LSAs going out of an OSPF area.                                                                                                                                                                                                      |
| Sequence Number   | Enter a sequence number for the filter. Valid values range from 1 to 4294967294. When multiple filters apply to an LSA, the filter with the lowest sequence number is used.                                                                                                                                                                                   |
| Action            | Select “Permit” to allow the LSA traffic or “Deny” to block the LSA traffic.                                                                                                                                                                                                                                                                                  |

**Table 56-65 Add/Edit Filtering Dialog Box (continued)**

| Element     | Description                                                                                                                                                                                                                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lower Range | Specify the minimum prefix length to be matched. The value of this setting must be greater than the length of the network mask entered in the Filtered Network field and less than or equal to the value, if present, entered in the Upper Range field.                                                  |
| Upper Range | Enter the maximum prefix length to be matched. The value of this setting must be greater than or equal to the value, if present, entered in the Lower Range field, or, if the Lower Range field is left blank, greater than the length of the network mask length entered in the Filtered Network field. |

## Filter Rule Tab

Use the Filter Rule tab to configure rules to filter networks received or transmitted in Open Shortest Path First (OSPF) updates.

**Note** Filter rules are supported on ASA 9.2(1)+ only.

### Navigation Path

You can access the Filter Rule tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 56-75](#).

### Field Reference

**Table 56-66 Filter Rule Tab**

| Element            | Description                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID         | The OSPF process associated with the filter rule.                                                                                                                                                                                                            |
| ACL                | Standard IP access list name. The list defines which networks are to be received and which are to be suppressed in routing updates.                                                                                                                          |
| Direction          | The direction for the filter rule: <ul style="list-style-type: none"> <li>• in—The rule filters default route information from incoming routing updates.</li> <li>• out—The rule filters default route information from outgoing routing updates.</li> </ul> |
| Interface          | (Optional) The interface to which the filter rule applies.                                                                                                                                                                                                   |
| Routing Process    | The routing process: None, BGP, Connected, EIGRP, OSPF, RIP, or Static.                                                                                                                                                                                      |
| Routing Process ID | The identifier for the routing process.                                                                                                                                                                                                                      |

## Add/Edit Filter Rule Dialog Box

Use the Add/Edit Filter Rule dialog box to add new filter rules to the Filter Rules table or to modify an existing filter rule.

### Note

Filter rules are supported on ASA 9.2(1)+ only.

### Navigation Path

You can access the Add/Edit Filter Rule dialog box from the [Filter Rule Tab, page 56-94](#).

### Related Topics

- [Configuring OSPF, page 56-75](#)

### Field Reference

**Table 56-67 Add/Edit Filter Rule Dialog Box**

| Element            | Description                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process       | Select the OSPF process associated with the filter rule.                                                                                                                                                                                                             |
| ACL                | Select an Access Control List that defines which networks are to be received and which are to be suppressed in routing updates.                                                                                                                                      |
| Direction          | Specify the direction for the filter rule: <ul style="list-style-type: none"> <li>• in—The rule filters default route information from incoming routing updates.</li> <li>• out—The rule filters default route information from outgoing routing updates.</li> </ul> |
| Interface          | (Optional) Specify the interface on which to apply the routing updates. Specifying an interface causes the access list to be applied only to routing updates received on that interface.                                                                             |
| Routing Process    | Select the routing process for which you want to filter: None, BGP, Connected, EIGRP, OSPF, RIP, or Static.                                                                                                                                                          |
| Routing Process ID | Enter the identifier for the routing process. Applies to BGP, EIGRP, and OSPF routing protocols.                                                                                                                                                                     |

## Summary Address Tab

Use the Summary Address tab to configure summary addresses for each OSPF routing process.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.

**Navigation Path**

You can access the Summary Address tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 56-75](#).

**Field Reference**

**Table 56-68 Summary Address Tab**

| Element    | Description                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID | The OSPF process associated with the summary address.                                                                                                   |
| Network    | The IP address and network mask of the summary address.                                                                                                 |
| Tag        | A 32-bit decimal value attached to each external route. This value is not used by OSPF itself. It may be used to communicate information between ASBRs. |
| Advertise  | Displays “true” if the summary routes are advertised. Displays “false” if the summary route is not advertised.                                          |

**Add/Edit Summary Address Dialog Box**

Use the Add/Edit Summary Address dialog box to add new entries or to modify existing entries in the Summary Address table.

**Navigation Path**

You can access the Add/Edit Summary Address dialog box from the [Summary Address Tab, page 56-95](#).

**Related Topics**

- [Configuring OSPF, page 56-75](#)

**Field Reference**

**Table 56-69 Add/Edit Summary Address Dialog Box**

| Element      | Description                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Choose the OSPF process associated with the summary address. You cannot change this information when editing an existing entry.                                                                             |
| Network      | The IP address and network mask of the summary address.                                                                                                                                                     |
| Tag          | The tag value is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295. |
| Advertise    | When selected, summary routes are advertised. Deselect this check box to suppress routes that fall under the summary address. By default, this check box is selected.                                       |

## Interface Tab

Use the Interface tab to configure interface-specific OSPF authentication routing properties.

### Navigation Path

You can access the Interface tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 56-75](#).

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface       | The name of the interface to which the configuration applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Authentication  | The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values: <ul style="list-style-type: none"> <li>• None—OSPF authentication is disabled.</li> <li>• Password—Clear text password authentication is enabled.</li> <li>• MD5—MD5 authentication is enabled.</li> <li>• Area—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |
| Point-to-Point  | Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Cost            | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Priority        | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MTU Ignore      | Displays “false” if MTU mismatch detection is enabled. Displays “true” if the MTU mismatch detection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Database Filter | Displays “true” if outgoing LSAs are filtered during synchronization and flooding. Displays “false” if filtering is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hello Interval  | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds. The default value is 10 seconds.                                                                                                                                                                                                                                                                                                                                                                      |

**Table 56-70** *Interface Tab (continued)*

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmit Delay                         | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds. The default value is 1 second. |
| Retransmit Interval                    | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                              |
| Dead Interval                          | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535. The default value of this setting is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                |
| Hello Multiplier<br>(ASA 9.2(1)+ only) | The number of hello packets to be sent per second. Valid values are between 3 and 20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Add/Edit Interface Dialog Box

Use the Add/Edit Interface dialog box to add OSPF authentication routing properties for an interface or to change an existing entry.

### Note

Beginning with ASA version 9.2(1), the upper limit for acceptable entries for Hello Interval, Transmit Delay, Retransmit Interval, and Dead Interval has been reduced from 65535 seconds to 8192 seconds. If you configure a shared policy that uses a value over 8192, you will receive a validation error if that policy is assigned to an 9.2(1)+ device.

### Navigation Path

You can access the Add/Edit Interface dialog box from the [Interface Tab, page 56-97](#).

| Interface | The name of the interface to which the configuration applies. |

**Table 56-71 Add/Edit Interface Dialog Box (continued)**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication          | <p>The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values:</p> <ul style="list-style-type: none"> <li>• No Authentication—OSPF authentication is disabled.</li> <li>• Area Authentication—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> <li>• Password Authentication—Clear text password authentication is enabled.</li> <li>• MD5 Authentication—MD5 authentication is enabled.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |
| Key Chain               | <p>Click <b>Select</b> and choose the configured key chain. To know the configuration steps, refer <a href="#">“Configuring Key Chain” section on page 56-101</a>.</p> <p><b>Note</b> Use the same authentication type and key ID for the peers to establish a successful adjacency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Authentication Password | <p>Contains the settings for entering the password when password authentication is enabled.</p> <ul style="list-style-type: none"> <li>• Enter Password—Enter a text string of up to 8 characters.</li> <li>• Confirm—Re-enter the password.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MD5 Key IDs and Keys    | <p>Contains the settings for entering the MD5 keys and parameters when MD5 authentication is enabled. All devices on the interface using OSPF authentication must use the same MD5 key and ID.</p> <ul style="list-style-type: none"> <li>• Key ID—Enter a numerical key identifier. Valid values range from 1 to 255.</li> <li>• Key—An alphanumeric character string of up to 16 bytes.</li> <li>• Confirm—Re-enter the MD5 key.</li> </ul> <p>Enter the above values, then click &gt;&gt; to add the key information to the Keys table. Select a key entry and then click &lt;&lt; to remove it from the Keys table.</p>                                                                                                                                                                                 |
| Cost                    | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Priority                | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MTU Ignore              | When selected, MTU mismatch detection is disabled. Clear this check box to enable MTU mismatch detection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Database Filter All Out | When selected, outgoing LSAs are filtered during synchronization and flooding. Deselect this check box to disable filtering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 56-71 Add/Edit Interface Dialog Box (continued)**

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hello Interval (sec)                               | <p>The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value is 10 seconds.</p>                                                                                                                                                                                                          |
| Transmit Delay (sec)                               | <p>The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value is 1 second.</p> |
| Retransmit Interval (sec)                          | <p>The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value is 5 seconds.</p>                                                                          |
| Dead Interval (sec)                                | <p>The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value of this setting is four times the interval set by the Hello Interval field.</p>                                                                                                                                                                                                                                                                                                                        |
| Hello Multiplier (Hello/Sec)<br>(ASA 9.2(1)+ only) | <p>The number of hello packets to be sent per second. Valid values are between 3 and 20.</p> <p><b>Note</b> If you specify a Hello Multiplier, the Hello Interval and Dead Interval values will be ignored. If you entered a value for Hello Interval or Dead Interval, you will be asked to confirm that you want to use the Hello Multiplier instead of the Hello Interval and Dead Interval settings.</p>                                                                                                                                                                                                                                                                            |
| Point-to-Point                                     | <p>Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# Configuring Key Chain

To enhanced data security and protection on the networking devices, the devices are configured with rotating keys for authenticating IGP peers that have a duration of 180 days or less. The rotating keys prevent any malicious user from guessing the keys used for routing protocol authentication and thereby protecting the network from advertising incorrect routes and redirecting traffic. Changing the keys frequently reduces the risk of them eventually being guessed. When configuring authentication for routing protocols that provide key chains, configure the keys in a key chain to have overlapping lifetimes. This configuration helps to prevent loss of key-secured communication due to absence of an active key. If the key lifetime expires and no active keys are found, OSPF uses the last valid key to maintain the adjacency with peers.

The two limitations of key chain configuration in Cisco Security Manager are:

- The configured Key ID will be displayed in unencrypted format in the [OOB \(Out of Band\) Changes Dialog Box](#).
- The option to copy provision is not available for key chains.

## Lifetime of a Key

To maintain stable communications, each device stores key chain authentication keys and uses more than one key for a feature at the same time. Based on the send and accept lifetimes of a key, keychain management provides a secured mechanism to handle key rollover. The device uses the lifetimes of keys to determine which keys in a key chain are active.

Each key in a key chain has two lifetimes:

- Accept lifetime—The time interval within which the device accepts the key during key exchange with another device.
- Send lifetime—The time interval within which the device sends the key during key exchange with another device.

During a key send lifetime, the device sends routing update packets with the key. The device does not accept communication from other devices when the key sent is not within the accept lifetime of the key on the device.

If lifetimes are not configured then it is equivalent to configuring MD5 authentication key without timelines.

## Key Selection

- When key chain has more than one valid key, OSPF selects the key that has the maximum life time.
- Key having an infinite lifetime is preferred.
- If keys have the same lifetime, then key with the higher key ID is preferred.

## Add/Edit Key Chain

Use the Add/Edit KeyChain dialog box to add new entries or to modify existing entries in the KeyChain table.

### Navigation Path

- You can access the Key Chain page tab from the Interface tab of OSPF page. For more information about the Interface tab, see [Interfaces Tab, page 56-47](#).
- You can directly access the Add Key Chain page from **Manage > Policy Objects > Key Chain**.

- Step 1** Create a key chain policy object that includes the key chains for authentication.
- Select **Manage > Policy Objects** to open the Policy Object Manager window (see [Policy Object Manager, page 6-4](#)).
  - Select **Key Chain** from the table of contents.
  - Right-click and choose **New Object**.
  - In the Add Key Chain dialog box, enter a name for the object, for example, Chain 1.
  - Click the **Add** button to add the key chain entry to the Key Chain list.
- Step 2** Enter the relevant values in the **Add Key Chain Entry** dialog box:

## Configuring OSPFv3

The OSPFv3 page provides two tabbed panels for configuring OSPF (Open Shortest Path First) version 3 routing on a firewall device.

#### Navigation Path

- (Device view) Select **Platform > Routing > OSPFv3** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPFv3** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

This is the basic procedure for configuring an OSPFv3 process and assigning it to an interface on the OSPFv3 page:

1. On the [Process Tab, page 56-106](#):
  - Specify which of the two processes you are configuring by choosing **Process 1** or **Process 2** from the OSPFv3 Process drop-down list.
  - Check **Enable OSPFv3 Process**.

- Assign a **Process ID**; any positive integer between 1 and 65535.
- Use the following features as needed to define the process:
  - **Advanced** button, opening the [OSPFv3 Advanced Properties Dialog Box](#), page 56-107.
  - **Area Tab (OSPFv3)**, page 56-111, for managing area, range, and virtual-link definitions, by means of the [Add/Edit Area Dialog Box \(OSPFv3\)](#), page 56-111, [Add/Edit Range Dialog Box \(OSPFv3\)](#), page 56-113, and [Add/Edit Virtual Link Dialog Box \(OSPFv3\)](#), page 56-114.
  - **Redistribution** panel, for managing route redistribution definitions by means of the [Add/Edit Redistribution Dialog Box \(OSPFv3\)](#), page 56-115.

## About OSPFv3

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. Version 3 is basically OSPFv2 enhanced for IPv6. It is similar to OSPFv2 (see [About OSPF](#), page 56-75), but it is not backward compatible. To use OSPF to route both IPv4 and IPv6 packets, it will be necessary to run both OSPFv2 and OSPFv3 concurrently. They co-exist with each other, but do not interact.

#### Note

---

OSPFv3 is supported on ASA 9.0+ devices operating in single-context, routed mode only. That is, multiple contexts and transparent mode are not supported.

---

Think of a link as being an interface on a networking device. A link-state protocol makes its routing decisions based on the states of the links that connect source and destination devices. The state of a link is a description of that interface and its relationship to its neighboring networking devices. This interface information includes the IPv6 prefix/length of the interface, the type of network it is connected to, the devices connected to that network, and so on. This information is propagated in various type of link-state advertisements (LSAs). Because only LSAs are exchanged, rather than entire routing tables, OSPF networks converge more quickly than RIP networks.

The ASA can run two processes of the OSPFv3 protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to co-exist, but OSPFv3 does not allow overlapping addresses). Or you might want to run one process on the inside interface and another on the outside, redistributing a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPFv3 routing process from another OSPFv3 routing process, a RIP routing process, or from static and connected routes configured on OSPFv3-enabled interfaces.

If NAT is employed but OSPFv3 is only running in public areas, routes to public networks can be redistributed inside the private network, either as default or type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the security appliance. Also, you should not mix public and private networks on the same security appliance interface.

### Differences Between OSPFv2 and OSPFv3

The additional features provided by OSPFv3 over OSPFv2 include the following:

- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Authentication support using the IPSec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

### Configuration Restrictions

The following are ASA OSPFv3 configuration restrictions:

- To enable OSPFv3 on a specific interface, IPv6 should be enabled on the interface and it must be named.
- Only one OSPFv3 process, with one area and one instance, can be assigned to an interface.
- The Interface neighbor entries take effect only when the OSPFv3 is enabled, and network type should be point-to-point on the specified interface.
- Interface neighbor address must be a link-local address.
- Range value in area Range table should be unique across the area.
- If the area is set to NSSA or stub, the same area cannot be set for virtual-link.
- OSPFv3 redistribution not applicable on the same OSPFv3 process.
- If used in an ASA cluster, OSPFv3 encryption should be disabled.
- The Layer 3 cluster pool is not shared between OSPFv3 and the interface.

## Process Tab

Use the Process tab on the OSPFv3 page to enable and configure up to two OSPFv3 routing processes. Each OSPF process has its own associated areas and networks. For each, at minimum, create an area for OSPFv3, enable an interface for OSPFv3, then redistribute the route into the targeted OSPFv3 routing processes. Note that only single-context mode is supported.

### Navigation Path

The Process tab is on the OSPFv3 page.

- (Device view) Select **Platform > Routing > OSPFv3** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPFv3** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timers (in milliseconds) | <p>LSA and SPF throttling provide a dynamic mechanism to slow LSA updates in OSPFv3 during times of network instability, and allow faster OSPFv3 convergence by providing LSA rate limiting. The settings used to configure LSA pacing and SPF calculation timers are:</p> <ul style="list-style-type: none"> <li>• LSA Arrival – The minimum delay between acceptance of the same LSA arriving from neighbors. Valid values range from 0 to 600000 milliseconds. The default is 1000.</li> <li>• LSA Flood Pacing – The amount of time LSAs in the flooding queue are paced in between updates. Valid values range from 5 to 100 milliseconds. The default value is 33.</li> <li>• LSA Group Pacing – The interval at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800; the default value is 240 milliseconds.</li> <li>• LSA Retransmission Pacing – The length of time at which LSAs in the retransmission queue are paced. Valid values range from 5 to 200 milliseconds. The default value is 66.</li> <li>• LSA Throttle – The delay in milliseconds to generate the first occurrence of the LSA. Valid values range from 0 to 600000 milliseconds. When you enter a value in this field, the min and max fields are enabled: <ul style="list-style-type: none"> <li>– min – The minimum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> <li>– max – The maximum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> <li>• SPF Throttle – The delay to receive a change to the SPF calculation. Valid values range from 1 to 600000 milliseconds. When you enter a value in this field, the min and max fields are enabled: <ul style="list-style-type: none"> <li>– min – The delay between the first and second SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> <li>– max – The maximum wait time for SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> </ul> <p><b>Note</b> For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.</p> |

| Element                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Link State Advertisement                                           | Enables strict link-state advertisement (LSA) checking.<br><b>Note</b> When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated. |
| Enable graceful-restart (Use when Spanned Cluster or Failover configured) | Enables graceful restart on the ASA.                                                                                                                                                                                                                                                                                                                                                                        |
| Length of graceful restart interval                                       | (Optional) Specifies the length of the graceful restart interval, in seconds. The range is from 1 to 1800. The default is 120.<br><b>Note</b> For a restart interval below 30 seconds, graceful restart will be terminated.                                                                                                                                                                                 |

## Area Tab (OSPFv3)

Use the Area panel on the [Process Tab, page 56-106](#) of the OSPFv3 page to configure OSPFv3 areas, ranges and virtual links. The Area panel consists of three definition tables—Area, Range, and Virtual Link:

- Refer to [Add/Edit Area Dialog Box \(OSPFv3\), page 56-111](#) for information about adding and editing Area table entries.
- Refer to [Add/Edit Range Dialog Box \(OSPFv3\), page 56-113](#) for information about adding and editing Range table entries.
- Refer to [Add/Edit Virtual Link Dialog Box \(OSPFv3\), page 56-114](#) for information about adding and editing Virtual Link table entries.

Refer to [Using Tables, page 1-48](#) for basic information about working with Security Manager tables.

### Navigation Path

You can access the Area tab from the [Process Tab, page 56-106](#) of the OSPFv3 page. For more information about the OSPFv3 page, see [Configuring OSPFv3, page 56-103](#).

### Related Topics

| Area ID | Enter an identifier for the area as either a decimal number or an IP address. Valid decimal values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Cost    | <p>The cost of sending a packet on an interface. Valid values are 0 to 65535.</p> <p>Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The ASA calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Type    | <p>Define the area type by choosing one of the following:</p> <ul style="list-style-type: none"> <li>• Normal – Make the area a standard OSPFv3 area. This option is selected by default when you first create an area.</li> <li>• NSSA – Make the area a “not-so-stubby area.” NSSAs accept Type 7 LSAs. When you choose this option, the Default Information Originate options are enabled.</li> </ul> <p>When you create a NSSA, you can prevent summary LSAs from being flooded into the area by deselecting <i>Allow sending summary LSA into this area</i>. You can also disable route redistribution by deselecting <i>Redistribute</i>, and enabling <i>Default information originate</i>.</p> <ul style="list-style-type: none"> <li>• Stub – Make the area a stub area. Stub areas do not have any routers or areas beyond it. Stub areas prevent AS External LSAs (Type 5 LSAs) from being flooded into the stub area. When you choose this option, <i>Allow sending summary LSA into this area</i> is enabled.</li> </ul> <p>When you create a stub area, you can prevent summary LSAs (Type 3 and 4) from being flooded into the area by deselecting <i>Allow sending summary LSA into this area</i>.</p> |

### Default Information Originate

These options are enabled when you choose NSSA as the area Type. The first option is enabled when you choose Stub as the area Type.

|                                                        |                                                         |
|--------------------------------------------------------|---------------------------------------------------------|
| Allow sending summary LSA into this area               | Select to allow flooding of summary LSAs into the area. |
| Redistribute (imports routes to normal and NSSA areas) | Select to allow route redistribution.                   |

**Table 56-75 Add/Edit Area Dialog Box (continued)**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default information originate | <p>Check this box to generate a Type 7 default into the NSSA. Selecting this option enables the following metric options:</p> <ul style="list-style-type: none"> <li>• Metric – The OSPF metric value for the default route. Valid values range from 1 to 16777214. The default is 1.</li> <li>• Metric Type – The OSPF metric type for the default route. Choose 1 (Type 1) or 2 (Type 2). The default is 1.</li> </ul> |

**Add/Edit Range Dialog Box (OSPFv3)**

Use the Add/Edit Area Range Network dialog box to add a new range to the area selected in the Area table, or to change an existing entry.

**Navigation Path**

You can access the Add/Edit Range dialog box from the Range panel under the [Area Tab \(OSPFv3\)](#), page 56-111.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Area ID           | This read-only entry is the ID of the area to which this virtual link applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Peer Router ID    | Enter the IP address of the virtual link neighbor.<br><b>Tip</b> You can click <b>Select</b> to select from a list of network objects.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TTL Security      | The time-to-live (TTL) security hop count on a virtual link. The hop count value can range from 1 to 254.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Dead Interval     | The interval, in seconds, if no hello packets are received, neighbors declare the device down. Valid values range from 1 to 8192. The default value of this field is four times the Hello Interval.                                                                                                                                                                                                                                                                                                                                                                           |
| Hello Interval    | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 8192 seconds. The default value is 10 seconds.                                                                                                                                                                                                          |
| Transmit Interval | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a device sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the device does not receive an acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 8192 seconds. The default value is 5 seconds.                                                                  |
| Transmit Delay    | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 8192 seconds. The default value is 1 second. |

## Add/Edit Redistribution Dialog Box (OSPFv3)

Use the Add/Edit Redistribution dialog box to add a redistribution rule to this process, or to edit an existing redistribution rule.

### Navigation Path

You can access the Redistribution dialog box from the Redistribution panel under the [Process Tab](#), page 56-106.

| The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol. |                                                                                                                                                                                                                         |
| Internal                                                                                                                                                                                                                                                                                       | The route is internal to a specific autonomous system.                                                                                                                                                                  |
| External 1                                                                                                                                                                                                                                                                                     | Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.                                                                                                                |
| External 2                                                                                                                                                                                                                                                                                     | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.                                                                                                                |
| NSSA External 1                                                                                                                                                                                                                                                                                | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.                                                                                                                    |
| NSSA External 2                                                                                                                                                                                                                                                                                | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.                                                                                                                    |

## Add/Edit Summary Prefix Dialog Box (OSPFv3)

Use the Add/Edit Summary Prefix dialog box to add new route-summarization entries to the selected process, or to modify existing entries.

### Navigation Path

You can access the Add/Edit Summary Prefix dialog box from the Summary Prefix panel under the [Process Tab, page 56-106](#).

|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advertise      | When selected, summary routes that match the specified prefix and mask pair are advertised. When deselected, routes that match the specified prefix and mask pair are suppressed. By default, this check box is selected.                                             |
| Tag (optional) | The tag is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between border devices. Valid values range from 0 to 4294967295.<br><br>This field is enabled when you check Advertise. |

## OSPFv3 Interface Tab

Use the Interface panel to configure interface-and neighbor-specific OSPFv3 routing properties. The Interface panel consists of two definition tables, Interface and Neighbor:

- Refer to [Add/Edit Interface Dialog Box \(OSPFv3\), page 56-117](#) for information about adding and editing Interface table entries.
- Refer to [Add/Edit Neighbor Dialog Box \(OSPFv3\), page 56-121](#) for information about adding and editing Neighbor table entries.

Refer to [Using Tables, page 1-48](#) for basic information about working with Security Manager tables.

### Navigation Path

Click the Interface tab on the OSPFv3 page to display this panel. For more information about the OSPFv3 page, see [Configuring OSPFv3, page 56-103](#).

### Related Topics

- [About OSPFv3, page 56-104](#)
- [Process Tab, page 56-106](#)

## Add/Edit Interface Dialog Box (OSPFv3)

Use the Add/Edit Interface dialog box to define OSPFv3 routing properties for an individual interface, or to change an existing entry.

### Navigation Path

You can access the Add/Edit Interface dialog box from the Interface panel under the [OSPFv3 Interface Tab, page 56-117](#).

### Related Topics

- [Configuring OSPFv3, page 56-103](#)
- [About OSPFv3, page 56-104](#)
- [Process Tab, page 56-106](#)

## Field Reference

Table 56-80 Add/Edit Interface Dialog Box

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                                 | The name of the interface to which this routing configuration applies.<br><b>Tip</b> You can click <b>Select</b> to select from a list of interface objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable OSPFv3 on this interface           | Check this box to enable OSPFv3 on the specified interface, and activate the following fields: <ul style="list-style-type: none"> <li>Process ID – Choose the process to apply to this interface; defined on the OSPFv3 <a href="#">Process Tab, page 56-106</a>.</li> <li>Area ID – Identify the area to be assigned; areas are also defined on the OSPFv3 <a href="#">Process Tab, page 56-106</a>.</li> <li>Instance ID – (Optional) Specify an ID for this process instance. Valid values for this setting range from 0 to 255.</li> </ul> <p>This feature lets you have multiple OSPFv3 processes on a single link. Received packets with other instance IDs are then ignored by this process.</p> |
| <b>Properties</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Filter outgoing link-state advertisements | Check this box to filter outgoing LSAs. All outgoing LSAs are flooded to the interface by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Disable MTU mismatch detection            | Check this box to disable the OSPFv3 MTU mismatch detection when database description (DBD) packets are received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Flood Reduction                           | Check this box to suppress unnecessary flooding of LSAs in stable topologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Point-to-point Network                    | Check this box to define this as a link to a point-to-point network; that is, a network between two routing devices. All neighbors on a point-to-point network establish adjacency and there is no designated router.<br><br>This option is unavailable when the Broadcast option is selected.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Broadcast                                 | Check this box to define this as a link to a network with multiple routing devices. Such networks establish a designated router (DR), as well as a backup designated router (BDR), that controls LSA flooding on the network.<br><br>This option is unavailable when the Point-to-point Network option is selected.                                                                                                                                                                                                                                                                                                                                                                                     |
| Cost                                      | The cost of sending a packet through the interface. Link cost is an arbitrary number used in shortest path first calculations. If you do not assign a value, the configured reference bandwidth divided by the interface port speed is used. (The default reference bandwidth is 40 Gb/sec.)                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 56-80 Add/Edit Interface Dialog Box (continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority              | <p>Assign an OSPFv3 priority to this interface. Valid values for this setting range from 0 to 255. Entering 0 for this setting makes the device ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, non-broadcast interfaces.</p> <p>When two routing devices connect to a network, both attempt to become the designated router. The device with the higher priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router.</p>                                                                                        |
| Dead Interval         | <p>If no hello packets are received from a neighbor within this interval, that device is designated as inactive. Valid values range from 1 to 65535. The default value for this setting is four times the hello interval.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Poll Interval         | <p>If a neighboring device is inactive, it may be necessary to continue sending hello packets to that neighbor. The hello packets are sent at this reduced interval, which should be larger than the hello interval.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Retransmit Interval   | <p>The time, in seconds, between LSA retransmissions for adjacent neighbors. When a router sends an LSA to a neighbor, it keeps the LSA until it receives an acknowledgment. If an acknowledgment is not received within this interval, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds.</p>                                                                                                                                                                                                                              |
| Transmit Delay        | <p>The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds.</p>                                                                                                                                      |
| <b>Authentication</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type                  | <p>The type of authentication enabled on this interface. Choose one of the following:</p> <ul style="list-style-type: none"> <li>• Area – OSPFv3 does not provide “built-in” authentication, instead relying on IPv6/IPSec protocols. Choose this option to use those protocols to authenticate OSPFv3 traffic on all interfaces in the area; this means all routing devices in the area must use this option. This is the default.</li> <li>• Interface – Choose this option to secure this interface and protect OSPFv3 virtual links. The additional parameters in this section are enabled when you choose this option.</li> <li>• None – OSPFv3 authentication is disabled.</li> </ul> |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encryption Key | Enter an encryption key. The length of the key entered depends on the type of encryption chosen as the Encryption Algorithm, and whether the key is to be encrypted (when you check the Encrypt Key box): <ul style="list-style-type: none"> <li>• 3des – 48 characters (192 bits).</li> <li>• 3des (encrypted) – 98 characters (192 bits).</li> <li>• aes-cbc/128 – 32 characters (128 bits).</li> <li>• aes-cbc/128 (encrypted) – 66 characters (128 bits).</li> <li>• aes-cbc/192 – 48 characters (192 bits).</li> <li>• aes-cbc/192 (encrypted) – 98 characters (192 bits).</li> <li>• aes-cbc/256 – 64 characters (256 bits).</li> <li>• aes-cbc/256 (encrypted) – 130 characters (256 bits).</li> <li>• des – 16 characters (64 bits).</li> <li>• des (encrypted) – 34 characters (64 bits).</li> </ul> |
| Encrypt Key    | Check this box to require encryption of the specified Encryption Key for transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Add/Edit Neighbor Dialog Box (OSPFv3)

You must define a static neighbor for each point-to-point, non-broadcast interface. This feature lets you broadcast OSPFv3 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel. Note the following restrictions:

- You cannot define the same static neighbor for two different OSPFv3 processes.
- You must define a static route for each static neighbor.

Use the Add/Edit Neighbor dialog box to define a static neighbor for the interface selected in the Interface table, or to change information for an existing static neighbor.

### Navigation Path

You can access the Add/Edit Neighbor dialog box from the Neighbor panel under the [OSPFv3 Interface Tab](#), page 56-117.

|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link-local Address       | Enter the IPv6 address of the static neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Cost and Database Filter | <p>Check this box to enable filtering of the outgoing LSAs on the interface during synchronization and flooding. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• Cost – Use this field to assign an arbitrary cost to this neighbor. If a value is not assigned, the cost of the interface is used (this value is based on the port speed of the interface, and is calculated as reference bandwidth divided by interface speed). Valid values range from 1 to 65535.</li> <li>• Filter outgoing link-state advertisements – Check this box to disable forwarding of outgoing LSAs to this neighbor.</li> </ul> <p><b>Note</b> The Cost and Database Filter options and the Poll-Interval options are mutually exclusive.</p>                                                                                                                                                                                                                                                                |
| Poll-Interval            | <p>Check this box to enable the following options:</p> <ul style="list-style-type: none"> <li>• Poll Interval – Time interval in seconds between transmission of hello packets to a “dead” neighbor. The default is 120.<br/>If a neighboring device becomes inactive (hello packets have not been received for the dead interval period), it may be necessary to continue sending hello packets to the dead neighbor at a reduced rate. Thus this value should be larger than the interface hello interval.</li> <li>• Priority – The router priority value of this neighbor. The default is 0; valid values range from 1 to 255.<br/>The priority value helps determine the designated router for an OSPFv3 link. A value of zero means the device is ineligible to become the designated router, or backup designated router.</li> </ul> <p><b>Note</b> The Poll-Interval options and the Cost and Database Filter options are mutually exclusive. Also, these values do not apply to point-to-multipoint interfaces.</p> |

## Configuring RIP

Routing Information Protocol (RIP) is a dynamic routing protocol, or more precisely, an interior gateway protocol that is based on distance vectors. RIP uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcast packets with neighboring devices to dynamically learn about and advertise routes. These RIP packets contain information about the destination networks that the gateways can reach, and the number of gateways that a packet must travel through to reach those destinations.

Cisco Security Manager supports both RIP version 1 and RIP version 2. Version 1 does not send the subnet mask with the routing update; RIP version 2 sends the subnet mask with the routing update, and supports variable-length subnet masks. Additionally, RIP version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the security appliance receives reliable routing information from a trusted source.

**Note**

You cannot enable RIP if you have OSPF processes running.

**Limitations**

RIP has the following limitations:

- Cisco Security Manager cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.

**RIP Version 2 Notes**

The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP version 2 updates to the interface.
- With RIP version 2, the security appliance transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP version 2 configuration is removed from an interface, that multicast address is unregistered.

**Using Security Manager to Configure RIP on Security Appliances**

Use the RIP page to enable the Routing Information Protocol on an interface. The settings and features available when configuring RIP depend on the type of device and OS version that you are configuring:

- To configure RIP on a PIX Firewall or ASA running an OS version earlier than 7.2, or on any FWSM, see [RIP Page for PIX/ASA 6.3–7.1 and FWSM, page 56-123](#).
- To configure RIP on a PIX Firewall or ASA running OS version 7.2 or later, see [RIP Page for PIX/ASA 7.2 and Later, page 56-125](#).

## RIP Page for PIX/ASA 6.3–7.1 and FWSM

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any bug fixes or enhancements.

Use this RIP page to enable the Routing Information Protocol (RIP) on an interface in any FWSM, or in a PIX/ASA running a pre-7.2 version operating system.

The RIP table on this page lists all interfaces on which RIP is currently defined. Use the Add RIP Configuration and Edit RIP Configuration dialog boxes to create and maintain these entries. See [RIP Page for PIX/ASA 6.3–7.1 and FWSM, page 56-123](#) for more information.

#### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > RIP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

When creating a shared RIP policy, you must choose a Version in the Create a Policy dialog box, as follows:

- **PIX/ASA 6.3-7.1 and FWSM**
- **PIX/ASA 7.2 and Later**

When assigning a shared RIP policy, be sure to assign the appropriate RIP policy for the device. For example, you cannot assign a PIX/ASA 7.2+ RIP policy to an FWSM.

## Add/Edit RIP Configuration (PIX/ASA 6.3–7.1 and FWSM) Dialog Boxes

#### Note

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any bug fixes or enhancements.

Use the Add RIP Configuration and Edit RIP Configuration dialog boxes to add a RIP configuration to the security appliance, or to make changes to an existing RIP configuration. By adding a RIP configuration, you enable RIP on the specified interface. Except for their titles, the two dialog boxes are identical.

#### Navigation Path

You can access the Add and Edit RIP Configuration dialog boxes from the [RIP Page for PIX/ASA 6.3–7.1 and FWSM, page 56-123](#).

#### Field Reference

Configuring RIP Version 2 registers the multicast address 224.0.0.9 on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Version 2 Authentication | <p>These options let you enable and select the type of authentication used with RIP Version 2.</p> <ul style="list-style-type: none"> <li>• <b>Enable Authentication</b> – This option is available when you select RIP Version 2 above. When this box is checked, RIP neighbor authentication is enabled and the following options become available: <ul style="list-style-type: none"> <li>– <b>Type</b> – Select <b>MD5</b> to use the MD5 hash algorithm for authentication (recommended), or select <b>Clear text</b> to use clear text for authentication.</li> <li>– <b>Key ID</b> – The identification number of the authentication key. This number must be shared with all other devices sending updates to and receiving updates from the security appliance. Valid values range from 1 to 255.</li> <li>– <b>Key</b> – The shared key used for authentication. This key must be shared with all other devices sending updates to and receiving updates from the security appliance. The key can be up to 16 characters.</li> </ul> </li> </ul> |

## RIP Page for PIX/ASA 7.2 and Later

### Note

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any bug fixes or enhancements.

Use this RIP page to enable and configure the Routing Information Protocol (RIP) on PIX and ASA devices running operating system 7.2 or later. The RIP page consists of these tabbed panels:

- [RIP - Setup Tab, page 56-126](#)
- [RIP - Redistribution Tab, page 56-128](#)
- [RIP - Filtering Tab, page 56-129](#)

- [RIP - Interface Tab, page 56-130](#)

#### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > RIP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

When creating a shared RIP policy, you must choose a Version in the Create a Policy dialog box, as follows:

- **PIX/ASA 6.3-7.1 and FWSM**
- **PIX/ASA 7.2 and Later**

When assigning a shared RIP policy, be sure to assign the appropriate RIP policy for the device. For example, you cannot assign a PIX/ASA 7.2+ RIP policy to an FWSM.

Table 56-83 Setup Tab

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks                       | <p>Define one or more networks for RIP routing. Enter IP address(es), or enter or Select the desired Network/Hosts objects (see <a href="#">Understanding Networks/Hosts Objects, page 6-80</a>); IP addresses must not contain any subnet information. There is no limit to the number of networks you can add to the security appliance configuration.</p> <p>The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates.</p>                                                                                                                                                                                                                                       |
| Passive Interface              | <p>Use this option to specify passive interfaces on the security appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates. Choose one of these options:</p> <ol style="list-style-type: none"> <li><b>None</b> – No interfaces are designated as passive.</li> <li><b>All Interfaces</b> – All interfaces on the device are designated as passive, except those entered the Excluded Interfaces field below.</li> <li><b>Specified Interfaces</b> – Only those interfaces explicitly specified in the Interfaces field below are designated as passive.</li> </ol> |
| Interfaces/Excluded Interfaces | <p>Use this field to specify the interfaces excluded from the passive list, or those explicitly designated as passive, depending on your choice from the Passive Interface list above:</p> <ul style="list-style-type: none"> <li>If you chose All Interfaces, this field is labeled <b>Excluded Interfaces</b>: enter or Select only those interfaces to be excluded (that is, those that are to be active not passive).</li> <li>If you chose Specified Interfaces in the Passive Interface list, enter or Select those interfaces that are to be designated as passive.</li> </ul> <p><b>Note</b> You cannot specify two different RIP configurations for the same interface.</p>                                                                                                                                           |
| RIP Version                    | <p>Choose the RIP versions for sending and receiving RIP updates:</p> <ul style="list-style-type: none"> <li>Receive Version 1 and 2, Send Version 1</li> <li>Send and Receive Version 1</li> <li>Send and Receive Version 2</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Generate Default Route         | <p>When selected, a default route is generated for distribution, based on the Route Map you specify.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Route Map                      | <p>Specify the route map to use for generating default routes.</p> <p><b>Note</b> This field contains only the Route Map name. The Route Map is created and contained within a FlexConfig; see <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 56-83 Setup Tab (continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Auto-Summary | <p>When Send and Receive Version 2 is the chosen RIP Version, this option is available. When checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised.</p> <p><b>Note</b> RIP Version 1 always uses automatic summarization—you cannot disable it.</p> |

## RIP - Redistribution Tab

Use the Redistribution panel to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process. See [Add/Edit Redistribution Dialog Box, page 56-128](#) for more information.

### Navigation Path

You can access the Redistribution tab from the [RIP Page for PIX/ASA 7.2 and Later, page 56-125](#).

## Add/Edit Redistribution Dialog Box

Use the Add Redistribution and Edit Redistribution dialog boxes to add and edit redistribution routes on the [RIP - Redistribution Tab, page 56-128](#). These are the routes that are being redistributed from other routing processes into the RIP routing process. Except for their titles, these two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit Redistribution dialog boxes from the Redistribution tab on the [RIP Page for PIX/ASA 7.2 and Later, page 56-125](#).

**Table 56-84 Add/Edit Redistribution Dialog Box**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol to Redistribute | <p>Choose the routing protocol to redistribute into the RIP routing process:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> – Static routes.</li> <li>• <b>Connected</b> – Directly connected networks.</li> <li>• <b>OSPF</b> – Routes discovered by the OSPF routing process.</li> </ul> <p>If you choose OSPF, you must also enter the OSPF Process ID and, optionally, Match criteria.</p> |

**Table 56-84 Add/Edit Redistribution Dialog Box (continued)**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID   | Enter the process ID when the OSPF protocol is chosen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Match        | <p>If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute. Ctrl-click to select multiple types:</p> <ul style="list-style-type: none"> <li>• Internal – Routes internal to the autonomous system (AS) are redistributed.</li> <li>• External 1 – Type 1 routes external to the AS are redistributed.</li> <li>• External 2 – Type 2 routes external to the AS are redistributed.</li> <li>• NSSA External 1 – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.</li> <li>• NSSA External 2 – Type 2 routes external to an NSSA are redistributed.</li> </ul> <p>Match criteria are optional. The default is match Internal, External 1, and External 2.</p> |
| Metric       | <p>The RIP metric type to apply to the redistributed routes. The two choices are:</p> <ul style="list-style-type: none"> <li>• <b>Transparent</b> – Use the current route metric.</li> <li>• <b>Specified Value</b> – Assign a specific metric value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Metric Value | The metric value to be assigned; enter a value from 0 to 16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Route Map    | <p>The name of a route map that must be satisfied before the route can be redistributed into the RIP routing process.</p> <p><b>Note</b> This field contains only the route Map name. The contents of the route map are created and contained within a FlexConfig. See <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |

## RIP - Filtering Tab

Use the Filtering panel to manage filters for the RIP policy. Filters are used to limit network information in incoming and outgoing RIP advertisements. See [Add/Edit Filter Dialog Box, page 56-130](#) for more information.

### Navigation Path

You can access the Filtering tab from the [RIP Page for PIX/ASA 7.2 and Later, page 56-125](#).

### Related Topics

- [RIP - Setup Tab, page 56-126](#)

|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface           | Enter or Select an interface defined on this appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Send (Version)      | These options let you override, for this interface, the global Send versions specified on the <a href="#">RIP - Setup Tab, page 56-126</a> . Select the appropriate boxes to specify sending updates using RIP Version 1, Version 2, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Receive (Version)   | These options let you override the global Receive versions. Select the appropriate boxes to specify accepting updates using RIP Version 1 only, Version 2 only, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Authentication type | <p>Choose the authentication used on this interface for RIP broadcasts:</p> <ul style="list-style-type: none"> <li>• <b>None</b> – No authentication.</li> <li>• <b>MD5</b> – Employ MD5.</li> <li>• <b>Clear Text</b> – Employ clear-text authentication.</li> </ul> <p>If you choose MD5 or Clear Text, you must also provide the following authentication parameters:</p> <ul style="list-style-type: none"> <li>• <b>Key ID</b> – The ID of the authentication key. Valid values are from 0 to 255.</li> <li>• <b>Key</b> – The key used by the chosen authentication method. Can contain up to 16 characters.</li> <li>• <b>Confirm</b> – Enter the authentication key again, to confirm.</li> </ul> |

## Configuring Static Routes

A static route is a specific path to a particular destination network that is manually defined on the current device. Static routes are used in a variety of situations, and can be a quick and effective way to route data from one network to another when there is no dynamic route to the destination, or when use of a dynamic routing protocol is not feasible.

All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.

For static routes, the default metric value is one, which gives them precedence over routes from dynamic routing protocols. If you increase the metric to a value greater than that of a dynamic route, the static route operates as a back-up in the event that dynamic routing fails. For example, Open Shortest Path First

(OSPF)-derived routes have a default administrative distance of 100. To configure a back-up static route that is overridden by an OSPF route, specify a metric value for the static route that is greater than 100. This is referred to as a “floating” static route.

There is a special kind of static route known as a default route, or a “zero-zero” route because all zeroes are used for both the destination address and subnet mask. The default static route serves as a catch-all gateway: if there are no matches for a particular destination in the device’s routing table, the default route is used. The default route generally includes a next-hop IP address or local exit interface.

Use the Static Route page to maintain manually defined static routes. The Static Route table on this page lists all currently defined static routes, showing for each, the name of the interface or interface role for which the route is defined, the destination network(s), the next hop gateway, the route metric, whether the route is tunneled, and whether there is service-level agreement tracking for the route. For a detailed explanation of these fields, see [Add/Edit Static Route Dialog Box, page 56-133](#) or [Add/Edit IPv6 Static Route Dialog Box, page 56-134](#).

### Static null0 Route Configuration

Typically ACLs are used for traffic filtering and they enable you to filter packets based on the information contained in their headers. In packet filtering, the ASA firewall examines packet headers to make a filtering decision, thus adding some overhead to the processing of the packets and affecting performance.

Static null 0 routing is a complementary solution to filtering. A static null0 route is used to forward unwanted or undesirable traffic into a black hole. The null interface null0, is used to create the black hole. Static routes are created for destinations that are not desirable, and the static route configuration points to the null interface. Any traffic that has a destination address that has a best match of the black hole static route is automatically dropped. Unlike with ACLs, static null0 routes do not cause any performance degradation.

The static null0 route configuration is used to prevent routing loops. BGP leverages the static null0 configuration for Remotely Triggered Black Hole routing.

### Navigation Path

- (Device view) Select **Platform > Routing > Static Route** or **Platform > Routing > IPv6 Static Route** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > Static Route** or **PIX/ASA/FWSM Platform > Routing > IPv6 Static Route** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit Static Route Dialog Box

The Add/Edit Static Route dialog box lets you add or edit a static route.

### Navigation Path

You can access the Add/Edit Static Route dialog box from the Static Routes page. Click the Add Row button to add a new static route; select an existing static route and click the Edit Row button to edit that route.

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | <p>Enter or Select the interface to which this static route applies.</p> <p>Sending traffic to a Null0 interface results in dropping the packets destined to the specified network. This feature is useful in configuring Remotely Triggered Black Hole (RTBH) for BGP. For more information, see <a href="#">Configuring Static Routes, page 56-131</a>.</p> <p><b>Note</b> If Null0 is selected as the interface, the Gateway and Tunneled options are disabled.</p>                                                                                                                                                                                                                                                                                      |
| Network   | <p>Enter or Select the destination network(s). You can provide one or more IP address/netmask entries, one or more Networks/Hosts objects, or a combination of both; separate the entries with commas.</p> <p>Enter “0.0.0.0/0” or “any” to specify a default route.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Gateway   | <p>Enter or Select the gateway router which is the next hop for this route. You can provide an IP address, or a Networks/Hosts object.</p> <p><b>Note</b> If an IP address from one of the security appliance’s interfaces is used as the Gateway IP address, the security appliance will resolve the designated IP address in the packet instead of resolving the Gateway IP address.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| Metric    | <p>The Metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. Because the hop count includes the destination network, all directly connected networks have a metric of 1.</p> <p>Enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1.</p> <p>The maximum number of equal-cost (equal-metric) routes that can be defined per interface is three. You cannot add a route with the same metric on different interfaces that are on the same network.</p> |

**Table 56-87 Add/Edit Static Route Dialog Box (continued)**

| Element        | Description                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunneled       | Select this option to make this a tunnel route; can be used only for a default route. You can configure only one default tunneled gateway per device. The Tunneled option is not supported in transparent mode. Available only on PIX/ASA 7.0+ devices.                                                                        |
| Route Tracking | To monitor route availability, enter or Select name of an SLA (service level agreement) object that defines the monitoring policy. Available only on PIX/ASA 7.2+ devices.<br><br>For more information on route tracking, see <a href="#">Monitoring Service Level Agreements (SLAs) To Maintain Connectivity</a> , page 51-8. |

## Add/Edit IPv6 Static Route Dialog Box

The Add/Edit IPv6 Static Route dialog box lets you add or edit an IPv6 static route. IPv6 static routes are only supported on the following devices:

- ASA 7.0 and later (Routed mode)
- ASA 8.2 and later (Transparent mode)
- FWSM 3.1 and later (Routed mode)

### Navigation Path

You can access the Add/Edit IPv6 Static Route dialog box from the IPv6 Static Route page. Click the **Add Row** button to add a new static route; select an existing static route and click the **Edit Row** button to edit that route.

| Tunneled | Select this option to specify the route as the default tunnel gateway for VPN traffic. You can configure only one default tunneled gateway per device. Available only on ASA 7.0+ devices in routed mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configuring Policy Objects for ASA Routing Policies

There are several policy objects that you use with ASA routing policies. This reference explains the configuration of these policy objects.

This section contains the following topics:

- [Understanding Route Map Objects, page 56-135](#)
- [Add or Edit Policy List Object Dialog Box, page 56-146](#)
- [Add or Edit Prefix List Object Dialog Box, page 56-149](#)
- [Add or Edit Prefix List IPv6 Object Dialog Box, page 56-151](#)
- [Add or Edit As Path Object Dialog Boxes, page 56-154](#)
- [Add or Edit Community List Object Dialog Box, page 56-156](#)
- [Create BFD Template, page 56-70](#)

## Understanding Route Map Objects

You can use route maps to define the conditions for redistributing routes from one routing protocol into another, or to enable policy routing.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, each has a permit or deny result. Evaluation of ACL or route maps consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.
- They are generic mechanisms—Criteria matches and match interpretation are dictated by the way that they are applied. The same route map applied to different tasks might be interpreted differently.

These are some of the differences between route maps and ACLs:

- Route maps frequently use ACLs as matching criteria.

---

**Note** Route maps do not support ACLs that include a user, user group, security group tag, or fully qualified domain name objects.

---

- The main result from the evaluation of an ACL is a yes or no answer—An ACL either permits or denies input data. Applied to redistribution, an ACL determines if a particular route can (route matches ACLs permit statement) or can not (matches deny statement) be redistributed. Typical route maps not only permit (some) redistributed routes but also modify information associated with the route, when it is redistributed into another protocol.
- Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs can not verify. For example, a route map can verify if the type of route is internal.
- Each ACL ends with an implicit deny statement, by design convention; there is no similar convention for route maps. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Fortunately, route maps that are applied to redistribution behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained deny statement at the end.

Route maps are preferred if you intend to either modify route information during redistribution or if you need more powerful matching capability than an ACL can provide. If you simply need to selectively permit some routes based on their prefix or mask, we recommend that you use a route map to map to an ACL (or equivalent prefix list).

**Note**

---

You must use a standard ACL as the match criterion for your route map. Using an extended ACL will not work, and your routes will never be redistributed. We recommend that you number clauses in intervals of 10 to reserve numbering space in case you need to insert clauses in the future.

---

### Permit and Deny Clauses

Route maps can have permit and deny clauses. If the match criteria are met for this route map, and the permit keyword is specified, the route is redistributed as controlled by the set actions. If the match criteria are not met, and the permit keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set. If the match criteria are met for the route map and the deny keyword is specified, the route is not redistributed.

The following rules apply:

- If you use an ACL in a route map using a permit clause, routes that are permitted by the ACL are redistributed.
- If you use an ACL in a route map deny clause, routes that are permitted by the ACL are not redistributed.
- If you use an ACL in a route map permit or deny clause, and the ACL denies a route, then the route map clause match is not found and the next route-map clause is evaluated.

### Match and Set Clause Values

Each entry in a route map statement contains a combination of match and set clauses. The match clause defines the criteria for whether appropriate packets meet the particular policy (that is, the conditions to be met). The set clause explains how the packets should be routed once they have met the match criteria.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeed, then the route is redistributed or rejected as dictated by the permit or deny clause, and some of its attributes might be modified as defined by the set clause. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map. Scanning of the route map continues until a clause is found whose match clause matches the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

- If several Match Clause values are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).
- If a Match Clause value refers to several objects in one command, any of the objects should match (the logical OR algorithm is applied).
- If a Match Clause value is not present, all routes match the clause.
- If a Set Value is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

**Note**

Do not configure a Set Value in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

A route map clause without a Match or Set value performs an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).

**BGP Match and BGP Set Clauses**

In addition to the match and set values described above, BGP provides additional match and set capabilities to route maps.

The following route-map match clauses are supported with BGP:

- match AS path access list
- match community
- match policy list

The following route-map set clauses are supported with BGP:

- set AS path
- set community
- set automatic tag
- set local preference
- set weight
- set origin
- set next hop
- set IP prefix list

### Creating and Using Route Map Objects

When configuring a policy that requires that you identify a route map, you can select or create route map objects by clicking the **Select** button next to the Route Map field. To create a new route map from the Route Map Object Selector dialog box, click the **Create** button beneath the route map list. You can also create route map objects from the [Policy Object Manager](#) by selecting **Route Map** from the Object Type Selector and then clicking the **New Object** button. For information on the specific fields available when creating a route map object, see [Add or Edit Route Map Object Dialog Boxes, page 56-139](#).

### Note about the use of Route Map Objects in BGP Policies

Some of the match and set criteria used in route maps are not supported in all BGP subcommands. For example:

The following route map match criteria:

- Match Clause tab > Match first hop interface of route, Match Next Hop (IPv4 and IPv6), Match Route Source (IPv4 and IPv6), Match Metric Route Value, and Match Tag
- BGP Match Clause tab > Match AS path access lists

and the following route map set criteria:

- Set Clause tab > Metric Values (all fields) and Metric Type
- BGP Set Clause tab > Set AS path, Prepend AS path, and Prepend last AS to the AS path

are not supported in the following places:

- BGP policy > IPv4 Address Family:
  - Aggregate Address tab > Attribute Map, Advertise Map, and Suppress Map
  - Neighbor tab > Filtering tab
  - Route Injection tab > Inject Map and Exist Map

Security Manager allows you to use route maps in your BGP configuration even if the route map contains unsupported match or set criteria and you will not receive a warning or error during validation. In such cases, deployment will fail and you will receive an error from the device in the following format:

```
...% "My-Route-map" used as BGP inbound route-map, nexthop match not supported...
```

Please refer to the ASA documentation for guidelines on the match/set criteria supported in route maps used in BGP configuration.

## Add or Edit Route Map Object Dialog Boxes

Use the Add/Edit Route Map Object dialog box to create, copy and edit route map policy objects. You can use route maps to define the conditions for redistributing routes from one routing protocol into another, or to enable policy routing.

### Navigation Path

Select **Manage > Policy Objects**, then select **Route Map** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Table 56-89 Add/Edit Route Map Object Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | <p>Enter a meaningful name for the route map object. The route map object name cannot be more than 58 characters.</p> <p> <b>Caution</b> Security Manager allows you to rename these objects even though you cannot rename them on the device. When you rename these objects in Security Manager, the name change is accomplished by negating the existing CLI, and then issuing new CLI to create and assign the object using the new name. This initial negation may cause routing/network issues in your environment. Security Manager will not provide a warning message about these consequences when you rename the object.</p> |
| Description     | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Route Map table | <p>The Route Map entries that are defined in the object.</p> <ul style="list-style-type: none"> <li>• To add a Route Map entry, click the <b>Add</b> button to open the <a href="#">Add or Edit Route Map Entry Dialog Box, page 56-140</a>.</li> <li>• To edit a Route Map entry, select it and click the <b>Edit</b> button.</li> <li>• To delete a Route Map entry, select it and click the <b>Delete</b> button.</li> </ul>                                                                                                                                                                                                                                                                                          |

**Table 56-89 Add/Edit Route Map Object Dialog Box (continued)**

| Element                                   | Description                                                                                                                                                                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                              |
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

### Add or Edit Route Map Entry Dialog Box

Use the Add/Edit Route Map Entry dialog box to create a new route map entry for a Route Map object or to edit an existing one.

#### Navigation Path

From the [Add or Edit Route Map Object Dialog Boxes, page 56-139](#), click the **Add** button beneath the Route Map table or select an entry in the table and click the **Edit** button.

**Table 56-90 Add/Edit Route Map Entry Dialog Box (continued)**

| Element                  | Description                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Metric Route Value | Enable or disable matching the metric of a route. Type the metric values to use for matching in the Match Metric Route Value field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.    |
| Match Tag                | Enable or disable matching the security group tag of a route. Type the tag values to use for matching in the Match Tag field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295. |
| Match Route Type         | Enable or disable matching of the route type. Valid route types are External1, External2, Internal, Local, NSSA-External1, and NSSA-External2. When enabled, you can choose more than one route type from the list.                                                                                                   |

**Set Clause Tab**

Select the Set Clause tab to modify the following information, which will be redistributed to the target protocol:

**Note** You can specify just the Bandwidth value, all of the values, or none of the values.

|                   |                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bandwidth         | Metric value or Bandwidth in Kbits per second; an integer value from 0 to 4294967295.                                                                            |
| EIGRP Delay       | EIGRP route delay, in tens of microseconds. Valid values range from 1 to 4294967295.                                                                             |
| EIGRP Reliability | Likelihood of successful packet transmission for EIGRP expressed as a number from 0 to 255. The value 255 means 100 percent reliability; 0 means no reliability. |
| EIGRP Effective   | Effective EIGRP bandwidth of a route expressed as a number from 1 to 255. The value 255 means 100 percent loading.                                               |
| EIGRP MTU         | Minimum MTU size of a route for EIGRP, in bytes. Valid values range from 1 to 4294967295.                                                                        |
| Set Metric Type   | Select to specify the type of metric for the destination routing protocol, and choose the metric type from the drop-down list: internal, type-1, or type-2.      |

**BGP Match Clause Tab**

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match AS path access lists | <p>Select to enable matching the BGP autonomous system path access list with the specified path access list. If you specify more than one path access list, then the route can match either path access list.</p> <p>Use the ellipsis to open the AS Path Object Selector from which you can select one or more AS path objects. You can also create new AS path objects from the AS Path Object Selector. For more information, see <a href="#">Add or Edit As Path Object Dialog Boxes, page 56-154</a>.</p> |

**Table 56-90 Add/Edit Route Map Entry Dialog Box (continued)**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match community   | <p>Select to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. Any route that does not match at least one Match community will not be advertised for outbound route maps.</p> <p>Use the ellipsis to open the Community List Object Selector from which you can select one or more Community List objects. You can also create new Community List objects from the Community List Object Selector. For more information, see <a href="#">Add or Edit Community List Object Dialog Box, page 56-156</a>.</p> <p>To enable matching the BGP community exactly with the specified community, check the <b>Match the specified community exactly</b> check box.</p> |
| Match policy list | <p>Select to configure a route map to evaluate and process a BGP policy. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.</p> <p>Use the ellipsis to open the Policy List Object Selector from which you can select one or more Policy List objects. You can also create new Policy List objects from the Policy List Object Selector. For more information, see <a href="#">Add or Edit Policy List Object Dialog Box, page 56-146</a>.</p>                                                                                                                                                                                                                                         |

**BGP Set Clause Tab**

Select the BGP Set Clause tab to modify the following information, which will be redistributed to the BGP protocol:

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set AS path   | <p>Select to modify an autonomous system path for BGP routes.</p> <ul style="list-style-type: none"> <li>Select <b>Prepend AS path</b> to prepend an arbitrary autonomous system path string to BGP routes. Usually the local AS number is prepended multiple times, increasing the autonomous system path length. If you specify more than one AS path number then the route can prepend either AS number.</li> <li>Select <b>Prepend last AS to the AS path</b> to prepend the AS path with the last AS number. Enter a value for the AS number from 1 to 10.</li> <li>Select <b>Convert route tag into AS path</b> to convert the tag of a route into an autonomous system path.</li> </ul> |
| Set community | <p>Select to set the BGP communities attributes.</p> <ul style="list-style-type: none"> <li>Select <b>None</b> to remove the community attribute from the prefixes that pass the route map.</li> <li>Select <b>Specify community</b> to enter a community number, if applicable. Valid values are from 1 to 4294967295.</li> </ul> <p>Select <b>Add to the existing communities</b> to add the community to the already existing communities.</p> <ul style="list-style-type: none"> <li>Select <b>Internet, no-advertise</b> or <b>no-export</b> to use one of the well-known communities.</li> </ul>                                                                                         |

**Table 56-90 Add/Edit Route Map Entry Dialog Box (continued)**

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set Automatic-tag    | Select to automatically compute the tag value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Set local preference | Select to specify a preference value for the autonomous system path. Enter a value between 0 and 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Set weight           | Select to specify the BGP weight for the routing table. Enter a value between 0 and 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Set origin           | Select to specify the BGP origin code. Valid values are Local IGP and Incomplete.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop IPv4</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Set next hop         | Select to specify the output address of packets that fulfill the match clause of a route map: <ul style="list-style-type: none"> <li>• Select <b>Specify IPv4 address</b> to enter the IPv4 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv4 address then the packets can output at either IP address.</li> <li>• Select <b>Use peer address</b> to set the next hop to be the BGP peer address.</li> </ul>                                                    |
| <b>Next hop IPv6</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Set next hop         | Select to specify the output address of packets that fulfill the match clause of a route map: <ul style="list-style-type: none"> <li>• Select <b>Specify IPv6 address</b> to enter the IPv6 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv6 address then the packets can output at either IP address. You can enter multiple values separated by commas.</li> <li>• Select <b>Use peer address</b> to set the next hop to be the BGP peer address.</li> </ul> |
| <b>Prefix List</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Set IPv4 prefix list | Select to set an IPv4 prefix list.<br><br>Use the ellipsis to open the Prefix List Object Selector from which you can select one or more Prefix List objects. You can also create new Prefix List objects from the Prefix List Object Selector. For more information, see <a href="#">Add or Edit Prefix List Object Dialog Box, page 56-149</a> .                                                                                                                                                                                      |
| Set IPv6 prefix list | Select to set an IPv6 prefix list.<br><br>Use the ellipsis to open the Prefix List Object IPv6 Selector from which you can select one or more IPv6 Prefix List objects. You can also create new IPv6 Prefix List objects from the Prefix List Object Selector. For more information, see <a href="#">Add or Edit Prefix List IPv6 Object Dialog Box, page 56-151</a> .                                                                                                                                                                  |

**Table 56-90 Add/Edit Route Map Entry Dialog Box (continued)**

| Element                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Policy Based Routing (PBR) Tab</b>                                         |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                                                               | Click the Policy Based Routing tab to define policy for traffic flows, and lessening reliance on routes derived from routing protocols. PBR gives you more control over routing by extending and complementing the existing mechanisms provided by routing protocols. PBR allows you to set the IP precedence. It also allows you to specify a path for certain traffic, such as priority traffic over a high-cost link. |
| Set Default Next-Hop IPv4 Address                                             | Check the Set default next-hop IPv4 address check box to indicate where to output packets that pass a match clause of a route map for policy routing. In the IPv4 Address enter the destination address.                                                                                                                                                                                                                 |
| Set Default Next-Hop IPv6 Address                                             | Check the Set default next-hop IPv6 address check box to indicate where to output packets that pass a match clause of a route map for policy routing. In the IPv6 Address enter the destination address.                                                                                                                                                                                                                 |
| Recursively find and set Next-Hop IPv4 Address                                | Check the Recursively find and set next-hop IP address check box and specify an IP address in the IPv4 Address field. In this case, the next-hop IP address need not be on a directly connected subnet.                                                                                                                                                                                                                  |
| Set Interfaces                                                                | Check the Set interfaces check box and select a destination interface from the Interfaces Selector dialog box.                                                                                                                                                                                                                                                                                                           |
| Set Null0 Interfaces as Default Interface                                     | Check the Set null0 interface as the default interface check box, if there is a need to completely black hole or drop some traffic.                                                                                                                                                                                                                                                                                      |
| Set do-not-fragment bit to either 0 or 1                                      | Check the Set do-not-fragment bit to either 1 or 0 and then select the appropriate radio button.                                                                                                                                                                                                                                                                                                                         |
| Set Differential Service Code point (DSCP) value in Q...                      | Check the Set differential service code point (DSCP) value in QoS bits for IPv4 packets check box and either enter a value between 0 and 63 or select a value from the Select Value drop-down list.                                                                                                                                                                                                                      |
| Set Differential Service Code point (DSCP) value in QOS bits for IPv6 packets | Check the Set differential service code point (DSCP) value in QoS bits for IPv6 packets check box and either enter a value between 0 and 63 or select a value from the Select Value drop-down list.                                                                                                                                                                                                                      |

## Add or Edit Policy List Object Dialog Box

Use the Add/Edit Policy List Object dialog box to create, copy, and edit policy list policy objects. You can create policy list objects to use when you are configuring route maps (see [Understanding Route Map Objects, page 56-135](#)).

When a policy list is referenced within a route map, all of the match statements within the policy list are evaluated and processed. Two or more policy lists can be configured with a route map. A policy list can also coexist with any other preexisting match and set statements that are configured within the same route map but outside of the policy list. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

### Navigation Path

Select **Manage > Policy Objects**, then select **Policy List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 56-91 Add/Edit Policy List Object Dialog Box**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | <p>The name of the object. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a>.</p> <p> <b>Caution</b> Security Manager allows you to rename these objects even though you cannot rename them on the device. When you rename these objects in Security Manager, the name change is accomplished by negating the existing CLI, and then issuing new CLI to create and assign the object using the new name. This initial negation may cause routing/network issues in your environment. Security Manager will not provide a warning message about these consequences when you rename the object.</p> |
| Description      | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Basic Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Action           | <p>Whether to permit access for matching conditions or not.</p> <p><b>Note</b> The Action for a policy list object cannot be changed after the initial creation of the policy list object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Match Interface  | <p>Select to distribute routes that have their next hop out of one of the interfaces specified. Enter or select the interfaces to match. Separate multiple entries with a comma. If you specify more than one interface, then the route can match either interface.</p> <p>Use the ellipsis to open the Interfaces Selector from which you can select one or more interfaces. You can also create new interface roles from the Interfaces Selector. For more information, see <a href="#">Understanding Interface Role Objects, page 6-73</a>.</p>                                                                                                                                                                                                |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Community Rules           | <p>Select to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community.</p> <p>Use the ellipsis to open the Community List Object Selector from which you can select one or more Community List objects. You can also create new Community List objects from the Community List Object Selector. For more information, see <a href="#">Add or Edit Community List Object Dialog Box, page 56-156</a>.</p> <p>To enable matching the BGP community exactly with the specified community, check the <b>exact-match</b> check box.</p> |
| Match Metric                    | <p>Enable or disable matching the metric of a route. Type the metric values to use for matching in the Match Metric field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.</p>                                                                                                                                                                                                                                                                                                               |
| Match Tag                       | <p>Enable or disable matching the security group tag of a route. Type the tag values to use for matching in the Match Tag field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.</p>                                                                                                                                                                                                                                                                                                |
| Category                        | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow Value Override per Device | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a>.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                                                                            |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Edit button                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Add or Edit Prefix List Object Dialog Box

Use the Add/Edit Prefix List Object dialog box to create, copy and edit prefix list policy objects. You can create prefix list objects to use when you are configuring route maps (see [Understanding Route Map Objects, page 56-135](#)), policy maps (see [Add or Edit Policy List Object Dialog Box, page 56-146](#)), OSPF Filtering (see [Add/Edit Filtering Dialog Box, page 56-93](#)), or BGP Neighbor Filtering (see [Add/Edit Neighbor Dialog Box, page 56-11](#)).

Area Border Router (ABR) type 3 link-state advertisement (LSA) filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Prefix List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | <p>The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a>.</p> <p> <b>Caution</b> Security Manager allows you to rename these objects even though you cannot rename them on the device. When you rename these objects in Security Manager, the name change is accomplished by negating the existing CLI, and then issuing new CLI to create and assign the object using the new name. This initial negation may cause routing/network issues in your environment. Security Manager will not provide a warning message about these consequences when you rename the object.</p> |
| Description       | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Add or Edit Prefix List Entry Dialog Box

Use the Add/Edit Prefix List Entry dialog box to create a new prefix list entry or edit an existing one.

### Navigation Path

From the [Add or Edit Prefix List Object Dialog Box, page 56-149](#), click the **Add** button beneath the Prefix List table or select an entry in the table and click the **Edit** button.

**Table 56-93 Add/Edit Prefix List Entry Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                | Select the Permit or Deny radio button to indicate the redistribution access.                                                                                                                                                                                                 |
| Sequence No           | (Optional) Unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object. If left blank, the sequence number will default to five more than the largest sequence number currently in use. |
| IP Address            | Specify the prefix number in the format of IP address/mask length.                                                                                                                                                                                                            |
| Minimum Prefix Length | (Optional) Enter the minimum prefix length.<br>The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.                                                                                                              |
| Maximum Prefix Length | (Optional) Enter the maximum prefix length.<br>The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.                                                               |

## Add or Edit Prefix List IPv6 Object Dialog Box

Use the Add/Edit Prefix List IPv6 Object dialog box to create, copy and edit IPv6 prefix list policy objects. You can create IPv6 prefix list objects to use when you are configuring route maps (see [Understanding Route Map Objects, page 56-135](#)), policy maps (see [Add or Edit Policy List Object Dialog Box, page 56-146](#)), OSPF Filtering (see [Add/Edit Filtering Dialog Box, page 56-93](#)), or BGP Neighbor Filtering (see [Add/Edit Neighbor Dialog Box, page 56-11](#)).

Area Border Router (ABR) type 3 link-state advertisement (LSA) filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number.

### Navigation Path

Select **Manage > Policy Objects**, then select **Prefix ListIPv6** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | <p>The IPv6 Prefix List object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a>.</p> <p> <b>Caution</b> Security Manager allows you to rename these objects even though you cannot rename them on the device. When you rename these objects in Security Manager, the name change is accomplished by negating the existing CLI, and then issuing new CLI to create and assign the object using the new name. This initial negation may cause routing/network issues in your environment. Security Manager will not provide a warning message about these consequences when you rename the object.</p> |
| Description | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                             |

## Add or Edit IPv6 Prefix List Entry Dialog Box

Use the Add/Edit IPv6 Prefix List Entry dialog box to create a new IPv6 prefix list entry or edit an existing one.

### Navigation Path

From the [Add or Edit Prefix List IPv6 Object Dialog Box, page 56-151](#), click the **Add** button beneath the Prefix List table or select an entry in the table and click the **Edit** button.

### Field Reference

**Table 56-95 Add/Edit Prefix List Entry Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                | Select the Permit or Deny radio button to indicate the redistribution access.                                                                                                                                                                                                                                                                                  |
| Sequence No           | (Optional) Unique number that indicates the position a new IPv6 prefix list entry will have in the list of IPv6 prefix list entries already configured for this object. If left blank, the sequence number will default to five more than the largest sequence number currently in use.<br><b>Note</b> Sequence Number must be in the range of 1 to 4294967295 |
| IPv6 Address          | Specify the prefix number in the format: IPv6 address/mask length where mask length is less than or equal to 128.                                                                                                                                                                                                                                              |
| Minimum Prefix Length | (Optional) Enter the minimum prefix length in the range of 1 to 128.<br>The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.                                                                                                                                                                      |

**Table 56-95 Add/Edit Prefix List Entry Dialog Box (continued)**

| Element               | Description                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Prefix Length | (Optional) Enter the maximum prefix length in the range of 1 to 128.<br>The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified. |

## Add or Edit As Path Object Dialog Boxes

Use the Add/Edit As Path Object dialog box to create, copy and edit autonomous system (AS) path policy objects. You can create AS path objects to use when you are configuring route maps (see [Understanding Route Map Objects, page 56-135](#)), policy maps (see [Add or Edit Policy List Object Dialog Box, page 56-146](#)), or BGP Neighbor Filtering (see [Add/Edit Neighbor Dialog Box, page 56-11](#)).

An AS path filter allows you to filter the routing update message by using access lists and look at the individual prefixes within an update message. If a prefix within the update message matches the filter criteria then that individual prefix is filtered out or accepted depending on what action the filter entry has been configured to carry out.

### Note

AS path object names must be a unique integer from 1-500. If an AS path object is discovered from a device or configuration file that uses the same name as an existing AS path object, the AS path object on Security Manager will be overwritten regardless of the Allow Device Override for Discovered Policy Objects setting on the Security Manager Administration - Discovery page.

### Navigation Path

Select **Manage > Policy Objects**, then select **As Path** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | Enter a name for the AS Path Filter. Specify a unique value between 1 and 500.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description                     | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| AS Path table                   | The AS path entries that are defined in the object. <ul style="list-style-type: none"> <li>To add an AS path entry, click the <b>Add</b> button to open the <a href="#">Add or Edit As Path Entry Dialog Box, page 56-155</a>.</li> <li>To edit an AS path entry, select it and click the <b>Edit</b> button.</li> <li>To delete an AS path entry, select it and click the <b>Delete</b> button.</li> <li>To rearrange the entries, select an entry and then click the <b>Move Up</b> or <b>Move Down</b> button.</li> </ul> |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                    |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                                                                                                                       |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                 |

**Add or Edit As Path Entry Dialog Box**

Use the Add/Edit As Path Entry dialog box to create a new autonomous system (AS) path entry or edit an existing one.

**Navigation Path**

From the [Add or Edit As Path Object Dialog Boxes, page 56-154](#), click the **Add Row** button beneath the AS Path table or select an entry and click the **Edit Row** button.

**Field Reference****Table 56-97 Add/Edit As Path Entry Dialog Box**

| Element | Description                                                                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | Select the <b>Permit</b> or <b>Deny</b> radio button to indicate the redistribution access.                                                                                                                                         |
| Reg Exp | Specify the regular expression that defines the AS path filter. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions, page 17-110</a> . |

## Add or Edit Community List Object Dialog Box

Use the Add/Edit Community List Object dialog box to create, copy and edit community list policy objects. You can create community list objects to use when you are configuring route maps (see [Understanding Route Map Objects, page 56-135](#)) or policy maps (see [Add or Edit Policy List Object Dialog Box, page 56-146](#)).

A community is a group of destinations that share some common attribute. You can use community lists to create groups of communities to use in a match clause of a route map. Just like an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

### Navigation Path

Select **Manage > Policy Objects**, then select **Community List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                            |

## Add or Edit Community List Entry Dialog Box

Use the Add/Edit Community List Entry dialog box to create a new community list entry or edit an existing one.

### Navigation Path

From the [Add or Edit Community List Object Dialog Box](#), page 56-156, click the **Add** button beneath the Community List table or select an entry in the table and click the **Edit** button.

### Field Reference

**Table 56-99 Add/Edit Community List Entry Dialog Box**

| Element      | Description                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type         | Select the <b>Standard</b> or <b>Expanded</b> radio button to indicate the community rule type.<br><b>Note</b> You cannot have entries using Standard and entries using Expanded community rule types in the same Community List object.                       |
| Action       | Select the <b>Permit</b> or <b>Deny</b> radio button to indicate the redistribution access.                                                                                                                                                                    |
| Communities  | Specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.                                                                                                                                                               |
| internet     | Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).                                                                                                                           |
| no-advertise | Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).                                                                                                                     |
| no-export    | Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers. |
| Expressions  | For an expanded community list, specify the regular expression. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions</a> , page 17-110.                            |

## Add or Edit Community List Entry Dialog Box

Use the Add/Edit Community List Entry dialog box to create a new community list entry or edit an existing one.

### Navigation Path

From the [Add or Edit Community List Object Dialog Box, page 56-156](#), click the **Add** button beneath the Community List table or select an entry in the table and click the **Edit** button.

### Field Reference

**Table 56-100 Add/Edit Community List Entry Dialog Box**

| Element      | Description                                                                                                                                                                                                                                                    |

| Action       | Select the <b>Permit</b> or <b>Deny</b> radio button to indicate the redistribution access.                                                                                                                                                                    |
| Communities  | Specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.                                                                                                                                                               |
| internet     | Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).                                                                                                                           |
| no-advertise | Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).                                                                                                                     |
| no-export    | Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers. |
| Expressions  | For an expanded community list, specify the regular expression. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions, page 17-110</a> .                            |

# Configuring Security Policies on Firewall Devices

You can configure general security settings for the device using the General page and the Timeouts page under Platform > Security. You can enable anti-spoofing on interfaces, configure IP fragment settings, and configure a variety of timeout values for the device.

This chapter contains the following topics:

- [General Page, page 57-1](#)
- [Configuring Timeouts, page 57-4](#)

## General Page

Use the General page to configure security settings that help protect against malformed packets, spoofed packets, fragmented packets, and denial of service attacks. See [Configuring Floodguard, Anti-Spoofing and Fragment Settings, page 57-2](#) for more information about the settings on this page.

### Navigation Path

- (Device view) Select **Platform > Security > General** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Security > General** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

| Use these options to configure global fragment settings for the device. You can override these settings for individual interfaces; see <a href="#">Add/Edit General Security Configuration Dialog Box, page 57-3</a> for more information. |                                                                                                                                                                                                                                                                                                                                              |
| Enable Default Settings                                                                                                                                                                                                                    | Check this box to enable the default fragment settings fields.                                                                                                                                                                                                                                                                               |
| Size                                                                                                                                                                                                                                       | Specify the maximum number of fragments that can be in the IP re-assembly database waiting for re-assembly. The default is 200.                                                                                                                                                                                                              |
| Chain                                                                                                                                                                                                                                      | Specify the maximum number of fragments into which a full IP packet can be fragmented. The default is 24 packets.                                                                                                                                                                                                                            |
| Timeout                                                                                                                                                                                                                                    | Specify the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds. |

**Interface Configuration Table**

This table lists all interfaces on which individual anti-spoofing and fragment settings have been defined. Refer to [Configuring Floodguard, Anti-Spoofing and Fragment Settings, page 57-2](#) for more information about these settings. Refer to [Add/Edit General Security Configuration Dialog Box, page 57-3](#) for more information about configuring these settings on individual interfaces.

## Configuring Floodguard, Anti-Spoofing and Fragment Settings

Use the General page under Platform > Security to enable or disable Floodguard (on a PIX 6.3 or FWSM 2.x device), to enable Unicast Reverse Path Forwarding (anti-spoofing) on individual interfaces, and to configure IP fragment settings for the device, and for each interface of the device.

**Floodguard**

Floodguard lets you reclaim firewall resources if the user authentication subsystem runs out of resources. If an inbound or outbound `uauth` connection is being attacked or overused, the firewall will actively reclaim TCP user resources.

If the user authentication subsystem is depleted, TCP user resources in different states are reclaimed in the following order, depending on urgency:

1. Timewait
2. LastAck
3. FinWait
4. Embryonic
5. Idle

Floodguard is enabled by default. This option applies only to PIX 6.3 or FWSM 2.x devices.

### Anti-spoofing

Unicast Reverse Path Forwarding (RPF) guards against IP spoofing—a packet using an incorrect source IP address to obscure its true source—by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the security appliance looks only at the destination address when determining where to forward the packet. Unicast RPF instructs the security appliance to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the security appliance, the security appliance routing table must include a route back to the source address. See RFC 2267 for more information.

With outside traffic, for example, the security appliance can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the security appliance uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, the security appliance drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the security appliance drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:

- ICMP packets have no session, so each packet is checked.
- UDP and TCP have sessions, so the initial packet requires a reverse route look-up. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

### Fragment Settings

Fragment settings provide management of packet fragmentation and improve compatibility with the Network File System (NFS). By default, the security appliance allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to allow fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the security appliance, as fragmented packets are often used as DoS attacks.

| Override Default Fragment Settings | To override the default fragment settings on the specified interface, check this box to enable the following fields, and then enter the new values. See the <a href="#">General Page, page 57-1</a> for the default global fragment settings on the device.                                                                                                             |
| Size                               | Specify the maximum number of fragments that can be in the IP re-assembly database waiting for re-assembly for the specified interface. The default is 200.                                                                                                                                                                                                             |
| Chain                              | Specify the maximum number of fragments into which a full IP packet can be fragmented for the specified interface. The default is 24 packets.                                                                                                                                                                                                                           |
| Timeout                            | Specify the maximum number of seconds to wait for an entire fragmented packet to arrive on the specified interface. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds. |

## Configuring Timeouts

The Timeouts page lets you set a variety of timeout values on the security appliance. All times are in the format **hh:mm:ss**.

These values represent idle timeouts for the connection and translation slots for various protocols. If a slot has not been used for the idle time specified, the resource is returned to the free pool. TCP connection slots are freed approximately 60 seconds after a normal connection close sequence.

### Warning

**We recommend that you do not change these values unless advised to do so by Customer Support.**

### Navigation Path

- (Device view) Select **Platform > Security > Timeouts** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Security > Timeouts** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.

## Field Reference

Table 57-3 Timeouts Page

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | To change the timeout value for a parameter, click the radio button to the left of the parameter entry to activate it, and then enter the new value in the parameter field. To reset any value to its default, click the related Default button.<br><br>Clicking the Disable button, where provided, disables the timeout by setting its value to 0:00:00. Follow either of the procedures in the previous paragraph to re-enable a disabled value. |
| Translation Slot (xlate)            | Length of time idle until a translation slot is freed. This value must be at least 1 minute; the default is 3 hours. Enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                                         |
| Connection (conn)                   | Length of time idle until a connection slot is freed. This value must be at least 5 minutes; the default is 1 hour. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                         |
| Half-Closed                         | Length of time idle until a half-closed TCP connection is closed. For ASA 9.1.2 and later devices, the minimum is 30 seconds. For all other devices, the minimum is 5 minutes. The default is 10 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                   |
| UDP                                 | Length of time idle until a UDP protocol connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                              |
| SCTP                                | Length of time idle until a SCTP protocol connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                             |
| Connection Holddown                 | Length of time idle until traffic is forwarded. This is the time for which the ASA waits before forwarding traffic, to avoid route flapping. This value must be at least 1 second; the default is 15 seconds. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                               |
| ICMP (PIX 7.x+, ASA, FWSM 3.x+)     | Length of time idle after which general ICMP states are closed.                                                                                                                                                                                                                                                                                                                                                                                     |
| RPC/Sun RPC                         | Length of time idle until a SunRPC slot is freed. This value must be at least 1 minute; the default is 10 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                          |
| H.225                               | Length of time idle until an H.225 signaling connection is closed. The H.225 default timeout is 1 hour (01:00:00). Setting the value to 00:00:00 means never close the connection. To close a connection immediately after all calls are cleared, enter 1 second (0:00:01).                                                                                                                                                                         |
| H.323                               | Length of time idle until an H.323 media connection is closed. The default is 5 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                                                    |
| MGCP                                | Length of time idle after which MGCP media ports are closed. The default is 5 minutes (0:05:00). Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                                            |
| MGCP PAT (PIX 7.x+, ASA, FWSM 3.x+) | Length of time idle after which an MGCP PAT translation is removed. The minimum time is 30 seconds; the default is 5 minutes (0:05:00). Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                     |

Table 57-3 Timeouts Page (continued)

| Element                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP                                                  | Length of time idle until an SIP signaling port connection is closed. This value must be at least 5 minutes; the default is 30 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SIP Media                                            | Length of time idle until an SIP media port connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SIP Disconnect (PIX 6.3(5), PIX/ASA 7.2+, FWSM 3.2+) | Length of time idle after which a SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message. The minimum value is 0:00:01; the maximum value is 0:10:00. The default value is 0:02:00.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SIP Invite (PIX 6.3(5), PIX/ASA 7.2+, FWSM 3.2+)     | Length of time idle after which pinholes for PROVISIONAL responses and media xlates will be closed. The minimum value is 0:01:00; the maximum value is 0:30:00. The default value is 0:03:00.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SIP Provisional Media (PIX/ASA 7.2(3)+)              | The timeout value for SIP provisional media connections; must be a value between 0:01:00 and 1193:00:00. The default is 2 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Auth. (uath) Absolute                                | <p>Length of time until the authentication cache times out and new connections must be re-authenticated. The system waits until a user starts a new connection to prompt for re-authentication. This time must be shorter than the Translation Slot value. Click Disable or enter 0:00:00 to disable caching and require re-re-authentication on every new connection.</p> <p><b>Note</b> Do not set this value to 0:00:00 if passive FTP is used on the connections.</p> <p><b>Note</b> If you set this value to 0:00:00; HTTPS authentication may not work. If a browser initiates multiple TCP connections to load a Web page after HTTPS authentication, the first connection is permitted through, but subsequent connections trigger authentication. As a result, users are continuously presented with an authentication page, even after successful authentication. To work around this, set the authentication absolute timeout to 1 second. However, this workaround opens a one-second window of opportunity that might allow non-authenticated users through the firewall if they are coming from the same source IP address.</p> |
| Auth. (uath) Inactivity                              | Length of time idle until the authentication cache times out and users have to re-authenticate new connections. This duration must be shorter than the Translation Slot value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IGP                                                  | <p>The Cisco ASA supports Non-Stop Forwarding from software Version 9.3.1 and later for dynamic routing protocols— Border Gateway Protocol (BGP) and Open Shortest Path First (OSPF). The length of convergence time of Open Shortest Path First (OSPF) is 70 seconds by default.</p> <p>Using this field, you can change the length of the convergence time. This value must be within the range of 10 seconds to 1 hour and 40 seconds. The default value for IGP is 0:01:10.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Configuring Service Policy Rules on Firewall Devices

---

This section describes configuring service policy rules. Service policies provide a consistent and flexible way to configure certain security appliance features, including priority queuing, application inspection, and QoS (quality of service). For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications.

**Note**

Detailed information regarding the range and implementation of particular service policies can be found on [cisco.com](http://cisco.com). For example, the following references may be helpful:

[Using Modular Policy Framework](#)

[QoS Configuration and Monitoring](#)

---

This chapter contains the following topics:

- [About Service Policy Rules, page 58-1](#)
- [About TCP State Bypass, page 58-3](#)
- [Priority Queues Page, page 58-4](#)
- [Service Policy Rules Page, page 58-5](#)
- [Configuring Traffic Flow Objects, page 58-18](#)
- [Configuring TCP Maps, page 58-22](#)

## About Service Policy Rules

Service policy rules encompass these features:

- TCP and general connection settings (including TCP State Bypass; see [About TCP State Bypass, page 58-3](#))
- Content security control (CSC)
- Application inspection
- Intrusion Prevention Services
- QoS queuing and policing

- ASA CX redirection (see [About the ASA CX, page 58-17](#))
- ASA FirePOWER redirection
- User statistics for identity-based firewall policies

The configuration options for these features are presented on two pages in Security Manager—**Priority Queues** and **Rules**—accessed by navigating to Platform > Service Policy.

### Priority Queuing

Priority queuing establishes two queues on an interface, a Low Latency Queuing (LLQ) priority queue and a “best effort” queue. This lets you prioritize latency-sensitive traffic like voice and video, so it is transmitted ahead of other traffic. Packets in the priority queue are always transmitted before packets in the best effort queue.

Because queues are not of infinite size, they can fill and overflow. When a queue is full, additional packets cannot get into the queue and are dropped. This is called “tail drop.” To minimize tail drop, you can increase the queue buffer size. You can also fine-tune the maximum number of packets allowed into the transmit queue. These options let you control the latency and robustness of priority queuing.

Priority queuing is a Quality of Service (QoS) feature. In Security Manager, priority queue size and transmit queue size are managed on the [Priority Queues Page, page 58-4](#), while establishment of priority queuing for a traffic class is an option on the QoS tab of the Service Policy (MPC) Rule Wizard, which is accessed from the [Service Policy Rules Page, page 58-5](#).

### Application Inspection and QoS

Some applications require special handling by the security appliance, and specific application inspection engines are provided for this purpose. Specifically, applications that embed IP addressing information in the user data packet, or open secondary channels on dynamically assigned ports require special inspection.

Application inspection is enabled by default for many protocols, while it is disabled for others. In many cases, you can change the port which the application inspection engine monitors for traffic.

Application inspection engines work with network address translation (NAT) to help identify the location of embedded addressing information. This allows NAT to translate these embedded addresses, and to update any checksum or other fields that are affected by the translation.

Service policy rules define how specific types of application inspection are applied to different types of traffic processed by the security appliance. You can apply rules to specific interfaces, or globally to every interface.

These rules provide a means to configure security appliance features in a manner similar to the Cisco IOS software quality-of-service (QoS) CLI. For example, with service policy rules you can include IP Precedence as one of the criteria to identify traffic for rate-limiting. You can also create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications.

Traffic match criteria are used to define the types of traffic to which you want to apply application inspection. For example, TCP traffic on port 23 might be classified as the Telnet traffic class. You then might use the traffic class to apply connection limits.

Multiple traffic match criteria can be assigned to a single interface, but a packet will only match the first criteria within a specific service policy rule.

# About TCP State Bypass

By default, all traffic that enters an ASA or FWSM is inspected using the Adaptive Security Algorithm, and is either allowed through or dropped based on the security policy. The device maximizes its firewall performance by checking the state of each packet—to determine whether this a new connection, or an established connection—and assigning it to the session management path (if it is a new connection SYN packet), the fast path (if it is an established connection), or the control-plane path (for advanced inspection).

**Note**

---

TCP State Bypass is available on FWSM 3.2+ and ASA 8.2+ devices only.

---

TCP packets that match existing connections in the fast path can pass through the appliance without every aspect of the security policy being rechecked. This feature maximizes performance. However, the method of establishing the session in the fast path using the SYN packet, and the checks that occur in the fast path (such as TCP sequence number), require that both outbound and inbound flows for a connection pass through the same device, which is not the case in asymmetric routing environments.

For example, assume a new connection is assigned to security device 1. The SYN packet goes through the session management path, and an entry for the connection is added to the fast path table. If subsequent packets of this connection go through device 1, then the packets match the entry in the fast path, and are passed through. But if subsequent packets go to device 2, where a SYN packet did not go through the session management path, there is no entry in the fast path for the connection, and the packets are dropped.

Thus, if you have asymmetric routing configured on upstream routers, and traffic alternates between two security devices, enable TCP state bypass for those specific traffic flows. TCP state bypass alters the way sessions are established in the fast path and disables the fast path checks. TCP traffic is then treated much as a UDP connection is treated: when a non-SYN packet matching the specified networks enters the security device, and there is not a fast path entry, then the packet goes through the session management path to establish a connection in the fast path. Once in the fast path, the traffic bypasses the fast path checks.

## Unsupported Features

The following features are not supported when you enable TCP state bypass:

- Application inspection – Application inspection requires both inbound and outbound traffic to go through the same security device, so application inspection is not supported with TCP state bypass.
- AAA authenticated sessions – When a user authenticates with one security device, traffic returning via the other security device will be denied because the user did not authenticate with that device.
- TCP Intercept, Maximum Embryonic Connections limit, TCP sequence number randomization – If TCP state bypass is enabled, the device does not keep track of the state of the connection, so these features are not applicable.
- Cisco CSC SSM (Content Security and Control Security Services Module) – SSM and SSC functionality cannot be used with TCP state bypass.

## Compatibility with NAT

Because the translation session is established separately for each security device, be sure to configure static NAT on both devices for TCP state bypass traffic; if you use dynamic NAT, the address chosen for the session on device 1 will differ from the address chosen for the session on device 2.

## Priority Queues Page

Priority queues let you define how traffic is prioritized in the network. You can define a series of filters based on packet characteristics to cause traffic to be placed in a higher or lower priority queue. The queue with the highest priority is serviced first until it is empty, then the lower queues are serviced in sequence.

In Security Manager, priority queue size and transmit queue size are managed on this page, while establishment of priority queuing for a traffic class is an option on the QoS tab of the Service Policy (MPC) Rule Wizard, which is accessed from the [Service Policy Rules Page, page 58-5](#).

The Priority Queue Configuration dialog box is used to add and edit these queues. Refer to [Priority Queue Configuration Dialog Box, page 58-4](#) for descriptions of the fields displayed in the Priority Queues table on this page.

**Note**

---

Priority queuing is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

**Navigation Path**

- (Device view) Select **Platform > Service Policy > Priority Queues** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy > Priority Queues** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Table 58-1** *Priority Queue Configuration Dialog Box*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name          | Specify the interface to which this rule applies; you can enter the interface name, or click Select to choose an available interface.                                                                                                                                                                                                                                                                                                                  |
| Queue Limit             | Enter the maximum number of packets that can be queued in a priority queue before it drops data. This limit must be in the range of 0 through 2048 packets.                                                                                                                                                                                                                                                                                            |
| Transmission Ring Limit | Enter the maximum number of packets allowed into the transmit queue. This fine-tuning of the transmit queue can reduce latency and offer better performance through the transmit driver.<br><br>On PIX devices, this value can range from 3 through 128 packets. On ASAs prior to version 7.2, this limit can be in the range 3 through 256 packets, while on ASAs running version 7.2 and later, the value can be in the range 3 through 512 packets. |

## Service Policy Rules Page

Use the Service Policy Rules page to define new service policy rules, and to edit or delete existing service policy rules.

Configuring Service Policy Rules consists of three tasks:

1. **Configure a service policy.** Create a service policy and determine the interfaces to which the service policy applies. For more information, see [Step 1. Configure a Service Policy, page 58-6](#).
2. **Configure the traffic class.** Specify the criteria you want to use to identify the traffic to which the service policy applies. For more information, see [Step 2. Configure the traffic class, page 58-7](#).
3. **Configure the actions.** Specify the actions that should be taken to protect information or resources, or to perform QoS functions for the traffic specified in this service policy. For more information, see [Step 3. Configure the MPC actions, page 58-8](#).

The three tasks are performed using the [Insert/Edit Service Policy \(MPC\) Rule Wizard, page 58-6](#). Refer to the individual task topics for descriptions of the fields displayed in the Service Policy Rules table on this page.

### Navigation Path

- (Device view) Select **Platform > Service Policy > Rules** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy > Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### ASA CX Auth Proxy Configuration

The CXSC Auth Proxy button below the Service Policy Rules table opens the Add/Edit CXSC Auth Proxy Configuration dialog box, which is described in [ASA CX Auth Proxy Configuration, page 58-17](#).

The CXSC Auth Proxy button is available below the Service Policy Rules table only in Device view; it is not visible in Policy view.

**Note**

Security Manager uses “CXSC” in some places to refer to an ASA CX Security Services Processor (SSP).

## Insert/Edit Service Policy (MPC) Rule Wizard

Use the Insert/Edit Service Policy (MPC) Rule wizard to add and edit service policy rules on the Service Policy Rules page. The Insert/Edit Service Policy (MPC) Rule wizard presents the following steps:

- [Step 1. Configure a Service Policy, page 58-6](#)
- [Step 2. Configure the traffic class, page 58-7](#)
- [Step 3. Configure the MPC actions, page 58-8](#)

**Note**

“MPC” refers to what is now called the Modular Policy Framework. Refer to [Using Modular Policy Framework](#) for additional information.

**Navigation Path**

Open the Insert/Edit Service Policy (MPC) Rule wizard by clicking the Add Row or Edit Row button on the [Service Policy Rules Page, page 58-5](#).

### Step 1. Configure a Service Policy

The first step in using the Insert/Edit Service Policy (MPC) Rule Wizard to configure a Service Policy Rule involves enabling the rule and specifying the interface(s) to which it is applied.

**Navigation Path**

Open the Insert/Edit Service Policy (MPC) Rule wizard by clicking the Add Row or Edit Row button on the [Service Policy Rules Page, page 58-5](#).

**Related Topics**

- [Step 2. Configure the traffic class, page 58-7](#)

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable The Current MPC Rule        | Check this box to enable this service policy rule. You can deselect this option if you want to define the rule now, but not deploy it to the device until later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category                           | To assign the rule to a category, choose the category from the list. Categories can help you organize and identify rules and objects. For more information, see <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description                        | Optionally, enter a description for the service policy rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Global - Applies to All Interfaces | Select this option to apply the rule globally to all interfaces. This option is not compatible with matching traffic based on the source or destination IP address using an access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interfaces                         | Select this option to apply the rule to a specific interface or group of interfaces (or interface roles), and then enter or Select the name of an interface or interface object.<br><br>This selection is required if you want to match traffic based on the source or destination IP address using an access list.<br><br><b>Note</b> Interface-specific rules take precedence over the global service policy for a given feature. For example, if you have a global policy with FTP inspection, and an interface policy with TCP connection limits, then both FTP inspection and TCP connection limits are applied to the interface. However, if you have a global policy with FTP inspection, and an interface policy with FTP inspection, then only the interface policy FTP inspection is applied to that interface. |

## Step 2. Configure the traffic class

The second step in using the Insert/Edit Service Policy (MPC) Rule Wizard to configure a Service Policy Rule involves specifying the traffic class to which the rule is applied.

Specify the class to use to match traffic for this rule:

- **Use class-default As The Traffic Class**—Select this option to use the traffic class `class-default` for this service policy. The class-default traffic class matches all traffic.
- **Traffic Class**—Select this option to apply this rule to a specific traffic class. Enter the name of the previously defined traffic class, or click **Select** to select it from the Traffic Flows Selector.

You also can define or edit a traffic flow “on the fly” by clicking the either Create or Edit buttons in the Traffic Flows Selector. (Traffic flows are also created and edited on the Traffic Flows page of the Policy Object Manager.) See [Configuring Traffic Flow Objects, page 58-18](#) for more information.

### Related Topics

- [Step 1. Configure a Service Policy, page 58-6](#)
- [Step 3. Configure the MPC actions, page 58-8](#)

### Step 3. Configure the MPC actions

The third step in the Insert/Edit Service Policy (MPC) Rule Wizard involves specifying IPS, CXSC, FirePOWER, Connection Setting, QoS, CSC, User Statistics, ScanSafe Web Security, and NetFlow parameters for the rule; each set of parameters is presented on a separate tabbed panel.

| <b>Intrusion Prevention tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable IPS for this Traffic     | <p>Enables or disables intrusion prevention for this traffic flow. When this box is checked, the other parameters on this panel are available.</p> <p><b>Note</b> These parameters are applicable only on ASA 7.0+ devices that have an IPS module installed. See <a href="#">About IPS Modules on ASA Devices, page 58-15</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IPS Mode                        | <p>Select the operating mode for intrusion prevention:</p> <ul style="list-style-type: none"> <li>• <b>Inline</b>—This mode places the IPS module directly in the traffic flow. No traffic that you identified for IPS inspection can continue through the ASA without first passing through, and being inspected by, the IPS module. This mode is the most secure because every packet identified for inspection is analyzed before being allowed through. Also, the IPS module can implement a blocking policy on a packet-by-packet basis. However, this mode can affect throughput.</li> <li>• <b>Promiscuous</b>—This mode sends a duplicate stream of traffic to the IPS module. This is less secure than Inline mode, but has little impact on traffic throughput. Unlike Inline mode, in Promiscuous mode the IPS module cannot drop the original packets, it can only block traffic by instructing the ASA to shun the traffic, or by resetting the connection on the appliance.</li> </ul> <p>Also, while the IPS module is analyzing the traffic, a small amount of traffic may pass through the ASA before the IPS module can shun it.</p> |
| On IPS Card Failure             | <p>Specify the action to be taken if the IPS module becomes inoperable. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Open</b>—Permits traffic if the module or card fails.</li> <li>• <b>Close</b>—Blocks traffic if the module or card fails.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Virtual Sensor                  | Text box in which you can view, edit, or remove the virtual sensor in the service policy that you are adding or editing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Enable Connection Settings For This Traffic | Enables or disables connection settings for this traffic flow. When this box is checked, the other parameters on this panel become active. From the Connection Settings tab you can configure maximum connections, embryonic connections, timeouts, and TCP parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Maximum Connections                         | <p>You can specify the maximum number of TCP and UDP connections, and the maximum number of embryonic connections for this traffic flow:</p> <ul style="list-style-type: none"> <li>• <b>Maximum TCP &amp; UDP Connections</b> – Specify the maximum number of simultaneous TCP and UDP connections for the entire subnet, up to 65,535, for ASA versions earlier than 8.4(5); for ASA 8.4(5) and later, the maximum number is 2,000,000. The default is zero for both protocols, which means the maximum possible connections are allowed.</li> <li>• <b>Maximum TCP &amp; UDP Connections Per Client</b> – For ASA/PIX 7.1+ only; specify the maximum number of simultaneous TCP and UDP connections on a per client basis. For ASA 8.4(5) and later, the maximum number is 2,000,000.</li> <li>• <b>Maximum Embryonic Connections</b> – For ASA/PIX 7.0+ only; specify the maximum number of embryonic connections per host, up to 65,535, for ASA versions earlier than 8.4(5); for ASA 8.4(5) and later, the maximum number is 2,000,000. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. This limit enables the TCP Intercept feature. The default is zero, which means the maximum embryonic connections. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server. This feature is not applicable if TCP State Bypass is enabled.</li> <li>• <b>Maximum Embryonic Connections Per Client</b> – For ASA/PIX 7.1+ only; specify the maximum number of embryonic connections on a per client basis. For ASA 8.4(5) and later, the maximum number is 2,000,000. This feature is not applicable if TCP State Bypass is enabled.</li> </ul> |

**Table 58-3 Insert/Edit Service Policy (MPC) Rule Wizard—Step 3. Configure the actions.**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Timeouts           | <p>You can specify the following connection timeout settings for this traffic flow:</p> <ul style="list-style-type: none"> <li>• <b>Embryonic Connection Timeout</b> – Specify the idle time until an embryonic connection slot is freed. Enter 0:00:00 to disable timeout for the connection. The default is 20 seconds for FWSMs, and 30 seconds for ASA/PIX devices.</li> <li>• <b>Half Closed Connection Timeout</b> – Specify the idle time until a half-closed connection slot is freed. Enter 0:00:00 to disable timeout for the connection.<br/><br/>For FWSMs, the default value is 20 seconds; the maximum value is 255 seconds (four minutes, 15 seconds).<br/><br/>For ASA 9.1.2 and later devices, the minimum is 30 seconds. For all other ASA/PIX devices, the minimum is 5 minutes. The default is 10 minutes for all ASA/PIX devices.</li> <li>• <b>Idle Connection Timeout</b> – Specify the idle time until a connection slot is freed. Enter 0:00:00 to disable timeout for the connection. This duration must be at least 5 minutes. The default is 1 hour.</li> </ul> |
| Reset Connection Upon Timeout | If selected, connections are reset after a timeout occurs. Available for ASA/PIX 7.0(4)+ only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Detect Dead Connections       | <p>Enables the Dead Connection Detection feature; available for ASA/PIX 7.2+ devices. Selecting this option enables these two fields:</p> <ul style="list-style-type: none"> <li>• <b>Dead Connection Detection Timeout</b> – Specify the period of time between retries when a dead connection is detected. The default is 15 seconds.</li> <li>• <b>Dead Connection Detection Retries</b> – Specify the number of retries to be performed after a dead connection is detected. The default is five.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Traffic Flow Idle Timeout     | Specify the period of time between a traffic flow becoming idle and the flow's disconnection. Applicable to FWSM 3.2+ only. The default is 1 hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable TCP Normalization      | Enables TCP normalization, and activates the TCP Map selection option. Applies to ASA/PIX 7.0+ only; not applicable if TCP State Bypass is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TCP map                       | Specify the TCP map to use for TCP normalization: enter or Select the name of a TCP map. For more information, see <a href="#">Configuring TCP Maps, page 58-22</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 58-3** *Insert/Edit Service Policy (MPC) Rule Wizard—Step 3. Configure the actions.*

| Element                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Randomize TCP Sequence Number                                                | Enables the Randomize Sequence Number feature. Disable this feature only if another inline security appliance is also randomizing sequence numbers and the result is scrambling the data. Each TCP connection has two Initial Sequence Numbers: one generated by the client and one generated by the server. The security appliance randomizes the ISN that is generated by the host/server on the higher security interface. At least one ISN must be randomly generated so that attackers cannot predict the next ISN and potentially hijack the session. Not applicable if TCP State Bypass is enabled.                                                                                                                                                                                                                                                                                   |
| Enable TCP State Bypass                                                      | Enables TCP state bypass for this traffic flow. This allows specific traffic flows in asymmetric routing environments when both the outbound and inbound flow for a connection do not pass through the same device. Applicable to FWSM 3.2+ and ASA 8.2+ only. See <a href="#">About TCP State Bypass, page 58-3</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable SCTP State Bypass (ASA 9.5.2 + only)                                  | You can bypass Stream Control Transmission Protocol (SCTP) stateful inspection if you do not want SCTP protocol validation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Decrement TTL                                                         | Select this option to turn on decrementing of the time-to-live (TTL) value in packets passed by the security appliance. Applicable to PIX/ASA 7.2.2+ only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Configure Flow Offload (For Firepower 9000/4000 series ASA 9.6(1) and above) | <p><b>Note</b> You must enable flow offload manually on the ASA and restart the device, before configuring flow offload in the Service Policy Wizard in Cisco Security Manager. Flow offload and flow offload statistics are supported on the ASA only in the single context and system context modes. It is not supported in the admin or user context.</p> <p>ASA supports flow offload starting from version 9.5.2(1); however Cisco Security Manager supports flow offload from ASA 9.6(1).</p> <p>Select this option to offload specific traffic to a super-fast path; traffic is switched and processed in the NIC instead of the ASA. Offloading can help you improve performance for data-intensive applications such as large file transfers.</p> <p><b>Tip</b> You can configure flow offload only when TCP State Bypass and SCTP State bypass are not enabled on your device.</p> |
| <b>QoS tab</b>                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable QoS For This Traffic                                                  | Enables Quality of Service (QoS) options for this traffic flow. When selected, the Enable Priority For This Flow and the Traffic Policing options become active. <p><b>Note</b> The options on this tab are applicable to PIX/ASA 7.0+ devices only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Priority For This Flow                                                | Enables strict scheduling priority for this flow. The priority queues must be defined on the <a href="#">Priority Queues Page, page 58-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Traffic Policing                                                             | Enables output and input traffic policing. Traffic policing lets you control the maximum rate of traffic transmitted or received on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NetFlow tab</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable NetFlow for this traffic | Enables or disables the use of NetFlow for this traffic flow. When this box is checked, the NetFlow options become available.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Collectors                      | <p>Specify the collectors that should be used when sending NetFlow events of a specific event type:</p> <p><b>Note</b> Only use collectors that have been configured on the NetFlow page at Platform &gt; Logging &gt; NetFlow.</p> <ul style="list-style-type: none"> <li>• Flow Create Event</li> <li>• Flow Deny Event</li> <li>• Flow Tear Event</li> <li>• All Event Types</li> </ul> <p><b>Note</b> Cisco Security Manager does not allow duplicate netflow collectors for ASA 9.6(4) to 9.7.0, and 9.8(2) and above devices. Ensure that you remove the duplicate collectors.</p> |

## About IPS Modules on ASA Devices

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

You can install a variety of IPS modules, such as the Advanced Inspection and Prevention Security Services Module (AIP-SSM), in some ASA device models. The IPS modules supported by each ASA model differ. The IPS modules run advanced IPS software that provides proactive, full-featured intrusion prevention services to stop malicious traffic, including worms and network viruses, before they can affect your network.

The ASA IPS module runs separately from the adaptive security appliance, and you need to add it to the device inventory as a separate device. It is, however, integrated into the ASA traffic flow.

When you configure the ASA IPS module, you need to configure the service policy rules on the host ASA as well as the IPS policies on the IPS module. The service policy rules determine which traffic is inspected by the IPS module. For an overview of IPS policy configuration, see [Overview of IPS Configuration, page 36-5](#).

When you identify traffic for IPS inspection, the traffic flows through the ASA and the IPS module as follows:

1. Traffic enters the ASA.
2. Firewall policies, such as interface access rules, are applied.
3. Traffic is sent to the IPS module over the backplane when you operate in inline mode. If you configure the system to use promiscuous mode, a copy of the traffic is sent to the IPS module.

See **IPS Mode** in the Intrusion Prevention section of the Insert/Edit Service Policy (MPC) Rule wizard ([Step 3. Configure the MPC actions, page 58-8](#)) for more information about Inline and Promiscuous modes.

4. The IPS module applies its security policy to the traffic and takes appropriate actions.
5. Allowed traffic is sent back to the adaptive security appliance over the backplane. In Inline mode, the IPS module may block some traffic according to its security policy; in other words, that traffic is not passed back.
6. VPN policies are applied (if configured).
7. Traffic exits the ASA.

The following illustration depicts traffic flow when running the IPS module in Inline mode. In this example, the IPS module automatically blocks traffic that it identifies as an attack. All other traffic is returned to the ASA.

The next illustration depicts traffic flow when the IPS module is running in Promiscuous mode. In this example, the IPS module sends a shun message to the ASA for traffic it has identified as a threat.

## About the ASA CX

The ASA CX is a Security Services Processor (SSP) that can be installed in the Cisco ASA-5585-X series Adaptive Security Appliance. You configure the parent ASA to redirect traffic to the ASA CX, which then applies its security policies and either drops the traffic, or returns it to the ASA for further processing and routing to the next destination.

There are two basic policies that may need adjustment in the ASA when you add a ASA CX: access rules and inspection rules:

- Access rules, whether global rules or those applied to specific interfaces, are always applied before traffic is redirected to the ASA CX. Thus, the security card sees only the traffic already permitted, and does not process traffic that was dropped at entry to the ASA. Consider adjusting the rules to ensure that all traffic that you want the ASA CX to process is permitted.
- Inspection rules determine which traffic is inspected. The ASA CX does not inspect traffic that has already been inspected by the ASA. Therefore, you must ensure that you do not inspect traffic that you intend the ASA CX to inspect. Specifically, do not inspect HTTP traffic, because HTTP inspection is one of the core functions of the ASA CX. The default inspection rules on the ASA do not include HTTP inspection, so you must alter your inspection rules only if you added HTTP rules.

Determine if you need to create access rules for an interface, or global access rules that apply to all interfaces. Use the ASA access rules to filter traffic before it is redirected to the ASA CX. If you know there are classes of traffic that you never want to pass, it is more efficient to drop them immediately upon entry to the ASA.

If you have already established access rules, there is no requirement to change them. However, you should evaluate whether they need to be relaxed in order to have the ASA CX process certain types of traffic that you are now dropping by means of access rules.

Enabling traffic redirection to an installed ASA CX is described in [Step 3. Configure the MPC actions, page 58-8](#) of the [Insert/Edit Service Policy \(MPC\) Rule Wizard, page 58-6](#).

## ASA CX Auth Proxy Configuration

If you enabled ASA CX authentication proxy—on the **CXSC** tab during Step 3 of the Insert/Edit Service Policy (MPC) Rule Wizard; see [Step 3. Configure the MPC actions, page 58-8](#)—and you want to use a non-default port for active authentication, use the Add/Edit CXSC Auth Proxy Configuration dialog box to change the ASA CX Auth Proxy Port number.

If users must be prompted for authentication credentials, the prompting is done through this port.

### Note

Security Manager uses “CXSC” in some places to refer to an ASA CX Security Services Processor (SSP).

### Navigation Path

Open the Add/Edit CXSC Auth Proxy Configuration dialog box by clicking the **CXSC Auth Proxy** button below the rules table on the [Service Policy Rules Page, page 58-5](#).

**Note**

The CXSC Auth Proxy button is available below the IPS, QoS, and Connection Rules table only in Device view; it is not visible in Policy view.

| Element              | Description                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| CXSC Auth Proxy Port | The default authentication proxy TCP port is 885; however, if you change it, you must enter a port number between 1024 and 65535. |

## Configuring Traffic Flow Objects

Use the Add and Edit Traffic Flow dialog boxes to configure traffic-match definitions. These traffic-flow definitions correspond to class maps (the **class map** command) in the IPS, QoS and Connection Rules service policy for devices running the PIX 7.0+, ASA 7.0+, and FWSM 3.2+ operating systems. For more information on configuring these rules, see [Chapter 58, “Configuring Service Policy Rules on Firewall Devices”](#).

**Navigation Path**

Select **Manage > Policy Objects**, then select **Traffic Flows** from the Object Type selector. Right-click inside the work area and choose New Object, or right-click a row and choose Edit Object.

These dialog boxes also can be opened by clicking the Create or Edit buttons in the Traffic Flows Selector while defining a Service Policy rule. See for [Step 2. Configure the traffic class, page 58-7](#) more information about selecting a Traffic Flow class.

|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the Traffic Flow object. A maximum of 40 characters is allowed. The name space for class maps is local to a security context. Therefore, the same name may be used in multiple security contexts. The maximum number of class maps per security context is 255. |
| Description | A description of the Traffic Flow (optional). A maximum of 1024 characters is allowed.                                                                                                                                                                                      |

**Table 58-5 Add and Edit Traffic Flow Dialog Boxes (continued)**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Match Type | <p>The type of traffic to match. The option you choose may change the fields in the dialog box; all possible fields are explained later in this table. The Traffic Match Type options are:</p> <ul style="list-style-type: none"> <li>• Any Traffic – Matches all traffic.</li> <li>• Source and Destination IP Address (access-list) – Matches the source and destination IP addresses in a packet based on the access control list that you specify.<br/><br/>For ASA 8.4(2+) devices, the ACL can include FQDN objects and user specifications to perform identity-based traffic matching.</li> <li>• Default Inspection Traffic – Matches default inspection traffic. For a list of default settings, see <a href="#">Default Inspection Traffic, page 58-20</a>.</li> <li>• Default Inspection Traffic with access list – Matches default inspection traffic limited by the access control list that you specify.</li> <li>• TCP or UDP or SCTP Destination Port – Matches traffic to the TCP or UDP or SCTP destination port or port range that you specify. Valid port numbers here are 0 to 65535.</li> <li>• RTP Range – Matches traffic to the range of UDP destination ports that you specify. Valid port numbers here are 2000 to 65535.</li> <li>• Tunnel Group – Matches the destination address based on flows in VPN tunnels belonging to a specified tunnel group.</li> <li>• IP Precedence Bits – Matches precedence values assigned to the traffic packets. You can select a maximum of four values.</li> <li>• IP DiffServe Code Points (DSCP) Values – Matches DSCP values associated with the traffic packets. You can select a maximum of eight values.</li> </ul> |

**Variable Fields**

The following fields may appear in the Add and Edit Traffic Flow dialog boxes, depending on your choice in the Traffic Match Type field. This list is the complete set of possible fields.

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available ACLs                                        | A list of the access control list (ACL) objects that you can select for the map. Select the ACL that defines the target traffic, or click the Create button to add a new object. You can also select an object and click Edit to change its definition. If the list of objects is large, use the Filter field to limit the display (see <a href="#">Filtering Items in Selectors, page 1-45</a> ). |
| TCP or UDP or SCTP<br>TCP/UDP/SCTP Port or Port Range | <p>Radio buttons used to specify a protocol (either TCP, UDP, or SCTP), and a text field used to specify a destination port number or range of numbers to use when matching traffic based on the specified protocol/ports.</p> <p>You can specify a single port value, or a range of port numbers (for example, 0-2000). Valid port numbers are 0 to 65535.</p>                                    |

**Table 58-5 Add and Edit Traffic Flow Dialog Boxes (continued)**

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RTP Port Range                                         | The range of RTP destination ports associated with the traffic flow. You must enter a port range within the valid range of 2000 to 65535.<br><br><b>Note</b> When you close the dialog box, the port range you entered is converted to port-span values by subtracting the start value from the end value. For example, if you enter the range 2001-3000 in the dialog box, “RTP port 2001 range 999” appears in the Match Value column of the Traffic Flows policy object table. Port-span values are expected by the device. |
| Tunnel group name<br>Match Flow IP Destination Address | Lists available VPN tunnel groups. Choose one or enter the name of a group. You can also select Match Flow IP Destination Address to recognize the destination address as the match type.<br><br><b>Tip</b> You can use FlexConfig objects and policies to define a VPN tunnel group on a PIX 7.0+ device. For more information, see <a href="#">Understanding FlexConfig Policies and Policy Objects, page 7-2</a> .                                                                                                          |
| Available IP Precedence<br>Match on IP Precedence      | The IP precedence numbers. Select the values you want to match and click >> to add them to the Match table. Ctrl-click to select multiple values. You can select a maximum of four values.<br><br>To remove a value from the Match table, select it and click <<.                                                                                                                                                                                                                                                              |
| Available DSCP Values<br>Match on DSCP                 | The IP DiffServe Code Points (DSCP) numbers. Select the values you want to match and click >> to add them to the Match table. Ctrl-click to select multiple values. You can select a maximum of eight values.<br><br>To remove a value from the Match table, select it and click <<.                                                                                                                                                                                                                                           |
| Category                                               | The category assigned to the traffic-flow object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                         |

## Default Inspection Traffic

When you create a Traffic Flow policy object, you can choose to match the default inspection traffic. For more information, see [Configuring Traffic Flow Objects, page 58-18](#). The following table lists the types of traffic included in the Default Inspection Traffic category.

**Table 58-6 Default Inspection Traffic**

| Value        | Port           | NAT Limitations                                  | Comments                    |
|--------------|----------------|--------------------------------------------------|-----------------------------|
| CTIQBE       | TCP/2748       |                                                  |                             |
| CuSeeMe      | UDP/7648       |                                                  |                             |
| DNS over UDP | UDP/53         | No NAT support for name resolution through WINS. | No PTR records are changed. |
| FTP          | TCP/21         |                                                  |                             |
| GTP          | UDP/2123, 3386 |                                                  |                             |

**Table 58-6** *Default Inspection Traffic (continued)*

| Value                                          | Port                              | NAT Limitations                                     | Comments                                                                                                                                                                                    |
|------------------------------------------------|-----------------------------------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H.323, H.225                                   | TCP/1720,<br>1718                 | No NAT on same security interfaces. No static PAT.  |                                                                                                                                                                                             |
| RAS                                            | UDP/1718,<br>1719                 | No NAT on same security interfaces. No static PAT.  |                                                                                                                                                                                             |
| HTTP                                           | TCP/80                            |                                                     |                                                                                                                                                                                             |
| ICMP                                           | —                                 |                                                     | All ICMP traffic is matched in the default class map.                                                                                                                                       |

# Configuring TCP Maps

Use the Add and Edit TCP Map dialog boxes to define TCP normalization maps for use with IPS, QoS, and Connection Rules service policies. The TCP normalization feature lets you specify criteria that identify abnormal packets, which the security appliance drops when they are detected. The map is used for TCP traffic that passes through the device or that is going to the device.

These TCP maps can be applied to TCP flows on PIX 7.x+ and ASA devices. For more information on configuring IPS, QoS, and Connection Rules, see [Chapter 58, “Configuring Service Policy Rules on Firewall Devices”](#).

## Navigation Path

Select **Manage > Policy Objects**, then select **Maps > TCP Maps** from the Object Type selector. Right-click inside the work area and choose New Object, or right-click a row and choose Edit Object.

These dialog boxes also can be opened by clicking the Create or Edit buttons in the TCP Maps Selector while defining a Service Policy rule. See the “Connection Settings” section of [Step 3. Configure the MPC actions, page 58-8](#) for more information about enabling TCP normalization and selecting a TCP map.

| Time Out<br>(ASA 7.2(4)+ devices only)            | The maximum amount of time that out-of-order packets can remain in the buffer before they are dropped; enter a value between 1 and 20 seconds. The default is 4 seconds.<br><br>This setting is ignored if you entered 0 for the Queue Limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Verify TCP Checksum                               | If checked, checksum verification is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Drop SYN Packets with Data                        | If checked, TCP SYN packets that include data are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Drop Connection on Window Variation               | If checked, connections that change window size unexpectedly are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Drop Packets that Exceed Maximum Segment Size     | If checked, packets that exceed the maximum segment size (MSS) set by a peer are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check if Transmitted Data is the Same as Original | If checked, retransmit data checking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Clear Urgent Flag                                 | If checked, the URG (urgent) flag is cleared through the security appliance. The URG flag is used to indicate that the packet contains information that is of higher priority than other data within the stream. The TCP RFC is vague about the exact interpretation of the URG flag; therefore end systems handle urgent offsets in different ways, which may make the end system vulnerable.                                                                                                                                                                                                                                                                                                            |
| Enable TTL Evasion Protection                     | Enables the TTL evasion protection offered by the security appliance. Do not enable this option if you want to prevent attacks that attempt to evade security policy.<br><br>For example, an attacker can send a packet that passes policy with a very short TTL. When the TTL goes to zero, a router between the security appliance and the endpoint drops the packet. It is at this point that the attacker can send a malicious packet with a long TTL that appears to the security appliance to be a retransmission and is passed. To the endpoint host, however, it is the first packet that has been received. In this case, an attacker is able to succeed without security preventing the attack. |
| <b>Selective Acknowledgment</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Clear Selective Ack                               | When checked, clears window selective acknowledgment mechanism option and allows packet. When unchecked, allows packets with single selective acknowledgment option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Selective Ack Allow Multiple                      | Whether or not packets with multiple selective acknowledgment mechanism (SACK) are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Note</b>                                       | If the selective acknowledgment options are not configured, by default, packets with a single selective acknowledgment option are allowed and packets with multiple selective acknowledgment options are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Range Options table | <p>The TCP Range Options table lists TCP options ranges defined for the TCP map, and the action to take for those options. The typical range numbers are 6-7, 9-18 and 20-255; the lower bound must be less than or equal to the upper bound.</p> <ul style="list-style-type: none"> <li>To add a range, click the Add button to open the Add TCP Option Range dialog box (see <a href="#">Add and Edit TCP Option Range Dialog Boxes, page 58-25</a>).</li> <li>To edit a range, select it and click the Edit button.</li> <li>To delete a range, select it and click the Delete button.</li> </ul> <p><b>Note</b> Prior to ASA 9.6(2), the TCP values are in the range of 6-7 and 9-255.</p> |
| Category                | The category assigned to the map object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Add and Edit TCP Option Range Dialog Boxes

Use the Add and Edit TCP Option Range dialog boxes to define or edit a range of TCP options for use with a TCP normalization map; these are TCP options not explicitly supported on the device. This feature lets you allow or discard packets with the specified TCP options set. The typical range numbers are 6-7, 9-18 and 20-255.

### Navigation Path

In the Add and Edit TCP Map dialog boxes, right-click inside the TCP Range Options table and choose Add Row, or right-click an existing row and choose Edit Row. See [Configuring TCP Maps, page 58-22](#).

### Field Reference

**Table 58-8 Add and Edit TCP Option Range Dialog Boxes**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | Prior to ASA 9.6(2), specify either 6 or 7 or an integer from 9-255 for the lower and upper bounds of the range, respectively. For all devices, the Lower bound must be less than or equal to the Upper bound.                                                                                                                                             |
| Lower       | The lower bound of the range; enter either 6 or 7, or an integer from 9 to 18 or an integer from 20-255.                                                                                                                                                                                                                                                   |
| Upper       | The upper bound of the range; enter either 6 or 7, or an integer from 9 to 18 or an integer from 20-255.                                                                                                                                                                                                                                                   |
| Action      | <p>Choose the action to take for packets with the specified options set:</p> <ul style="list-style-type: none"> <li>Allow – Allows any packet with a specified option set.</li> <li>Clear – Clears the specified option from any packet that has it set and allows the packet.</li> <li>Drop – Discards any packet with a specified option set.</li> </ul> |

# Configuring Security Contexts on Firewall Devices

You can define multiple security “contexts” on a single security appliance. Each context operates as an independent virtual device, with its own security policy, interfaces and administrators. Multiple contexts are similar to having multiple stand-alone devices. Many features are supported in multiple-context mode, including routing tables, firewall features, IPS, and management. Some features are not supported; for example, VPN, multicast, and dynamic routing protocols; security contexts support only static routes; and you cannot enable OSPF or RIP in multiple-context mode. Also, some features are not directly managed by Cisco Security Manager, such as the IPS feature set for ASA and PIX devices.

In multiple-context mode, the security appliance includes a configuration for each context that identifies the security policy, interfaces, and most of the options you can configure on a stand-alone device. The system administrator adds and manages contexts by configuring them in the system configuration, which, like a single-mode configuration, is the start-up configuration. The system configuration identifies basic settings for the security appliance, but it does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses the context that is designated as the Admin context. The system configuration is used to add, delete and edit basic context settings, including allocating network interfaces to the various contexts.

The Admin context is just like any other context, except that when a user logs in to the Admin context, that user has system administrator rights and can access the system configuration and all other contexts.

This chapter contains the following topics:

- [Enabling and Disabling Multiple-Context Mode, page 59-1](#)
- [Checklist for Configuring Multiple Security Contexts, page 59-3](#)
- [Managing Security Contexts, page 59-7](#)

## Enabling and Disabling Multiple-Context Mode

Cisco Security Manager does not support switching to multiple-context mode on an existing device. To perform this task, you must delete the device from Security Manager, enable multiple-context mode using a device manager or CLI input, and then add the device again to Security Manager. After the device is added in multiple-context mode, you can add, edit and delete security contexts.

**Note**

When manually defining a multiple-context device, choose **Multi** from the Contexts list in the Operating System section of the New Device - Device Information dialog box.

Similarly, Cisco Security Manager does not support restoring an existing device to single-context mode. To perform this task, you must delete the device and any of its child contexts from Security Manager, restore single-context operation using a device manager or CLI input, and then add the device again to Security Manager.

**Note**

---

When manually defining a single-context device, choose **Single** from the Contexts list in the Operating System section of the New Device - Device Information dialog box.

## Checklist for Configuring Multiple Security Contexts

Security contexts allow a single physical device to act as multiple independent firewalls. Each security context defines a single virtual firewall, complete with its own configuration—and just as with physical devices, each security context must be correctly configured, or overall security can be compromised. Thus, defining and configuring multiple firewalls on the same physical appliance requires special care.

The following checklist outlines the basic steps necessary to configure a firewall device with multiple security contexts. Each of these steps may involve multiple substeps; all steps should be performed in the order presented. For example, you must define interfaces before configuring the various contexts.

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Step 1 | <p data-bbox="542 260 1414 289"><b>Define interfaces and subinterfaces, or VLANs, on the physical appliance.</b></p> <p data-bbox="542 310 1471 464">In this task, you define the interfaces and subinterfaces, or VLANs on FWSMs, that will be allocated to the various security contexts when you create them later. Provide physical interface parameters, such as connection type (Ethernet, GigabitEthernet, etc.), hardware Port ID, speed, and duplex mode, as well as VLAN ID if defining a subinterface.</p> <p data-bbox="542 485 1122 514"><b>Result:</b> All interfaces and subinterfaces are defined.</p> <p data-bbox="542 527 1409 556">For more information, see <a href="#">Configuring Firewall Device Interfaces, page 46-3</a>.</p> |

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p data-bbox="581 264 1425 296"><b>Define an Admin context for administering the base security appliance.</b></p> <p data-bbox="581 310 1510 436">This task is called out separately to ensure you define a context and IP address specifically for administration of the security appliance. The process is the same as defining a security context; however, during the process, be sure to check <b>Admin Context</b> to designate this as the administration context.</p> <p data-bbox="581 451 1502 577">In addition to being used to administer the appliance, the Admin context is used to publish syslog and SNMP messages to monitoring devices, such as the Cisco Security Monitoring, Analysis and Response System (CS-MARS), for further processing.</p> <p data-bbox="581 592 1510 718">Until you associate a specific management IP address with the Admin context, the IP address used to manage the security appliance is the one you specified when defining the device. When you specify a Management IP Address with the Admin context, it takes precedence over the one on the Device Properties page.</p> <p data-bbox="581 732 1458 764"><b>Result:</b> The Admin context is defined and associated with a physical interface.</p> <p data-bbox="581 779 878 810">For more information, see:</p> <ul data-bbox="592 825 1317 898" style="list-style-type: none"><li data-bbox="592 825 1317 856">• <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA), page 59-9</a></li><li data-bbox="592 871 1317 898">• <a href="#">Add/Edit Security Context Dialog Box (FWSM), page 59-8</a></li></ul> |

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>Define each security context, or virtual firewall, on the base appliance.</b></p> <p>In this task, you define individual security contexts, naming each, assigning a location for its configuration files, and allocating interfaces. Each security context represents a virtual firewall, and its definition includes the interfaces and range of associated VLAN IDs that are under its control.</p> <p><b>Note</b> While the Admin context can operate as a firewall device, it is typically used as such only in single-context mode. Therefore, security contexts are treated as separate entities in this checklist.</p> <p>You cannot add new interfaces or modify the hardware Port value when defining a security context—you simply select previously defined interfaces for allocation to the context.</p> <p><b>Result:</b> Each security context is defined and associated with a physical interface; the VLANs on which the security context will inspect traffic are also specified.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA), page 59-9</a></li> <li>• <a href="#">Add/Edit Security Context Dialog Box (FWSM), page 59-8</a></li> </ul>                                                                                                                                                                                                                                                                                                                                     |
| Step 4 | <p><b>Submit/deploy to generate the virtual firewalls as children of the base appliance.</b></p> <p>You must create the desired contexts on the security appliance before you can begin defining the individual settings of each context. To create contexts on the appliance, you must define them, and then either submit changes in Workflow mode, or deploy the changes to the security appliance in non-Workflow mode.</p> <p>When you create a security context, a “virtual firewall device” appears beneath the original security appliance in the Device View. Each virtual device is indicated by a related device icon with a dotted outline, and its name is the base security appliance name, underscore (_), context name. For example, the virtual device <i>asaMultiRouted_admin</i> would represent the Admin context (named “admin”) on the security appliance named “asaMultiRouted.” Similarly, <i>asaMultiRouted_security1</i> would represent the security context “security1” on the same base appliance.</p> <p><b>Result:</b> Your changes are submitted or deployed (depending on the Workflow mode), which in turn creates the Admin and security contexts as children of the base security appliance.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Workflow and Activities Overview, page 1-20</a></li> <li>• <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver), page 4-20</a></li> <li>• <a href="#">Working with Deployment and the Configuration Archive, page 8-25</a></li> </ul> |
| Step 5 | <p><b>Define additional settings for each security context.</b></p> <p>You can now complete the definition of each security context by selecting a virtual firewall device in the Device Selector and editing available policies, such as access rules, translation options and so on.</p> <p><b>Result:</b> Each security context is fully defined, ready to operate as a virtual firewall.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Managing Security Contexts

The Security Contexts page lists security contexts configured for the selected device. You can add, edit and delete security contexts for an ASA, PIX 7.0+, or FWSM device running in multiple-context mode from this page.

**Tip**

Deleting a security context from an FWSM device removes the security context from the running configuration of the device, but it does not delete the associated configuration file. This can cause problems if you later add another security context with the same name as the one previously deleted. This is a known issue for FWSM and is not connected to the behavior of Security Manager. A work-around is to use the CLI to delete the configuration file from the device.

Remember, the security appliance must be in multiple-context mode in order for you to configure contexts using Security Manager. See [Enabling and Disabling Multiple-Context Mode, page 59-1](#) for more information.

Follow these steps to manage security contexts:

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager, page 5-30](#)).

**Step 2** Select the appliance you want to configure.

**Step 3** Select **Security Contexts** in the Device Policy selector to display the Security Contexts page.

**Note** The child contexts of a multiple-mode device are represented using a different icon than firewall devices in single mode.

**Step 4** Add, edit and delete contexts, as necessary:

- To define a new context, click the **Add Row** button at the bottom of the page to open the Add Security Context box.
- To edit an existing context, select the desired entry in the Security Contexts list and then click the **Edit Row** button at the bottom of the page to open the Edit Security Context dialog box.
- To delete an existing context, select the desired entry in the list and then click the **Delete Row** button.

**Note** Deleting a security context here will also cause the security context device to be removed from device inventory.

Confirm the deletion of the security context and corresponding security context device.

**Note** Except for the titles, the Add Security Context dialog box and the Edit Security Context dialog box are identical. For PIX/ASA devices, see [Add/Edit Security Context Dialog Box \(PIX/ASA\)](#), page 59-9 for more information; for FWSMs, see [Add/Edit Security Context Dialog Box \(FWSM\)](#), page 59-8 for more information.

## Add/Edit Security Context Dialog Box (FWSM)

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

The Add Security Context and Edit Security Context dialog boxes let you define and maintain contexts for the currently selected Firewall Service Module. (Except for their titles, the two dialog boxes are identical.)

Note that at least one security context must be designated as the Admin context.

**Caution**

Security Manager does not support mapped (that is, “named” or “aliased”) interfaces for FWSMs. If you discover an FWSM with named interfaces and then change the related configuration, redeployment will fail. Replace any interface aliases with the appropriate VLAN IDs.

### Navigation Path

You can access the Add Security Context and Edit Security Context dialog boxes from the Security Contexts page, as described in [Managing Security Contexts](#), page 59-7.

**Table 59-1 Add/Edit Security Context Dialog Box (FWSM)**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | Enter a name of up to 32 characters for the context. The names <code>system</code> and <code>Null</code> (in any combination of upper- and lower-case letters) are reserved, and cannot be used.<br><br><b>Note</b> While context names are case-sensitive on the device, they are not in Security Manager. That is, you cannot have two contexts with the same name but different capitalization in Security Manager. |
| Mode (FWSM 3.1+) | Choose the mode, Router or Transparent, for this security context.<br><br><b>Note</b> You cannot change the chosen mode in the Edit Security Context dialog box.                                                                                                                                                                                                                                                       |
| Admin Context    | Check this box if this context is to be the Admin context for this device.<br><br><b>Note</b> The name of the Admin context for the device is displayed below the Security Contexts table.                                                                                                                                                                                                                             |

**Table 59-1 Add/Edit Security Context Dialog Box (FWSM) (continued)**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN IDs       | Enter the VLANs assigned to this context. Use commas to separate multiple VLAN entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Config URL     | Specify the context configuration location, as a URL-type address, by choosing a file-system protocol and then entering the path and name of the file to access for the context configuration.<br><br>That is, choose a protocol type from the drop-down list, and then type the server name (for remote file systems), path, and file name in the related text field. For example, the combined URL for FTP has the following format: <code>ftp://server.example.com/configs/admin.cfg</code> .<br><br>Available protocols are: <ul style="list-style-type: none"> <li>• <code>disk:/</code></li> <li>• <code>ftp://</code></li> <li>• <code>http://</code></li> <li>• <code>https://</code></li> <li>• <code>tftp://</code></li> </ul> |
| Failover Group | If this context is part of an active/active failover configuration, choose the failover group to which this context belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Description    | Enter an optional description for the context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Add/Edit Security Context Dialog Box (PIX/ASA)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

The Add Security Context and Edit Security Context dialog boxes let you define and maintain contexts for the currently selected PIX/ASA security appliance. (Except for their titles, the two dialog boxes are identical.)

Note that at least one security context must be designated as the Admin context.

### Navigation Path

You can access the Add Security Context and Edit Security Context dialog boxes from the Security Contexts page, as described in [Managing Security Contexts, page 59-7](#).

Table 59-2 Add/Edit Security Context Dialog Box (PIX/ASA)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | <p>Enter a name of up to 32 characters for the context. The names <code>System</code> and <code>Null</code> (in any combination of upper- and lower-case letters) are reserved, and cannot be used.</p> <p><b>Note</b> While context names are case-sensitive on the device, they are not in Security Manager. That is, you cannot have two contexts with the same name but different capitalization in Security Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| Description     | Enter an optional description for the context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mode (ASA 9.0+) | <p>Choose the mode, Router or Transparent, for this security context.</p> <p><b>Note</b> You cannot change the chosen mode in the Edit Security Context dialog box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Admin Context   | <p>Check this box if this context is to be the Admin context for this device.</p> <p><b>Note</b> The name of the Admin context for the device is displayed below the Security Contexts table.</p> <p><b>Note</b> If this box is checked, the IPv4 Address Pool field is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Config URL      | <p>Specify the context configuration location, as a URL-type address, by choosing a file-system protocol and then entering the path and name of the file to access for the context configuration.</p> <p>That is, choose a protocol type from the drop-down list, and then type the server name (for remote file systems), path, and file name in the related text field. For example, the combined URL for FTP has the following format: <code>ftp://server.example.com/configs/admin.cfg</code>.</p> <p>Available protocols are:</p> <ul style="list-style-type: none"> <li>• <code>disk0:/</code></li> <li>• <code>disk1:/</code></li> <li>• <code>flash:/</code></li> <li>• <code>ftp://</code></li> <li>• <code>http://</code></li> <li>• <code>https://</code></li> <li>• <code>tftp://</code></li> </ul> |

VPN in multiple context mode—Beginning with Security Manager version 4.12 for ASA version 9.6(2) devices, remote access VPN on multi-context supports flash virtualization. Within a multi-context structure, each created user context can have a private storage space and a shared storage place based on the total flash that is available.

**Table 59-2 Add/Edit Security Context Dialog Box (PIX/ASA) (continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage URL - Private | <p>Click the Private check box to store files associated only with that user and specific to the content that you want for that user. From the drop-down menu, choose the private directory that you created and map it to what you designated in Config URL. Select one of the following options for Private Storage URL for multi-context ASA 9.6(2) or later devices.</p> <ul style="list-style-type: none"> <li>• <code>disk0:/</code></li> <li>• <code>flash:/</code></li> </ul> <p>The default value of Storage URL - Private is <b>disk0:/</b>. You can modify this value. This context label name is used as a directory while performing any file deploy activity for ASA 9.6(2) Multi Context devices.</p>                                                                                                                                                                                                                                                                                                                                                                                  |
| Storage URL - Shared  | <p>Click the Shared check box to upload files to the shared storage space and have it accessible to any user context for read/write access. From the drop-down menu, choose the shared directory that you created and map it to what you designated in Config URL. Select one of the following options for Shared Storage URL for multi-context ASA 9.6(2) or later devices.</p> <ul style="list-style-type: none"> <li>• <code>disk0:/</code></li> <li>• <code>flash:/</code></li> </ul> <p>The default value of Storage URL - Shared is <b>shared</b>. You can modify this value. This context label name is used as a directory while performing any file deploy activity for ASA 9.6(2) Multi Context devices.</p>                                                                                                                                                                                                                                                                                                                                                                                |
| ScanSafe Settings     | <p>To enable ScanSafe inspection in this context, select Enable ScanSafe Web Security. To override the license specified in the system configuration, enter a license ID in the License field; must be 32 hexadecimal characters. See <a href="#">Chapter 20, “Working with ScanSafe Web Security”</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interfaces            | <p>This table lists the interfaces and subinterfaces allocated to this context, and their associated settings. These are the interfaces and subinterfaces for which the security context will inspect traffic.</p> <p>To add interfaces and subinterfaces to this context, click the Add Row button below the table to open the <a href="#">Allocate Interfaces Dialog Box (PIX/ASA only)</a>, page 59-12. You can allocate one or more interfaces, and optionally with each interface, one or a range of subinterfaces.</p> <p>To edit an allocation entry, select it and then click the Edit Row button below the table to open the Edit Interface dialog box. Note that you can edit only the Alias Name and the Show hardware properties option; you cannot change the interface/subinterface assignments. Refer to <a href="#">Allocate Interfaces Dialog Box (PIX/ASA only)</a>, page 59-12 for more information about these options.</p> <p>To remove an interface/subinterface allocation, select the appropriate row in this table and then click the Delete Row button below the table.</p> |

**Table 59-2 Add/Edit Security Context Dialog Box (PIX/ASA) (continued)**

| Element        | Description                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| Failover Group | If this context is part of an active/active failover configuration, choose the failover group to which this context belongs. |

## Allocate Interfaces Dialog Box (PIX/ASA only)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

The Allocate Interfaces dialog box lets you assign an interface, and optionally one or a range of related subinterfaces, to a context, and set name-aliasing options.

### Navigation Path

You access the Allocate Interfaces dialog box from the Add Security Context and Edit Security Context dialog boxes. See [Add/Edit Security Context Dialog Box \(PIX/ASA\)](#), page 59-9 for more information.

**Table 59-3 Allocate Interfaces Dialog Box**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical Interface       | Choose a physical interface to assign to this context.<br><br>In transparent firewall mode, you can assign only an interface that has not been allocated to another context. If you choose an interface already assigned to another context, you must also specify a subinterface.                                                                                                                                                                     |
| Sub Interface ID From/To | Use these drop-down lists to specify a subinterface, or a range of subinterfaces; both lists present the subinterface IDs associated with the chosen Physical Interface.<br><br>To specify a single subinterface, choose the desired ID from the first list. To specify a range, if available, choose the ending ID from the second list. (In transparent firewall mode, only subinterfaces that have not been allocated to other contexts are shown.) |
| View Allocation button   | Click this button to open the View Interface Allocation dialog box, which presents a read-only list of all physical interfaces defined on this device and the security contexts and failover groups associated with each. You can use this to quickly determine current allocations without closing the Allocate Interfaces dialog box.                                                                                                                |

**Table 59-3** *Allocate Interfaces Dialog Box (continued)*

| <b>Element</b>                      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use aliased name in context         | <p>To enable name aliasing for this interface/subinterface, check <b>Use aliased names in the security context</b> and then enter an alias in the Alias Name field.</p> <p>The specified alias replaces the name of this physical interface or subinterface anywhere it would be displayed for this context—for example, the Hardware Port column on the Interfaces Page.</p>                                                 |
| Alias Name                          | Enter the desired alias. An alias must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and underscores.                                                                                                                                                                                                                                                                |
| Suffix Range From/To                | <p>If you specified a range of subinterfaces, these fields are available to let you specify numeric suffixes for their aliased name. The aliased name for each subinterface consists of its sequence number from this range appended to the Alias Name you provided in the previous field.</p> <p>These values default to the beginning and ending subinterface ID numbers, but you can enter any valid range of numbers.</p> |
| Show hardware properties in context | Select this option to allow the <b>show interface</b> CLI command to display of physical interface properties for the context even if you defined an alias. If not selected, the show interface output includes the aliased name.                                                                                                                                                                                             |

## User Preferences

---

The User Preferences section consists of the Deployment page and the Transactional Commit page. The Deployment page provides access to the **Clear XLATE on deployment** option. The Transactional Commit page allows you to enable or disable the transactional commit model for access rules or NAT rules.

### Configuring Deployment Preferences on Firewall Devices

Use the User Preferences Deployment page to specify deployment options for specific firewall devices. You can create a policy with the deployment options you want to use and then apply that policy to all devices that you want using those deployment settings.

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > User Preferences > Deployment** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > User Preferences > Deployment** from the Policy Types selector. Right-click **Deployment** and choose **New Deployment Policy** to create a policy, or select an existing policy from the Policies selector.

The Deployment page is displayed.

- Step 2** Check **Clear XLATE on deployment** if you want the translation table cleared when a configuration is deployed to this device.

Select this option to send a **clear xlate** command to the firewall before changes to access lists are made. This command clears all NAT translations. By default this option is not selected.

---

**Note** This option is necessary for certain commands to take effect. If these commands are changed, you should make sure this option is enabled for the device. However, clearing the translation table disconnects all current connections that use translations.

---

- Step 3** Click **Save** at the bottom of the page.
-

# Configuring Transactional Commit Preferences on Firewall Devices

By default, when you change a rule-based policy (such as access rules), the changes become effective immediately. However, this immediacy comes at a slight cost in performance. The performance cost is more noticeable for very large rule lists in a high connections-per-second environment, for example, when you change a policy with 25,000 rules while the ASA is handling 18,000 connections per second.

The performance is affected because the rule engine compiles rules to enable faster rule lookup. By default, the system will also search uncompiled rules when evaluating a connection attempt so that new rules can be applied; since the rules are not compiled, the search takes longer.

Beginning with ASA 9.1(5), you can change this behavior so that the rule engine uses a transactional model when implementing rule changes, continuing to use the old rules until the new rules are compiled and ready for use. Using the transactional model, performance should not drop during the rule compilation. The following table clarifies the behavioral difference.

| Model         | Before Compilation | During Compilation                                                    | After Compilation |
|---------------|--------------------|-----------------------------------------------------------------------|-------------------|
| Default       | Match old rules.   | Match new rules.<br>(Connections per second rate will decrease.)      | Match new rules.  |
| Transactional | Match old rules.   | Match old rules.<br>(Connections per second rate will be unaffected.) | Match new rules.  |

An additional benefit of the transactional model is that, when replacing an ACL on an interface, there is no gap between deleting the old ACL and applying the new one. This reduces the chances that acceptable connections will be dropped during the operation.

### Tip

If you enable the transactional model for a rule type, there are syslog messages to mark the beginning and the end of the compilation. These messages are numbered 780001 and following.

### Step 1 Do one of the following:

- (Device view) Select **Platform > User Preferences > Transactional Commit** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > User Preferences > Transactional Commit** from the Policy Types selector. Right-click **Transactional Commit** and choose **New Transactional Commit Policy** to create a policy, or select an existing policy from the Policies selector.

The Transactional Commit page is displayed.

### Step 2 Enable the transactional commit model for the desired features. Options include:

- Access Group
- NAT

**Step 3** Click **Save** at the bottom of the page.

---

## **PART 6**

### **Router and Switch Device Configuration**

## Managing Routers

---

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

Cisco Security Manager supports the management and configuration of security features and other platform-specific features on Cisco IOS access security routers. You configure these features in the form of policies, each of which defines a different aspect of the configuration of the router. For a detailed explanation of the policy paradigm used by Security Manager, see [Chapter 5, “Managing Policies”](#).

You can discover the configurations that are already defined on Cisco IOS routers. The discovery process imports the device configuration into Security Manager as policies and policy objects that you can then manage as required. For more information, see [Discovering Router Policies, page 61-3](#).

**Note**

Security Manager supports Cisco IOS Software Releases 12.3 and later. However, a limited number of policies are supported for routers running Cisco IOS Software Release 12.1 or 12.2. See [Configuring Routers Running IOS Software Releases 12.1 and 12.2, page 61-3](#).

---

By right-clicking a policy type in one of the policy selectors, you can assign a policy to a single router, share the policy among multiple routers, or unassign the policy from the device.

The following topics describe how to configure platform policies and interface policies on Cisco IOS routers:

- Interface policies:

**Note**

---

The settings on the Policy Management page of the Security Manager Administration window determine which router platform policies can be managed with Security Manager. Any policy type that you do not select in this window does not appear on the configuration pages of Security Manager.

# Configuring Routers Running IOS Software Releases 12.1 and 12.2

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Security Manager provides limited support for routers running Cisco IOS Software Releases 12.1 and 12.2 (with the exception of the ASR 1000 Series, which supports more features). You can configure the following policies on these routers:

- Access Rules (Layer 3 only). See [Chapter 16, “Managing Firewall Access Rules”](#).
- Access Rule Settings. See [Chapter 16, “Managing Firewall Access Rules”](#).
- Interfaces. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).
- FlexConfigs. See [Chapter 7, “Managing FlexConfigs”](#).

All other policies require Cisco IOS Software Release 12.3 or later. For more information about supported devices, see [Supported Devices and Software Versions for Cisco Security Manager](#).

## Discovering Router Policies

You can discover the configurations of your Cisco IOS routers and import these configurations as policies into Security Manager. This makes it possible to add existing devices and manage them with Security Manager without having to manually configure each device policy by policy. For more information, see [Adding Devices to the Device Inventory, page 3-7](#).

You can discover all Cisco IOS commands that can be configured with Security Manager. Discovery ignores unsupported commands, which means that they are left intact on the device even after subsequent deployments. Additionally, in cases where Security Manager can discover the command, but not all the subcommands and keywords related to that command, the unsupported elements are ignored and left intact on the device.

You can also rediscover the configurations of devices that you are already managing with Security Manager at any time. Be aware, however, that performing rediscovery overwrites the policies that you have defined in Security Manager, and is therefore not generally recommended. For more information, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

**Note**

We recommend that you perform deployment immediately after you discover the policies on a Cisco IOS router, *before* you make any changes to policies or unassign policies from the device. Otherwise, the changes that you configure in Security Manager might not be deployed to the device.

**Note**

If a policy that is not configured in Security Manager was configured on the device using an out-of-band method (such as the CLI) between the time of the first discovery and rediscovery, we recommend that you perform deployment immediately after rediscovery.

## Basic Interface Settings on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

You typically add interfaces to Security Manager by performing discovery, as described in [Discovering Policies, page 5-12](#). After you have discovered the interfaces, you can modify the properties of each interface.

You can also use Security Manager to configure physical and virtual interfaces manually. This is useful when you modify interface configurations of existing devices, and makes it possible for you to configure all the interfaces of a device before you physically add the device to the network.

## Available Interface Types

[Table 62-1 on page 62-2](#) describes the types of interfaces that can be configured on Cisco IOS routers.

**Table 62-1 Router Interface Types**

| Type             | Description                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Null             | Null interface.                                                                                                                                                                                                                                                                                                                    |
| Analysis-module  | A Fast Ethernet interface that connects to the internal interface on the Network Analysis Module (NAM).<br><b>Note</b> You cannot configure parameters such as speed and duplex mode for this type of interface.                                                                                                                   |
| Async            | Port line used as an asynchronous interface.                                                                                                                                                                                                                                                                                       |
| ATM              | ATM interface.                                                                                                                                                                                                                                                                                                                     |
| BRI              | ISDN BRI interface. This interface configuration propagates to each B channel. B channels cannot be configured individually.<br><b>Note</b> You must configure a dialer interface policy for calls to be placed on a BRI interface. For more information, see <a href="#">Dialer Interfaces on Cisco IOS Routers, page 62-28</a> . |
| BVI              | Bridge-group virtual interface. BVI interfaces are used to route traffic at Layer 3 to the interfaces in a bridge group.                                                                                                                                                                                                           |
| Content-engine   | Content engine (CE) network module interface.<br><b>Note</b> You cannot configure parameters such as speed and duplex mode for this type of interface. You cannot create subinterfaces for this type of interface.                                                                                                                 |
| Dialer           | Dialer interface.                                                                                                                                                                                                                                                                                                                  |
| Ethernet         | Ethernet IEEE 802.3 interface.                                                                                                                                                                                                                                                                                                     |
| Fast Ethernet    | 100-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                       |
| FDDI             | Fiber Distributed Data Interface.                                                                                                                                                                                                                                                                                                  |
| Gigabit Ethernet | 1000-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                      |

**Table 62-1 Router Interface Types (continued)**

| Type                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group-Async          | Main asynchronous interface. This interface type creates a single asynchronous interfaces to which other interfaces are associated. This one-to-many configuration enables you to configure all associated member interfaces by configuring the main interface.                                                                                                                                                                                                  |
| HSSI                 | High-Speed Serial Interface.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Loopback             | A logical interface that emulates an interface that is always up. For example, having a loopback interface on the router prevents a loss of adjacency with neighboring OSPF routers if the physical interfaces on the router go down.<br><br>The name of a loopback interface must end with a number ranging from 0-2147483647.<br><br><b>Note</b> This interface type is supported on all platforms. You can create an unlimited number of loopback interfaces. |
| Multilink            | Multilink interface. A logical interface used for multilink PPP (MLP).                                                                                                                                                                                                                                                                                                                                                                                           |
| Port channel         | Port channel interface. This interface type enables you to bundle multiple point-to-point Fast Ethernet links into one logical link. It provides bidirectional bandwidth of up to 800 Mbps.                                                                                                                                                                                                                                                                      |
| POS                  | Packet OC-3 interface on the Packet-over-SONET (POS) interface processor.                                                                                                                                                                                                                                                                                                                                                                                        |
| PRI                  | ISDN PRI interface. Includes 23/30 B-channels and one D-channel.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Serial               | Serial interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Switch               | Switch interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Ten Gigabit Ethernet | 10000-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Token Ring           | Token Ring interface.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Tunnel               | Tunnel interface.<br><br><b>Note</b> You can create an unlimited number of virtual, tunnel interfaces. Valid values range from 0-2147483647.                                                                                                                                                                                                                                                                                                                     |
| VG-AnyLAN            | 100VG-AnyLAN port adapter.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| VLAN                 | Virtual LAN subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Virtual Template     | Virtual template interface. When a user dials in, a predefined configuration template is used to configure a virtual access interface; when the user is done, the virtual access interface goes down and the resources are freed for other dial-in uses.                                                                                                                                                                                                         |

## Defining Basic Router Interface Settings

When you define an interface or subinterface for a Cisco IOS router, you name it, specify how it is assigned an IP address, and optionally define other properties, such as the speed, maximum transmission unit (MTU), and the encapsulation type.

### Note

Basic interface settings are always local to the device on which they are configured. You cannot share this policy with other devices. You can, however, share advanced interface settings. For more information, see [Advanced Interface Settings on Cisco IOS Routers, page 62-13](#).

### Related Topics

- [Deleting a Cisco IOS Router Interface, page 62-6](#)

- 
- Step 1** In Device view, select **Interfaces > Interfaces** from the Policy selector. The [Router Interfaces Page, page 62-7](#) is displayed.
- Step 2** To add a new interface or subinterface, click the Add Row button to open the Create Router Interface dialog box.
- To edit an existing interface or subinterface, select it in the Interfaces table, and then click the Edit Row button to open the Edit Router Interface dialog box. Refer to [Create Router Interface Dialog Box, page 62-8](#) for descriptions of the fields in these dialog boxes.
- Step 3** Select **Enabled** to have Security Manager actively manage this interface or subinterface. If this option is deselected, the interface/subinterface definition is retained, but the interface/subinterface itself is disabled (or “shutdown”).
- Step 4** Choose **Interface** or **Subinterface** from the Type list.
- Step 5** If you are creating an interface, enter a name for the interface. You can click **Select** to open a dialog box that will help you generate a standard name based on interface type and details about the interface’s location, such as card, slot, and subinterface. For more information on using the dialog box to generate an interface name, see [Interface Auto Name Generator Dialog Box, page 62-12](#).

### Note

When naming a BVI interface, use the bridge group number as the card number. Deployment will fail if you configure a BVI interface without configuring a corresponding bridge group.

- Step 6** If you are creating a subinterface, provide the following:
- Parent**—Choose the parent interface for this subinterface.
  - Subinterface ID**—Enter a number to identify the subinterface.

### Note

Security Manager configures serial subinterfaces as point-to-point, not multipoint.

- Step 7** To specify a **Layer Type**, choose a Level 2 (data link) or Level 3 (network) option from this list.
- Step 8** Choose a method of **IP** address assignment for this interface/subinterface, then provide additional information, as required:
- **Static IP**—Provide an **IP Address** and **Subnet Mask**.
  - **DHCP**—No additional information is required.

- **PPPoE**—No additional information is required.
- **Unnumbered**—Provide the name of the interface from which an IP address is to be “borrowed.”

**Note** Layer 2 interfaces do not support IP addresses.

**Step 9** Define additional properties of the interface/subinterface:

- Use the **Negotiation** check box to enable and disable auto-negotiation for the interface.

Auto-negotiation detects the capabilities of remote devices and negotiates the best possible performance between the two devices. When Negotiation is enabled, the Fast Ethernet Duplex and Speed options are disabled.

**Note** Auto-negotiation is available only for Fast Ethernet and Gigabit Ethernet interfaces on ASR devices.

- Choose a transmission mode from the **Duplex** list. If you choose Auto, be sure the network device to which this interface is connected is set to automatically detect the transmission mode. (Auto is not available on ASRs; use auto-negotiation instead.)

**Note** You must configure a fixed speed to define the duplex value. Tunnel and loopback interfaces do not support this setting.

- Choose a transmission speed from the **Speed** list. If you choose Auto, be sure the network device to which this interface is connected is set to automatically detect the transmission speed. (Auto is not available on ASRs; use auto-negotiation instead.)
- Enter the maximum transmission unit (**MTU**), which defines the largest packet size, in bytes, that this interface can support.

**Note** Certain interface properties are set automatically, or are unavailable, depending on the interface type and the underlying port type. For example, the Speed options are available for Fast Ethernet and Gigabit Ethernet interfaces only.

**Step 10** Choose an encapsulation method from the **Encapsulation** list:

- **None**—No encapsulation; no additional parameters are required.
- (Ethernet subinterfaces only) **DOT1Q**—VLAN encapsulation, as defined by the IEEE 802.1Q standard. Provide the following VLAN parameters for this subinterface:
  - Enter a VLAN ID to associate with this subinterface.

**Note** All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.

- If you are defining the 802.1Q trunk interface, select Native VLAN.

**Tip**

To configure DOT1Q encapsulation on an Ethernet interface without associating a VLAN with the subinterface, enter the **vlan-id dot1q** command using CLI commands or FlexConfigs. See [Understanding FlexConfig Policies and Policy Objects, page 7-2](#). Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.

- (Serial interfaces only) **Frame Relay**—IETF Frame Relay encapsulation. Provide a data-link connection identifier (DLCI) for the subinterface.

**Note**

Frame relay must be configured on the parent interface.

**Note**

IETF Frame Relay encapsulation provides interoperability between a Cisco IOS router and equipment from other vendors. To configure Cisco Frame Relay encapsulation, use CLI commands or FlexConfigs.

**Step 11** (Optional) Enter a description of up to 1024 characters for the interface.

**Step 12** Click **OK** to save the interface/subinterface definition and close the dialog box. The new interface is displayed on the Router Interfaces page. Subinterfaces are displayed beneath the parent interface.

## Deleting a Cisco IOS Router Interface

Although you can delete the definition of a virtual interface at any time, use this option with great care. If the interface is included in any policy definitions that exist for this router, deleting the interface causes these policy definitions to fail when they are deployed to the device.

**Note**

Deleting the basic interface definition does not delete any advanced settings that are configured under **Interface > Settings > Advanced Settings**. You must delete these advanced settings separately. If you fail to do so, deployment fails.

**Note**

Deleting the definition of a physical interface from the Router Interfaces page does not remove the interface from the device. If you perform this operation by mistake, you can perform rediscovery to restore the definition to Security Manager. For more information, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

- [Basic Interface Settings on Cisco IOS Routers, page 62-1](#)

**Step 1** Click the **Device View** button on the toolbar.

**Step 2** Select a router from the Device selector.

- Step 3** Select **Interfaces > Interfaces** from the Policy selector. The Router Interfaces page is displayed. See [Table 62-2 on page 62-7](#) for an explanation of the fields on this page.
- Step 4** Select an interface from the table, then click the **Delete** button. The interface is deleted.

## Router Interfaces Page

Use the Router Interfaces page to view, create, edit, and delete interface definitions (physical and virtual) on a selected Cisco IOS router. The Router Interfaces page displays interfaces that were discovered by Security Manager as well as interfaces added manually after you added the device to the system.

### Note

Unlike other router policies, the Interfaces policy cannot be shared among multiple devices. The Advanced Settings policy, however, may be shared. See [Local Policies vs. Shared Policies, page 5-3](#).

For more information, see [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

### Navigation Path

Select a Cisco IOS router from the Device selector, then select **Interfaces > Interfaces** from the Policy selector.

**Table 62-2 Router Interfaces Page**

| Element         | Description                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Type  | The interface type. Subinterfaces are displayed indented beneath their parent interface.                                                   |
| Interface Name  | The name of the interface.                                                                                                                 |
| Enabled         | Indicates whether the interface is currently enabled (managed by Security Manager) or disabled (shutdown state).                           |
| IP Address      | The IP address of interfaces defined with a static address.                                                                                |
| IP Address Type | The type of IP address assigned to the interface—static, DHCP, PPPoE, or unnumbered. (IP address is defined by a selected interface role.) |
| Interface Role  | The interface roles that are assigned to the selected interface.                                                                           |
| Add button      | Opens the <a href="#">Create Router Interface Dialog Box, page 62-8</a> . From here you can create an interface on the selected router.    |
| Edit button     | Opens the <a href="#">Create Router Interface Dialog Box, page 62-8</a> . From here you can edit the selected interface.                   |

**Table 62-2 Router Interfaces Page (continued)**

| Element       | Description                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Delete button | Deletes the selected interfaces from the table. Ensure that the interface is not being used in any other policy before deleting it. |

## Create Router Interface Dialog Box

Use the Create Router Interface dialog box to create and edit physical and virtual interfaces on the selected Cisco IOS router.

### Tip

Interface configuration is specific to the type of device. Many of the options on this page might be greyed out for specific device or interface types because they do not apply or they are not configurable.

### Navigation Path

Go to the [Router Interfaces Page, page 62-7](#), then click the **Add** or **Edit** button beneath the table.

**Table 62-3 Create Router Interface Dialog Box**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled | Whether the interface is enabled (no shutdown). If you deselect this option, the interface is created in the configuration but it is shut down.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Type    | Specifies whether you are defining an interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Name    | Applies only to interfaces.<br>The name of the interface. Enter a name manually, or click <b>Select</b> to display a dialog box for generating a name automatically. See <a href="#">Interface Auto Name Generator Dialog Box, page 62-12</a> .<br>Logical interfaces require a number after the name: <ul style="list-style-type: none"> <li>• The range for dialer interfaces is 0-799.</li> <li>• The range for loopback interfaces is 0-2147483647.</li> <li>• The range for BVI interfaces is 1-255.</li> <li>• The only allowed value for null interfaces is 0.</li> </ul> |
| Parent  | Applies only to subinterfaces.<br>The parent interface of the subinterface. Choose the parent interface from this list.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 62-3 Create Router Interface Dialog Box (continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subinterface ID | <p>Applies only to subinterfaces.</p> <p>The ID number of the subinterface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IP              | <p>The method of IP address assignment for the interface:</p> <ul style="list-style-type: none"> <li>• Static IP—Defines a static IP address and subnet mask for the interface. Enter this information in the fields that appear below the option.</li> </ul> <p><b>Note</b> You can define the mask using either dotted decimal (for example, 255.255.255.255) or CIDR notation (/32). See <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a>, page 6-81.</p> <ul style="list-style-type: none"> <li>• DHCP—The interface obtains its IP address dynamically from a DHCP server.</li> <li>• PPPoE—The router automatically negotiates its own registered IP address from a central server (via PPP/PCP). The following interface types support PPPoE: <ul style="list-style-type: none"> <li>– Async</li> <li>– Serial</li> <li>– High-Speed Serial Interface (HSSI)</li> <li>– Dialer</li> <li>– BRI, PRI (ISDN)</li> <li>– Virtual template</li> <li>– Multilink</li> </ul> </li> <li>• Unnumbered—The interface obtains its IP address from a different interface on the device. Choose an interface from the Interface list. This option can be used with point-to-point interfaces only.</li> </ul> <p><b>Note</b> Layer 2 interfaces do not support IP addresses. Deployment fails if you define an IP address on a Layer 2 interface.</p> |
| Layer Type      | <p>The OSI layer at which the interface is defined:</p> <ul style="list-style-type: none"> <li>• Unknown—The layer is unknown.</li> <li>• Layer 2—The data link layer, which contains the protocols that control the physical layer (Layer 1) and how data is framed before being transmitted on the medium. Layer 2 is used for bridging and switching. Layer 2 interfaces do not have IP addresses.</li> <li>• Layer 3—The network layer, which is primarily responsible for the routing of data in packets across logical internetwork paths. This routing is accomplished through the use of IP addresses.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Negotiation | <p>Available on ASRs; applies to Fast Ethernet and Gigabit Ethernet interfaces only.</p> <p>Auto-negotiation detects the capabilities of remote devices and negotiates the best possible performance between the two devices. When Negotiation is enabled, the Duplex and Speed options are disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Duplex      | <p>The interface transmission mode:</p> <ul style="list-style-type: none"> <li>• None—The transmission mode is returned to its device-specific default setting.</li> <li>• Full—The interface transmits and receives at the same time (full duplex).</li> <li>• Half—The interface can transmit or receive, but not at the same time (half duplex). This is the default.</li> <li>• Auto—The router automatically detects and sets the appropriate transmission mode, either full or half duplex. Not available on ASRs; use auto-negotiation instead.</li> </ul> <p><b>Note</b> When using Auto mode, be sure that the port on the active network device to which you connect this interface is also set to automatically negotiate the transmission mode. Otherwise, select the appropriate fixed mode.</p> <p><b>Note</b> You can configure a duplex value only if you set the Speed to a fixed speed, not Auto.</p> <p><b>Note</b> This setting does not apply to serial, HSSI, ATM, PRI, DSL, tunnel, or loopback interfaces.</p> |
| Speed       | <p>Applies only to Fast Ethernet and Gigabit Ethernet interfaces.</p> <p>The speed of the interface:</p> <ul style="list-style-type: none"> <li>• None—The setting is not configurable on the device.</li> <li>• 10—10 megabits per second (10Base-T networks).</li> <li>• 100—100 megabits per second (100Base-T networks). This is the default for Fast Ethernet interfaces.</li> <li>• 1000—1000 megabits per second (Gigabit Ethernet networks). This is the default for Gigabit Ethernet interfaces.</li> <li>• Auto—The router automatically detects and sets appropriate interface speed. Not available on ASRs; use auto-negotiation.</li> </ul> <p><b>Note</b> When using Auto mode, be sure that the port on the active network device to which you connect this interface is also set to automatically negotiate the transmission speed. Otherwise, select the appropriate fixed speed.</p>                                                                                                                                 |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTU           | <p>The maximum transmission unit, which refers to the maximum packet size, in bytes, that this interface can handle.</p> <p>Valid values for serial, Ethernet, and Fast Ethernet interfaces range from 64 to 17940 bytes.</p> <p>Valid values for Gigabit Ethernet interfaces range from 1500 to 9216 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Encapsulation | <p>The type of encapsulation performed by the interface:</p> <ul style="list-style-type: none"> <li>• None—No encapsulation.</li> <li>• DOT1Q—VLAN encapsulation, as defined by the IEEE 802.1Q standard. Applies only to Ethernet subinterfaces.</li> <li>• Frame Relay—IETF Frame Relay encapsulation. Applies only to serial interfaces (not serial subinterfaces).</li> </ul> <p><b>Note</b> IETF Frame Relay encapsulation provides interoperability between a Cisco IOS router and equipment from other vendors. To configure Cisco Frame Relay encapsulation, use CLI commands or FlexConfigs.</p>                                                                                                                                                                                                                                                |
| VLAN ID       | <p>Applies only to subinterfaces with encapsulation type DOT1Q.</p> <p>The VLAN ID associated with this subinterface. The VLAN ID specifies where 802.1Q tagged packets are sent and received on this subinterface; without a VLAN ID, the subinterface cannot send or receive traffic. Valid values range from 1 to 4094.</p> <p><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.</p> <p><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. See <a href="#">Understanding FlexConfig Policies and Policy Objects, page 7-2</a>. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.</p> |

**Table 62-3** Create Router Interface Dialog Box (continued)

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Native VLAN | <p>Applies only when the encapsulation type is DOT1Q and you are configuring a physical interface that is meant to serve as an 802.1Q trunk interface. Trunking is a way to carry traffic from several VLANs over a point-to-point link between two devices.</p> <p>When selected, the Native VLAN is associated with this interface, using the ID specified in the VLAN ID field. (If no VLAN ID is specified for the Native VLAN, the default is 1.) The native VLAN is the VLAN to which all untagged VLAN packets are logically assigned by default. This includes the management traffic associated with the VLAN. If no VLAN ID is defined, the default is 1.</p> <p>For example, if the VLAN ID of this interface is 1, all incoming untagged packets and packets with VLAN ID 1 are received on the main interface and not on a subinterface. Packets sent from the main interface are transmitted without an 802.1Q tag.</p> <p>When deselected, the Native VLAN is not associated with this interface.</p> <p><b>Note</b> The Native VLAN cannot be configured on a subinterface of the trunk interface. Be sure to configure the same Native VLAN value at both ends of the link; otherwise, traffic may be lost or sent to the wrong VLAN.</p> |
| DLCI        | <p>Applies only to serial subinterfaces with Frame Relay encapsulation.</p> <p>Enter the data-link connection identifier to associate with the subinterface. Valid values range from 16 to 1007.</p> <p><b>Note</b> Security Manager configures serial subinterfaces as point-to-point not multipoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description | Additional information about the interface (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Roles       | The interface roles assigned to this interface. A message is displayed if no roles have yet been assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Interface Auto Name Generator Dialog Box

Use the Interface Auto Name Generator dialog box to have Security Manager generate a name for the interface based on the interface type and its location in the router or switch.

### Navigation Path

Go to the [Create Router Interface Dialog Box, page 62-8](#), select **Interface** from the Type list, then click **Select** in the Name field.

## Field Reference

Table 62-4 Interface Auto Name Generator Dialog Box

| Element | Description                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | The type of interface. Your selection from this list forms the first part of the generated name, as displayed in the Result field. For more information, see <a href="#">Available Interface Types, page 62-2</a> .                                                                              |
| Card    | The card related to the interface.<br><b>Note</b> When defining a BVI interface, enter the number of the corresponding bridge group.                                                                                                                                                             |
| Slot    | The slot related to the interface.                                                                                                                                                                                                                                                               |
| Port    | The port related to the interface.<br><b>Note</b> The information you enter in these fields forms the remainder of the generated name, as displayed in the Result field.                                                                                                                         |
| Result  | The name generated by Security Manager from the information you entered for the interface type and location. The name displayed in this field is read-only.<br><b>Tip</b> After closing this dialog box, you can edit the generated name in the Create Router Interface dialog box, if required. |

## Advanced Interface Settings on Cisco IOS Routers

In addition to the basic interface definitions that you can define on the Interfaces page, Security Manager provides a method for defining selected advanced settings on interfaces that support those settings.

Unlike the basic interface settings defined on the Interface page, you can share an advanced settings policy with multiple devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-37](#).

You can define a variety of advanced settings on a selected interface, subinterface, or interface role, including:

- Cisco Discovery Protocol (CDP) settings.
- Internet Control Message Protocol (ICMP) settings.
- Directed broadcast settings.
- Load interval for determining the average load.
- Throughput delay for use by routing protocols.
- Configuring TCP maximum segment size.
- Helper addresses for forwarding UDP broadcasts. For more information on helper addresses, see [Understanding Helper Addresses, page 62-14](#).
- Enabling Maintenance Operation Protocol (MOP).
- Enabling virtual fragmentation reassembly (VFR).
- Enabling proxy ARP.
- Enabling NBAR protocol discovery.

- Enabling and configuring unicast reverse path forwarding (RFP).

**Tip**

You can define these settings for multiple interfaces on a device at once by choosing an interface role instead of a specific interface. For example, if you have defined an All-Ethernets interface role, you can define identical advanced settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects, page 6-73](#).

**Before You Begin**

- Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

**Step 1**

Do one of the following:

- (Device view) Select **Interfaces > Settings > Advanced Settings** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Advanced Settings** from the Policy Type selector. Select an existing policy or create a new one.

The Advanced Interface Settings page is displayed (see [Advanced Interface Settings Page, page 62-16](#)).

**Step 2**

Do one of the following:

- Click the **Add** button to add an interface or interface role to the table. In the Advanced Interface Settings dialog box, enter the name of the interface or interface role, or click **Select** to select an existing role or to create a new role.
- Select an existing entry in the table and click the **Edit** button to change its settings.

**Step 3**

Configure the advanced settings required for the selected interface. For details about each setting, see [Advanced Interface Settings Dialog Box, page 62-16](#).

**Step 4**

Click **OK** to save your definitions. Your definitions are displayed in the Advanced Interface Settings table.

## Understanding Helper Addresses

Network hosts occasionally use User Datagram Protocol (UDP) broadcasts to determine address, configuration, and name information. This presents a problem if the host is on a network segment that does not include the required server, as by default, routers do not forward UDP broadcasts beyond their subnet. You can remedy this situation by configuring the interface to forward certain classes of broadcasts to a helper address.

One common use of helper addresses is when the router acts as a relay agent for DHCP clients who need to contact a DHCP server located on a different subnet. The helper address can either represent a specific DHCP server or a network address for a segment containing multiple DHCP servers. You can also configure a helper address for each DHCP server.

In [Figure 62-1](#), hosts located on network 192.168.1.0 can use 10.44.23.7 as a helper address to forward UDP broadcasts to the other network, while hosts located on network 10.44.0.0 can use 192.168.1.19 as their helper address.

**Figure 62-1** *Helper Addresses*

Table 62-5 on page 62-15 lists the default UDP services that can be forwarded to helper addresses.

**Table 62-5** *Default UDP Services Forwarded to Helper Addresses*

| Service                  | Port |
|--------------------------|------|
| BOOTP/DHCP Client        | 68   |
| BOOTP/DHCP Server        | 67   |
| DNS                      | 53   |
| NetBIOS datagram service | 138  |
| NetBIOS name service     | 137  |
| TACACS                   | 49   |
| TFTP                     | 69   |
| Time                     | 37   |

**Tip**

To forward additional UDP services, use the CLI or FlexConfigs to configure the `ip forward-protocol` command. Use the `no` form of this command to prevent the forwarding of any of the default services listed in Table 62-5 on page 62-15.

All of the following conditions must be met in order for a UDP or IP packet to use helper addresses:

- The MAC address of the received frame must be an all-ones broadcast address (ffff.ffff.ffff).
- The IP destination address must be one of the following: all-ones broadcast (255.255.255.255), subnet broadcast for the receiving interface, or major-net broadcast for the receiving interface if the `no ip classless` command is also configured.
- The IP time-to-live (TTL) value must be at least 2.
- The IP protocol must be UDP (17).

## Advanced Interface Settings Page

Use the Advanced Interface Settings page to configure advanced interface definitions (physical and virtual) on a router. Examples of advanced settings include Cisco Discovery Protocol (CDP) settings, ICMP message settings, and virtual fragment reassembly settings. You can configure settings for specific interfaces or for interface roles. The columns in the table summarize the advanced settings for an entry and are explained in [Advanced Interface Settings Dialog Box, page 62-16](#).

To configure advanced settings:

- Click the **Add** button to add an interface or interface role to the table, and fill in the Advanced Interface Settings dialog box.
- Select an entry and click the **Edit** button to edit an existing entry.
- Select an entry and click the **Delete** button to delete it.

For more information, see [Advanced Interface Settings on Cisco IOS Routers, page 62-13](#).

**Navigation Path**

- (Device view) Select **Interfaces > Settings > Advanced Settings** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Advanced Settings** from the Policy Type selector. Right-click **Advanced Settings** to create a policy, or select an existing policy from the Shared Policy selector.

## Advanced Interface Settings Dialog Box

Use the Advanced Interface Settings dialog box to define a variety of advanced settings on a selected interface as described in the table below.

**Navigation Path**

Go to the [Advanced Interface Settings Page, page 62-16](#), then click the **Add** or **Edit** button beneath the table.

**Table 62-6** *Advanced Interface Settings Dialog Box*

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                | <p>The interface on which the advanced settings are defined. Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the you want is not listed, click the <b>Create</b> button to create it.</p> <p><b>Note</b> The only advanced settings supported on Layer 2 interfaces are Max. Bandwidth, Load Interval, and CDP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Max Bandwidth            | <p>The bandwidth value to communicate to higher-level protocols in kilobits per second (kbps). The value you define in this field is an informational parameter only; it does not affect the physical interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Load Interval            | <p>The length of time, in seconds, used to calculate the average load on the interface. Valid values range from 30 to 600 seconds, in multiples of 30 seconds. The default is 300 seconds (5 minutes). Load interval is not supported on subinterfaces.</p> <p>Modify the default to shorten the length of time over which load averages are computed. You can do this if you want load computations to be more reactive to short bursts of traffic.</p> <p>Load data is gathered every 5 seconds. This data is used to compute load statistics, including input/output rate in bits and packets per second, load, and reliability. Load data is computed using a weighted-average calculation in which recent load data has more weight in the computation than older load data.</p> <p><b>Tip</b> You can use this option to increase or decrease the likelihood of activating a backup interface; for example, a backup dial interface may be triggered by a sudden spike in the load on an active interface.</p>                  |
| TCP Maximum Segment Size | <p>The maximum segment size (MSS) of TCP SYN packets that pass through this interface. Valid values range from 500 to 1460 bytes. If you do not specify a value, the MSS is determined by the originating host.</p> <p>This option helps prevent TCP sessions from being dropped as they pass through the router. Use this option when the ICMP messages that perform auto-negotiation of TCP frame size are blocked (for example, by a firewall). We highly recommend using this option on the tunnel interfaces of DMVPN networks.</p> <p>For more information, see <i>TCP MSS Adjustment</i> at this URL:<br/> <a href="http://www.cisco.com/en/US/docs/ios/12_2t/12_2t4/feature/guide/ft_a_dmss.html">http://www.cisco.com/en/US/docs/ios/12_2t/12_2t4/feature/guide/ft_a_dmss.html</a></p> <p><b>Note</b> Typically, the optimum MSS is 1452 bytes. This value plus the 20-byte IP header, the 20-byte TCP header, and the 8-byte PPPoE header add up to a 1500-byte packet that matches the MTU size for the Ethernet link.</p> |

Table 62-6 Advanced Interface Settings Dialog Box (continued)

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Helper Addresses                  | <p>The helper addresses that are used to forward User Datagram Protocol (UDP) broadcasts that are received on this interface. Enter one or more addresses or the names of the network/host objects, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p>By default, routers do not forward broadcasts outside of their subnet. Helper addresses provide a solution by enabling the router to forward certain types of UDP broadcasts as a unicast to an address on the destination subnet. For more information, see <a href="#">Understanding Helper Addresses, page 62-14</a>.</p>                                                   |
| Interface Throughput Delay        | <p>The expected delay for the interface in tens of microseconds (for example, 3000 translates to 30,000 microseconds). You can enter a value between 1 and 16777215, and the default varies by the type of interface.</p> <p>Higher-level protocols might use delay information to make operating decisions. For example, IGRP can use delay information to differentiate between a satellite link and a land link. This setting is for informational purposes only and does not affect the actual delay on the interface.</p>                                                                                                                                              |
| Cisco Discovery Protocol settings | <p>Settings related to the Cisco Discovery Protocol (CDP). CDP is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment including routers, access servers, bridges, and switches. It is primarily used to obtain protocol addresses of neighboring devices and to discover the platform of those devices. The options are:</p> <ul style="list-style-type: none"> <li>• Enable CDP—Whether to enable the Cisco Discovery Protocol (CDP) on this interface. You cannot enable CDP on ATM interfaces.</li> <li>• Log CDP Messages—On Ethernet interfaces, whether to log duplex mismatches for this interface.</li> </ul> |
| <b>ICMP Messages Settings</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Redirect Messages          | <p>Whether to enable the sending of Internet Control Message Protocol (ICMP) redirect messages if the device is forced to resend a packet through the same interface on which it was received to another device on the same subnet. Redirect messages are sent when the device wants to instruct the originator of the packet to remove it from the route and substitute a different device that offers a more direct path to the destination.</p>                                                                                                                                                                                                                          |

**Table 62-6** *Advanced Interface Settings Dialog Box (continued)*

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Unreachable Messages                 | <p>Whether to enable the sending of ICMP unreachable messages. Unreachable messages are sent in two circumstances:</p> <ul style="list-style-type: none"> <li>• If the interface receives a nonbroadcast packet destined for itself that uses an unknown protocol, the interface sends an ICMP unreachable message to the source.</li> <li>• If the device receives a packet that it cannot deliver to its ultimate destination because it knows of no route to the destination address, it sends an ICMP host unreachable message to the originator of the packet.</li> </ul> <p><b>Note</b> This is the only advanced setting supported by the null0 interface.</p> |
| Enable Mask Reply Messages                  | Whether to enable the sending of ICMP mask reply messages. Mask reply messages are sent in response to mask request messages, which are sent when a device needs to know the subnet mask for a particular subnetwork.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Additional Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Maintenance Operation Protocol (MOP) | Whether to enable MOP on the interface. You can use MOP for utility services such as uploading and downloading system software, remote testing, and problem diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable Virtual Fragment Reassembly (VFR)    | <p>Whether to enable virtual fragmentation reassembly (VFR) on this interface. VFR is a feature that enables the Cisco IOS Firewall to create dynamic ACLs that can protect the network from various fragmentation attacks. For more information, see <i>Virtual Fragmentation Reassembly</i> at this URL:</p> <p><a href="http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_virt_frag_reasm_ps6441_TSD_Products_Configuration_Guide_Chapter.html">http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_virt_frag_reasm_ps6441_TSD_Products_Configuration_Guide_Chapter.html</a></p>                                   |
| Enable Proxy ARP                            | Whether to enable proxy Address Resolution Protocol (ARP) on the interface. Proxy ARP, defined in RFC 1027, is the technique in which one host, usually a router, answers ARP requests intended for another machine, thereby accepting responsibility for routing packets to the real destination. Proxy ARP can help machines on a subnet reach remote subnets without configuring routing or a default gateway.                                                                                                                                                                                                                                                     |
| Enable NBAR Protocol Discovery              | <p>Whether to enable network-based application recognition (NBAR) on this interface to discover traffic and keep traffic statistics for all protocols known to NBAR. Protocol discovery provides a method to discover application protocols traversing an interface so that QoS policies can be developed and applied to them. For more information, go to:</p> <p><a href="http://www.cisco.com/en/US/products/ps6616/products_qanda_item09186a00800a3ded.shtml">http://www.cisco.com/en/US/products/ps6616/products_qanda_item09186a00800a3ded.shtml</a></p>                                                                                                        |

Table 62-6 Advanced Interface Settings Dialog Box (continued)

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Directed Broadcasts<br>ACL                     | <p>Whether to have directed broadcast packets “exploded” as a link-layer broadcast when this interface is directly connected to the destination subnet. When deselected, directed broadcast packets that are intended for the subnet to which this interface is directly connected are dropped rather than being broadcast. This is the default.</p> <p>An IP directed broadcast is an IP packet whose destination address is a valid broadcast address on a different subnet from the node on which it originated. In such cases, the packet is forwarded as if it was a unicast packet until it reaches its destination subnet.</p> <p>This option affects only the final transmission of the directed broadcast on its destination subnet; it does not affect the transit unicast routing of IP directed broadcasts.</p> <p>If you enable directed broadcasts, you can apply an ACL to determine which directed broadcasts are permitted to be broadcast on the destination subnet. All other directed broadcasts destined for the subnet to which this interface is directly connected are dropped. Enter the name of a standard or extended ACL object, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p><b>Tip</b> Because directed broadcasts, and particularly ICMP directed broadcasts, have been abused by malicious persons, we recommend deselecting this option on interfaces where directed broadcasts are not needed. When you enable directed broadcasts, apply an ACL to restrict their use.</p> |
| <b>Unicast Reverse Path Forwarding (RFP) Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Unicast RFP                                    | <p>Whether to enable unicast reverse path forwarding (RFP) on the interface. When you enable Unicast RFP on an interface, the router examines all packets that are received on that interface. The router checks to make sure that the source address appears in the FIB, and takes action based on your unicast RFP settings. Use unicast RFP to mitigate problems caused by malformed or forged (spoofed) IP source addresses that pass through a router. Malformed or forged source addresses can indicate DoS attacks based on source IP address spoofing. For more information on unicast RFP, see the description of the <b>ip verify unicast source reachable-via</b> command in the <i>Cisco IOS Interface and Hardware Component Command Reference</i>.</p> <p>To enable unicast RFP, you must also globally enable Cisco Express Forwarding (CEF). For more information on CEF, see <a href="#">CEF Interface Settings on Cisco IOS Routers, page 62-25</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 62-6 Advanced Interface Settings Dialog Box (continued)

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                            | <p>How strict to make unicast RFP:</p> <ul style="list-style-type: none"> <li>• <b>Loose Mode</b>—The default. Examines incoming packets to determine whether the source address is in the Forwarding Information Base (FIB) and permits the packet if the source is reachable through any interface on the router.</li> </ul> <p>Use loose mode on interfaces where asymmetric paths allow packets from valid source networks (networks contained in the FIB). For example, routers that are in the core of an ISP network have no guarantee that the best forwarding path out of the router will be the path selected for packets returning to the router.</p> <ul style="list-style-type: none"> <li>• <b>Strict Mode</b>—Examines incoming packets to determine whether the source address is in the FIB and permits the packet only if the source is reachable through the interface on which the packet was received.</li> </ul> <p>Use strict mode on interfaces where only one path allows packets from valid source networks (networks contained in the FIB). Also, use strict mode when a router has multiple paths to a given network as long as the valid networks are switched through the incoming interfaces. Packets for invalid networks are dropped. For example, routers at the edge of the network of an ISP are likely to have symmetrical reverse paths. Strict mode is also applicable in certain multihomed situations, provided that optional Border Gateway Protocol (BGP) attributes, such as weight and local preference, are used to achieve symmetric routing.</p> |
| Allow Use Of Default Route for RFP Verification | Whether to permit Unicast RFP to successfully match on prefixes that are known through the default route when determining whether to pass packets. Normally, sources found in the FIB but only by way of the default route are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Allow Self Ping                                 | <p>Whether to allow the router to ping its own interfaces. By default, when you enable Unicast RFP, packets that are generated by the router and destined to the router are dropped, thereby making certain troubleshooting and management tasks difficult to accomplish.</p> <p> <b>Caution</b> Allowing self-ping opens a potential denial of service (DoS) hole.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ACL<br>(For Unicast RFP)                        | If you enable unicast RFP, you can apply an ACL to refine how packets are handled when a reverse path is not found. If you specify an ACL, when (and only when) a packet fails the Unicast RFP check, the ACL is checked to determine whether the packet should be dropped (using a deny statement in the ACL) or forwarded (using a permit statement in the ACL). Enter the name of a standard or extended ACL object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# IPS Module Interface Settings on Cisco IOS Routers

## Note

From version 4.17, though Cisco Security Manager continues to support IPS and IOS features/functionality, it does not support any bug fixes or enhancements.

On some routers, you can install IPS modules such as the Cisco Intrusion Prevention System Advanced Integration Module or Network Module. When installed and active, you must configure the IPS Module interface settings policy to define the following:

- The name of the interface between the module and the router.
- The failure mode of the module. If the module fails, you can configure it to allow all traffic or to deny all traffic.
- The router interfaces to monitor. You can name specific interfaces or use interface roles to cover more than one interface at a time. For example, if you have defined an All-Ethernets interface role, you can define identical monitoring settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects, page 6-73](#).

## Tip

After you have defined an IPS Module interface settings policy, you can share the policy and assign it to other devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-37](#).

## Before You Begin

Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

## Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > IPS Module** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > IPS Module** from the Policy Type selector. Select an existing policy or create a new one.

The IPS Module Interface Settings page is displayed. See [IPS Module Interface Settings Page, page 62-23](#) for an explanation of the fields on this page.

## Step 2

In the IPS Module Interface Settings fields, enter the name of the IPS interface (such as IDS-Sensor1/0) or click Select to select it from a list. Also determine whether you want to allow all traffic if the module fails (fail open) or to deny all traffic (fail closed).

## Step 3

Identify the router interfaces that the module should monitor. Click the **Add** button below the IPS Module Service Module Monitoring Settings table to add interfaces to the list, or select an interface and click the **Edit** button to change the settings for an existing interface. Use the IPS Monitoring Information dialog box to define the interface name or role, monitoring mode, and access list (if any). For more information, see [IPS Monitoring Information Dialog Box, page 62-24](#).

# IPS Module Interface Settings Page

## Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Module Interface Settings page to define the settings on the Cisco Intrusion Prevention System Advanced Integration Module or Network Module. The module must be running IPS 6.0 or later. You can define the fail mode for the IPS interface, and the interfaces that the module should monitor. Configure this policy only if the router hosts an IPS module.

## Caution

Cisco IOS IPS and the Cisco IPS module cannot be used together. Cisco IOS IPS must be disabled when the IPS module is installed.

### Navigation Path

- (Device view) Select **Interfaces > Settings > IPS Module** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > IPS Module** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

**Table 62-7** *IPS Module Interface Settings Page*

| Element        | Description                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the IPS module interface. Enter the name or click <b>Select</b> to select the interface or interface role. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Fail Over Mode | How the module should handle traffic inspection during a module failure, either to fail open (passing all traffic without inspection) or fail closed (dropping all traffic). The default is fail open.         |

**Table 62-7** *IPS Module Interface Settings Page (continued)*

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPS Module Service Module Monitoring Settings table | <p>The list of interfaces on the router that the IPS module should monitor. The table shows the name of the interface or interface role, whether monitoring is inline or promiscuous, and whether an ACL is used to filter traffic for inspection on the interface. Inline mode puts the IPS module directly into the traffic flow, allowing it to stop attacks by dropping malicious traffic before it reaches the intended target. In promiscuous mode, packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. If the ACL is matched, the matched traffic is not inspected.</p> <ul style="list-style-type: none"> <li>To add an interface to the table, click the Add button and fill in the <a href="#">IPS Monitoring Information Dialog Box, page 62-24</a>.</li> <li>To edit the settings for an interface, select it and click the Edit button.</li> <li>To delete an interface, select it and click the Delete button.</li> </ul> |

## IPS Monitoring Information Dialog Box

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Monitoring Information dialog box to add or edit the properties of interfaces to be monitored by the IPS module.

### Navigation Path

Go to the [IPS Module Interface Settings Page, page 62-23](#), then click the **Add** or **Edit** button beneath the IPS Module Service Module Monitoring Settings table.

| Access List     | The name of the standard or extended access list policy object to use to filter traffic on this interface for inspection, if you want to apply one. A matched ACL causes traffic not to be inspected for that ACL. Click <b>Select</b> to select the ACL or to create a new one.                                                                                                                                         |

## CEF Interface Settings on Cisco IOS Routers

Cisco Express Forwarding (CEF) is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks, from those that carry small amounts of traffic to those that carry large amounts of traffic in complex patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions. CEF is enabled by default on most Cisco IOS routers.

Typically, you do not need to configure a CEF policy unless you want to enable CEF accounting so that you can view statistics with the **show ip cef** command on the router. You would also configure the policy if you want to disable CEF, or to configure non-default CEF behavior on specific interfaces, for example, to have CEF load balance based on packets rather than source-destination packet streams.

When configuring alternate CEF settings for interfaces, you can name specific interfaces or use interface roles to cover more than one interface at a time. For example, if you have defined an All-Ethernets interface role, you can define identical CEF settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects, page 6-73](#).

### Tip

After you have defined a CEF interface settings policy, you can share the policy and assign it to other devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-37](#).

### Before You Begin

Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

### Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > CEF** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > CEF** from the Policy Type selector. Select an existing policy or create a new one.

The CEF Interface Settings page is displayed. See [CEF Interface Settings Page, page 62-26](#) for an explanation of the fields on this page.

### Step 2

If you are enabling CEF, select the accounting options you desire.

- Step 3** If you want to configure non-default behavior for certain interfaces, add them to the CEF Interface Settings table. Click the **Add** button below the table to add interfaces to the list, or select an interface and click the **Edit** button to change the settings for an existing interface. For more information about the options, see [CEF Interface Settings Dialog Box, page 62-27](#).
- 

## CEF Interface Settings Page

Use the CEF Interface Settings page to define the settings for Cisco Express Forwarding. CEF is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks, from those that carry small amounts of traffic to those that carry large amounts of traffic in complex patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions. CEF is enabled by default on most Cisco IOS routers.

### Navigation Path

- (Device view) Select **Interfaces > Settings > CEF** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > CEF** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

In per-packet load balancing, packets for a given source-destination pair can take different equal-cost routes, and thus reach their destination out of order.<br><br>The default is to balance the load based on the destination of the traffic. |

## Dialer Interfaces on Cisco IOS Routers

Before you can configure a dial backup policy for a site-to-site VPN (see [Configuring Dial Backup, page 25-40](#)), you must configure a dialer interface policy on the appropriate Cisco IOS router. The dialer interface policy uses dialer pools to associate the dialer interface used by dial backup with a physical BRI interface on the router. Each dialer interface is associated with a single dialer pool, which can contain one or more physical interfaces. Multiple dialer interfaces can reference the same dialer pool.

The following topics describe how to create dialer interfaces policies on Cisco IOS routers:

- [Defining Dialer Profiles, page 62-28](#)
- [Defining BRI Interface Properties, page 62-30](#)

### Defining Dialer Profiles

When you configure a dialer profile, you must select the interface or interface role representing the dialer interface and specify the number to be dialed. You must also assign a pool ID, which you use to reference this dialer interface when configuring the physical dialer interface. Additionally, you can modify the default timeout settings for the line.

**Note**

IP is the only protocol supported for dialer profiles by Security Manager.

**Note**

Authentication parameters for the dialer profile are defined in the PPP policy.

**Before You Begin**

Define the virtual and physical dialer interfaces on the router. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

**Note**

In addition, you can optionally define interface roles for the virtual and physical dialer interfaces. See [Defining Dialer Profiles, page 62-28](#).

**Related Topics**

- [Defining BRI Interface Properties, page 62-30](#)
- [Dialer Interfaces on Cisco IOS Routers, page 62-28](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Select an existing policy or create a new one.
- The Dialer page is displayed. See [Table 62-11 on page 62-31](#) for a description of the fields on this page.
- Step 2** Select a dialer profile from the upper table on the Dialer Interfaces page, then click **Edit**, or click **Add** to create a profile. The Dialer Profile dialog box appears. See [Table 62-12 on page 62-32](#) for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role that represents the virtual dialer interface, or click **Select** to select an interface role object or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
- Step 4** Enter a name for the dialer profile. Having a name makes it easier for you to assign the correct dialer pool to the physical interface. See [Defining BRI Interface Properties, page 62-30](#).
-  **Tip** We recommend that you define a name that is logically associated with the site to which the dialer interface serves as a backup. For example, if the dialer interface is serving as a backup connection to the London site, define the name London for the dialer profile.
- 
- Step 5** Enter an ID number for the dialer pool to associate with this dialer interface. Each dialer interface is associated with a single pool. Multiple interfaces may, however, be associated with the same dialer pool.
- Step 6** Enter the number of the dialer group to assign to the dialer interface.
- Step 7** (Optional) In the Interesting Traffic ACL field, enter the name of the extended ACL object that defines which packets are permitted to initiate calls using this dialer profile, or click **Select** to select the object from a list or to create a new one. Use this option to limit the IP traffic that can make use of the dialer.
- Step 8** Enter the dialer string, which is the phone number of the remote side of the dialer interface connection.
- Step 9** (Optional) Modify the default timeout values (Idle Timeout and Fast Idle Timeout), if required.
- Step 10** Click **OK** to save your definitions locally on the client and close the dialog box. The dialer profile appears in the Dialer Profile table on the Dialer page.
-

## Defining BRI Interface Properties

You configure the properties of the physical BRI interfaces used for dialer interface policies by selecting the appropriate interface or interface role, defining the dialer pools to which the interface belongs, and defining the ISDN switch type. It is the dialer pool that connects the physical interface with the virtual dialer interface.

### Note

To define other types of physical dialer interfaces, such as ATM and Ethernet, use FlexConfigs. For more information, see [Understanding FlexConfig Policies and Policy Objects, page 7-2](#).

### Before You Begin

Define the virtual and physical dialer interfaces on the router. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

### Note

In addition, you can optionally define interface roles for the virtual and physical dialer interfaces. See [Creating Interface Role Objects, page 6-74](#).

- [Defining Dialer Profiles, page 62-28](#)
- [Dialer Interfaces on Cisco IOS Routers, page 62-28](#)

- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Select an existing policy or create a new one.
- The Dialer Interfaces page is displayed. See [Table 62-11 on page 62-31](#) for a description of the fields on this page.
- Step 2** Select a physical BRI interface from the Dialer Physical Interfaces table, then click **Edit**, or click **Add** to add an interface. The Dialer Physical Interface dialog box appears. See [Table 62-13 on page 62-33](#) for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role that represents the physical dialer interface, or click **Select** to select an interface role object from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
- Step 4** Enter the names of the dialer pools to associate with the physical interface, or click **Select** to display a selector. Separate multiple entries with commas.
- Step 5** Select the ISDN switch type used by the physical interface. [Table 62-13 on page 62-33](#) describes the available switch types.
- Step 6** (Optional) If you selected the Basic-DMS-100, Basic-NI, or Basic-5ess switch type, enter up to two service provider identifiers (SPIDs).

### Note

We recommend that you do not enter SPIDs for the Basic-5ess switch type, even though SPIDs are supported.

- Step 7** Click **OK** to save your definitions locally on the client and close the dialog box. The interface definition appears in the Dialer Physical Interfaces table on the Dialer Interface page.

## Dialer Policy Page

Use the Dialer page to define the relationship between physical Basic Rate Interface (BRI) and virtual dialer interfaces. You use these dialer interfaces when you configure the dial backup feature for site-to-site VPNs.

For more information, see [Dialer Interfaces on Cisco IOS Routers, page 62-28](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Right-click **Dialer** to create a policy, or select an existing policy from the Shared Policy selector.

**Table 62-12** *Dialer Profile Dialog Box*

| Element                             | Description                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                | A descriptive name for the dialer profile. This name enables you to assign the correct dialer pool to the physical interface. You can also use the profile name as a reference to the site to which this dialer interface serves as a backup.                                                                                    |
| Interface                           | The virtual dialer interface to associate with the dialer profile. Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                |
| Pool ID                             | The dialer pool ID. Each pool can contain multiple physical interfaces and can be associated with multiple dialer interfaces. Each dialer interface, however, is associated with only one pool.                                                                                                                                  |
| Group                               | The group ID, which identifies the dialer group that this dialer interface uses.                                                                                                                                                                                                                                                 |
| Interesting Traffic ACL             | The extended, numbered ACL that defines which packets are permitted to initiate calls using this dialer profile. The valid ACL number range is 100 to 199.<br><br>Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Dialer String (Remote Phone Number) | The phone number of the destination that the dialer contacts.                                                                                                                                                                                                                                                                    |
| Idle Timeout                        | The default amount of idle time before an uncontested line is disconnected. The default is 120 seconds.                                                                                                                                                                                                                          |
| Fast Idle Timeout                   | The default amount of idle time before a contested line is disconnected. The default is 20 seconds.<br><br>Line contention occurs when a busy line is requested to send another packet to a different destination.                                                                                                               |

## Dialer Physical Interface Dialog Box

Use the Dialer Physical Interface dialog box to add or edit the properties that associate physical BRI interfaces with dialer interfaces.

### Note

Use FlexConfigs to define other types of physical dialer interfaces, such as ATM and Ethernet. For more information, see [Understanding FlexConfig Policies and Policy Objects, page 7-2](#).

### Navigation Path

Go to the [Dialer Policy Page, page 62-31](#), then click the **Add** or **Edit** button beneath the Dialer Physical Interfaces table.

## ADSL on Cisco IOS Routers

Digital Subscriber Line (DSL) is a family of technologies that transports data over existing twisted-pair copper wire. DSL uses frequencies that are beyond the upper list used by POTS (plain old telephone service) to deliver broadband applications, such as multimedia and video, over the local loop (or *last mile*) that connects the telephone company's central office to customer sites.

Asymmetric Digital Subscriber Line (ADSL) is a form of DSL where the data flow downstream to customer sites is much greater than the data flow upstream to the central office (CO). This asymmetric setup is well-suited for applications where users typically download far more information than they send, such as web surfing, video-on-demand, and remote LAN access. With ADSL, the connection speed is related to the distance between the customer site and the digital subscriber line-access multiplexer (DSLAM) that aggregates the connections from multiple customer sites onto a high-speed line.

ADSL downstream rates range from 1.5 to 9 Mbps, whereas upstream bandwidth ranges from 16 to 640 kbps. ADSL transmissions work at distances up to 18,000 feet (5,488 meters) over a single copper twisted pair. Newer versions of ADSL technology, such as ADSL2 and ADSL2+, offer even higher data rates for short distances, as well as power management and realtime performance monitoring.

ATM is used in many ADSL implementations due to its small, fixed-length cell size, which makes it suitable for carrying time-critical traffic, such as voice and video, in conjunction with other traffic. You can use Security Manager to configure ATM over DSL on a Cisco IOS router. For more information about configuring ADSL policies in Security Manager, see [Defining ADSL Settings, page 62-36](#).

To configure ADSL in Security Manager, you must do the following:

1. Configure an ATM interface or subinterface. See [Defining Basic Router Interface Settings, page 62-4](#).
2. Configure ADSL settings on the ATM interface or subinterface. See [Defining ADSL Settings, page 62-36](#).
3. Configure PVCs on the ATM interface or subinterface. See [Defining ATM PVCs, page 62-51](#).

**Note**

If you perform discovery on the device, Security Manager populates the Interfaces policy with the ATM interface and subinterface and the ADSL policy with the ADSL settings for that interface. Any discovered PVCs are added to the PVC policy.

## Supported ADSL Operating Modes

[Table 62-14 on page 62-35](#) describes the operating modes that are supported on each ADSL interface card that can be configured with Security Manager.

**Table 62-14** *ADSL Cards and Supported DSL Operating Modes*

| ADSL Interface Card | Supported DSL Operating Modes          |
|---------------------|----------------------------------------|
| WIC-1ADSL           | auto, ansi-dmt, itu-dmt, splitterless  |
| WIC-1ADSL-I-DG      | auto, etsi, itu-dmt                    |
| WIC-1ADSL-DG        | auto, ansi-dmt, itu-dmt, splitterless  |
| HWIC-1ADSL          | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| HWIC-1ADSLI         | auto, etsi, itu-dmt, adsl2, adsl2+     |
| HWIC-ADSL-B/ST      | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| HWIC-ADSLI-B/ST     | auto, etsi, itu-dmt, adsl2, adsl2+     |

Table 62-15 on page 62-36 describes the operating modes that are supported on each ADSL device that can be configured with Security Manager.

**Table 62-15 Fixed ADSL Devices and Supported DSL Operating Modes**

| Device                          | Supported DSL Operating Modes          |
|---------------------------------|----------------------------------------|
| 857 Integrated Services Router  | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| 876 Integrated Services Router  | auto, etsi, itu-dmt, adsl2, adsl2+     |
| 877 Integrated Services Router  | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| 1801 Integrated Services Router | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| 1802 Integrated Services Router | auto, etsi, itu-dmt, adsl2, adsl2+     |

## Defining ADSL Settings

When you configure an ADSL definition in Security Manager, you must select the ATM interface on which ADSL is being defined. In addition, we highly recommend that you specify the router type or the type of WIC (WAN interface card) installed in the router. The validity of DSL policy definitions is highly dependent on the hardware. By specifying the hardware used by this policy, you enable Security Manager to properly validate the values you define and avoid deployment failures.

You can optionally specify the following parameters:

- The DSL operating mode.
- Whether to enable dynamic VC bandwidth adjustments when using Inverse Multiplexing over ATM (IMA).
- Whether certain interface cards should use a particular set of carrier tones.

Modular Cisco IOS routers may contain multiple interface cards, each of which contains a single ATM interface. You may define only one ADSL definition per interface.

#### Before You Begin

- Make sure that the device contains an ADSL ATM interface. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

#### Related Topics

- [Supported ADSL Operating Modes, page 62-35](#)
- [ADSL on Cisco IOS Routers, page 62-34](#)
- [PVCs on Cisco IOS Routers, page 62-47](#)

**Step 1** Do one of the following:

- (Device view) Select **Interfaces > Settings > DSL > ADSL** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > DSL > ADSL** from the Policy Type selector. Select an existing policy or create a new one.

The ADSL page is displayed. See [Table 62-16 on page 62-38](#) for a description of the fields on this page.

- Step 2** Click the **Add** button beneath the table to display the ADSL Settings dialog box. See [Table 62-17 on page 62-39](#) for a description of the fields in this dialog box.
- Step 3** In the ATM Interface field, enter the name of the ATM interface or interface role on which you want to define ADSL settings, or click **Select** to select an interface role or create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).

**Note** The interface that you select must be physically present on the device; otherwise, deployment fails.

- Step 4** (Optional) Select the interface card type installed on the router.

**Note** When discovering from a live device, the correct interface card type is already displayed. If you did not perform discovery on a live device, or if Security Manager cannot detect the type of interface card installed on the device, this field displays “Unknown”.

- Step 5** (Optional) When using IMA groups, select the **Allow bandwidth change on ATM PVCs** check box to enable dynamic adjustments to VC bandwidth in response to changes in group bandwidth. If this check box is left deselected, you must make these adjustments manually.

- Step 6** (Optional) Specify the DSL operating mode for this ATM interface. See [Table 62-14 on page 62-35](#) for a list of the operating modes supported for each card type.

- Step 7** (Optional) Select the **Use low tone set** check box to have the interface card use carrier tones 29 through 48.

- Step 8** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the ADSL table.

**Note** To edit an ADSL definition, select it from the table, then click **Edit**. To remove an ADSL definition, select it, then click **Delete**.

- Step 9** Repeat [Step 2](#) through [Step 8](#) to define ADSL settings on additional ATM interfaces. Only one ADSL definition may be defined on an interface.

## ADSL Policy Page

Use the ADSL page to create, edit, and delete ADSL definitions on the ATM interfaces of the router. For more information, see [Defining ADSL Settings, page 62-36](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > DSL > ADSL** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > DSL > ADSL** from the Policy Type selector. Right-click **ADSL** to create a policy, or select an existing policy from the Shared Policy selector.

**Field Reference****Table 62-16** *ADSL Page*

| Element            | Description                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface      | The ATM interface on which ADSL settings are defined.                                                                                                                             |
| Interface Card     | The type of device or ADSL interface card on which the ATM interface resides.                                                                                                     |
| Bandwidth Change   | Indicates whether the router makes dynamic adjustments to VC bandwidth as overall bandwidth changes. (This is relevant only when IMA groups are configured on the ATM interface.) |
| DSL Operating Mode | The DSL operating mode for this interface.                                                                                                                                        |
| Tone Low           | Indicates whether the interface is using the low tone set (carrier tones 29 through 48).                                                                                          |
| Add button         | Opens the <a href="#">ADSL Settings Dialog Box, page 62-38</a> . From here you can define the ADSL settings for a selected ATM interface.                                         |
| Edit button        | Opens the <a href="#">ADSL Settings Dialog Box, page 62-38</a> . From here you can edit the selected ADSL definition.                                                             |
| Delete button      | Deletes the selected ADSL definition from the table.                                                                                                                              |

## ADSL Settings Dialog Box

Use the ADSL Settings dialog box to configure ADSL settings on a selected ATM interface.

**Note**

When you configure ADSL settings, we highly recommend that you select the type of device or interface card on which the ATM interface is defined. ADSL settings are highly dependent on the hardware. Defining the hardware type in Security Manager enables proper validation of your configuration for a successful deployment to your devices.

**Navigation Path**

Go to the [ADSL Policy Page, page 62-37](#), then click the **Add** or **Edit** button beneath the table.

# SHDSL on Cisco IOS Routers

Digital Subscriber Line (DSL) is a family of technologies that transports data over existing twisted-pair copper wire. DSL uses frequencies that are beyond the upper list used by POTS (plain old telephone service) to deliver broadband applications, such as multimedia and video, over the local loop (or *last mile*) that connects the telephone company's central office to customer sites.

Based on the International Telecommunications Union (ITU) G.991.2 global industry standard, symmetric high-speed digital subscriber line (SHDSL) delivers symmetrical data rates from 192 up to 2.3 Mbps on a single wire pair. It transports many types of signals, such as T1, E1, ISDN, ATM, and IP. In addition, the G.SHDSL signal has a greater distance reach from the central office than ADSL and proprietary SDSL connections.

To configure SHDSL in Security Manager, do the following:

1. Configure the SHDSL controller. See [Defining SHDSL Controllers, page 62-41](#).
2. Deploy the SHDSL policy. If ATM mode is activated, the router creates an ATM interface that corresponds to the controller upon deployment. See [Working with Deployment and the Configuration Archive, page 8-25](#).
3. Rediscover the device to add the new ATM interface to Security Manager. See [Discovering Policies on Devices Already in Security Manager, page 5-15](#).
4. (Optional) Create one or more subinterfaces on the ATM interface. See [Defining Basic Router Interface Settings, page 62-4](#).
5. Configure PVCs on the ATM interface or subinterface. See [Defining ATM PVCs, page 62-51](#).

**Note**

If you perform discovery on the device, Security Manager populates the SHDSL policy with the definition of the controller and the Interfaces policy with the ATM interface and subinterface. Any discovered PVCs are added to the PVC policy.

**Related Topics**

- [PVCs on Cisco IOS Routers, page 62-47](#)

## Defining SHDSL Controllers

When you configure an SHDSL controller in Security Manager, you must enter the name of the controller that is installed in the Cisco IOS router. The following settings are then applied automatically:

- ATM mode is enabled.
- The line termination is set to CPE (customer premises equipment).
- The line mode is set to Auto.

You can optionally change the line termination to CO and specify the DSL mode and line mode. In addition, you can define signal-to-noise ratio margins to improve line stability.

A Cisco IOS router may contain multiple SHDSL controllers. You may define only one SHDSL definition per controller.

**Note**

When you deploy an SHDSL policy with ATM mode enabled, an ATM interface is created automatically on the router. Perform rediscovery to add the interface into Security Manager. You can then define PVCs on the ATM interface as required. See [Defining ATM PVCs, page 62-51](#).

**Before You Begin**

- Make sure that an SHDSL controller is installed on the device.

**Related Topics**

- [SHDSL on Cisco IOS Routers, page 62-41](#)
- [PVCs on Cisco IOS Routers, page 62-47](#)

**Step 1**

Do one of the following:

- (Device view) Select **Interfaces > Settings > DSL > SHDSL** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > DSL > SHDSL** from the Policy Type selector. Select an existing policy or create a new one.

The SHDSL page is displayed. See [Table 62-18 on page 62-43](#) for a description of the fields on this page.

**Step 2**

Click the **Add** button beneath the table to display the SHDSL dialog box.

**Step 3**

Enter the name of the controller, or click **Select** to display the utility for generating the name. See [Controller Auto Name Generator Dialog Box, page 62-46](#).

**Note**

The controller that you select must be physically present on the device; otherwise, deployment fails.

**Step 4**

Define the SHDSL controller as required. For more information, see [Table 62-19 on page 62-44](#).

**Step 5**

Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the SHDSL table.

**Note**

To edit an SHDSL controller, select it from the table, then click **Edit**. To remove an SHDSL controller, select it, then click **Delete**.

**Step 6**

Repeat [Step 2](#) through [Step 5](#) to define additional SHDSL controllers. Only one definition may be defined per controller.

## SHDSL Policy Page

Use the SHDSL page to create, edit, and delete DSL controller definitions on the router. For more information, see [Defining SHDSL Controllers, page 62-41](#).

**Navigation Path**

- (Device view) Select **Interfaces > Settings > DSL > SHDSL** from the Policy selector.

- (Policy view) Select **Router Interfaces > Settings > DSL > SHDSL** from the Policy Type selector. Right-click **SHDSL** to create a policy, or select an existing policy from the Shared Policy selector.

#### Field Reference

**Table 62-18** SHDSL Page

| Element            | Description                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | The name of the DSL controller.                                                                                                                      |
| Description        | An optional description of the controller.                                                                                                           |
| Shutdown           | Indicates whether the DSL controller is in shutdown mode.                                                                                            |
| Configure ATM Mode | Indicates whether the DSL controller has been set into ATM mode.                                                                                     |
| Line Termination   | The line termination set for the router (CPE or CO).                                                                                                 |
| DSL Mode           | The operating mode defined for the DSL controller.                                                                                                   |
| Line Mode          | The line mode defined for the DSL controller.                                                                                                        |
| Line Rate          | The line rate (in kbps) defined for the DSL controller.<br><b>Note</b> A value is displayed in this column only if the line mode is not set to Auto. |
| SNR Margin Current | The current signal-to-noise ratio on the controller.                                                                                                 |
| SNR Margin Snext   | The self near-end crosstalk (Snext) signal-to-noise ratio on the controller.                                                                         |
| Add button         | Opens the <a href="#">SHDSL Controller Dialog Box, page 62-43</a> . From here you can define the settings for a DSL controller.                      |
| Edit button        | Opens the <a href="#">SHDSL Controller Dialog Box, page 62-43</a> . From here you can edit the selected DSL controller definition.                   |
| Delete button      | Deletes the selected DSL controller definition from the table.                                                                                       |

## SHDSL Controller Dialog Box

Use the SHDSL Controller dialog box to configure SHDSL controllers.

#### Navigation Path

Go to the [SHDSL Policy Page, page 62-42](#), then click the **Add** or **Edit** button beneath the table.

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current | <p>The current signal-to-noise (SNR) ratio on the controller, in decibels (dB). Valid values range from -10 to 10 dB.</p> <p>This option can create a more stable line by making the line train more than current noise margin plus SNR ratio threshold during training time. If any external noise is applied that is less than the set SNR margin, the line will be stable.</p> <p><b>Note</b> Select <b>disable</b> to disable the current SNR.</p> |
| Snext   | <p>The Self Near-End Crosstalk (SNEXT) signal-to-noise ratio on the controller, in decibels. Valid values range from -10 to 10 dB.</p> <p>This option can create a more stable line by making the line train more than SNEXT threshold during training time. If any external noise is applied that is less than the set SNEXT margin, the line will be stable.</p> <p><b>Note</b> Select <b>disable</b> to disable the SNEXT SNR.</p>                  |

## Controller Auto Name Generator Dialog Box

Use the Controller Auto Name Generator dialog box to have Security Manager generate a name for the DSL controller based on its location in the router.

### Navigation Path

Go to the [SHDSL Controller Dialog Box, page 62-43](#), then click **Select** in the Name field.

|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Result  | <p>The name generated by Security Manager from the information you entered for the controller location. The name displayed in this field is read-only.</p> <p><b>Tip</b> After closing this dialog box, you can edit the generated name in the SHDSL dialog box, if required.</p> |

## PVCs on Cisco IOS Routers

Asynchronous Transfer Mode (ATM) is an International Telecommunication Union (ITU-T) standard designed for the high-speed transfer of voice, video, and data through public and private networks using cell relay technology. A cell switching and multiplexing technology, ATM combines the benefits of circuit switching (constant transmission delay, guaranteed capacity) with those of packet switching (flexibility, efficiency for intermittent traffic). An ATM network is made up of one or more ATM switches and ATM endpoints, such as a Cisco IOS router.

There are three general types of ATM services, permanent virtual connections (PVCs), switched virtual connections (SVCs), and connectionless service. PVCs allow direct and permanent connections between sites to provide a service that is similar to a leased line. Advantages of PVCs are the guaranteed availability of a connection and that no call setup procedures are required between switches. Each piece of equipment between the source and destination must be manually provisioned for the PVC.

For more information about ATM PVCs, see:

- [Understanding Virtual Paths and Virtual Channels, page 62-47](#)
- [Understanding ATM Service Classes, page 62-48](#)
- [Understanding ATM Management Protocols, page 62-49](#)

For more information about defining PVCs in Security Manager, see:

- [Defining ATM PVCs, page 62-51](#)
- [Defining OAM Management on ATM PVCs, page 62-54](#)

## Understanding Virtual Paths and Virtual Channels

ATM networks are fundamentally connection oriented. This means that a virtual connection needs to be established across the ATM network before any data transfer. Two types of ATM connections exist:

- Virtual path connections (VPCs), identified by a virtual path identifier (VPI).
- Virtual channel connections (VCCs), identified by the combination of a VPI and a VCI (virtual channel identifier). PVCs are a type of VCC where a permanent connection is defined between two sites.

As shown in [Figure 62-2](#), a virtual path is a bundle of virtual channels, all of which are switched transparently across the ATM network on the basis of the common VPI. A VPC can be thought of as a bundle of VCCs with the same VPI value.

**Figure 62-2** ATM Virtual Path and Virtual Channel Connections

Every cell header contains a VPI field and a VCI field, which explicitly associate a cell with a given virtual channel on a physical link. It is important to remember the following attributes of VPIs and VCIs:

- VPIs and VCIs are not addresses, such as MAC addresses used in LAN switching.
- VPIs and VCIs are explicitly assigned at each segment of a connection and, as such, have only local significance across a particular link. They are remapped, as appropriate, at each switching point.

Using the VPI/VCI identifier, the ATM layer can multiplex (interleave), demultiplex, and switch cells from multiple connections. Certain VPI/VCI identifiers are reserved for particular uses, such as the Integrated Local Management Interface (ILMI).

## Understanding ATM Service Classes

Version 4.0 of the Traffic Management Specification published by the ATM Forum defines five service classes that describe the user traffic transmitted on a network and the quality of service that a network needs to provide for that traffic. Security Manager supports the following ATM service classes:

- *Available Bit Rate (ABR)* This is a service class where ATM switches make no guarantee of cell delivery, but do guarantee a minimum bit rate and that cell loss is kept as low as possible with the use of a feedback mechanism. The ABR service category is designed for VCs that carry file transfers and other bursty, non-real-time traffic that requires a minimum amount of bandwidth. This bandwidth is specified via a minimum cell rate that must be available while the VC is configured and active. For more details, see *Understanding the Available Bit Rate (ABR) Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a00800fbc76.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a00800fbc76.shtml).
- *Constant Bit Rate (CBR)* This is a service class where cells are transmitted in a continuous bitstream to meet voice and video QoS needs. The CBR service class is designed for ATM virtual circuits (VCs) that need a static amount of bandwidth that is continuously available for the duration of the active connection. An ATM VC configured as CBR can send cells at peak cell rate (PCR) at any time and for any duration. It also can send cells at a rate less than the PCR or even emit no cells. The

configuration on CBR may vary with different platforms. For more details, see *Understanding the CBR Service Category for ATM VCs* at:

[http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094e6a.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094e6a.shtml).

- *Unspecified Bit Rate (UBR)* This is a service class where the network management makes no Quality of Service (QoS) commitment. It models the best-effort service that the Internet normally provides and is suitable for applications tolerant to delay that do not require real-time responses. Examples include email, fax transmission, file transfers, Telnet, LAN and remote office interconnections. For more details, see *Understanding the UBR Service Category for ATM Virtual Circuits* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a00800a4837.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a00800a4837.shtml).
- *Unspecified Bit Rate (UBR+)* Cisco provides a variant of the UBR service class called UBR+. The main advantage of the UBR+ service class is that it allows an ATM end-system to signal a minimum cell rate to an ATM switch in a connection request, and the ATM network attempts to maintain this minimum as an end-to-end guarantee. For more details, see *Understanding the UBR+ Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094b40.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094b40.shtml).
- *Variable Bit Rate - Non-Real Time (VBR-nrt)* This service class is used to transmit non-real-time applications that are bursty in nature. The traffic characteristics are defined in terms of the Peak Cell Rate (PCR), Sustained Cell Rate (SCR), and Minimum Burst Size (MBS). For more details, see *Understanding the VBR-nrt Service Category and Traffic Shaping for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080102a42.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080102a42.shtml).
- *Variable Bit Rate - Real Time (VBR-rt)* This service class is used to transmit real-time data that is sensitive to time delays, like compressed voice over IP and video conferencing. As with VBR-nrt, VBR-rt traffic is defined in terms of a PCR, SCR, and MBS. For more details, see *Understanding the Variable Bit Rate Real Time (VBR-rt) Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094cd0.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094cd0.shtml).

You can use these service classes to define ATM quality of service (QoS) guarantees, such as traffic shaping. Traffic shaping is the use of queues to constrain data bursts, limit peak data rate, and smooth jitter so that traffic fits within the envelope defined by the traffic contract. ATM devices use traffic shaping to adhere to the terms of the traffic contract.

## Understanding ATM Management Protocols

ATM uses two different types of signaling for tracking the status of PVCs:

- Integrated Local Management Interface (ILMI). For more information, see [Understanding ILMI, page 62-50](#).
- Flow 4 (F4) and Flow 5 (F5) Operation, Administration, and Maintenance (OAM) cells. For more information, see [Understanding OAM, page 62-51](#).

Security Manager can be used to enable and disable ILMI on specific PVCs and to configure F5 OAM functionality.

## Understanding ILMI

The Integrated Local Management Interface (ILMI) is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. ILMI facilitates network-wide autoconfiguration by enabling devices to determine the status of components at the other end of a physical link and to negotiate a common set of operational parameters to ensure interoperability. The ATM routing protocols, PNNI (Private Network to Network Interface) and IISP (Interim-Interswitch Signaling Protocol), use this information to discover and bring up a network of interconnected ATM switch routers.

When two ATM interfaces run the ILMI protocol, they exchange ILMI packets across the physical connection. These packets consist of SNMP messages as large as 484 octets. ATM interfaces encapsulate these messages in an ATM adaptation layer 5 (AAL5) trailer, segment the packet into cells, and schedule the cells for transmission. ATM interfaces use the SNMP object IDs in network functions such as permanent virtual circuit (PVC) autodiscovery, which is particularly useful in digital subscriber line (DSL) applications.

ILMI organizes managed objects into multiple information bases (MIBs), including one for link management. This MIB contains the following object groups for all ATM interfaces:

- Physical layer—ILMI 4.0 discontinues or "deprecates" earlier physical-layer ILMI values and specifies the use of the standard Interface MIB (RFC 1213).
- ATM layer—Indicates the number of available bits for VPI and VCI values in the ATM cell header, maximum number of virtual path connections (VPCs) and virtual channel connections (VCCs) allowed, number of configured PVCs, and so on.
- Virtual path connection—Indicates the up or down status of a VPC and its Quality of Service (QoS) parameters.
- Virtual channel connection—Indicates the up or down status of the VCC and its QoS parameters.

Administrators may enable or disable ILMI at will, but we highly recommend you enable it. Without ILMI, you must manually configure many of the parameters otherwise managed by ILMI for the ATM devices to operate correctly. ILMI operates over a reserved PVC of VPI=X, VCI=16.

## Understanding OAM

The Operation, Administration, and Maintenance (OAM) feature provides fault management and performance management for ATM and is based on the standard defined in ITU recommendation I.610. OAM detects network connectivity failures on a PVC and reacts by bringing down the PVC. Without OAM, a PVC would remain up after network connectivity is lost. In such a situation, routing table entries would continue to point to the PVC, resulting in lost packets.

Security Manager enables the use of F5 OAM, which operates at the virtual circuit (VC) level. To detect a failure along the PVC path on an end-device, such as a Cisco IOS router, OAM uses the following cells:

- Loopback cells—At regular intervals, routers configured for OAM send loopback cells which must be looped in the network. This looping point can be the machine at the end of the PVC (end-to-end loopback cells) or a device on the path (segment loopback cells). A failure occurs when the loopback cell fails to return to its point of origin.
- Continuity Check (CC) cells—CC cells are sent regularly by routers configured for OAM to check the integrity of the link. CC cells can be sent either end-to-end or confined to a particular segment of the PVC. Activation and deactivation cells are used to initiate and suspend continuity checking. Any connectivity failures are reported in special SNMP notifications.
- Alarm Indication Signal (AIS) cells—In the event of a failure at the physical layer, AIS cells are sent to downstream devices to report a virtual connection failure at the ATM layer. The PVC moves to the down state after a defined number of AIS cells are received and does not come up again until a defined interval passes without additional AIS cells.
- Remote Detection Indication (RDI) cells—When AIS cells are sent to warn downstream devices of a connectivity failure, RDI cells are sent upstream in response as a control and feedback mechanism for the network.

AIS/RDI cells are sent using the same VPI/VCI as the user cells on the affected PVC until the failure is resolved.

## Defining ATM PVCs

You define an ATM permanent virtual circuit (PVC) by selecting an ATM interface and then defining the following settings:

- The PVC ID.
- The type of encapsulation to use.
- Whether ILMI management is enabled on this PVC.
- Whether Inverse ARP (InARP) is used to learn the IP addresses of the destination devices.
- Options related to PPP over Ethernet (PPPoE) and PPP over ATM (PPPoA).
- Quality-of-service settings, such as traffic shaping.
- Static IP address mappings in place of InARP.

For information about defining F5 Operation, Administration, and Maintenance (OAM) management, such as loopbacks and continuity checks, on PVCs, see [Defining OAM Management on ATM PVCs, page 62-54](#).

#### Before You Begin

- When configuring ATM over DSL, make sure that you have configured either an ADSL policy (see [ADSL on Cisco IOS Routers, page 62-34](#)) or an SHDSL policy ([SHDSL on Cisco IOS Routers, page 62-41](#)).
- Make sure that the device contains an ATM interface and subinterface. (PVCs are typically configured on ATM subinterfaces.) See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

#### Note

When configuring ATM for SHDSL, the ATM interface is created when you define the SHDSL controller and enable ATM mode. You must then rediscover the device to add the ATM interface to Security Manager. See [Defining SHDSL Controllers, page 62-41](#).

#### Related Topics

- [Defining OAM Management on ATM PVCs, page 62-54](#)
- [Understanding Policing and Shaping Parameters, page 66-6](#)
- [PVCs on Cisco IOS Routers, page 62-47](#)

#### Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > PVC** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PVC** from the Policy Type selector. Select an existing policy or create a new one.

The PVC page is displayed. See [Table 62-21 on page 62-56](#) for a description of the fields on this page.

#### Step 2

Click the **Add** button beneath the table to display the PVC dialog box. See [Table 62-22 on page 62-57](#) for a description of the fields in this dialog box.

#### Step 3

In the Interface field, enter the name of the ATM interface, ATM subinterface, or interface role on which you want to define the PVC, or click **Select** to select an interface role or to create a new one.

#### Step 4

Select the type of device or DSL WAN interface card that contains the ATM interface.

#### Note

We highly recommend that you define this setting to ensure the proper validation of your PVC policy, as the settings in this policy are highly hardware-dependent.

#### Step 5

On the Settings tab of the PVC dialog box, define the basic settings of the PVC:

- Enter the VPI/VCI identifier and an optional text handle. If you are defining the management PVC, select the **Management PVC (ILMI)** check box.

#### Note

An error occurs if two users attempt to define PVCs with the same identifiers at the same time.

- Select the type of ATM encapsulation to use. If you select aal5autoppp or aal5ciscoppp, you must define the virtual template to use for PPPoA, or click Select to display a selector. If you select aal5mux as the encapsulation type, you must select the protocol that is carried by the PVC.

---

**Note** Do not select an encapsulation type when defining the management PVC.

---

---

**Note** If you modify the virtual template settings on an existing PVC, you must enter the **shutdown** command followed by the **no shutdown** command on the ATM subinterface to restart the interface. This causes the newly configured parameters to take effect.

---

- c. Select the Enable ILMI check box to enable the ILMI to manage this PVC. For more information, see [Understanding ILMI, page 62-50](#).

---

**Note** You cannot configure the management PVC on a subinterface.

---

- d. Select the Inverse ARP check box to enable the PVC to dynamically learn the Layer 3 addresses that are required to forward traffic to those devices.

---

**Note** Alternatively, you can create static address mappings, as described in [Step 7](#).

---

- e. In the PPPoE Max Sessions field, define the maximum number of PPPoE sessions allowed on the PVC.
- f. In the VPN Service Name field, define the static domain name to use for PPPoA sessions on the PVC.

See [Table 62-23 on page 62-58](#) for a description of the fields on the Settings tab.

**Step 6** (Optional) On the QoS tab of the PVC dialog box, define the type of ATM traffic shaping to perform on the traffic carried by this PVC. Traffic shaping regulates the flow of traffic carried by the PVC by queuing traffic that exceeds the defined bit rates. See [Table 62-24 on page 62-62](#) for a description of the fields on the QoS tab.

**Step 7** (Optional) On the Protocol tab of the PVC dialog box, create static mappings for the IP addresses at the other end of the PVC:

- a. Click **Add** to display the Define Mapping dialog box. See [Table 62-26 on page 62-66](#) for a description of the fields in this dialog box.
- b. Select IP Address, then enter the address or network/host object that you want to map, or click **Select** to select a network/host object from a list or to create a new one.
- c. Click **OK**. The static mapping is displayed on the Protocol tab.
- d. Repeat [a.](#) through [c.](#) to define additional static mappings.

---

**Note** You can also use the Protocol tab to change the type of InARP to use, broadcast or non-broadcast.

---

**Step 8** Click **Advanced** to configure OAM management on the PVC. See [Defining OAM Management on ATM PVCs, page 62-54](#).

**Step 9** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the PVC table.

---

**Note** To edit a PVC, select it from the table, then click **Edit**. To remove a PVC, select it, then click **Delete**.

---

**Step 10** Repeat [Step 2](#) through [Step 9](#) to define additional PVCs.

---

## Defining OAM Management on ATM PVCs

Security Manager enables you to configure the following F5 (VC level) Operation, Administration, and Maintenance (OAM) cells for detecting PVC failures in a Cisco IOS router:

- Loopback cells
- Continuity Check (CC) cells
- Alarm Indication Signal (AIS) cells
- Remote Detection Indication (RDI) cells

You can enable and disable each of these cell types and define settings that determine how each cell type affects the PVC when a failure is detected.

### Before You Begin

- Select the ATM interface on which the PVC is defined.
- Define the general settings and the QoS settings of the PVC. See [Defining ATM PVCs, page 62-51](#).

### Related Topics

- [Defining ATM PVCs, page 62-51](#)
- [PVCs on Cisco IOS Routers, page 62-47](#)

---

**Step 1** In the PVC dialog box, click **Advanced** to display the PVC Advanced Settings dialog box. See [Table 62-27 on page 62-66](#) for a description of the fields in this dialog box.

**Step 2** Enable OAM loopback cells on the selected PVC:

- a. Click the **OAM-PVC** tab. See [Table 62-29 on page 62-69](#) for a description of the fields on this tab.
- b. Select the **Enable OAM Management** check box.
- c. Define the frequency of loopback cell transmissions.

**Step 3** (Optional) Enable segment CC cells on the PVC:

- a. Under Segment Continuity Check, select **Configure Continuity Check**.
- b. Choose whether the router should act as the sink, source, or both. This determines the direction in which CC cells are sent.
- c. Choose whether the PVC should remain up after segment or end-to-end failures are detected.

---

**Note** Select **Deny Activation Requests** to have the router reject CC activation requests received from peers.

---

- Step 4** (Optional) Enable end-to-end CC cells on the PVC, using the procedure described in [Step 3](#) for segment CC cells.
- Step 5** (Optional) Configure additional loopback cell parameters:
- Click the **OAM** tab.
  - Select the **Enable OAM Retry** check box, then define the down count, up count, and retry frequency. See [Table 62-28 on page 62-67](#) for a description of the available options.
- Step 6** (Optional) Configure additional CC cell parameters:
- Select the **Enable** check box for segment CC cells, then define the activation count, deactivation count, and retry frequency. These fields determine how many activation and deactivation requests are sent to peers and how often the router waits between each attempt. See [Table 62-28 on page 62-67](#) for a description of the available options.
  - Repeat **a.** for end-to-end CC cells.
- Step 7** (Optional) Configure AIS/RDI cells on the PVC:
- On the OAM tab, select the **Enable AIS-RDI Detection** check box.
  - Define how many AIS/RDI cells are required to move the PVC to the down state.
  - Define how many seconds must elapse without receiving AIS/RDI cells before moving the PVC to the up state.
- Step 8** Click **OK** to close the dialog box and return to PVC dialog box.
- 

## PVC Policy Page

Use the PVC page to create, edit, and delete permanent virtual connections (PVCs) on the router. PVCs allow direct and permanent connections between sites to provide a service that is similar to a leased line. These PVCs can be used in ADSL, SHDSL, or pure ATM environments. For more information, see [Defining ATM PVCs, page 62-51](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > PVC** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PVC** from the Policy Type selector. Right-click **PVC** to create a policy, or select an existing policy from the Shared Policy selector.

| Element        | Description                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface  | The ATM interface on which the PVC is defined.                                                                                      |
| Interface Card | The type of device or WAN interface card on which the ATM interface resides.                                                        |
| PVC ID         | The Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) of the PVC.                                                  |
| Settings       | Additional settings configured for the PVC, including encapsulation, the number of PPPoE sessions, and the VPN service name.        |
| QoS            | Quality-of-service settings defined for the PVC, such as traffic shaping.                                                           |
| Protocol       | The IP protocol mappings (static maps or Inverse ARP) configured for the PVC.                                                       |
| OAM            | The F5 Operation, Administration, and Maintenance (OAM) loopback, continuity check, and AIS/RDI definitions configured for the PVC. |
| OAM-PVC        | The OAM management cells that are configured for the PVC.                                                                           |
| Add button     | Opens the <a href="#">PVC Dialog Box, page 62-56</a> . From here you can define a PVC.                                              |
| Edit button    | Opens the <a href="#">PVC Dialog Box, page 62-56</a> . From here you can edit the selected PVC.                                     |
| Delete button  | Deletes the selected PVC from the table.                                                                                            |

## PVC Dialog Box

Use the PVC dialog box to configure ATM permanent virtual circuits (PVCs).

You can configure the following types of interface cards:

- Unknown—The interface card type is not defined.
- WIC-1ADSL—A 1-port ADSL WAN interface card that provides ADSL over POTS (ordinary telephone lines).
- WIC-1ADSL-I-DG—A 1-port ADSL WAN interface card that provides ADSL over ISDN with Dying Gasp support. (With Dying Gasp, the router warns the DSLAM of imminent line drops when the router is about to lose power.)
- WIC-1ADSL-DG—A 1-port ADSL WAN interface card that provides ADSL over POTS with Dying Gasp support.
- HWIC-1ADSL—A 1-port high-speed ADSL WAN interface card that provides ADSL over POTS.
- HWIC-1ADSLI—A 1-port high-speed ADSL WAN interface card that provides ADSL over ISDN.
- HWIC-ADSL-B/ST—A 2-port high-speed ADSL WAN interface card that provides ADSL over POTS with an ISDN BRI port for backup.
- HWIC-ADSLI-B/ST—A 2-port high-speed ADSL WAN interface card that provides ADSL over ISDN with an ISDN BRI port for backup.
- WIC-1-SHDSL-V2—A 1-port multiline G.SHDSL WAN interface card with support for 2-wire mode and enhanced 4-wire mode.

- WIC-1-SHDSL-V3—A 1-port multiline G.SHDSL WAN interface card with support for 2-wire mode and 4-wire mode (standard & enhanced).
- NM-1A-T3—A 1-port ATM network module with a T3 link.
- NM-1A-OC3-POM—A 1-port ATM network module with an optical carrier level 3 (OC-3) link and three operating modes (multimode, single-mode intermediate reach (SMIR), and single-mode long-reach (SMLR)).
- NM-1A-E3—A 1-port ATM network module with an E3 link.
- 857 ADSL—Cisco 857 Integrated Service Router with an ADSL interface.
- 876 ADSL—Cisco 876 Integrated Services Router with an ADSL interface.
- 877 ADSL—Cisco 877 Integrated Services Router with an ADSL interface.
- 878 888 G.SHDSL—Cisco 878 Integrated Services Router with a G.SHDSL interface.
- 1801 ADSLoPOTS—Cisco 1801 Integrated Services Router that provides ADSL over POTS.
- 1802 ADSLoISDN—Cisco 1802 Integrated Services Router that provides ADSL over ISDN.
- 1803 G.SHDSL—Cisco 1803 Integrated Services Router that provides 4-wire G.SHDSL.

### Navigation Path

Go to the [PVC Policy Page, page 62-55](#), then click the **Add** or **Edit** button beneath the table.

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface  | <p>The ATM interface on which the PVC is defined. Enter the name of an interface, subinterface, or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p><b>Note</b> We strongly recommend not defining an interface role that includes ATM interfaces from different interface cards. The different settings supported by each card type may cause deployment to fail.</p>                                         |
| Interface Card | <p>The type of WAN interface card installed on the router or the router type. Supported card types are listed above.</p> <p><b>Note</b> To ensure proper policy validation, we highly recommend that you define a value in this field. When you discover a live device, the correct interface card type will already be displayed. If you did not perform discovery on a live device, or if Security Manager cannot detect the type of interface card installed on the device, this field displays “Unknown”.</p> |
| Settings tab   | <p>Defines basic PVC settings, such as the VPI/VCI and encapsulation. See <a href="#">PVC Dialog Box—Settings Tab, page 62-58</a>.</p>                                                                                                                                                                                                                                                                                                                                                                            |
| QoS tab        | <p>Defines ATM traffic shaping and other quality-of-service settings for the PVC. See <a href="#">PVC Dialog Box—QoS Tab, page 62-61</a>.</p>                                                                                                                                                                                                                                                                                                                                                                     |

**Table 62-22 PVC Dialog Box (continued)**

| Element         | Description                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol tab    | Defines the IP protocol mappings configured for the PVC (static maps or Inverse ARP). See <a href="#">PVC Dialog Box—Protocol Tab, page 62-64</a> .          |
| Advanced button | Defines F5 Operation, Administration, and Maintenance (OAM) settings for the PVC. See <a href="#">PVC Advanced Settings Dialog Box—OAM Tab, page 62-67</a> . |

## PVC Dialog Box—Settings Tab

Use the Settings tab of the PVC dialog box to configure the basic settings of the PVC, including:

- ID settings.
- Encapsulation settings.
- Whether ILMI and Inverse ARP are enabled.
- The maximum number of PPPoE sessions.
- The static domain (VPN service) name to use for PPPoA.

### Navigation Path

Go to the [PVC Dialog Box, page 62-56](#), then click the **Settings** tab.

### Field Reference

**Table 62-23 PVC Dialog Box—Settings Tab**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PVC ID settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VPI             | <p>The virtual path identifier of the PVC. In conjunction with the VCI, identifies the next destination of a cell as it passes through a series of ATM switches on the way to its destination. Valid values for most platforms range from 0 to 255.</p> <p>For Cisco 2600 and 3600 Series routers using Inverse Multiplexing for ATM (IMA), valid values range from 0 to 15, 64 to 79, 128 to 143, and 192 to 207.</p> <p><b>Note</b> VPI/VCI values must be unique for all the PVCs configured on a selected interface. VPI/VCI values are unique to a single link only and might change as cells traverse the ATM network.</p> |

**Table 62-23 PVC Dialog Box—Settings Tab (continued)**

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VCI                    | <p>The 16-bit virtual channel identifier of the PVC. In conjunction with the VPI, identifies the next destination of a cell as it passes through a series of ATM switches on the way to its destination. Valid values vary by platform. Typically, values up to 31 are reserved for special traffic (such as ILMI) and should not be used. 3 and 4 are invalid.</p> <p><b>Note</b> VPI/VCI values must be unique for all the PVCs configured on a selected interface. VPI/VCI values are unique to a single link only and might change as cells traverse the ATM network.</p>                                                         |
| Handle                 | <p>An optional name to identify the PVC. The maximum length is 15 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Management PVC (ILMI)  | <p>Does not apply when configuring the PVC on a subinterface.</p> <p>When selected, designates this PVC as the management PVC for this ATM interface by enabling communication with the Interim Local Management Interface (ILMI). ILMI is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. See <a href="#">Understanding ILMI, page 62-50</a>.</p> <p>When deselected, this PVC does not act as the management PVC. This is the default.</p> <p><b>Note</b> The VPI/VCI for the management PVC is typically set to 0/16.</p> |
| Encapsulation settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 62-23 PVC Dialog Box—Settings Tab (continued)

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type             | <p>Does not apply when the Management PVC (ILMI) check box is enabled.</p> <p>The ATM adaptation layer (AAL) and encapsulation type to use on the PVC:</p> <ul style="list-style-type: none"> <li>• [blank]—The encapsulation type is not defined. (When deployed, aal5snap is applied.)</li> <li>• aal2—For PVCs dedicated to AAL2 Voice over ATM. AAL2 is used for variable bit rate (VBR) traffic, which can be either realtime (VBR-RT) or non-realtime (VBR-NRT).</li> <li>• aal5autopp—Enables the router to distinguish between incoming PPP over ATM (PPPoA) and PPP over Ethernet (PPPoE) sessions and create virtual access for both PPP types based on demand.</li> <li>• aal5ciscopp—For the proprietary Cisco version of PPP over ATM.</li> <li>• aal5mux—Enables you to dedicate the PVC to a single protocol, as defined in the Protocol field.</li> <li>• aal5nlpid—Enables ATM interfaces to work with High-Speed Serial Interfaces (HSSI) that are using an ATM data service unit (ADSU) and running ATM-Data Exchange Interface (DXI).</li> <li>• aal5snap—Supports Inverse ARP and incorporates the Logical Link Control/Subnetwork Access Protocol (LLC/SNAP) that precedes the protocol datagram. This allows multiple protocols to traverse the same PVC.</li> </ul> |
| Virtual Template | <p>The virtual template used for PPP over ATM on this PVC. Enter the name of a virtual template interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>When a user dials in, the virtual template is used to configure a virtual access interface. When the user is done, the virtual access interface goes down and the resources are freed for other dial-in users.</p> <p><b>Note</b> If you modify the virtual template settings on an existing PVC, you must enter the shutdown command followed by the no shutdown command on the ATM subinterface to restart the interface. This causes the newly configured parameters to take effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol            | <p>Applies only when aal5mux is the defined encapsulation type.</p> <p>The protocol carried by the MUX-encapsulated PVC:</p> <ul style="list-style-type: none"> <li>• frame-relay—Frame-Relay-ATM Network Interworking (FRF.5) on the Cisco MC3810.</li> <li>• fr-atm-srv—Frame-Relay-ATM Service Interworking (FRF.8) on the Cisco MC3810.</li> <li>• ip—IP protocol.</li> <li>• ppp—IETF-compliant PPP over ATM. You must specify a virtual template when using this protocol type.</li> <li>• voice—Voice over ATM.</li> </ul>                                         |
| Additional settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable ILMI         | <p>When selected, enables ILMI management on this PVC.</p> <p>When deselected, ILMI management on this PVC is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Inverse ARP         | <p>When selected, the Inverse Address Resolution Protocol (Inverse ARP) is enabled on the PVC.</p> <p>When deselected, Inverse ARP is disabled. This is the default.</p> <p>Inverse ARP is used to learn the Layer 3 addresses at the remote ends of established connections. These addresses must be learned before the virtual circuit can be used.</p> <p><b>Note</b> Use the Protocol tab to define static mappings of IP addresses instead of dynamically learning the addresses using Inverse ARP. See <a href="#">PVC Dialog Box—Protocol Tab, page 62-64</a>.</p> |
| PPPoE Max Sessions  | The maximum number of PPP over Ethernet sessions that are permitted on the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VPN Service Name    | <p>The static domain name to use on this PVC. The maximum length is 128 characters.</p> <p>Use this option when you want PPP over ATM (PPPoA) sessions in the PVC to be forwarded according to the domain name supplied, without starting PPP.</p>                                                                                                                                                                                                                                                                                                                        |

## PVC Dialog Box—QoS Tab

Use the QoS tab of the PVC dialog box to configure the ATM traffic shaping and other quality-of-service settings of the PVC, including:

- The limit on packets placed on transmission rings.
- The QoS service.
- Whether random detection is enabled.

These settings regulate the flow of traffic over the PVC by queuing traffic that exceeds the defined allowable bit rates.

**Note**

QoS values are highly hardware dependent. Please refer to your router documentation for additional details about the settings that can be configured on your device.

**Navigation Path**

Go to the [PVC Dialog Box](#), page 62-56, then click the **QoS** tab.

An ATM VC configured for CBR can send cells at this rate for as long as required.</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| UBR     | <p>The following field is displayed when UBR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| UBR+    | <p>The following fields are displayed when UBR+ is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> <li>• MCR—The minimum guaranteed cell rate for output in kilobits per second (kbps). Traffic is always allowed to be sent at this rate.</li> </ul> <p><b>Note</b> UBR+ requires Cisco IOS Software Release 12.4(2)XA or later, or version 12.4(6)T or later.</p>                                                                                                                                                         |
| VBR-NRT | <p>The following fields are displayed when VBR-NRT is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> <li>• SCR—The sustained cell rate for output in kilobits per second (kbps). This value, which must be lower than or equal to the PCR, represents the maximum rate at which cells can be transmitted without incurring data loss.</li> <li>• MBS—The maximum burst cell size for output. This value represents the number of cells that can be transmitted above the SCR but below the PCR without penalty.</li> </ul> |

**Table 62-24 PVC Dialog Box—QoS Tab (continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VBR-RT          | <p>The following fields are displayed when VBR-RT is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• <b>Peak Rate</b>—The peak information rate for realtime traffic in kilobits per second (kbps).</li> <li>• <b>Average Rate</b>—The average information rate for realtime traffic in kilobits per second (kbps). This value must be lower than or equal to the peak rate.</li> <li>• <b>Burst</b>—The burst size for realtime traffic, in number of cells. Configure this value if the PVC carries bursty traffic.</li> </ul> <p>These values configure traffic shaping between realtime traffic (such as voice and video) and data traffic to ensure that the carrier does not discard realtime traffic, for example, voice calls.</p> |
| IP QoS settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Random Detect   | <p>When selected, enables Weighted Random Early Detection (WRED) or VIP-distributed WRED (DWRED) on the PVC.</p> <p>When deselected, WRED and DWRED are disabled. This is the default.</p> <p>WRED is a queue management method that selectively drops packets as the interface becomes congested. See <a href="#">Tail Drop vs. WRED</a>, page 66-4.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |

## PVC Dialog Box—Protocol Tab

Use the Protocol tab of the PVC dialog box to add, edit, or delete the protocol mappings configured for the PVC. You may configured static mappings or Inverse ARP (broadcast or nonbroadcast) for each PVC, but not both.

### Note

IP is the only protocol supported by Security Manager for protocol mapping on ATM networks. You cannot define protocol mappings on the Management PVC (ILMI).

### Navigation Path

Go to the [PVC Dialog Box](#), page 62-56, then click the **Protocol** tab.

| Element             | Description                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| IP Protocol Mapping | Displays the IP protocol mappings configured for the PVC.                                                          |
| Add button          | Opens the <a href="#">Define Mapping Dialog Box, page 62-65</a> . From here you can define an IP protocol mapping. |
| Edit button         | Opens the <a href="#">Define Mapping Dialog Box, page 62-65</a> . From here you can edit the selected mapping.     |
| Delete button       | Deletes the selected mapping from the table.                                                                       |

**Define Mapping Dialog Box**

Use the Define Mapping dialog box to configure the IP protocol mappings to use on the ATM PVC. Mappings are required by the PVC to discover which IP address is reachable at the other end of a connection. Mappings can either be learned dynamically using Inverse ARP (InARP) or defined statically. Static mappings are best suited for simple networks that contain only a few nodes.

**Note**

Inverse ARP is only supported for the aal5snap encapsulation type. See [PVC Dialog Box—Settings Tab, page 62-58](#).

**Tip**

Use the CLI or FlexConfigs to configure mappings for protocols other than IP.

**Navigation Path**

Go to the [PVC Dialog Box—Protocol Tab, page 62-64](#), then click **Add** or **Edit**.

|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Options        | <p>The type of IP protocol mapping to use:</p> <ul style="list-style-type: none"> <li>IP Address—Select this option when using static mapping. Enter the address or the name of a network/host object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>InARP—Inverse ARP. Select this option when using dynamic mapping. This allows the PVC to resolve its own network addresses without configuring a static map. Dynamic mappings age out and are refreshed periodically every 15 minutes by default.</li> </ul> <p><b>Note</b> InARP can be used only when aal5snap is the defined encapsulation type for the PVC. See <a href="#">PVC Dialog Box—Settings Tab, page 62-58</a>.</p> |
| Broadcast Options | <p>Indicates whether to use this map entry when sending IP broadcast packets (such as EIGRP updates):</p> <ul style="list-style-type: none"> <li>Broadcast—The map entry is used for broadcast packets.</li> <li>No Broadcast—The map entry is used only for unicast packets.</li> <li>None—Broadcast options are disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## PVC Advanced Settings Dialog Box

Use the PVC Advanced Settings dialog box to configure F5 Operation, Administration, and Maintenance (OAM) functionality on an ATM PVC. OAM is used to detect connectivity failures at the ATM layer.

For more information, see [Defining OAM Management on ATM PVCs, page 62-54](#).

**Navigation Path**

Go to the [PVC Dialog Box, page 62-56](#), then click **Advanced**.

**Related Topics**

- [PVC Policy Page, page 62-55](#)

**Field Reference****Table 62-27** *PVC Advanced Settings Dialog Box*

| Element     | Description                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------|
| OAM tab     | Defines loopback, connectivity check, and AIS/RDI settings. See <a href="#">PVC Advanced Settings Dialog Box—OAM Tab, page 62-67</a> .   |
| OAM-PVC tab | Enables OAM loopbacks and connectivity checks on the PVC. See <a href="#">PVC Advanced Settings Dialog Box—OAM-PVC Tab, page 62-69</a> . |

## PVC Advanced Settings Dialog Box—OAM Tab

Use the OAM tab of the PVC Advanced Settings dialog box to define:

- The number of loopback cell responses that move the PVC to the down or up state.
- The number of alarm indication signal/remote defect indication (AIS/RDI) cells that move the PVC to the down or up state.
- The number and frequency of segment/end continuity check (CC) activation and deactivation requests that are sent on this PVC.

For more information, see [Defining OAM Management on ATM PVCs, page 62-54](#).

### Note

The settings defined in this tab are dependent on the settings defined in the OAM-PVC tab. See [PVC Advanced Settings Dialog Box—OAM-PVC Tab, page 62-69](#).

### Navigation Path

Go to the [PVC Advanced Settings Dialog Box, page 62-66](#), then click the **OAM** tab.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retry settings   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable OAM Retry | <p>When selected, OAM management settings can be defined.</p> <p>When deselected, OAM management settings cannot be defined.</p> <p><b>Note</b> If Enable OAM Management is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p>                                                                                                                                                                                                                 |
| Down Count       | The number of consecutive, unreceived, end-to-end loopback cell responses that cause the PVC to move to the down state. The default is 3.                                                                                                                                                                                                                                                                                                                                                                |
| Up Count         | The number of consecutive end-to-end loopback cell responses that must be received in order to move the PVC to the up state. The default is 5.                                                                                                                                                                                                                                                                                                                                                           |
| Retry Frequency  | <p>The interval between loopback cell verification transmissions in seconds. The default is 1 second.</p> <p>If a PVC is up and a loopback cell response is not received within the specified interval (as defined in the Frequency field of the PVC-OAM tab), loopback cells are transmitted at the frequency defined here to verify whether the PVC is down. If the number of consecutive cells that do not receive a response matches the defined down count, the PVC is moved to the down state.</p> |
| AIS-RDI settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 62-28 PVC Advanced Settings Dialog Box—OAM Tab (continued)**

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable AIS-RDI Detection             | <p>When selected, alarm indication signal (AIS) cells and remote defect indication (RDI) cells are used to report connectivity failures at the ATM layer of the PVC.</p> <p>When deselected, AIS/RDI cells are disabled.</p> <p>AIS cells notify downstream devices of the connectivity failure. The last ATM switch then generates RDI cells in the upstream direction towards the device that sent the original failure notification.</p> |
| Down Count                           | The number of consecutive AIS/RDI cells that cause the PVC to go down. Valid values range from 1 to 60. The default is 1.                                                                                                                                                                                                                                                                                                                   |
| Up Count                             | The number of seconds after which a PVC is brought up if no AIS/RDI cells are received. Valid values range from 3 to 60 seconds. The default is 3.                                                                                                                                                                                                                                                                                          |
| Segment Continuity Check settings    |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Segment Continuity Check      | <p>When selected, OAM F5 continuity check (CC) activation and deactivation requests are sent to a device at the other end of a segment.</p> <p>When deselected, segment CC activation and deactivation requests are disabled.</p> <p><b>Note</b> If Configure Continuity Check is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p>                                              |
| Activation Count                     | The maximum number of times that the activation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                               |
| Deactivation Count                   | The maximum number of times that the deactivation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                             |
| Retry Frequency                      | The interval between activation/deactivation retries, in seconds. The default is 30 seconds.                                                                                                                                                                                                                                                                                                                                                |
| End-to-End Continuity Check settings |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable End-to-End Continuity Check   | <p>When selected, OAM F5 continuity check (CC) activation and deactivation requests are sent to a device at the other end of the PVC.</p> <p>When deselected, segment CC activation and deactivation requests are disabled.</p> <p><b>Note</b> If Configure Continuity Check is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p>                                                |
| Activation Count                     | The maximum number of times that the activation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                               |
| Deactivation Count                   | The maximum number of times that the deactivation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                             |

| Element         | Description                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------|
| Retry Frequency | The interval between activation/deactivation retries, in seconds. The default is 30 seconds. |

## PVC Advanced Settings Dialog Box—OAM-PVC Tab

Use the OAM-PVC tab of the PVC Advanced Settings dialog box to enable loopback cells and connectivity checks (CCs) on the PVC. These functions test the connectivity of the virtual connection.

For more information, see [Defining OAM Management on ATM PVCs, page 62-54](#).

### Note

Use the OAM tab to define additional settings related to the settings on this tab. See [PVC Advanced Settings Dialog Box—OAM Tab, page 62-67](#).

### Navigation Path

Go to the [PVC Advanced Settings Dialog Box, page 62-66](#), then click the **OAM-PVC** tab.

## PPP on Cisco IOS Routers

The Point-to-Point Protocol (PPP), as defined in RFC 1661, provides a method for transporting packets between two devices or hosts using physical or logical links. PPP is a Layer 2 data-link protocol that can work with multiple Layer 3 network-layer protocols, including IP, IPX, and AppleTalk.

PPP is used in many common scenarios, such as:

- Connecting remote users to a central network over dial-in connections.
- Connecting the gateway of an enterprise network to an ISP for internet access.
- Connecting two LANs (for example, a central office and a branch office) to exchange data between them.

PPP connectivity is established in stages:

1. First, a Link Control Protocol (LCP) establishes, configures, and tests the data-link connection.
2. (Optional) Authentication verifies the identity of the two parties.
3. A family of Network Control Protocols (NCPs) establishes and configures the necessary network-layer protocols.

The PPP policy in Security Manager provides a method for configuring selected parameters that are negotiated between the two nodes during the LCP stage, including authentication (typically CHAP or PAP) and Multilink PPP (MLP). For more information about MLP, see [Defining Multilink PPP Bundles, page 62-75](#).

The following topics describe the tasks you perform to create PPP policies on Cisco IOS routers:

- [Defining PPP Connections, page 62-72](#)
- [Defining Multilink PPP Bundles, page 62-75](#)

## Understanding Multilink PPP (MLP)

MLP, as defined in RFC 1990, is a method for splitting, recombining, and sequencing datagrams across multiple logical data links. MLP was originally designed to exploit multiple bearer channels in ISDN, but it can be used whenever multiple PPP links connect two systems, including asynchronous links.

MLP spreads inbound and outbound traffic across multiple physical WAN links (known collectively as a bundle) while providing the following benefits:

- Packet fragmentation and reassembly
- Proper sequencing
- Multivendor interoperability
- Load balancing

As shown in [Figure 62-3](#), traffic routed across an MLP link is fragmented, with the fragments being sent across the different physical links. At the remote end of the link, the fragments are reassembled and forwarded to the next hop toward their ultimate destination. By using multiple physical links, MLP provides a way to temporarily use the additional bandwidth afforded by these links.

**Figure 62-3** Multilink PPP

Every MLP bundle is controlled by a single interface, the bundle director, which is a virtual-access interface. This interface is created in the background when the bundle is first created. The physical interface becomes part of the bundle that is managed by the bundle director. Bundles are also used when you create a multilink group consisting of a multilink interface and its associated serial interfaces, which is a setup that is often found in static, leased-line environments.

MLP uses an endpoint discriminator to identify the system transmitting a packet. By default, this discriminator is based on the hostname of the router, but it can also be based on other criteria, such as the IP address or MAC address of the interface, a telephone number, or a user-defined string. If the endpoint discriminator matches the discriminator of an existing link, the new link is added to the matching bundle. If no match exists, a new bundle is created. When authentication is used, a new bundle is established whenever there is a mismatch in either the discriminator or the authentication information exchanged between the two nodes.

## Defining PPP Connections

When you define a PPP connection, the first step is to select the interface on which PPP should be enabled. You must select one of the following interface types:

- Async
- Group-Async
- Serial
- High-Speed Serial Interface (HSSI)
- Dialer
- BRI, PRI (ISDN)
- Virtual template

- Multilink

You cannot define PPP connections on:

- Subinterfaces.
- Serial interfaces with Frame Relay encapsulation.
- Virtual template interfaces defined as Ethernet or tunnel types (serial is supported).

**Note**

You cannot configure PPP on serial interfaces that are configured for Frame Relay encapsulation. See [Defining Basic Router Interface Settings, page 62-4](#).

**Note**

Deployment might fail if you define PPP on a virtual template that is also used in an 802.1x policy. See [Defining 802.1x Policies, page 64-4](#).

You can select one or more authentication protocols and define when authentication should be performed.

In addition, you can configure the authentication and authorization methods to use when performing AAA on a remote security server. You can either define a default method list to use for all PPP connections on the device or define a customized method list that applies to a specific connection.

**Before You Begin**

- Make sure that the device contains an interface on which PPP can be configured. See [Basic Interface Settings on Cisco IOS Routers, page 62-1](#).

**Related Topics**

- [Defining Multilink PPP Bundles, page 62-75](#)
- [PPP on Cisco IOS Routers, page 62-71](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > PPP/MLP** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > PPP/MLP** from the Policy Type selector. Select an existing policy or create a new one.
- The PPP/MLP page is displayed. See [Table 62-30 on page 62-76](#) for a description of the fields on this page.
- Step 2** Click the **Add** button beneath the table to display the PPP dialog box.
- Step 3** In the Interface field, enter the name of the interface or interface role on which you want to define the PPP connection, or click **Select** to select an interface role from a list or to create a new one.
- Step 4** (Optional) On the PPP tab, define authentication for the PPP connection:
- a. Select one or more authentication protocols.
  - b. Select one or more authentication options. These options determine when to perform authentication (callin, callout, and callback), whether to use one-time passwords, and whether to allow a mobile station in a PDSN configuration to receive Simple IP and Mobile IP services without using CHAP or PAP.

---

**Note** The Call Back option only enables authentication during callback. Use the CLI or FlexConfigs to configure the callback feature on the device.

---

c. See [PPP Dialog Box—PPP Tab, page 62-78](#) for a description of the fields on this tab.

**Step 5** (Optional) When using a remote AAA server to perform authentication, select Default List or Custom Method List in the Authenticate Using field, then define the methods to use in the Prioritized Method List field.

---

**Note** If you modify the default list, your changes affect all PPP connections on the devices that use this list. If you leave this field blank, authentication is performed using the local database on the device.

---

**Step 6** (Optional) When using a remote AAA server to perform authorization, select AAA Policy Default List or Custom Method List, then define the methods to use in the Prioritized Method List field.

---

**Note** If you choose AAA Policy Default List, the device uses the default authorization methods defined in the AAA policy. See [Defining AAA Services, page 63-4](#).

---

**Step 7** (Optional) Define the username and password to send in response to PAP authentication requests.

---

**Note** If you entered the encrypted version of the password, select the **Encrypted** check box.

---

**Step 8** (Optional) Define a different hostname to send in all CHAP challenges and responses in place of the router's own hostname.

---

**Note** If you entered the encrypted version of the password, select the **Encrypted** check box.

---

**Step 9** (Optional) To enable Multilink PPP on this connection, click the **MLP** tab. See [Defining Multilink PPP Bundles, page 62-75](#).

**Step 10** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the PPP table.

---

**Note** To edit a PPP connection, select it from the table, then click **Edit**. To remove a PPP connection, select it, then click **Delete**.

---

**Step 11** Repeat [Step 2](#) to [Step 10](#) to define PPP connections on additional interfaces. Only one PPP connection may be defined on an interface.

---

## Defining Multilink PPP Bundles

You enable Multilink PPP (MLP) on the selected interface by selecting the check box at the top of the Multilink tab in the PPP dialog box. You can optionally enable Multiclass Multilink PPP (MCMP), which prevents delay-sensitive traffic from fragmentation, and interleaving, which enables packets to be interspersed among the fragments of larger packets. If you want to restrict a serial interface to a specific bundle, you can select the multilink interface that represents that bundle.

In addition, you can optionally modify the following default settings:

- The maximum fragment delay.
- The endpoint discriminator that identifies the router when negotiating the use of MLP.
- The maximum receive reconstructed unit (MRRU) permitted by the router and its peers.
- The maximum queue depth for first-in, first-out (FIFO) and non-FIFO queues.

### Before You Begin

- Select the interface on which the PPP connection should be enabled.

### Related Topics

- [Defining PPP Connections, page 62-72](#)
- [PPP on Cisco IOS Routers, page 62-71](#)

- 
- Step 1** In the PPP dialog box, click the **MLP** tab. See [PPP Dialog Box—MLP Tab, page 62-80](#) for a description of the fields on this tab.
- Step 2** Select the **Enable Multilink Protocol (MLP)** check box.
- Step 3** (Optional) Configure one or more of the following options:
- a. Whether to enable the multiclass feature that prevents delay-sensitive traffic from being fragmented. This is achieved by placing delay-sensitive traffic in a separate class from regular traffic.
  - b. Whether to enable the interleaving of packets among the fragments of larger packets on the MLP bundle.
  - c. Whether to restrict the physical link to joining only a designated multilink-group (defined by selecting a multilink interface). If a peer at the other end of the link tries to join a different bundle, the connection is severed.
  - d. Whether to modify the default amount of time required to transmit a fragment on the MLP bundle. The default is 30 milliseconds.

**Note** If you enable interleaving without defining a fragment delay, the default delay of 30 seconds is configured. This value does not appear in Security Manager or in the device configuration.

- Step 4** (Optional) Under Endpoint, modify the default endpoint discriminator used on the MLP bundle. The endpoint discriminator is used to identify the router on the MLP bundle. The default endpoint discriminator is either the globally configured hostname, or the PAP username or CHAP hostname (depending on the authentication protocol being used), if you configured those values on the PPP tab. See [Defining PPP Connections, page 62-72](#).
- Step 5** (Optional) In the MRRU fields, modify the default maximum packet size that the router (local) or the peer (remote) is capable of receiving.

- Step 6** (Optional) Modify the default maximum size of link transmit queues when using FIFO and non-FIFO (QoS) queuing.
- Step 7** Click **OK** to close the dialog box. Your definitions are displayed on the PPP page.

## PPP/MLP Policy Page

Use the PPP/MLP page to create, edit, and delete PPP connections on the router. For more information, see [Defining PPP Connections, page 62-72](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > PPP/MLP** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PPP/MLP** from the Policy Type selector. Right-click **PPP/MLP** to create a policy, or select an existing policy from the Shared Policies selector.

| CHAP Authentication settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Hostname                     | By default, the router uses its hostname to identify itself to the peer. If required, you can enter a different hostname to use for all CHAP challenges and responses. For example, use this field to specify a common alias for all routers in a rotary group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Secret                       | The secret used to compute the response value for any CHAP challenge from an unknown peer. Enter the secret again in the Confirm field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Encrypted Secret             | When selected, this indicates that the password you entered is already encrypted. When deselected, this indicates that the password you entered is in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authorization settings       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Authorize Using              | <p>AAA authorization settings for the PPP connection:</p> <ul style="list-style-type: none"> <li>• AAA Policy Default List—Uses the default authorization method list that is defined in the device’s AAA policy. See <a href="#">AAA Policy Page, page 63-6</a>.</li> <li>• Prioritized Method List—Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select it. Use the up and down arrows to define the order in which selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> </ul> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> Leave this field blank to perform authorization using the local database on the router.</p> |

## PPP Dialog Box—MLP Tab

Use the MLP tab of the PPP dialog box to define Multilink PPP (MLP) parameters for the selected PPP connection.

### Navigation Path

Go to the [PPP Dialog Box, page 62-77](#), then click the **MLP** tab.

| Enable Multilink PPP (MLP)                                       | When selected, MLP is enabled on this PPP connection.<br>When deselected, MLP is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Allow Multiple Data Classes                                      | When selected, enables multiple data classes on the MLP bundle. Delay-sensitive traffic is placed into Class 1, where it can be interleaved but never fragmented. Normal data traffic is placed into Class 0, which is subject to fragmentation just as regular multilink packets are.<br>When deselected, all traffic is subject to fragmentation.                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Interleaving of Packets Among Fragments of Larger Packets | When selected, enables the interleaving of packets among the fragments of larger packets on the MLP bundle.<br><b>Note</b> If you enable interleaving without defining a fragment delay, the default delay of 30 seconds is configured. This value does not appear in Security Manager or in the device configuration.<br>When deselected, interleaving is disabled.<br><b>Note</b> Serial interfaces do not support interleaving.                                                                                                                                                                                                                                                                                             |
| Multilink Group                                                  | Applies only to serial, Group-Async, and multilink interfaces.<br>Restricts the physical link to the selected multilink-group interface. Enter the name of a multilink interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.<br>This option is typically used in static leased-line environments, where the remote systems to which the device's serial lines are connected are known in advance.<br>In effect, this option dedicates a specific interfaces to a particular user, even when that user is not connected. If a peer at the other end of the link tries to join a different bundle, the connected is severed. |
| Maximum Fragment Delay                                           | The maximum amount of time that should be required to transmit a fragment on the MLP bundle. Valid values range from 1 to 1000 milliseconds.<br>Fragment size is determined by the defined fragment delay and the bandwidth of the links.<br><b>Note</b> Serial interfaces do not support this feature.                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 62-33 PPP Dialog Box—MLP Tab (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Endpoint Type           | <p>The identifier used by the router when transmitting packets on the MLP bundle:</p> <ul style="list-style-type: none"> <li>• [null]—Negotiation is conducted without using an endpoint discriminator. (No CLI command is generated.)</li> <li>• Hostname—The hostname of the router. This option is useful when multiple routers are using the same username to authenticate but have different hostnames.</li> <li>• IP—A defined IP address. Enter the address or the name of a network/host object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• MAC—The MAC address of a specific interface. Enter the name of the interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• None—Negotiation is conducted without using an endpoint discriminator. (The relevant CLI command is generated, but no endpoint discriminator is provided.) This option is useful when the router is connected to a malfunctioning peer that does not handle the endpoint discriminator properly.</li> <li>• Phone—An E.164-compliant telephone number. Enter the number in the field displayed.</li> <li>• String—A character string. Enter the string in the field displayed.</li> </ul> <p>The default endpoint discriminator is either the globally configured hostname, or the PAP username or CHAP hostname (depending on the authentication protocol being used), if you have configured those values on the PPP tab.</p> |
| MRRU Local Peer         | <p>The maximum receive reconstructed unit (MRRU) value of the local peer. This value represents the maximum size packet that the local router is capable of receiving.</p> <p>Valid values range from 128 to 16384 bytes. The default is the maximum transmission unit (MTU) of the multilink group interface and 1524 bytes for all other interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
