| Product Description | Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy.<br>Select the check box, then select the description of the product from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Version             | Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy.<br>Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version.                                                                                                                                                                                                                                                                                                                                                                                |
| Last Update         | Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy.<br>Specify the number of days since the last update. You might want to indicate that an update should occur in less than or greater than the number of days you enter here.                                                                                                                                                                                                                                                                                                                                              |

**Add/Edit DAP Entry Dialog Box > AnyConnect Identity**

To configure AnyConnect Identity attributes as selection criteria for dynamic access policies, set AnyConnect Identity as the selection criterion in the Add/Edit DAP Entry dialog box. The ASA generates DAP endpoint attributes based on the AnyConnect Identification attributes received from the AnyConnect mobile client. You are not required to enable Cisco Secure Desktop to configure these specific attributes using Security Manager.

For the purposes of assigning a dynamic access policy, if you configure more than one AnyConnect Identity attribute for a particular DAP entry, the entry will be considered a match if any of the attributes values are true. There is no limit for the number of AnyConnect Identity attributes for each dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AnyConnect Identity** as the Criterion.

**Table 32-11 Add/Edit DAP Entry Dialog Box > AnyConnect Identity**

| Element          | Description                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion        | Shows AnyConnect Identity as the selection criterion.                                                                                                                                                                         |
| Client Version   | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the AnyConnect Client version number.                                                                         |
| Platform         | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the appropriate platform from the drop-down list.                                                            |
| Platform Version | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the appropriate version number of the platform.                                                               |
| Device Type      | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the appropriate device type from the drop-down list.                                                         |
| Device Unique ID | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the unique device ID. This ID distinguishes the device allowing you to set policies exclusive to that device. |

**Add/Edit DAP Entry Dialog Box > Application**

Use this dialog box to indicate the type of remote access connection as the endpoint attribute for the dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Application** as the Criterion.

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion   | Shows Application as the selection criterion.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Client Type | Select the check box, then select the matching criteria (for example, <i>is</i> or <i>isn't</i> ) from the drop-down list, and specify the type of remote access connection from the list: AnyConnect, Clientless, Cut-through Proxy, IPsec, Generic IKEv2 Client, or L2TP.<br><br><b>Note</b> If you select AnyConnect as the client type, make sure to enable Cisco Secure Desktop. If it is not enabled, Security Manager generates an error. |

**Add/Edit DAP Entry Dialog Box > Device**

The DAP Device Criterion lets you provide specific device information for use during the associated prelogin policy checking. You can provide one or more of the following attributes for a device—host name, MAC address, port number, Privacy Protection selection—and indicate whether each *is* or *isn't* to be matched.

Note that *isn't* is exclusionary. For example, if you specify the criterion `Host Name isn't zulu_2`, all devices not named `zulu_2` will match.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Choose **Device** as the Criterion.

| Criterion                   | Shows Device as the selected Criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Host Name                   | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the device host name to be matched.                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAC Address                 | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the device's MAC address to be matched.                                                                                                                                                                                                                                                                                                                                                                                              |
| BIOS Serial Number          | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the BIOS serial number value of the device you are matching for. The number format is manufacturer-specific. There is no format requirement.                                                                                                                                                                                                                                                                                         |
| Port Number                 | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ), and then enter or Select the device port to be matched.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TCP/UDP Port Number         | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ), and then enter or Select the TCP/UDP port in listening state that you are matching for.<br><br>In the TCP/UDP combo box, select the kind of port you are matching for: TCP (IPv4), UDP(IPv4), TCP(IPv6) or UDP(IPv6). Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the version 9.0 or later. If you are matching for more than one port, make several individual endpoint attribute rules in the DAP and specify one port in each. |
| Privacy Protection          | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ), and then choose the Privacy Protection option defined on the device: <b>none</b> , <b>cache cleaner</b> , or <b>secure desktop</b> .                                                                                                                                                                                                                                                                                                                                                |
| CSD Version                 | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the version of the Host Scan image running on the endpoint.                                                                                                                                                                                                                                                                                                                                                                          |
| Endpoint Assessment Version | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the version of endpoint assessment (OPSWAT) you are matching for.                                                                                                                                                                                                                                                                                                                                                                    |

**Add/Edit DAP Entry Dialog Box > File**

The file criterion prelogin check lets you specify that a certain file must or must not exist to be eligible for the associated prelogin policy. For example, you might want to use a file prelogin check to ensure a corporate file is present or one or more peer-to-peer file-sharing programs containing malware are not present before assigning a prelogin policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 32-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **File** as the Criterion.

| Criterion   | Shows File as the selection criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type        | Specify whether this endpoint attribute must match or not match the criteria configured for selecting and applying dynamic access policies during session establishment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Endpoint ID | Select a string that identifies an endpoint for files. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Filename    | Specify the filename.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Last Update | Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy.<br><br>Specify the number of days since the last update. You might want to indicate that an update should occur in less than (<) or more than (>) the number of days you enter here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Checksum    | Available only if you selected the criteria to match the endpoint attribute for the DAP record.<br><br>Select the check box to specify a checksum to authenticate the file, then enter a checksum in hexadecimal format, beginning with 0x.<br><br>Beginning with version 4.7, Security Manager provides a utility to compute CRC32 checksum for a file. Click the <b>Compute CRC32 Checksum</b> button to open the Compute Checksum dialog box. Click Browse to open the File browser, select the required file and then click the Compute button. The CRC32 checksum of the file will be calculated and populated in the Checksum field.<br><br><b>Note</b> Only client-side browsing is supported for the Compute CRC32 Checksum utility. By default client-side browsing is enabled. If you have disabled it, you must enable it by selecting <b>Tools &gt; Security Manager Administration</b> and select <b>Customize Desktop</b> from the table of contents. For more information, see <a href="#">Customize Desktop Page, page 11-10</a> . |

**Add/Edit DAP Entry Dialog Box > NAC**

NAC protects the enterprise network from intrusion and infection from worms, viruses, and rogue applications by performing endpoint compliancy and vulnerability checks as a condition for production access to the network. We refer to these checks as *posture†validation*. You can configure posture

validation to ensure that the anti-virus files, personal firewall rules, or intrusion protection software on a host with an AnyConnect or Clientless SSL VPN session are up-to-date before providing access to vulnerable hosts on the intranet. Posture validation can include the verification that the applications running on the remote hosts are updated with the latest patches. NAC occurs only after user authentication and the setup of the tunnel. NAC is especially useful for protecting the enterprise network from hosts that are not subject to automatic network policy enforcement, such as home PCs. The security appliance uses Extensible Authentication Protocol (EAP) over UDP (EAPoUDP) messaging to validate the posture of remote hosts.

The establishment of a tunnel between the endpoint and the security appliance triggers posture validation. You can configure the security appliance to pass the IP address of the client to an optional audit server if the client does not respond to a posture validation request. The audit server, such as a Trend server, uses the host IP address to challenge the host directly to assess its health. For example, it may challenge the host to determine whether its virus checking software is active and up-to-date. After the audit server completes its interaction with the remote host, it passes a token to the posture validation server, indicating the health of the remote host.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 32-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **NAC** as the Criterion.

| Element        | Description                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Criterion      | Shows NAC as the selection criterion.                                                                                                  |
| Posture Status | Select the matching criteria (for example, <i>is</i> ) from the drop-down list, then enter the posture token string received from ACS. |

**Add/Edit DAP Entry Dialog Box > Operating System**

The prelogin assessment includes a check for the OS attempting to establish a VPN connection. When the user attempts to connect, however, Cisco Secure Desktop checks for the OS, regardless of whether you insert an OS prelogin check.

If the prelogin policy assigned to the connection has Secure Desktop (Secure Session) enabled and if the remote PC is running Microsoft Windows XP or Windows 2000, it installs Secure Session, regardless of whether you insert an OS prelogin check. If the prelogin policy has Secure Desktop enabled and the operating system is Microsoft Windows Vista, Mac OS X 10.4, or Linux, Cache Cleaner runs instead. Therefore, you should make sure the Cache Cleaner settings are appropriate for a prelogin policy on

which you have configured Secure Desktop or Cache Cleaner to install. Although Cisco Secure Desktop checks for the OS, you may want to insert an OS prelogin check as a condition for applying a prelogin policy to isolate subsequent checks for each OS.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Operating System** as the Criterion.

| Element      | Description                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion    | Shows Operating System as the selection criterion.                                                                                                                                                       |
| OS Version   | Select the check box, then select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the OS version from the list. Select Apple Plugin for iPhones and similar devices. |
| Service Pack | Select the check box, then select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the service pack for the operating system.                                         |

**Add/Edit DAP Entry Dialog Box > Personal Firewall**

You can click Host Scan in the Cisco Secure Desktop interface to enable Endpoint Assessment, a scan for personal firewalls that are running on the remote computer. Most, but not all, personal firewall programs support active scan, which means that the programs are memory-resident, and therefore always running.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes Cisco** as the Criterion.

| Type                | Select one of the following options and assign the associated values: <ul style="list-style-type: none"> <li>• <b>Not Installed</b>—Select if the absence of the named personal firewall from the remote PC is sufficient to match the prelogin policy you are configuring.</li> <li>• <b>Installed and enabled</b>—Select if the named personal firewall must be present and enabled on the remote PC to match the prelogin policy you are configuring.</li> <li>• <b>Installed and disabled</b>—Select if the mere presence of the named personal firewall on the remote PC is sufficient to match the prelogin policy you are configuring.</li> </ul> |
| Vendor Name         | Select the text that describes the application vendor from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Product ID          | Select a unique identifier for the product that is supported by the selected vendor from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Product Description | Available only if you selected that this endpoint attribute and all its settings must be available on the remote PC.<br>Select the check box, then select the description of the product from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Version             | Available only if you selected that this endpoint attribute and all its settings must be available on the remote PC.<br>Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version.                                                                                                                                                                                                                                                                                                                                                                                           |

### Add/Edit DAP Entry Dialog Box > Policy

Windows locations let you determine how clients connect to your virtual private network, and protect it accordingly. For example, clients connecting from within a workplace LAN on a 10.x.x.x network behind a NAT device are an unlikely risk for exposing confidential information. For these clients, you might set up a Cisco Secure Desktop Windows Location named Work that is specified by IP addresses on the 10.x.x.x network, and disable both the Cache Cleaner and the Secure Desktop function for this location. Cisco Secure Desktop checks locations in the order listed on the Windows Location Settings window, and grants privileges to client PCs based on the first location definition they match.

#### Note

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Policy** as the Criterion.

**Field Reference****Table 32-18 Add/Edit DAP Entry Dialog Box > Policy**

| Element   | Description                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Shows Policy as the selection criterion.                                                                                                                                                                                                                           |
| Location  | Select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the Cisco Secure Desktop Microsoft Windows location profile from the list. All the locations configured in the Cisco Secure Desktop Manager are displayed in this list. |

**Add/Edit DAP Entry Dialog Box > Process**

You can specify a set of process names, which form a part of Basic Host Scan. The host scan, which includes Basic Host Scan and Endpoint Assessment, or Advanced Endpoint Assessment; occurs after the prelogin assessment but before the assignment of a dynamic access policy. Following the Basic Host Scan, the security appliance uses the login credentials, the host scan results, prelogin policy, and other criteria you configure to assign a DAP.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Process** as the Criterion.

|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type        | Select one of the following options and assign the associated values: <ul style="list-style-type: none"> <li>• <b>Matches</b>—Select if the mere presence of the named process on the remote PC is sufficient to match the prelogin policy you are configuring.</li> <li>• <b>Doesn't Match</b>—Select if the absence of the named process from the remote PC is sufficient to match the prelogin policy you are configuring.</li> </ul>                                                                                                                                                    |
| Endpoint ID | A string that identifies an endpoint for files, processes or registry entries. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.                                                                                                                                                           |
| Path        | Select the check box, then select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the name of the process. You can display it in Microsoft Windows by opening the Windows Task Manager window and clicking the Processes tab.<br><br>Configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it and specify the same index when you assign this entry as an endpoint attribute when configuring a DAP, reducing the possibility of errors in typing or syntax. |

**Add/Edit DAP Entry Dialog Box > Registry**

Registry key scans apply only to computers running Windows Microsoft Windows operating systems. Basic Host Scan ignores registry key scans if the computer is running Mac OS or Linux.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Registry** as the Criterion.

Table 32-20 Add/Edit DAP Entry Dialog Box &gt; Registry

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion     | Shows Registry as the selection criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Type          | Select one of the following options and assign the associated values: <ul style="list-style-type: none"> <li>• <b>Matches</b>—Select if the mere presence of the named registry key on the remote PC is sufficient to match the prelogin policy you are configuring. For example, select this option if you want to require the following registry key to be present to match a criterion for assigning a prelogin policy:<br/>HKEY_LOCAL_MACHINE\SOFTWARE\&lt;Protective_Software &gt;</li> <li>• <b>Doesn't Match</b>—Select if the absence of the named registry key from the remote PC is sufficient to match the prelogin policy you are configuring. For example, select this option if you want to require the following registry key to be absent to match a criterion for assigning a prelogin policy:<br/>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run\&lt;Evil_SpyWare&gt;</li> </ul> |
| Endpoint ID   | A string that identifies an endpoint for files, processes or registry entries. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Registry Name | Select the text that describes the registry name from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Value         | Select the value, <b>dword</b> or <b>string</b> , from the list, then select the matching criteria (whether it equals or does not equal), and enter a decimal or a string to compare with the dword or string value of the registry key on the remote PC. <p><b>Note</b> “DWORD” refers to the attribute in the Add/Edit Registry Criterion dialog box. “Dword” refers to the attribute as it appears in the registry key. Use the regedit application, accessed on the Windows command line, to view the Dword value of a registry key, or use it to add a Dword value to the registry key to satisfy the requirement you are configuring.</p>                                                                                                                                                                                                                                                                      |
| Ignore Case   | When selected, ignores the case in the registry entry if it includes a string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Add/Edit DAP Entry Dialog Box &gt; Multiple Certificate Authentication

The DAP multiple certificate authentication criterion allows you to provide specific certificate information for use during the associated prelogin policy checking. Cisco Security Manager supports two certificates to authenticate remote VPN users. You can provide one or more of the following attributes for the certificates—subject, issuer, subject alternate name, serial number and certificate store.

**Note**

You can modify the DAP entry except the certificate option.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Multiple Certificate Authentication** as the Criterion.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate Store | <p>Select the relevant store from where the certificate can be found for authentication:</p> <ul style="list-style-type: none"> <li>• None—Choose if you are not aware of the certificate type.</li> <li>• Machine—Choose if the certificate pertains to machine (accessible only by privileged processes). You cannot select this option for both cert1 and cert2.</li> <li>• User—Choose if the certificate pertains to user log in (accessible only by processes owned by the logged-in user).</li> </ul> <p><b>Note</b> For Windows, the store may be a) one machine and one user, or b) two users. For non-Windows platforms, the indication is always two user certificates.</p> |

## Logical Operations Tab

Use the Logical Operations tab of the Add/Edit Dynamic Access Policy dialog box to configure multiple instances of the AAA and each type of endpoint attribute that you defined in the DAP Entry dialog box. On this tab, set each type of endpoint or AAA attribute to require only one instance of a type (Match Any = OR) or to have all instances of a type (Match All = AND).

- If you configure only one instance of an endpoint category, you do not need to set a value.
- For some endpoint attributes, it is not useful to configure multiple instances. For example, no users have more than one running OS.
- You are configuring the Match Any/Match All operation within each endpoint type. The security appliance evaluates each type of endpoint attribute, and then performs a logical AND operation on all of the configured endpoints. That is, each user must satisfy the conditions of ALL of the endpoints you configure, as well as the AAA attributes.

### Navigation Path

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#), then click the **Logical Operations** tab.

| Registry          | <p>Registry key scans apply only to computers running Windows Microsoft Windows operating systems. Basic Host Scan ignores registry key scans if the computer is running Mac OS or Linux.</p> <p>Select one of the following options if you defined Registry as an endpoint attribute:</p> <ul style="list-style-type: none"> <li>• <b>Match Any</b>—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring.</li> <li>• <b>Match All</b>—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.</li> </ul> |

## Advanced Expressions Tab

Use the Advanced Expressions tab of the Add/Edit Dynamic Access Policy dialog box to set additional attributes for the dynamic access policy. You can configure multiple instances of each type of endpoint attribute. Be aware that this is an advanced feature that requires knowledge of LUA ([www.lua.org](http://www.lua.org)).

**Note**

For detailed information about advanced expressions, see [About Advanced Expressions for AAA or Endpoint Attributes](#) and [Examples of DAP Logical Expressions](#).

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 32-12, then click the **Advanced Expressions** tab.

| Basic Expressions           | This text box is populated with basic expressions based on the endpoint and AAA attributes that you configured in the dynamic access policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Relationship Drop-down List | Specify the relationship between the basic selection rules and the logical expressions you enter on this tab, that is, whether the new attributes add to or substitute for the AAA and endpoint attributes already set. Select one of the following options: <ul style="list-style-type: none"> <li>• <b>Basic AND Advanced</b>—Creates an AND relationship between the basic and advanced expressions. Both the basic and advanced expressions defined in the dynamic access policy are considered while authenticating users.<br/>By default, this option is selected.</li> <li>• <b>Basic OR Advanced</b>—Creates an OR relationship between the basic and advanced expressions. Users are granted access to a session if either the basic or advanced expressions in the dynamic access policy are matched with the user policy.</li> <li>• <b>Basic Only</b>—Only the basic expressions defined in the DAP entry are used to determine whether the security appliance grants users access to a particular session.</li> <li>• <b>Advanced Only</b>—Only the advanced expressions defined in the DAP entry are used to authorize users for an SSL VPN session.</li> </ul> |
| Advanced Expressions        | Enter one or more logical expressions to set AAA or endpoint attributes other than what is possible in the AAA and Endpoint areas above.<br><br>Enter free-form LUA text that defines new AAA and/or endpoint selection attributes. Security Manager does not validate text that you enter here; it just copies this text to the dynamic access policy XML file, and the security appliance processes it, discarding any expressions it cannot parse.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Cisco Secure Desktop Manager Policy Editor Dialog Box

Using the Cisco Secure Desktop Manager (CSDM) Policy Editor dialog box, you can configure prelogin policies, specify the checks to be performed between the time the user establishes a connection with the security appliance and the time the user enters the login credentials, and configure host scans. For an explanation of configuring CSD on an ASA device, see [Configuring Cisco Secure Desktop Policies on ASA Devices, page 32-9](#).

**Note**

The Cisco Secure Desktop Manager Policy Editor is an independent program. For information about configuring CSD, and what CSD can do for you, see the materials available online at [http://www.cisco.com/en/US/products/ps6742/tsd\\_products\\_support\\_configure.html](http://www.cisco.com/en/US/products/ps6742/tsd_products_support_configure.html). Look specifically for information on configuring prelogin policies and host scan. Select the configuration guide for the CSD version you are configuring.

**Navigation Path**

Open the [Dynamic Access Page \(ASA\), page 32-11](#), then click **Configure** from the Cisco Secure Desktop section (you must first specify a CSD package). The CSDM Policy Editor dialog box is displayed.

# Managing Remote Access VPNs on IOS and PIX 6.3 Devices

## Note

From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

You can configure and manage remote access IPsec on devices running Cisco IOS Software or PIX 6.3, and SSL VPNs on IOS 12.4(6)T or later devices (but not on PIX devices). For more information on the specific device models supported, see [Understanding Devices Supported by Each Remote Access VPN Technology](#), page 30-8.

The configuration of these remote access VPNs are the same for these device types. ASA and PIX 7.0+ devices use different configurations for remote access VPNs (as explained in [Chapter 31, “Managing Remote Access VPNs on ASA and PIX 7.0+ Devices”](#)).

The topics in this chapter explain how to configure policies that are specific to IOS and PIX 6.3 devices. Additionally, review the following topics for more information about remote access VPNs:

- [Understanding Remote Access VPNs](#), page 30-1
- [Understanding Devices Supported by Each Remote Access VPN Technology](#), page 30-8
- [Discovering Remote Access VPN Policies](#), page 30-12
- [Using the Remote Access VPN Configuration Wizard](#), page 30-13
  - [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(IOS and PIX 6.3 Devices\)](#), page 30-36
  - [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\)](#), page 30-32

This chapter contains the following topics:

- [Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices](#), page 33-2
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 33-3
- [Configuring High Availability in Remote Access VPNs \(IOS\)](#), page 33-11
- [Configuring User Group Policies](#), page 33-13
- [Configuring an SSL VPN Policy \(IOS\)](#), page 33-14

# Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices

## Note

From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

When you configure remote access VPNs on IOS or PIX 6.3 devices, you use the following policies based on the type of VPN you are configuring. Note that you cannot configure SSL VPNs on PIX 6.3 devices.

- **Policies used with both IPsec and SSL remote access VPNs:**
  - **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional; configure it only if you need non-default behavior. For more information, see [Configuring VPN Global Settings, page 26-30](#).
  - **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see [Understanding Public Key Infrastructure Policies, page 26-51](#) and [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#).
- **Policies used in remote access IPsec VPNs only:**
  - **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see [Configuring an IKE Proposal, page 26-9](#).
  - **IPsec Proposal (IOS/PIX 6.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\), page 33-3](#).
  - **High Availability**—High Availability (HA) is supported by the creation of an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see [Configuring High Availability in Remote Access VPNs \(IOS\), page 33-11](#).
  - **User Groups (IOS/PIX 6.x)**—A user group policy specifies the attributes that determine user access to and use of the VPN. For more information, see [Configuring User Group Policies, page 33-13](#).
- **Policies used in remote access SSL VPNs only:**
  - **SSL VPN**—The SSL VPN policy table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. For more information, see [Configuring an SSL VPN Policy \(IOS\), page 33-14](#).

# Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices)

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

This procedure describes how to create or edit an IPsec proposal for your remote access VPN server when the server uses Cisco IOS Software or PIX release 6.3.

An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.

When configuring an IPsec proposal, you must define the external interface through which the remote access clients connect to the server, and the encryption and authentication algorithms that protect the data in the VPN tunnel. You can also select a group authorization (Group Policy Lookup) method that defines the order in which group policies are searched (on the local server or on external AAA servers) and a user authentication (Xauth) method that defines the order in which user accounts are searched.

For more information on IPsec tunnel concepts, see [Understanding IPsec Proposals, page 26-19](#).

When you create or edit an IPsec proposal, you can also configure:

- A VPN Services Module (VPNSM) interface IPsec VPN Shared Port Adapter (VPN SPA) on a Catalyst 6500/7600 device (see [VPNSM/VPN SPA/VSPA Settings Dialog Box, page 33-6](#)).
- A dynamic virtual interface on an IOS router running Cisco IOS Software version 12.4(2)T or later, except 7600 device. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\), page 33-7](#).
- VRF-Aware IPsec on a router or Catalyst 6500/7600 device (see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\), page 33-7](#)).

**Related Topics**

- [Understanding VRF-Aware IPsec, page 25-14](#)
- [VPNSM/VPN SPA/VSPA Settings Dialog Box, page 33-6](#)
- [Table Columns and Column Heading Features, page 1-49](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy Type selector. Select an existing policy or create a new one.

The IPsec Proposal page opens and lists the configured proposals, including the VPN endpoint, IPsec transform set, and whether reverse route injection is configured for the proposal. You can add other columns to the default display to show the AAA, VRF, and dVTI configuration.

- Step 2** Do any of the following:
- To add a new IPsec proposal, click the **Add Row (+)** button and fill in the IPsec Proposal Editor dialog box. For detailed information on the available options, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\), page 33-4](#).

- To edit an existing proposal, select it and click the **Edit Row (pencil)** button.
- To delete a proposal, select it and click the **Delete Row (trash can)** button.

## IPsec Proposal Editor (IOS, PIX 6.3 Devices)

### Note

From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

Use the IPsec Proposal Editor to create or edit an IPsec proposal for an IOS or PIX 6.3 device, including Catalyst 6500/7600, in your remote access VPN. The editor has two tabs—General and Dynamic VTI/VRF Aware IPsec. This topic explains the basic settings on the General tab. For an explanation of Dynamic VTI/VRF Aware IPsec settings, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\)](#), page 33-7.

The elements in this dialog box differ according to the selected device. The table below describes the elements on the General tab in the IPsec Proposal Editor dialog box when a Cisco IOS router, Catalyst 6500/7600, or PIX 6.3 device is selected.

### Note

For a description of the elements in the dialog box when a PIX 7.0+ or ASA device is selected is selected, see [IPsec Proposal Editor \(ASA, PIX 7.0+ Devices\)](#), page 31-41.

### Navigation Path

- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy selector. Click the Add Row (+) or Edit Row (pencil) buttons.
- (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy Type selector. Select an existing policy or create a new one. Click the Add Row (+) or Edit Row (pencil) buttons.

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Policy Lookup/AAA Authorization Method          | <p>The AAA authorization method list that will be used to define the order in which the group policies are searched. Group policies can be configured on both the local server or on an external AAA server. Remote users are grouped, so that when the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p> |
| User Authentication (Xauth)/AAA Authentication Method | <p>The AAA or Xauth user authentication method that defines the order in which user accounts are searched.</p> <p>Xauth allows all Cisco IOS software AAA authentication methods to perform user authentication in a separate phase after the IKE authentication phase 1 exchange.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p>                                                                                                                                                    |

## VPNSM/VPN SPA/VSPA Settings Dialog Box

### Note

This dialog box is available only if the selected device is a Catalyst 6500/7600.

Use the VPNSM/VPN SPA/VSPA Settings dialog box to specify the settings for configuring a VPN Services Module (VPNSM), a VPN Shared Port Adapter (VPN SPA), or a Cisco VPN Service Port Adapters (VSPAs) on a Catalyst 6500/7600 device.

### Notes

- Before you define the settings, you must import your Catalyst 6500/7600 device to the Security Manager inventory and discover its interfaces. For more information, see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 25-42](#).
- Before you configure VPNSM or VPN SPA with VRF-Aware IPsec on a device, verify that an IPsec proposal with VRF-Aware IPsec and an IPsec proposal without VRF-Aware IPsec were not configured on the device.

### Navigation Path

In the General tab of the IPsec Proposal Editor Dialog Box (for Catalyst 6500/7600 Devices), click **Select** next to the Inside VLAN field. For more information about opening the IPsec Proposal Editor, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\), page 33-4](#).

### Related Topics

|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inside VLAN           | The inside VLAN that serves as the inside interface to the VPNSM, VPN SPA, or VSPA, and to which the required crypto maps will be applied. Enter the VLAN ID or click <b>Select</b> to select it or to create a new interface role object to identify the VLAN.                                                                                                                                                                                                                                                                                                                                                                   |
| Slot<br>Subslot       | The number designating the slot location of the VPNSM or VPNSPA/VSPA. If you are configuring a VPNSPA/VSPA, the subslot number is also required.<br><br><b>Note</b> If you are configuring a VPNSM, select 0.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| External Port         | The external port or VLAN that connects to the inside VLAN. Enter the name of the VLAN or interface role object, or click <b>Select</b> to select it from a list. You must select an interface or interface role that differs from the one selected for the inside VLAN.<br><br><b>Note</b> If VRF-Aware IPsec is configured on the device, the external port or VLAN must have an IP address. If VRF-Aware IPsec is not configured, the external port or VLAN must not have an IP address.                                                                                                                                       |
| Enable Failover Blade | Whether to configure a failover VPNSM or VPNSPA/VSPA blade for intra-chassis high availability.<br><br><b>Note</b> A VPNSM and VPNSPA/VSPA blade cannot be used on the same device as primary and failover blades.<br><br>Specify the failover blade, as follows: <ul style="list-style-type: none"> <li>• <b>Slot</b>—The slot number that identifies where the VPNSM blade or VPNSPA/VSPA blade is located.</li> <li>• <b>Subslot</b>—If you are configuring a VPNSPA/VSPA, select the number of the subslot on which the failover VPN SPA blade is installed.</li> </ul> <b>Note</b> If you are configuring a VPNSM, select 0. |

## Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices)

**Note**

The Dynamic VTI/VRF Aware IPsec tab is available only when the selected device is a Cisco IOS router or Catalyst 6500/7600.

Use the Dynamic VTI/VRF Aware IPsec tab of the IPsec Proposal Editor to configure VRF Aware IPsec settings (on a Cisco IOS router or Catalyst 6500/7600 device), configure a dynamic virtual interface on a Cisco IOS router, or do both, in your remote access VPN.

IOS devices allow dynamic virtual template interfaces (VTIs), which provide highly secure and scalable connectivity for remote-access VPNs, replacing dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels. You can use dynamic VTIs for both the server and remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is duplicated from a virtual template configuration, which includes the IPsec configuration and any features configured on the virtual template interface. Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. They enable dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. Dynamic VTI simplifies VRF-Aware IPsec deployment, as the VRF is configured on the interface.

When this feature is enabled, Security Manager implicitly creates the virtual template interface for the selected device in a remote access VPN. All you must do is provide the IP address on the server that will be used as the virtual template interface, or use an existing loopback interface. The virtual template interface is created on the remote client without an IP address.

### Notes

- You can configure dynamic VTI only on routers running Cisco IOS Release 12.4(2)T and later, except 7600 devices.
- You can configure dynamic VTI with or without VRF-Aware IPsec. For more information about VRF-Aware IPsec, see [Understanding VRF-Aware IPsec, page 25-14](#).
- You can also configure dynamic VTI in a site-to-site Easy VPN topology. For more information, see [Easy VPN with Dynamic Virtual Tunnel Interfaces, page 28-3](#).

### Navigation Path

In the IPsec Proposal Editor Dialog Box (for IOS routers and Catalyst 6500/7600 devices), click the **Dynamic VTI/VRF Aware IPsec** tab. For more information, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\), page 33-4](#).

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Group               | <p>When you configure a remote access VPN server, remote clients must have the same group name as the user group object configured on the VPN server so that they can connect to the device.</p> <p>Enter the name of the user group policy object associated with the device, or click <b>Select</b> to select it from a list. You can also create new objects or edit existing ones from the selection list.</p>                                                                                                                                                                                                                                                                                                                             |
| CA Server                | <p>Select the Certification Authority (CA) server to use for managing certificate requests for the device. Click <b>Select</b> to select the PKI enrollment policy object that defines the CA server, or to create a new object. For more information, see <a href="#">PKI Enrollment Dialog Box, page 26-58</a>.</p> <p>For more information about IPsec configuration with CA servers, see <a href="#">Understanding Public Key Infrastructure Policies, page 26-51</a>.</p>                                                                                                                                                                                                                                                                 |
| Virtual Template IP Type | <p>Available if you selected <b>Enable Dynamic VTI</b>.</p> <p>Specify the virtual template interface to use:</p> <ul style="list-style-type: none"> <li>• <b>IP</b>—To use an IP address as the virtual template interface. Specify the private IP address.</li> <li>• <b>Use Loopback Interface</b>—To use the IP address taken from an existing loopback interface as the virtual template interface. Click <b>Select</b> to select the interface or interface role object, or to create a new object that identifies the loopback interface.</li> </ul>                                                                                                                                                                                    |
| VRF Solution             | <p>Available if you selected <b>Enable VRF Settings</b>.</p> <p>Select the VRF solution:</p> <ul style="list-style-type: none"> <li>• <b>1-Box (IPsec Aggregator + MPLS PE)</b>—One device serves as the Provider Edge (PE) router that does the MPLS tagging of the packets in addition to IPsec encryption and decryption from the Customer Edge (CE) devices. For more information, see <a href="#">VRF-Aware IPsec One-Box Solution, page 25-14</a>.</li> <li>• <b>2-Box (IPsec Aggregator Only)</b>—The PE device does only the MPLS tagging, while the IPsec Aggregator device does the IPsec encryption and decryption from the CEs. For more information, see <a href="#">VRF-Aware IPsec Two-Box Solution, page 25-15</a>.</li> </ul> |
| VRF Name                 | The name of the VRF routing table on the IPsec Aggregator. The VRF name is case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 33-3 IPsec Proposal Editor, Dynamic VTI/VRF Aware IPsec Tab (continued)

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Distinguisher             | <p>The unique identifier of the VRF routing table on the IPsec Aggregator. This unique route distinguisher maintains routing separation for each VPN across the MPLS core to the other PE routers. The identifier can be in either of the following formats:</p> <ul style="list-style-type: none"> <li>• <i>IP address:X</i>, where <i>X</i> is in the range of 0-999999999.</li> <li>• <i>N:X</i>, where <i>N</i> is in the range of 0-65535, and <i>X</i> is in the range of 0-999999999.</li> </ul> <p><b>Note</b> You cannot override the RD identifier after deploying the VRF configuration to your device. To modify the RD identifier after deployment, you must manually remove it through the device CLI and then deploy again.</p> |
| Interface Towards Provider Edge | <p>Available only for 2-Box VRF.</p> <p>The VRF forwarding interface on the IPsec Aggregator towards the PE device. Click <b>Select</b> to select the interface or interface role object, or to create a new object that identifies the interface.</p> <p><b>Note</b> If the IPsec Aggregator (hub) is a Catalyst VPN service module, you must specify a VLAN.</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Routing Protocol                | <p>Available only for 2-Box VRF.</p> <p>Select the routing protocol to use between the IPsec Aggregator and the PE. The options are BGP, EIGRP, OSPF, RIPv2, or Static route.</p> <p>If the routing protocol for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, select the routing protocol for redistributing the routing to the secured IGP.</p>                                                                                                                                                                                                                                                                                                                                                 |
| AS Number                       | <p>Available only for 2-Box VRF with BGP or EIGRP routing.</p> <p>The number to use to identify the autonomous system (AS) area between the IPsec Aggregator and the PE. The AS number must be between 1 and 65535.</p> <p>If the routing protocol for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, enter an AS number that identifies the secured IGP into which the routing will be redistributed from the IPsec Aggregator and the PE. This is relevant only if GRE or DMVPN are applied.</p>                                                                                                                                                                                                 |
| Process Number                  | <p>Available only for 2-Box VRF with OSPF routing.</p> <p>The routing process ID number to use to configure the routing between the IPsec Aggregator and the PE. The process number must be between 1 and 65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OSPF Area ID                    | <p>Available only for 2-Box VRF with OSPF routing.</p> <p>The ID number of the area in which the packet belongs. You can enter any number from 0 to 4294967295.</p> <p><b>Note</b> All OSPF packets are associated with a single area, so all devices must have the same area ID number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Redistribute Static Route | <p>Available only for 2-Box VRF with any routing protocol other than Static route.</p> <p>When selected, enables static routes to be advertised in the routing protocol configured on the IPsec Aggregator towards the PE device.</p> <p><b>Note</b> If this check box is deselected and Enable Reverse Route Injection is enabled (default) for the IPsec proposal, static routes are still advertised in the routing protocol on the IPsec Aggregator.</p> |
| Next Hop IP Address       | <p>Available only for 2-Box VRF with Static routing.</p> <p>The IP address of the provider edge device (or the interface that is connected to the IPsec aggregator).</p>                                                                                                                                                                                                                                                                                     |

## Configuring High Availability in Remote Access VPNs (IOS)

Use the High Availability page to configure a High Availability (HA) policy on a Cisco IOS router or Cisco Catalyst switch in a remote access VPN.

In Security Manager, High Availability (HA) is supported by the creation of an HA group made up of two or more devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. By sharing a virtual IP address, the devices in the HA group present the appearance of a single virtual device or default gateway to the remote access users. One device in the HA group is always active and assumes the virtual IP address, while the others are standby devices. The devices in the group watch for hello packets from active and standby devices. If the active device becomes unavailable for any reason, a standby device takes ownership of the virtual IP address and takes over the remote access VPN. This transfer is seamless and transparent to remote access users.

Stateful SwitchOver (SSO) is used to ensure that state information is shared between the HSRP devices in the HA group. If a device fails, the shared state information enables the standby device to maintain IPsec sessions without having to re-establish the tunnel or renegotiate the security associations.

### Tips

- When configuring an HA group, you must provide an inside virtual IP that matches the subnet of one of the interfaces on the device, in addition to a VPN virtual IP that matches the subnet of one of the device's interfaces and is configured with an IPsec proposal. See [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 33-3.
- A remote access VPN server device on which HA is configured cannot be configured as a hub in a site-to-site VPN topology on which HA is configured, using the same outside interface that was used for the remote access VPN server.

### Step 1 Do one of the following:

- (Device view) With an IOS device selected, select **Remote Access VPN > IPsec VPN > High Availability** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPsec VPN > High Availability** from the Policy Type selector. Select an existing policy or create a new one.

The High Availability page opens.

**Step 2** Configure the options explained in the following table.

**Table 33-4 High Availability Page, Remote Access VPNs**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inside Virtual IP              | <p>The IP address that is shared by the devices in the HA group and that represents the inside interface of the HA group. The virtual IP address must be on the same subnet as the inside interfaces of the devices in the HA group, but must not be identical to the IP address of any of these interfaces.</p> <p>You must provide an inside virtual IP that matches the subnet of one of the interfaces on the device, in addition to a VPN virtual IP that matches the subnet of one of the device's interfaces and is configured with an IPsec proposal.</p> <p><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.</p> |
| Inside Mask                    | The subnet mask for the inside virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VPN Virtual IP                 | <p>The IP address that is shared by the devices in the HA group and represents the VPN interface of the HA group. This IP address serves as the endpoint of the VPN tunnel.</p> <p><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| VPN Mask                       | The subnet mask for the VPN virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Hello Interval                 | The duration in seconds (within the range of 1-254) between each hello message sent by a device to the other devices in the group to indicate status and priority. The default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hold Time                      | The duration in seconds (within the range of 2-255) that a standby device will wait to receive a hello message from the active device before concluding that the device is down. The default is 15 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Standby Group Number (Inside)  | The standby number of the inside device interface that matches the internal virtual IP subnet for the devices in the HA group. The number must be within the range of 0-255. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Standby Group Number (Outside) | <p>The standby number of the outside device interface that matches the external virtual IP subnet for the devices in the HA group. The number must be within the range of 0-255. The default is 2.</p> <p><b>Note</b> The outside standby group number must be different to the inside standby group number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Failover Server                | The IP address or network/host policy object that identifies the inside interface of the remote peer failover servers. Enter the IP address or network/host object name, or click <b>Select</b> to select an object or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Stateful Failover       | Enables SSO for stateful failover. This option is always selected and you cannot deselect it for remote access VPNs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Configuring User Group Policies

Use the User Groups (IOS/PIX 6.x) policy to specify user groups for your remote access IPsec VPN server. You can configure user groups on a Cisco IOS router, PIX 6.3 Firewall, or Catalyst 6500 /7600 device.

When you configure a remote access VPN server, you must create user groups to which remote clients will belong. A user group policy specifies the attributes that determine user access to and use of the VPN. User groups simplify system management, enabling you to quickly configure VPN access for large numbers of users.

For example, in a typical remote access VPN, you might allow a finance group to access one part of a private network, a customer support group to access another part, and an MIS group to access other parts. In addition, you might allow specific users within MIS to access systems that other MIS users cannot access. User group policies provide the flexibility to do so securely.

Remote clients must have the same group name as the user group configured on the VPN server so that they can connect to the device; otherwise, a connection cannot be established. When a remote client establishes a connection to the VPN server, the group policies for that user group are pushed to all clients belonging to the same user group. You can configure user groups on the local remote access VPN server and external AAA servers.

## Notes

- You can also specify user groups using the Remote Access VPN Configuration Wizard. For more information, see [Using the Remote Access VPN Configuration Wizard, page 30-13](#).
- To specify group policies for an SSL VPN on an IOS device, use the SSL VPN policy as explained in [Configuring an SSL VPN Policy \(IOS\), page 33-14](#).

## Related Topics

- [Understanding Remote Access IPsec VPNs, page 30-2](#)

- 
- Step 1** Do one of the following:
- (Device view) With an IOS router, Catalyst 6500/7600, or PIX 6.3 device selected, select **Remote Access VPN > IPsec VPN > User Groups (IOS/PIX 6.x)** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > IPsec VPN > User Groups (IOS/PIX6.x)** from the Policy Type selector. Select an existing policy or create a new one.

The User Groups page opens.

The page contains two lists: Available User Groups lists all existing User Group policy objects that are configured for remote access IPsec VPNS; Selected User Groups lists all of the User Group policy objects that will be configured on the device.

- Step 2** Ensure that the list of selected user groups contains the desired User Group policy objects:
- To create a new User Group policy object, click the Create (+) button beneath the available user groups list to open the Add User Group dialog box. For instructions on creating the object, see [Add or Edit User Group Dialog Box, page 34-73](#).

After you create the group, it is added to the available list, and you must add it to the selected list if you want to use it.

- To add a User Group to the selected list, select it in the available list and click >>.
- To remove a User Group, select it in the selected list and click <<. If the group is already configured on the device, it will be removed during the next deployment.

- You can edit the properties of a User Group object by selecting it in either list and clicking the **Edit** button.

## Configuring an SSL VPN Policy (IOS)

Use the SSL VPN policy to configure the SSL VPN connection policies for an IOS router. From this page, you can create, edit, or delete SSL VPN policies.

### Related Topics

- [Understanding Remote Access SSL VPNs, page 30-2](#)
- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\), page 30-32](#)
- [Filtering Tables, page 1-48](#)

**Step 1** Do one of the following:

- (Device view) With an IOS device selected, select **Remote Access VPN > SSL VPN** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > SSL VPN Policy (IOS)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN page appears.

The table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. The status of the context is also shown, either In Service or Out of Service.

**Step 2** Do either of the following:

- To add a context, click the **Add Row** button to open the [SSL VPN Context Editor Dialog Box \(IOS\), page 33-15](#).
- To edit a context, select it and click the **Edit Row** button.

**Note** To delete a context, select it and click the **Delete Row** button.

**Step 3** Configure at least the following general settings for the policy. For information on other fields, see [General Tab, page 33-16](#).

- **Name, Domain**—For new policies, the name of the context that defines the virtual configuration of the SSL VPN. To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.
- **Gateway**—The SSL VPN gateway policy object that identifies the gateway device to which users will connect, including interface and port configuration. Click **Select** to select the object from a list or to create a new object.

When you select the object, the Portal Page URL field shows the URL to which users connect.

- **Authentication Server Group**—A prioritized list of AAA server group objects that identify the AAA servers to use for authenticating users.

- **User Groups**— The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway.

To add a user group, click **Add Row** to open a list of existing user group policy objects from which you can select the group. If the desired group does not already exist, click the **Create** button below the available groups list and create it. For more information about user group objects, see [Add or Edit User Group Dialog Box](#), page 34-73.

**Step 4** Click the **Portal Page** tab and customize the design of the login page. You can customize the title, the logo graphic, the message that appears above the login prompt, and the background and text colors.

If you want to select a different graphic, you must first copy the graphic onto the Security Manager server. You cannot select it from your workstation's hard drive.

**Step 5** Click the **Secure Desktop** tab to configure Cisco Secure Desktop (CSD) software. CSD policies define entry requirements for client systems and provide a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session.

If you want to use CSD, select **Enable Cisco Secure Desktop** and click **Select** to select a Secure Desktop Configuration policy object, which defines the rules you want to use to control VPN access and host scanning. You can create a new object from the selection list. For information about configuring these objects, see [Creating Cisco Secure Desktop Configuration Objects](#), page 33-18.

**Note** You must install and activate the Secure Desktop Client software on a device for your configuration to work.

**Step 6** Click the **Advanced** tab to configure a maximum number of simultaneous users for the context or if you are using VRF, the name of the VRF instance that is associated with the SSL VPN context.

**Step 7** Click **OK** to save your changes.

## SSL VPN Context Editor Dialog Box (IOS)

Use this dialog box to create or modify a context that defines the virtual configuration of an SSL VPN. For more information, see [Configuring an SSL VPN Policy \(IOS\)](#), page 33-14.

### Navigation Path

Open the SSL VPN (IOS) policy, then click **Add Row (+)**, or select a context in the table and click **Edit Row**. For information on opening the SSL VPN policy, see [Configuring an SSL VPN Policy \(IOS\)](#), page 33-14.

| User Groups | <p>The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client, CIFS file access, and thin client is enabled for the group.</p> <ul style="list-style-type: none"> <li>To add a user group, click <b>Add Row</b> to open a list of existing user group policy objects from which you can select the group. If the desired group does not already exist, click the <b>Create</b> button below the available groups list and create it. For more information about user group objects, see <a href="#">Add or Edit User Group Dialog Box, page 34-73</a>.</li> <li>To edit a user group, select it and click the <b>Edit Row</b> button.</li> <li>To delete a user group, select it and click the <b>Delete Row</b> button. This deletes the group only from the policy, it does not delete the user group policy object.</li> </ul> |

## Creating Cisco Secure Desktop Configuration Objects

Cisco Secure Desktop (CSD) Configuration objects define the settings you want to use if you enable Secure Desktop in an SSL VPN policy for an IOS device (see [Configuring an SSL VPN Policy \(IOS\), page 33-14](#)). For ASA devices, the feature is set up as part of the Dynamic Access Policy (see [Understanding Dynamic Access Policies, page 32-1](#) and [Configuring Cisco Secure Desktop Policies on ASA Devices, page 32-9](#)).

Cisco Secure Desktop (CSD) provides a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system. CSD provides a session-based interface where sensitive data is shared only for the duration of an SSL VPN session. All session information is encrypted, and all traces of the session data are removed from the remote client when the session is terminated, even if the connection terminates abruptly.

### About Windows Locations

Windows locations let you determine how clients connect to your virtual private network, and protect it accordingly. For example, clients connecting from within a workplace LAN on a 10.x.x.x network behind a NAT device are an unlikely risk for exposing confidential information. For these clients, you might set up a CSD Windows Location named Work that is specified by IP addresses on the 10.x.x.x network, and disable both the Cache Cleaner and the Secure Desktop function for this location.

In contrast, users' home PCs might be considered more at risk to viruses due to their mixed use. For these clients, you might set up a location named Home that is specified by a corporate-supplied certificate that employees install on their home PCs. This location would require the presence of antivirus software and specific, supported operating systems to grant full access to the network.

Alternatively, for untrusted locations such as Internet cafes, you might set up a location named "Insecure" that has no matching criteria (thus making it the default for clients that do not match other locations). This location would require full Secure Desktop functions, and include a short timeout period to prevent access by unauthorized users. If you create a location and do not specify criteria, make sure it is the last entry in the Locations list.

- [Creating Policy Objects, page 6-9](#)

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)).
- Step 2** Select **Cisco Secure Desktop Configuration** from the Object Type selector.
- Step 3** Right-click in the work area and select **New Object** to open the [Add or Edit Secure Desktop Configuration Dialog Box, page 34-35](#).
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Select **Windows Location Settings** to create locations (such as Work, Home, or Insecure), and define the location-based settings (also called adaptive policies) for CSD.
- a. For each location you want to configure, enter its name in the **Location to Add** field and click **Add** to move it to the Locations field. You can reorder the locations using the Move Up and Move Down buttons. When users connect, these locations are evaluated in order and the first one that matches is used to define the policies for the user.  
  
When you add a location, a folder for the location is added to the table of contents. The folder and its subfolders define the policies for the location.
  - b. If you want all the open browser windows to close after the Secure Desktop installation, make sure to select the corresponding check box.
  - c. Select the required check boxes to configure a VPN Feature policy that enables web browsing, file access, port forwarding, and full tunneling, if installation or location matching fails.
- Step 6** Select the folders and subfolders for the Windows locations you added and configure their settings. For detailed information about these settings, see *Setting Up CSD for Microsoft Windows Clients* at [http://www.cisco.com/en/US/docs/security/csd/csd311/csd\\_for\\_vpn3k\\_cat6k/configuration/guide/CSDwin.html](http://www.cisco.com/en/US/docs/security/csd/csd311/csd_for_vpn3k_cat6k/configuration/guide/CSDwin.html).
- Step 7** Select **Windows CE** to configure a VPN feature policy to enable or restrict web browsing and remote server file access for remote clients running Microsoft Windows CE.
- Step 8** Select **Mac and Linux Cache Cleaner** to configure the Cache Cleaner and a VPN Feature Policy for these clients, such as enabling or restricting web browsing, remote server file access, and port forwarding.
- Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-13](#).
- Step 10** Click **OK** to save the object.
-

## Configuring Policy Objects for Remote Access VPNs

---

There are several policy objects that you use primarily or exclusively with remote access VPNs. Some of these objects, the ASA Group Policies and User Group objects, are also used with Easy VPN site-to-site topologies. This reference explains the configuration of these policy objects.

This chapter contains the following topics:

- [ASA Group Policies Dialog Box, page 34-1](#)
- [Add or Edit Secure Desktop Configuration Dialog Box, page 34-35](#)
- [Add and Edit File Object Dialog Boxes, page 34-37](#)
- [Add or Edit Port Forwarding List Dialog Boxes, page 34-40](#)
- [Add or Edit Single Sign On Server Dialog Boxes, page 34-42](#)
- [Add or Edit Bookmarks Dialog Boxes, page 34-44](#)
- [Add and Edit SSL VPN Customization Dialog Boxes, page 34-51](#)
- [Add or Edit SSL VPN Gateway Dialog Box, page 34-64](#)
- [Add and Edit Smart Tunnel List Dialog Boxes, page 34-66](#)
- [Add and Edit Smart Tunnel Network Lists Dialog Boxes, page 34-69](#)
- [Add and Edit Smart Tunnel Auto Signon List Dialog Boxes, page 34-71](#)
- [Add or Edit User Group Dialog Box, page 34-73](#)
- [Add or Edit WINS Server List Dialog Box, page 34-89](#)

### ASA Group Policies Dialog Box

Use the Add or Edit ASA Group Policies dialog box to create, copy, and edit an ASA user group policies object.

ASA group policies are configured on ASA security appliances in Easy VPN topologies, remote access IPSec VPNs, and remote access SSL VPNs. When you configure an Easy VPN or remote access VPN, you must create group policies to which remote clients will belong. A group policy is a set of user-oriented attribute/value pairs for VPN connections that are stored either internally (locally) on the device or externally on a AAA server. The tunnel group uses a group policy that sets terms for user connections after the tunnel is established. Group policies let you apply whole sets of attributes to a user or a group of users rather than having to specify each attribute individually for each user.

**Note**

You must select the technology for which you are creating the object. Depending on the selected technology, the appropriate settings are available for configuration. If you select the IKEv1 or IKEv2 options, the IKE Proposal and IPsec Proposal policies must also be configured to support the selected IKE version.

From version 4.18, Cisco Security Manager has introduced the option to override group policies. In the ASA Group Policy page, you can enable device overrides and edit device overrides from right-click menu. When override is enabled,

**Navigation Path**

Select **ASA Group Policies** in the [Policy Object Manager, page 6-4](#). Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Tip**

You can also create objects while configuring policies that use this type of object, including Connection Profile policies for remote access and Easy VPN, or the Group Policies policy for remote access VPNs.

**Field Reference**

**Table 34-1 Add or Edit ASA Group Policies Dialog Box, including Technology Settings**

| Element     | Description                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> . |
| Description | An optional description of the object.                                                                                                                                 |

**Settings Pane**

The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right.

You must first configure technology settings, then you can select items from the table of contents on the left and configure the options you require. Your selections on the Technology page control which options are available on these pages and in the table of contents.

The top folders in the table of contents represent the VPN technologies or other settings that you can configure, and are explained next.

Table 34-1 Add or Edit ASA Group Policies Dialog Box, including Technology Settings

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technology settings | <p>These settings control what you can define in the group policy:</p> <ul style="list-style-type: none"> <li>• <b>Group Policy Type</b>—Whether you are storing the group policy on the ASA device itself (<b>Internal</b>) or on a AAA server (<b>External</b>). You cannot change this option when editing an object.<br/><br/>If you select <b>External</b>, the only attributes you can configure are the name of the AAA server group object that identifies the AAA server and its password.</li> <li>• <b>Technology</b>—The types of VPN for which this object defines group policies. Select all that apply: <ul style="list-style-type: none"> <li>– Easy VPN/IPSec IKEv1—For Easy VPN topologies or remote access IPsec VPNs that allow IKEv1 negotiations.</li> <li>– Easy VPN/IPSec IKEv2—For remote access IPsec VPNs that allow IKEv2 negotiations. IKEv2 is not supported in Easy VPN topologies.</li> <li>– SSL Clientless—For remote access SSL VPNs of all types, not just clientless.</li> </ul> </li> </ul> <p><b>Note</b> To enable web-based VPN (webvpn) option in group-policy attribute, you must enable either “ssl-client” or “ssl-clientless” tunneling protocol. In other words, upon device discovery in Security Manager, if the group-policy attribute “vpn-tunnel-protocol” does not have either “ssl-client” or “ssl-clientless” in the configuration, during the next deployment of the device, Security Manager would remove the “webvpn” option under group-policy attributes.</p> <ul style="list-style-type: none"> <li>• <b>External Server Group</b>—If you are storing the group policy attributes on an external AAA server, specify the AAA server group that will be used for authentication. Click <b>Select</b> to select the object from a list or to create a new object.<br/><br/>After you select an external server group, the <b>Password</b> and <b>Confirm</b> fields become active. Enter the alphanumeric password to use for authenticating with the server in both fields. The password can be a maximum of 128 characters; spaces are not allowed.</li> </ul> |
| DNS/WINS            | <p>The DNS and WINS servers and the domain name that should be pushed to clients associated with the group. See <a href="#">ASA Group Policies DNS/WINS Settings, page 34-30</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Split Tunneling     | <p>Settings to allow a remote client to conditionally direct encrypted packets through a secure tunnel to the central site and simultaneously allow clear text tunnels to the Internet through a network interface. ## Override ASA Group Policy

In Cisco Security Manager, group policies are created for the devices and maintained at the Cisco Security Manager level. When there is an upgrade, on rediscovery, Cisco Security Manager recreates these policies as new (with a suffix to the policy name). To overcome this duplication, from version 4.18, an Allow Value Override per device check box is used to set the group policy override on the specific device(s). For more information, see [Managing Object Overrides, page 6-17](#).

You can edit the device-level overrides for the group policies. See [Policy Object Overrides Window, page 6-20](#).

## Supported CLIs in Remote Access VPN Multi-Context Mode - Group Policy

The following CLIs are supported for Group Policy in ASA version 9.5(2) for remote access VPN in multiple context mode. These CLIs are supported in Admin and User Context.

**Note**

For the configurations that are not supported, Security Manager displays a warning message that you can ignore. No delta will be generated.

## ASA Group Policies Client Configuration Settings

Use the Client Configuration settings page to configure the Cisco client parameters for the ASA group policy for Easy VPN or remote access VPN.

Client Configuration is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **Easy VPN/IPSec VPN > Client Configuration** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

### Field Reference

**Table 34-2** ASA Group Policies Client Configuration Settings

|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Store Password on Client System | Whether to allow users to store a password on their local systems. Enable this feature only if you are certain that the local systems will be in secure sites.                                                                                                                                                                                                                                                                                                                                                            |
| Enable IPsec over UDP UDP Port  | Whether to allow a Cisco VPN client or hardware client to connect using UDP to a security appliance that is running NAT.<br>If you select this option, specify the UDP port number within the range of 4001-49151. In IPsec negotiations, the security appliance listens on the configured port and forwards UDP traffic for that port even if other filter rules drop UDP traffic.<br><b>Note</b> The Cisco VPN client must also be configured to use IPsec over UDP, which is configured by default on certain devices. |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPsec Backup Servers<br>Servers List | <p>Specify the backup server configuration:</p> <ul style="list-style-type: none"> <li>• <b>Keep Client Configuration</b>—The security appliance sends no backup server information to the client. The client uses its own backup server list, if configured. This is the default.</li> <li>• <b>Clear Client Configuration</b>—The client uses no backup servers. The security appliance pushes a null server list.</li> <li>• <b>Use Specified Backup Servers</b>—Use the backup servers you specify in the servers list. Enter the IP addresses of the servers, or the name of a network/host object. Click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> <p>You can configure backup servers either on the client or on the primary security appliance. If you configure backup servers on the security appliance, it pushes the backup server policy to the clients in the group, replacing the backup server list on the client if one is configured.</p> |

## ASA Group Policies Client Firewall Attributes

Use the Client Firewall Attributes settings to configure the firewall settings for VPN clients for the ASA group policy for Easy VPN or remote access IPSec VPN. Only VPN clients running Microsoft Windows can use these firewall settings.

Client Firewall Attributes are not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **Easy VPN/IPSec VPN > Client Firewall Attributes** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

## Field Reference

Table 34-3 ASA Group Policies Client Firewall Attributes

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall Mode | <p>The firewall requirements for client systems for the group:</p> <ul style="list-style-type: none"> <li>• <b>No Firewall</b>—Do not use a firewall. You cannot configure any other options on the page.</li> <li>• <b>Firewall Required</b>—All users in this group must use the designated firewall. The security appliance drops any session that attempts to connect without the designated firewall installed and running. In this case, the security appliance notifies the VPN client that its firewall configuration does not match.</li> </ul> <p><b>Note</b> Make sure the group does not include any clients other than Windows VPN Clients. Any other clients in the group (including VPN 3002 Hardware Clients) are unable to connect if you require a client firewall.</p> <ul style="list-style-type: none"> <li>• <b>Firewall Optional</b>—Users can use a firewall but it is not required. This option allows all users in the group to connect. Those who have a firewall can use it; users that connect without a firewall receive a warning message. This setting is useful if you are creating a group in which some users have firewalls and others do not. For example, you might have clients with systems that do not run Microsoft windows, or your clients have not all had the opportunity to install firewall software.</li> </ul> |
| Firewall Type | <p>The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco, Network ICE, Sygate, and Zone Labs.</p> <ul style="list-style-type: none"> <li>• If you select Custom Firewall, you must fill in the fields in the Custom Firewall group. You also need to configure the policy source; select options only if they are supported by the vendor.</li> <li>• Some firewall types require you to specify the source of the policy implemented by the firewall.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Policy Source | <p>Some types of firewall allow you to configure where the client firewall should obtain its policies:</p> <ul style="list-style-type: none"> <li>• <b>Get Policy From Remote Firewall</b>—The policy is configured in the client firewall application. This is how most client firewalls work.</li> <li>• <b>Use Specified Policy</b>—The policy you specify should be pushed to the client firewall application, which should use your policy.</li> </ul> <p>You must enter the name of an extended access control list policy object or Unified ACL, or click <b>Select</b> to select one from a list or to create a new one, in both in the <b>Inbound Traffic Policy</b> and <b>Outbound Traffic Policy</b> fields. Unified ACLs are supported from ASA version 9.0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 34-3 ASA Group Policies Client Firewall Attributes (continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom Firewall | <p>The attributes that define the required or optional firewall if you select custom firewall as the firewall type:</p> <ul style="list-style-type: none"> <li>• Vendor ID—The number that identifies the vendor of the custom firewall. Values are 1-255.</li> <li>• Product ID—The number that identifies the product or model of the custom firewall. Values are 1-32 or 255. Multiple ranges are allowed, for example, 4-12, 24-32. Use 255 for all supported products.</li> <li>• Description—An optional description of the custom firewall, for example, the name of the vendor and product.</li> </ul> |

## ASA Group Policies Hardware Client Attributes

Use the Hardware Client Attributes settings to configure the VPN 3002 Hardware Client settings for the ASA group policy in an Easy VPN or remote access IPSec VPN.

Hardware Client Attributes are not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **Easy VPN/IPSec VPN > Hardware Client Attributes** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

### Field Reference

**Table 34-4 ASA Group Policies Hardware Client Attributes**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Require Interactive Client Authentication | <p>Whether to enable secure unit authentication, which provides additional security by requiring VPN hardware clients to authenticate with a username and password each time that the client initiates a tunnel. The hardware client does not have a saved username and password.</p> <p><b>Note</b> Secure unit authentication requires that you have an authentication server group configured for the tunnel group the hardware clients use. If you require secure unit authentication on the primary security appliance, be sure to configure it on any backup servers as well.</p> |
| Require Individual User Authentication    | <p>Whether to require that individual users behind a hardware client authenticate to gain access to the network across the tunnel. Individual users authenticate according to the order of authentication servers that you configure.</p> <p>If you do not select this option, the security appliance allows inheritance of a value for user authentication from another group policy.</p>                                                                                                                                                                                              |

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Cisco IP Phone Bypass | Whether to allow IP phones behind hardware clients to connect without undergoing a user authentication processes. Secure unit authentication remains in effect for other users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable LEAP Bypass           | Whether to enable Lightweight Extensible Authentication Protocol (LEAP) packets from wireless devices behind a VPN hardware client to travel across a VPN tunnel prior to user authentication. This action lets workstations using Cisco wireless access point devices establish LEAP authentication and then authenticate again per user authentication.<br><br><b>Note</b> LEAP is an 802.1X wireless authentication method that implements mutual authentication between a wireless client on one side of a connection and a RADIUS server on the other side. The credentials used for authentication, including a password, are always encrypted before they are transmitted over the wireless medium. |
| Allow Network Extension Mode | Whether to enable network extension mode for hardware clients.<br><br>Network extension mode lets hardware clients present a single, routable network to the remote private network over the VPN tunnel. IPsec encapsulates all traffic from the private network behind the hardware client to networks behind the security appliance. PAT does not apply. Devices behind the security appliance have direct access to devices on the private network behind the hardware client over the tunnel, and only over the tunnel, and vice versa. The hardware client must initiate the tunnel, but after the tunnel is up, either side can initiate data exchange.                                              |
| Idle Timeout Mode            | How to handle periods of inactivity from individual clients: <ul style="list-style-type: none"> <li>Specified Timeout—If there is no communication activity by a user behind a hardware client for the number of minutes you specify, the security appliance terminates the client's access. Values are 1-35791394 minutes.</li> <li>Unlimited Timeout—User sessions are not terminated due to inactivity.</li> </ul>                                                                                                                                                                                                                                                                                      |

## ASA Group Policies IPsec Settings

Use the IPsec settings to specify tunneling protocols, filters, connection settings, and servers for the ASA group policy for Easy VPN or remote access IPsec VPN. This creates security associations that govern authentication, encryption, encapsulation, and key management.

IPsec is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **Easy VPN/IPsec VPN > IPsec** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

## Field Reference

Table 34-5 ASA Group Policies IPsec Settings

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Re-Authentication on IKE Re-Key | Whether the security appliance should prompt the user to enter a username and password during initial Phase 1 IKE negotiation and also prompt for user authentication whenever an IKE rekey occurs, providing additional security. Reauthentication fails if no user is at the other end of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable IPsec Compression               | <p>Whether to enable data compression, which speeds up transmission rates for remote dial-in users connecting with modems.</p> <p> <b>Caution</b> Data compression increases the memory requirement and CPU usage for each user session and consequently decreases the overall throughput of the security appliance. For this reason, it is recommended that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users and enable compression only for them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Perfect Forward Secrecy (PFS)   | Whether to enable the use of Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. In IPsec negotiations, PFS ensures that each new cryptographic key is unrelated to any previous key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Tunnel Group Lock                      | <p>Tunnel group lock restricts users by checking if the group configured in the VPN client is the same as the tunnel group to which the user is assigned. If it is not, the security appliance prevents the user from connecting.</p> <p>If you do not specify a tunnel name, the security appliance authenticates users without regard to the assigned group. Group locking is disabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Client Access Rules table              | <p>The access rules for clients. These rules control which types of clients are denied access, if any. You can have up to 25 rules, and combined they are limited to 255 characters.</p> <p><b>Tip</b> If you define any rule, an implicit deny all rule is added. Thus, if a client matches no permit rule, the client is denied access. If you create rules, ensure that you have permit rules for all allowed clients. You can use * as a wildcard to match partial strings.</p> <p>The rule with the lowest integer has the highest priority. Therefore, the rule with the lowest integer that matches a client type or version is the rule that applies. If a lower priority rule contradicts, the security appliance ignores it.</p> <ul style="list-style-type: none"> <li>To add a rule, click the <b>Add Row</b> button to open the <a href="#">Add or Edit Client Access Rules Dialog Box</a>, page 34-12.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete</b> button.</li> </ul> |

## Add or Edit Client Access Rules Dialog Box

Use the Client Access Rules dialog box to create or edit the priority, action, VPN client type and VPN client version for a client access rule.

### Navigation Path

From [ASA Group Policies IPsec Settings, page 34-10](#), click the **Add Row** button beneath the Client Access Rules table, or select a rule and click the **Edit Row** button.

### Field Reference

**Table 34-6 Add or Edit Client Access Rules Dialog Box**

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority                              | <p>The relative priority of the rule.</p> <p>The rule with the lowest integer has the highest priority. Therefore, the rule with the lowest integer that matches a client type or version is the rule that applies. If a lower priority rule contradicts, the security appliance ignores it. Values are 1-65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Action                                | Whether this rule permits or denies traffic access to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| VPN Client Type<br>VPN Client Version | <p>The type or version of VPN client to which this rule applies. Spaces are allowed.</p> <p>You can use * as a wildcard to match zero or more characters. You can use n/a for clients that do not send their type or version. The strings you enter in these fields must match the strings displayed using the <b>show vpn-sessiondb remote</b> command on the ASA device.</p> <p>Following are some examples, where priority, permit/deny, type, and version are shown in order:</p> <ul style="list-style-type: none"> <li>• <b>3 Deny * version 3.*</b> is a priority 3 rule that denies all client types with software version 3.x.</li> <li>• <b>5 Permit VPN3002 *</b> is a priority 5 rule that allows VPN3002 clients of all software versions.</li> <li>• <b>255 Permit * *</b> is a priority 255 rule that allows all types and versions of clients. This is useful if you are only trying to deny specific types of clients without wanting to create permit rules for all the other types.</li> </ul> |

## ASA Group Policies SSL VPN Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in a remote access SSL VPN for the ASA group policy object.

When a user connects to the SSL VPN in clientless mode, the user logs into the SSL VPN portal page. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers, depending on how you configure the portal.

Clientless is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

**Navigation Path**

Select **SSL VPN > Clientless** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

**Field Reference****Table 34-7 ASA Group Policies SSL VPN Clientless Settings**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Portal Page Websites          | The name of the SSL VPN bookmarks policy object that includes the website URLs to display on the portal page. These websites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                            |
| Allow Users to Enter Websites | Whether to allow the remote user to enter website URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable File Server Browsing   | Whether to allow the remote user to browse for file shares on the CIFS file servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable File Server Entry      | Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Hidden Shares          | Whether to make hidden CIFS shares visible, and thus accessible, to users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HTTP Proxy                    | The type of access you want to allow to the external HTTP proxy server to which the security appliance forwards HTTP connections. You can enable access, disable access, or select Auto Start, which starts the proxy automatically upon user login.                                                                                                                                                                                                                                                                                                                                                 |
| Filter ACL                    | The name of the web type access control list policy object to use to restrict user access to the SSL VPN. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. Beginning with version 4.10, you can enter IPv6 values for the web type ACL.                                                                                                                                                                                                                                                                                                       |
| Enable ActiveX Relay          | Whether to enable ActiveX relay, which allows users to start ActiveX programs from the portal page. This allows users to start Microsoft Office applications from the web browser and upload and download Office documents.                                                                                                                                                                                                                                                                                                                                                                          |
| UNIX Authentication Group ID  | The UNIX authentication group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| UNIX Authentication User ID   | The UNIX authentication user ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Smart Tunnel                  | The name of the smart tunnel list policy object assigned to this group. Click <b>Select</b> to select it from a list or to create a new object.<br><br>A smart tunnel is a connection between a Winsock 2, TCP-based application and a private site. The connection uses a clientless (browser-based) SSL VPN session with the security appliance as the pathway, and the security appliance as a proxy server. Thus, smart tunnels do not require users to have administrator privileges. For more information, see <a href="#">Configuring SSL VPN Smart Tunnels for ASA Devices, page 31-85</a> . |

Table 34-7 ASA Group Policies SSL VPN Clientless Settings (continued)

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Auto Start Smart Tunnel              | <p>Whether to start smart tunnel access automatically upon user login. If you do not select this option, the user must start the tunnel manually through the Application Access tools on the portal page.</p> <p>Auto sign-on supports only applications that use HTTP and HTTPS using the Microsoft WININET library on a Microsoft Windows operating system. For example, Microsoft Internet Explorer uses the WININET dynamic linked library to communicate with web servers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Smart Tunnel Network List            | <p>Choose from the following options to select the list of hosts or network for which you want to use the smart tunnel. To enable the selection, you must first create the smart tunnel network list entries. For more information, see <a href="#">Add and Edit Smart Tunnel Network Lists Dialog Boxes, page 34-69</a>. Note that this feature is supported on devices that are running ASA software version 8.3(1) and later.</p> <ul style="list-style-type: none"> <li>• None—If you select this option, the group policy inherits the values from the default Group Policy. This option is enabled by default.</li> <li>• Tunnel All—Select this option if you want to use the smart tunnel for all network traffic.</li> <li>• Include—Select this option if you want to use the smart tunnel for specific networks. Then click <b>Select</b> to open the Smart Tunnel Network List Selector dialog box. You can select from the available entries or add entries. To add smart tunnel network list entries, see <a href="#">Add and Edit Smart Tunnel Network Lists Dialog Boxes, page 34-69</a>.</li> <li>• Exclude—Select this option if you do not want to use the smart tunnel for specific networks. Then click <b>Select</b> to open the Smart Tunnel Network List Selector dialog box. You can select from the available entries or add entries. To add smart tunnel network list entries, see <a href="#">Add and Edit Smart Tunnel Network Lists Dialog Boxes, page 34-69</a>.</li> </ul> |
| Smart Tunnel Auto Signon Server List | The name of the smart tunnel auto sign-on list policy object assigned to this group. Click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Domain Name (Optional)               | The Windows domain to add to the username during auto sign-on, if the universal naming convention (domain\username) is required for authentication. For example, enter CISCO to specify CISCO\qa_team when authenticating for the username qa_team. You must also check the Use Domain option when configuring associated entries in the auto sign-on server list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Port Forwarding List                 | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Auto Start Port Forwarding           | Whether to start port forwarding automatically upon user login.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Forwarding Applet Name | The application name or short description to display on the Port Forwarding Java applet screen on the portal, up to 64 characters. This is the name of the applet users will download to act as a TCP proxy on the client machine for the services configured on the SSL VPN gateway.                                                                                                                                         |
| VDI Servers List table      | The Citrix XenApp or XenDesktop servers that comprise the Virtual Desktop Infrastructure. <ul style="list-style-type: none"> <li>To add a VDI server, click the <b>Add Row</b> button to open the <a href="#">Add or Edit VDI Server Dialog Box</a>, page 34-15.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete</b> button.</li> </ul> |

## Add or Edit VDI Server Dialog Box

Use the VDI Server dialog box to create or edit a Citrix XenApp or XenDesktop Server entry.

In a Virtual Desktop Infrastructure (VDI) model, administrators publish enterprise applications or desktops pre-loaded with enterprise applications, and end users remotely access these applications. These virtualized resources appear just as any other resources, such as email, so that users do not need to go through a Citrix Access Gateway to access them. Users log onto the ASA using Citrix Receiver mobile client, and the ASA connects to a pre-defined Citrix XenApp or XenDesktop Server. The administrator must configure the Citrix server's address and logon credentials under Group Policy so that when users connect to their Citrix Virtualized resource, they enter the ASA's SSL VPN IP address and credentials instead of pointing to the Citrix Server's address and credentials. When the ASA has verified the credentials, the receiver client starts to retrieve entitled applications through the ASA.

### Supported Mobile Devices

- iPad—Citrix Receiver version 4.x or later
- iPhone/iTouch—Citrix Receiver version 4.x or later
- Android 2.x/3.x/4.0/4.1 phone—Citrix Receiver version 2.x or later
- Android 4.0 phone—Citrix Receiver version 2.x or later

### Navigation Path

From [ASA Group Policies SSL VPN Clientless Settings](#), page 34-12, click the **Add Row** button beneath the VDI Servers List table, or select a rule and click the **Edit Row** button.

### Field Reference

**Table 34-8** Add or Edit VDI Server Dialog Box

| Element                         | Description                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hostname/IP Address (IPv4/IPv6) | Address of the XenApp or XenDesktop server. This value can be a clientless macro. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the version 9.0 or later. For invalid IPv6 addresses, Security Manager throws up an error. |

| Password | <p>Password for logging into the virtualization infrastructure server. This value can be a clientless macro.</p> <p>The macros available for password are:</p> <ul style="list-style-type: none"> <li>• CSCO_WEBVPN_PASSWORD—SSL VPN user login password.</li> <li>• CSCO_WEBVPN_INTERNAL_PASSWORD—SSL VPN user internal resource password. This is a cached credential, and not authenticated by a AAA server. If a user enters this value, it is used as the password for auto sign-on, instead of the password value.</li> <li>• CSCO_WEBVPN_MACRO1—Password for the MACRO1 username.</li> <li>• CSCO_WEBVPN_MACRO2—Password for the MACRO2 username.</li> <li>• CSCO_WEBVPN_MACROLIST1 and CSCO_WEBVPN_MACROLIST2—Statically configured bookmarks which can use arbitrarily-sized lists provided by LDAP attribute maps.</li> </ul> <p>These macros take the following three parameters:</p> <ul style="list-style-type: none"> <li>- Delimiter—Delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro.</li> <li>- Index—Index is an administrator-supplied integer which specifies the number of the element in the list to select. The value can range between 1 and 128.</li> <li>- URL Encoding—URL Encoding is the choice to apply the LDAP string before it is substituted into the ASA device's request. You can select one of the following values: <ul style="list-style-type: none"> <li>- None—No transformation occurs on the string value before sending to the backend server.</li> <li>- url-encode—Each parsed value is URL encoded, except for a list of reserved characters that make up the special characters in a URL.</li> <li>- url-encode-data—Each parsed value is transformed fully with URL encoding.</li> <li>- base64—Each parsed value is base 64 encoded.</li> </ul> </li> </ul> <ul style="list-style-type: none"> <li>• CSCO_WEBVPN_PRIMARY_PASSWORD—Primary user login password for double authentication.</li> <li>• CSCO_WEBVPN_SECONDARY_PASSWORD—Secondary user login ID for double authentication.</li> </ul> |

## ASA Group Policies SSL VPN Full Client Settings

Use the Full Client settings to configure the full client mode of access to the corporate network in a remote access SSL VPN for the ASA group policy object.

Full client mode enables access to the corporate network completely over an SSL VPN tunnel. In full client access mode, the tunnel connection is determined by the group policy configuration. The full client software, SSL VPN Client (SVC) or AnyConnect, is downloaded to the remote client, so that a tunnel connection is established when the remote user logs in to the SSL VPN gateway.

### Tip

To enable full client access, you must configure the **Remote Access VPN > SSL VPN > Other Settings** policy on the device to identify AnyConnect image packages to install on the device. The images must be on the device so that users can download them. For more information, see [Understanding SSL VPN AnyConnect Client Settings, page 31-62](#) and [Add and Edit File Object Dialog Boxes, page 34-37](#).

The following policies are supported for ASA 9.5(2) Remote Access VPN in Multi-context mode:

- Security Group Tag
- Periodic Certificate Verification
- Client Dead Peer Detection Timeout
- Gateway Dead Peer Detection Timeout
- Datalayer Transport layer Security Compression
- Keep AnyConnect Client on Client System
- Ignore Routing and Filter Rules
- AnyConnect Modules
- AnyConnect MTU
- AnyConnect Firewall-Client Public ACL
- AnyConnect Firewall-Client Private ACL
- Enable Datagram Transport Layer Security

### Navigation Path

Select **SSL VPN > Full Client** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                      | <p>The mode in which to operate the SSL VPN:</p> <ul style="list-style-type: none"> <li>• <b>Use Other Access Modes if AnyConnect Client Download Fails</b>—If the full client fails to download to the remote user, allow the user to make clientless or thin client access to the VPN.</li> <li>• <b>Full Client Only</b>—Prohibit clientless or thin client access. The user must have the full client installed and functional to connect to the VPN.</li> </ul>                                                                                                                                                                                                                                   |
| Keep AnyConnect Client on Client System   | Whether to leave the AnyConnect client installed on the client system after the client disconnects. If you do not leave the client installed, it must be download each time the user connects to the gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Keepalive Messages                 | <p>Whether to exchange keepalive messages between peers to demonstrate that they are available to send and receive data in the tunnel. Keepalive messages transmit at set intervals, and any disruption in that interval results in the creation of a new tunnel using a backup device.</p> <p>If you select this option, enter the time interval (in seconds) that the remote client waits between sending IKE keepalive packets in the <b>Interval</b> field.</p>                                                                                                                                                                                                                                    |
| SSL Compression                           | <p>Whether to enable data compression, and if so, the method of data compression to use: None, Deflate, or LZS. Data compression speeds up transmission rates for remote dial-in users connecting with modems.</p> <p> <b>Caution</b> Data compression increases the memory requirement and CPU usage for each user session and consequently decreases the overall throughput of the security appliance. For this reason, it is recommended that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users and enable compression only for them.</p> |
| Client Dead Peer Detection Timeout (sec)  | <p>The time interval, in seconds, that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the remote user.</p> <p>DPD is used to send keepalive messages between peer devices only when no incoming traffic is received and outbound traffic needs to be sent.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| Gateway Dead Peer Detection Timeout (sec) | The time interval, in seconds, that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Renegotiation Method                      | <p>The method by which the tunnel key is refreshed for the remote user group client:</p> <ul style="list-style-type: none"> <li>• <b>Disabled</b>—Disables the tunnel key refresh.</li> <li>• <b>Use Existing Tunnel</b>—Renegotiates the SSL tunnel connection.</li> <li>• <b>Create New Tunnel</b>—Initiates a new tunnel connection.</li> </ul> <p>Enter the time interval (in minutes) between the tunnel refresh cycles in the <b>Interval</b> field.</p> |
| Enable Datagram Transport Layer Security      | <p>Whether to enable Datagram Transport Layer Security (DTLS) connections for the group.</p> <p>Enabling DTLS allows the AnyConnect client establishing an SSL VPN connection to use two simultaneous tunnels, an SSL tunnel and a DTLS tunnel. Using DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.</p>                          |
| Datagram Transport Layer Security Compression | <p>Whether to compress Datagram Transport Layer Security (DTLS) connections for the group, and if so, the method of data compression to use: None, Default, or LZS.</p>                                                                                                                                                                                                                                                                                        |
| Ignore Don't Fragment (DF) bit                | <p>Whether to ignore the DF bit in packets that need fragmentation. This feature allows the force fragmentation of packets that have the DF bit set, allowing them to pass through the tunnel. An example use case is for servers in your network that do not respond correctly to TCP MSS negotiations.</p>                                                                                                                                                   |

Table 34-9 ASA Group Policies SSL VPN Full Client Settings (continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AnyConnect Module | <p>The modules that the AnyConnect client needs to enable optional features. Click <b>Select</b> to select the applicable modules from the Add AnyConnect Module dialog box.</p> <ul style="list-style-type: none"> <li>• <b>AnyConnect DART</b>—Select this module to enable the AnyConnect Diagnostics and Reporting Tool (DART), which bundles specified log files and diagnostic information that can be used for analyzing and debugging the client connection.</li> <li>• <b>AnyConnect Network Access Manager</b>—Select this module to enable the Network Access Manager, which enforces administratively defined end user and authentication policies and makes the pre-configured network profiles available to end users.</li> <li>• <b>AnyConnect SBL</b>—Select this module to enable Start Before Logon (SBL), which forces the user to connect to the enterprise infrastructure over a VPN connection before logging on to Windows by starting AnyConnect before the Windows login dialog box appears. After authenticating to the ASA, the Windows login dialog appears, and the user logs in as usual. SBL is only available for Windows and lets you control the use of login scripts, password caching, mapping network drives to local drives, and more.</li> <li>• <b>AnyConnect Web Security Module</b>—Select this module to enable the AnyConnect Web Security module, which is an endpoint component that routes HTTP traffic to a ScanSafe scanning proxy where the ScanSafe web scanning service evaluates it.</li> <li>• <b>AnyConnect Telemetry Module</b>—Select this module to enable the AnyConnect telemetry module for AnyConnect Secure Mobility Client, which sends information about the origin of malicious content to the web filtering infrastructure of the Cisco IronPort Web Security Appliance (WSA). The web filtering infrastructure uses this data to strengthen its web security scanning algorithms, improve the accuracy of the URL categories and web reputation database, and ultimately provide better URL filtering rules.</li> <li>• <b>AnyConnect ISE Network Setup Assistant</b>—Select this module to enable the AnyConnect ISE Network Setup Assistant module.</li> <li>• <b>AnyConnect ISE Posture</b>—Select this module to enable the AnyConnect ISE Posture module.</li> <li>• <b>AnyConnect Posture Module</b>—Select this module to enable the AnyConnect Posture Module, which provides the AnyConnect Secure Mobility Client the ability to identify the operating system, antivirus, antispymware, and firewall software installed on the host. The Host Scan application, which is among the components delivered by the posture module, is the application that gathers this information.</li> </ul> <p><b>Note</b> If other options are listed, see the release notes for the Cisco AnyConnect VPN Client for an explanation of the feature.</p> |

**Table 34-9 ASA Group Policies SSL VPN Full Client Settings (continued)**

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AnyConnect MTU               | The maximum transmission unit (MTU) size for SSL VPN connections established by the Cisco AnyConnect VPN Client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| AnyConnect Always-On VPN     | <p>Always-On VPN enables AnyConnect to automatically establish a VPN session after you log onto the system. Note that until you log off from the system, the VPN session will remain open.</p> <p>Select one of these options:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—AnyConnect service profile remains unchanged. It inherits the value from the default group policy.</li> <li>• <b>AnyConnect Profile Setting</b>—Always-On VPN option configured in the AnyConnect VPN profile is used by the AnyConnect client.</li> <li>• <b>Disable</b>—disables the Always-On VPN option.</li> </ul>                                                                                                                                                                       |
| AnyConnect Profile Name      | <p>The name of the AnyConnect profile to use for the group. You can enter multiple profile names each separated by a comma. You must configure this name and relate it to a profile in the <b>Remote Access VPN &gt; SSL VPN &gt; Other Settings</b> policy.</p> <p><b>Note</b> The AnyConnect Profile name is supported from Security Manager version 4.12 for ASA devices running version 9.6(2) in Multi-context mode. The supported CLIs are:</p> <ul style="list-style-type: none"> <li>– <b>Webvpn</b>—Anyconnect profiles</li> </ul>                                                                                                                                                                                                                                           |
| Prompt User to Choose Client | Whether to ask the user to download the client. Enter the number of seconds the user has to make a selection in the <b>Time User Has to Choose</b> field. The default is 120 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Time User Has to Choose      | <p>If you do not select this option, the user is immediately taken to the default location. The user is also taken to the default location after the time to choose expires.</p> <ul style="list-style-type: none"> <li>• <b>Web Portal</b>—The portal page is loaded in the web browser.</li> <li>• <b>AnyConnect Client</b>—The AnyConnect client is downloaded.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                         |

| Security Group Tag           | <p>ASA Version 9.3(1)+ supports security group tagging of VPN sessions. A Security Group Tag (SGT) can be assigned to a VPN session using an external AAA server, or by configuration of the local user database. This tag can then be propagated through the Cisco TrustSec system over Layer 2 Ethernet. Security group tags are useful on group policies and for local users when the AAA server cannot provide an SGT.</p> <p>When the Default check box is selected, no Security Group Tag is assigned.</p> <p>To specify a Security Group Tag, clear the <b>Default</b> check box and then enter the numerical value of the SGT tag that will be assigned to VPN users connecting with this group policy in the Security Group Tag field. Valid values are from 2 to 65519.</p> |

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Periodic Certificate Verification      | <p>Whether to enable periodic validation and revocation checking of the client certificates in VPN sessions. If you select this option, enter the interval of time, in hours, between 1 to 168. This feature is supported only in devices running ASA software version 9.4(1) or later.</p> <p>Periodic certificate verification is disabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| AnyConnect Firewall-Client Public ACL  | <p>The name of the Extended or Unified access control list or policy object to use to restrict user access to the SSL VPN. Public rules are applied to all interfaces on the client. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>Unified ACLs are supported from ASA version 9.0. The default is Extended. If the device version is later than ASA 9.0, all the Anyconnect values are discovered as Unified ACL and deployed during deployment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| AnyConnect Firewall-Client Private ACL | <p>The name of the Extended or Unified access control list policy object to use to restrict user access to the SSL VPN. Private rules are applied to the Virtual Adapter. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>Unified ACLs are supported from ASA version 9.0. The default is Extended. If the device version is later than ASA 9.0, all the Anyconnect values are discovered as Unified ACL and deployed during deployment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| AnyConnect Custom Attributes table     | <p>The AnyConnect Custom Attribute table lists the custom attributes, names, and the corresponding values that are assigned to this group policy. AnyConnect custom attributes that are defined on the AnyConnect Custom Attribute tab of the SSL VPN Other Settings page are listed here (see <a href="#">Configuring AnyConnect Custom Attributes (ASA), page 31-70</a>). Beginning with version 4.7, Security Manager enables to add a Custom Attribute Data to an existing Custom Attribute Type.</p> <p>You can add or remove the custom attributes for a group policy, and configure values for each attribute.</p> <ul style="list-style-type: none"> <li>• To add a custom attribute and its value click the <b>Add Row</b> button beneath the table and fill in the Add AnyConnect Custom Attribute dialog box.</li> <li>• To edit a custom attribute and its value, select it, click the <b>Edit Row</b> button, and make your changes in the Edit AnyConnect Custom Attribute dialog box.</li> <li>• To delete a custom attribute, select it and click the <b>Delete Row</b> button. You are asked to confirm the deletion.</li> </ul> <p>For more details, see <a href="#">Add/Edit AnyConnect Custom Attribute Dialog Box, page 31-71</a>.</p> |

## ASA Group Policies SSL VPN Settings

Use the SSL VPN Settings to configure attributes that are required for clientless and port forwarding (thin client) access modes to work, including auto signon rules for user access to servers. Auto Signon configures the security appliance to automatically pass SSL VPN user login credentials (username and password) on to internal servers. You can configure multiple auto signon rules.

The Homepage URL policy is supported for the SSL tab in ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **SSL VPN > Settings** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

### Field Reference

**Table 34-10 ASA Group Policies SSL VPN Settings**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Home Page                                 | <p>The URL of the SSL VPN home page. The URL is free text. The page is displayed when users log into the VPN. If you do not enter a URL, no home page is displayed.</p> <p>Beginning with version 4.12, Security Manager supports IPv6 address in the Home Page URL for ASA devices running the software version 9.0 or later. The format for the Home Page URL for IPv6 address is: <code>http://[IPv6 address]/appname</code>. The Home page URL should be prefixed with <code>http://</code> (or) <code>https://</code></p>                                                    |
| Authentication Failure Message            | <p>The message to deliver to a remote user who successfully logs into the VPN but has no VPN privileges, and so can do nothing. The default message is:</p> <p>“Login was successful, but because certain criteria have not been met or due to some specific group policy, you do not have permission to use any of the VPN features. Contact your IT administrator for more information.”</p>                                                                                                                                                                                    |
| Minimum Keepalive Object Size (kilobytes) | The minimum size (in kilobytes) of an IKE keepalive packet that can be stored in the cache on the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Single Sign On Server                     | <p>The name of the single sign on (SSO) server policy object that identifies the server to use for this group, if any. An SSO server allows users to enter their username and password once and be able to access other server in the network without logging into each of them. If configure an SSO server, also configure the auto signon rules table.</p> <p>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Add or Edit Single Sign On Server Dialog Boxes, page 34-42</a>.</p> |
| Enable HTTP Compression                   | Whether to allow an HTTP compressed object to be cached on the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 34-10** ASA Group Policies SSL VPN Settings (continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Signon Rules table   | <p>If you configure a single sign on server, the auto signon rules table contains the rules that determine which internal servers are provided the user's credentials. Thus, you can provide single sign on for some servers in your network but not others.</p> <p>Each rule is an allow rule, and indicates the IP address, subnet, or Universal Resource Identifier (URI) that identifies the server, and the type of authentication that will be sent to the server when the user tries to access it (either basic HTML, NTLM, FTP, or all of these). The rules are processed in order, top to bottom, and the first match is applied. Therefore, be sure to order the rules correctly using the up and down arrow buttons.</p> <p>If the user accesses a server that is not identified in one of these rules, the user must log into the server to gain access.</p> <ul style="list-style-type: none"> <li>To add a rule, click the <b>Add Row</b> button to open the <a href="#">Add or Edit Auto Signon Rules Dialog Box, page 34-27</a>.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Portal Page Customization | <p>The name of the SSL VPN customization policy object that defines the appearance of the portal web page. The portal page allows the remote user access to all the resources available on the SSL VPN network. If you do not specify an object, the default page appearance is used.</p> <p>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Configuring ASA Portal Appearance Using SSL VPN Customization Objects, page 31-78</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| User Storage Location     | <p>The location where personalized user information is stored between clientless SSL VPN sessions. If you do not specify a location, information is not stored between sessions. Stored information is encrypted.</p> <p>Enter a file system designation in the following format:</p> <p><b>protocol://username:password@host:port/path</b></p> <p>Where <b>protocol</b> is the protocol of the server, <b>username</b> and <b>password</b> are a valid user account on the server, and <b>host</b> is the name of the server. Also indicate the <b>port</b> number (if you do not use the default for the protocol) and directory <b>path</b> of the location on the server to use. For example:</p> <p><b>cifs://newuser:12345678@anyfiler02a/new_share</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Storage Key Confirm       | The storage key used to protect data stored between sessions. Spaces are not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Post Max Size             | The maximum size allowed for a posted object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent posting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Upload Max Size           | The maximum size allowed for a uploaded object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent uploading.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Add or Edit Auto Signon Rules Dialog Box

Use the Add or Edit Auto Signon Rules dialog box to configure the Auto Signon rules that the security appliance uses to pass SSL VPN user login credentials on to an internal server.

### Navigation Path

Open the [ASA Group Policies SSL VPN Settings, page 34-25](#), then click **Create**, or select an item in the table and click **Edit**.

### Field Reference

**Table 34-11** Add or Edit Auto Signon Rules Dialog Box

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow IP  | <p>Select this option to configure an IPv4 or IPv6 address or subnet for the rule. Any server within this subnet is supplied the specified login credentials. Beginning with version 4.12, Security Manager supports IPv6 addresses for devices running ASA 9.0 or later.</p> <ul style="list-style-type: none"> <li>To enter the IP address of a single server, enter the full IP address and use 255.255.255.255 as the subnet mask.</li> <li>To specify a subnet, enter the network address and subnet mask, for example, IP address 10.100.10.0 mask 255.255.255.0.</li> </ul> <p>If you want the appliance to send credentials to any internal server the user tries to access, create rules for all of your internal networks. You might be able to do this with a single rule.</p> |
| Allow URI | <p>Select this option to configure a Universal Resource Identifier (URI) for the rule. This identifies the internal server based on URI rather than IP address. For example, <b>https://*.example.com/*</b> creates a rule for all web pages on any server in the example.com domain. Use the asterisk as a wildcard to apply to zero or more characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |

|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Type | <p>The type of credentials that the security appliance will pass on to the servers covered by this rule: Basic HTML, NTLM (NT LAN Manager) authentication, FTP, or all of these methods.</p> <p>The default option is <b>All</b>. Use the default unless you want to limit logins to a certain type.</p> |

## ASA Group Policies Browser Proxy Settings

Use the Browser Proxy settings to configure the attributes for the browser.

Browser Proxy is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **Browser Proxy** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

### Field Reference

**Table 34-12 ASA Group Policies Browser Proxy Settings**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxy Server Setting               | Enter the following: <ul style="list-style-type: none"> <li>Server Address—Specify the IP address or name and the port of the browser server that is applied for the client device in the format 'ServerAddress:PortNumber'. To configure multiple proxy servers, separate the server addresses using a space.</li> <li>Exception List—List the server names and IP addresses that you want to exclude from proxy server access. Enter the list of addresses that you do not want to have accessed through a proxy server. This list corresponds to the Exceptions list in the Proxy Settings dialog box in the browser. To configure multiple exception lists, separate the lists using a space, comma, or semicolon.</li> <li>Bypass Server for Local Addresses—Configures the browser proxy local-bypass settings for a client device. Click <b>Yes</b> to enable local bypass or <b>No</b> to disable local bypass. Select <b>None</b> if you do not want to use this option. The default selected option is None.</li> </ul> |
| Proxy Auto Configuration (PAC) URL | Specify the URL of the auto-configuration file. This file tells the browser where to look for proxy information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Policy Lockdown                    | Select <b>Enable</b> to hide the Connections tab in the browser for the duration of an AnyConnect VPN session. Select <b>Disable</b> to leave the display of the Connections tab unchanged. Select <b>None</b> if you do not want to use this option. The default selected option is None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## ASA Group Policies DNS/WINS Settings

Use the DNS/WINS settings to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the ASA group policy. These settings apply to Easy VPN and remote access IPsec and SSL VPN configurations.

DNS/WINS is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **DNS/WINS** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary IPv6 DNS Server   | The IPv6 address of the primary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices 9.0 or later. Primary IPv6 DNS Server address is mandatory to be able to configure Secondary IPv6 DNS Server. |
| Secondary IPv6 DNS Server | The IPv6 address of the secondary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices 9.0 or later.                                                                                               |
| Primary WINS Server       | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                        |
| Secondary WINS Server     | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                        |
| DHCP Network Scope        | The scope of the DHCP network for the group. Enter the IP network address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                            |
| Default Domain            | The default domain name for the group. The default, blank, is none.                                                                                                                                                                                                                                                                                                                                          |

## ASA Group Policies Split Tunneling Settings

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet. These settings apply to Easy VPN and remote access IPsec and SSL VPN configurations.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

Split Tunneling is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Tip

For optimum security, we recommend that you not enable split tunneling.

### Navigation Path

Select **Split Tunneling** from the table of contents in the [ASA Group Policies Dialog Box](#), page 34-1.

## Field Reference

Table 34-14 ASA Group Policies Split Tunneling Settings

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks | <p>The name of a standard, extended, or unified access control list policy object that identifies the networks that require traffic to travel across the tunnel and those that do not require tunneling. Unified ACLs are supported from ASA version 9.0. How permit and deny are interpreted depends on your selection for <b>Tunnel Option</b>.</p> <p>Enter the name of the object, or click <b>Select</b> to select it from a list or to create a new object. If you do not specify an ACL, the network list is inherited from the default group policy.</p> |

## ASA Group Policies Connection Settings

Use the Connection Settings to configure the connection characteristics for the ASA group policy, including access control and session timeouts. These settings are used for Easy VPN and remote access IPsec or SSL VPN sessions.

Connection Settings is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

Select **Connection Settings** from the table of contents in the [ASA Group Policies Dialog Box, page 34-1](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter ACL         | <p>The name of the extended access control list (ACL) policy object to use for filtering traffic on the VPN connection. The ACL determines which traffic is permitted or denied. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. Beginning with version 4.10 and ASA version 9.0, you can select from a list of Standard, Extended, or Unified ACL objects.</p> <p>This ACL does not apply to clientless SSL VPN connections.</p> |
| Banner Text        | <p>The banner, or welcome text, to display on remote clients when they connect to the VPN.</p> <ul style="list-style-type: none"> <li>Beginning with version 4.9, Security Manager supports up to 4000 characters for the banner text for ASA devices on version 9.5(1) or later.</li> <li>For ASA version lower than 9.5(1), Security Manager allows you to enter up to 500 characters for the banner text.</li> </ul>                                                                   |
| IPv4 Address Pools | <p>Specifies the name of one or more IPv4 address pools to use for this group policy. Enter the names of the IPv4 address pool objects separated by a comma or click <b>Select</b> to select the objects from a list or to create a new objects.</p>                                                                                                                                                                                                                                      |

Table 34-15 ASA Group Policies Connection Settings (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Address Pools      | Specifies the name of one or more IPv6 address pools to use for this group policy. Enter the names of the IPv6 address pool objects separated by a comma or click <b>Select</b> to select the objects from a list or to create a new objects. Beginning with version 4.12, Security Manager supports IPv6 address pools for ASA devices 9.0 or later.                                                                                                                                                                                                 |
| Access hours            | <p>The name of a time range policy object that specifies the times that users are allowed to access the VPN. If you do not specify a time range, users can access the VPN at all times. Specify a time range if you want to limit access to the network to certain hours, such as the typical work days and work hours for your organization.</p> <p>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Configuring Time Range Objects, page 6-71</a>.</p> |
| Max Simultaneous Logins | The number of simultaneous logins a single user is allowed. Values are 0-2147483647. The default is 3. Specify 0 to disable logins and prevent user access.                                                                                                                                                                                                                                                                                                                                                                                           |
| Max Connection Time     | <p>The maximum amount of time a user is allowed to be connected to the VPN. Select one of the following:</p> <ul style="list-style-type: none"> <li>Specified Connection time—Use the maximum time value that you enter. Values are 1-35791394 minutes. After the time is exceeded, the security appliance closes the connection.</li> <li>Unlimited Connection time—The security appliance does not close connections based on connection time.</li> </ul>                                                                                           |
| Idle Timeout            | <p>The amount of time a user is allowed to be connected to the VPN while the connection is idle, that is, there is no communication activity. Select one of the following:</p> <ul style="list-style-type: none"> <li>Specified Timeout—Use the time out value you enter. Values are 1-4473924 minutes. When the idle time is exceeded, the security appliance closes the connection. The default is 30 minutes.</li> <li>Unlimited Timeout—The security appliance does not close idle connections.</li> </ul>                                        |
| VLAN Mapping<br>VLAN ID | <p>The VLAN ID value can be between 1 and 4094 and must correspond to a VLAN interface on the ASA.</p> <p>The VLAN mapping feature on the ASA allows for traffic from VPN connections to be directed to a specified VLAN interface.</p> <p>Beginning with Cisco Security Manager version 4.10 and ASA version 9.5(1), you can assign IPv6 addresses to remote users.</p> <p>Beginning with Cisco Security Manager version 4.17, you can configure VLAN on ASA 9.9(2) or later multi-context devices.</p>                                              |

# Add or Edit Secure Desktop Configuration Dialog Box

Use the Add or Edit Cisco Secure Desktop Configuration dialog box to create, copy, and edit Cisco Secure Desktop Configuration objects for IOS routers. You can configure the settings required for Windows clients who are connecting from different location types, enable or restrict web browsing and file access for Windows CE clients, and configure the cache cleaner for Macintosh and Linux clients.

Cisco Secure Desktop (CSD) secures network endpoints by providing a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system.

This policy object uses the Secure Desktop Manager application to configure the settings. For an example of configuring settings, see *Cisco Secure Desktop on IOS Configuration Example Using SDM* at

[http://www.cisco.com/en/US/products/ps6496/products\\_configuration\\_example09186a008072aa7b.shtml](http://www.cisco.com/en/US/products/ps6496/products_configuration_example09186a008072aa7b.shtml). The first part of the configuration example explains setting up SDM, which you can ignore. Instead, look for the sections that describe setting up Windows locations midway through the example. The screen shots will help you identify when you are looking at CSD configuration.

## Navigation Path

Select **Manage > Policy Objects**, then select **Cisco Secure Desktop (Router)** from the Object Type Selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| <b>Windows Location Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Windows Locations                                 | <p>The names of the locations that you want to configure for Windows clients connecting from specific locations, such as Work, Home, or Insecure.</p> <p>When you create a location, an item for the location is added to the table of contents, where you can select the settings folders related to the location and configure its properties. The settings include a definition of how to determine if a client is connecting from that particular location.</p> <p>For each location you want to configure, enter its name in the <b>Location to Add</b> field and click <b>Add</b> to move it to the <b>Locations</b> list.</p> <p>You can reorder the locations using the Move Up/Move Down buttons. CSD checks locations in the order listed in this dialog box, and grants privileges to client PCs based on the first location definition they match. You can create a default location, such as Insecure, as the final location and configure the strictest security for it. For more information, see <a href="#">Creating Cisco Secure Desktop Configuration Objects</a>, page 33-18.</p> |
| Close all open browser windows after installation | Whether to close all the open browser windows after installing the Secure Desktop application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                                                | Description                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Secure Delete                                          | The number of passes for CSD to perform a secure cleanup. The default is 1 pass.<br><br>CSD encrypts and writes the cache to the remote client's disk. Upon termination of the Secure Desktop, CSD converts all bits occupied by the cache to all 0's, then to all 1's, and then to randomized 0's and 1's. |
| Enable Web Browsing if Mac or Linux Installation Fails | Whether to allow web browsing (but not other remote access features) if the cache cleaner installation fails.                                                                                                                                                                                               |
| VPN Feature Policy                                     | Whether to allow web browsing, remote server file access, and port forwarding for Macintosh and Linux clients. Port forwarding permits the use of the Secure Desktop to connect a client application installed on the local PC to the TCP/IP port of a peer application on a remote server.                 |
| Category                                               | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                   |

## Add and Edit File Object Dialog Boxes

Use the Add and Edit File Object dialog boxes to create, copy, and edit file objects. File objects represent files that are used in device configurations, typically for remote access VPN policies and policy objects. Such files include Anyconnect client profile and image files, image (graphic) files, plug-in jar files, and Cisco Secure Desktop package files.

When you create a file object, Security Manager makes a copy of the file in its storage system. These files are backed up whenever you create a backup of the Security Manager database, and they are restored if you restore the database. When you deploy configurations that specify a file object, the associated file is download to the device in the appropriate directory.

After you create a file object, you typically should not edit it. If you need to replace the file, edit the file object to select the new file, or create a new file object. If the file is editable, you can edit the file object to identify the file's location in the file repository, and use the desired editor to open and edit the file outside of Security Manager. The file repository is the **CSCOpX\MDC\FileRepository** folder in the installation directory (typically, C:\Program Files). The files are organized in subfolders named for the file type.

For all file types except Image files, you can add a file from the Security Manager server or from the local Security Manager client by selecting the appropriate tab on the Choose a file dialog box. You cannot select files from a network server. You can control the ability to add files from the Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see [Customize Desktop Page, page 11-10](#).

### Tip

If you are copying a file to the Security Manager server so that it can be used in a file object, do not copy the file directly to the file repository.

When you delete a file object, the associated file is not deleted from the file repository.

**Navigation Path**

Select **Manage > Policy Objects**, then select **File Objects** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

## File Object — Choose a file Dialog Box

Use the File Object — Choose a file dialog box to select the file to use for the file object you are adding or editing. The available files are managed using Image Manager. For more information, see [Image Manager Supported Image Types, page 73-5](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **File Objects** from the Object Type Selector. Add or Edit a file object and from the Add or Edit File Object dialog box, click **Browse** to open the File Object — Choose a file dialog box.

## Add or Edit Port Forwarding List Dialog Boxes

Use the Port Forwarding List dialog box to create, copy and edit port forwarding list policy objects. You can create port forwarding list objects to use when you are configuring the thin client access mode for SSL VPN.

Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. When port forwarding is enabled, the hosts file on the SSL VPN client is modified to map the application to the port number configured in the forwarding list. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

### Navigation Path

Select **Manage > Policy Objects**, then select **Port Forwarding List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Name                                                  | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                                                                                                            |
| Description                                           | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Port Forwarding List table                            | The port forwarding entries that are defined in the object. The entries show the mapping of the local port to the remote server and port. <ul style="list-style-type: none"> <li>To add a mapping, click the <b>Add Row</b> button to open the <a href="#">Add or Edit A Port Forwarding Entry Dialog Box, page 34-41</a>.</li> <li>To edit a mapping, select it and click the <b>Edit Row</b> button.</li> <li>To delete a mapping, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Include Port Forwarding Lists                         | The names of other port forwarding list objects to include in the object. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. Separate multiple entries with commas.<br><br>When you add other port forwarding lists, the entries from those lists are treated as if they were directly entered into this object, and the names of the included objects are not reflected in the device configuration commands during deployment.             |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                         |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.        |

## Add or Edit A Port Forwarding Entry Dialog Box

Use the Add or Edit A Port Forwarding Entry dialog boxes to create a new port forwarding list entry or edit an existing one.

**Navigation Path**

Go to the [Add or Edit Port Forwarding List Dialog Boxes, page 34-40](#) and click the **Add Row** button or select an entry and click the **Edit Row** button beneath the Port Forwarding List table.

**Field Reference****Table 34-20 Add or Edit A Port Forwarding Entry Dialog Box**

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local TCP Port                       | The port number to which the local application is mapped (between 1 and 65535).                                                                                                                                                                                                                                                                                                                                                                                               |
| Remote Server IPv4/IPv6 Address Name | The IPv4 or IPv6 address or fully qualified domain name of the remote server. Select the type of entry and enter the IP address or name.<br>Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the software version 9.0 or later.<br>For the IP address, you can enter the name of a network/host object that specifies the remote server's IP address, or click <b>Select</b> to select it from a list or to create a new object. |
| Remote TCP Port                      | The port number of the application for which port forwarding is configured (between 1 and 65535).                                                                                                                                                                                                                                                                                                                                                                             |
| Description                          | A description of the port forwarding entry. This information is mandatory on Cisco IOS devices.                                                                                                                                                                                                                                                                                                                                                                               |

## Add or Edit Single Sign On Server Dialog Boxes

Use the Add or Edit Single Sign On Server dialog box to create, copy, and edit single sign on (SSO) server objects for use with SSL VPNs (as configured in ASA group policy objects). For information on how to configure SSO servers in an ASA group policy, see [ASA Group Policies SSL VPN Settings, page 34-25](#).

Single sign-on lets users access different secure services on different servers without entering a username and password more than once. In the authentication, the security appliance acts as a proxy for the SSL VPN user to the SSO server. You can configure this object to identify either a Computer Associates SiteMinder SSO server or a Security Assertion Markup Language (SAML) Browser Post Profile version 1.1 server.

The SSO mechanism starts as part of the AAA process or just after successful user authentication to an AAA server. The SSL VPN server running on the security appliance acts as a proxy for the user to the authenticating server. When a user logs in, the SSL VPN server sends an SSO authentication request, including username and password, to the authenticating server. If the server approves the authentication request, it returns an SSO authentication cookie to the SSL VPN server. The security appliance keeps this cookie on behalf of the user and uses it to authenticate the user to secure web sites within the domain protected by the SSO server.

If you want to configure SSO for an SSL VPN group, you must also configure a AAA server, such as a RADIUS or LDAP server.

**Note**

The SAML Browser Artifact profile method of exchanging assertions is not supported.

**Navigation Path**

Select **Single Sign On Servers** in the [Policy Object Manager, page 6-4](#). Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

You can also create the object when configuring an ASA user group object for SSL VPN (see [ASA Group Policies SSL VPN Settings, page 34-25](#)).

**Table 34-21 Add or Edit Single Sign-On Server Dialog Box**

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                        | The object name, which must be 4 to 31 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                   |
| Description                                 | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                  |
| Authentication Type                         | The type of SSO server to use with clientless SSL VPN connections. The other attributes on the page change based on your selection. <ul style="list-style-type: none"> <li>• <b>SiteMinder</b>—Computer Associates SiteMinder SSO server.</li> <li>• <b>SAML POST</b>—Security Assertion Markup Language (SAML) Browser Post Profile server.</li> </ul>                                                 |
| URL<br>(SiteMinder only.)                   | The URL of the SiteMinder SSO server to which the security appliance makes authentication requests. Select whether to use HTTP or HTTPS and enter the URL. <p><b>Tip</b> For HTTPS communication, make sure that the SSL encryption settings match on both the security appliance and the SiteMinder server. On the security appliance, you can verify this with the <b>ssl encryption</b> command.</p> |
| Secret Key<br>Confirm<br>(SiteMinder only.) | The key used to encrypt authentication communications with the SiteMinder server, if any. The key can contain any alphanumeric characters. There is no minimum or maximum number of characters. Enter the same key in both fields. <p><b>Tip</b> If you enter a secret key, you must configure the same key in the SiteMinder server using the Cisco Java plug-in authentication scheme.</p>            |
| Assertion URL<br>(SAML POST only.)          | The URL for the SAML-type SSO assertion consumer service. Select whether to use HTTP or HTTPS and enter the URL, which must be fewer than 255 characters.                                                                                                                                                                                                                                               |
| Assertion Issuer<br>(SAML POST only.)       | The name of the security device that is sending assertions to a SAML-type SSO server. This is usually the name of the security appliance, for example, asa.example.com. The name must be fewer than 65 characters.                                                                                                                                                                                      |
| Trustpoint<br>(SAML POST only.)             | The name of the PKI enrollment policy object that identifies the certificate authority (CA) server that acts as the trustpoint that contains the certificate to use to sign the SAML-type browser assertion. Enter the name or click <b>Select</b> to select it from a list or to create a new object.                                                                                                  |
| Max Retries                                 | The number of times the security appliance retries a failed SSO authentication attempt before the authentication times out. The range is 1 to 5 retries, and the default is 3 retries.                                                                                                                                                                                                                  |
| Request Timeout                             | The number of seconds before a failed SSO authentication attempt times out. The range is 1 to 30 seconds, and the default is 5 seconds.                                                                                                                                                                                                                                                                 |

**Table 34-21** Add or Edit Single Sign-On Server Dialog Box (continued)

| Element                                   | Description                                                                                                                                                                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                              |
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Add or Edit Bookmarks Dialog Boxes

Use the Add or Edit Bookmarks dialog boxes to configure browser-based clientless SSL VPN bookmarks (URL lists) for an SSL VPN Bookmark object. From this dialog box, you can change the order of the bookmark entries within the table, create, copy, edit, and delete SSL VPN Bookmark objects.

An SSL VPN Bookmark object defines the URLs that are displayed on the portal page after a successful login.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Bookmarks** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                                                                     |

## Add or Edit Bookmark Entry Dialog Boxes

Use the Add or Edit Bookmark Entry dialog boxes to create or edit a bookmark to be included in an SSL VPN Bookmark object.

You can use non-English, non-ASCII languages for the text to display for bookmarks if you are configuring the object for use on an ASA device. For more information about how you can configure the SSL VPN portal in local languages, see [Localizing SSL VPN Web Pages for ASA Devices, page 31-80](#).

### Navigation Path

In the Policy Object Manager, from the [Add or Edit Bookmarks Dialog Boxes](#), right-click inside the Bookmarks table, then select **Add Row** or right-click a row, then select **Edit Row**.

| Title                           | The text label that the user sees for the bookmark.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| URL                             | <p>The Universal Resource Locator address for the bookmark. Select the protocol for the bookmark and enter the rest of the URL in the edit box.</p> <p><b>Tip</b> If you are creating bookmarks for use on an ASA device, and you are also configuring Kerberos Constrained Delegation on the device, you might need to add the service principle name (SPN) to the URL. For more information, see <a href="#">Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)</a>, page 31-69.</p>                                                                                                                                                                                                                                                                        |

## Settings

These settings are applicable only to SSL VPN portals hosted on ASA devices running software version 8.x or later. Do not configure these settings for SSL VPN Bookmark objects that you will use on other devices.

|          |                                                                     |
|----------|---------------------------------------------------------------------|
| Subtitle | An additional user-visible title that describes the bookmark entry. |
|----------|---------------------------------------------------------------------|

**Table 34-23 Add or Edit Bookmark Entry Dialog Boxes (continued)**

| Element                    | Description                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Thumbnail                  | The File object that represents an icon you want to associate with the bookmark on the Portal. Enter the name of the File object or click <b>Select</b> to select it from a list or to create a new object. |
| Authentication Access      | Whether to display the thumbnail only on the Portal page. If you deselect this option, the thumbnail is also displayed on the Logon page.                                                                   |
| Enable Favorite URL Option | Whether to display the bookmark entry on the portal home page. Deselect the check box if you want the bookmark entry to appear on the application page only.                                                |

**Advanced Form and URL Settings**

These settings are applicable only to SSL VPN portals hosted on ASA devices running software version 8.x or later. Do not configure these settings for SSL VPN Bookmark objects that you will use on other devices.

|                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URL Method                                                   | Select the required URL method from the list: <ul style="list-style-type: none"> <li>• <b>Get</b>—Select this option if you want simple data retrieval.</li> <li>• <b>Post</b>—Select this option when processing the data might involve changes to it, for example, storing or updating data, ordering a product, or sending e-mail. If you select this option, you must configure the Post parameters in the Post Parameters table.</li> <li>• <b>Auto Sign-on Form</b>—Select this option if you want to use auto sign-on.</li> </ul> |
| Enable Smart Tunnel Option<br>(Get and Post URL Method only) | Whether to open the bookmark in a new window that uses the smart tunnel functionality to pass data to and from the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Preload Page Options<br>(Get and Post URL Method only)       | Optionally, configure the following Preload options: <p><b>Preload URL</b>—The URL of a page to load before the bookmark link is loaded.</p> <p><b>Wait Time</b>—The time to allow for loading of the page before you are forwarded to the actual POST URL.</p>                                                                                                                                                                                                                                                                          |

**Table 34-23 Add or Edit Bookmark Entry Dialog Boxes (continued)**

| Element                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Sign-on (ASA 9.0.1+ only)<br>(Auto Sign-on Form URL Method only) | <p>When Auto Sign-on Form is selected as the URL Method, configure the following options:</p> <p><b>Note</b> Wildcards can be used in the URLs you enter for the following fields. For example, you can enter <code>http*://www.example.com/myurl*</code>.</p> <p><b>Login Page URL</b>—The URL of the login page for which to auto sign-on.</p> <p><b>Landing Page URL</b>—The URL of the page that is loaded after a successful login. The ASA requires the Landing Page to be configured to detect a successful login to the application.</p> <p><b>Pre-Login Page URL</b>—The URL of the page which is loaded before the login page. This page will require user interaction to proceed to the login screen.</p> <p><b>Control ID</b>—The ID of the control/tag that will get a click event on the pre-login page URL to proceed to the login page.</p> |
| Post Parameters                                                       | <p>The list of the names and values of the Post parameters for the bookmark entry.</p> <ul style="list-style-type: none"> <li>To add a parameter, click the Add button and fill in the Add Post Parameter dialog box (see <a href="#">Add and Edit Post Parameter Dialog Boxes, page 34-48</a>).</li> <li>To edit a parameter, select it and click the Edit button.</li> <li>To delete a parameter, select it and click the Delete button.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                       |
| Post Script                                                           | <p>An optional field for entering JavaScript required by some applications. Some Web applications, such as Microsoft Outlook Web Access, may execute a JavaScript to change the request parameters before the log-on form is submitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Add and Edit Post Parameter Dialog Boxes

Use the Add and Edit Post Parameter dialog boxes to create a new Post parameter entry or edit an existing one in the table. For a detailed discussion of Post parameters, see [Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks, page 31-84](#).

### Navigation Path

In the Policy Object Manager, from the [Add or Edit Bookmark Entry Dialog Boxes](#), right-click inside the Post Parameters table, then select **Add Row** or right-click a row, then select **Edit Row**.

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value   | <p>The value of the post parameter exactly as defined in the corresponding HTML form. For example, <b>param_value</b> in &lt;input name="param_name" value="param_value"&gt;.</p> <p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• CSCO_WEBVPN_USERNAME—SSL VPN user login ID.</li> <li>• CSCO_WEBVPN_PASSWORD—SSL VPN user login password.</li> <li>• CSCO_WEBVPN_INTERNAL_PASSWORD—SSL VPN user internal resource password. This is a cached credential, and not authenticated by a AAA server. If a user enters this value, it is used as the password for auto sign-on, instead of the password value.</li> <li>• CSCO_WEBVPN_CONNECTION_PROFILE—SSL VPN user login group drop-down, a group alias within the connection profile.</li> <li>• CSCO_WEBVPN_DYNAMIC_URL1—A single bookmark that can generate multiple bookmark links on the user's portal. This macro takes <i>delimiter</i> as an option, where <i>delimiter</i> is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro.</li> <li>• CSCO_WEBVPN_DYNAMIC_URL2—A single bookmark that can generate multiple bookmark links on the user's portal. This macro takes <i>delimiter</i> as an option, where <i>delimiter</i> is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro.</li> <li>• CSCO_WEBVPN_MACRO1—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an <i>ldap-attribute-map</i>, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value1. Variable substitution via RADIUS is performed by VSA#223.</li> <li>• CSCO_WEBVPN_MACRO2—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an <i>ldap-attribute-map</i>, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value2. Variable substitution via RADIUS is performed by VSA#224.</li> <li>• CSCO_WEBVPN_MACROLIST1 and CSCO_WEBVPN_MACROLIST2—Statically configured bookmarks which can use arbitrarily-sized lists provided by LDAP attribute maps.</li> </ul> <p>These macros take the following three parameters:</p> <ul style="list-style-type: none"> <li>– Delimiter—Delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro.</li> <li>– Index—Index is an administrator-supplied integer which specifies the number of the element in the list to select. The value can range between 1 and 128.</li> <li>– URL Encoding—URL Encoding is the choice to apply the LDAP string before it is substituted into the ASA device's request. You can select one of the following values: <ul style="list-style-type: none"> <li>– None—No transformation occurs on the string value before</li> </ul> </li> </ul> |

# Add and Edit SSL VPN Customization Dialog Boxes

Use the Add and Edit SSL VPN Customization dialog boxes to create, copy, and edit SSL VPN Customization objects. An SSL VPN Customization policy object describes how to customize web pages for a browser-based clientless SSL VPN hosted on an ASA 8.x device. For more information, see [Configuring ASA Portal Appearance Using SSL VPN Customization Objects, page 31-78](#).

You can use non-English, non-ASCII languages for the text to display on these pages. For more information about how you can configure the SSL VPN portal in local languages, see [Localizing SSL VPN Web Pages for ASA Devices, page 31-80](#).

## Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Customization** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

## Field Reference

**Table 34-25** Add and Edit SSL VPN Customization Dialog Boxes

| Element     | Description                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> . |
| Description | An optional description of the object.                                                                                                                                 |

## Settings Pane

The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right. Before configuring settings, click the Preview button to see the default settings to help you determine what, if anything, you want to change.

The top folders in the table of contents represent the SSL VPN web pages that you can customize, and are explained next.

**Table 34-25 Add and Edit SSL VPN Customization Dialog Boxes (continued)**

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logon Page | <p>The Logon web page is the one users see first when connecting to the SSL VPN portal. It is used for logging into the VPN. Select the following items in the Logon Page folder in the table of contents to view and change the settings:</p> <ul style="list-style-type: none"> <li>• <b>Logon Page</b>—The Browser Window Title field defines the title of the web page, which is displayed in the browser’s title bar.</li> <li>• <b>Title Panel</b>—The title displayed in the web page itself. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Title Panel, page 34-53</a>.</li> <li>• <b>Language</b>—The languages you will support for the Logon, Portal, and Logout pages. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Language, page 34-54</a>.</li> <li>• <b>Logon Form</b>—The labels and colors used in the form that accepts user logon information. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Logon Form, page 34-56</a>.</li> <li>• <b>Informational Panel</b>—An extra informational panel for conveying information to users. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Informational Panel, page 34-57</a>.</li> <li>• <b>Copyright Panel</b>—The copyright information on the logon page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Copyright Panel, page 34-58</a>.</li> <li>• <b>Full Customization</b>—If you do not want to use the security appliance’s built-in logon page, even customized, you can instead enable full customization and supply your own web page. For more information about creating a custom Logon page and the settings, see <a href="#">Creating Your Own SSL VPN Logon Page for ASA Devices, page 31-82</a> and <a href="#">SSL VPN Customization Dialog Box—Full Customization, page 34-59</a>.</li> </ul> |

**Table 34-25 Add and Edit SSL VPN Customization Dialog Boxes (continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Portal Page                     | <p>The Portal web page is the one users see after logging into the SSL VPN; it is the home page. Select the following items in the Portal Page folder in the table of contents to view and change the settings:</p> <ul style="list-style-type: none"> <li>• <b>Portal Page</b>—The <b>Browser Window Title</b> field defines the title of the web page, which is displayed in the browser's title bar.</li> <li>• <b>Title Panel</b>—The title displayed in the web page itself. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Title Panel, page 34-53</a>.</li> <li>• <b>Toolbar</b>—The toolbar displayed above the main part of the Portal page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Toolbar, page 34-59</a>.</li> <li>• <b>Applications</b>—The application buttons that will appear on the page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Applications, page 34-60</a>.</li> <li>• <b>Custom Panes</b>—The layout of the main part of the Portal page. The default is a single column with no internal panes. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Custom Panes, page 34-61</a>.</li> <li>• <b>Home Page</b>—How and whether to display URL lists on the home page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Home Page, page 34-62</a>.</li> </ul> |
| Logout Page                     | The Logout web page is the one users see after logging out of the SSL VPN. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Logout Page, page 34-63</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## SSL VPN Customization Dialog Box—Title Panel

Use the Title Panel page of the SSL VPN Customization dialog box to determine whether the Logon page or Portal page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic.

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Title Panel** in the table of contents to configure the title of the Logon page, or **Portal Page > Title Panel** to configure the title of the Portal page.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Display Title Panel | Whether to display a title panel within the web page. The default is to not display a title. If you select this option, you can configure the title using the other fields on this page.                                                                                                                                                                                                                                                               |
| Gradient            | Whether to have the background color change in a gradual progression.                                                                                                                                                                                                                                                                                                                                                                                  |
| Title Text          | The text to display in the title panel.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Font Weight         | The characteristics of the font used for the title text. You can select a weight, font size, and color. Click <b>Select</b> to choose a font color.                                                                                                                                                                                                                                                                                                    |
| Font Size           |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Font Color          |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Background Color    | The color of the background of the title panel. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                                 |
| Style (CSS)         | Cascading Style Sheet (CSS) parameters that define the style characteristics of the title panel. You can include a maximum of 256 characters.<br><br><b>Tip</b> For more information about CSS, visit the World Wide Web Consortium (W3C) website at <a href="http://www.w3.org">www.w3.org</a> .                                                                                                                                                      |
| Logo Image          | The File policy object that identifies the logo image you want to include in the title panel, if any. Enter the name of the File object or click <b>Select</b> to select it from a list or to create a new object.<br><br><b>Tip</b> The image file can be a GIF, JPG, or PNG file, and it can be up to 100 kilobytes in size.<br><br>For more information about File objects, see <a href="#">Add and Edit File Object Dialog Boxes, page 34-37</a> . |

## SSL VPN Customization Dialog Box—Language

Use the Language page of the SSL VPN Customization dialog box identify the languages you will support on the browser-based clientless SSL VPN portal. If you want to configure translation tables for other languages on the ASA device and use them, you can configure the supported languages and allow users to choose their language. Before you configure these settings, read [Localizing SSL VPN Web Pages for ASA Devices, page 31-80](#).

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Language** in the table of contents.

| Automatic Browser Language Selection | <p>This table lists the languages you will support on the web pages for automatic browser language selection. Automatic browser language select allows the ASA device to negotiate with the user's web browser to determine the language in which to present the web pages. You must configure a translation table on the ASA device for any language you list here. For more detailed information about automatic browser language selection, see <a href="#">Localizing SSL VPN Web Pages for ASA Devices</a>, page 31-80.</p> <p>Languages are listed by their abbreviation in the table. The languages are evaluated top to bottom until a match is found. The language that is indicated as the default language (indicated as True in the table) is used if the device is unable to negotiate a different language with the browser. If you do not specify a default, English is the default.</p> <ul style="list-style-type: none"> <li>• To add a language, click the Add Row button below the table.</li> <li>• To edit a language, select it and click the Edit Row button.</li> <li>• To delete a language, select it and click the Delete Row button.</li> </ul> |
| Enable Language Selector             | Whether to display the Language Selector on the Logon page. The Language Selector allows users to select their preferred language. The Language Selector is complementary to the automatic browser language selection capability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Language Selector Prompt             | The text label for the Language Selector prompt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Language Table                       | <p>The list of languages included in the Language Selector drop-down list. You must configure a translation table on the ASA device for any language you list here. For more detailed information, see <a href="#">Localizing SSL VPN Web Pages for ASA Devices</a>, page 31-80.</p> <p>The table lists the languages by abbreviation and title, or the common name of the language. The title is the text displayed in the drop-down list. You can change the language title but not the abbreviation.</p> <ul style="list-style-type: none"> <li>• To add a language, click the Add Row button below the table.</li> <li>• To edit a language, select it and click the Edit Row button.</li> <li>• To delete a language, select it and click the Delete Row button.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |

## Add and Edit Language Dialog Boxes

Use the Add and Edit Language dialog boxes to add or edit an entry for a language you will support for automatic browser language selection or in the Language Selector drop-down list.

### Navigation Path

From the [SSL VPN Customization Dialog Box—Language](#) page, click the **Add Row** button for either the Automatic Browser Language Selection table or the Language Selector table, or select a row and click the **Edit Row** button.

### Field Reference

**Table 34-28 Add and Edit Language Dialog Boxes**

| Element                                                | Description                                                                                                                                                                          |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Language                                               | The list of languages that you can support on the browser-based clientless SSL VPN web pages, listed by their abbreviation.                                                          |
| Default<br>(Automatic Browser Language Selection only) | Whether the language should be defined as the default language for the portal. The default language is used if the ASA device cannot negotiate a language with the client's browser. |
| Title<br>(Language Selector only)                      | The name of the language that should appear in the Language Selector on the Logon page.                                                                                              |

## SSL VPN Customization Dialog Box—Logon Form

Use the Logon Form settings of the SSL VPN Customization dialog box to customize the title of the login box, login prompts of the SSL VPN page (including username, password, and group prompts), login buttons, and style elements of the login box that appears to browser-based clientless SSL VPN users when they initially connect to the security appliance.

### Navigation Path

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Logon Form** in the table of contents.

|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message                                                | The message that appears in the login box above the username and password fields. You can enter a maximum of 256 characters.                                                                                                                                                                                                                                                                                                              |
| Username Prompt                                        | The text of the prompt for the username entry field.                                                                                                                                                                                                                                                                                                                                                                                      |
| Password Prompt                                        | The text of the prompt for the password entry field.                                                                                                                                                                                                                                                                                                                                                                                      |
| Secondary Username Prompt<br>Secondary Password Prompt | The prompts for a second username and password if you require two login credentials. You can enable secondary authentication only if the Connection Profile policy is configured to require it.<br><br>The secondary username and password prompt are displayed only if you configure them. If you leave the username prompt blank, the primary username is used and the secondary password must be associated with the primary username. |
| Internal Password Prompt                               | The text of the prompt for the internal password entry field.                                                                                                                                                                                                                                                                                                                                                                             |
| Show Internal Password First                           | Whether the prompt for the internal password should be placed above the password prompt. The internal password is required when using a clientless SSL VPN to access an internal protected website.                                                                                                                                                                                                                                       |
| Group Selector Prompt                                  | The text of the prompt for the Group Selector drop-down list.                                                                                                                                                                                                                                                                                                                                                                             |
| Button Text                                            | The name of the button the user clicks to log onto the SSL VPN.                                                                                                                                                                                                                                                                                                                                                                           |
| Border Color                                           | The color of the border of the login box. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                          |
| Title Font Color                                       | The color of the font for the login box title. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                     |
| Title Background Color                                 | The background color for the Title area of the login box. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                          |
| Font Color                                             | The color of the font of the login form. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                           |
| Background Color                                       | The background color for the login form. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                           |

## SSL VPN Customization Dialog Box—Informational Panel

Use the Informational Panel page of the SSL VPN Customization dialog box to customize the appearance of the Informational panel in the Logon page. The Informational panel is an area where you can provide extra information to the user, and is optional.

### Navigation Path

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Informational Panel** in the table of contents.

|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                                             | The sequential number of the application in the table. To change the order of an application, select it and click the Move Up or Move down buttons to the desired position. The applications appear on the Portal page in the order represented here.                                                                                                                                |
| Move Up and Move Down buttons (below the table) |                                                                                                                                                                                                                                                                                                                                                                                      |
| Application                                     | The graphic associated with an application.                                                                                                                                                                                                                                                                                                                                          |
| Title                                           | The name of the application. Standard applications include Home, Web Applications, Browse Networks, Application Access, and AnyConnect Client. Also listed are the browser plug-ins that you create when you configure the SSL VPN global settings are also available for selection from this page.<br><br>Double-click a title to make it editable so that you can change the name. |
| Enable                                          | Whether the application is included on the Portal page.                                                                                                                                                                                                                                                                                                                              |
| Show Navigation Panel                           | Whether to display the navigation panel in the portal page. If you deselect this option, the list of applications does not appear on the portal.                                                                                                                                                                                                                                     |

## SSL VPN Customization Dialog Box—Custom Panes

Use the Custom Panes page of the SSL VPN Customization dialog box to customize the appearance of the main body of the Portal page. By creating custom panes and specifying a column layout, you can create a grid of information that can help you present portal information effectively to your end users.

### Navigation Path

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Portal Page > Custom Panes** in the table of contents.

|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Columns table      | <p>The list of columns that the main body of the Portal page should be divided into. You define the column based on a percentage of the width of the page. The percentages should add up to 100. If they do not add up to 100, the device will adjust the column widths.</p> <p>Create the columns as you want them to appear, left to right, on the Portal page.</p> <ul style="list-style-type: none"> <li>• To add a column, click the Add Row button below the table.</li> <li>• To edit a column, select it and click the Edit Row button.</li> <li>• To delete a column, select it and click the Delete Row button.</li> </ul>                                                                                                  |
| Custom Panes table | <p>The custom panes that should appear in the main body of the Portal page. The table shows whether a pane is enabled to appear, the type of pane, its characteristics, and the column and row in which it will appear on the page. The panes can display plain text or include a URL for HTML, image, or RSS links.</p> <p>For more detailed information about the settings, see <a href="#">Add or Edit Custom Pane Dialog Boxes, page 34-62</a>.</p> <ul style="list-style-type: none"> <li>• To add a custom pane, click the Add Row button below the table.</li> <li>• To edit a custom pane, select it and click the Edit Row button.</li> <li>• To delete a custom pane, select it and click the Delete Row button.</li> </ul> |

## Add and Edit Column Dialog Boxes

Use the Add or Edit Column dialog box to create or edit columns in the main body of the Portal page for browser-based clientless SSL VPNs. Enter the desired width of the column as a percentage of the total area in the Percentage field.

### Navigation Path

From the [SSL VPN Customization Dialog Box—Custom Panes](#) page, click the **Add Row** button in the Column table, or select a column and click the **Edit Row** button.

## Add or Edit Custom Pane Dialog Boxes

Use the Add or Edit Custom Pane dialog box to create or edit a pane to display in the main body or the Portal page of a browser-based clientless SSL VPN.

### Navigation Path

From the [SSL VPN Customization Dialog Box—Custom Panes](#) page, click the **Add Row** button in the Custom Pane table, or select a pane and click the **Edit Row** button.

### Field Reference

**Table 34-36 Add and Edit Custom Pane Dialog Boxes**

| Element                                     | Description                                                                                                                                                                                                                                                                            |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable                                      | Whether to display the custom pane on the Portal page.                                                                                                                                                                                                                                 |
| Type                                        | The type of content to show in the pane, one of: <ul style="list-style-type: none"> <li>Text—Plain text. You can include HTML mark up.</li> <li>HTML—HTML content provided by a URL.</li> <li>Image—An Image provided by a URL.</li> <li>RSS—An RSS feed provided by a URL.</li> </ul> |
| Show Title<br>Title                         | Whether to display a title in the pane. If you select this option, enter the title in the Title field.                                                                                                                                                                                 |
| Show Border                                 | Whether to display a border around the pane.                                                                                                                                                                                                                                           |
| Column<br>Row                               | The column and row numbers in which the pane should appear. Select or enter the number for each to specify the desired grid location.                                                                                                                                                  |
| Height                                      | The height of the pane in pixels.                                                                                                                                                                                                                                                      |
| URL<br>(HTML, Image, and RSS content only.) | The URL that hosts the content you want to display in the pane.                                                                                                                                                                                                                        |
| Text<br>(Text content only.)                | The text you want to display in the pane. You can include HTML markup in the text.                                                                                                                                                                                                     |

## SSL VPN Customization Dialog Box—Home Page

Use the Home Page page in the SSL VPN Customization dialog box to customize the appearance of the URL and file lists on the Portal page and the content of the main body of the Portal page. URL lists are considered to be default elements on the portal home page unless they are explicitly disabled.

### Navigation Path

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Portal Page > Home Page** in the table of contents.

| Font Color<br>Background Color             | The font and background color of the message that appears in the logout box. Click <b>Select</b> to choose a color. |

## Add or Edit SSL VPN Gateway Dialog Box

Use the Add or Edit SSL VPN Gateway dialog box to create, copy and edit SSL VPN gateway objects. You use these objects when you are configuring an SSL VPN connection on an IOS device. For more information, see [SSL VPN Configuration Wizard—Gateway and Context Page \(IOS\)](#), page 30-33.

An SSL VPN gateway acts as a proxy for connections to protected resources that are accessed through an SSL-encrypted connection between the gateway and a web-enabled browser on a remote device. You can configure only one gateway per SSL VPN.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Gateway** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Related Topics

| Element     | Description                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , page 6-9. |
| Description | An optional description of the object (up to 1024 characters).                                                                                                         |

**Table 34-39 Add and Edit SSL VPN Gateway Dialog Boxes (continued)**

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address                         | <p>The IP address for the gateway, which is the address to which remote users connect:</p> <ul style="list-style-type: none"> <li>• <b>Use Static IP Address</b>—Specify the address that you want to use. You must also configure this address on an interface on the router.</li> <li>• <b>Obtained from Interface</b>—Specify the interface role that resolves to a single interface on the device. The IP address configured for the interface is used. This option allows you to identify the external interface you want to use for connections without having to explicitly enter the IP address. If you have to change the address on the interface, you do not have to also reconfigure this object.</li> </ul> |
| Port                               | <p>The number of the port that will carry the HTTPS traffic. You can also enter the name of a port list object that specifies the single port number, or click <b>Select</b> to select the object from a list. The default is the HTTPS object, which specifies port 443. If you do not use port 443, you can enter another port number between 1025 and 65535.</p>                                                                                                                                                                                                                                                                                                                                                      |
| Trustpoint                         | <p>The digital certificate required to establish the secure connection. A self-signed certificate is generated when an SSL VPN gateway is activated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Gateway                     | <p>Whether to activate the SSL VPN gateway.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Specify SSL Encryption Algorithms  | <p>Whether to restrict the encryption algorithms used for the connection, or to specify a different order of use. The default is to make all algorithms available in this order of preference: 3DES and SHA1, AES and SHA1, RC4 and MD5.</p> <p>Select the priority order for the algorithms. Select None to eliminate one or two algorithms.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| Redirect HTTP Traffic<br>HTTP Port | <p>Whether to have the gateway redirect HTTP traffic over secure HTTP (HTTPS). Traffic that comes to this port is redirected to the port you specify in the Port field.</p> <p>Enter the port number for HTTP traffic in the <b>HTTP Port</b> field. You can enter a number or the name of a port list object, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p>The HTTP port is normally 80. However, you can enter any other number that is used in your network between 1025-65535.</p>                                                                                                                                                                                       |
| Hostname                           | <p>The hostname for the gateway.</p> <ul style="list-style-type: none"> <li>• <b>Do Not Specify</b>—No hostname is assigned; the IP address to the gateway is used.</li> <li>• <b>Use the host and domain names of the device</b>—These are defined in the <b>Platform &gt; Device Admin &gt; Hostname</b> policy.</li> <li>• <b>Use the Object</b>—The hostname is the value defined in a text policy object. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.</li> </ul>                                                                                                                                                                                        |
| Category                           | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 34-39 Add and Edit SSL VPN Gateway Dialog Boxes (continued)**

| Element                         | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     |                                                                                                                                                                                                                                                                        |
|                                 | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Add and Edit Smart Tunnel List Dialog Boxes

Use the Add and Edit Smart Tunnel Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel objects.

An SSL VPN smart tunnel list object lists the applications that are eligible for smart tunnel access to a private site. You can configure the clientless settings of an ASA group policy with a smart tunnel list to allow users to access the specified applications through the SSL VPN portal. For an explanation of the types of applications that support smart tunnel access, see [Configuring SSL VPN Smart Tunnels for ASA Devices, page 31-85](#).

You can include other SSL VPN smart tunnel list objects in an object. Thus, you can create a smaller set of objects that identify your basic list of applications, then create other objects that create the required combination of applications. For example, you might want all three of your ASA group policies to allow smart tunnel access to applications A and B, but the remaining applications are unique for each group. By creating a single object that specifies A and B, you can include that object in each of the SSL VPN smart tunnel list objects for the group policies, and these objects need only specify their unique applications in the applications table.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smart Tunnel Entries table      | The applications to which users will be allowed smart tunnel access through the SSL VPN, including the name of the application and its location on client workstations. <ul style="list-style-type: none"> <li>To add an application, click the <b>Add Row</b> button to open the <a href="#">Add and Edit A Smart Tunnel Entry Dialog Boxes, page 34-67</a>.</li> <li>To edit an application, select it and click the <b>Edit Row</b> button.</li> <li>To delete an application, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Include Smart Tunnel Lists      | The other SSL VPN smart tunnel list objects that you want to include in this object, if any. Enter the names of the objects or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.                                                                                                                                                                                                                                                                                                 |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                      |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                                                                                                                                         |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                   |

## Add and Edit A Smart Tunnel Entry Dialog Boxes

Use the Add and Edit A Smart Tunnel Entry dialog boxes to create a new smart tunnel entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Lists dialog box.

### Navigation Path

From [Add and Edit Smart Tunnel List Dialog Boxes, page 34-66](#), click the **Add Row** button beneath the Smart Tunnel Entries table, or select an entry and click the **Edit Row** button.

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| App Path | <p>The filename and optionally, the path, of the application. This entry can be up to 128 characters. Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Filename</b>—For example, <b>outlook.exe</b>. By only specifying the file name, it does not matter where users install the application on their workstations. However, the file name must match exactly.</li> <li>• <b>Full path and filename</b>—For example, <b>C:\Program Files\Microsoft Office\OFFICE11\OUTLOOK.EXE</b>. This allows the application smart tunnel access only if it is installed in the specified directory, which you can use to enforce organizational standards.</li> </ul> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you specify the full path, and the smart tunnel application stops working after it had been working for a while, it is likely that a product upgrade changed the installation path. Add a new entry that accounts for the new path.</li> <li>• If you are granting smart tunnel access to an application that is started from the command line, create one entry for <b>cmd.exe</b> (the Windows command line), and another entry for the application.</li> </ul> |
| Platform | <p>Specify the host operating system of the application:</p> <ul style="list-style-type: none"> <li>• Windows</li> <li>• Mac</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hash Value | <p>(Optional) The hash value for the application. By specifying a hash value, you can ensure that the user does not rename another application to use a supported filename and thus start an unsupported and undesired application over the smart tunnel.</p> <p>To obtain the hash value, enter the checksum of the application (that is, the checksum of the executable file) into a utility that calculates a hash using the SHA-1 algorithm. One example of such a utility is the Microsoft File Checksum Integrity Verifier (FCIV), which is available at <a href="http://support.microsoft.com/kb/841290/">http://support.microsoft.com/kb/841290/</a>. Place a temporary copy of the application to be hashed on a path that contains no spaces (for example, c:\temp) and then enter <code>fciv.exe -sha1</code> application at the command line (for example, <code>fciv.exe -sha1 c:\msimn.exe</code>) to display the SHA-1 hash. Copy and paste the value into this field.</p> <p>The SHA-1 hash is always 40 hexadecimal characters. Before authorizing an application for smart tunnel access, clientless SSL VPN calculates the hash of the application matching the App Name. It qualifies the application for smart tunnel access if the result matches the value of hash.</p> <p>Because the checksum varies with each version or patch of an application, the hash you enter can match only one version or patch on the remote host. To specify a hash for more than one version of an application, create a unique smart tunnel entry for each hash value.</p> <p><b>Tip</b> Hash values require maintenance. You must update the smart tunnel list if you want to support future versions or patches of an application for which you supply a hash value. A sudden problem with smart tunnel access might be an indication that the application list containing hash values is not up-to-date with an application upgrade. You can avoid this problem by not entering a hash.</p> |

## Add and Edit Smart Tunnel Network Lists Dialog Boxes

Beginning from Security Manager version 4.7, you can use the Add and Edit Smart Tunnel Network Lists dialog boxes to create and edit a list of hosts that you can use for configuring smart tunnel policies.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Network Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**. Alternatively, you can click the **Add (+)** button to add a new object, or click the **Edit (pencil)** button to edit an object.

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                  | The smart tunnel network list object name that you use to apply to the tunnel policy. The name can be up to 64 characters. Spaces are not allowed. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                      |
| Description                                           | An optional description of the network list object.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Smart Tunnel Network List Entries table               | The host mask or IP address of the network to which applications will be allowed smart tunnel access through the SSL VPN. <ul style="list-style-type: none"> <li>• To add an entry, click the <b>Add Row</b> button to open the <a href="#">Add and Edit A Smart Tunnel Entry Dialog Boxes, page 34-67</a>.</li> <li>• To edit an entry, select it and click the <b>Edit Row</b> button.</li> <li>• To delete an entry, select it and click the <b>Delete Row</b> button.</li> </ul>       |
| Include Other Lists                                   | The other SSL VPN smart tunnel network list objects that you want to include in this object, if any. Enter the names of the objects or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.                                                                                                                                                                                                                                     |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add and Edit A Smart Tunnel Network List Entry Dialog Box

Use the Add and Edit A Smart Tunnel Network List Entry dialog box to create a new smart tunnel network list entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Network Lists dialog box.

### Navigation Path

From [Add and Edit Smart Tunnel List Dialog Boxes, page 34-66](#), click the **Add Row** button beneath the Smart Tunnel Network List Entries table, or select an entry and click the **Edit Row** button.

**Table 34-43** Add and Edit Smart Tunnel Network List Entry Dialog Boxes

| Element     | Description                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host        | The host mask that will be part of the smart tunnel network list entry.                                                                                     |
| IP Address  | The IP address of the host that will be part of the smart tunnel network list entry. Beginning with version 4.12, Security Manager supports IPv6 addresses. |
| Subnet Mask | The subnet mask for the specified IP address.                                                                                                               |

## Add and Edit Smart Tunnel Auto Signon List Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel auto sign-on objects.

Smart Tunnel Auto Sign-on is a single sign-on method for Clientless SSL VPN users. It passes the login credentials (username and password) to internal servers for authentication using NTLM authentication, HTTP Basic authentication, or both. Smart Tunnel Auto Sign-on is supported on ASA 5500 devices running software version 7.1(1) and later.

An SSL VPN smart tunnel auto sign-on list object identifies the servers for which to automate the submission of login credentials during smart tunnel setup. You can configure the clientless settings of an ASA group policy with a smart tunnel auto sign-on list if you want to reissue the user credentials when the user establishes a smart tunnel connection to a server. For an explanation of the types of applications that support smart tunnel access, see [Configuring SSL VPN Smart Tunnels for ASA Devices, page 31-85](#).

You can include other SSL VPN smart tunnel auto sign-on list objects in an object. Thus, you can create a set of objects that identify your basic list of servers and include those objects in another object that expands upon that list of servers.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Auto Signon Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Matching Mode: <ul style="list-style-type: none"> <li>• Host</li> <li>• IPv4/IPv6 Address</li> </ul> | <p>Identifies the server for which to automate the submission of login credentials during smart tunnel setup. Use Host to specify the server by host name or wildcard mask, and use IP Address to specify the server by IP address and netmask:</p> <ul style="list-style-type: none"> <li>• <b>Host</b>—Select Host and then enter the host name or a wildcard mask in the Hostname Mask field that identifies the host for which to automate the submission of login credentials during smart tunnel setup.</li> </ul> <p><b>Note</b> Using this option protects the configuration from dynamic changes to IP addresses.</p> <ul style="list-style-type: none"> <li>• <b>IPv4/IPv6 Address</b>—Select the IP Address and then enter the IP address and netmask of the host or sub-network of hosts for which to automate the submission of login credentials during smart tunnel setup.</li> </ul> <p><b>Note</b> Beginning with version 4.12 Security Manager supports IPv6 addresses. By default, when you select the <b>IPv4/IPv6 Address</b>, Security Manager looks for IPv4/IPv6 address. Enter the Subnet Mask or Prefix Length as required.</p> <p><b>Note</b> Firefox requires the administrator to specify hosts using an exact host name or IP address (instead of a host mask with wild cards, a subnet using IP addresses, or a netmask). For example, within Firefox, you cannot enter *.cisco.com and expect auto sign-on to host email.cisco.com.</p> |
| Port Number                                                                                          | The port that performs auto sign-on. For Firefox, if no port number is specified, auto sign-on is performed on HTTP and HTTPS, accessed by default port numbers 80 and 443 respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Authentication Realm                                                                                 | The realm for the authentication. The Authentication Realm is associated with the protected area of the website and is passed back to the browser either in the authentication prompt or in the HTTP headers during authentication. After auto sign-on is configured and a realm string is specified, users can configure the realm string on a web application (such as Outlook Web Access) and access web applications without signing on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Use Domain                                                                                           | Select this option to add the Windows domain to the username if authentication requires it. If you use this option, be sure to specify the domain name when assigning the smart tunnel list to one or more group policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Add or Edit User Group Dialog Box

Use the Add or Edit User Group dialog box to create or edit a user group object. User group objects are used in Easy VPN topologies, remote access VPNs, and SSL VPNs for IOS devices.

When you configure a remote access VPN, SSL VPN, or Easy VPN server, you can create user groups to which remote clients belong. The remote clients must be configured with the same group name as the user group on the VPN server in order to connect to the server; otherwise, no connection is established. When the remote client connects to the VPN server successfully, the group policies for that particular user group are pushed to all remote clients belonging to the user group.

For more information about user groups, see:

- [Configuring User Group Policies, page 33-13](#)
- [Configuring a User Group Policy for Easy VPN, page 28-14](#)
- [Configuring an SSL VPN Policy \(IOS\), page 33-14](#)

**Note**

You must select the technology (Easy VPN/Remote Access VPN, or SSL VPN) for which you are creating the user group object. If you are editing an existing user group object, the technology is already selected and you cannot change it. Depending on the selected technology, the appropriate settings are available for configuration.

**Navigation Path**

Select **Manage > Policy Objects**, then select **User Groups** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Tip**

You can also access this dialog box from the **Remote Access VPN > IPSec VPN > User Groups** or the **Remote Access VPN > SSL VPN** policies.

**Field Reference**

**Table 34-46** *User Group Dialog Box*

| Element     | Description                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> . |
| Description | An optional description of the object.                                                                                                                                 |

**Settings Pane**

The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right.

You must first configure technology settings, then you can select items from the table of contents on the left and configure the options you require. Your selections on the Technology page control which options are available on these pages and in the table of contents.

The top folders in the table of contents represent the VPN technologies or other settings that you can configure, and are explained next.

## User Group Dialog Box—General Settings

The general settings you configure for your user group include the authentication method, IP address pool information, and connection attributes for PIX 6.3 Firewalls.

**Note**

These settings apply in Easy VPN and remote access IPsec VPN configurations.

**Navigation Path**

Select **General** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preshared Key                 | <p>The preshared key that will be used to authenticate the clients associated to the user group.</p> <p><b>Note</b> You do not have to enter a preshared key if you are using digital certificates for group authentication.</p> <p>In regular IPsec VPNs, preshared keys allow for one or more peers to use individual shared secrets to authenticate encrypted tunnels. A preshared key must be configured on each participating peer. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.</p> <p>In Easy VPN authentication, the same Easy VPN server key is used for the spoke configuration to ensure that the server/client keys match.</p> <p>In remote access IPsec VPN authentication, the same key is used to negotiate a VPN connection between the remote access VPN server and the remote clients.</p> |
| IP Address Pool Subnet/Ranges | <p>The IP address ranges for a local pool that will be used to allocate an internal IP address to a client. Remote clients are assigned IP addresses from this pool. Separate multiple entries with commas. The default is 172.16.0.1-172.16.4.254.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Backup Servers IP Address     | <p>The IP address of the servers to be used as backups for the Easy VPN or remote access IPsec VPN server. The router tries to connect to these servers if the primary connection to the Easy VPN or remote access VPN server fails. Separate multiple entries with commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PIX Only Attributes           | <p>These attributes apply only to PIX 6.3 devices.</p> <ul style="list-style-type: none"> <li>• <b>Idle Time</b>—The timeout period for VPN connections, in seconds. If no communication occurs on the connection during this period, the device terminates the connection. The minimum is 60 seconds, and the maximum time is 35791394 minutes. The default is 30 minutes.</li> <li>• <b>Max Time</b>—The maximum amount of time for VPN connections, in seconds. At the end of the time, the device terminates the connection. The minimum is 60 seconds, and the maximum is 35791394 minutes. There is no default.</li> </ul>                                                                                                                                                                                                                                                   |

## User Group Dialog Box—DNS/WINS Settings

Configure the DNS/WINS settings for your user group to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the user group.

### Note

The DNS/WINS settings you configure for a user group apply in Easy VPN, remote access VPN, and SSL VPN configurations.

### Navigation Path

Select **DNS/WINS** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

### Field Reference

**Table 34-48** *User Group Dialog Box—DNS/WINS Settings*

| Element               | Description                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary DNS Server    | The IP address of the primary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.   |
| Secondary DNS Server  | The IP address of the secondary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. |
| Domain Name           | The domain name of the DNS server you want to configure on the user group.                                                                                                                             |
| Primary WINS Server   | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |
| Secondary WINS Server | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |

## User Group Dialog Box—Split Tunneling

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination.

The split tunneling policy is applied to a specific network. When you configure split tunneling, you can transmit both secured and unsecured traffic on the same interface. You must specify which traffic will be secured and what the destination of that traffic is, so that you have a secure tunnel to the central site, while the clear (unsecured) traffic is transmitted across the public network.

### Tip

For optimum security, we recommend that you not enable split tunneling.

**Note**

Split tunneling can be applied in Easy VPN, remote access VPN, and SSL VPN configurations. For information about configuring split tunneling for SSL VPN, see [User Group Dialog Box—SSL VPN Split Tunneling](#), page 34-86.

**Navigation Path**

Select **Split Tunneling** from the table of contents in the [Add or Edit User Group Dialog Box](#), page 34-73 when configuring Easy VPN/Remote Access IPsec VPN.

**Field Reference**

**Table 34-49** *User Group Dialog Box—Split Tunneling*

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split Tunneling | <p>The networks for which you want to tunnel traffic. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. You can identify the networks using one of these options:</p> <ul style="list-style-type: none"> <li>• <b>Protected Networks</b>—Specify the networks by network addresses. Enter the addresses or network/host objects, or click <b>Select</b> to select the objects from a list or to create new objects. For information on specifying addresses, see <a href="#">Specifying IP Addresses During Policy Definition</a>, page 6-87.</li> <li>• <b>ACL</b>—Specify the networks using an extended access control list policy object. Enter the name of the object or click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> |
| Split DNS       | <p>A list of domain names that must be tunneled or resolved to the private network. All other names will be resolved through the public DNS server.</p> <p>You can enter multiple domain names separated by commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## User Group Dialog Box—IOS Client Settings

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Configure IOS client settings to define Cisco IOS specific options for your user group, including firewall settings for VPN clients.

**Note**

These settings apply in Easy VPN and remote access IPsec VPN configurations.

**Navigation Path**

Select **Client Settings (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box](#), page 34-73.

## Field Reference

Table 34-50 User Group Dialog Box—Client Settings (IOS)

| Element                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Firewall Are-You-There<br>(Not available on 7600 series or ASR routers.) | <p>This feature may be used if a VPN client is running the Black Ice or Zone Alarm personal firewall.</p> <p>When selected, it ensures that the personal firewall is running at connection time and throughout the connection. The Firewall-Are-U-There attribute is sent by the Black Ice and Zone Alarm personal firewalls if the server prompts them to do so. If the personal firewall stops running, the connection is terminated. If this feature is enabled and there is no personal firewall running on the server, the connection is never established.</p>                                                                                                                                                                                                                                  |
| Mode                                                                            | <p>A Central Policy Push (CPP) firewall policy on a server allows or denies a tunnel on the basis of whether the remote device has a required firewall for a local AAA server.</p> <p>The Mode option specifies whether the Central Policy Push (CPP) policy is optional or mandatory, as follows:</p> <ul style="list-style-type: none"> <li>• <b>Optional</b>—If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy.</li> <li>• <b>Required</b>—If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms this policy. Otherwise, the tunnel is terminated.</li> </ul> |
| Firewall Type                                                                   | <p>The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco and Zone Labs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Policy Type                                                                     | <p>Specifies the CPP firewall policy type:</p> <ul style="list-style-type: none"> <li>• <b>Check Presence</b>—Instructs the server to check for the presence of the specified firewall type.</li> <li>• <b>Central Policy Push</b>—The actual policy, such as the input and output access lists, that must be applied by the specified client firewall type. Specify the following:             <ul style="list-style-type: none"> <li>– The access control list to be used. Enter the name of the extended ACL object or click <b>Select</b> to select it from a list or to create a new object.</li> <li>– The direction of the access control list—Inbound or Outbound.</li> </ul> </li> </ul>                                                                                                     |
| Include Local LAN                                                               | <p>Whether to allow a non split-tunneling connection to access the local LAN at the same time as the client.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Perfect Forward Secrecy                                                         | <p>Whether to enable Perfect Forward Secrecy (PFS). If PFS is enabled, the server is configured to notify the client of the central-site policy about whether PFS is required for any IPsec SA. The Diffie-Hellman (D-H) group that is proposed for PFS is the same that was negotiated in Phase 1 of the IKE negotiation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## User Group Dialog Box—IOS Xauth Options

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

IOS Xauth options configure IKE Extended Authentication (Xauth) user authentication and connection parameters for the user group, including the banner text.

**Note**

These settings apply in Easy VPN and remote access VPN configurations.

**Navigation Path**

Select **Xauth Options (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

**Field Reference**

**Table 34-51** *User Group Dialog Box—IOS Xauth Options*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Banner                  | The banner text that is displayed to Easy VPN remote clients during Xauth and web-based activation the first time the Easy VPN tunnel is brought up. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Maximum Logins Per User | The maximum number of connections a user can establish simultaneously. The maximum is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Maximum Connections     | The maximum number of client connections to the Easy VPN Server from this group. The maximum is 5000 per group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Group-Lock       | Whether to enable group lock, which requires that the user enter the extended Xauth username in one of the following formats: <ul style="list-style-type: none"> <li>• username/groupname</li> <li>• username\groupname</li> <li>• username@groupname</li> <li>• username%groupname</li> </ul> The group that is specified after the delimiter is then compared to the group identifier that is sent during IKE aggressive mode. The groups must match or the connection is rejected. <p><b>Note</b> Do not select this option if you are using RSA signature authentication mechanisms such as certificates.</p> |
| Enable Save Password    | Whether to allow users to save their Xauth password locally on the client. On subsequent authentications, users can activate the password by using the check box on the software client or by adding the username and password to the Cisco IOS hardware client profile. After users activate the password, their username and password are sent to the server automatically during Xauth. <p>This option is useful only if users have static passwords, that is, they are not one-time passwords such as those that are generated by a token.</p>                                                                |

## User Group Dialog Box—IOS Client VPN Software Update

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Client VPN Software Update (IOS) settings configure, for an IOS VPN client, the platform type, VPN Client revisions, and image URL for each client VPN software package installed, for your user group.

The Client Update feature is supported on IOS routers version 12.4(2)T and later, and Catalyst 6500/7600 devices version 12.2(33)SRA and later.

- To add a client, click the **Add Row** button to open the [Add/Edit Client Update Dialog Box, page 34-81](#).
- To edit a client, select it and click the **Edit Row** button.
- To delete a client, select it and click the **Delete Row** button.

### Note

These settings apply in Easy VPN and remote access VPN configurations.

### Navigation Path

Select **Client VPN Software Update (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

## Add/Edit Client Update Dialog Box

Use the Add or Edit Client Update dialog box to configure the platform type, image URL, and VPN Client revisions for a client VPN software package.

### Navigation Path

Open the [User Group Dialog Box—IOS Client VPN Software Update, page 34-81](#), then click **Add Row**, or select an item in the table and click **Edit Row**.

| Element                  | Description                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Type              | The platform on which the IOS VPN client operates. <ul style="list-style-type: none"> <li>• All Windows (Default)—This option includes any Windows platform for which a VPN client is available.</li> <li>• Macintosh OS X</li> </ul> |
| IOS Image URL            | Enter the URL from where the client can be downloaded. The URL must start with http:// or https://.                                                                                                                                   |
| IOS VPN Client Revisions | Enter the revision level of the VPN client. You can specify more than one client revision separated by commas.                                                                                                                        |

## User Group Dialog Box—Advanced PIX Options

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

The Advanced PIX Options are specifically for PIX 6.3 Firewalls in your user group.

**Note**

These settings apply in Easy VPN and remote access VPN configurations.

**Navigation Path**

Select **Advanced Options (PIX)** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

**Field Reference**

**Table 34-53** *User Group Dialog Box—Advanced PIX Options*

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Idle Timeout (sec)           | The length of time that a VPN tunnel can remain open without user activity, in seconds. Values range from 60-86400 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| User Authentication Server        | The AAA server to which remote devices send user authentication requests. Enter the name of the server group or click <b>Select</b> to select it from a list or to create a new group. See <a href="#">Understanding AAA Server and Server Group Objects, page 6-27</a> .                                                                                                                                                                                                                                                                                   |
| Enable Device Pass-Through        | Whether to use Media Access Control (MAC) addresses to bypass authentication for devices, such as Cisco IP phones, that do not support AAA authentication.<br><br>When MAC-based AAA exemption is enabled, the device bypasses the AAA server for traffic that matches both the MAC address of the device and the IP address that was dynamically assigned by a DHCP server. Authorization services are disabled automatically when you bypass authentication. Accounting records continue to be generated (if enabled), but the username is not displayed. |
| Enable Secure Unit Authentication | Whether to provide increased security when allowing access to the device from a remote client.<br><br>With Secure Unit Authentication (SUA), you can use one-time passwords, two-factor authentication, and similar authentication schemes to authenticate the remote device during Extended Authentication (Xauth).<br><br>SUA is specified in the VPN policy on the device and is downloaded to the remote client. This enables SUA and determines the connection behavior of the remote client.                                                          |
| Enable User Authentication        | Whether to enable Individual User Authentication (IUA), which supports individually authenticating clients on the inside network of the remote access VPN, based on the IP address of each inside client. IUA supports both static and OTP authentication mechanisms.                                                                                                                                                                                                                                                                                       |

## User Group Dialog Box—Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in an SSL VPN.

In clientless access mode, once a user is authenticated and a session is established, an SSL VPN portal page and toolbar is displayed on the user's web browser. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers.

### Navigation Path

Select **Clientless** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

| Portal Page Websites                      | The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Allow Users to Enter Websites             | Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Common Internet File System (CIFS) | In Clientless mode, files and directories created on Microsoft Windows servers can be accessed by the remote client through the web browser. When you enable the Common Internet File System (CIFS), a list of file server and directory links are displayed on the portal page after login.<br><br>The CIFS protocol lets you customize permissions on the SSL VPN gateway to allow shared files to be accessed or modified by the remote client, as follows: <ul style="list-style-type: none"> <li>• <b>Enable File Browsing</b>—Whether to allow the remote user to browse for file shares on the CIFS file servers.</li> <li>• <b>Enable File Entry</b>—Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.</li> </ul> |
| WINS Server List                          | The name of the WINS server list policy object that identifies the WINS/NetBIOS servers to use for resolving file server names. You should supply an object if you enable CIFS. Enter the name of the object or click <b>Select</b> to select if from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Citrix                             | Whether to enable remote clients to run Citrix-enabled applications, such as Microsoft Word or Excel, through the SSL VPN as if the application were locally installed, without the need for client software. The Citrix software must be installed on one or more servers on a network that the router can reach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## User Group Dialog Box—Thin Client Settings

Use the Thin Client settings to enable the thin client, or port forwarding, mode of access to the corporate network in an SSL VPN. Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

In thin client access mode, the remote user downloads a Java applet that acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The proxy provides the port forwarding services.

|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Thin Client                              | Whether to allow thin client access to the SSL VPN.                                                                                                                                                                                                                                                                     |
| Port Forward List                               | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. |
| Download Port Forwarding Applet on Client Login | Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.                                                                                               |

## User Group Dialog Box—SSL VPN Full Tunnel Settings

Use the SSL VPN Full Tunnel settings to enable the full tunnel client access mode in your SSL VPN. When you enable full tunnel access, you should also define DNS/WINS server settings, browser proxy settings, and split tunneling for the user group.

In full tunnel client access mode, the tunnel connection is determined by the group policy configuration. The full tunnel client software, SSL VPN Client (SVC), must be downloaded to the remote client so that a tunnel connection can be established when the remote user logs in to the SSL VPN gateway.

### Tip

For full tunnel client access to work, you must install the client software on the gateway. The user downloads the client when connecting to the gateway.

**Navigation Path**

|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Renegotiation Method | <p>The method by which the tunnel key is refreshed for the remote user group client:</p> <ul style="list-style-type: none"> <li>• <b>Disabled</b>—Disables the tunnel key refresh.</li> <li>• <b>Create New Tunnel</b>—Initiates a new tunnel connection. Enter the time interval (in seconds) between the tunnel refresh cycles in the <b>Interval</b> field.</li> </ul> |

## User Group Dialog Box—SSL VPN Split Tunneling

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet for SSL VPNs.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

### Tip

For optimum security, we recommend that you not enable split tunneling.

### Navigation Path

Select **Full Tunnel** > **Split Tunneling** from the table of contents in the [Add or Edit User Group Dialog Box](#), page 34-73.

### Field Reference

**Table 34-57** User Group Dialog Box—Split Tunneling Settings

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Option | <p>Whether to allow split tunneling and if so, which traffic should be secured or transmitted unencrypted across the public network:</p> <ul style="list-style-type: none"> <li>• <b>Disabled</b>—(Default) No traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks.</li> <li>• <b>Tunnel Specified Traffic</b>—Tunnel all traffic from or to the addresses listed in the <b>Destinations</b> field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider.</li> <li>• <b>Exclude Specified Traffic</b>—Traffic goes in the clear from and to the addresses listed in the <b>Destinations</b> field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.</li> </ul> |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destinations       | <p>The IP addresses for hosts or networks that identify the networks that require traffic to travel across the tunnel and those that do not require tunneling. Whether traffic to these addresses is encrypted and tunneled to the gateway, or sent in the clear, is determined by your selection for <b>Tunnel Option</b>.</p> <p>Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple addresses with commas.</p> |
| Exclude Local LANs | <p>Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the <b>Exclude Specified Traffic</b> tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN.</p> <p>When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client.</p>                                                                                                      |
| Split DNS Names    | <p>A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server.</p> <p>Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.</p>                                                                                                                                                                                                                                                                                                                             |

## User Group Dialog Box—Browser Proxy Settings

Use the Browser Proxy settings to configure proxy bypass for full tunnel access in an SSL VPN.

A security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers, which act as intermediaries between users and the Internet. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

### Tip

The browser proxy settings work only for Microsoft Internet Explorer; they do not work for other types of browsers.

### Navigation Path

Select **Full Tunnel > Browser Proxy Settings** from the table of contents in the [Add or Edit User Group Dialog Box, page 34-73](#).

| Element      | Description                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Idle Timeout | The idle timeout period for the SSL VPN session. The session is disconnected if the client is idle longer than the specified idle timeout. Values range from 0-3600 seconds. |

**Table 34-59** *User Group Dialog Box—Connection Settings (continued)*

| Element         | Description                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session Timeout | The timeout period for the SSL VPN session. The session is disconnected when this timeout is reached even if the user is still active. Values range from 1-1209600 seconds.                                                                                              |
| Banner Text     | The banner, for example, a welcome message, that is displayed to remote users when they connect to the SSL VPN.<br><br>You cannot use double quotes or new lines (carriage returns) in the banner text. However, you can include HTML tags to create the desired layout. |

## Add or Edit WINS Server List Dialog Box

Use the WINS Server Lists dialog box to create, copy, and edit WINS server list objects. A WINS Server List object defines a list of Windows Internet Naming Server (WINS) servers, which are used to translate Windows file server names to IP addresses.

### Navigation Path

Select **Manage > Policy Objects**, then select **WINS Server Lists** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit WINS Server Dialog Box

Use the Add/Edit WINS Server dialog box to create a new WINS server entry or edit an existing entry in the table in the WINS Server Lists dialog box.

### Navigation Path

From the [Add or Edit WINS Server List Dialog Box](#), click the **Add** button beneath the WINS Server List table, or select a server in the table and click the **Edit** button.

### Related Topics

### Field Reference

**Table 34-61** Add/Edit WINS Server Dialog Box

| Element               | Description                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server                | The IP address of the WINS server used to translate Windows file server names to IP addresses. You can also enter the name of a network/host policy object that identifies the server. Click <b>Select</b> to choose a network/hosts object or to create a new object.                       |
| Set as Master Browser | Whether to server is a primary browser. The primary browser maintains the list of computers and shared resources.                                                                                                                                                                            |
| Timeout               | The period of time the security appliance waits for a response to a WINS query before sending the query again to the same server (if it is the only one), or to the next server (if there is more than one).<br><br>The default timeout is 2 seconds. The range is between 1 and 30 seconds. |
| Retries               | The number of times to retry sending WINS queries to the configured servers. The security appliance recycles through the list of servers this number of times before sending an error message.<br><br>The default is 2. The range is between 0 and 10.                                       |

## Using Map View

---

The following topics describe how to use the Map view:

- [Understanding Maps and Map View, page 35-1](#)
- [Working With Maps, page 35-8](#)
- [Displaying Your Network on the Map, page 35-14](#)
- [Managing VPNs in Map View, page 35-20](#)
- [Managing Device Policies in Map View, page 35-22](#)

## Understanding Maps and Map View

The Security Manager Map view provides a graphical view of your VPN and Layer 3 network topology.

Using the map view, you can investigate details of your VPN configuration graphically. Topological display of tunnels enables you to easily derive the relationship among multiple VPN configurations (for example, a hierarchical VPN). You can group devices to achieve a more complete picture of your VPN configuration. This is useful in situations where a hub failover pair is a peer with hundreds of spokes.

You can represent your Layer 3 network topology graphically, populating it with managed devices (called device nodes). You can make the picture of the topology more complete by adding unmanaged objects (called map objects) such as devices, clouds, and networks. For large networks, you can choose to simplify the topology graph by incorporating only a portion of the overall topology. You can save the topology maps for future use.

You can save multiple topology maps to reflect your network's geographical or functional organization. You can link a saved map to a node on a parent map, so that from the parent map you can drill down to the linked map with more detailed information (for more information, see [Using Linked Maps, page 35-13](#)). Saved maps are shared among all users who have the necessary access privileges.

You can launch other Security Manager features from the map view. In some cases, you can simplify the use of features by selecting nodes from the map before you start another feature. For example, you can select multiple nodes, then create a VPN that includes those nodes as members.

**Tip**

---

The network data that is displayed on maps is typically updated as this data changes. However, to be certain that a map displays current network data, you can refresh it manually by selecting **Map > Refresh Map**.

## Understanding the Map View Main Page

Map view enables you to create customized, visual topology maps of your network, within which you can view connections between your devices and easily configure VPNs and access control settings. The following figure identifies the functional areas of the Map view.

To open the Map view main page, click the **Map View** button in the toolbar.

You can undock the map window, which enables you to use other product features while keeping the map open. To undock the map, select **Map > Undock Map View**. To dock the map window, select **Map > Dock Map View**.

## Map Toolbar

The following table describes the buttons on the map toolbar.

**Table 35-1** *Map Toolbar*

| Toolbar Button                                                                      | Description                                                                                                                                    |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Selects objects on the map. Click the button, then click items on the map.                                                                     |
|    | Pans the map. Click the button, click and hold on the map, then drag the cursor.                                                               |
|    | Zooms in on the map.                                                                                                                           |
|    | Zooms out from the map.                                                                                                                        |
|    | Zooms the map to fill a rectangle that you draw.                                                                                               |
|    | Zooms the map to include the entire map.                                                                                                       |
|    | Zooms the map to actual size.                                                                                                                  |
|   | Creates a new Security Manager-managed node. After you create the new device in the inventory, it is added to the active map as a device node. |
|  | Adds a new map object to the map.                                                                                                              |
|  | Adds a new link to the map.                                                                                                                    |
|  | Creates a new VPN connection between nodes on the map.                                                                                         |
|  | Select devices to show on the map as device nodes.                                                                                             |
|  | Select VPNs to show on the map.                                                                                                                |

## Using the Navigation Window

The navigation window displays a smaller version of the entire active map. The shaded rectangle defines the area of the map that is currently displayed.

Use the navigation window to select the portion of the map to view and to change the map zoom level.

- To toggle the display of the navigation window, select **Map > Show/Hide Navigation Window**.
- To pan the navigation control to select which portion of the map to display, click within the shaded rectangle and drag it to a new location.
- To change the zoom level, click one of the resizing handles in the corners of the shaded rectangle, then drag it to increase or decrease the area of the map to display. The map zooms to display the area covered by the map indicator.

The title bar in the navigation window displays the name of the map. If the map has unsaved changes, an asterisk (\*) appears next to the map name.

For information on other ways to pan and zoom maps, see [Panning, Centering, and Zooming Maps](#), page 35-11.

## Maps Context Menus

The following topics describe the menus that contain maps commands. To open the context menus, right-click map elements.

- [Managed Device Node Context Menu](#), page 35-5
- [Multiple Selected Nodes Context Menu](#), page 35-6
- [VPN Connection Context Menu](#), page 35-6
- [Layer 3 Link Context Menu](#), page 35-7
- [Map Object Context Menu](#), page 35-7
- [Map Background Context Menu](#), page 35-7

## Managed Device Node Context Menu

The Managed Device Node context menu opens when you right-click a map node that represents a managed device. The commands that you see depend on the type of device you select. The following table lists all commands that you might see.

**Table 35-2** *Managed Device Node Context Menu*

| Menu Command                  | Description                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit Firewall Policies        | Edits firewall policies on the device.<br>Select a firewall policy type from the submenu to edit it.                                                                                                          |
| Edit Firewall Settings        | Edits firewall settings on the device.<br>Select a setting from the submenu to edit it.                                                                                                                       |
| Edit VPN Peers                | Edits peers in VPNs in which the device participates.                                                                                                                                                         |
| Edit VPN Policies             | Edits VPN policies on the device.                                                                                                                                                                             |
| Device Properties             | Displays device properties.                                                                                                                                                                                   |
| Clone Device                  | Creates a copy of the device. See <a href="#">Cloning a Device</a> , page 3-57.                                                                                                                               |
| Copy Policies Between Devices | Copies policies between the device and other devices. See <a href="#">Copying Policies Between Devices</a> , page 5-33.                                                                                       |
| Share Device Policies         | Shares device local policies.                                                                                                                                                                                 |
| Catalyst Summary Info         | Allows you to view high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered. See <a href="#">Viewing Catalyst Summary Information</a> , page 68-2. |
| Show in Device View           | Opens the Device View for the selected device.                                                                                                                                                                |
| Device Manager                | Launches the Device Manager. See <a href="#">Starting Device Managers</a> , page 72-14.                                                                                                                       |

**Table 35-2** *Managed Device Node Context Menu (continued)*

| Menu Command                | Description                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------------------|
| Inventory Status            | Displays the Inventory Status window for the device. See <a href="#">Inventory Status Window</a> , page 72-13. |
| Show VPN Peers              | Shows peers in VPNs in which the device participates.                                                          |
| Preview Configuration       | Previews the device configuration with all committed changes included.                                         |
| Show Containment            | Shows the security contexts and service modules in devices that have them.                                     |
| Node Properties             | Displays node properties.                                                                                      |
| Set Linked Map              | Creates a link from this node to another map.                                                                  |
| Open Linked Map             | Opens the map that is linked to the node.                                                                      |
| Discover Policies on Device | Discovers policies on the device.                                                                              |
| Move To Center              | Pans the map to display the node in the center.                                                                |
| Delete Device               | Deletes the device from the device inventory.                                                                  |
| Remove from Map             | Removes the node from the map.                                                                                 |

## Multiple Selected Nodes Context Menu

The Multiple Selected Device Node context menu opens when you select more than one map node, then right-click on a selected node.

If all of the selected nodes are not VPN-capable, the commands to configure VPNs do not appear.

**Table 35-3** *Multiple Selected Nodes Context Menu*

| Menu Command              | Description                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Create Point to Point VPN | Creates a point to point VPN between two selected devices.<br>All selected nodes must be managed and VPN-capable.                                                       |
| Create Hub and Spoke VPN  | Creates a hub and spoke VPN that includes the selected nodes.<br>The node that you right-click becomes the VPN hub. All selected nodes must be managed and VPN-capable. |
| Create Meshed VPN         | Creates a full mesh VPN that includes the selected nodes.<br>All selected nodes must be managed and VPN-capable.                                                        |
| Remove Selected Nodes     | Removes all selected device nodes. Appears only if you right-click on a selected device node.                                                                           |
| Delete Map Objects        | Deletes all selected map objects. Appears only if you right-click on a selected map object.                                                                             |

## VPN Connection Context Menu

The VPN Connection context menu opens when you right-click on a VPN connection on the map. For more information, see [Editing VPN Policies or Peers From the Map](#), page 35-22.

**Table 35-4 VPN Connection Context Menu**

| Menu Command      | Description                 |
|-------------------|-----------------------------|
| Edit VPN Peers    | Edits the peers in the VPN. |
| Edit VPN Policies | Edits the VPN policies.     |

## Layer 3 Link Context Menu

The Layer 3 Link context menu opens when you right-click on a layer 3 link on the map.

**Table 35-5 Layer 3 Link Context Menu**

| Menu Command    | Description                    |
|-----------------|--------------------------------|
| Link Properties | Displays the link properties.  |
| Delete Link     | Deletes the link from the map. |

## Map Object Context Menu

The Map Object context menu opens when you right-click a map object that does not represent a managed device.

**Table 35-6 Map Object Context Menu**

| Menu Command      | Description                                     |
|-------------------|-------------------------------------------------|
| Node Properties   | Displays the node properties.                   |
| Move To Center    | Pans the map to display the node in the center. |
| Set Linked Map    | Links the node to a map.                        |
| Open Linked Map   | Opens the map to which the node is linked.      |
| Delete Map Object | Deletes the map object.                         |

## Map Background Context Menu

The Map Background context menu opens when you right-click in the background area of a map, that is, not on any object or link.

**Table 35-7 Map Background Context Menu**

| Menu Command        | Description                                                           |
|---------------------|-----------------------------------------------------------------------|
| Show Devices on Map | Selects the managed devices to show on the map.                       |
| Show VPNs on Map    | Selects the VPNs to display on the map.                               |
| Add Map Object      | Adds a map object to the map.                                         |
| Add Link            | Adds a Layer 3 link to the map.                                       |
| New Device          | Creates a new managed device and adds it to the map as a device node. |
| New VPN             | Creates a new VPN and adds it to the map.                             |
| Find Map Node       | Finds nodes on the map.                                               |

**Table 35-7** Map Background Context Menu (continued)

| Menu Command                | Description                                              |
|-----------------------------|----------------------------------------------------------|
| Open Map                    | Opens a saved map.                                       |
| Save Map                    | Saves the open map.                                      |
| Show/Hide Navigation Window | Toggles the display of the navigation window on the map. |
| Map Properties              | Displays the properties of the map.                      |
| Hierarchical layout         | Arranges the network nodes in a hierarchical layout.     |
| Radial layout               | Arranges the network nodes in a radial layout.           |
| Circular layout             | Arranges the network nodes in a circular layout.         |
| Dock/Undock Map             | Undocks the Map view.                                    |

## Access Permissions for Maps

Access to maps is controlled based on two systems of user privileges:

- Device privileges—You must have at least read privileges to all the devices in a map to open the map.
- Map privileges—Access to maps is based on your Security Manager user role. There are two levels of map access:
  - Read-only—You can open maps, but you cannot modify them. If you have this map privilege level, the features for modifying maps are not available.
  - Read-write—You can modify maps. All map modification features are available.

## Working With Maps

A map is a representation of a portion of your network. You can create and save multiple maps to address your network management needs. To work with any map, you must be in Map view (select **View > Map View**).

After you create and save a map, the map is available to all users on the system that have at least read privileges to all the devices on the map. Users that do not have read privileges to a device on a map do not see the map in the list of existing maps when they try to open a map. For more information, see [Access Permissions for Maps, page 35-8](#).

You can only have one map open at a time. If a map is open and you create a new map or open an existing map, you are prompted to save or discard any unsaved changes that you made to the current map.

Multiple users can open and modify a map at the same time. When a user saves changes to a map, any other users who are using the map are notified and have the option to do one of the following:

- Update their map to the version saved by the other user, losing any changes they have made.
- Save their version of the map as a new map, preserving any changes they made.

This section contains the following topics:

- [Using Linked Maps, page 35-13](#)
- [Setting the Map Background Properties, page 35-13](#)

## Creating New or Default Maps

You have two options for creating a new map:

- Create an empty map—To create a new empty map, select **Map > New Map**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it. For information about adding elements to a map, see [Displaying Your Network on the Map, page 35-14](#).
- Create a new map containing all managed devices and VPNs in the inventory—This is called the default map. Generating the default map is a good way to create a map. After generating the map, save it with a unique name to make it a standard map and modify it as desired.

You can generate the default map whenever you want to, and it contains the inventory as it exists at the time you generate it. You cannot specifically save the default map *as* the default map; it is regenerated every time you select it.

The following procedure explains how to create a new map using the default map.

### Tips

- If you refresh the map (select **Map > Refresh Map**), items that you added to the inventory after generating the default map are not added to the map. You must reopen the default map to see new devices.

---

**Step 1** In Map view, select **Map > Open Map**.

**Step 2** Select **Default Map** from the Available Maps list, then click **OK**.

**Note** If you do not have sufficient access rights to all devices in the inventory, the default map that opens shows only the subset of devices for which you do have access rights. For more information, see [Access Permissions for Maps, page 35-8](#).

---

**Step 3** To save the default map as a standard map, select **Map > Save Map** or **Map > Save Map As**, enter a name for the map and click **OK**.

---

## Opening Maps

To open an existing map, select **Map > Open Map**, select the desired map from the list of available maps, and click **OK**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it.

The list of available maps includes a special map called the **Default Map**. This map contains all of the managed devices and VPNs in the inventory. You are essentially creating a new map each time you open it. For more information about the default map, see [Creating New or Default Maps, page 35-9](#).

**Tip**

You can open any map that you have created or the default map. You can also open any map that another user has created provided you have the requisite permission settings with regard to the devices shown on that map (see [Access Permissions for Maps, page 35-8](#)).

**Related Topics**

- [Working With Maps, page 35-8](#)

## Saving Maps

To save the active map, select **Map > Save Map**. Any changes that you made since you last saved it are saved. If you did not save the map previously, the Save Map As dialog box opens, enabling you to assign a name to the map and save it.

To save a map under a new name, select **Map > Save Map As**. The map name can be as long as 256 characters, but cannot be the reserved names “Default Map” or “New Map.”

If you close a map that contains unsaved changes, you are prompted to save the changes.

If your Security Manager session closes automatically because of inactivity when a map is open with unsaved changes, the current version of the map is saved if it has a name. If you have not yet saved the map, the map is discarded. For example, if you generate the default map, or create a new map, and do not save it before your session times out, you cannot retrieve that map.

## Deleting Maps

If you no longer need a map, you can delete it (presuming that you have edit permission). Deleting a map does not delete any devices or VPNs shown on the map, nor does it delete or modify their configurations; only the map is deleted.

When you delete a map, it is permanently deleted from the server. Other users cannot use the deleted map.

To delete a map, select **Map > Delete Map**, select the map you want to delete from the available maps list and click **OK**. You are asked to confirm the deletion.

You must already be in Map view (select **View > Map View**) to delete a map.

## Exporting Maps

When viewing a map, you can export the map to a scalable vector graphics (SVG) image file for use outside of Security Manager.

### Related Topics

- [Working With Maps, page 35-8](#)
- [Understanding Map Elements, page 35-14](#)

- 
- Step 1** Select **Map > Export Map**. The Export Topology Map to SVG dialog box opens.
- Step 2** Browse to the location in which to save the file.
- Step 3** Enter a filename in the File name field. The correct file extension will be added for you.
- Step 4** Click **Save**.
- 

## Arranging Map Elements

To move a map element, click and hold, then drag it to the desired position. Attached links move automatically, but the other end of the link remains where it is.

You can also automatically arrange the network nodes on the map in several predefined layouts. Only nodes that are already displayed on the map are arranged. Any nodes that you later add do not follow the layout.

To select a map layout, right-click the map background, then select one of the following layouts from the map context menu:

- Hierarchical Layout—Arranges the nodes in a hierarchical layout.
- Radial Layout—Arranges the nodes in a radial layout.
- Circular Layout—Arranges the nodes in a circular layout.

## Panning, Centering, and Zooming Maps

There are many options for navigating maps. You can pan the map (move around in the map without changing the zoom level), pan a map so that a particular map element is centered in your view, or zoom in or out to see a different map extent.

### To pan a map without changing the zoom level:

- Click the Pan Map toolbar button, then click and hold anywhere on the map and drag the cursor.
- Use the vertical and horizontal scroll bars that are available if the entire map does not fit in the visible page.
- Click and drag the shaded rectangle in the navigation window.
- To center the display of the map on a particular map element, right-click the element, then select **Move to Center**.

**To zoom in or out of a map:**

- To change the zoom level of the map in predefined increments:
  - To zoom in on the map, select **Map > Zoom In**, or click the **Zoom In** toolbar button.
  - To zoom out from the map, select **Map > Zoom Out**, or click the **Zoom Out** toolbar button.
- To zoom into a specific area of the map, click **Zoom Rectangle** in the map toolbar, then click the map and drag a rectangle around the area. When you release the mouse button, the map zooms to display the area defined by the rectangle.
- Alternatively, to zoom in to or out of a specific area of the map, click and drag the corner of the shaded rectangle in the navigation window.
- To display the entire map, select **Map > Fit to Window**.
- To display the map at actual size, select **Map > Display Actual Size**.

## Selecting Map Elements

The following table describes how to select map elements. If the selected element contains other elements (for example, a Catalyst switch that contains an FWSM), the containment relationship is shown. For more information, see [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances, page 35-16](#).

**Table 35-8**      *Selecting Network Elements*

| To select...                        | Do the following                                               |
|-------------------------------------|----------------------------------------------------------------|
| A single map element                | Click the element.                                             |
| Multiple noncontiguous map elements | Ctrl+click each element.                                       |
| Multiple contiguous map elements    | Click the map and drag a rectangle that includes the elements. |

## Searching for Map Nodes

To search for a map node to help you find it in the active map, select **Map > Find Map Node**. This command opens the Find Node dialog box.

The Find Node dialog box initially lists all objects on the map. Use the fields above the list to filter it (the list shows only objects that satisfy all filter criteria). When you find the desired node, select it in the list and click **OK** to have the node centered and selected in the map.

To filter the list, you can:

- Select a node type from the **Type** list to show only objects of that type.
- Enter the name, or at least the initial characters of the name, in the **Name** field. The list is filtered as you type. Your search term must be from the start of the object name. You cannot use wildcard characters.
- Enter all or part of the IP address or subnet mask. The list is filtered as you enter information.

## Using Linked Maps

A linked map is a map that you associate with a map element on another map. Because it is not practical to include all the nodes on a large network in a single map, you can use linked maps to create a hierarchical topology of your network.

You cannot link a node to the another node in the same map.

### Before You Begin

You must create the map to link to before you can link to it.

- 
- Step 1** Right-click the map element to which to link a map, then select **Set Linked Map**. The Set Linked Map dialog box opens.
- Step 2** Select a map to associate with the selected map element, then click **OK**.
- Step 3** To open the linked map, right-click the linked node, then select **Open Linked Map**. The current map closes and the linked map opens.
- 

## Setting the Map Background Properties

You can change the background of a map by changing the color or by configuring an image. A suggested use for a background image is to use an image that represents a geographic area. Then you can position map elements according to their geographic locations.

Some background images are included with Security Manager. You can also transfer images to the server to use as background images. You can use background images of the following file formats: JPEG, GIF, PNG, IVL, and SVG. If you want to use a new image, copy the image file to the Security Manager server file system by connecting directly to the server. For security reasons, Security Manager does not provide a method of transferring files to the server.

To configure the map background, in Map view, select **Map > Map Properties** to open the Map Settings dialog box.

- To configure a background image, select it in the file list. (Select **none** to remove the map's background image.)

If the image is not listed, click **Add** and browse to the file you placed on the server using the Import Background Image dialog box. Click **OK** to have Security Manager add it to the list of available background images.

If you no longer need a listed image, select it and click **Delete**.

### Tip

You can control the position and scale of the image using the X and Y coordinates and scale settings. The X,Y source point is the upper left corner of the image. You can use positive or negative numbers. You must experiment to get the results you desire. The scale setting is in percentage.

- To change the background color, click **Select** next to the background color field and choose the desired color.

# Displaying Your Network on the Map

You use the map view to represent your network topology by creating maps. A map is a visual representation of your network, or a portion of it if it is too large to fit on a single map. Maps consist of map elements that represent devices, links, and other objects in your network. For more information about map, see [Working With Maps, page 35-8](#).

The following topics describe how to create maps:

- [Understanding Map Elements, page 35-14](#)
- [Displaying Managed Devices on the Map, page 35-16](#)
- [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances, page 35-16](#)
- [Using Map Objects To Represent Network Topology, page 35-17](#)
- [Creating and Managing Layer 3 Links on the Map, page 35-19](#)

## Understanding Map Elements

All objects that can appear on a map are map elements. You display map elements on a map to create a representation of a portion of your network. For more information about maps, see [Working With Maps, page 35-8](#). To open a map, see [Opening Maps, page 35-10](#).

The following tables describe the elements that can appear on a map:

- [Table 35-9 on page 35-14](#) describes the device nodes that can appear on a map. These elements are managed by Security Manager.
- [Table 35-10 on page 35-15](#) describes the map objects that can appear on a map. These elements are not managed by Security Manager.
- [Table 35-11 on page 35-15](#) describes the map element indicators that can appear with a device node.

**Table 35-9** Device Node Types

| Node Type                                    | Icon                                                                                | Description                                                                                                                            |
|----------------------------------------------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Firewall                                     |  | When you select a device, its security contexts are highlighted.                                                                       |
| Firewall security context                    |  | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| Adaptive Security Appliance                  |  | When you select a device, its security contexts are highlighted.                                                                       |
| Adaptive Security Appliance security context |  | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| Router                                       |  | Router or VPN concentrator.                                                                                                            |

**Table 35-9** Device Node Types (continued)

| Node Type                             | Icon                                                                              | Description                                                                                                                            |
|---------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Catalyst 6500/7600 or Catalyst switch |  | When you select a Catalyst device node, any Firewall Service Modules contained in it are highlighted.                                  |
| Firewall Services Module (FWSM)       |  | When you select a Firewall Services Module, the security contexts it contains are highlighted on the map.                              |
| FWSM security context                 |  | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| IPS Sensor or Security Service Module |  | An IPS sensor.                                                                                                                         |
| VPN connection                        |  | Any type of VPN connection.<br>For GET VPNs, a dashed line indicates the connection between group members and key servers.             |

**Table 35-10** Map Object Types

| Node Type          | Icon                                                                                | Description                                                                             |
|--------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Unmanaged firewall |  | Unmanaged firewall device.                                                              |
| Unmanaged router   |  | Unmanaged router.                                                                       |
| Network            |  | Network with a specified address space.                                                 |
| Host               |  | Network host.<br>Examples: CSA, Syslog Server, CA Server, AAA Host                      |
| Cloud              |  | An unspecified group of map objects that provides connectivity between specified nodes. |
| Layer 3 link       | —                                                                                   | Layer 3 network connection                                                              |

**Table 35-11** Map Element Indicators

| Indicator  | Icon                                                                                | Description                    |
|------------|-------------------------------------------------------------------------------------|--------------------------------|
| Linked map |  | Node is linked to another map. |

## Displaying Managed Devices on the Map

A device node represents a device that is managed by Security Manager. You add a device node to a map by selecting the device from the Security Manager inventory.

When you add a device node to a map, its layer 3 connectivity to other nodes on the map is created automatically. For more information, see [Creating and Managing Layer 3 Links on the Map, page 35-19](#).

You can add, remove, or show managed nodes by the following means:

- **To add devices that are already in the Security Manager inventory**—Select **Map > Show Devices on Map** to open a device selector. Select the desired devices from the list of available devices and click **>>** to move them to the selected devices list. You can select device groups to move all devices in the group. Click **OK** when the list of selected devices has the desired nodes. Only those devices in the selected list are shown on the map.

You can remove devices by selecting them in the selected list and clicking **<<**.

- **To add a new device to the map and the device inventory**—Click the **New Device** button in the map toolbar or right-click the map background and select **New Device**. The New Device dialog box opens. Follow the procedures for adding new devices described in [Adding Devices to the Device Inventory, page 3-7](#).
- **To remove a managed node**—Right-click the node and select **Remove from Map**.
- **To locate a device on the open map when in Device view**—Right-click the device in the device selector and select **Show in Map view**. If the device is shown on the active map, it is shown centered and highlighted on the undocked map. You are told that the device cannot be found if the device is not shown on the active map.
- **To locate a device in Device view from the map**—Right-click the device and select **Show in Device View**. Device view is opened with the device selected so that you can edit its policies.

## Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances

### Note

---

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

---

The containment relationship between Catalyst and Adaptive Security Appliance (ASA) devices and their service modules and security contexts, between PIX 7.x+ devices and FWSM and their security contexts, or between IPS devices and their virtual sensors, is displayed in maps as follows:

- When you select a Catalyst device, nodes that represent its Firewall Services Modules (FWSM) are highlighted.

- When you select an ASA, nodes that represent its Security Service Modules are highlighted.
- When you select a service module, the device that contains it is highlighted.
- When you select an IPS device, the nodes that represent virtual sensors defined on the device are highlighted.
- You can view a list of the security contexts contained in an ASA, firewall, or FWSM device, or the virtual sensors contained in an IPS device, by right-clicking the node and selecting **Show Containment**. This command also shows the service modules in a device that has them.
- When you select a security context node, all its ancestor device nodes are highlighted.
- When you select a virtual sensor, the device on which it is defined is highlighted.

## Using Map Objects To Represent Network Topology

You can add map elements to a map that represent objects (such as devices and links) that Security Manager does not manage. These nodes are called map objects. You can use map objects to create a more useful representation of your network topology. (If you want to add a managed device, see [Displaying Managed Devices on the Map, page 35-16](#).)

You can add layer 3 links between any map elements, whether they are device nodes, map nodes, or a combination of both types.

### Tip

To delete a map object, right-click the object and select **Delete Map Object**.

- 
- Step 1** Select **Map > Add Map Object**. The Add Map Object dialog box appears (see [Add Map Object and Node Properties Dialog Boxes, page 35-18](#)).
- Step 2** Do one of the following:
- If you are adding a map object based on the definition of an Security Manager policy object, click **Copy Policy Object** to open the [Select Policy Object Dialog Box, page 35-18](#). Then, select the type of object (AAA server, network/host, PKI enrollment), click **Select** to choose the object, then click **OK** in the Select Policy Object dialog box. Information from the policy object is entered in the Add Map Object dialog box.  
The name of the object is used as the map object name, but you can edit this if desired.
  - If you are adding a map object that is not based on a policy object, enter a name for the map object in the **Name** field.
- Step 3** Select the type of object that the node represents from the **Type** list. If you selected a policy object, the type is pre-selected, but you can change the selection.
- Step 4** (Optional) Add interfaces to the node by doing the following for each interface:
- a. Click **Add** to open the [Interface Properties Dialog Box, page 35-19](#). If items already appear in the list, you can select them and click **Edit** to change them.
  - b. Enter an interface name, IP address, and network mask, then click **OK**.
- Step 5** Click **OK**. The map object is added to the center of the map. Move it to the desired location.
-

## Add Map Object and Node Properties Dialog Boxes

For unmanaged map objects, the Add Map Object and Node Properties dialog boxes are the same. Use the Add Map Object dialog box to add an object to the map. Use the Node Properties dialog box to view or edit map object properties. For more information, see [Using Map Objects To Represent Network Topology, page 35-17](#).

For managed map objects (such as a managed device), the Node Properties dialog box is read-only. It displays the object name, type, and list of interface names and IP addresses (if any are defined in Security Manager for the device). The reference information below does not apply to this version of the Node Properties dialog box.

### Navigation Path

- To open the Add Map Object dialog box, select **Map > Add Map Object**.
- To open the Node Properties dialog box, right-click a map object or managed device and select **Node Properties**.

### Field Reference

**Table 35-12 Add Map Object and Node Properties Dialog Boxes for Unmanaged Nodes**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                      | The name of the map object. If you select a policy object, the name of the object is automatically used, but you can change it.                                                                                                                                                                                                                                                                                                                                                      |
| Copy Policy Object button | Click to browse for a policy object to use as the basis for the map object using the <a href="#">Select Policy Object Dialog Box, page 35-18</a> .                                                                                                                                                                                                                                                                                                                                   |
| Type list                 | The type of object you are creating. If you select a policy object, a type is selected for you, but you can change it if necessary.                                                                                                                                                                                                                                                                                                                                                  |
| Interfaces table          | The interfaces on the node. If you select a policy object, information might have been added to this table. <ul style="list-style-type: none"> <li>• To add an interface, click the <b>Add (+)</b> button and fill in the <a href="#">Interface Properties Dialog Box, page 35-19</a>.</li> <li>• To edit an interface, select it and click the <b>Edit (pencil)</b> button.</li> <li>• To delete an interface, select it and click the <b>Delete (trash can)</b> button.</li> </ul> |

## Select Policy Object Dialog Box

Use the Select Policy Object dialog box to add an object to the map that is defined in a policy object.

Select the type of object that defines the node you want to add to the map from the **Select a Policy Object** list, then click **Select** to select the specific policy object. If you know the object’s name, you can type it into the text box instead of clicking Select.

For more information, see [Using Map Objects To Represent Network Topology, page 35-17](#).

### Navigation Path

To open this dialog box, click **Copy Policy Object** in the Add Map Object dialog box (see [Add Map Object and Node Properties Dialog Boxes, page 35-18](#)).

## Interface Properties Dialog Box

Use the Interface Properties dialog box to add and edit interfaces on map objects. For more information, see [Using Map Objects To Represent Network Topology, page 35-17](#).

### Navigation Path

To open this dialog box, click the **Add** or **Edit** button in the [Add Map Object and Node Properties Dialog Boxes, page 35-18](#).

### Field Reference

**Table 35-13** *Interface Properties Dialog Box*

| Element                | Description                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------|
| Interface Name         | The interface name.                                                                                  |
| Interface IP Addr/Mask | The interface IP address and network mask, for example, 10.100.10.0/24 or 10.100.10.0/255.255.255.0. |

## Creating and Managing Layer 3 Links on the Map

A layer 3 link is a line on the map that represents a network connection between two device interfaces.

Layer 3 connectivity information is automatically added to the map when you add map elements that have interface information. When you add a map element that has interface information, one of the following happens:

- If the interface is on a network that is not represented on the map as a network map object, a network map object is added to the map with a layer 3 link to the new map element.
- If the interface is on a network that is represented on the map as a network map object, a layer 3 link is added between the new map element and the network map object.

When you remove a node interface that is a layer 3 link endpoint, the link is also removed.

You can add additional layer 3 links between device nodes and map objects to illustrate your network's connectivity. Adding Layer 3 links to a map does not configure any network devices. Layer 3 links are just visual elements on the map.

You create layer 3 links to connect any two interfaces on a map. Depending on the interfaces that you choose, the layer 3 link might include intermediary networks or network clouds. In some cases, you have the option to select which intermediary networks and networks clouds are inserted between the connected interfaces.

The following procedure explains how to manually create a new layer 3 link.

### Tips

- The automatic addition of network objects and links is called Autolink. You can configure Autolink to not automatically add private or certain reserved network addresses. To configure these settings, select **Tools > Security Manager Administration**, then click **Autolink**.
- To view the properties of a link, right-click the layer 3 link and select **Link Properties**.
- To delete a layer 3 link, right-click the layer 3 link to be removed and select **Delete Link**. Deleting a layer 3 link does not delete any intermediary network or network clouds between map elements.

- 
- Step 1** In Map view, click **Map > Add Link** or the Add Link button in the toolbar.
- Step 2** Click one of the map elements to connect, then click the other map element to connect.
- Step 3** If the map elements contain interfaces, select the source and destination interfaces for the link in the [Select Interfaces and Link Properties Dialog Boxes](#), then click **OK**.  
The Add Link dialog box might open, depending on which interfaces you select.
- Step 4** If the [Add Link Dialog Box](#) opens, select which intermediary objects and network clouds to insert, then click **OK**.
- 

## Select Interfaces and Link Properties Dialog Boxes

The Select Interfaces and Link Properties dialog boxes are used with layer 3 links on maps. These dialog boxes show information about the source and destination devices for the link (the source being the first device you clicked when making the link).

If you are creating a link, the Select Interfaces dialog box is used. If there are interfaces defined for the device in Security Manager, select the desired source and destination interfaces for the link you are creating from the **Source/Destination Interface** list.

**Tip**

When creating a link, if there are no interfaces defined for either device, the Interface lists are greyed out. If one device has interfaces defined, both fields are active, but empty for the device that does not have interfaces defined for it. You cannot change the interface when viewing link properties.

---

### Navigation Path

For information on how to create layer 3 links or view their properties, see [Creating and Managing Layer 3 Links on the Map, page 35-19](#).

## Add Link Dialog Box

Use the Add Link dialog box to select how to represent the layer 3 link that you are adding to the map.

The contents of the Add Link dialog box vary according to which nodes and interfaces you are connecting. Select the check boxes for each intermediary map object (network or cloud) that you want to insert between the connected nodes. If desired, you can change the names of the map objects.

### Navigation Path

This dialog box might open when you add a link between nodes, depending on which interfaces you select to connect. For the procedure, see [Creating and Managing Layer 3 Links on the Map, page 35-19](#).

# Managing VPNs in Map View

The following topics describe how to manage VPNs in the Map view:

- [Displaying Existing VPNs on the Map, page 35-21](#)
- [Creating VPN Topologies in Map View, page 35-21](#)
- [Editing VPN Policies or Peers From the Map, page 35-22](#)

## Displaying Existing VPNs on the Map

To display an existing VPN on the map, select **Map > Show VPNs on Map**. You are prompted with a list of existing VPNs. Select the ones you want from the available VPNs list and click >> to move them to the selected list.

You can also remove a VPN using this command. Select the VPNs you want to remove from the selected VPNs list and click <<. When you remove a VPN, only the VPN tunnels are removed. The device nodes remain on the map.

When you display a VPN, all of its member devices are added to the map as device nodes, and all of its tunnels are highlighted. However, devices that you removed from the map previously are not added, even if they are members of a VPN that you display. You can add such devices to the map manually, and their VPN connectivity is displayed.

A VPN tunnel is a line on the map that represents a VPN connection between two devices. VPN tunnels are not added to the map automatically when you add a device node that is a member of a VPN. However, if the VPN was already selected to be shown on the map, adding a device in the VPN to the map will also display the tunnel.

For an explanation of the icons used in the map, see [Understanding Map Elements, page 35-14](#).

## Creating VPN Topologies in Map View

You can create VPN connections between VPN-capable managed device nodes that are displayed on the map. You cannot create Extranet VPNs, however.

To create a VPN, do one of the following:

- Click the **New VPN** button in the toolbar and select the type of VPN you want to configure: point-to-point, hub and spoke, or full mesh.
- Select the devices that you want to participate in the VPN (use Ctrl+click to select multiple devices), and either right click and select the command for the desired type of VPN, or click the **New VPN** button and select the VPN type.

Consider the following tips:

- Select only 2 devices to create a point-to-point VPN.
- If you create a hub-and-spoke VPN, the device you right-click is initially defined as the hub, but you can change that in the wizard.
- While in the wizard, you can add or remove devices. You are not restricted to the devices you selected on the map.

Using either technique, the Create VPN wizard opens, where you can create the VPN. For more information, see [Creating or Editing VPN Topologies, page 25-28](#) or click the Help button in the wizard.

The VPN is displayed on the map when you are finished with the wizard.

### Related Topics

- [Selecting Map Elements, page 35-12](#)

## Editing VPN Policies or Peers From the Map

You can edit VPN policies, or the peers that participate in a VPN, from map view. To edit policies or peers, right-click a VPN tunnel or device node and select one of these commands:

- **Edit VPN Policies**—To open the Site-to-Site VPN Manager, where you can edit the policies that define the VPN. For more information, see [Site-to-Site VPN Manager Window, page 25-18](#).
- **Edit VPN Peers**—To open a dialog box that allows you to configure the peers that participate in the VPN. Click the **Help** button in the dialog box for more information.
- **Show VPN Peers**—To see which devices participate in a VPN without editing the list (VPN Peers dialog box).

If the device participates in more than one VPN, you are first prompted to select the desired VPN (with the Select VPN to Configure dialog box) before the appropriate dialog box is opened.

## Managing Device Policies in Map View

You can perform only basic policy management and configure firewall services policies in Map view. You cannot configure other types of policies. The following topics describe how to manage policies from the Map view:

- [Performing Basic Policy Management in Map View, page 35-22](#)
- [Managing Firewall Policies in Map View, page 35-23](#)
- [Managing Firewall Settings in Map View, page 35-23](#)

## Performing Basic Policy Management in Map View

You can perform some basic policy management tasks in Map view. Right click the device and select one of the following commands:

- **Copy Policies Between Devices**—To copy local device policies from one device to another. For more information on copying policies, see [Copying Policies Between Devices, page 5-33](#).
- **Share Device Policies**—To create shared policies from local device policies. For more information on sharing policies, see [Sharing Multiple Policies of a Selected Device, page 5-42](#).
- **Clone Device**—To create a copy of a device, including its policies. For more information on cloning devices, see [Cloning a Device, page 3-57](#).
- **Preview Configuration**—To view the configuration file that will be generated for the device, including the changes from the previous deployment. For more information on previewing configurations, see [Previewing Configurations, page 8-44](#).
- **Discover Policies on Device**—To discover the policies defined on the device and configure them in Security Manager, wiping out whatever policies are defined in Security Manager for the device. For more information device discovery, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

## Managing Firewall Policies in Map View

You can configure firewall policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

Tip

---

If you want to assign a shared policy to a device, see [Performing Basic Policy Management in Map View, page 35-22](#).

---

To configure local firewall policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Policies > AAA Rules**—To configure AAA policies, which control who is allowed access to the device and what services they are allowed to use once they have access. For more information on configuring AAA rules, see [AAA Rules Page, page 15-10](#).
- **Edit Firewall Policies > Access Rules**—To configure Access Rules policies, which control the traffic that flows through a device. For more information on configuring access rules, see [Access Rules Page, page 16-10](#).
- **Edit Firewall Policies > Inspection Rules**—To configure Inspection Rules policies, which analyze traffic at the application layer and track TCP and UDP sessions to perform refined access control. For more information on configuring inspection rules, see [Inspection Rules Page, page 17-8](#).
- **Edit Firewall Policies > Botnet Traffic Filter Rules**—(ASA 8.2 and later only) To configure Botnet Traffic Filter Rules policies, which monitor web traffic. For more information on configuring botnet traffic filter rules, see [Botnet Traffic Filter Rules Page, page 19-9](#).
- **Edit Firewall Policies > Transparent Rules**—To configure Transparent Rules policies, which define EtherType rules for transparent firewalls. For more information on configuring inspection rules, see [Transparent Rules Page, page 23-3](#).
- **Edit Firewall Policies > Web Filter Rules**—To configure Web Filter Rules policies, which define rules for web access. For more information on configuring web filter rules, see [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#) or [Web Filter Rules Page \(IOS\), page 18-12](#).
- **Edit Firewall Policies > Zone Based Firewall Rules**—(IOS 12.4(6)T and later only) To configure Zone Based Firewall Rules policies, which configure inspection and web filtering using security zones. For more information on configuring zone based firewall rules, see [Zone-based Firewall Rules Page, page 21-58](#).

### Related Topics

## Managing Firewall Settings in Map View

You can configure firewall settings policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

**Tip**

If you want to assign a shared policy to a device, see [Performing Basic Policy Management in Map View, page 35-22](#).

To configure local firewall settings policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Settings > AAA Firewall**—(ASA/PIX/FWSM only) To configure AAA Firewall settings policies, which configures proxy, authentication challenge, MAC exempt lists, and other general AAA settings. For more information on configuring AAA firewall settings, see [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#) and [AAA Firewall Page, MAC-Exempt List Tab, page 15-26](#).
- **Edit Firewall Settings > Access Control**—To configure Access Control settings policies, which configures optimization and other general access control settings. For more information on configuring access control settings, see [Access Control Settings Page, page 16-24](#).
- **Edit Firewall Settings > AuthProxy**—(IOS devices only) To configure AuthProxy settings policies, which configure general settings for authorization proxies. For more information on configuring authorization proxies, see [AAA Page, page 15-28](#).
- **Edit Firewall Settings > Inspection**—(IOS devices only) To configure Inspection settings policies, which configure timeout and session settings for inspection rules. For more information on configuring inspection settings, see [Configuring Settings for Inspection Rules for IOS Devices, page 17-112](#).
- **Edit Firewall Settings > Web Filter**—To configure Web Filter settings policies, which configure the server used for web filtering. For more information on configuring web filter settings, see [Web Filter Settings Page, page 18-16](#).
- **Edit Firewall Settings > Zone Based Firewall**—(IOS 12.4(6)T and later devices) To configure Zone Based Firewall settings policies, which configure zones and Trend web filter server settings.

## **PART 4**

### **IPS Configuration**

## Getting Started with IPS Configuration

---

### Note

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

---

Cisco Intrusion Prevention System (IPS) Sensors are network devices that perform real-time monitoring of network traffic for suspicious activities and active network attacks. The IPS sensor analyzes network packets and flows to determine whether their contents appear to indicate an attack against your network.

Using Cisco Security Manager, you can configure and manage sensors, which can be dedicated stand-alone network appliances, Catalyst 6500 switch modules, service modules running in supported ASA devices or routers, and IPS-enabled Cisco IOS Software images running on integrated services routers. For a full list of supported IPS devices and software versions, see the [Supported Devices and Software Versions for Cisco Security Manager](#) document for this version of the product.

This chapter contains the following topics:

- [Understanding IPS Network Sensing, page 36-2](#)
- [Overview of IPS Configuration, page 36-5](#)
- [Identifying Allowed Hosts, page 36-7](#)
- [Configuring SNMP, page 36-8](#)

- [Configuring IPS Security Settings, page 36-32](#)

# Understanding IPS Network Sensing

Network sensing can be accomplished using Cisco IPS sensors (appliances, switch modules, network modules, and SSMs) and Cisco IOS IPS devices (Cisco IOS routers with IPS-enabled images and Cisco ISRs). These sensing platforms are components of the Cisco Intrusion Prevention System and can be managed and configured through Cisco Security Manager. These sensing platforms monitor and analyze network traffic in real time. They do this by looking for anomalies and misuse on the basis of network flow validation, an extensive embedded signature library, and anomaly detection engines. However, these platforms differ in how they can respond to perceived intrusions.

**Tip**

Cisco IPS sensors and Cisco IOS IPS devices are often referred to collectively as IPS devices or simply sensors. However, Cisco IOS IPS does not run the full dedicated IPS software, and its configuration does not include IPS device-specific policies. Additionally, the amount of sensing that you can perform with Cisco IOS IPS is more limited. The following sections focus on using dedicated IPS devices, including service modules installed in IOS routers, rather than Cisco IOS IPS. For a discussion focused on Cisco IOS IPS, see [Intrusion Prevention System \(IPS\) Cisco IOS Intrusion Prevention System Deployment Guide](#) on Cisco.com and [Chapter 45, “Configuring IOS IPS Routers”](#). Also, see <http://www.cisco.com/go/iosips>.

When an IPS device detects unauthorized network activity, it can terminate the connection, permanently block the associated host, and take other actions.

**Note**

For more overview information on IPS sensors, including a comparison of the available appliances and service modules and details about device interfaces, see [Introducing the Sensor](#) in *Installing Cisco Intrusion Prevention System Appliances and Modules*. A list of these documents for each IPS release is available at [http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod\\_installation\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod_installation_guides_list.html).

This section contains the following topics:

- [Capturing Network Traffic, page 36-2](#)
- [Correctly Deploying the Sensor, page 36-4](#)
- [Tuning the IPS, page 36-4](#)

## Capturing Network Traffic

The sensor can operate in either promiscuous or inline mode. The following illustration shows how you can deploy a combination of sensors operating in both inline (IPS) and promiscuous (IDS) modes to protect your network.

Figure 36-1 Comprehensive IPS Deployment Solutions

The command and control interface is always Ethernet. This interface has an assigned IP address, which allows it to communicate with the manager workstation or network devices (Cisco switches, routers, and firewalls). Because this interface is visible on the network, you should use encryption to maintain data privacy. SSH is used to protect the CLI and TLS/SSL is used to protect the manager workstation. SSH and TLS/SSL are enabled by default on the manager workstations.

When responding to attacks, the sensor can do the following:

- Insert TCP resets via the sensing interface.

**Note** You should select the TCP reset action only on signatures associated with a TCP-based service. If selected as an action on non-TCP-based services, no action is taken. Additionally, TCP resets are not guaranteed to tear down an offending session because of limitations in the TCP protocol.

- Make ACL changes on switches, routers, and firewalls that the sensor manages.

**Note** ACLs may block only future traffic, not current traffic.

- Generate IP session logs, session replay, and trigger packets display.  
IP session logs are used to gather information about unauthorized use. IP log files are written when events occur that you have configured the appliance to look for.
- Implement multiple packet drop actions to stop worms and viruses.

## Correctly Deploying the Sensor

Before you deploy and configure your sensors, you should understand the following about your network:

- The size and complexity of your network.
- Connections between your network and other networks, including the Internet.
- The amount and type of traffic on your network.

This knowledge will help you determine how many sensors are required, the hardware configuration for each sensor (for example, the size and type of network interface cards), and how many managers are needed.

You should always position the IPS sensor behind a perimeter-filtering device, such as a firewall or adaptive security appliance. The perimeter device filters traffic to match your security policy thus allowing acceptable traffic in to your network. Correct placement significantly reduces the number of alerts, which increases the amount of actionable data you can use to investigate security violations. If you position the IPS sensor on the edge of your network in front of a firewall, your sensor will produce alerts on every single scan and attempted attack even if they have no significance to your network implementation. You will receive hundreds, thousands, or even millions of alerts (in a large enterprise environment) that are not really critical or actionable in your environment. Analyzing this type of data is time consuming and costly.

## Tuning the IPS

Tuning the IPS ensures that the alerts you see reflect true actionable information. Without tuning the IPS, it is difficult to do security research or forensics on your network because you will have thousands of benign events, also known as false positives. False positives are a by-product of all IPS devices, but they occur much less frequently in Cisco IPS devices because Cisco IPS devices are stateful, normalized, and use vulnerability signatures for attack evaluation. Cisco IPS devices also provide risk rating, which identifies high risk events, and policy-based management, which lets you deploy rules to enforce IPS signature actions based on risk rating.

Follow these tips when tuning your IPS sensors:

- Place your sensor on your network behind a perimeter-filtering device.  
Proper sensor placement can reduce the number of alerts you need to examine by several thousands a day.
- Deploy the sensor with the default signatures in place.  
The default signature set provides you with a very high security protection posture. The Cisco signature team has spent many hours on testing the defaults to give your sensor the highest protection. If you think that you have lost these defaults, you can restore them.
- Make sure that the event action override is set to drop packets with a risk rating greater than 90.  
This is the default and ensures that high risk alerts are stopped immediately.

- Filter out known false positives caused by specialized software, such as vulnerability scanner and load balancers by one of the following methods:
  - You can configure the sensor to ignore the alerts from the IP addresses of the scanner and load balancer.
  - You can configure the sensor to allow these alerts and then use Event Viewer to filter out the false positives.
- Filter the Informational alerts.
 

These low priority events notifications could indicate that another device is doing reconnaissance on a device protected by the IPS. Research the source IP addresses from these Informational alerts to determine what the source is.
- Analyze the remaining actionable alerts:
  - Research the alert.
  - Fix the attack source.
  - Fix the destination host.
  - Modify the IPS policy to provide more information.

## Overview of IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on dedicated appliances and service modules. For Cisco IOS IPS devices (which does not include IPS service modules installed in a router), see [Overview of Cisco IOS IPS Configuration, page 45-4](#).

---

**Step 1** Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager.

Follow the instructions in the *Installing Cisco Intrusion Prevention System Appliances and Modules* document for the IPS version you are using.

**Step 2** Add the device to the Security Manager device inventory (see [Adding Devices to the Device Inventory, page 3-7](#)).

---

**Tip** You can discover router and Catalyst switch modules when adding the device in which the module is installed. For ASA devices, you must add the service module separately.

---

**Step 3** Configure the interfaces as described in [Configuring Interfaces, page 37-6](#). You must enable the interfaces connected to your network for the device to function.

For certain types of service module, there are additional policies to configure:

- Router-hosted service modules—Configure the **IPS Module** interface settings policy on the router. For more information, see [IPS Module Interface Settings on Cisco IOS Routers, page 62-22](#).

- IDSM—Configure the **IDSM Settings** Catalyst platform policy. For more information, see [IDSM Settings, page 68-43](#).
  - IPS modules on ASA devices—Configure the **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** policy on the host ASA to specify the traffic that should be inspected. For more information, see [About IPS Modules on ASA Devices, page 58-15](#) and [Service Policy Rules Page, page 58-5](#).
- Step 4** Use the **Virtual Sensors** policy to assign interfaces to the virtual sensors, including the base vs0 virtual sensor that exists for all IPS devices. For information about virtual sensor settings and assigning interfaces to a virtual sensor, see [Defining A Virtual Sensor, page 38-5](#).
- If the device supports it, and you have a need for it, you can also create user-defined virtual sensors so that a single device acts like multiple sensors. Most of the IPS configuration is done on the parent device, but you can configure unique settings per virtual sensor for signatures, anomaly detection, and event actions. For more information, see [Chapter 38, “Configuring Virtual Sensors”](#).
- Step 5** Configure basic device access platform policies. These policies determine who can log into the device:
- **AAA**—Configure this policy if you want to use a RADIUS server to control access to the device. You can use AAA control in conjunction with local user accounts defined in the User Accounts policy. See [Configuring AAA Access Control for IPS Devices, page 36-21](#).
  - **Allowed Hosts**—The addresses of hosts who are allowed access. Ensure that the Security Manager server is included as an allowed host, or you cannot configure the device using Security Manager. See [Identifying Allowed Hosts, page 36-7](#).
  - **SNMP**—Configure this policy if you want to use an SNMP application to manage the device. See [Configuring SNMP, page 36-8](#).
  - **Password Requirements**—You can define the acceptable characteristics of a user password. See [Configuring User Password Requirements, page 36-20](#).
  - **User Accounts**—The user accounts defined on the device. See [Configuring IPS User Accounts, page 36-18](#).
- Step 6** Configure basic server access platform policies. These policies identify the servers to which the device can connect:
- **External Product Interface**—If you use Management Center for Cisco Security Agents, configure this policy to allow the sensor to download host postures from the application. See [Configuring the External Product Interface, page 36-26](#).
  - **NTP**—Configure this policy if you want to use a Network Time Protocol server to control the device time. See [Identifying an NTP Server, page 36-23](#).
  - **DNS, HTTP Proxy**—The DNS and HTTP Proxy policies are required only if you configure global correlation. They identify a server that can resolve DNS names to IP addresses. Use the HTTP Proxy policy if your network requires the use of a proxy to make Internet connections; otherwise, use the DNS policy. See [Identifying DNS Servers, page 36-24](#) or [Identifying an HTTP Proxy Server, page 36-24](#).
- Step 7** Configure the Logging policy if you want non-default logging. See [Configuring IPS Logging Policies, page 36-30](#).
- Step 8** Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:
- [Chapter 40, “Configuring Event Action Rules”](#)
  - [Configuring Signatures, page 39-4](#)

- Step 9** If you use any of the Request Block or Request Rate Limit event actions, configure blocking or rate limiting hosts. See [Configuring IPS Blocking and Rate Limiting, page 43-7](#).
- Step 10** Configure other desired advanced IPS services. See the following topics:
- [Chapter 42, “Configuring Global Correlation”](#)
  - [Configuring Anomaly Detection, page 41-6](#)
- Step 11** Maintain the device:
- Update and redeploy configurations as necessary.
  - Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see [Managing IPS Updates, page 44-4](#).
  - Manage the device licenses. You can update and redeploy licenses, or automate license updates. For more information, see the following topics:
    - [Updating IPS License Files, page 44-1](#)
    - [Redeploying IPS License Files, page 44-2](#)
    - [Automating IPS License File Updates, page 44-3](#)
  - Manage the certificates required for SSL (HTTPS) communication. These certificates expire, so you need to regenerate them approximately every 2 years. For information on regenerating certificates and ensuring that the certificates defined on the device are synchronized with those stored in the Security Manager certificate store, see [Managing IPS Certificates, page 44-10](#).
- Step 12** Monitor the device:
- Use the Event Viewer application to view alerts generated from the device. You can open Event Viewer from the Launch menu in Configuration Manager or Report Manager, or from the Windows Start menu.
    - For information on using Event Viewer, see [Chapter 69, “Viewing Events”](#).
    - For an example of how to filter IPS alerts, see [Removing False Positive IPS Events from the Event Table, page 69-66](#).
  - Use the Report Manager application to generate reports on IPS usage, including comparisons of inline vs. promiscuous mode, and global correlation vs. traditional inspection. You can also analyze top attackers, victims, signatures, blocked signatures, and perform target analysis. The following topics explain Report Manager and the IPS reports in more detail:
    - [Chapter 70, “Managing Reports”](#)
    - [Understanding General IPS Reports, page 70-19](#)
    - [Understanding IPS Top Reports, page 70-17](#)
    - [Opening and Generating Reports, page 70-20](#)

## Identifying Allowed Hosts

Use the Allowed Hosts policy to identify which hosts or networks have permission to access the IPS sensor. By default, no hosts are permitted to access a sensor, so you must add hosts or networks to this policy.

Specifically, you must add either the IP address of the Security Manager server, or its network address, or Security Manager cannot configure the device. Also add the addresses of all other management hosts that you use, such as CS-MARS.

**Tip**

If you add host addresses only, you will be limited to using those workstations to access the device. Instead, you can specify network addresses to allow all hosts connected to specific “safe” networks access.

- 
- Step 1** Do one of the following to open the Allowed Hosts policy:
- (Device view) Select **Platform > Device Admin > Device Access > Allowed Hosts** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Allowed Hosts**, then select an existing policy or create a new one.
- Step 2** Do one of the following:
- To add an entry, click the **Add Row** button and fill in the Access List dialog box. You can add up to 512 entries.
  - To edit an entry, select it and click the **Edit Row** button.
  - To delete an entry, select it and click the **Delete Row** button.
- Step 3** When adding or editing an entry, specify the host or network address in the Add or Modify Access List dialog box, then click **OK**. You can enter addresses using the following formats:
- Host address—A simple IP address, such as 10.100.10.10.
  - Network address—A network address and mask, such as 10.100.10.0/24 or 10.100.10.0/255.255.255.0.
  - A network/host policy object—Click **Select** to select an existing object or to create a new one. To use the object in this policy, it must have a single value, either a single network or a single host.
- 

## Configuring SNMP

SNMP is an application layer protocol that facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

SNMP is a simple request/response protocol. The network-management system issues a request, and managed devices return responses. This behavior is implemented by using one of four protocol operations: Get, GetNext, Set, and Trap.

You can configure the sensor for monitoring by SNMP. SNMP defines a standard way for network management stations to monitor the health and status of many types of devices, including switches, routers, and sensors.

You can configure the sensor to send SNMP traps. SNMP traps enable an agent to notify the management station of significant events by way of an unsolicited SNMP message.

Trap-directed notification has the following advantage—if a manager is responsible for a large number of devices, and each device has a large number of objects, it is impractical to poll or request information from every object on every device. The solution is for each agent on the managed device to notify the manager without solicitation. It does this by sending a message known as a trap of the event.

After receiving the event, the manager displays it and can take an action based on the event. For example, the manager can poll the agent directly, or poll other associated device agents to get a better understanding of the event.

**Tip**

Trap-directed notification results in substantial savings of network and agent resources by eliminating frivolous SNMP requests. However, it is not possible to totally eliminate SNMP polling. SNMP requests are required for discovery and topology changes. In addition, a managed device agent cannot send a trap if the device has had a catastrophic outage.

This procedure describes how to configure SNMP on an IPS sensor so that you can manage the sensor with an SNMP management station, including the configuration of traps.

- Step 1** Do one of the following to open the SNMP policy:
- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one.
- Step 2** On the **General Configuration** tab, configure at least the following options. For a complete description of all available options, see [General SNMP Configuration Options, page 36-10](#).
- **Enable SNMP Gets/Sets**—Select this option to enable the SNMP management workstation to obtain (get) information, and to modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor.
  - **Read-Only Community String**—The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests.
  - **Read-Write Community String**—The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests.
- Step 3** On the **SNMPv3 Users** tab, add one or more SNMPv3 users to configure SNMPv3 settings on the managed IPS devices. Beginning with version 4.6, Security Manager enables you to configure SNMPv3 settings on the IPS devices it manages. For more information, see [SNMPv3 Users Tab, page 36-11](#).

**Note**

SNMPv3 is supported in IPS version 7.2.2 and later, but not in the IPS version 7.3.1. Security Manager can however manage IPS 7.3.1 devices. If you try to use Security Manager to upgrade an IPS device from version 7.2.2, with SNMP policy configured, to version 7.3.1, a mouse-over tooltip displays the message "Selected upgrade is not recommended. Unassign the SNMP policy on the device and deploy it to continue with the upgrade to 7.3.1". For information about managing SNMPv3 policies on IPS devices with version 7.2.2 and later, see the Release Notes for Cisco Intrusion Prevention System 7.2(2).

- Step 4** If you want to configure SNMP traps, click the **SNMP Trap Configuration** tab and configure at least the following options. For a complete description of all available options, see [SNMP Trap Configuration Tab, page 36-13](#).

- **Enable Notifications**—Select this option to allow the sensor to send SNMP traps.
- **Trap Destinations**—Add the SNMP management stations that should be trap destinations. Click the **Add Row (+)** button to add a new destination, or select a destination and click the **Edit Row (pencil)** button to change its configuration.

When adding or editing a trap destination, the trap community string that you enter overrides the default community string entered on the SNMP Trap Configuration tab. The community string appears in the traps sent to this destination and is useful if you are receiving multiple types of traps from multiple agents. For example, a router or sensor could be sending the traps, and if you put something that identifies the router or sensor specifically in your community string, you can filter the traps based on the community string.

To remove a destination, select it and click the **Delete Row (trash can)** button.

**Step 5** If you configure trap destinations, you must also ensure that the desired alerts include the **Request SNMP Trap** action. You have the following options for adding this action:

- (Easy way.) Create an event action override to add the Request SNMP Trap action to all alerts of a specified risk rating (**IPS > Event Actions > Event Action Overrides** policy). For example, you could generate traps for all alerts with a risk rating between 85-100. Event action overrides let you add an action without individually editing each signature. For more information, see [Configuring Event Action Overrides, page 40-13](#).
- (Precise way.) Edit the Signatures policy (**IPS > Signatures > Signatures**) to add the Request SNMP Trap action to the signatures for which you want to send trap notifications. Traps are sent only for signatures that you configure to send traps.

**Note**

If the signature has Default for the source, you have to change the source to the Local source before you can change the action. However, if you right-click the Action cell in the signatures table and select **Edit Actions**, then select Request SNMP Trap (along with any other desired action) and click **OK**, the source is automatically changed to Local.

**Step 6** Add the SNMP management stations to the Allowed Hosts policy. The management stations must be allowed hosts to access the sensor. See [Identifying Allowed Hosts, page 36-7](#).

## General SNMP Configuration Options

Use the General Configuration tab on the SNMP page to configure general SNMP parameters and apply them to IPS sensors. For the procedure, see [Configuring SNMP, page 36-8](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the General Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the General Configuration tab.

**Field Reference****Table 36-1** General Configuration Tab, SNMP Policy for IPS Sensors

| Element                     | Description                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable SNMP Gets/Sets       | Whether to enable the SNMP management workstation to obtain (get) information, and modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor; the sensor will not respond to SNMP requests.                                                               |
| Read-Only Community String  | The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests. Use the string to help identify the sensor.                                                      |
| Read-Write Community String | The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests. Use the string to help identify the sensor.        |
| Sensor Contact              | The network administrator or contact point who is responsible for this sensor.                                                                                                                                                                                                                                                |
| Sensor Location             | The physical location of the sensor, such as building address, name, and room number.                                                                                                                                                                                                                                         |
| Sensor Agent Port           | The port to use for SNMP get/set communication with the sensor. The default is 161. The valid range is 1 to 65535.<br><br>Enter a port number or the name of a port list object, or click <b>Select</b> to select a port list object from a list or to create a new object. The port list object must identify a single port. |
| SNMP Agent Protocol         | The protocol you are using for SNMP, either UDP (the default) or TCP. Select the protocol used by your SNMP management station.                                                                                                                                                                                               |

## SNMPv3 Users Tab

Beginning with version 4.6, Security Manager enables you to configure SNMPv3 settings on the IPS devices it manages. You must add SNMPv3 users to configure SNMPv3 settings on the managed IPS devices.

You can use the SNMPv3 Users tab on the SNMP page to view, add, edit, or delete SNMPv3 users.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMPv3 Users tab.
- (Policy view) Select **IPS > Platform > Device Admin > SNMP**, then select an existing policy or create a new one. Select the SNMPv3 Users tab.

Do one of the following:

- To add an SNMPv3 user, click the **Add Row (+)** button. This opens the Add SNMPv3 User dialog box. Enter the information required to create the user. For detailed information on the settings, see [Add SNMPv3 User Dialog Box, page 36-12](#)

- To edit an SNMPv3 user, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit SNMPv3 User dialog box.
- To delete an existing SNMPv3 user, select it and click the **Delete Row (trash can)** button.

### Field Reference

**Table 36-2** *SNMPv3 Users*

| Element                 | Description                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| User Name               | Name of the user on the host that belongs to the SNMP agent.                                           |
| Access Control          | Access privilege for the SNMPv3 user.                                                                  |
| Security Level          | Security level for the SNMPv3 user.                                                                    |
| Authentication Protocol | The authentication protocol keyword is the authentication level used to configure the SNMPv3 user.     |
| Privacy Protocol        | The privacy protocol keyword is the privacy or encryption algorithm used to configure the SNMPv3 user. |

## Add SNMPv3 User Dialog Box

Use the Add SNMPv3 User dialog box to configure a new SNMPv3 user for the managed IPS device.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMPv3 Users tab and click the **Add Row (+)** button.
- (Policy view) Select **IPS > Platform > Device Admin > SNMP**, then select an existing policy or create a new one. Select the SNMPv3 Users tab and click the **Add Row (+)** button.

### Field Reference

**Table 36-3** *Add SNMPv3 Users Dialog Box*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name               | Enter a name for the new SNMPv3 user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Access Control          | Select the access privilege for the new SNMPv3 user.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Security Level          | Select one of the following security levels for the SNMPv3 user: <ul style="list-style-type: none"> <li>• <b>NoAuthNoPriv</b>—There is no authentication and no privacy, which means that no security is applied to the messages.</li> <li>• <b>AuthNoPriv</b>—There is authentication but there is no privacy, which means that messages are authenticated.</li> <li>• <b>AuthPriv</b>—Authentication and privacy are configured, which means that messages are authenticated and encrypted.</li> </ul> |
| Authentication Protocol | Select the authentication protocol keyword that specifies which authentication level should be used. There is no default value.                                                                                                                                                                                                                                                                                                                                                                          |
| Privacy Protocol        | Select the privacy protocol keyword that specifies which privacy or encryption algorithm should be used. For the encryption algorithm, you can specify the AES keyword. There is no default value.                                                                                                                                                                                                                                                                                                       |

**Table 36-3 Add SNMPv3 Users Dialog Box (continued)**

| Element                   | Description                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Passphrase | Enter the authentication passphrase argument that specifies the authentication user password. This password must not be less than eight characters. There is no default value. |
| Privacy Passphrase        | Enter the privacy passphrase argument that specifies the encryption user password. This password must not be less than eight characters. There is no default value.            |

## SNMP Trap Configuration Tab

Use the SNMP Trap Communication tab on the SNMP page to configure traps and apply them to sensors and to identify recipients that the traps should be sent to. For the procedure, see [Configuring SNMP, page 36-8](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMP Trap Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the SNMP Trap Configuration tab.

### Field Reference

**Table 36-4 SNMP Trap Configuration Tab, SNMP Policy for IPS Sensors**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Notifications          | Whether to enable the sensor to send trap notifications to the trap destinations whenever a specific type of event occurs in a sensor. If you do not select this option, the sensor does not send traps.<br><br><b>Tip</b> To have the sensor send SNMP traps, you must also select <b>Request SNMP Trap</b> as the event action when you configure signatures. Traps are sent only for signatures that you configure to send traps.                    |
| Error Filter                  | The type of events that will generate SNMP traps based on the severity of the event: fatal, error, or warning. Select all severities that you want; use Ctrl+click to select multiple values.<br><br>The sensor sends notifications of events of the selected severities only.                                                                                                                                                                          |
| Enable Detail Traps           | Whether to include the full text of the alert in the trap. If you do not select this option, sparse mode is used. Sparse mode includes less than 484 bytes of text for the alert.                                                                                                                                                                                                                                                                       |
| Default Trap Community String | The community string used for the traps if no specific string has been set for the trap destination in the Trap Destinations table.<br><br><b>Tip</b> All traps carry a community string. By default, all traps that have a community string identical to that of the destination are taken by the destination. All other traps are discarded by the destination. However, you can configure the destination to determine which trap strings to accept. |

**Table 36-4** *SNMP Trap Configuration Tab, SNMP Policy for IPS Sensors (continued)*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trap Destinations table | <p>The SNMP management stations that will be sent trap notifications. The table shows the IP address of the management station, the community string added to traps from this sensor, and the port to which traps are sent.</p> <ul style="list-style-type: none"> <li>To add a destination, click the <b>Add Row</b> button and fill in the Add SNMP Trap Communication dialog box (see <a href="#">SNMP Trap Communication Dialog Box, page 36-14</a>).</li> <li>To edit a destination, select it, click the <b>Edit Row</b> button and make your changes.</li> <li>To delete a destination, select it and click the <b>Delete Row</b> button.</li> </ul> |

## SNMP Trap Communication Dialog Box

Use the Add or Modify SNMP Trap Communication dialog box to configure SNMP trap destinations. These are the SNMP management stations that should receive traps from the IPS sensor.

### Navigation Path

Go to the **IPS Platform > Device Admin > Device Access > SNMP** policy, select the **SNMP Trap Configuration** tab, and click the **Add Row** button beneath the Trap Destinations table, or select a destination in the table and click the **Edit Row** button. For more information, see [SNMP Trap Configuration Tab, page 36-13](#).

### Field Reference

**Table 36-5** *SNMP Trap Communication Dialog Box*

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address            | The IP address of the SNMP management station that should receive trap notifications. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new object. The network/host object must specify a single host IP address.                                                                                                                                                             |
| Trap Community String | The community string of the trap. If you do not enter a trap string, the default trap string defined on the SNMP Trap Communication tab is used for traps sent to this destination.                                                                                                                                                                                                                                                                            |
| Trap Port             | The port used by the SNMP management station to receive traps. Enter the port number or the name of a port list object, or click <b>Select</b> to select the object from a list or to create a new one. The port list object must identify a single port.                                                                                                                                                                                                      |
| SNMPv3 User           | <p>Enter the username of the SNMPv3 user that you configured by using the <a href="#">Add SNMPv3 User Dialog Box, page 36-12</a>. Leave this field blank if you do not want to associate any SNMPv3 user.</p> <p><b>Note</b> If you enter a username that is not a configured SNMPv3 user, you will receive an error message while trying to save the SNMP trap communication settings. () Also, note that you can add up to a maximum of 23 SNMPv3 users.</p> |

# Managing User Accounts and Password Requirements

You can configure user accounts and passwords, and general password requirements, for your IPS devices. You can configure local users (defined directly on the device), use a RADIUS AAA server, or use them both in conjunction. The policies used are the **AAA**, **User Accounts**, and **Password Requirements** policies in the **Platform > Device Admin > Device Access** folder.

When you create or edit a local user account in Security Manager, the password you enter must satisfy the requirements defined in the Password Requirements policy. This ensures that new passwords meet your security requirements.

**Tip**

If you change the password requirements, and then make changes to any local user account, the new requirements must be met by all user accounts that have passwords managed by Security Manager. This is because Security Manager reconfigures the passwords for all managed accounts if any single account needs to be reconfigured.

The User Accounts policy allows you to centrally manage the local user accounts for your IPS devices. Using a shared policy can help you ensure that all IPS devices contain the same accounts with the same passwords. However, it is important to understand that passwords are encrypted, so Security Manager cannot discover the actual passwords defined on the device. Security Manager manages the passwords for an account only if you define that password in Security Manager. Security Manager does not manage any user accounts defined in a RADIUS AAA server.

The following topics describe IPS user accounts, and Security Manager discovery and deployment considerations, in more detail:

- [Understanding IPS User Roles, page 36-15](#)
- [Understanding Managed and Unmanaged IPS Passwords, page 36-16](#)
- [Understanding How IPS Passwords are Discovered and Deployed, page 36-17](#)
- [Configuring IPS User Accounts, page 36-18](#)
- [Configuring User Password Requirements, page 36-20](#)
- [Configuring AAA Access Control for IPS Devices, page 36-21](#)

## Understanding IPS User Roles

There are four user roles for IPS user accounts:

- **Viewer**—Users can view the device configuration and events, but they cannot modify any configuration data except their user passwords.
- **Operator**—Users can view everything and they can modify the following options:
  - Signature tuning (priority, disable or enable).
  - Virtual sensor definition.
  - Managed routers.
  - Their user passwords.
- **Administrator**—Users can view everything and they can modify all options that Operators can modify in addition to the following:
  - Sensor addressing configuration.

- List of hosts allowed to connect as configuration or viewing agents.
  - Assignment of physical sensing interfaces.
  - Enable or disable control of physical interfaces.
  - Add and delete users and passwords.
  - Generate new SSH host keys and server certificates.
- **Service**—Only one user with service privileges can exist on a sensor. The service user cannot log in to IDM or IME. The service user logs in to a bash shell rather than the CLI. The service role is a special role that allows you to bypass the CLI if needed.

**Note**

The purpose of the Service account is to provide Cisco Technical Support access to troubleshoot unique and unusual problems. It is not needed for normal system configuration and troubleshooting. You should carefully consider whether you want to create a service account. The service account provides shell access to the system, which makes the system vulnerable. However, you can use the service account to create a password if the administrator password is lost. Analyze your situation to decide if you want a service account existing on the system.

## Understanding Managed and Unmanaged IPS Passwords

Every IPS local user account has a password, which allows secure user login to the device. These user passwords are encrypted on the IPS device. Thus, when you add an IPS device to the Security Manager inventory, Security Manager cannot read the actual user passwords.

Because Security Manager cannot read the password, it is unable to deploy newly-discovered user account passwords to the device. To avoid putting user accounts into a state where the passwords are unknown and unusable, Security Manager marks discovered user account passwords as **unmanaged**. The status of a password is indicated in the **Is Password Managed?** column of the **Platform > Device Admin > Device Access > User Accounts** policy:

- If **No** is indicated, the password for this account is not configured in Security Manager. When you deploy this policy, Security Manager will not attempt to configure the password for this user account.
- If **Yes** is indicated, the password for this account was configured or updated in Security Manager. When you deploy this policy, Security Manager reconfigures the passwords for all managed accounts, not just the passwords that changed since the last deployment.

Because Security Manager configures even unchanged passwords, all managed passwords must satisfy the password requirements defined in the Password Requirements policy.

Thus, you can have a mix of managed and unmanaged account passwords. For example, you can have a set of shared user accounts that are centrally managed, and manage these account passwords in Security Manager. Other accounts might be unique to individuals; if you never edit these account passwords in Security Manager, the user can manage these passwords individually on the device.

**Tip**

If you do not want to manage any user accounts in Security Manager, ensure that the User Accounts policy is empty, or simply unassign the policy (right-click the policy and select **Unassign Policy**). Security Manager will not modify user account configurations.

## Understanding How IPS Passwords are Discovered and Deployed

Because user passwords are encrypted on IPS devices, Security Manager has to handle them with special care when discovering policies on the device or deploying configurations. When discovering or deploying user accounts on IPS devices, Security Manager does the following:

- **Discovery**—When you add an IPS device to the inventory, or rediscover policies on it, Security Manager determines the current status of each user account, updates the User Account policy with each discovered username and associated role, and marks the user password as unmanaged (as described in [Understanding Managed and Unmanaged IPS Passwords, page 36-16](#)).

You cannot view the account status through Security Manager, because it is dynamic and can change. However, the Discovery Status window displays the status at discovery. Accounts can have these statuses:

- **Active**—This state indicates that the account is available for use. Active accounts can be accessed using an authentication token if one has been assigned to the account.
- **Expired**—This state indicates that the account's authentication token has expired and the account can not be accessed using a token until the token has been updated.
- **Locked**—This state indicates that logins to the account have been disabled due to too many failed authentication attempts. You should update the password for these accounts.
- **Deployment**—You are warned if any deployed user accounts are in the Expired or Locked state. Any unmanaged passwords are not deployed to the device. Also, keep in mind the following points:

- If you make changes to any user account on the device, all user accounts with managed passwords are reconfigured. If you also changed the Password Requirements policy, all passwords are compared to the new policy and must meet the new requirements.
- If you change the password of the user account you defined in the device's properties for Security Manager to use when configuring the device, after successful deployment, Security Manager updates the password in the device properties to the new password. You do not need to manually update the password. To see device properties, select **Tools > Device Properties**.  
This behavior assumes that you selected **Security Manager Device Credentials** for the Connect to Device Using option on the **Tools > Security Manager Administration > Device Communication** page. If you are using the logged-in users credentials for deployment, after successful deployment, the overall deployment is marked as failed, and a message explains how to reestablish connection. See [Device Communication Page, page 11-21](#).
- If you use out-of-band change detection, changes to passwords are not detected. However, changes to usernames and roles are detected. For more information about out-of-band change detection, see [Detecting and Analyzing Out of Band Changes, page 8-45](#).
- When previewing configurations, you can see changes to the user accounts by selecting to IPS(Delta – User Passwords). However, passwords are masked. For more information, see [Previewing Configurations, page 8-44](#).
- If you are rolling back configurations, the user accounts are never rolled back. The current status and configuration of user accounts does not change.

**Tip**

The IPS sensor can accept public keys for RSA authentication when logging into the device through an SSH client. Each user has an associated list of authorized keys. Users can use these keys instead of passwords. Security Manager ignores these keys during discovery and deployment. Thus, if keys are configured, Security Manager does not remove the configuration.

## Configuring IPS User Accounts

Use the User Accounts policy to configure local user accounts for IPS devices. Users can use these accounts to log into the device. You can create new users, modify user privileges and passwords, and delete users.

The user accounts policy should have at least these accounts:

- **cisco**—An account named “cisco” must exist on the device and you cannot delete it.
- An administrator account that Security Manager can use—Security Manager must be able to log into the device to configure it. Typically, you create an account for this purpose. However, you have the option of having Security Manager use the user account of the person deploying configurations to log into the device. You can configure this using the **Connect to Device Using** option on the **Tools > Security Manager Administration > Device Communication** page. See [Device Communication Page, page 11-21](#).

IPS user account configuration is more complicated than it seems. Before you configure IPS user accounts, read the following topics:

- [Managing User Accounts and Password Requirements, page 36-15](#)
- [Understanding IPS User Roles, page 36-15](#)
- [Understanding Managed and Unmanaged IPS Passwords, page 36-16](#)
- [Understanding How IPS Passwords are Discovered and Deployed, page 36-17](#)
- [Configuring User Password Requirements, page 36-20](#)
- [Configuring AAA Access Control for IPS Devices, page 36-21](#)

**Tips**

- Cisco IOS IPS devices use the same user accounts that are defined for the router. This procedure does not apply to Cisco IOS IPS configurations.
- If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see [Device Credentials Page, page 3-46](#).

**Related Topics**

- [Filtering Tables, page 1-48](#)
- [Table Columns and Column Heading Features, page 1-49](#)

---

**Step 1** Do one of the following to open the User Accounts policy:

- (Device view) Select **Platform > Device Admin > Device Access > User Accounts** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > User Accounts**, then select an existing policy or create a new one.

The policy shows existing user accounts, including the username, role, and whether the password is managed by Security Manager (as explained in [Understanding Managed and Unmanaged IPS Passwords](#), page 36-16).

**Step 2** Do one of the following:

- To add a user account, click the **Add Row (+)** button. This opens the Add User dialog box. Enter the information required to define the account. For detailed information on the settings, see [Add User and Edit User Credentials Dialog Boxes](#), page 36-19.
- To edit a user account, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit User dialog box.  
You cannot change a user role to or from the Service role.
- To delete a user account, select it and click the **Delete Row (trash can)** button. You cannot delete the account named cisco.

**Tip**

All password changes must meet the requirements of the Password Requirements policy. If you change the requirements policy, all new user accounts, or edited accounts, are tested against the new requirements. Although the passwords for existing unedited user accounts are not tested, they too must meet the password requirements if you change any user account defined in this policy, because Security Manager will deploy all of the accounts during the next configuration deployment. Passwords are checked for conformity when you validate policies, which typically happens when you submit changes to the database. For more information, see [Understanding How IPS Passwords are Discovered and Deployed](#), page 36-17.

## Add User and Edit User Credentials Dialog Boxes

Use the Add User or Edit User Credentials dialog boxes to add or edit IPS device user accounts.

### Navigation Path

From the IPS platform User Accounts policy, click the **Add Row (+)** button to create a new account, or select an existing account and click the **Edit Row (pencil)** button. For information on accessing the User Accounts policy, see [Configuring IPS User Accounts](#), page 36-18.

| Element   | Description                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name | The username for the account. The name can be 1 to 64 characters, including uppercase and lowercase letters and numbers, plus the special characters ( ) + : , _ / - ] + \$.<br><br>You cannot change the username when editing an account. |

**Table 36-6** Add or Edit User Dialog Box (continued)

| Element  | Description                                                                                                                                                                                                                                                                                |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password | The password for this user account. Enter the password in both fields.                                                                                                                                                                                                                     |
| Confirm  | The password must conform to the Password Requirements policy for IPS devices; see <a href="#">Configuring User Password Requirements</a> , page 36-20.                                                                                                                                    |
| Role     | The role for this user. For an explanation of these roles, see <a href="#">Understanding IPS User Roles</a> , page 36-15.<br><b>Tip</b> When editing a user account, you cannot select the Service role. When editing an account assigned to the Service role, you cannot change the role. |

## Configuring User Password Requirements

Use the IPS platform Password Requirements policy to configure the rules for passwords for local IPS device user accounts. All user-created sensor passwords must conform to the requirements defined in this policy. You can configure password requirements for sensor running IPS software version 6.0 or later.

**Tip**

The requirements you define here determine what is considered an acceptable password in the User Accounts policy (see [Configuring IPS User Accounts](#), page 36-18). If you change this policy, it can be applied even to unchanged user accounts. For more information about the implications of deploying changes to this policy, see [Understanding How IPS Passwords are Discovered and Deployed](#), page 36-17.

To configure IPS password requirements, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Device Access > Password Requirements** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Password Requirements** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the password requirement options that you can configure.

**Table 36-7** Password Requirements Policy

| Element       | Description                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attempt Limit | How many times a user is allowed to try to log into the device before you lock the user account due to excessive failed attempts.<br>The default is 0, which indicates unlimited authentication attempts. For security purposes, you should change this number. |

**Table 36-7 Password Requirements Policy (continued)**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Size Range                     | The minimum and maximum size allowed for user passwords; separate the minimum and maximum with a hyphen. The range is 6 to 64 characters; the default is 8-64.<br><br><b>Tip</b> If you configure non-zero values for any of the minimum characters options, the minimum size you enter in the Size Range field must be equal to or greater than the sum of those values. For example, you cannot set a minimum password size of eight and also require that passwords must contain at least five lowercase and five uppercase characters. |
| Minimum Digit Characters       | The minimum number of numeric digits that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Minimum Uppercase Characters   | The minimum number of uppercase alphabet characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Minimum Lowercase Characters   | The minimum number of lowercase alphabet characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Minimum Other Characters       | The minimum number of non-alphanumeric printable characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Number of Historical Passwords | The number of historical passwords that you want the sensor to remember for each account. Any attempt to change the password of an account fails if the new password matches any of the remembered passwords. If you specify 0, no previous passwords are remembered.                                                                                                                                                                                                                                                                      |

## Configuring AAA Access Control for IPS Devices

Use the AAA policy to configure AAA access control for your IPS devices. The device must use IPS Software release 7.0(4) or above or 7.1.3 or above to configure AAA; for example, neither 7.1.1 nor 7.1.2 supports AAA.

You can configure the IPS device to use a RADIUS AAA server to authenticate user access to the device. By configuring AAA, you can reduce the number of local users defined on the device and take advantage of your existing RADIUS setup. If you configure a AAA server, you can configure the device to allow local user accounts as a fallback mechanism if the RADIUS servers are unavailable.

When configuring AAA, you identify the RADIUS server using a AAA server policy object. You can create the object while configuring the policy, or you can create it in the Policy Object Manager. When you configure the AAA server object, you must adhere to the following restrictions:

- **Host**—You must specify the IP address; you cannot use a DNS name.
- **Timeout**—If you enter a timeout value, it must be from 1 to 512 seconds. The generic AAA server object allows higher numbers, but IPS has a more limited timeout range. The default is 3.
- **Protocol**—RADIUS is the only supported protocol.
- **Key**— You must specify the shared secret key that is defined on the RADIUS server. Although this field is optional for a generic AAA server object, IPS requires a key.
- **Port**—Ensure that the RADIUS Authentication/Authorization port is correct. Note that the default port in the AAA server object is different from the IPS default, which is 1812. You will need to change the port if you want to use the IPS default.

For more information about configuring AAA server objects, see [Creating AAA Server Objects, page 6-32](#).

**Tip**

You must ensure that the user account configured in the device properties exists in the RADIUS server or as a local user account, depending on the authorization method that you use. If you switch between local and AAA modes, or change AAA servers, you must ensure that the account is defined in whatever user account database you are using. If you are using AAA with local fallback, the account should be defined in all databases. This account must exist, with the same password defined in the Security Manager device properties for the device, or deployment to the device will fail. The user account used for discovery and deployment must have administrator privileges.

**Related Topics**

- [Managing User Accounts and Password Requirements, page 36-15](#)
- [Configuring IPS User Accounts, page 36-18](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > AAA** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > AAA**, then select an existing policy or create a new one.
- Step 2** Configure the following basic properties:
- **Authentication Mode**—Whether to use Local or AAA mode. Local mode uses user accounts defined on the IPS device only. With AAA mode, the RADIUS servers are the primary means of user authentication, and you can configure local user accounts as a fallback mechanism. The default is Local. You must select AAA to configure any other options in this policy.
  - **Primary RADIUS Server, Secondary RADIUS Server**—The main (primary) AAA server and a backup server, if any. Enter the name of the AAA server policy object that identifies the RADIUS server, or click **Select** to select it from a list of objects or to create a new object.
- When authenticating users, the IPS device sends the user authentication attempt to the primary server. The secondary server is contacted only if the request to the primary server times out.
- Step 3** Configure the following optional properties if you want non-default values:
- **Console Authentication**—How you want to authenticate users who access the IPS device through the console:
    - Local—Users connected through the console port are authenticated through local user accounts.
    - Local and RADIUS—Users connected through the console port are authenticated through RADIUS first. If RADIUS fails, local authentication is attempted.
    - RADIUS—Users connected through the console port are authenticated by RADIUS. If you also select Enable Local Fallback, then users can also be authenticated through the local user accounts.
  - **RADIUS NAS ID**—The Network Access ID, which identifies the service requesting authentication. The value can be no NAS-ID, cisco-ips, or a NAS-ID already configured on the RADIUS server. The default is cisco-ips.
  - **Enable Local Fallback**—Whether you want to fall back to local user account authentication if all RADIUS servers are unavailable. This option is selected by default. Note that local authentication is not attempted if the RADIUS server responds negatively to the logon attempt; local authentication is tried only if no response is received from the RADIUS server.

- **Default User Role**—The role to assign to users who do not have a role assigned in the RADIUS server. You can make Viewer, Operator, or Administrator the default roles, but not Service; select Unspecified to assign no default role (this is the default). For an explanation of user roles, see [Understanding IPS User Roles, page 36-15](#).

**Note** User role configuration is very important. If you do not assign a role to the user, either through the default user role or in the RADIUS server, the sensor prevents user login even if the RADIUS server accepted the username and password.

To assign roles specifically to users on the RADIUS server, you configure the Accept Message for those accounts as either `ips-role=administrator`, `ips-role=operator`, `ips-role=viewer`, or `ips-role=service`. You configure the Accept Message individually for each user account. An example of a Reply attribute for a given user could be configured to return “Hello <user> your ips-role=operator.”

If you configure a service account in the RADIUS server, you must also configure an identical service account locally on the device. For service accounts, both the RADIUS and Local accounts are checked during login.

## Identifying an NTP Server

Use the NTP policy to configure a Network Time Protocol (NTP) server as the time source for the IPS device. Using NTP helps ensure synchronized time among your network devices, which can aid event analysis. NTP is the recommended way to configure time settings on an IPS device.

For detailed information on how to set the time on a sensor, including how to set up a Cisco IOS router as an NTP server, refer to [Configuring Time](#) in *Configuring the Cisco Intrusion Prevention System Sensor Using the Command Line Interface Version 7.0*.

### Tip

Check the time on your IPS sensor if you are having trouble updating your IPS software. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected, and the sensor software update fails.

**Step 1** Do one of the following to open the NTP policy:

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > NTP**, then select an existing policy or create a new one.

**Step 2** In the **NTP Server IP Address** field, enter the IP address of the NTP server. You can also enter the name of a network/host object that identifies the single host address of the server, or click **Select** to select the object from a list or to create a new one.

**Note** Beginning with Cisco Security Manager 4.19, you can configure NTP server with IPV6 address for all ASA 9.12(1) and later devices.

**Step 3** If the NTP server does not require authentication, deselect the **Authenticated NTP** checkbox.

If the NTP server requires authentication, configure the following options:

- **Authenticated NTP**—Select this option to enable authenticated connections.
- **Key, Confirm**—The key value of the NTP server. The key is an MD5 type of key (either numeric or character); it is the key that was used to set up the NTP server.
- **Key ID**—The key ID value of the NTP server, a numeric value between 1 and 65535.

**Tip** The key and key ID are configured on the NTP server; you must obtain them from the NTP server configuration.

## Identifying DNS Servers

If you configure global correlation on an IPS 7.0+ sensor, the sensor must be able to resolve domain names to successfully connect to the update server when downloading global correlation updates. Use the DNS policy to identify the Domain Name System (DNS) servers that the sensor can use to resolve domain names to IP addresses.

**Tip** If your network requires HTTP proxies when making Internet connections, configure the HTTP Proxy policy instead of the DNS policy. See [Identifying an HTTP Proxy Server, page 36-24](#).

**Note** The AIP-SSC-5 service module does not support DNS servers.

- Step 1** Do one of the following to open the HTTP Proxy policy:
- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Server Access > DNS**, then select an existing policy or create a new one.

- Step 2** Specify the IP addresses of up to three DNS servers in the **Primary, Secondary, and Tertiary Address** fields. The sensor uses the servers in the order listed; if one server does not respond, the next server is contacted.

You can enter an IP address or the name of a network/host object that contains a server address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must specify a single host address.

## Identifying an HTTP Proxy Server

If you configure global correlation on an IPS 7.0+ sensor, and your network requires the use of HTTP proxies to connect to the Internet, you need to configure the HTTP Proxy policy to identify a proxy that the IPS sensor can use. When downloading global correlation updates, the IPS sensor connects to the update server using this proxy. The proxy must be able to resolve DNS names.

**Tip**

If you do not use HTTP proxies, configure DNS servers so that the IPS sensor can resolve the address of the update server. See [Identifying DNS Servers, page 36-24](#).

**Note**

The AIP-SSC-5 service module does not support HTTP proxy servers.

- Step 1** Do one of the following to open the HTTP Proxy policy:
- (Device view) Select **Platform > Device Admin > Server Access > HTTP Proxy** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Server Access > HTTP Proxy**, then select an existing policy or create a new one.
- Step 2** Configure the following options:
- **Enable Proxy**—Select this option to tell the device to connect through the configured proxy server.
  - **IP Address**—Enter the IP address of the proxy server, or the name of the network/host object that contains the server's IP address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must contain a single host IP address.
  - **Port**—Enter the port number used for HTTP connections to the proxy server. The default is 80.

## IPS SSHv2 Known Host Keys

The IPS SSHv2 Known Host Keys policy enables you to configure SSHv2 server host keys (outgoing SSHv2 connections from an IPS sensor to an SSH server). This feature is available on IPS sensors running 7.1(8) and later versions of Cisco IPS.

The host key can be retrieved from an IPS sensor using valid IP addresses; alternatively, it can be entered manually if you know it. The host key retrieval may take few seconds.

- Step 1** Do one of the following to open the IPS SSHv2 Known Host Keys policy:
- (Device view) Select **Platform > Device Admin > Server Access > SSHv2 Known Host Keys** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Server Access > SSHv2 Known Host Keys**, then select an existing policy or create a new one.
- Step 2** Click the **Add** button to open the [Add or Edit Known Host RSA Key Dialog Box, page 36-25](#).
- Step 3** Select a row and then click the **Edit** button to open the [Add or Edit Known Host RSA Key Dialog Box, page 36-25](#).

## Add or Edit Known Host RSA Key Dialog Box

Use the Add or Edit Known Host RSA Key dialog box to retrieve an SSHv2 key from an IPS sensor or to enter the key manually if you know it.

**Navigation Path**

From the SSHv2 Known Host Keys policy, click the **Add** button beneath the IP Address/Public Key table, or select a row in the table and click the **Edit** button. For information on the SSHv2Known Host Keys policy, see [IPS SSHv2 Known Host Keys, page 36-25](#).

**Field Reference****Table 36-8 Add or Edit Known Host RSA Key Dialog Box**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address          | The IP address of the IPS sensor from which you want to retrieve the public key.                                                                                                                                                                                                                                                                                        |
| Retrieve Public Key | Initiates retrieval of the public key from the device identified in the IP Address field.<br><br>The Retrieve Public Key option is available in device view (it is not shown in shared policy view). However, you can enter inline values for the public key in shared policies or retrieve the public key in device view and share it using the "share policy" option. |
| Public Key          | The public key that you know and are able to enter manually.<br><br>For shared policies, you will be able to enter inline values for the host key.                                                                                                                                                                                                                      |

## Configuring IPS SSHv1 Fallback Settings

The IPS SSHv1 Fallback policy is available on IPS sensors running 7.1(8) and later versions of Cisco IPS.

- 
- Step 1** Do one of the following to enable or disable SSHv1 Fallback:
- (Device view) Select **Platform > Device Admin > Server Access > Settings** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Server Access > Settings**, then select an existing policy or create a new one.
- Step 2** To enable SSHv1 fallback, click the checkbox.
- Step 3** To disable SSHv1 fallback, clear the checkbox.
- 

## Configuring the External Product Interface

Use the External Product Interface policy to configure the way that Security Manager works with Management Center for Cisco Security Agents (CSA MC).

In general, the external product interface is designed to receive and process information from external security and management products. These external security and management products collect information that can be used to automatically enhance the sensor configuration information.

Management Center for Cisco Security Agents is the only external product that can be configured to communicate with the IPS. At most two Management Center for Cisco Security Agents servers can be configured per IPS device.

**Tip**

Management Center for Cisco Security Agents is no longer an active product. Configure this policy only if you are still using that application. For more information, see [About CSA MC](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 6.0* and <http://www.cisco.com/en/US/products/sw/cscowork/ps5212/index.html>.

Management Center for Cisco Security Agents enforces a security policy on network hosts. It has two components:

- Agents that reside on and protect network hosts.
- A management console, which is an application that manages agents. It downloads security policy updates to agents and uploads operational information from agents.

**Before You Begin**

Add the external product as an allowed host so that Security Manager allows the sensor to communicate with the external product. For more information, see [Identifying Allowed Hosts](#), page 36-7.

**Step 1** Do one of the following to open the External Product Interface policy:

- (Device view) Select **Platform > Device Admin > Server Access > External Product Interface** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > External Product Interface**, then select an existing policy or create a new one.

The **Management Center for Cisco Security Agents** tab shows any existing definitions, including the IP address (or network/host object), URL, and port of the external application, the username and password used to log into it, and whether the connection is enabled. The interface type is always Extended SDEE.

**Step 2** Do one of the following:

- To add a server, click the **Add Row (+)** button. This opens the External Product Interface dialog box. Enter the information required to identify the server and configure the posture ACLs. For detailed information on the settings, see [External Product Interface Dialog Box](#), page 36-27.  
You can add at most two servers.
- To edit a server, select it and click the **Edit Row (pencil)** button and make the required changes in the External Product Interface dialog box.
- To delete a server, select it and click the **Delete Row (trash can)** button.

## External Product Interface Dialog Box

Use the Add or Edit External Product Interface dialog box to add or modify interfaces between Management Center for Cisco Security Agents (CSA MC) and the IPS device and the related posture ACLs.

**Navigation Path**

From the External Product Interface IPS platform policy, click **Add Row** or select an entry and click **Edit Row**. For information on opening the External Product Interface policy, see [Configuring the External Product Interface, page 36-26](#).

**Field Reference****Table 36-9 External Product Interface Dialog Box**

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| External Product's IP Address     | The IP address, or the network/host policy object that contains the address, of the external product. Enter the IP address or object name, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                        |
| Interface Type                    | Identifies the physical interface type, which is always Extended SDEE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable receipt of information     | Whether information is allowed to be passed from the external product to the sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SDEE URL                          | The URL on the CSA MC the IPS uses to retrieve information using SDEE communication. You must configure the URL based on the software version of the CSA MC that the IPS is communicating with as follows: <ul style="list-style-type: none"> <li>For CSA MC version 5.0—/csamc50/sdee-server.</li> <li>For CSA MC version 5.1—/csamc51/sdee-server.</li> <li>For CSA MC version 5.2 and later—/csamc/sdee-server (the default value).</li> </ul>                                                                                                                                                                |
| Port                              | The port, or the port list object that identifies the port, being used for communications. Enter the port or port list name, or click <b>Select</b> to select the object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                  |
| User name<br>Password             | A username and password that can log into the external product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable receipt of host postures   | Whether to allow the receipt of host posture information from CSA MC. The host posture information received from a CSA MC is deleted if you disable this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Allow unreachable hosts' postures | Whether to allow the receipt of host posture information for hosts that are not reachable by the CSA MC.<br><br>A host is not reachable if the CSA MC cannot establish a connection with the host on any IP addresses in the host's posture. This option is useful in filtering the postures whose IP addresses may not be visible to the IPS sensor or that might be duplicated across the network. This filter is most applicable in network topologies where hosts that are not reachable by the CSA MC are also not reachable by the IPS, for example if the IPS and CSA MC are on the same network segment. |

ACLs are processed in order, and the action associated with the first match is applied.</li> </ul> |
| Enable receipt of watch listed addresses | Whether to allow the receipt of the watch list information from CSA MC. The watch list information received from a CSA MC is deleted if you disable this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Manual Watch List RR increase            | The percentage of the manual watch list risk rating (RR). The default is 25, and the valid range is 0 to 35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Session-based Watch List RR Increase     | The percentage of the session-based watch list risk rating. The default is 25, and the valid range is 0 to 35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Packed-based Watch List RR Increase      | The percentage of the packet-based watch list risk rating. The default is 10, and the valid range is 0 to 35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Posture ACL Dialog Box

Use the Add or Modify Posture ACL dialog box to configure posture ACLs for Management Center for Security Agents. Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network.

Configure the following fields to define a posture ACL:

- **Network Address**—Enter the IP address of a host or network, or the name of a network/host object that specifies one. You can click **Select** to select the object from a list or to create a new object.
- **Action**—Whether host postures will be permitted or denied from the hosts on the network address.

### Navigation Path

From the External Product Interface dialog box (see [External Product Interface Dialog Box, page 36-27](#)), click the **Add Row (+)** button underneath the Posture ACL table, or select a posture ACL and click the **Edit Row (pencil)** button.

# Configuring IPS Logging Policies

Use the IPS platform Logging policy to configure traffic flow notifications and Analysis Engine global variables. These settings apply to the general operation of the IPS sensor.

Traffic flow notifications have to do with the flow of traffic across the interface of a sensor. You can configure the sensor to monitor the flow of packets across an interface and send notification if that flow changes (starts and stops) during a specified interval. You can configure the missed packet threshold within a specific notification interval and also configure the interface idle delay before a status event is reported.

The Analysis Engine performs packet analysis and alert detection. It monitors traffic that flows through specified interfaces. For the Analysis Engine, there is only one global variable: Maximum Open IP Log Files.

### Navigation Path

- (Device view) Select **Platform > Logging** from the Policy selector.
- (Policy view) Select **IPS > Platform > Logging**, then select an existing policy or create a new one.

### Field Reference

**Table 36-10** *IPS Logging Page*

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Notifications Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                          |
| Missed Packets Threshold           | The percent of missed packets that has to occur before you want to receive notification. The default is 0, and the range is 0 to 100.                                                                                                                                                                                                                                                    |
| Notification Interval              | The length of time, in seconds, that you want to check for the percentage of missed packets. The default is 30, and the range is 5 to 3600.                                                                                                                                                                                                                                              |
| Interface Idle Threshold           | The length of time, in seconds, that you will allow an interface to be idle and not receiving packets before you want to be notified. The default is 30, and the range is 5 to 3600.                                                                                                                                                                                                     |
| <b>Analysis Engine Tab</b>         |                                                                                                                                                                                                                                                                                                                                                                                          |
| Specify-Flow-Depth                 | Lets you specify the inspection depth of the flow. Flow depth is the number of bytes inspected in a flow. The new value applies for new flows only. The valid range is from 0 to 429496296. The default is 0.                                                                                                                                                                            |
| Enable Service Activity            | Service activity lets you gather information about service activities for diagnostic purposes. The details are more granular and have port level details. Enabling service activity impacts system performance. Enable service activity collection temporarily for diagnostic purposes only. You must reboot the sensor after you enable service activity for the change to take effect. |
| Service Activity Limit             | Sets the limit for how many services you want to enable. The valid range is from 10 to 65536. The default is 15.                                                                                                                                                                                                                                                                         |
| <b>Note</b>                        | The Specify-Flow-Depth, Enable Service Activity, and Service Activity Limit fields are applicable to IPS devices of version 7.2(2) or later.                                                                                                                                                                                                                                             |
| Maximum Open IP Log Files          | The maximum number of open IP log files that you want to allow on the sensor. The default is 20, and the range is 20 to 100.                                                                                                                                                                                                                                                             |

# IPS Health Monitor

Use the IPS Health Monitor page to configure the metrics, or parameters, that are used to determine the health and network security status of your IPS devices. Your IPS devices use these metrics to assign appropriate severity when sending IPS events. The results appear in the Health and Performance Monitor of Security Manager (Launch > Health and Performance Monitor).

IPS Health Monitor is supported in IPS devices beginning with IPS version 6.1 and in Security Manager beginning with version 4.4. Please note the following special cases:

1. For IPS devices running 7.x, all 11 configuration items in the IPS Security Settings Policy are displayed and monitored properly in the Security Manager GUI.
2. For IPS devices running less than 6.1, the Network Participation and Global Correlation entries are hidden in the device view of Security Manager.
3. Some IPS Health Monitor configuration items are protected entries on the device side itself and cannot be edited. Security Manager informs you in such cases.

If you do not select a metric by checking the check box, it does not appear in the Health and Performance Monitor. You can accept the default configuration or edit the values. Items will be disabled and will not be editable if you do not select a metric.

The overall health is set to the most critical settings of any of the metrics. For instance, if all the selected metrics are normal except for one that is critical, the overall health becomes critical. The IPS sensor sends a health and security status event when the overall health status of the IPS sensor changes.

The security status of the IPS sensor is determined for each virtual sensor using the threat ratings of events detected by the virtual sensors. The security status of the virtual sensor is raised when the virtual sensor detects an event with a threat rating that exceeds the threshold for that virtual sensor. After a threshold has been exceeded, the security status remains at a critical level until the configured amount of time has passed with no more events being detected at the higher level.

To configure the metrics on the IPS Health Monitor page, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Health Monitor** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Health Monitor** from the Policy Type selector, then select an existing policy or create a new one.

**Note** In policy view, no validation is performed if a shared IPS Health Monitor policy is applied to an IPS device running less than 6.1. Security Manager ignores such policies during deployment to device and captures them in deployment logs also.

The following table explains the IPS Health Monitor Metrics that you can configure.

**Table 36-11** IPS Security Settings Policy

| Element         | Description                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------|
| Inspection Load | Lets you set a threshold for inspection load and whether this metric is applied to the overall sensor health rating.           |
| Missed Packet   | Lets you set a threshold percentage for missed packets and whether this metric is applied to the overall sensor health rating. |
| Memory Usage    | Lets you set a threshold percentage for memory usage and whether this metric is applied to the overall sensor health rating.   |

**Table 36-11** IPS Security Settings Policy (continued)

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signature Update                   | Lets you set a threshold for when the last signature update was applied and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                  |
| License Expiration                 | Lets you set a threshold for when the license expires and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                    |
| Event Retrieval                    | Lets you set a threshold for when the last event was retrieved and whether this metric is applied to the overall sensor health rating.<br><br><b>Note</b> The event retrieval metric keeps track of when the last event was retrieved by an external monitoring application such as IME. Disable Event Retrieval if you are not doing external event monitoring. |
| Network Participation              | Lets you choose whether the Network Participation health metrics contribute to the overall sensor health rating.                                                                                                                                                                                                                                                 |
| Global Correlation                 | Let you choose whether the Global Correlation health metrics contribute to the overall sensor health rating.                                                                                                                                                                                                                                                     |
| Application Failure                | Lets you choose to have an application failure applied to the overall sensor health rating.                                                                                                                                                                                                                                                                      |
| IPS in Bypass Mode                 | Let you choose to know if bypass mode is active and have that apply to the overall sensor health rating.                                                                                                                                                                                                                                                         |
| One or More Active Interfaces Down | Lets you choose to know if one or more enabled interfaces are down and have that apply to the overall sensor health rating.                                                                                                                                                                                                                                      |
| Warning                            | Lets you set the lowest threshold in percentage, days, seconds, or failures for the warning threshold.                                                                                                                                                                                                                                                           |
| Critical                           | Lets you set the lowest threshold in percentage, days, seconds, or failures for the critical threshold.                                                                                                                                                                                                                                                          |

## Configuring IPS Security Settings

Use the IPS Security Settings policy to configure two items that are important to the security of your IPS devices:

- **Permit packet capture logging**—With this feature, IPS devices can prevent users from arbitrarily executing packet capture/display/iplog commands. In previous versions of Security Manager, such actions leave no trace of who executed the command.
- **Configurable idle timeout**—When configured, this feature terminates the connection to an IPS device after a period of time that you specify. Its purpose is to increase the security of a CLI session.

### Note

These settings are available for devices operating with IPS 7.1.3 and later.

To configure IPS security settings, select one of the following policies:

- (Device view) Select **Platform > Security > Settings** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Settings** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the IPS security settings that you can configure.

**Table 36-12** *IPS Security Settings Policy*

| <b>Element</b>                      | <b>Description</b>                                                                  |
|-------------------------------------|-------------------------------------------------------------------------------------|
| Permit packet logging               | Whether to enable packet logging; applies to packet capture/display/iplog commands. |
| CLI Inactivity Timeout (In Minutes) | Terminates the connection to an IPS device after the specified period of time.      |

## Managing IPS Device Interfaces

Note

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

Dedicated IPS appliances and service modules have their own interface configuration, whereas Cisco IOS IPS devices are configured using the regular router interface policies. This chapter explains how to configure interfaces for dedicated IPS appliances and service modules only.

This chapter contains the following topics:

- [Understanding Interfaces, page 37-1](#)
- [Understanding Interface Modes, page 37-2](#)
- [Configuring Interfaces, page 37-6](#)

## Understanding Interfaces

Tip

This topic is an overview of IPS interfaces. For more detailed information, including the specific interface names and locations for each type of appliance and service module, supported roles, configuration restrictions, and hardware considerations, refer to the “Configuring Interfaces” chapter of the *Installing and Using Cisco Intrusion Prevention System Device Manager* for the IPS software version you are using on Cisco.com. The information is also in the IME and CLI guides. For general information, see <http://www.cisco.com/go/ips>.

The sensor interfaces are named according to the maximum speed and physical location of the interface. For example, GigabitEthernet2/1 supports a maximum speed of 1 Gigabit and is the second-from-the-right interface in the second-from-the bottom expansion slot.

There are three interface roles:

- **Command and control**—The command and control interface has an IP address and is used for configuring the sensor. It receives security and status events from the sensor and queries the sensor for statistics.

The command and control interface is permanently enabled. It is permanently mapped to a specific physical interface, which depends on the specific model of sensor. You cannot use the command and control interface as either a sensing or alternate TCP reset interface. See the IPS document cited above for a list of command and control interfaces by device type.

- **Sensing**—Sensing interfaces are used by the sensor to analyze traffic for security violations. A sensor has one or more sensing interfaces depending on the sensor. Sensing interfaces can operate individually in promiscuous mode or you can pair them to create inline interfaces. In promiscuous mode, packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic. In inline mode, the IPS is in the traffic flow and can directly affect the traffic. For more information about sensing modes, see [Understanding Interface Modes, page 37-2](#).

---

**Note** On appliances, all sensing interfaces are disabled by default. You must enable them to use them. On modules, the sensing interfaces are permanently enabled. See the IPS document cited above for a list of sensing interfaces by device type.

---

- **Alternate TCP reset**—You can configure sensors to send TCP reset packets to try to reset a network connection between an attacker host and its intended target host. In some installations when the interface is operating in promiscuous mode, the sensor may not be able to send the TCP reset packets over the same sensing interface on which the attack was detected. In such cases, you can associate the sensing interface with an alternate TCP reset interface and any TCP resets that would otherwise be sent on the sensing interface when it is operating in promiscuous mode are instead sent out on the associated alternate TCP reset interface.

If a sensing interface is associated with an alternate TCP reset interface, that association applies when the sensor is configured for promiscuous mode but is ignored when the sensing interface is configured for inline mode (interface or VLAN pair), because TCP resets are always sent on the sensing interfaces in those modes.

---

**Note** With the exception of IDSM-2, any sensing interface can serve as the alternate TCP reset interface for another sensing interface. The alternate TCP reset interface on IDSM-2 is fixed because of hardware limitation. However, there is only one sensing interface on IPS modules (on routers or ASA devices), so you cannot specify an alternate TCP reset interface on them. See the IPS document cited above for a list of eligible alternate TCP reset interfaces by device type, and for more information about the conditions under which you would use one.

---

## Understanding Interface Modes

Sensing interfaces can operate in various modes. The mode configured for an interface determines the traffic it can inspect and how it can respond to events.

This section contains the following topics:

- [Promiscuous Mode, page 37-2](#)
- [Inline Interface Mode, page 37-3](#)
- [Inline VLAN Pair Mode, page 37-3](#)
- [VLAN Group Mode, page 37-4](#)

## Promiscuous Mode

In promiscuous mode, packets do not flow through the sensor. The sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. The advantage of operating in promiscuous mode is that the sensor does not affect the packet flow with the forwarded traffic. The disadvantage of

operating in promiscuous mode, however, is the sensor cannot stop malicious traffic from reaching its intended target for certain types of attacks, such as atomic attacks (single-packet attacks). The response actions implemented by promiscuous sensor devices are post-event responses and often require assistance from other networking devices, for example, routers and firewalls, to respond to an attack. While such response actions can prevent some classes of attacks, in atomic attacks the single packet has the chance of reaching the target system before the promiscuous-based sensor can apply an ACL modification on a managed device (such as a firewall, switch, or router).

By default, all sensing interfaces are in promiscuous mode. To change an interface from inline interface mode to promiscuous mode, delete any inline interface that contains that interface and delete any inline VLAN pair subinterfaces of that interface from the interface configuration.

- [Configuring Physical Interfaces, page 37-10](#)

## Inline Interface Mode

Operating in inline interface pair mode puts the IPS directly into the traffic flow and affects packet-forwarding rates making them slower by adding latency. This allows the sensor to stop attacks by dropping malicious traffic before it reaches the intended target, thus providing a protective service. Not only is the inline device processing information on Layers 3 and 4, but it is also analyzing the contents and payload of the packets for more sophisticated embedded attacks (Layers 3 to 7). This deeper analysis lets the system identify and stop or block attacks that would normally pass through a traditional firewall device.

In inline interface pair mode, a packet comes in through the first interface of the pair on the sensor and out the second interface of the pair. The packet is sent to the second interface of the pair unless that packet is being denied or modified by a signature.

#### Notes:

- If the paired interfaces are connected to the same switch, you should configure them on the switch as access ports with different access VLANs for the two ports. Otherwise, traffic does not flow through the inline interface.
- You can configure IPS modules for routers and ASA devices to operate inline even though these modules have only one sensing interface.

- [Configuring Inline Interface Pairs, page 37-13](#)

## Inline VLAN Pair Mode

You can associate VLANs in pairs on a physical interface. This is known as inline VLAN pair mode. Packets received on one of the paired VLANs are analyzed and then forwarded to the other VLAN in the pair.

Inline VLAN pair mode is an active sensing mode where a sensing interface acts as an 802.1q trunk port, and the sensor performs VLAN bridging between pairs of VLANs on the trunk. The sensor inspects the traffic it receives on each VLAN in each pair, and can either forward the packets on the other VLAN in

the pair, or drop the packet if an intrusion attempt is detected. You can configure an IPS sensor to simultaneously bridge up to 255 VLAN pairs on each sensing interface. The sensor replaces the VLAN ID field in the 802.1q header of each received packet with the ID of the egress VLAN on which the sensor forwards the packet. The sensor drops all packets received on any VLANs that are not assigned to inline VLAN pairs.

**Notes:**

- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.
- Inline VLAN pairs are not supported on IPS modules for routers or ASA devices.

**Related Topics**

- [Understanding Interfaces, page 37-1](#)
- [Configuring Inline VLAN Pairs, page 37-14](#)

## VLAN Group Mode

You can divide each physical interface or inline interface into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. If you configure multiple virtual sensors, each of them can monitor one or more of these interfaces. This lets you apply multiple policies to the same sensor. The advantage is that now you can use a sensor with only a few interfaces as if it had many interfaces.

**Note**

---

You cannot divide physical interfaces that are in inline VLAN pairs into VLAN groups.

---

VLAN group subinterfaces associate a set of VLANs with a physical or inline interface. No VLAN can be a member of more than one VLAN group subinterface. Each VLAN group subinterface is identified by a number between 1 and 255. Subinterface 0 is a reserved subinterface number used to represent the entire unvirtualized physical or logical interface. You cannot create, delete, or modify subinterface 0 and no statistics are reported for it.

When you create a VLAN group, it is either promiscuous or inline:

- Promiscuous VLAN group—If you configure a VLAN group on a physical interface, the VLAN group is promiscuous, as described in [Promiscuous Mode, page 37-2](#).
- Inline VLAN group—If you configure a VLAN group on an inline interface pair (a logical interface), the VLAN group is inline, as described in [Inline Interface Mode, page 37-3](#).

Thus, VLAN groups augment the operation of promiscuous mode interfaces or inline interfaces by confining their operation to selected VLANs. Once you assign a VLAN group to an interface (physical or inline interface), the interface is no longer a plain promiscuous or inline interface pair and can only be used for inline VLAN groups.

An unassigned VLAN group is maintained that contains all VLANs that are not specifically assigned to another VLAN group. You cannot directly specify the VLANs that are in the unassigned group. When a VLAN is added to or deleted from another VLAN group subinterface, the unassigned group is updated.

Packets in the native VLAN of an 802.1q trunk do not normally have 802.1q encapsulation headers to identify the VLAN number to which the packets belong. A default VLAN variable is associated with each physical interface and you should set this variable to the VLAN number of the native VLAN or to 0. The value 0 indicates that the native VLAN is either unknown or you do not care if it is specified. If the default VLAN setting is 0, the following occurs:

- Any alerts triggered by packets without 802.1q encapsulation have a VLAN value of 0 reported in the alert.
- Non-802.1q encapsulated traffic is associated with the unassigned VLAN group and it is not possible to assign the native VLAN to any other VLAN group.

**Note**

You can configure a port on a switch as either an access port or a trunk port. On an access port, all traffic in a single VLAN is called the access VLAN. On a trunk port, multiple VLANs can be carried over the port, and each packet has a special header attached called the 802.1q header that contains the VLAN ID. This header is commonly referred to as the VLAN tag. However, a trunk port has a special VLAN called the native VLAN. Packets in the native VLAN do not have the 802.1q headers attached. IDSM-2 can read the 802.1q headers for all nonnative traffic to determine the VLAN ID for that packet. However, IDSM-2 does not know which VLAN is configured as the native VLAN for the port in the switch configuration, so it does not know what VLAN the native packets are in. Therefore, you must tell IDSM-2 which VLAN is the native VLAN for that port. Then IDSM-2 treats any untagged packets as if they were tagged with the native VLAN ID.

- [Understanding Interfaces, page 37-1](#)
- [Configuring VLAN Groups, page 37-15](#)

## Deploying VLAN Groups

Because a VLAN group of an inline pair does not translate the VLAN ID, an inline paired interface must exist between two switches to use VLAN groups on a logical interface. For an appliance, you can connect the two pairs to the same switch, make them access ports, and then set the access VLANs for the two ports differently. In this configuration, the sensor connects between two VLANs, because each of the two ports is in access mode and carries only one VLAN. In this case the two ports must be in different VLANs, and the sensor bridges the two VLANs, monitoring any traffic that flows between the two VLANs. IDSM-2 also operates in this manner, because its two data ports are always connected to the same switch.

You can also connect appliances between two switches. There are two variations. In the first variation, the two ports are configured as access ports, so they carry a single VLAN. In this way, the sensor bridges a single VLAN between the two switches.

In the second variation, the two ports are configured as trunk ports, so they can carry multiple VLANs. In this configuration, the sensor bridges multiple VLANs between the two switches. Because multiple VLANs are carried over the inline interface pair, the VLANs can be divided into groups and each group can be assigned to a virtual sensor. The second variation does not apply to IDSM-2 because it cannot be connected in this way.

# Configuring Interfaces

Use the Interfaces policy for IPS appliances and service modules to configure the interface settings for the device. The following topics explain how to configure the various types of settings. These topics do not apply to Cisco IOS IPS devices, which use the standard router interface policies.

- [Understanding the IPS Interfaces Policy, page 37-6](#)
- [Configuring Physical Interfaces, page 37-10](#)
- [Configuring Bypass Mode, page 37-12](#)
- [Configuring CDP Mode, page 37-13](#)
- [Configuring Inline Interface Pairs, page 37-13](#)
- [Configuring Inline VLAN Pairs, page 37-14](#)
- [Configuring VLAN Groups, page 37-15](#)
- [Viewing a Summary of IPS Interface Configuration, page 37-8](#)

## Understanding the IPS Interfaces Policy

Use the Interfaces policy to configure the physical interfaces, inline pairs, VLAN pairs, and VLAN groups on IPS appliances and service modules. This policy does not apply to Cisco IOS IPS devices.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, inline VLAN pair mode, promiscuous VLAN group, or inline VLAN group, but you cannot configure an interface in a combination of these modes.

**Tip**

---

The contents of this policy differ depending on the device type and IPS software version. For example, some devices display the physical interfaces tab only; creating the other types of configurations is not supported. If a tab or option described below does not appear on the policy you are configuring, it does not apply to the device.

---

**Navigation Path**

(Device view only) Select **IPS > Interfaces** from the Policy selector.

**Table 37-1** IPS Interfaces Policy (continued)

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary tab | <p>A summary of how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, and the interfaces you have configured as inline VLAN pairs.</p> <p>For more information, see <a href="#">Viewing a Summary of IPS Interface Configuration, page 37-8</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Bypass Mode | <p>The bypass mode for the device, which determines how the sensor should handle inline mode traffic when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. This is a global setting that applies to all inline mode interfaces on the device. Select the desired option; for a detailed explanation of how each of these options affect inline traffic, see <a href="#">Configuring Bypass Mode, page 37-12</a>.</p> <ul style="list-style-type: none"> <li>• <b>Off (Always inspect inline traffic)</b>—Disables bypass mode. Traffic is always inspected, and if the monitoring process of the sensor is down, traffic stops flowing.</li> <li>• <b>On (Never inspect inline traffic)</b>—Traffic bypasses the Analysis Engine and is never inspected.</li> <li>• <b>Auto (Bypass inspection when analysis engine is stopped)</b>—Traffic is inspected unless the monitoring process of the sensor is down, in which case traffic continues to flow through the sensor uninspected. This is the default. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor is being upgraded.</li> </ul> |
| CDP Mode    | <p>How to handle Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs). For more information, see <a href="#">Configuring CDP Mode, page 37-13</a>. Select the desired option:</p> <ul style="list-style-type: none"> <li>• <b>Forward CDP packets</b>—To allow CDP packets to pass through the sensor.</li> <li>• <b>Drop CDP packets</b>—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Viewing a Summary of IPS Interface Configuration

The Summary tab of the Interfaces policy contains a table summarizing how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, the interfaces you have configured as inline VLAN pairs, inline VLAN groups, and promiscuous VLAN groups. The content of this table changes when you change your interface configuration.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, or inline VLAN pair mode, but you cannot configure an interface in a combination of these modes.

**Tip**

Not all service modules have a summary tab.

**Navigation Path**

(Device view) Select **Interfaces** from the Policy selector. Click the **Summary** tab.

**Field Reference****Table 37-2** *IPS Interface Summary Tab*

| Element               | Description                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                  | The name of the interface.<br><br>The names are FastEthernet or GigabitEthernet for promiscuous interfaces. For inline interfaces, the name is whatever you assigned to the pair.                                                     |
| Subinterface Number   | The subinterface number of the inline VLAN pair or VLAN group. Subinterface numbers can be from 1 to 255.                                                                                                                             |
| Inline Interface Name | The name of the inline interface pair.                                                                                                                                                                                                |
| Mode                  | The mode for the interface: promiscuous, inline, promiscuous VLAN group, or inline VLAN group and whether there are VLAN pairs. For an explanation of interface modes, see <a href="#">Understanding Interface Modes, page 37-2</a> . |
| VLAN A<br>VLAN B      | The VLAN ID for the first and second VLANs for VLAN pairs. VLAN numbers can be from 1 to 4095.                                                                                                                                        |
| VLAN Range            | The range of VLAN IDs belonging to the VLAN group, for example, 100-200.<br><br>If the VLAN group is configured to apply to all unassigned VLANs, the field is empty.                                                                 |

## Configuring Physical Interfaces

The Physical Interfaces tab of the IPS Interfaces policy lists the existing physical interfaces on your sensor and their associated settings. You cannot add or delete physical interfaces in this policy; instead, you must use policy discovery to obtain the current list of interfaces from the device. Thus, if you add or remove interface cards (available for some appliances), you must rediscover the device as described in [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

To configure the sensor to monitor traffic, you must enable the interface using this procedure. When you initialized the sensor using the **setup** command (using the command line interface on the IPS), you assigned the interface or the inline pair to a virtual sensor, and enabled the interface or inline pair. If you need to change your interfaces settings, you can do so on the Physical Interfaces tab. To assign an interface to a virtual sensor, select the Virtual Sensors policy and add or edit the virtual sensor, as appropriate.

**Tip**

Each physical interface can be divided into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. For more information, see [Configuring VLAN Groups, page 37-15](#).

- [Configuring Inline Interface Pairs, page 37-13](#)

- 
- Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **Physical Interfaces** tab (if necessary).
- Step 2** Select the interface whose configuration you want to change and click the **Edit Row** button. The Modify Physical Interface Map dialog box appears.
- Step 3** Make the desired configuration changes and click **OK**. Following are the settings you are most likely to want to change; for a description of all options, see [Modify Physical Interface Map Dialog Box, page 37-11](#).
- **Enabled**—Whether the interface is enabled (**Yes** or **No**). Select Yes to make the interface functional. The value of this option is shown in the Administrative State column in the Physical Interfaces tab.
  - **Default VLAN**—The VLAN to which the interface is assigned.
  - **Specify Interface for TCP Reset**—If you want to assign an alternate TCP reset interface, as described in [Understanding Interfaces, page 37-1](#), select this option, then select the alternate interface from the **interface-name** list.
-

## Modify Physical Interface Map Dialog Box

Use the Modify Physical Interface Map dialog box to change the configuration of the physical interfaces of an IPS sensor. For the procedure, see [Configuring Physical Interfaces, page 37-10](#).

### Navigation Path

(Device view) Select **Interfaces** from the Policy selector. On the **Physical Interfaces** tab, select an interface and click the **Edit Row** button.

| Specify Interface for TCP Reset<br>interface-name | <p>Whether to send TCP resets on an alternate interface when this interface is used for promiscuous monitoring and the reset action is triggered by a signature firing.</p> <p>If you select this option, select the alternate TCP reset interface from the interface-name list.</p> <p>For more information about alternate TCP reset, see <a href="#">Understanding Interfaces, page 37-1</a>.</p> |

## Configuring Bypass Mode

You can use inline bypass as a diagnostic tool and a failover protection mechanism. Normally, the sensor Analysis Engine performs packet analysis. When inline bypass is activated, Analysis Engine is bypassed, allowing traffic to flow through the inline interfaces and inline VLAN pairs without inspection. Inline bypass ensures that packets continue to flow through the sensor when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. There are three modes: on, off, and automatic. By default, bypass mode is set to automatic.

Keep the following factors in mind before deciding which bypass mode to use:

- There are security consequences when you put the sensor in bypass mode. When bypass mode is on, the traffic bypasses the sensor and is not inspected; therefore, the sensor cannot prevent malicious attacks.
- The inline bypass functionality is implemented in software, so it functions only when the operating system is running. If the sensor is powered off or shut down, inline bypass does not work—traffic does not flow through the sensor.
- When the sensor applies a signature or global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.

To change the bypass mode setting, follow these steps:

---

**Step 1** (Device view) Select the **Interfaces** policy from the Policy selector.

**Step 2** In the **Bypass Mode** field at the bottom of the policy, select the desired option:

- **Off (Always inspect inline traffic)**—Disables bypass mode.  
Traffic flows through the sensor for inspection. If the monitoring process of the sensor is down, traffic stops flowing. This means that inline traffic is always inspected.
- **On (Never inspect inline traffic)**—Traffic bypasses the Analysis Engine and is not inspected. This means that inline traffic is never inspected.
- **Auto (Bypass inspection when analysis engine is stopped)**—Traffic flows through the sensor for inspection unless the monitoring process of the sensor is down. This is the default.

If the monitoring process of the sensor is down, traffic bypasses the sensor until the sensor is running again. The sensor then inspects the traffic. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor is being upgraded. Auto mode also helps to ensure traffic continues to pass through the sensor if the monitoring process fails.

## Configuring CDP Mode

You can configure the IPS sensor to enable or disable the forwarding of Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs).

Cisco Discovery Protocol is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment, including routers, access servers, bridges, and switches. Using CDP, a device can advertise its existence to other devices and receive information about other devices on the same LAN or on the remote side of a WAN. CDP runs on all media that support SNAP, including LANs, Frame Relay, and ATM media.

**Tip**

The CDP Mode setting is not available on all IPS appliances and service modules. If the CDP Mode field does not appear on the Interfaces policy, the setting does not apply to the device you are configuring.

To change the CDP mode setting on a device, follow these steps:

- Step 1** (Device view) Select the **Interfaces** policy from the Policy selector.
- Step 2** In the **CDP Mode** field at the bottom of the policy, select the desired option:
- **Forward CDP packets**—To allow CDP packets to pass through the sensor.
  - **Drop CDP packets**—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.

## Configuring Inline Interface Pairs

You can pair interfaces on your sensor if your sensor is capable of inline monitoring. For more information about inline pairs, see [Inline Interface Mode, page 37-3](#).

**Tip**

IPS modules for routers and ASA devices do not need an inline pair for monitoring. You only need to add the physical interface to a virtual sensor.

**Related Topics**

- [Understanding Interfaces, page 37-1](#)
- [Configuring Bypass Mode, page 37-12](#)
- [Configuring CDP Mode, page 37-13](#)
- [Configuring Physical Interfaces, page 37-10](#)
- [Configuring VLAN Groups, page 37-15](#)

- [Defining A Virtual Sensor, page 38-5](#)
- [Editing Policies for a Virtual Sensor, page 38-9](#)
- [Assigning Interfaces to Virtual Sensors, page 38-4](#)

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **Inline Pairs** tab.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add Interface Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit Interface Pair dialog box opens.

---

**Tip** You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline pair if there is an inline VLAN group. First delete the inline VLAN group from the VLAN Groups tab, and then delete the inline pair.

---

**Step 3** In the Add or Edit Inline Pairs dialog box, configure the following options:

- **Inline Interface Name**—The name you want to give to this inline pair. The name cannot be longer than 32 characters; alphanumeric and underscore characters are allowed. You cannot edit this name after you create the pair.
- **Interface 1 and 2**—Select the two physical interfaces that you want to form a pair. The lists include only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline pair, VLAN pair, or VLAN group.
- **Description**—An optional description for the pair.

**Step 4** Click **OK** to save your changes.

---

## Configuring Inline VLAN Pairs

Use the VLAN Pairs tab of the IPS Interfaces policy to configure the VLAN pairs for physical interfaces. The summary table displays the existing VLAN pairs for each physical interface. You can create multiple VLAN pairs on a single physical interface. For more information about inline VLAN pair mode, see [Inline VLAN Pair Mode, page 37-3](#).

### Tips

- You cannot create a VLAN pair for an interface if it is already part of an inline interface pair; create VLAN groups for inline interface pairs.
- To create an inline VLAN pair for an interface that is in promiscuous mode and assigned to a virtual sensor, you must first remove the interface from the virtual sensor (using the Virtual Sensors policy) and then create the inline VLAN pair.
- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.
- If your sensor does not support inline VLAN pairs, the VLAN Pairs pane is not displayed. IPS modules on routers and ASA devices do not support inline VLAN pairs.
- When using inline VLAN pairs, you should configure UniDirectional Link Detection (UDLD) on the connected switch that is hosting the VLANs. UDLD can help switches prevent spanning-tree forwarding loops and single direction links. For detailed information, see [Configuring UDLD in Installing and Using Intrusion Prevention System Device Manager](#).

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Pairs** tab.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Pair dialog box opens.

---

**Tip** You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline VLAN pair if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the inline VLAN pair.

---

**Step 3** In the Add or Edit VLAN Pairs dialog box, configure the following options:

- **Physical Interfaces**—Select the physical interface on which you are creating this VLAN pair. The list includes only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline interface pair or VLAN group. However, you can create multiple VLAN pairs on a single interface.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN pair on the selected physical interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the pair.
- **VLAN A, B**—The numbers of the two VLANs that you want to join as a pair. VLAN numbers are from 1 to 4095. You must enter different numbers, and the numbers must not already be part of another VLAN pair on the selected physical interface.

**Step 4** Click **OK** to save your changes.

---

## Configuring VLAN Groups

Use the VLAN Groups tab of the IPS Interfaces policy to configure the VLAN groups for physical interfaces and inline interface pairs (logical interfaces). The summary table displays the existing VLAN groups. You can create multiple VLAN groups on a single physical interface or inline interface pair. For more information about VLAN group mode, see [VLAN Group Mode, page 37-4](#).

A VLAN group consists of a group of VLAN IDs that exist on an interface. Each VLAN group consists of at least one VLAN ID. You can have up to 255 VLAN groups per interface (logical or physical). Each group can contain any number of VLAN IDs.

After you assign the VLAN IDs to the VLAN group, you must assign the VLAN group to a virtual sensor for it to be operational. You can assign a single group to at most one virtual sensor. Use the Virtual Sensors policy to make the assignment.

**Note**

VLAN groups are supported in IPS 6.0 and later only. Not all IPS appliances or service modules support VLAN groups. If the VLAN Groups tab does not appear in the Interfaces policy, the device you are configuring does not support the feature.

**Related Topics**

- [Understanding Interfaces, page 37-1](#)
- [Configuring Bypass Mode, page 37-12](#)
- [Configuring CDP Mode, page 37-13](#)
- [Configuring Physical Interfaces, page 37-10](#)
- [Defining A Virtual Sensor, page 38-5](#)
- [Editing Policies for a Virtual Sensor, page 38-9](#)
- [Assigning Interfaces to Virtual Sensors, page 38-4](#)

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Groups** tab.

The table shows the existing VLAN groups, including the interface for which the group is defined, the subinterface number, description (if any), and the VLANs assigned to the group. If the VLANs cell is empty, the group is defined for all unassigned VLANs on the interface.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Group dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Group dialog box opens.

**Tip**

You can also delete a group by selecting it and clicking the **Delete Row** button. You cannot delete a VLAN group if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the VLAN group.

**Step 3** In the Add or Edit VLAN Group dialog box, configure the following options:

- **Physical and Logical Interfaces**—Select the physical interface or inline interface pair for which you are creating this VLAN group. The list includes only unpaired physical interfaces (defined on the Physical Interfaces tab) that do not already have inline VLAN pairs defined, or inline interface pairs that are defined on the Inline Pairs tab. You can create multiple VLAN groups on a single interface. Keep the following in mind:
  - If you select a physical interface, you are creating a promiscuous VLAN group.
  - If you select a logical interface, you are creating an inline VLAN group.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN group on the selected interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the group.
- **VLAN assignment**—Select one of the following options:
  - **All Unassigned VLAN IDs**—The group contains all VLANs that are not assigned to other VLAN groups. This is the default option

- **Range of free VLAN IDs**—The group contains specific VLANs. In the **Range** box, enter any combination of single VLAN IDs or ranges (separate starting and ending ID with a hyphen), and separate multiple entries with commas. For example, 10, 12-25, 33-49. VLAN numbers are from 1 to 4095.

The VLAN ID cannot already be in another VLAN group for the selected interface. The VLANs also must be configured on the connected switch or there will be no traffic to inspect.

**Step 4** Click **OK** to save your changes.

---

## Configuring Virtual Sensors

### Note

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

All IPS devices and service modules have a base virtual sensor named vs0. When you configure the IPS appliance or service module, you must configure the base vs0 sensor to assign interfaces to it. This assignment tells the device which interfaces to inspect. There are also other settings that are configured on virtual sensors.

In addition to the base vs0 virtual sensor, many IPS appliances and service modules allow you to create user-defined virtual sensors. You can use these virtual sensors to create separate policies for traffic, so that a single physical sensor can act as if it were multiple sensors. A virtual sensor is a logical grouping of sensing interfaces and the configuration policy for the signature engines and event action filters to apply.

This chapter contains the following topics:

- [Understanding the Virtual Sensor, page 38-1](#)
- [Defining A Virtual Sensor, page 38-5](#)
- [Editing Policies for a Virtual Sensor, page 38-9](#)
- [Deleting A Virtual Sensor, page 38-10](#)

## Understanding the Virtual Sensor

The sensor can receive data inputs from one or many monitored data streams. These monitored data streams can either be physical interface ports or virtual interface ports. For example, a single sensor can monitor traffic from in front of the firewall, from behind the firewall, or from in front of and behind the firewall concurrently. A single sensor can monitor one or more data streams. In this situation a single sensor policy or configuration is applied to all monitored data streams.

With virtual sensors, you can create separate policies to apply to specific traffic feeds. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

You configure the following policies and settings separately for a virtual sensor:

- Signature and signature settings (policies in the IPS > Signatures folder).
- Event action policies (policies in the IPS > Event Actions folder).

- Anomaly detection policies (the IPS > Anomaly Detection policy) and the anomaly detection mode (in the Virtual Sensors policy).
- The promiscuous interfaces, inline interface pairs, inline VLAN pairs, inline VLAN groups, or promiscuous VLAN groups that the virtual sensor monitors.

**Note** No packet is processed by more than one virtual sensor; you cannot assign the same physical or logical interface to more than one sensor. Packets from interfaces, inline interface pairs, inline VLAN pairs, and VLAN groups that are not assigned to any virtual sensor are disposed of according to the inline bypass configuration that you define in the **Interfaces** policy.

- The inline TCP session tracking and Normalizer modes (in the Virtual Sensors policy).

**Note**

If you create a policy instance on an IPS device for signatures, event actions, or anomaly detection but do not assign it to any of the virtual sensors on that device (that is, you do not use that policy instance), then that policy instance is deleted by Security Manager during deployment.

All other policies and settings are configured on the parent device that hosts the virtual sensor. For example, if you want to use global correlation, you configure it on the parent device and the virtual sensors share that configuration.

You can configure up to four virtual sensors on one appliance, but you can add only three user-defined virtual sensors. The first virtual sensor, vs0, is the base sensor and you cannot delete it. In Security Manager, virtual sensors are presented as follows:

- The device selector in Device view contains the parent device, which doubles as the base virtual sensor, vs0. Select this device to configure all device-level policies and to create virtual sensors in the Virtual Sensors policy.
- Any user-defined virtual sensors are also shown in the device selector in Device view. The display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob\_vs1.”

To configure the signature, anomaly detection, and event action policies for a virtual sensor, you must select it in the device selector. You cannot configure these policies by selecting the parent device; those policies on the parent device are for the vs0 base sensor.

The following topics explain more about virtual sensors:

- [Advantages and Restrictions of Virtualization, page 38-3](#)
- [Inline TCP Session Tracking Mode, page 38-3](#)
- [Understanding Normalizer Mode, page 38-4](#)
- [Assigning Interfaces to Virtual Sensors, page 38-4](#)
- [Identifying the Virtual Sensors for a Device, page 38-5](#)
- [Defining A Virtual Sensor, page 38-5](#)
- [Editing Policies for a Virtual Sensor, page 38-9](#)
- [Deleting A Virtual Sensor, page 38-10](#)

## Advantages and Restrictions of Virtualization

An advantage of using virtual sensors is that you can operate more than one virtual sensor on one appliance while configuring each virtual sensor differently with regard to signature behavior and traffic feed. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

Virtualization has the following advantages:

- You can apply different configurations to different sets of traffic.
- You can monitor two networks with overlapping IP spaces with one sensor.
- You can monitor both inside and outside a firewall or NAT device.

Virtualization has the following restrictions:

- You must assign both sides of asymmetric traffic to the same virtual sensor.
- Using VACL capture or SPAN (promiscuous monitoring) is inconsistent with regard to VLAN tagging, which causes problems with VLAN groups.
  - When using Cisco IOS software, a VACL capture port or a SPAN target does not always receive tagged packets even if it is configured for trunking.
  - When using the MSFC, fast path switching of learned routes changes the behavior of VACL captures and SPAN.
- Persistent store is limited.
- Not all IPS sensors support multiple virtual sensors. The Virtual Sensors policy appears for all IPS appliances and service modules, because you must use it to assign interfaces to the base vs0 sensor. If the Add button in the policy is disabled for a device, and you have not configured user-defined virtual sensors, then the device does not support virtualization. Examples of devices that do not support virtualization include the Cisco IPS 4215, NM-CIDS, AIM-IPS, NME-IPS, and AIP-SSC. IDSM2 supports virtualization, but it does not support VLAN groups or inline interface pairs.
- You must use IPS 6.0+ software. Older software versions do not support virtualization.
- Cisco IOS IPS devices do not support virtualization. Use the **IPS > Interface Rules** policy to specify the interfaces that IPS should monitor.

Virtualization has the following traffic capture requirements:

- The virtual sensor must receive traffic that has 802.1q headers (other than traffic on the native VLAN of the capture port).
- The sensor must see both directions of traffic in the same VLAN group in the same virtual sensor for any given sensor.

## Inline TCP Session Tracking Mode

When you choose to modify packets inline, if the packets from a stream are seen twice by the Normalizer engine, it cannot properly track the stream state and often the stream is dropped. This situation occurs most often when a stream is routed through multiple VLANs or interfaces that are being monitored by

the IPS. A further complication in this situation is the necessity of allowing asymmetric traffic to merge for proper tracking of streams when the traffic for either direction is received from different VLANs or interfaces.

To deal with this situation, you can set the mode so that streams are perceived as unique if they are received on separate interfaces or VLANs (or the subinterface for VLAN pairs).

The following inline TCP session tracking modes apply:

- **Interface and VLAN**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **VLAN Only**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **Virtual Sensor**—All packets with the same session key (AaBb) within a virtual sensor belong to the same session. This is the default and almost always the best option to choose.

You configure the inline TCP session tracking mode as a property of the virtual sensor as described in [Defining A Virtual Sensor, page 38-5](#).

## Understanding Normalizer Mode

Normalizer mode applies only when the sensor is operating in inline mode. The default is strict evasion protection, which is full enforcement of TCP state and sequence tracking. The Normalizer enforces duplicate packets, changed packets, out-of-order packets, and so forth, which helps prevent attackers from evading the IPS.

Asymmetric mode disables most of the Normalizer checks. Use Asymmetric mode only when the entire stream cannot be inspected, because in this situation, attackers can now evade the IPS.

You configure the Normalizer mode as a property of the virtual sensor as described in [Defining A Virtual Sensor, page 38-5](#).

## Assigning Interfaces to Virtual Sensors

An IPS sensor monitors traffic that traverses interfaces, interface pairs, or VLAN pairs assigned to a virtual sensor.

You can assign one or more of the following types of interfaces to a virtual sensor:

- **Promiscuous interface**—A physical interface that does not have VLAN groups and which is not part of an inline interface pair.
- **Inline interface pair**—A logical interface composed of two physical interfaces.
- **Inline VLAN pair**—A logical interface composed of two VLANs.
- **Promiscuous VLAN group**—A VLAN group that is assigned to a subinterface on a physical interface.

The physical interface cannot already be used for an inline interface or VLAN pair. There can be many promiscuous VLAN groups on the same promiscuous interface, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to a promiscuous interface, it is no longer a plain promiscuous interface and can only be used for promiscuous VLAN groups.

- **Inline VLAN group**—A VLAN group that is assigned to a subinterface of an inline interface pair.

There can be many inline VLAN groups on the same inline interface pair, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to an inline interface pair it is no longer a plain inline interface pair and can only be used for inline VLAN groups.

VLAN groups cannot be assigned to inline VLAN pairs.

You must configure the interfaces before you can assign them to virtual sensors. For more information about configuring all of these types of interfaces, see [Configuring Interfaces, page 37-6](#). For information on assigning interfaces to virtual sensors, see [Defining A Virtual Sensor, page 38-5](#).

## Identifying the Virtual Sensors for a Device

If you configure user-defined virtual sensors on an IPS appliance or service module, the virtual sensor appears in the device selector in Device view.

Normally, the display name of a virtual sensor is in the form *device-name\_virtual-sensor-name*, where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10\_vs1.

Thus, under normal conditions, the virtual sensors for a device should appear immediately after the parent device in the device selector. However, you can change the virtual sensor's display name by editing the device properties. If you alter the default name, the virtual sensors might not appear anywhere near the parent device in the device selector.

You can use the following techniques to identify the virtual sensors defined on a device, or to identify the parent device of a virtual sensor:

- To see a list of virtual sensors defined on an IPS device, select the **Virtual Sensors** policy on the device. The table shows all virtual sensors, including the base vs0 sensor. Note that the vs0 sensor does not appear separately in the device selector; it is represented by the parent device itself.

Unless you radically alter the display names of virtual sensors, the virtual sensor name, along with the parent device's display name, should help you find the virtual sensor in the device selector.

- To determine which IPS device is the host of a virtual sensor, right-click the virtual sensor in the device selector and select **Device Properties**. The Hostname display-only field on the General tab shows the host device display name plus the virtual sensor name as defined on the device.

## Defining A Virtual Sensor

Use the Virtual Sensors policy to configure virtual sensors on your Cisco IPS devices. Even if your IPS device does not support multiple virtual sensors, you must use this policy to assign interfaces to the base sensor, vs0, and configure properties that are associated with the virtual sensor.

**Tip**

---

For Cisco IOS IPS devices, you configure the interfaces that the IPS examines in the **IPS > Interface Rules** policy. You cannot configure virtual sensors in an IOS IPS device.

---

### Before You Begin

Configure the interfaces on the sensor, including inline interface pairs, inline VLAN pairs, and promiscuous and inline VLAN groups. The interface configurations must exist before you can assign them to a virtual sensor. For information on interfaces, interface modes, and how to configure them, see [Chapter 37, "Managing IPS Device Interfaces"](#).

**Related Topics**

- [Understanding Interfaces, page 37-1](#)
- [Understanding Interface Modes, page 37-2](#)
- [Advantages and Restrictions of Virtualization, page 38-3](#)
- [Inline TCP Session Tracking Mode, page 38-3](#)
- [Understanding Normalizer Mode, page 38-4](#)
- [Assigning Interfaces to Virtual Sensors, page 38-4](#)
- [Identifying the Virtual Sensors for a Device, page 38-5](#)
- [Editing Policies for a Virtual Sensor, page 38-9](#)

---

**Step 1** (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.

The policy lists all existing virtual sensors, including the base vs0 sensor, which you cannot delete. The information for each sensor shows the interfaces assigned to the sensor, anomaly detection mode, inline TCP tracking mode, normalizer mode, and a description, if any. If the Assignments cell is empty, no interfaces are assigned to the virtual sensor, which means the virtual sensor cannot analyze any traffic.

**Step 2** Do one of the following:

- To add a virtual sensor, click the **Add Row** button. The Add Virtual Sensor dialog box opens.  
You can add at most three sensors. The device supports four virtual sensors, including the base vs0 sensor. If the Add Row button is disabled, you either have configured the maximum number of sensors, or your device does not support multiple virtual sensors.
- To edit a virtual sensor, select it and click the **Edit Row** button. The Edit Virtual Sensor dialog box opens.

---

**Tip** You can also delete a virtual sensor by selecting it and clicking the **Delete Row** button. You cannot delete the base vs0 sensor. For more information about deleting virtual sensors, see [Deleting A Virtual Sensor, page 38-10](#).

---

**Step 3** In the Add or Edit Virtual Sensor dialog box, configure at least the following options. The defaults for the other options are appropriate in most cases. For detailed information on all available options, see [Virtual Sensor Dialog Box, page 38-7](#).

- Virtual Sensor Name—The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces.
- Interface assignments (Available, Assigned lists)—The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor.
  - To assign interfaces, select them in the available list and click >>.
  - To remove an assignment, select the interface in the assigned list and click <<. You must remove an assignment before you can assign an interface to a different virtual sensor.

**Tip:** If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.

**Step 4** Click **OK** to save your changes and add them to the Virtual Sensors policy.

**Step 5** Click **Save** to save the Virtual Sensors policy.

- Step 6** If you created a new virtual sensor, you must submit your changes to the database for the new virtual sensor to appear in the device selector in Device view.
- Non-Workflow mode—Select **File > Submit**.
  - Workflow mode—Select **Activities > Approve Activity**, or if you are operating with an activity approver, **Activities > Submit Activity**. The activity must be approved before the virtual sensor appears in the device selector.

**Note** In the device selector, the display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob\_vs1.”

- Step 7** To configure the policies associated with a virtual sensor, select it in the device selector in Device view. You can then configure the associated policies. See the following topics:
- [Chapter 39, “Defining IPS Signatures”](#)
  - [Chapter 40, “Configuring Event Action Rules”](#)
  - [Configuring Anomaly Detection, page 41-6](#)

## Virtual Sensor Dialog Box

Use the Add or Edit Virtual Sensor dialog box to configure the properties for a virtual sensor.

### Navigation Path

(Device view only.) Select **Virtual Sensors** from the Policy selector. Click the **Add Row** button, or select an existing virtual sensor and click the **Edit Row** button.

You must remove an assignment before you can assign an interface to a different virtual sensor.</li> </ul> <p><b>Tip</b> If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.</p>                                                                |
| Anomaly Detection Mode                         | <p>The mode that you want the anomaly detection policy to operate in for this virtual sensor: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see <a href="#">Anomaly Detection Modes, page 41-2</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Inline TCP Session Tracking Mode               | <p>The mode used to segregate multiple views of the same stream if the same stream passes through the sensor more than once. The default mode is Virtual Sensor. For more information, see <a href="#">Inline TCP Session Tracking Mode, page 38-3</a>. Select one of the following:</p> <ul style="list-style-type: none"> <li>Interface and VLAN—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.</li> <li>VLAN Only—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.</li> <li>Virtual Sensor—All packets with the same session key (AaBb) within a virtual sensor belong to the same session.</li> </ul> |

Table 38-1 Add or Edit Virtual Sensor Dialog Box (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Normalizer Mode | <p>The type of Normalizer mode you need for traffic inspection. For more information, see <a href="#">Understanding Normalizer Mode, page 38-4</a>.</p> <ul style="list-style-type: none"> <li>• <b>Strict Evasion Protection</b>—(Default) If a packet is missed for any reason, all packets after the missed packet are not processed. Strict evasion protection provides full enforcement of TCP state and sequence tracking.</li> </ul> <p>Any out-of-order packets or missed packets can produce Normalizer engine signatures 1300 or 1330 firings, which try to correct the situation, but can result in denied connections.</p> <ul style="list-style-type: none"> <li>• <b>Asymmetric Mode Protection</b>—Can only see one direction of bidirectional traffic flow. Asymmetric mode protection relaxes the evasion protection at the TCP layer.</li> </ul> <p>Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.</p> |
| Description     | The description of the virtual sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Editing Policies for a Virtual Sensor

Virtual sensors have two types of policies: the virtual sensor's properties, and policies assigned to the virtual sensor. You use a different approach to edit these items.

- To edit the properties of a virtual sensor, select the virtual sensor's parent device in the device selector in Device view. Then, select the **Virtual Sensors** policy. You can then select the virtual sensor in the table and click the **Edit Row** button.

Using the Virtual Sensors policy, you can change the interfaces assigned to a sensor, the anomaly detection mode, inline TCP session tracking mode, and Normalizer mode. For more information, see the following topics:

- [Defining A Virtual Sensor, page 38-5](#)
- [Virtual Sensor Dialog Box, page 38-7](#)

- To edit the policies assigned to a virtual sensor, select the virtual sensor in the device selector in Device view. A virtual sensor's name is in the form *device-name\_virtual-sensor-name*, where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10\_vs1.

**Note** The base virtual sensor, vs0, is integrated with the parent device and does not appear separately in the device selector. To configure the base virtual sensor, select the parent device.

You can then select the policies in the Policies selector and configure them. For more information, see the following topics:

- [Chapter 39, “Defining IPS Signatures”](#)

- [Chapter 40, “Configuring Event Action Rules”](#)
- [Configuring Anomaly Detection, page 41-6](#)

All other policies are configured on the parent device, and the configurations apply to all virtual sensors configured on the device.

## Deleting A Virtual Sensor

Virtual sensors appear in the device selector in Device view. However, you cannot delete them from the selector using the same command used for other devices. Instead, you must delete the virtual sensor from the Virtual Sensors policy of the parent device, that is, the device on which the virtual sensor is defined. The following procedure explains how to delete a user-defined virtual sensor.

### Tip

The base virtual sensor, vs0, does not appear in the device selector. Instead, it is represented by the parent IPS sensor; it is considered to be the base IPS device. To delete the base vs0 sensor, you delete the entire device from the inventory. For information on deleting devices from the inventory, see [Deleting Devices from the Security Manager Inventory, page 3-59](#).

### Before You Begin

When you delete a virtual sensor, you also delete the policies defined for the sensor, such as signature, event action, and anomaly detection policies. If you configured non-default local policies, and you want to preserve them for use on other virtual sensors, you must first convert the local policies to shared policies. Then, after you delete the virtual sensor, the policies continue to exist as unassigned shared policies. You can then assign them to another virtual sensor. For more information on creating a shared policy from a local policy, see [Sharing a Local Policy, page 5-41](#).

Using this technique is ideal if you are deleting a virtual sensor simply as a means to change the virtual sensor's name. Because you cannot change a virtual sensor's name, you must delete it and create a new virtual sensor with the desired name. If you created shared policies, you could then assign those shared policies to your new sensor, and it will have the same configuration as the sensor had under the old name.

**Step 1** (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.

**Step 2** Select the user-defined virtual sensor that you want to delete and click the **Delete Row** button.

**Step 3** You are asked for a two-step confirmation. First, you are warned that you must save the policy to keep the policy and device synchronized. Click **OK** to continue, and you are also asked to confirm that you want to delete the node.

If you confirm, the virtual sensor is removed from both the policy and the device selector. It will take a few moments before the device view is updated and the virtual sensor disappears from the list of devices.

## Defining IPS Signatures

---

### Note

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

---

You can use Security Manager to configure IPS signatures for dedicated IPS appliances and service modules or Cisco IOS IPS devices. When configuring signatures for Cisco IOS IPS, keep in mind that the router cannot use as many signatures as a dedicated appliance or service module.

This chapter contains the following topics:

- [Understanding Signatures, page 39-1](#)
- [Configuring Signatures, page 39-4](#)
- [Configuring Signature Settings, page 39-30](#)

## Understanding Signatures

Network intrusions are attacks on, or other misuses of, network resources. Cisco IPS sensors and Cisco IOS IPS devices use a signature-based technology to detect network intrusions. A signature specifies the types of network intrusions that you want the sensor to detect and report. As sensors scan network packets, they use signatures to detect known types of attacks, such as denial of service (DoS) attacks, and respond with actions that you define.

On a basic level, signature-based intrusion detection technology can be compared to virus-checking programs. Cisco IPS contains a set of signatures that the sensor compares with network activity. When a match is found, the sensor takes some action, such as logging the event or sending an alarm to the Security Manager Event Viewer.

Signatures can produce false positives, because certain normal network activity can be construed as malicious. For example, some network applications or operating systems may send out numerous ICMP messages, which a signature-based detection system might interpret as an attempt by an attacker to map out a network segment. You can minimize false positives by editing your signature parameters (tuning your signatures).

To configure a sensor to monitor network traffic for a particular signature, you must enable the signature. By default, the most critical signatures are enabled when you install the signature update. When an attack is detected that matches an enabled signature, the sensor generates an alert, which is stored in the event store of the sensor. The alerts, as well as other events, may be retrieved from the event store by web-based clients such as Event Viewer. By default the sensor logs all Informational alerts or higher.

Some signatures have subsignatures, that is, the signature is divided into subcategories. When you configure a subsignature, changes made to the parameters of one subsignature apply only to that subsignature. For example, if you edit signature 3050 subsignature 1 and change the severity, the severity change applies to only subsignature 1 and not to 3050 2, 3050 3, and 3050 4.

Cisco IPS contains over 10,000 built-in default signatures. You cannot rename or delete signatures from the list of built-in signatures, but you can retire signatures to remove them from the sensing engine. You can later activate retired signatures; however, this process requires the sensing engines to rebuild their configuration, which takes time and could delay the processing of traffic. You can tune built-in signatures by adjusting several signature parameters. Built-in signatures that have been modified are called tuned signatures.

**Note**

---

We recommend that you retire any signatures that you are not using. This improves sensor performance.

---

You can create signatures, which are called custom signatures. Custom signature IDs begin at 60000. You can configure them for several things, such as matching of strings on UDP connections, tracking of network floods, and scans. Each signature is created using a signature engine specifically designed for the type of traffic being monitored.

For more about signatures, see:

- [Obtaining Detailed Information About a Signature, page 39-2](#)
- [Understanding Signature Inheritance, page 39-3](#)

**Related Topics**

- [Configuring Signatures, page 39-4](#)
- [Chapter 42, “Configuring Global Correlation”](#)

## Obtaining Detailed Information About a Signature

You can find detailed information about each signature from the [Cisco Security Intelligence Operations](#) web site. The web site includes a wealth of information and best practice recommendations for network security, and you can set up IntelliShield alerts. There is education on advanced security topics to help you protect your network, prioritize remediation, and structure your systems to reduce organizational risk.

When you edit the Signatures policy in Security Manager (see [Signatures Page, page 39-4](#)), the signature ID is linked directly into the Cisco Security Intelligence Operations database of IPS signatures. Clicking a signature ID opens a page containing information about the signature, including a description, the vulnerabilities on which the signature is based, when the signature was created, and so forth. You can search this database yourself at <http://tools.cisco.com/security/center/search.x?search=Signature>. (The database was formerly called the Cisco Network Security Database or NSDB.)

If you do not have access to Cisco.com, then the signature ID is linked to a local copy of the signature database information. Security Manager detects whether you have access to Cisco.com and makes the appropriate link for you without your having to set a preference.

The database includes information only for built-in, default signatures. You cannot find information about custom (user-defined) signatures.

Beginning with Security Manager 4.4, the Signatures Page (IPS > Signatures > Signatures) contains an Explanation tab and a Related Threats tab for each signature. These tabs display detailed information in a separate window on the Signatures page. For example, the Explanation tab displays Description, Signature ID, and so forth; the Related Threats tab displays vulnerabilities for other software that you may be using, and so forth.

**Tip**

If this window is not visible to you, expand it with the up arrow button in the bottom-left corner of the Signatures page. To hide this window, collapse it with the corresponding down arrow, also in the bottom-left corner of the Signatures page. You can resize this window with standard controls.

## Understanding Signature Inheritance

Signature inheritance for IPS devices is different than for any other Security Manager rules-based policy. Inheritance refers to the capability of Security Manager to enforce hierarchical lists of first-match, rule-based policies such as access rules. Signature inheritance is different because for IPS devices, Security Manager allows inheritance on a per-signature basis.

This example shows what is meant by inheritance on a per-signature basis:

- 
- Step 1** In Policy View, select **IPS > Signatures > Signatures**.
  - Step 2** Create a policy named test1.
  - Step 3** Create a second policy, named test2.
  - Step 4** Right-click **test 2** and select **Inherit Signatures**. The Inherit Rules—test 2 dialog box appears.
  - Step 5** Select **test1** and click the **OK** button.
  - Step 6** Select **test1** and edit a signature. Note the edit that you made and save your change.
  - Step 7** Select **test2** and select the signature that you just edited. Observe that test2 inherited the editing that you did on test1.
- 

## IPS Signature Purge

Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database.

**Note**

As a result of the purge operation, you may notice the deletion of some of your unused tuning contexts.

Some of the purged signatures may be restored during your next download of IPS signature packages from Cisco.com.

IPS signature purge is disabled by default. To enable IPS signature purge,

- 
- Step 1** Stop the Cisco Security Manager Daemon Manager: At the command prompt, enter **net stop crmdmgtd**.
  - Step 2** Navigate to `NMSROOT\MDC\ips\etc\sensorupdate.properties` file, where `NMSROOT` is the path to the Security Manager installation directory. The default is `C:\Program Files\CSCOpX`.

- Step 3** In `sensorupdate.properties`, change `purgeUnusedSignaturesEntriesinDB:false` to `purgeUnusedSignaturesEntriesinDB:true`.
- Step 4** Re-start the Cisco Security Manager Daemon Manager: At the command prompt, enter **net start crmdmgttd**.
- IPS signature purge now runs at midnight every day.
- 

## Configuring Signatures

The Signatures policy is where you configure signatures for Cisco IPS sensors and Cisco IOS IPS devices.

This section contains the following topics:

- [Signatures Page, page 39-4](#)
- [Viewing Signature Update Levels, page 39-13](#)
- [Enabling and Disabling Signatures, page 39-14](#)
- [Editing Signatures, page 39-14](#)
- [Adding Custom Signatures, page 39-19](#)
- [Cloning Signatures, page 39-21](#)
- [Regular Expressions in Custom Signatures, page 39-22](#)
- [Editing Signature Parameters \(Tuning Signatures\), page 39-23](#)

## Signatures Page

Use the Signatures page to display the signature summary table, in which you can add, edit, and delete IPS signatures. From this page you can tune the active signature set in a policy by enabling or disabling signatures. You can also use this page to unload signatures from the engine.

Beginning with Version 4.6, Security Manager enables you to apply a signature threat profile to one or more signature policies, starting from IPS device version 7.3(1). A signature threat profile is a predefined signature template that includes customized tunings. These tunings adjust the signature coverage and response actions to enable the sensor to make better choices in various deployment and threat scenarios. This Signatures page displays the threat profile and its version, that has been applied to the policy. Click the **To Change** button to select a threat profile to apply to the policy. For more information, see [Apply Signature Threat Profiles, page 39-9](#). To see the signatures that belong to a threat profile, filter the Source column to contain the text **Threat Profile**. For information about how to filter tables, see [Filtering Tables, page 1-48](#)

If you download a particular signature package that does not contain one or more of the threat profiles already created in shared signature policy, Security Manager displays the warning message "**Currently applied threat profile is not applicable to this signature version**" on the shared signature Policy View. Similarly on the Device View, Security Manager displays the same warning message if you try to apply the shared signature policy to an unsupported device.

Since threat profile updates cannot be performed separately, you must update the current signature version of the device if you want to update its threat profile version. Note that any update made to a threat profile version modifies the signatures associated with the threat profiles, but retains any user-defined signature tuning already performed by the user.

**Note**

Threat profiles are not supported in IOS-IPS.

**Tips**

- Enabled and disabled signatures are indicated by the "Enabled" checkbox for a particular signature. In previous releases of Security Manager, disabled signatures were indicated by hash marks covering the table row. When you deploy the configuration, disabled signatures are removed from the device. For more information, see [Enabling and Disabling Signatures, page 39-14](#).
- For many columns, you can right-click the column and edit the property directly. Your edits apply to all rows that you have selected. If you select more than one row, the options that you can select are limited to those that are valid for all selected rows. The contents of the right-click menu differ on the basis of the cell that you right-click. For more information on the available commands, see [Signature Shortcut Menu, page 39-10](#).
- To show or hide a column, right-click the table heading row on the signature summary table and then click **Show Columns**. By default, all columns are shown.

**Note**

Beginning with Version 4.5, Security Manager has a Notes column for each signature; this feature enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. This feature is helpful for network administrators in monitoring noisy signatures or signatures that need particular attention. However, the Notes column may not appear by default after you restore a Security Manager database. To show the Notes column, right-click the table heading row on the signature summary table, then click **Show Columns**, and finally click **Notes**. You may discover this situation during installation of Security Manager if you back up and restore the database; however, this situation will not occur during inline upgrades.

**Navigation Path**

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

| <b>Element</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID             | The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature. Click the ID number to open a page in your web browser with detailed information about the signature, as explained in <a href="#">Obtaining Detailed Information About a Signature</a> , page 39-2. |
| Sub            | The subsignature ID, which is the unique numerical value assigned to this subsignature. A Subsignature ID identifies a more granular version of a broad signature.                                                                                                                                                                                |
| Name           | The name assigned to the signature.                                                                                                                                                                                                                                                                                                               |
| Enabled        | A checkbox indicating whether the signature is enabled or disabled in this policy. A signature must be enabled for the sensor to protect against the traffic specified by the signature.                                                                                                                                                          |
| Severity       | The severity level that the signature reports: High, Medium, Low, or Informational.                                                                                                                                                                                                                                                               |
| Fidelity       | The weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                                                                                                                                                              |

Table 39-1 Signature Policy (continued)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes   | <p>Enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. This feature is helpful for network administrators in monitoring noisy signatures or signatures that need particular attention.</p> <p>Notes are not saved to the device during deployment to the device. Notes as described here are a Security Manager GUI feature only and are disregarded during deployment to the device, as they are not part of any IPS policy in Security Manager.</p> <p>Notes are not part of any IPS policy, so assignment or inheritance of a shared signature policy will have no effect on Notes.</p> <p>Right-clicking a signature and adding notes will not prompt for activity/ticket creation. However, adding notes by double-clicking a signature or clicking the Edit button will prompt for activity/ticket creation because this involves signature policy modification.</p> <p>Notes cannot be added to signatures as part of a signature update operation. Other parameters can be edited, though.</p> <p>Notes cannot be searched by the Global Search feature.</p> <p>The Notes column will not display the Notes text. Only an icon will be displayed. You must double-click the icon to display the Notes text.</p> <p>If you use the "Export to File" button, then in the resultant .csv file, the Notes column will display only Y or N, and in this way signifies that those signatures were annotated. The actual text will not be exported.</p> <p>Notes cannot be edited. All added notes are appended to the existing notes as a new note entry. You can of course delete the note and add the updated note afresh.</p> <p>To add a note, right-click the row for a particular signature and then click <b>Add Note</b>. After you add the note, click <b>Save</b> and then close the Notes dialog box. After you close the Notes dialog box, the row for a particular signature will display a "Note" icon.</p> <p>To add a note to more than one signature, select the signatures you want (Shift-click or Ctrl-click in Windows) and proceed as you would for one particular signature.</p> <p>Notes can be local or shared. If you add a note to a device with only local policies, you can add, edit, and delete only local notes. If you add a note to a device with a shared policy assigned, you can add, edit, and delete both local and shared notes—check the <b>Share this Note</b> option. However, you can add notes only to <i>that particular device</i> (i.e., local override of notes) even if a shared policy is assigned.</p> <p><b>Tip</b> If you have a shared policy assigned to a device and want to add the notes only to that device for a particular signature without affecting the shared policy, then you need to add the notes without choosing the <b>Share this Note</b> option in Device View.</p> <p><b>Tip</b> You can also work with notes in the Edit Signature dialog box. Refer to Edit Button later in this table.</p> |

Table 39-1 Signature Policy (continued)

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Base RR                                         | The base risk rating value of the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Actions                                         | The actions the sensor takes when this signature fires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source                                          | <p>The lowest policy in the inheritance hierarchy that overrides the settings for a signature. Values can be:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—The signature uses the default Cisco-defined settings.</li> <li>• <b>Local</b>—The signature is defined specifically for the selected device (Device view only.)</li> <li>• <b>Policy name</b>—The lowest shared policy in the inheritance hierarchy. You can see policy names in Policy view, or in Device view if you assign a shared signature policy to the device.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Retired                                         | <p>The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine.</p> <p><b>Timesaver</b> Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device.</p> <p>If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired.</p> <p>If the engine level of a signature policy is equal to E-4, the Retired field has four possible values:</p> <ul style="list-style-type: none"> <li>• <b>false</b>—The signature is not retired.</li> <li>• <b>low-mem-retired</b>—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 GB RAM or less.</li> <li>• <b>med-mem-retired</b>—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 GB RAM or less, but more than 2 GB RAM. (Any device with more than 4 GB RAM is considered a high-memory platform.)</li> <li>• <b>true</b>—The signature is retired on all platforms.</li> </ul> <p>When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired.</p> <p><b>Tip</b> The term <i>engine level</i> used here is not the same as the term <i>engine</i> in the row above.</p> |
| Engine                                          | The engine that parses and inspects the traffic specified by this signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| View Update Level button<br>(Device view only.) | Click this button view the signature update level for this device. For more information, see <a href="#">Viewing Signature Update Levels, page 39-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 39-1** Signature Policy (continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Export to File button | Click this button to export the signature summary for the current device to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.                                                                                                                     |
| Add button            | Click this button to add a custom signature. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Adding Custom Signatures, page 39-19</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 39-15</a></li> </ul>                                      |
| Edit button           | Click this button to edit the selected signature. You can edit one signature at a time. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Editing Signatures, page 39-14</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 39-15</a></li> </ul> |
| Delete button         | Click this button to delete the selected custom signatures.<br><br>You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.                                                                                                                               |

## Apply Signature Threat Profiles

Use the Apply Threat Profile dialog box to select a signature threat profile from the available profiles and apply to the policy. Applying a threat profile modifies only the **Enabled** and **Retired** fields on the [Signatures Page, page 39-4](#). After you have applied a particular threat profile to a policy, the corresponding signature tunings are merged with the existing signatures on the Signatures page. To see the signatures that belong to a threat profile, on the Signatures page, filter the Source column to contain the text **Threat Profile**. For information about how to filter tables, see [Filtering Tables, page 1-48](#)

Select any of the following threat profiles that are currently provided by Cisco:

- **SCADA**—Select this threat profile template if you are using the Cisco IPS device primarily to protect industrial control systems. In addition to signatures in the default set, SCADA signature template includes specialized signatures for general SCADA protocol detections and specific identifiers that address tools and environments common to most device controlled environments.
- **Edge**—Select this threat profile template if you are using the Cisco IPS device primarily for securing an internet connection. In addition to signatures in the default set, Edge signature template includes additional signatures that provide broader protection for desktop operating systems, web browsers, web technologies, and common desktop applications.
- **Web\_Applications**—Select this threat profile template if you are using the Cisco IPS device primarily for protecting web server farms. In addition to signatures in the default set, Web\_Applications signature template includes additional signatures that provide broader protection for web servers, web development tools and frameworks, content management systems, load balancers, and databases.
- **Data Center**—Select this threat profile template if you are using the Cisco IPS device primarily for protecting data centers. In addition to signatures in the default set, Data Center signature template includes additional signatures that provide broader protection for server operating systems, web servers, application servers, databases, content management systems, messaging servers and virtualization systems.

**Note**

Any signature tuning performed by the user on Local signatures (signatures defined for a selected device and for which the source policy is Local) will be preserved over the threat profile. For Default signatures, the threat profile tunings will be preserved.

**Navigation Path**

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS devices) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.

**Field Reference**

**Table 39-2 Threat Profile Details**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signature ID     | The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Sub Signature ID | The sub signature ID, which is the unique numerical value assigned to this sub signature. A sub signature ID identifies a more granular version of a broad signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enabled          | Indicates whether the signature is enabled or disabled in this threat profile. A signature must be enabled for the sensor to protect against the traffic specified by the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Retired          | Indicates whether the signature is retired or active in this threat profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Has Conflict     | Indicates whether a signature with tunings from the applied threat profile also has tunings performed by the user. Signatures that are tuned by the user and by the applied threat profile are flagged as True in the Has Conflict column. If there is no conflict between the applied threat profile and user tunings for a signature, the Has Conflict column for that signature shows False.<br><br><b>Note</b> Any signature tuning performed by the user on Local signatures (signatures defined for a selected device and for which the source policy is Local) will be preserved over the threat profile. For Default signatures, the threat profile tunings will be preserved. |

## Signature Shortcut Menu

Right-clicking inside the signature summary table in the Signatures policy displays a shortcut menu for performing various functions on the selected signatures. Some commands appear only if you select a single signature, while some commands can be used on more than one signature at a time; your changes apply to all selected signatures. For more information about the Signatures policy, see [Signatures Page, page 39-4](#).

Additionally, the available commands differ depending on which cell you right click. Some commands are available when right-clicking any cell, while others are specific to a single cell.

Tip

When you use a right-click command to change the value in a cell of a Default signature, the signature is converted to a Local signature in Device view or a shared-policy-specific signature in Policy view.

The following table explains the available commands.

**Table 39-3 Signature Shortcut Menu**

| Menu Command                            | Description                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commands Available for All Cells</b> |                                                                                                                                                                                                                                                                                                                                 |
| Add Row                                 | Adds a custom signature. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Adding Custom Signatures, page 39-19</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 39-15</a></li> </ul>                                                    |
| Edit Row                                | Edits the selected signature. You can edit one signature at a time. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Editing Signatures, page 39-14</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 39-15</a></li> </ul>               |
| Delete Row                              | Deletes the selected custom signatures.<br>You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.                                                                                                                                                 |
| Clone                                   | Creates a new custom signature that contains the same properties as the selected signature. For more information, see <a href="#">Cloning Signatures, page 39-21</a> .                                                                                                                                                          |
| Enable, Disable                         | Places the signature in the enabled or disabled state, respectively. Disabled signatures appear with crosshatching over them. For more information, see <a href="#">Enabling and Disabling Signatures, page 39-14</a> .                                                                                                         |
| Show Events<br>Show MARS Events         | Enables navigation to the Event Viewer or Cisco Security MARS application to view the realtime or historical events detected by the selected signature. For more information, see <a href="#">Viewing Events for an IPS Signature, page 69-57</a> and <a href="#">Viewing CS-MARS Events for an IPS Signature, page 72-46</a> . |
| <b>Action Cell Commands</b>             |                                                                                                                                                                                                                                                                                                                                 |
| Add to Actions                          | Adds an action to the current list of actions for the selected signature.                                                                                                                                                                                                                                                       |
| Delete from Actions                     | Deletes an action from the current list of actions for the selected signature.                                                                                                                                                                                                                                                  |
| Replace Actions With                    | Replace the current set of actions for the selected signature with the single action selected. If you want to select more than one action, select <b>More</b> from the submenu, then use Ctrl+click to select the desired actions.                                                                                              |
| Edit Actions                            | Opens the Edit Actions dialog box, where you can select the desired actions for the signature. Your selection replaces the current list of actions for the signature. For more information, see <a href="#">Edit, Add, Replace Action Dialog Boxes, page 39-12</a> .                                                            |

| Menu Command                                                                                                                                      | Description                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Severity Cell Commands</b>                                                                                                                     |                                                                                                                                                                                                                     |
| <ul style="list-style-type: none"> <li>• High</li> <li>• Medium</li> <li>• Low</li> <li>• Informational</li> </ul>                                | Changes the severity level of the signature to the level you select.                                                                                                                                                |
| <b>Fidelity Cell Commands</b>                                                                                                                     |                                                                                                                                                                                                                     |
| Edit Fidelity                                                                                                                                     | Changes the fidelity rating of the signature, which is the weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                         |
| <b>Retired Cell Commands</b>                                                                                                                      |                                                                                                                                                                                                                     |
| <ul style="list-style-type: none"> <li>• Retire</li> <li>• Activate</li> <li>• Retire on Low Memory</li> <li>• Retire on Medium Memory</li> </ul> | Changes the retired status of the signature to the selected status. For more information about the retired status categories, see <a href="#">Edit Signature or Add Custom Signature Dialog Boxes</a> , page 39-15. |

## Edit, Add, Replace Action Dialog Boxes

Use the Edit, Add, or Replace Action dialog boxes to change the actions defined for a signature. These dialog boxes are available only when you edit the Action cell using the right click menu as explained in [Signature Shortcut Menu](#), page 39-10. The behavior differs depending on the dialog box name:

- **Add Actions**—The actions that you select are added to those already defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Add to Actions > More**.
- **Replace Actions**—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Replace Actions With > More**.
- **Edit Actions**—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Edit Actions**.

For an explanation of the available actions, see [Understanding IPS Event Actions](#), page 40-2. You can select multiple actions using Ctrl+click.

### Note

When you open dialog box, the list of actions that you see varies. The list of actions depends upon whether you right-click in only one signature row in the Actions column or select more than one signature row before right-clicking in the Actions column. If you right-click in only one signature row in the Actions column, the list of actions is that of the engine for that signature. If you select more than one signature row before right-clicking in the Actions column, the list of actions is that which is available for each affected engine. (It is the list of common actions, not the union of actions.)

## Edit Fidelity Dialog Box

Use the Edit Fidelity dialog box to make changes in the Fidelity Rating for a particular signature. The Fidelity Rating, or Signature Fidelity Rating (SFR), identifies the weight associated with how well this signature might perform in the absence of specific knowledge of the target. This rating can be any number from 0 to 100, with 100 indicating the most confidence in the signature.

### Navigation Path

In the Signatures policy, right-click the Fidelity cell in a signature and select Edit Fidelity. For information on opening the Signatures policy, see [Signatures Page, page 39-4](#). For more information on the signature shortcut menu, see [Signature Shortcut Menu, page 39-10](#).

## Viewing Signature Update Levels

In Device view, you can determine the current signature update packages applied to the device in Security Manager and compare it to the one deployed on the device.

Differences between the applied and deployed update levels can occur when:

- The device is updated outside of Security Manager.
- An update is applied to the policy in Security Manager but not yet published to the device.
- During initial Security Manager deployment before the devices are under Security Manager control.

To view the signature update level, select the **IPS > Signatures > Signatures** policy for an IPS device in Device view. Then, click the **View Update Level** button to open the Update Level dialog box.

The following table describes the information displayed in the dialog box.

**Table 39-4** Update Level Dialog Box

| Element          | Description                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Applied Level    | This column displays the patch level that is applied to this device in Security Manager.                                                                                                                                                                                                       |
| Deployed Level   | This column displays the patch level that is currently running on the selected device.                                                                                                                                                                                                         |
| Major Update     | Identifies the major update level.                                                                                                                                                                                                                                                             |
| Minor Update     | Identifies the minor update level.                                                                                                                                                                                                                                                             |
| Service Pack     | Identifies the service pack level.                                                                                                                                                                                                                                                             |
| Patch            | Identifies the patch level.                                                                                                                                                                                                                                                                    |
| Engine           | Identifies the engine level.                                                                                                                                                                                                                                                                   |
| Signature Update | Identifies the signature update level.<br><b>Note</b> This field is the only field on this page that applies to the IOS IPS devices; all of the other fields are exclusive to IPS devices.                                                                                                     |
| Revert button    | If you mistakenly modify Applied Level, allows you to discard that new Applied Level; clicking <b>Revert</b> syncs the Applied Level to the Deployed Level.<br><b>Tip</b> A warning dialog appears before performing Revert. Also, a warning dialog appears asking you to submit the activity. |

## Enabling and Disabling Signatures

You can enable and disable individual signatures. Your change takes effect when you redeploy the configuration to the device.

If a signature is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled signatures are removed from the device.

Disabling signatures is useful when you want to reduce the number of signatures used by a device, or if you want to temporarily stop using a custom signature without deleting it. You can later reenable a signature that you disabled.

**Note**

---

You can enable a signature that is retired, but it then is not used to scan traffic, because it is not in the signature micro-engine. If you want a sensor to scan network traffic for a particular signature, you must enable it and not retire it. The AIP-SSC-5 does not support enabling a signature that is retired.

---

**Step 1**

Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page, page 39-4](#).

**Step 2**

Right-click the signature whose enabled status you want to change and select **Enable** or **Disable**, as appropriate.

---

## Editing Signatures

You can edit signatures to change their behavior. For example, you can change the action that should be taken when a signature fires, or the severity and fidelity ratings used to calculate the risk rating of the signature.

Some signatures have special requirements. For example, to configure a sensor to detect ACL violation signatures, you must first configure one or more Cisco IOS routers to log ACL violations. Then, you must configure those routers to communicate with the sensor. Finally, you must configure the sensor to accept syslog traffic from those routers.

**Tip**

---

This procedure describes how to edit an entire signature. You can also selectively edit individual properties of a signature using the right-click menu in the Signatures policy. For information on the available commands, see [Signature Shortcut Menu, page 39-10](#).

- [Configuring Event Action Filters](#), page 40-4
- [Chapter 40, “Configuring Event Action Rules”](#)

---

**Step 1** Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page](#), page 39-4.

**Step 2** Right-click the signature you want to edit and select **Edit Row**. You can also select the signature and click the Edit Row (pencil) button beneath the signatures table. The Edit Signature dialog box opens.

**Tip** Use the filter fields above the table to help you find the desired signature. For information on filtering tables, see [Filtering Tables](#), page 1-48.

---

**Step 3** Make the desired changes to the signature. For specific details about each option, see [Edit Signature or Add Custom Signature Dialog Boxes](#), page 39-15.

When editing signatures, keep the following in mind:

- You cannot edit a Default signature. Default signatures are the Cisco-defined version of a signature. Before you can edit a Default signature, you must convert it either to a Local signature (one defined specifically on the selected device) or a shared-policy-specific signature (one defined in a shared policy). You must select either Local or the shared policy name from the Source Policy field before you can change any field on the Edit Signature dialog box.
- You cannot change every characteristic of a signature. For example, you cannot change the signature or subsignature IDs. These fields are read-only.
- If you want to change the detailed parameters of a signature, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), page 39-23.

**Step 4** Click **OK** to save your changes.

---

## Edit Signature or Add Custom Signature Dialog Boxes

The Edit Signature and Add Custom Signature dialog boxes are essentially the same. Most of the fields are identical, although there are some layout differences. Use these dialog boxes as follows:

- Use the Edit Signature dialog box to edit the characteristics of a non-default signature (you can only view the characteristics of a default signature in read-only mode).

You cannot edit default signatures. To make any changes to a signature, you must select something other than Default in the Source Policy field at the top of the dialog box.

- Use the Add Custom Signature dialog box to create a custom signature. In the Add Custom Signature dialog box, you enter a name and then select an existing engine from a drop-down list. The signature ID and subsignature ID are assigned by Security Manager. After you finish selecting the remaining parameters, the new signature is added to the Signatures page in the appropriate numerical location, and it is selected.

**Note**

Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

**Navigation Path**

From the Signatures page:

- To edit a signature, right-click the policy you want to edit and select **Edit Row**.
- To add a custom signature, click the **Add Row (+)** button beneath the table, or right-click any row and select **Add Row**.

For information on opening the Signature page, see [Signatures Page, page 39-4](#).

| Inheritance Mandatory<br>(Edit signature only.)                                                              | When selected, forces any policy that inherits from this policy to use the signature settings defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enabled                                                                                                      | Whether the signature is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Severity                                                                                                     | The severity level that the signature will report: High, Medium, Low, or Informational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Fidelity Rating                                                                                              | The weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Actions                                                                                                      | The actions that the sensor will take when this signature fires. For a complete list of actions, see the <a href="#">Understanding IPS Event Actions, page 40-2</a> .<br>Use Ctrl+click to select multiple actions.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Base Risk Rating<br>Risk Rating<br>(Fields have slightly different names when adding or editing signatures.) | The base risk rating value of the signature, which is calculated by multiplying the fidelity rating and the severity factor and dividing them by 100 (Fidelity Rating x Severity Factor /100). This value is read only; you cannot directly change it. To change the value, alter the Severity and Fidelity fields.<br>The Severity Factor has the following values based on what you select in the Severity field: <ul style="list-style-type: none"> <li>• High = 100</li> <li>• Medium = 75</li> <li>• Low = 50</li> <li>• Informational = 25</li> </ul>                                                             |
| Engine<br>(Read-only when editing; read-write when adding custom signatures.)                                | The engine that parses and inspects the traffic specified by this signature. For a description of the engines, see <a href="#">Engine Options, page 39-20</a> .<br>When adding a custom signature, you must select the appropriate engine. For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the <i>Installing and Using Cisco Intrusion Prevention System Device Manager</i> document for the IPS Software release you are using.<br><b>Tip</b> The term <i>engine</i> used here is not the same as the term <i>engine level</i> used in the row below. |

| Element                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retired                                                                          | <p>The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine.</p> <p><b>Timesaver</b> Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device.</p> <p>If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired.</p> <p>If the engine level of a signature policy is equal to E-4, the Retired field has four possible values:</p> <ul style="list-style-type: none"> <li>• <b>false</b>—The signature is not retired.</li> <li>• <b>low-mem-retired</b>—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 MB RAM or less.</li> <li>• <b>med-mem-retired</b>—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 MB RAM or less, but more than 2 MB RAM. (Any device with more than 4 MB RAM is considered a high-memory platform.)</li> <li>• <b>true</b>—The signature is retired on all platforms.</li> </ul> <p>When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired.</p> <p><b>Tip</b> The term <i>engine level</i> used here is not the same as the term <i>engine</i> in the row above.</p> |
| Obsolete<br>(Edit signature only.)                                               | Identifies whether the signature is obsolete. An obsolete signature is removed from the signature engine. It cannot be re-activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Restore Defaults button<br>(Non-custom signatures only.<br>Edit signature only.) | Click this button to revert to default values for this signature as defined by Cisco.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Edit Parameters button                                                           | <p>Click this button to edit the detailed parameters for this signature using the Edit Signature Parameters dialog box. For more information, see the following topics:</p> <ul style="list-style-type: none"> <li>• <a href="#">Edit Signature Parameters Dialog Box, page 39-24</a></li> <li>• <a href="#">Editing Signature Parameters (Tuning Signatures), page 39-23</a></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Adding Custom Signatures

If you want to look for traffic patterns that are not identified by the built-in signatures, you can create your own custom signatures to define the traffic patterns.

Even if a built-in signature covers the traffic pattern, you might want to create a custom signature to edit the detailed signature parameters without altering the default signature. If you are creating a custom signature that is similar to an existing signature, the easiest way to do it is to clone the signature as described in [Cloning Signatures, page 39-21](#).

When adding a custom signature to some IPS devices, you can use regular expressions. For more information on the importance of proper syntax when using regular expressions, refer to [Regular Expressions in Custom Signatures, page 39-22](#)

**Note**

The AIP-SSC-5 does not support custom signatures.

- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
  - (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.
- The Signature page appears; see [Signatures Page, page 39-4](#).
- Step 2** Click the **Add Row (+)** button beneath the signature table to open the Add Custom Signature dialog box.
- Step 3** Configure the desired settings. For specific details about each option, see [Edit Signature or Add Custom Signature Dialog Boxes, page 39-15](#).
- When creating signatures, keep the following in mind:
- You cannot change the signature name after you define the signature. If you later want to change the name, you must clone the signature and change it while creating the clone.
  - Select the appropriate signature engine for the signature. For a description of the signature engines, see [Engine Options, page 39-20](#). You cannot change the engine after you create the signature; if you select the wrong engine and click OK to save the signature, you must start over and create an entirely new signature.
  - The default is to create an enabled signature, but you can deselect the Enabled check box to initially create a disabled signature. You might want to disable the signature if you have not finished editing its parameters.
  - Follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\), page 39-23](#) to define the detailed signature parameters. You must select the desired engine before you edit the parameters, because many of the parameters are determined by the signature engine.
- Whether you can save the signature before configuring parameters differs based on the engine that you select. At minimum, you must click **Edit Parameters** to open the Edit Signature Parameters dialog box, and then click **OK** in the Edit Signature Parameters dialog box, before you can save the signature definition. However, to create a meaningful signature, you will need to configure the parameters to identify the desired traffic pattern.
- Step 4** Click **OK** to save your changes.

The custom signature is added to the end of the table and given the next available signature ID starting at 60000.

**Note** Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

## Engine Options

The following list identifies the options you can specify in the Engine field of the Edit Signature Parameters dialog box. For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the *Installing and Using Cisco Intrusion Prevention System Device Manager* document for the IPS Software release you are using.

- AIC FTP—Inspects FTP traffic and lets you control the commands being issued.
- AIC HTTP—Provides granular control over HTTP sessions to prevent abuse of the HTTP protocol.
- Atomic ARP—Inspects Layer-2 ARP protocol. The Atomic ARP engine is different because most engines are based on Layer-3-IP.
- atomic-ip—Inspects IP protocol packets and associated Layer-4 transport protocols.
- Atomic IPv6—Detects IOS vulnerabilities that are stimulated by malformed IPv6 traffic.
- Flood Host—Detects ICMP and UDP floods directed at hosts.
- Flood Net—Detects ICMP and UDP floods directed at networks.
- Meta—Defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets.
- multi-string—Defines signatures that inspect Layer 4 transport protocol (ICMP, TCP, and UDP) payloads using multiple string matches for one signature. You can specify a series of regular expression patterns that must be matched to fire the signature.
- normalizer—Configures how the IP and TCP normalizer functions and provides configuration for signature events related to the IP and TCP normalizer. Allows you to enforce RFC compliance.
- service-dns—Inspects DNS (TCP and UDP) traffic.
- service-ftp—Inspects FTP traffic.
- Service Generic—Decodes custom service and payload.

The Service Generic engine allows programmatic signatures to be issued in a config-file-only signature update. It has a simple machine and assembly language that is defined in the configuration file. It runs the machine code (distilled from the assembly language) through its virtual machine, which processes the instructions and pulls the important pieces of information out of the packet and runs them through the comparisons and operations specified in the machine code. It is intended as a rapid signature response engine to supplement the String and State engines.

You cannot use the Service Generic engine to create custom signatures.

**Note** Due to the proprietary nature of this complex language, we do not recommend that you edit the Service Generic engine signature parameters. Change only the severity and event action for these signatures.

- Service Generic Advanced—Generically analyzes network protocols.
- Service H225—Inspects VoIP traffic.
- service-http—Inspects HTTP traffic. The WEBPORTS variable defines inspection port for HTTP traffic.
- Service IDENT—Inspects IDENT (client and server) traffic.
- Service MSRPC—Inspects MSRPC traffic.
- Service MSSQL—Inspects Microsoft SQL traffic.
- Service NTP—Inspects NTP traffic.
- service-rpc—Inspects RPC traffic.
- Service SMB—Inspects SMB traffic.
- Service SMB Advanced—Processes Microsoft SMB and Microsoft RPC over SMB packets.
- Service SNMP—Inspects SNMP traffic.
- Service SSH—Inspects SSH traffic.
- Service TNS—Inspects TNS traffic.
- state—Stateful searches of strings in protocols such as SMTP.
- string-icmp—Searches on Regex strings based on ICMP protocol.
- string-tcp—Searches on Regex strings based on TCP protocol.
- string-udp—Searches on Regex strings based on UDP protocol.
- Sweep—Analyzes sweeps of ports, hosts, and services, from a single host (ICMP and TCP), from destination ports (TCP and UDP), and multiple ports with RPC requests between two nodes.
- Sweep Other TCP—Analyzes TCP flag combinations from reconnaissance scans that are trying to get information about a single host. The signatures look for flags A, B, and C. When all three are seen, an alert is fired.
- Traffic ICMP—Analyzes nonstandard protocols, such as TFN2K, LOKI, and DDOS. There are only two signatures with configurable parameters.
- Traffic Anomaly—Analyzes TCP, UDP, and other traffic for worm-infested hosts.
- Trojan Bo2k—Analyzes traffic from the nonstandard protocol BO2K. There are no user-configurable parameters in this engine.
- Trojan Tfn2k—Analyzes traffic from the nonstandard protocol TFN2K. There are no user-configurable parameters in this engine.
- Trojan UDP—Analyzes traffic from the UDP protocol. There are no user-configurable parameters in this engine.

## Cloning Signatures

If you want to create a custom signature that is similar to an existing signature, you can create a clone, or copy, of the signature. You can then edit the parameters to make the clone perform according to your requirements.

For example, you might want to create a clone of a Cisco-defined signature to customize it to your needs. You might find this preferable to converting the Cisco signature to a Local or shared policy signature and directly editing its parameters.

To clone a signature, follow these steps:

- 
- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
  - (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.
- The Signature page appears; see [Signatures Page, page 39-4](#).
- Step 2** Right-click the signature that you want to clone and select **Clone**.
- Security Manager takes some time to make the copy, and might warn you that some attributes are read-only and cannot be copied. If you receive a warning, click **OK**. The Add Custom Signature dialog box then appears.
- Step 3** Edit the properties of the cloned signature, as described in [Adding Custom Signatures, page 39-19](#).
- Step 4** Click **OK**. The clone appears in the summary table on the Signatures page as the last signature. Cloned signatures are enabled and active by default.
- 

## Regular Expressions in Custom Signatures

You can use regular expressions when adding a custom signature to some IPS devices.

Regardless of the type of IPS device or the particular characteristics of the custom signature, incorrect syntax in a regular expression will cause device deployment to fail after adding the custom signature.

Regular expressions may contain many control characters or regex notations which are used to describe the regex pattern itself. If you intend to use them as literal characters in the regular expression itself, they should be escaped with the "\" escape character. If you intend to use them for their real meaning, on the other hand, you should be careful to conform to proper regular expression syntax.

Example of regular expression that will cause deployment failure: `!@#%^^&*()_+{}|:"<>?`

Example of regular expression that will be deployed successfully: `!@#%^^&*\\(\\)_+\\{|:|:"<>\\?`

Using regular expressions in custom IPS signatures is described in this example:

- 
- Step 1** Add a Cisco ASA 5500 Series IPS Security Services Processor (e.g., 5525-X).
- Step 2** Add a custom signature with a string-XL engine (e.g., string-xl-tcp) to the IPS device.
- Step 3** Click Edit Parameter and create a regular expression for the custom signature.
- Step 4** Deploy the IPS device.
- Step 5** Deployment will fail if incorrect syntax for regular expressions used, but deployment will succeed if correct syntax is used.
-

## Editing Signature Parameters (Tuning Signatures)

If you cannot alter the behavior of a signature to fit your needs using the Event Action Filters and Overrides policies, or by changing the actions associated with a signature, you might need to fine-tune the signature parameters. You should consider editing parameters to be your last option, however, because these parameters can be complex and frequently require that you have a deep understanding of packet characteristics.

The reason you would want to edit parameters is to reduce false positives and false negatives:

- A *false positive* occurs when legitimate network activity, such as virus scanning, is interpreted and reported as an attack. This happens when network activity meets criteria that were specified to identify an attack before the attack occurred. You can decrease the number of false positives by tuning your sensor configurations.
- A *false negative* occurs when an attack was not detected. Tuning your sensor configurations will help you decrease the number of false negatives.

### Tip

---

You cannot edit the parameters of a default signature. Before editing the parameters of a default signature, you must convert the signature to a local- or shared-policy signature. In some cases, such as regular expression editing, you must clone the signature and convert it to a custom signature.

---

This procedure describes how to edit signature parameters to tune a signature.

### Related Topics

- [Editing Signatures, page 39-14](#)
- [Understanding Signatures, page 39-1](#)
- [Configuring Event Action Filters, page 40-4](#)
- [Configuring Event Action Overrides, page 40-13](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
  - (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.
- The Signature page appears; see [Signatures Page, page 39-4](#).
- Step 2** Right-click the signature whose parameters you want to edit and select **Edit Row**. The Edit Signature dialog box appears (see [Edit Signature or Add Custom Signature Dialog Boxes, page 39-15](#)).
- Step 3** If the Source Policy field shows Default, you must change it to Local or to the name of a shared policy before you can edit the parameters. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.
- Step 4** Click **Edit Parameters**. The Edit Signature Parameters dialog box appears.
- The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated field in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see [Editing the Component List for Meta Engine Signatures, page 39-29](#).
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

For more information about the Edit Signature Parameters dialog box, see [Edit Signature Parameters Dialog Box, page 39-24](#).

**Step 5** Change the settings as desired, then click **OK** to save your changes. You are returned to the Edit Signature dialog box.

**Step 6** Click **OK** in the Edit Signature dialog box to save your changes to the signature.

**Tip** If you decide that your edits did not have the desired effect, or you suspect that you made a mistake, you can click the **Restore Defaults** button in the Edit Signature dialog box to erase your changes. You can then start over.

## Edit Signature Parameters Dialog Box

Use the Edit Signature Parameters dialog box to edit (also called tune) the built-in micro-engine parameters for a particular signature. Different engines have different parameters, so the appearance of the Edit Signature Parameters dialog box varies. For more information about editing signature parameters, see [Editing Signature Parameters \(Tuning Signatures\), page 39-23](#).

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated field in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see [Editing the Component List for Meta Engine Signatures, page 39-29](#).
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

#### Navigation Path

From the Edit Signature or Add Custom Signature dialog boxes, click the **Edit Parameters** button. For information on opening these dialog boxes, see [Edit Signature or Add Custom Signature Dialog Boxes, page 39-15](#).

#### Tip

If the button is not active, you must first select Local or the name of a shared policy from the Source Policy field, or clone the signature to create a custom policy. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

| Tuning Context<br>(Policy view only) | <p>Displays the information needed by Security Manager to uniquely describe how the signature parameters were edited (tuned) for a particular signature policy. The Tuning Context field is a character string that contains the following items:</p> <ul style="list-style-type: none"> <li>• <b>Context</b>—The identification given by the Security Manager server for the unique definition of this micro-engine.</li> <li>• <b>SigLevel (IPS) or Version (IOS IPS)</b>—For IPS policies, the range of signature update levels to which this definition of the signature micro-engine applies. For IOS IPS, this is the IOS IPS version.</li> <li>• <b>Engine</b>—The name of the IPS engine.</li> </ul> <p><b>Tip</b> As an example, the Tuning Context field could contain the following character string: Context:9, SigLevel:302-449, Engine:atomic-ip.</p> <p>For any particular signature policy, the Tuning Context field can contain one or many tuning contexts:</p> <ul style="list-style-type: none"> <li>• The tuning context with the highest signature level is pre-pended with "Reference context."</li> <li>• If you modify the shared policy that is pre-pended with "Reference context," Security Manager may ask you if you want to copy the policy to other applicable contexts. (A particular device may appear in more than one context.)</li> <li>• If you choose to copy the policy to other applicable contexts, an error message informs you if some parameters cannot be copied.</li> </ul> <p><b>Note</b> Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database. As a result, you may notice the deletion of some of your unused tuning contexts.</p> |
| Signature ID                         | <p>The unique numerical value assigned to this signature. This value lets the sensor identify a particular signature.</p> <p>The value is 1000 to 65000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SubSignature ID                      | <p>The unique numerical value assigned to this subsignature. The subsignature ID identifies a more granular version of a broad signature.</p> <p>The value is 0 to 255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Promiscuous Delta                    | <p>Modifies the seriousness of an alert when operating in promiscuous mode. The value is subtracted from an alert's overall risk rating. The promiscuous delta is ignored when operating in inline mode. The value can be 0 to 30.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Elements        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sig Description | <p>A description of the signature to help you distinguish this signature from other signatures:</p> <ul style="list-style-type: none"> <li>• Alert Notes—Additional information about this signature that will be included in the alert message.</li> <li>• User Comments—Your comments about the signature.</li> <li>• Alarm Traits—Traits you want to document about this signature. The value is 0 to 65535. The default is 0.</li> <li>• Release—The release in which the signature was most recently updated.</li> <li>• Signature Creation Date—The date on which the signature was created.</li> <li>• Signature Type—The type of signature: Anomaly, Component, Exploit, Vulnerability, or Other.</li> </ul>                                                                                                                                                     |
| Engine          | <p>The engine that parses and inspects the traffic specified by this signature. The engine determines which parameters are available in the Engines folder. For a description of the engines, see <a href="#">Engine Options</a>, page 39-20.</p> <p>For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the <i>Installing and Using Cisco Intrusion Prevention System Device Manager</i> document for the IPS Software release you are using.</p> <p><b>Tip</b> Many engines include the Fragment Status parameter, which lets you identify whether packet fragments should be inspected. You can elect to not inspect fragments, to inspect fragments, or to apply the signature to any packet status.</p>                                                                                                |
| Event Counter   | <p>How the sensor counts events. For example, you can specify that you want the sensor to send an alert only if the same signature fires 5 times for the same address set. Configure the following values:</p> <ul style="list-style-type: none"> <li>• Event Count—The number of times an event must occur before an alert is generated. The value is 1 to 65535. The default is 1.</li> <li>• Event Count Key—The storage type used to count events for this signature. Choose attacker address, attacker address and victim port, attacker and victim addresses, attacker and victim addresses and ports, or victim address. The default is attacker address.</li> <li>• Specify Alert Interval—Whether you want to specify the time between alerts for resetting the event count, Yes or No. If you select Yes, enter the time in seconds from 2 to 1000.</li> </ul> |

**Table 39-6** *Edit Signature Parameters Dialog Box (continued)*

| Elements                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alert Frequency                                           | <p>How often the sensor alerts you when this signature is firing. Specify the following parameters for this signature. These parameters are explained below.</p> <ul style="list-style-type: none"> <li>• Summary Mode</li> <li>• Summary Interval</li> <li>• Summary Key</li> <li>• Specify Global Summary Threshold</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Summary Mode<br>(Alert Frequency group)                   | <p>The mode of alert summarization. There are four modes: Fire All, Fire Once, Summarize, and Global Summarize. The summary mode is changed dynamically to adapt to the current alert volume. For example, you can configure the signature to Fire All, but after a certain threshold is reached, it starts summarizing. Your selection of summary mode controls which other parameters are available in the Summary Mode group.</p> <ul style="list-style-type: none"> <li>• Fire All—Fires an alert on all events.</li> <li>• Fire Once—Fires an alert only once.</li> <li>• Summarize—Summarizes alerts.</li> <li>• Global Summarize—Summarizes an alert so that it only fires once regardless of how many attackers or victims.</li> </ul> <p><b>Note</b> When multiple contexts from an ASA device are contained in one virtual sensor, the summary alerts contain the context name of the last context that was summarized. Thus, the summary is the result of all alerts of this type from all contexts that are being summarized.</p> |
| Specify Summary Threshold<br>(Summary Mode group.)        | <p>When you select Fire All, you can select whether you want to configure the summary threshold settings that will be used if the device dynamically changes to summary mode. If you select Yes, you can configure the summary interval, key, or global summary thresholds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Summary Interval<br>(Summary Mode group.)                 | <p>The time in seconds used in each summary alert. The value is 1 to 65535. The default is 15.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Summary Key<br>(Summary Mode group.)                      | <p>The storage type used to summarize alerts. Choose Attacker address, Attacker address and victim port, Attacker and victim addresses, Attacker and victim addresses and ports, or Victim address. The default is Attacker address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Specify Global Summary Threshold<br>(Summary Mode group.) | <p>Whether to specify the threshold number of events to take the alert into global summary, Yes or No. If you select Yes, enter the threshold number of events, from 1 to 65535. The default is 240.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 39-6** *Edit Signature Parameters Dialog Box (continued)*

| Elements            | Description                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status              | The status of the signature.<br><br>The Obsoletes list shows the signatures that are obsoleted by this signature; click the pencil icon to open the list. In many cases, this information is read-only. If you can modify the list, click Set in the parameter field to open the list, where you can add the obsoleted signature IDs. |
| Vulnerable OS List  | The list of operating systems that this attack targets.                                                                                                                                                                                                                                                                               |
| MARS Category       | The category in Cisco Security MARS to which this signature belongs. This metadata is used to color the events generated in such a way as to provide MARS with the data that it needs to process this signature relative to the event categories that it studies.                                                                     |
| Expand All button   | Expands all categories and subcategories.                                                                                                                                                                                                                                                                                             |
| Collapse All button | Collapses all fields to the category.                                                                                                                                                                                                                                                                                                 |

## Editing the Component List for Meta Engine Signatures

Use the Edit Signature Parameter—Component List dialog box to edit the component list for a meta engine signature.

The Meta engine defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets. As signature events are generated, the Meta engine inspects them to determine if they match any or several Meta definitions. The Meta engine generates a signature event after all requirements for the event are met.

All signature events are handed off to the Meta engine by the Signature Event Action Processor. The Signature Event Action Processor hands off the event after processing the minimum hits option. Summarization and event action are processed after the Meta engine has processed the component events.

The Meta engine is different from other engines in that it takes alerts as input where most engines take packets as input. Thus, in a Meta engine signature, you must identify the signatures that the Meta signature should be looking for. This list of signatures is contained in the Component list.

The Component list is part of the signature parameters. To edit the parameters, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), page 39-23. When you open the Edit Signature Parameters dialog box for a signature that uses the Meta engine, look for the **Engine > Component List** parameter. The parameter value contains a pencil icon and the word List. Click **List** to open the Edit Signature Parameter—Component List dialog box.

The dialog box is divided into two lists, an Inactive list (on the left) and an active list (on the right). The active list defines the signatures that the Meta engine signature is looking for.

To modify the components list:

- **Add new components**—Click the **Add Entry (+)** button to the left of the inactive list. The Add Signature Parameter—List Entry dialog box opens. Configure the following values:
  - **Entry Key**—A name for the component.
  - **Component Sig ID**—The signature ID of the signature you are looking for.
  - **Component SubSig ID**—The subsignature ID; enter 0 if there are no subsignatures.

- **Component Count**—The number of times this signature must fire before the Meta signature is triggered.
- **Is a Not Component**—This field lets you create negative entries; thus, you can identify a list where some signatures must fire, and some signatures must not fire. Select **No** for signatures that must fire, and **Yes** for signatures that must not fire.

When you click **OK** in the Add Signature Parameter—List Entry dialog box, the new component is added to the inactive list. Select it and click the >> button to move it to the active list. Then, use the Up and Down arrow buttons to position the component in the active component list; a third button is available to reset the order to the previously saved order.

- **Edit an existing component**—Select the component (in either list) and click the **Edit Entry (pencil)** button that is between the lists. The Edit Signature Parameter—List Entry dialog box opens. The parameters are the same as for adding a new entry, except that you cannot change the component name.
- **Delete a component**—Select the component in the inactive list and click the **Delete Entry (trash can)** button that is to the left of the inactive list. If you want to delete an active component, you must first select it in the active list and click the << button to move it to the inactive list.
- **Restore defaults**—If you want to restore the default values of a component, select it and click **Restore**.

## Obsoletes Dialog Box

Use the Obsoletes dialog box to identify obsolete signatures associated with a particular signature. In many cases, this information is read-only. In some cases, it is read-write; for example, you can edit the list for IOS IPS signature policies for Local or shared-policy-specific signatures.

If you can edit the list:

- Click the **Add Entry (+)** button to add the signature and subsignature ID of a signature that is made obsolete by the signature you are editing.
- Select an entry and click the **Delete Entry (trash can)** button to remove it from the list of obsoleted signatures.

### Navigation Path

The Obsoletes list is part of the signature parameters. To edit the parameters, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), page 39-23. When you open the Edit Signature Parameters dialog box, look for the **Status > Obsoletes** parameter. The parameter value contains a pencil icon and the word Set (when the parameter is not read-only). Click the pencil or word to open the Obsoletes dialog box.

# Configuring Signature Settings

Use the Signature Settings page to define settings for IPS appliances and service modules (but not Cisco IOS IPS devices). These settings define the following policies:

- **Application policy**—Enable or disable HTTP, determine and specify the maximum number of HTTP requests, specify AIC web ports, and enable or disable FTP.
- **Fragment reassembly policy**—Configure the sensor to reassemble a datagram that has been fragmented over more than one packet by selecting the IP reassembly mode.

- **Stream reassembly policy**—Configure the sensor to monitor only TCP sessions that have been established by a complete three-way handshake by specifying whether a TCP handshake is required and by selecting the TCP reassembly mode.
- **IP logging policy**—Configure the sensor to generate an IP session log when the sensor detects an attack by determining and selecting the maximum allowable number of log packets, the IP log time and the maximum allowable size of the IP log.

**Tip**

All of these settings have default values, so configure this policy only if you need to use a non-default value.

To configure the Signature Settings policy, do one of the following:

- (Device view) Select **IPS > Signatures > Settings** from the Policy selector.
- (Policy view) Select **IPS > Signatures > Settings**, then select an existing policy or create a new one.

You can then configure the options that are explained in the following table.

**Table 39-7** *Signature Settings Page*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable HTTP            | Enables protection for web services. Select <b>Yes</b> to require the sensor to inspect HTTP traffic for compliance with the RFC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Max HTTP Requests      | The maximum number of outstanding HTTP requests per connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| AIC Web Ports          | The ports on which to look for AIC traffic. Enter a comma-separated list of port numbers or port list objects that define the ports. You can click <b>Select</b> to select a port list object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable FTP             | Enables protection for FTP services. Select <b>Yes</b> to require the sensor to inspect FTP traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IP Reassembly Mode     | The method the sensor uses to reassemble the fragments, based on the operating system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TCP Handshake Required | Whether the sensor should only track sessions for which the three-way handshake is completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TCP Reassembly Mode    | The mode the sensor should use to reassemble TCP sessions with the following options: <ul style="list-style-type: none"> <li>• Asymmetric—May only be seeing one direction of bidirectional traffic flow.</li> </ul> <p><b>Note</b> Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.</p> <ul style="list-style-type: none"> <li>• Loose—Use in environments where packets might be dropped.</li> <li>• Strict—If a packet is missed for any reason, all packets after the missed packet are not processed.</li> </ul> |
| Max IP Log Packets     | The number of packets you want logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP Log Time            | The duration you want the sensor to log, from 1 to 60 minutes. The default is 30 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Element</b>   | <b>Description</b>                           |
|------------------|----------------------------------------------|
| Max IP Log Bytes | The maximum number of bytes you want logged. |

## Configuring Event Action Rules

**Note**

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

An IPS event is an IPS message that contains an alert, a block request, a status message, or an error message. An event action is the sensor's response to an event. An event action happens only if the event is not filtered. Possible event actions are TCP reset, block host, block connection, IP logging, and capturing the alert trigger packet. Event actions were known as alarms in Cisco IPS versions earlier than 5.x.

The IPS Event Actions folder is where you configure settings for the event action processing component of the sensor. These settings define the actions for the sensor to take when an event is detected.

**Note**

You cannot use IPv6 addresses in Event Action policies in Security Manager. For more information on IPv6 support in Security Manager, see [IPv6 Support in Security Manager, page 1-8](#).

This chapter contains the following topics:

- [Understanding the IPS Event Action Process, page 40-1](#)
- [Understanding IPS Event Actions, page 40-2](#)
- [Configuring Event Action Filters, page 40-4](#)
- [Configuring Event Action Overrides, page 40-13](#)
- [Configuring IPS Event Action Network Information, page 40-17](#)
- [Configuring Settings for Event Actions, page 40-23](#)

## Understanding the IPS Event Action Process

The IPS event action rules dictate the actions that the sensor performs when an event occurs. Although each signature is configured with specific actions that should be taken, the actual actions performed also depend on other factors.

Following is the general process that occurs when inspection identifies a signature event:

1. A signature alert occurs with actions specified by the signature. A risk rating for the alert is calculated.

For a detailed explanation of how risk rating is calculated, see [Calculating the Risk Rating](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

You can influence risk ratings by configuring target value ratings and OS mappings; see [Configuring IPS Event Action Network Information](#), page 40-17.

2. The **Event Action Overrides** policy is processed. If the risk rating of the event matches an override rule, the actions identified in the override rule are **added** to the actions defined in the signature. The overrides do not replace the actions specified in the signature.

For information on configuring overrides, see [Configuring Event Action Overrides](#), page 40-13.

3. The **Event Action Filters** policy is processed. If rules apply to the event, the rules **subtract** actions from the event. Thus, an action you added in a signature policy or override rule might be removed by one of your filter rules.

For information on creating filter rules, see [Configuring Event Action Filters](#), page 40-4.

4. Event summarization occurs, unless you turn off the summarization feature as described in [Configuring Settings for Event Actions](#), page 40-23.
5. The actions are performed. For an explanation of possible actions, see [Edit, Add, Replace Action Dialog Boxes](#), page 39-12.
6. A list of denied attackers is maintained, and subsequent access prevented, based on configurable settings. To change the default settings, see [Configuring Settings for Event Actions](#), page 40-23.

## Understanding IPS Event Actions

When you configure an event action filter or override, or a signature, you specify an action for events that meet the rule. For signatures and overrides, you are specifying an action to add to the event; for filters, you are specifying an action to remove from the event.

The most common action is Produce Alert, which generates an alert that you can view in your network management system, such as the Security Manager Event Viewer or CS MARS. However, there are a wide variety of actions that you can assign to an event. When looking over the possible actions, keep the following in mind:

- Many actions produce alerts in addition to the other action performed. The description for each action explains whether an alert is also produced.
- Cisco IOS IPS supports fewer actions for event action override or filter rules. The actions supported are Deny Attacker Inline, Deny Connection Inline, Deny Packet Inline, Product Alert, and Reset TCP Connection.
- Not all actions are necessarily available on all combinations of IPS software version and device type. Whenever you need to select an action, only those actions that are valid are available for selection.
- For deny and block actions, use the event actions settings policy to set the period of time for which addresses or packets are denied. For more information, see [Configuring Settings for Event Actions](#), page 40-23.

The following table explains the possible actions.

Table 40-1 IPS Event Actions

| Menu Command                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny Attacker Inline              | <p>Terminates the current packet and future packets from this attacker address for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p> <p>For Cisco IOS IPS devices, no connection can be established from the attacker to the router until the shun time expires.</p> <p><b>Tip</b> This is the most severe of the deny actions. It denies current and future packets from a single attacker address. For IPS appliances and service modules, you can use the IPS Device Manager to see a list of denied attackers and clear the list if necessary.</p> |
| Deny Attacker/Service Pair Inline | <p>Does not transmit this packet and future packets on the attacker address victim port pair for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |
| Deny Attacker/Victim Pair Inline  | <p>Does not transmit this packet and future packets on the attacker/victim address pair for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| Deny Connection Inline            | <p>Terminates the current packet and future packets on this TCP flow. Other connections from the attacker can be established.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| Deny Packet Inline                | <p>Terminates the packet.</p> <p>The IPS must be operating in inline mode.</p> <p>For Cisco IOS IPS devices, this action discards the packet without sending a reset. Cisco recommends using “drop and reset” in conjunction with alarm.</p> <p><b>Tip</b> For IPS appliances and service modules, there is an event action override that adds this action to high risk events. You cannot delete the override. If you do not want to use it, disable the override. For more information, see <a href="#">Configuring Event Action Overrides</a>, page 40-13.</p>                     |
| Log Attacker Packets              | <p>Starts IP logging on packets that contain the attacker address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| Log Pair Packets                  | <p>Starts IP Logging on packets that contain the attacker/victim address pair. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                               |
| Log Victim Packets                | <p>Starts IP Logging on packets that contain the victim address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| Modify Packet Inline              | <p>Modifies packet data to remove ambiguity about what the endpoint might do with the packet.</p> <p><b>Tip</b> This option is not available for event action override or filter rules. It is available in signatures.</p>                                                                                                                                                                                                                                                                                                                                                            |

**Table 40-1** IPS Event Actions (continued)

| Menu Command             | Description                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Alert            | Writes the event to the Event Store as an alert. For Cisco IOS IPS devices, the notification is sent through syslog or SDEE.<br><b>Note</b> A Produce Alert event action is added for an event when global correlation has increased the risk rating of an event, and has added either the Deny Packet Inline or Deny Attacker Inline event action. |
| Produce Verbose Alert    | Includes an encoded dump of the offending packet in the alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.                                                                                                                                                                                 |
| Request Block Connection | Sends a request to block this connection. You must have blocking devices configured to implement this action. For more information, see <a href="#">Configuring IPS Blocking and Rate Limiting, page 43-7</a> .                                                                                                                                     |
| Request Block Host       | Sends a request to block this attacker host. You must have blocking devices configured to implement this action.                                                                                                                                                                                                                                    |
| Request Rate Limit       | Sends a rate limit request to perform rate limiting. You must have rate limiting devices configured to implement this action.                                                                                                                                                                                                                       |
| Request SNMP Trap        | Requests that the sensor send an SNMP trap notification to the configured trap destinations. This action causes an alert to be written even if Produce Alert is not selected. You must have SNMP configured on the sensor for traps to actually be sent. For more information, see <a href="#">Configuring SNMP, page 36-8</a> .                    |
| Reset TCP Connection     | Sends TCP resets to hijack and terminate the TCP flow, sending a reset to both the source and destination addresses. Reset TCP Connection works only on TCP signatures that analyze a single connection, for example, half-open SYN attacks. It does not work for sweeps or floods.                                                                 |

## Configuring Event Action Filters

You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor.

Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes all actions from an event effectively consumes the event. Before configuring filter rules, read [Tips for Managing Event Action Filter Rules, page 40-6](#).

**Note**

When filtering sweep signatures, we recommend that you do not filter the destination addresses. If there are multiple destination addresses, only the last address is used for matching the filter.

### Related Topics

- [Understanding the IPS Event Action Process, page 40-1](#)

**Step 1** Do one of the following to open the Event Action Filters policy:

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

The table shows the existing filter rules organized into sections. The Local section is for rules defined specifically for a selected device (in Device view). For shared or inherited policies, there are also sections for mandatory and default rules. For more information about the contents of this policy, see [Event Action Filters Page, page 40-7](#).

**Step 2** Select the row after which you want to create the filter rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add Filter Item dialog box. For detailed information about the options in this dialog box, see [Filter Item Dialog Box, page 40-9](#).

### Tips

- If you do not select a row, the new rule is added at the end of the local scope.
- You can also select an existing row and edit either the entire row (by clicking the **Edit Row** button) or specific cells. To edit a specific cell, right-click the cell and select the **Edit** command related to the cell from the top of the context menu.
- You can delete a rule by selecting it and clicking the **Delete Row** button.
- You can export the entire list of filter rules to a comma-separated values (CSV) file. Click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

**Step 3** Configure the filter rule. Following are the highlights of what you typically need to configure. For specific information on configuring the fields, and for information on fields not mentioned here, see [Filter Item Dialog Box, page 40-9](#).

- Name—You must enter a name for the rule. Use a name that is meaningful to you.
- Signature, Subsignature ID—If the filter should apply to all signatures, use the default values. If you are targeting a specific signature, enter its signature and subsignature identifiers. You can obtain these values by finding the signature in the Signatures policy (see [Signatures Page, page 39-4](#)).
- Attacker and Victim Addresses and Ports—If the filter should apply no matter who is attacking, or who is the victim, use the default values. If you are creating a filter specific to an attacker or victim, update these fields to match the appropriate address and port.
- Risk Rating—You are most likely to want to change this value. The filter is applied to events that are within the minimum-maximum range you configure here. The default value, 0-100, will apply the filter rule to all events. If you configure a specific signature ID, the rating applies only to events for that signature (in which case the default risk rating might be acceptable).

For example, you might want to target only high-risk events, such as 90-100.

- Actions to Subtract—Select the actions that you want to subtract from the event. Use Ctrl+click to select more than one action. If you select an action that is not actually assigned to an event, the filter rule essentially has no effect on the event. For more information about the actions, see [Edit, Add, Replace Action Dialog Boxes, page 39-12](#).

- **Stop on Match**—Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:
  - If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.
  - If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.

Click **OK** when you are finished defining your filter rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Ensure that stop rules are placed after other rules that you want applied prior to the stop.
- 

## Tips for Managing Event Action Filter Rules

Following are some tips that might help you effectively manage your event action filter rules:

- Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

Disabling a rule is useful if you want to stop using the rule, but you might want to start using it again in the future. Disabled rules remain in the table so that you do not need to recreate them.

- For existing rules, you can edit most of the fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate Edit command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**.

Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. Other commands simply change a value, or open a sub-menu from which you can select a value to add or remove. For example, right-clicking the Action cell provides four commands:

- **Add to Actions**—Select from a list of actions to add to those already defined in the rule.
  - **Delete from Actions**—Select from a list of actions defined in the rule to remove from the rule.
  - **Replace Actions With**—Select from a list the action that you want to completely replace those defined in the rule.
  - **Edit Actions**—Opens a dialog box where you can select all actions for the rule. Your selection replaces the cell contents.
- Although filter rules are configured as an ordered list, the rules are not processed as a “first match wins” list, even through they are processed and applied top to bottom. Instead, each rule has a Stop property: the rule is either a stop rule or it is not a stop rule. Processing ends only if an event matches a stop rule. If an event matches a non-stop rule, the event is compared to subsequent filter rules. Thus, more than one filter rule can apply to an event. If you decide to create stop rules, ensure that you place them below all other rules that you want processed for an event.

If you define no stop rules, each event is compared to all filter rules, and all matching rules are applied to the event in top-to-bottom order.

- You can inherit event action filter rules policies. Thus, you could configure a shared policy in Policy view that includes filter rules that you want to share among all of your devices, inherit that rule for each device (in Device view), and in Device view configure local filter rules that are unique to each device. For more information on inheriting policies, see:
  - [Creating a New Shared Policy, page 5-54](#)
  - [Inheritance vs. Assignment, page 5-6](#)
  - [Inheriting or Uninheriting Rules, page 5-47](#)

## Event Action Filters Page

Use the Event Actions Filters page to configure event action filter rules. Filter rules can remove specific actions from an event or they can discard an entire event and prevent further processing by the sensor.

Event action filters are processed as an ordered list and you can move filters up or down in the list. Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes all actions from an event effectively consumes the event.

Before configuring event action filter rules, read the following topics:

- [Configuring Event Action Filters, page 40-4](#)
- [Tips for Managing Event Action Filter Rules, page 40-6](#)
- [Understanding the IPS Event Action Process, page 40-1](#)

#### Tip

Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

#### Navigation Path

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

#### Field Reference

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDs                   | The signature identifiers to which this rule applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Subs                  | The subsignature identifiers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Attackers             | <p>The IP address of the attacker that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object.</p> <p><b>Tip</b> If you use a network/host object, you can see the contents of the object by right-clicking it and selecting <b>Show Contents</b>.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> |
| Attack Ports          | The port used by the attacker host that triggers the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Victims               | <p>The IP address of the victim that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object.</p> <p><b>Tip</b> If you use a network/host object, you can see the contents of the object by right-clicking it and selecting <b>Show Contents</b>.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p>   |
| Victim Ports          | The port targeted by the attacker host that triggers the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Actions               | The actions that should be removed from the event when the filter is triggered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| RR                    | <p>The risk rating range that triggers this event action filter.</p> <p>For a detailed explanation of how risk rating is calculated, see <a href="#">Calculating the Risk Rating</a> in <i>Installing and Using Cisco Intrusion Prevention System Device Manager 7.0</i> on Cisco.com.</p>                                                                                                                                                                                                                                                                     |
| Stop                  | Whether this is a stop rule. If Yes, then when an event meets the conditions of this rule, the filter is applied to the event but the event is not tested against the remaining rules in the event action filter rules policy.                                                                                                                                                                                                                                                                                                                                 |
| Export to File button | Click this button to export the event action filters summary to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.                                                                                                                                                                                                                                                                                                                                                          |

Table 40-2 Event Action Filters Page (continued)

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Up Row and Down Row buttons (arrow icons) | <p>Click these buttons to move the selected rules up or down within a scope.</p> <p>Filter rules are processed in order top to bottom for each event. If the conditions of an event match those defined for a filter, and the filter has the Stop field set to Yes, that filter is applied and no additional filters are considered. Ensure that stop rules are placed after the other rules you want applied to an event.</p> <p>You should order the more restrictive rules before general rules in the table.</p> |
| Add Row button                            | Click this button to add a filter rule to the table after the selected row using the Add Filter Item dialog box (see <a href="#">Filter Item Dialog Box, page 40-9</a> ). If you do not select a row, the rule is added at the end of the local scope.                                                                                                                                                                                                                                                               |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells by right-clicking the cell and selecting the appropriate Edit command.                                                                                                                                                                                                                                                                                                                                                               |
| Delete Row button                         | <p>Click this button to delete the selected rule.</p> <p><b>Tip</b> Instead of removing the rule, you can right-click the rule and select <b>Disable</b>. This prevents the rule from being used, but leaves it in the table in case you want to use it again at a later time.</p>                                                                                                                                                                                                                                   |

## Filter Item Dialog Box

Use the Add or Edit Filter Item dialog box to configure an event action filter rule.

### Tip

For existing rules, you can edit most of these fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**. Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. When seeking help for these context-editing dialog boxes, look for the property description in the table below.

### Navigation Path

From the Event Action Filters page (see [Event Action Filters Page, page 40-7](#)), click the **Add Row** button, or select a filter rule and click the **Edit Row** button.

Table 40-3 Filter Item Dialog Box

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active<br>Enabled<br><br>(Active does not apply to Cisco IOS IPS devices.) | <p>Whether the filter rule is active and enabled. Active means that the filter has been put into the filter list and will take effect on filtering events. The default is that the rule is both active and enabled, which means that the rule is used when events are processed.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If a filter is active but not enabled, it will still be included in the ordering list; it will be processed, but it will not be used.</li> <li>• If a filter is not active, then it will not be included at all in the ordering of the filters; it will not be processed at all.</li> <li>• Disabled rules are shown in the event action filters table with cross-hatching.</li> </ul> |
| Name                                                                       | <p>The name of the filter rule. The following characters are allowed in filter names:</p> <p>a-z, A-Z, 0-9, -, . (dot or period), : (colon), and _ (underscore).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Signature IDs                                                              | <p>The numerical signature IDs to which the filter rule applies. You can enter a single signature ID, a comma-separated list, or a range of IDs. The default is to apply the rule to signatures in the range 900-65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SubSignature ID                                                            | <p>The subsignature ID for the specified signature to which the filter rule applies. The subsignature ID identifies a more granular version of a broad signature, but it is not used for all signatures.</p> <p>Enter a subsignature ID appropriate for the signature ID you specified, or enter a range of subsignature IDs. The default value is the range of 0-255.</p>                                                                                                                                                                                                                                                                                                                                                              |
| Attacker IPv4 Address                                                      | <p>The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).</p>                                                                                                                                                                                                |
| Attacker IPv6 Address                                                      | <p>The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).</p>                                                                                                                                                                            |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attacker Port             | <p>The port used by the attacker host. This is the port from which the offending packet originated. You can also enter a range of ports.</p> <p>The default value is a range of all ports (0-65535).</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Victim IPv4 Address       | <p>The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).</p>                     |
| Victim IPv6 Address       | <p>The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).</p> |
| Victim Port               | <p>The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent. You can also enter a range of ports.</p> <p>The default value is a range of all ports (0-65535).</p>                                                                                                                                                                                                                                                                                                                                        |
| Risk Rating Min. and Max. | <p>The risk rating range, between 0 and 100, that should be used to trigger this event action filter. The default value is the complete range (0-100).</p> <p>If an event occurs with a risk rating that falls within the minimum-maximum range you configure here, the event is processed against the rules of this event filter.</p>                                                                                                                                                                                                                                               |
| OS Relevance              | <p>Indicates whether the alert is relevant to the OS that has been identified for the victim. Possible values include one or more of the following: Not Relevant, Relevant, Unknown. Use Ctrl+click to select multiple values. The default is all values selected.</p> <p><b>Note</b> OS Relevance is applicable only to appliances and service modules running IPS 6.x+ software. For Cisco IOS IPS devices, this field is read-only and cannot be edited, and for IPS 5.x devices, this field is blank.</p>                                                                        |
| Comments                  | <p>The user comments associated with this filter, such as an explanation of the purpose of the rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 40-3 Filter Item Dialog Box (continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Actions to Subtract | <p>The actions that should be removed from the event, should the conditions of the event meet the criteria of the event action filter. You can select one or more actions in this list box. All selected actions are removed from the event. Use Ctrl+click to select multiple values. For more information about the possible actions, see <a href="#">Edit, Add, Replace Action Dialog Boxes</a>, page 39-12.</p> <p>For IOS IPS devices, the possible values are restricted to the following:</p> <ul style="list-style-type: none"> <li>• <i>Deny Attacker Inline</i> blocks the attacker's source IP address completely. No connection can be established from the attacker to the router until the shun time expires. You can configure this time in the Event Actions Settings policy as described in <a href="#">Configuring Settings for Event Actions</a>, page 40-23.</li> <li>• <i>Deny Connection Inline</i> blocks the appropriate TCP flow from the attacker. Other connections from the attacker can be established to the router.</li> <li>• <i>Deny Packet Inline</i> discards the packet without sending a reset. Cisco recommends using "drop and reset" in conjunction with alarm.</li> <li>• <i>Produce Alert</i> sends a notification about the attack through syslog or SDEE.</li> <li>• <i>Reset TCP Connection</i> is effective for TCP-based connections and sends a reset to both the source and destination addresses. For example, in case of a half-open SYN attack, Cisco IOS IPS can reset the TCP connections.</li> </ul> |
| % to Deny           | <p>The percentage of packets to deny for deny attacker features. The range is 0 to 100. The default is 100 percent.</p> <p><b>Note</b> For IOS IPS devices, this field is read only and cannot be edited.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Stop on Match       | <p>Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:</p> <ul style="list-style-type: none"> <li>• If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.</li> <li>• If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# Configuring Event Action Overrides

You can add an event action override to change the actions associated with an event based on the risk rating of that event. Event action overrides are a way to add event actions globally without having to configure each signature individually.

Each event action has an associated risk rating range. If a signature event occurs and the risk rating for that event falls within the range for an event action, that action is added to the event. For example, if you want any event with a risk rating of 85 or more to generate an SNMP trap, you can create an event action override for Request SNMP Trap with the risk rating 85-100.

**Tip**

If you want to prevent the use of action overrides, you can disable the entire event action override component as described in [Configuring Settings for Event Actions, page 40-23](#).

**Related Topics**

- [Understanding the IPS Event Action Process, page 40-1](#)

**Step 1** Do one of the following to open the Event Action Overrides policy:

- (Device view) Select **IPS > Event Actions > Event Action Overrides** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.

The table shows the existing overrides, including the action, the risk rating of the alerts the action will be added to, and whether the rule is enabled. The order of the rules does not matter: all overrides that apply to an alert add the associated actions.

The table can have at most a single entry for each possible action.

**Step 2** Configure the desired overrides:

- To add a new override, click the **Add Row (+)** button beneath the table and fill in the Add Event Action Rule dialog box. In the dialog box, select the action you want to add, enter the rating range of the alerts to which you are adding the action (for example, 90-100), and click **OK**. For more information, see [Add or Edit Event Action Rule Dialog Box, page 40-14](#).

The risk rating range must be between 0 and 100. Separate the low and high of the range with a hyphen, for example, 80-90.

When adding a new override, you can define your own risk rating, or you can use a pre-defined Risk Rating policy object; beginning with Version 4.5, Security Manager has several pre-defined Risk Rating policy objects:

- Extreme Risk (90-100)
- High Risk (76-90)
- Medium-High Risk (61-75)
- Medium Risk (46-60)
- Medium-Low Risk (30-45)
- Low Risk (16-30)
- Very Low Risk (1-15)

For more information on these pre-defined policy objects, refer to [Configuring Risk Rating Policy Objects, page 40-15](#).

These pre-defined policy objects cannot be edited, but you can add and edit any of your own policy objects that you have defined.

- To edit an override, to disable it or to change the risk rating, select the override and click the **Edit Row (pencil)** button. You cannot change the event action.

---

**Note** Re-discovery of an IPS device will replace the Risk Rating policy object's value with its inline value. For example, if you assign the High Risk policy object (80-89) to any of the event actions and deploy it to the device, then after re-discovery that policy object's value will be replaced with its inline value of 80-89.

---

- To remove an override, select it and click the **Delete Row** button.

---

**Note** Policies for IPS appliances and service modules include a default override for Deny Packet Inline, which you cannot delete. If you do not want to use that override, disable it.

---

- To export the entire list of overrides to a comma-separated values (CSV) file, click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.
- 

## Add or Edit Event Action Rule Dialog Box

Use the Add or Edit Event Action Rule dialog box to add an event action rule based on one of the pre-defined Risk Rating policy objects that are available in Security Manager beginning with Version 4.5.

### Navigation Path

From the Event Action Overrides policy, click the **Add Row** button beneath the overrides table, or select a row in the table and click the **Edit Row** button. For information on opening the Event Action Overrides policy, see [Configuring Event Action Overrides, page 40-13](#).

**Field Reference****Table 40-4 Add or Edit Event Action Rule Dialog Box**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Risk Rating | <p>One of several pre-defined Risk Rating policy objects that are available in Security Manager beginning with Version 4.5:</p> <ul style="list-style-type: none"> <li>• Extreme Risk (90-100)</li> <li>• High Risk (76-90)</li> <li>• Medium-High Risk (61-75)</li> <li>• Medium Risk (46-60)</li> <li>• Medium-Low Risk (30-45)</li> <li>• Low Risk (16-30)</li> <li>• Very Low Risk (1-15)</li> </ul> <p>For more information on using one of these pre-defined Risk Rating policy objects, or defining your own, refer to <a href="#">Configuring Event Action Overrides, page 40-13</a>.</p> |
| Assigned    | Whether a particular action is assigned to at least one of the Risk Rating policy objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Action Name | The action to be taken for a particular Risk Rating when assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enabled     | Whether a particular action is enabled. Deselect this option to temporarily disable an action without deleting it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring Risk Rating Policy Objects

Use the Risk Rating Policy Object Dialog Box to configure policy objects for IPS. Seven pre-defined policy objects are available for risk rating; you can also define your own.

**Navigation Path**

Select **Manage > Policy Objects > All Object Types**, then select **Risk Rating** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**. You cannot edit the pre-defined policy objects, however.

Depending upon whether you selected **New Object** or **Edit Object**, the Add Risk Rating or Edit Risk Rating dialog box appears: refer to [Add or Edit Event Action Rule Dialog Box, page 40-14](#)

The remainder of this topic describes the fields that you see in the Risk Rating Policy Object dialog box.

**Related Topics**

**Field Reference****Table 40-5 Risk Rating Policy Object Dialog Box**

| Element            | Description                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | The name of a pre-defined policy object, such as "High Risk," or the name of a policy object that you have defined.                                                                                            |
| Range              | The Risk Rating of a particular policy object, expressed as a numerical range.                                                                                                                                 |
| Category           | Allows you to select Cat-A through Cat-G.<br>This is the category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> . |
| Overrides          | Whether any IPS event action overrides have been configured for this policy object                                                                                                                             |
| Description        | A text description that you can provide; applies to policy objects that you have defined, not to pre-defined policy objects.                                                                                   |
| Last Ticket(s)     | The last ticket used for this policy object.                                                                                                                                                                   |
| Last Modified Date | The last date on which this policy object was modified.                                                                                                                                                        |

## Add or Edit Risk Rating Dialog Box

Use the Add or Edit Risk Rating dialog box to define policy objects for IPS Risk Rating.

**Navigation Path**

Select **Manage > Policy Objects > All Object Types**, then select **Risk Rating** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**. You cannot edit the pre-defined policy objects, however.

## Configuring IPS Event Action Network Information

Use the Event Actions Network Information policy to configure these features:

- **Target value ratings (IPv4 Target Value Ratings tab and IPv6 Target Value Ratings tab)**—You can configure the target value ratings of your network assets. The sensor uses these ratings when calculating the overall risk rating of an alert. By identifying your mission-critical assets, you can trigger more severe signature event actions. As the names indicate, you can use IPv4 or IPv6 by selecting the appropriate tab.

Target value rating is available on IPS appliances, service modules, and Cisco IOS IPS devices.

For more information, see [Configuring Target Value Ratings, page 40-17](#).

- **Passive OS fingerprinting and OS mappings (OS Identification tab)**—You can enable the sensor to use information about the operating system running on a device to determine the attack relevance rating, which is a component of the overall risk rating.

Passive OS fingerprinting and OS mappings are available on devices running IPS 6.x+ software only, and are not available on Cisco IOS IPS devices.

For more information, see:

- [Understanding Passive OS Fingerprinting, page 40-19](#)
- [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\), page 40-21](#)

To open the Network Information policy, do one of the following:

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Network Information**, then select an existing policy or create a new one.

## Configuring Target Value Ratings

You can assign target value ratings to your network assets. The target value rating is one of the factors used to calculate the risk rating value for each alert. It identifies the perceived importance of a network asset, which you identify by its IP address.

You can develop a security policy that is more stringent for valuable corporate resources and looser for less important resources. For example, you could assign a target value rating to the company web server that is higher than the target value rating you assign to a desktop node. In this example, attacks against the company web server have a higher risk rating than attacks against the desktop node. Events with a higher risk rating trigger more severe signature event actions.

You can configure four value ratings. From highest value to lowest: Mission Critical, High, Medium, Low, No Value (zero value).

For a detailed explanation of how risk rating is calculated, see [Calculating the Risk Rating](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

**Tip**

If you are configuring target value ratings on a device that uses IPS 6.0 software lower than 6.0(5), you might also want to update the OS Identification tab of the Network Information policy to get around a software bug, even if you do not need to create OS maps. For detailed information, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), page 40-21.

**Related Topics**

- [Configuring IPS Event Action Network Information](#), page 40-17
- [Understanding the IPS Event Action Process](#), page 40-1

**Step 1**

Do one of the following to open the Network Information policy:

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector, then click the **IPv4 Target Value Ratings** tab or the **IPv6 Target Value Ratings** tab.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **IPv4 Target Value Ratings** tab or the **IPv6 Target Value Ratings** tab.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **IPv4 Target Value Ratings** tab.

**Note**

Cisco IOS IPS devices do not support IPv6.

The tab shows the target value ratings that are already configured, showing the IP addresses associated with each configured ratings category. The table can have at most five entries, one per rating category.

**Step 2**

Configure the desired target value ratings categories:

- To add a new ratings category, click the **Add Row (+)** button beneath the table and fill in the Add Target Value Rating dialog box. In the dialog box, select the rating you want to add, enter the host, network, and address ranges to associate with the category, and click **OK**. For more information, see [Target Value Rating Dialog Box](#), page 40-19.

For IPv4 addresses, you can specify a single network/host object, or a comma-separated list of host, network, or address ranges, such as 10.10.10.10, 10.10.10.0/24, or 10.10.10.2-10.10.10.254.

Addresses that you enter in the network format are converted to address ranges. For IPv6 addresses, use IPv6 addressing conventions.

- To edit the IP addresses in an existing ratings category, select the category and click the **Edit Row (pencil)** button. You cannot change the value rating.

- To remove a rating, select it and click the **Delete Row** button.

## Target Value Rating Dialog Box

Use the Add or Edit Target Value Rating dialog box to associate the IP addresses of your assets to a ratings category. IP addresses are IPv4 when you open the Target Value Rating dialog box from the IPv4 Target Value Ratings tab; they are IPv6 from the IPv6 tab.

### Navigation Path

From the IPv4 Target Value Rating tab or the IPv6 Target Value Rating tab of the IPS Event Actions Network Information policy, click the **Add Row** button beneath the Target Value Ratings table, or select a row in the table and click the **Edit Row** button. For information on opening the IPv4 Target Value Rating tab or the IPv6 Target Value Rating tab, see [Configuring Target Value Ratings, page 40-17](#).

### Field Reference

**Table 40-7 Target Value Rating Dialog Box**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value          | <p>The target value rating to associate with the specified addresses. From highest to lowest importance: Mission Critical, High, Medium, Low, No Value.</p> <p>This list includes only those value ratings that you have not already configured in the target value ratings table.</p> <p>You change this option when editing a ratings category.</p>                                                                                                                                                                                                                                                                                                                                                                |
| target-address | <p>The IP addresses of the network assets assigned to this value rating. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, using IPv4, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254. Addresses that you enter in the network format are converted to address ranges; for example, 10.10.10.0/24 is converted to 10.10.10.0-10.10.10.255.</li> </ul> |

## Understanding Passive OS Fingerprinting

Passive operating system (OS) fingerprinting is enabled by default on IPS 6.0+ sensors and the IPS contains a default vulnerable OS list for each signature.

Passive OS fingerprinting lets the sensor determine the OS that hosts are running. The sensor analyzes network traffic between hosts and stores the OS of these hosts with their IP addresses. The sensor inspects TCP SYN and SYNACK packets exchanged on the network to determine the OS type.

The sensor then uses the OS of the target host OS to determine the relevance of the attack to the victim by computing the attack relevance rating component of the risk rating. Based on the relevance of the attack, the sensor may alter the risk rating of the alert for the attack or the sensor may filter the alert for

the attack. You can then use the risk rating to reduce the number of false positive alerts (a benefit in IDS mode) or definitively drop suspicious packets (a benefit in IPS mode). Passive OS fingerprinting also enhances the alert output by reporting the victim OS, the source of the OS identification, and the relevance to the victim OS in the alert.

Passive OS fingerprinting consists of three components:

- Passive OS learning.

Passive OS learning occurs as the sensor observes traffic on the network. Based on the characteristics of TCP SYN and SYNACK packets, the sensor makes a determination of the OS running on the host of the source IP address.

- User-configurable OS identification.

You can configure OS host mappings, which take precedence over learned OS mappings.

- Computation of attack relevance rating and risk rating.

The sensor uses OS information to determine the relevance of the attack signature to the targeted host. The attack relevance is the attack relevance rating component of the risk rating value for the attack alert.

There are three sources of OS information. The sensor ranks the sources of OS information in the following order:

1. Configured OS mappings—OS mappings that you enter on the OS Identification tab of the Event Actions Network Information policy. You can configure different mappings for each virtual sensor. For more information, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), page 40-21.

We recommend configuring OS mappings to define the identity of the OS running on critical systems. It is best to configure OS mappings when the OS and IP address of the critical systems are unlikely to change.

2. Imported OS mappings—OS mappings imported from Management Center for Cisco Security Agents (CSA MC).

Imported OS mappings are global and apply to all virtual sensors. For information on configuring the sensor to use CSA MC, see [Configuring the External Product Interface](#), page 36-26.

3. Learned OS mappings—OS mappings observed by the sensor through the fingerprinting of TCP packets with the SYN control bit set.

Learned OS mappings are local to the virtual sensor that sees the traffic.

When the sensor needs to determine the OS for a target IP address, it consults the configured OS mappings. If the target IP address is not in the configured OS mappings, the sensor looks in the imported OS mappings. If the target IP address is not in the imported OS mappings, the sensor looks in the learned OS mappings. If it cannot find it there, the sensor treats the OS of the target IP address as unknown.

**Tip**

---

You can configure Event Action Filter rules to use the OS relevancy value of the target, and configure signatures to identify the OSes vulnerable to a signature.

---

## Configuring OS Identification (Cisco IPS 6.x and Later Sensors Only)

Use the OS Identification tab on the Event Actions Network Information policy to configure operating system (OS) host mappings, which take precedence over learned OS mappings. On the OS Identifications tab you can add, edit, and delete configured OS maps. You can move them up and down in the list to change the order in which the sensor computes the attack relevance rating and risk rating for that particular IP address and OS type combination.

### Note

OS Identification applies to IPS 6.0+ sensors only and does not apply to Cisco IOS IPS devices.

You can also move them up and down in the list to change the order in which the sensor resolves the OS associated with a particular IP address. Configured OS mappings allow for ranges, so for network 192.168.1.0/24 you might define the following:

| IP Address Range Set                  | OS      |
|---------------------------------------|---------|
| 192.168.1.1                           | IOS     |
| 192.168.1.2-192.168.1.10,192.168.1.25 | UNIX    |
| 192.168.1.1-192.168.1.255             | Windows |

More specific mappings should be at the beginning of the list. Overlap in the IP address range sets is allowed, but the entry closest to the beginning of the list takes precedence.

### Tip

There is a bug in IPS 6.0 versions lower than 6.0(5) related to the Network Information policy. Even if you change nothing on the OS Identification tab, but you make configuration changes to the Threat Value Ratings tab, Security Manager configures the device to use the **any** variable for restricting OS mappings to addresses. This can result in your monitoring application showing “any” as the event locality for all events. The solution is to upgrade the IPS version on your sensor. The workaround is to enter a non-default value in the **Restrict to these IP Addresses** field on the OS Identification tab, even if you are not configuring specific OS mappings. For example, enter 0.0.0.1-255.255.255.255 instead of “any” or 0.0.0.0-255.255.255.255.

### Navigation Path

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector, then click the **OS Identification** tab.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **OS Identification** tab.

|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Passive OS Fingerprinting | <p>When selected, lets the sensor perform passive OS analysis. You must enable this option for any of the maps configured on this page to be used.</p> <p>Passive OS fingerprinting functions as part of the sensor. As the sensor analyzes network traffic between hosts, the sensor stores the identity of the OS running on the hosts alongside the IP addresses of the hosts. The sensor determines the identity of the OSes on the hosts by inspecting characteristics of the packets exchanged on the network. The sensor then uses the target system's OS information to compute the ARR (Attack Relevance Rating) component for the RR (Risk Rating). The RR can then be used to drop suspicious packets.</p> <p>For more information about passive OS fingerprinting, see <a href="#">Understanding Passive OS Fingerprinting, page 40-19</a>.</p> |
| Restricted to these IP Addresses | <p>Restricts attack relevance rating calculation to the specified addresses. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254.</li> </ul>                                                                                                                                                                                                                                                                                                    |
| OS Maps table                    | <p>The list of OS mappings, showing the IP addresses of the hosts and the operating systems to which they are mapped. When looking for a match, the sensor goes from top to bottom and selects the first rule that matches the IP address.</p> <ul style="list-style-type: none"> <li>• To add a mapping, click the <b>Add Row</b> button and fill in the Add OS Map dialog box (see <a href="#">OS Map Dialog Box, page 40-22</a>).</li> <li>• To edit a mapping, select the rule and click the <b>Edit Row</b> button.</li> <li>• To delete a map, select it and click the <b>Delete Row</b> button.</li> <li>• To change the priority of a rule, select it and click the <b>Up</b> or <b>Down</b> arrow buttons until the rule is positioned correctly.</li> </ul>                                                                                       |

## OS Map Dialog Box

Use the Add or Edit OS Map dialog box to map a host through its IP address to an OS type. Create mappings only if you want to statically assign an OS type to an IP address. Because the sensor uses passive OS fingerprinting to discover the OS associated with an IP address, you might not want to create any mappings, or create mappings only for mission-critical devices that have static IP addresses. Update any mappings that you create if you install devices with different operating systems on the address.

**Navigation Path**

From the OS Identification tab of the IPS Event Actions Network Information policy, click the **Add Row** button beneath the OS Maps table, or select a row in the table and click the **Edit Row** button. For information on opening the OS Identification tab, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), page 40-21.

**Field Reference****Table 40-9 OS Map Dialog Box**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Addresses | <p>The IP addresses for this mapping. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254.</li> </ul>                                                                                  |
| OS Type      | <p>The operating system running on the identified hosts. Select the most appropriate option from the list. You can select multiple options (using Ctrl+click) to indicate that there is more than one possible OS.</p> <p><b>Tip</b> Because these mappings take precedence over learned mappings, you probably are better off not assigning General OS, Other, or Unknown OS. The sensor might be able to learn the actual OS through passive OS fingerprinting and provide a better matching. For more information, see <a href="#">Understanding Passive OS Fingerprinting</a>, page 40-19.</p> |

## Configuring Settings for Event Actions

Use the Event Actions Settings policy to configure general settings that apply globally to event action rules. The defaults for these options are appropriate for most situations, so change them only if you are certain that your situation requires non-default behavior.

To configure the Event Actions Settings policy, do one of the following:

- (Device view) Select **IPS > Event Actions > Settings** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Settings**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Settings**, then select an existing policy or create a new one.

The following table describes the options you can configure. Note that the options available for Cisco IOS IPS devices are more limited than those available for IPS appliances and service modules.

**Tip**

Do not disable the Summarizer except for troubleshooting purposes. If you disable the Summarizer, every signature is set to Fire All with no summarization. Note that you do not need to change the state of the Meta Event Generator. Cisco has discontinued the use of Meta signatures, and they have all been retired.

**Table 40-10** *Event Actions Settings Policy*

| Element                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Event Action Override<br>(All device types.)                          | When selected, enables override rules as defined on the Event Action Overrides page. You can add an event action override to add actions to an event based on specific details about that event. For configuring override rules, see <a href="#">Configuring Event Action Overrides, page 40-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Event Action Filters<br>(All device types.)                           | When selected, enables the filter rules as defined on the Event Action Filters page. You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor. For configuring event action filters rules, see <a href="#">Configuring Event Action Filters, page 40-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Event Action Summarizer<br>(IPS appliances and service modules only.) | <p>When selected, enables the Summarizer component. The Summarizer groups events into a single alert, thus decreasing the number of alerts the sensor sends out.</p> <p>By default, the Summarizer is enabled. If you disable it, all signatures are set to Fire All with no summarization. If you configure individual signatures to summarize, this configuration is ignored when the Summarizer is not enabled.</p> <p>The Report Manager component of Cisco Security Manager reports events individually. The Event Viewer component of Cisco Security Manager displays alerts. As stated above, the Summarizer groups events into a single alert, thus decreasing the number of alerts the sensor sends out.</p> <p><b>Tip</b> Cisco IPS Manager Express (IME) and Cisco Security Manager do not summarize events in precisely the same way.</p> |
| Enable Meta Event Generator<br>(IPS appliances and service modules only.)    | Cisco recommends that you do not change the state of the Meta Event Generator. Cisco has discontinued the use of Meta signatures, and they have all been retired.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 40-10 Event Actions Settings Policy (continued)**

| Element                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Threat Rating Adjustment<br>(IPS appliances and service modules only.)    | <p>When selected, enables threat rating adjustment, which adjusts the risk rating. If disabled, risk rating is equal to threat rating. Available in sensors running IPS 6.0+ software only.</p> <p>The Threat Rating feature provides a single view of the threat environment of the network. Threat Rating minimizes alarms and events through a customized view that shows only events with a high Threat Rating value. The Threat Rating value is derived as follows:</p> <ul style="list-style-type: none"> <li>• Dynamic adjustment of event Risk Rating based on success of response action</li> <li>• If response action was applied, Risk Rating is deprecated (Threat Rating &lt; Risk Rating)</li> <li>• If response action was not applied, Risk Rating remains unchanged (Threat Rating = Risk Rating)</li> </ul> <p>The result is a single value by which the threat risk is determined.</p> |
| Deny Attacker Duration in seconds<br>(All device types.)                         | <p>The number of seconds to deny the attacker inline.</p> <p>The range is 0 to 518400. The default is 3600.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Block Attack Duration in minutes<br>(IPS appliances and service modules only.)   | <p>The number of minutes to block a host or connection.</p> <p>The range is 0 to 10000000. The default is 30.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Maximum Number of Denied Attackers<br>(IPS appliances and service modules only.) | <p>Limits the number of denied attackers possible in the system at any one time.</p> <p>The range is 0 to 100000000. The default is 10000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable One Way TCP Reset<br>(IPS appliances and service modules only.)           | <p>When selected, enables a one-way TCP reset for deny packet inline actions for TCP-based alerts. Available only for sensors running IPS 6.1+ software.</p> <p>The one-way TCP reset operates for inline mode only and is an automatic addition to the deny packet inline actions. It sends a TCP reset to the victim of the alert, thus creating a black hole for the attacker and clearing the TCP resources of the victim.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• In inline mode, all packets entering or leaving the network must pass through the sensor.</li> <li>• An inline sensor denies packets for any alert with a risk rating of greater than or equal to 90. It also issues a one-way TCP reset on TCP alerts with a risk rating of greater than or equal to 90.</li> </ul>                                                                                       |

## Managing IPS Anomaly Detection

**Note**

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

Anomaly detection is designed to recognize network congestion caused by worm traffic that exhibits scanning behavior. Anomaly detection also will identify infected hosts on the network that are scanning for other vulnerable hosts.

Anomaly detection is enabled by default, but there are some configuration settings you should adjust to use it effectively.

**Note**

The sensor must use IPS software version 6.x or later to configure anomaly detection. In addition, Cisco IOS IPS and the AIP-SSC-5 do not support anomaly detection.

This chapter contains the following topics:

- [Understanding Anomaly Detection, page 41-1](#)
- [Configuring Anomaly Detection, page 41-6](#)

## Understanding Anomaly Detection

The anomaly detection component of the sensor detects worm-infected hosts. This enables the sensor to be less dependent on signature updates for protection against worms and scanners, such as Code Red and SQL Slammer and so forth. The anomaly detection component lets the sensor learn normal activity and send alerts or take dynamic response actions for behavior that deviates from what it has learned as normal behavior.

**Note**

Anomaly detection does not detect email-based worms, such as Nimda.

Anomaly detection detects the following two situations:

- When the network starts on the path of becoming congested by worm traffic.
- When a single worm-infected source enters the network and starts scanning for other vulnerable hosts.

The following topics explain anomaly detection in more detail:

- [Worm Viruses, page 41-2](#)
- [Anomaly Detection Modes, page 41-2](#)
- [Anomaly Detection Zones, page 41-3](#)
- [Knowing When to Turn Off Anomaly Detection, page 41-4](#)
- [Configuring Anomaly Detection Signatures, page 41-4](#)
- [Configuring Anomaly Detection, page 41-6](#)

## Worm Viruses

Worm viruses are automated, self-propagating, intrusion agents that make copies of themselves and then facilitate their spread. Worm viruses attack a vulnerable host, infect it, and then use it as a base to attack other vulnerable hosts. They search for other hosts by using a form of network inspection, typically a scan, and then propagate to the next target. A scanning worm virus locates vulnerable hosts by generating a list of IP addresses to probe, and then contacts the hosts. Code Red worm, Sasser worm, Blaster worm, and the Slammer worm are examples of worms that spread in this manner.

Anomaly detection identifies worm-infected hosts by their behavior as a scanner. To spread, a worm virus must find new hosts. It finds them by scanning the Internet using TCP, UDP, and other protocols to generate unsuccessful attempts to access different destination IP addresses. A scanner is defined as a source IP address that generates events on the same destination port (in TCP and UDP) for too many destination IP addresses.

The events that are important for TCP are non-established connections, such as a SYN packet that does not have its SYN-ACK response for a given amount of time. A worm-infected host that scans using TCP generates non-established connections on the same destination port for an anomalous number of IP addresses.

The events that are important for UDP are unidirectional connections, such as a UDP connection where all packets are going in only one direction. A worm-infected host that scans using UDP generates UDP packets but does not receive UDP packets on the same IP address within a time-out period on the same destination port for multiple destination IP addresses.

The events that are important for other protocols, such as ICMP (protocol number 1), are from a source IP address to many different destination IP addresses, that is, packets that are received in only one direction.

### Caution

If a worm virus has a list of IP addresses it should infect and does not have to use scanning to spread itself (for example, it uses passive mapping—listening to the network as opposed to active scanning), it will not be detected by anomaly detection worm policies. Worm viruses that receive a mailing list from probing files within the infected host and email this list will not be detected, because no Layer 3 or Layer 4 anomaly is generated.

## Anomaly Detection Modes

Anomaly detection initially conducts a “peacetime” learning process when the most normal state of the network is reflected. Anomaly detection then derives a set of policy thresholds that best fit the normal network. This is done in two phases: an initial learning mode phase, followed by the ongoing operational detect mode phase.

Anomaly detection has the following modes:

- Learning accept mode (initial setup)

Although anomaly detection is in detect mode by default, it conducts an initial learning accept mode for the default period of 24 hours. We assume that during this phase no attack is being carried out. Anomaly detection creates an initial baseline, known as a knowledge base, of the network traffic. The default interval value for periodic schedules is 24 hours and the default action is rotate, meaning that a new knowledge base is saved and loaded, and then replaces the initial knowledge base after 24 hours.

Keep the following in mind:

- Anomaly detection does not detect attacks when working with the initial knowledge base, which is empty. After the default of 24 hours, a knowledge base is saved and loaded and now anomaly detection also detects attacks.
- Depending on your network complexity, you may want to have anomaly detection in learning accept mode for longer than the default 24 hours. You configure the mode in the Virtual Sensors policy; see [Defining A Virtual Sensor, page 38-5](#). After your learning period has finished, edit the virtual sensor and change the mode to Detect.

- Detect mode

For ongoing operation, the sensor should remain in detect mode. This is for 24 hours a day, 7 days a week. Once a knowledge base is created and replaces the initial knowledge base, anomaly detection detects attacks based on it. It looks at the network traffic flows that violate thresholds in the knowledge base and sends alerts. As anomaly detection looks for anomalies, it also records gradual changes to the knowledge base that do not violate the thresholds and thus creates a new knowledge base. The new knowledge base is periodically saved and takes the place of the old one thus maintaining an up-to-date knowledge base.

- Inactive mode

You can turn anomaly detection off by putting it in inactive mode. Under certain circumstances, anomaly detection should be in inactive mode, for example, if the sensor is running in an asymmetric environment. Because anomaly detection assumes it gets traffic from both directions, if the sensor is configured to see only one direction of traffic, anomaly detection identifies all traffic as having incomplete connections, that is, as scanners, and sends alerts for all traffic flows.

The following example summarizes the default anomaly detection configuration. If you add a virtual sensor at 11:00 pm and do not change the default anomaly detection configuration, anomaly detection begins working with the initial knowledge base and only performs learning. Although it is in detect mode, it cannot detect attacks until it has gathered information for 24 hours and replaced the initial knowledge base. At the first start time (10:00 am by default), and the first interval (24 hours by default), the learning results are saved to a new knowledge base and this knowledge base is loaded and replaces the initial knowledge base. Because the anomaly detection is in detect mode by default, now that anomaly detection has a new knowledge base, the anomaly detection begins to detect attacks.

## Anomaly Detection Zones

By subdividing the network into zones, you can achieve a lower false negative rate. A zone is a set of destination IP addresses. There are three zones, each with its own thresholds: internal, illegal, and external.

The external zone is the default zone with the default Internet range of 0.0.0.0-255.255.255.255. By default, the internal and illegal zones contain no IP addresses. Packets that do not match the set of IP addresses in the internal or illegal zone are handled by the external zone.

We recommend that you configure the internal zone with the IP address range of your internal network. If you configure it in this way, the internal zone is all the traffic that comes to your IP address range, and the external zone is all the traffic that goes to the Internet.

You can configure the illegal zone with IP address ranges that should never be seen in normal traffic, for example, unallocated IP addresses or part of your internal IP address range that is unoccupied. An illegal zone can be very helpful for accurate detection, because we do not expect any legal traffic to reach this zone. This allows very low thresholds, which in turn can lead to very quick worm virus detection.

## Knowing When to Turn Off Anomaly Detection

Anomaly detection assumes that it gets traffic from both directions. If the sensor is configured to see only one direction of traffic, you should turn off anomaly detection. Otherwise, when anomaly detection is running in an asymmetric environment, it identifies all traffic as having incomplete connections, that is, as scanners, and sends alerts for all traffic flows.

You turn off anomaly detection in the Virtual Sensors policy. Edit the virtual sensor for which you are disabling anomaly detection, and change the Anomaly Detection Mode to Inactive. For information on editing virtual sensors, see [Editing Policies for a Virtual Sensor, page 38-9](#).

## Configuring Anomaly Detection Signatures

The Traffic Anomaly engine contains nine anomaly detection signatures covering three protocols (TCP, UDP, and other). Each signature has two subsignatures, one for the scanner and the other for the worm-infected host (or a scanner under worm attack). When anomaly detection discovers an anomaly, it triggers an alert for these signatures. All anomaly detection signatures are enabled by default and the alert severity for each one is set to high.

When a scanner is detected but no histogram anomaly occurred, the scanner signature fires for that attacker (scanner) IP address. If the histogram signature is triggered, the attacker addresses that are doing the scanning each trigger the worm signature (instead of the scanner signature). The alert details state which threshold is being used for the worm detection now that the histogram has been triggered. From that point on, all scanners are detected as worm-infected hosts.

The following anomaly detection event actions are possible:

- Produce alert—Writes the event to the Event Store.
- Deny attacker inline—(Inline only) Does not transmit this packet and future packets originating from the attacker address for a specified period of time.
- Log attacker packets—Starts IP logging for packets that contain the attacker address.
- Deny attacker service pair inline—Blocks the source IP address and the destination port.
- Request SNMP trap—Sends a trap notification to an SNMP trap destination. To use this action, you must configure SNMP trap hosts as described in [Configuring SNMP, page 36-8](#).
- Request block host—Sends a request to ARC to block this host (the attacker). To use this action, you must configure blocking devices as described in [Configuring IPS Blocking and Rate Limiting, page 43-7](#).

You can add actions to the signatures either directly, in the Signatures policy, or to events generated by the signatures based on risk rating in the Event Actions Overrides policy.

The following table lists the anomaly detection worm signatures.

**Table 41-1** Anomaly Detection Worm Signatures

| Signature ID | Subsignature ID | Name                   | Description                                                                                                                                                          |
|--------------|-----------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13000        | 0               | Internal TCP Scanner   | Identified a single scanner over a TCP protocol in the internal zone.                                                                                                |
| 13000        | 1               | Internal TCP Scanner   | Identified a worm attack over a TCP protocol in the internal zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13001        | 0               | Internal UDP Scanner   | Identified a single scanner over a UDP protocol in the internal zone.                                                                                                |
| 13001        | 1               | Internal UDP Scanner   | Identified a worm attack over a UDP protocol in the internal zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13002        | 0               | Internal Other Scanner | Identified a single scanner over an Other protocol in the internal zone.                                                                                             |
| 13002        | 1               | Internal Other Scanner | Identified a worm attack over an Other protocol in the internal zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |
| 13003        | 0               | External TCP Scanner   | Identified a single scanner over a TCP protocol in the external zone.                                                                                                |
| 13003        | 1               | External TCP Scanner   | Identified a worm attack over a TCP protocol in the external zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13004        | 0               | External UDP Scanner   | Identified a single scanner over a UDP protocol in the external zone.                                                                                                |
| 13004        | 1               | External UDP Scanner   | Identified a worm attack over a UDP protocol in the external zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13005        | 0               | External Other Scanner | Identified a single scanner over an Other protocol in the external zone.                                                                                             |
| 13005        | 1               | External Other Scanner | Identified a worm attack over an Other protocol in the external zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |
| 13006        | 0               | Illegal TCP Scanner    | Identified a single scanner over a TCP protocol in the illegal zone.                                                                                                 |

**Table 41-1** Anomaly Detection Worm Signatures (continued)

| Signature ID | Subsignature ID | Name                  | Description                                                                                                                                                         |
|--------------|-----------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13006        | 1               | Illegal TCP Scanner   | Identified a worm attack over a TCP protocol in the illegal zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13007        | 0               | Illegal UDP Scanner   | Identified a single scanner over a UDP protocol in the illegal zone.                                                                                                |
| 13007        | 1               | Illegal UDP Scanner   | Identified a worm attack over a UDP protocol in the illegal zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13008        | 0               | Illegal Other Scanner | Identified a single scanner over an Other protocol in the illegal zone.                                                                                             |
| 13008        | 1               | Illegal Other Scanner | Identified a worm attack over an Other protocol in the illegal zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |

## Configuring Anomaly Detection

Use the Anomaly Detection policy to configure anomaly detection settings. The Virtual Sensors policy also contains a setting important for anomaly detection.

This procedure explains the overall configuration of anomaly detection. Before configuring these settings, read the following topics:

- [Understanding Anomaly Detection, page 41-1](#)
- [Worm Viruses, page 41-2](#)
- [Anomaly Detection Modes, page 41-2](#)
- [Anomaly Detection Zones, page 41-3](#)
- [Knowing When to Turn Off Anomaly Detection, page 41-4](#)
- [Configuring Anomaly Detection Signatures, page 41-4](#)

---

**Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:

- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
- (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.

The Anomaly detection policy includes these tabs:

- **Operation Settings**—Defines the worm timeout and identifies any IP addresses that should be ignored by anomaly detection.

- **Learning Accept Mode**—The configuration for learning mode, including how the knowledge base is handled.
- **Internal Zone, Illegal Zone, External Zone**—The zones of your network that you define. You can configure unique settings for each zone. For an explanation of the zones, see [Anomaly Detection Zones, page 41-3](#).

**Step 2** Click the **Operation Settings** tab, if necessary, and configure the following:

- **Worm Timeout**—The time in seconds for the worm termination timeout. The range is 120 to 10,000,000 seconds. The default is 600 seconds. For an explanation of how this timeout is used, see [Understanding Anomaly Detection Thresholds and Histograms, page 41-9](#).
- **Enable Ignored Addresses and Source/Destination Addresses to Ignore**—Whether you are configuring a list of addresses that should be ignored while anomaly detection is processing. You can specify a list of source addresses (those that initiate a scan) or destination addresses (the hosts that are scanned).

The addresses can be single host (such as 10.100.10.1), a range of addresses (such as 10.100.10.0-10.100.10.255), or network/host objects that contain single hosts, address ranges, or a combination of hosts and ranges. Click **Select** to select objects from a list or to create new objects.

**Step 3** Click the **Learning Accept Mode** tab and define how the knowledge base will be generated and used. For detailed information, see [Configuring Anomaly Detection Learning Accept Mode, page 41-8](#).

**Step 4** Configure the internal, illegal, and external zones:

- Define the internal and illegal zones—The internal zones are the IP addresses of your internal network, the network that you manage. The illegal zone should represent IP address ranges that should never be seen in normal traffic, for example, unallocated IP addresses or part of your internal IP address range that is unoccupied.

Click the **Internal Zone** and **Illegal Zone** tabs in turn and configure the following on the **General** tab:

- **Enable this zone**—Whether the zone will be processed by anomaly detection.
- **Service Subnets**—The IP addresses that comprise the zone. The default (0.0.0.0) is that no address is included in the zone. Replace 0.0.0.0 to define addresses for the zone.

The addresses can be single host (such as 10.100.10.1), a range of addresses (such as 10.100.10.0-10.100.10.255), or network/host objects that contain single hosts, address ranges, or a combination of hosts and ranges. Click **Select** to select objects from a list or to create new objects.

- Decide whether to enable the external zone—The external zone comprises all IP addresses that are not configured for the internal or illegal zones. You do not explicitly assign addresses to this zone. On the **External Zone** tab, **General** sub-tab, you can enable or disable the zone using the **Enable this zone** checkbox. The external zone is enabled by default.
- Configure scanner thresholds and histograms—Each zone has sub-tabs for **TCP Protocol**, **UDP Protocol**, and **Other Protocols**. On these tabs, you can configure non-default settings for specific services that override the learned histograms. For detailed information about configuring these settings, see [Configuring Anomaly Detection Thresholds and Histograms, page 41-11](#).

At this point, you have finished configuring the basic anomaly detection settings.

**Step 5** (Device view only.) Configure the anomaly detection mode. This setting is defined in the **Virtual Sensors** policy. Consider the following tips to select the correct policy:

- If you configured the anomaly detection policy on a virtual sensor (other than vs0, which is represented by the parent IPS device), you must select the parent IPS device, then select the Virtual Sensors policy.

- If you configured the Anomaly Detection policy as a shared policy in Policy view, select the IPS device to which the policy is assigned, or that hosts a virtual sensor to which the policy is assigned.

Then, complete the following steps in the Virtual Sensors policy:

- Select the desired virtual sensor in the table and click the **Edit Row** button.
- In the Modify Virtual Sensors dialog box, select the appropriate option for the Anomaly Detection Mode setting: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see [Anomaly Detection Modes, page 41-2](#). For information about the other settings in this dialog box, see [Virtual Sensor Dialog Box, page 38-7](#).
- If you placed anomaly detection in Learning mode, remember to change the mode to Detect after the desired learning period has completed.

**Step 6** Add additional actions to the anomaly detection signatures, if desired. For example, you might want to add a deny action so that attacks are dropped. You can alternatively configure event action overrides to add actions based on risk rating. For more information, see [Configuring Anomaly Detection Signatures, page 41-4](#).

**Step 7** Manage the knowledge base, if necessary.

If you configured the knowledge base to automatically rotate (on the Learning Accept Mode tab), then the knowledge base is refreshed automatically and manual intervention is not necessary.

If you configured anomaly detection to only save new databases, and not use them, then you need to manually load updated knowledge bases periodically. You cannot do this in Security Manager; use the IPS Device Manager (IDM) instead.

Using IDM (or IME), you can load, delete, and rename knowledge bases, and upload them to or download them from an external server. For more information about what you can do, see the online help for IDM or IME.

## Configuring Anomaly Detection Learning Accept Mode

Use the Learning Accept Mode tab of the Anomaly Detection policy to configure whether you want the sensor to create a new knowledge base every so many hours. You can configure whether the knowledge base is created and loaded (Rotate) or saved (Save Only). You can schedule how often and when the knowledge base is loaded or saved.

The default generated filename is YYYY-Mon-dd-hh\_mm\_ss (that is, year-month-day-hour\_minute\_second), where Mon is a three-letter abbreviation of the current month.

The knowledge base has a tree structure and contains the following information:

- Knowledge base name
- Zone name
- Protocol
- Service

The knowledge base holds a scanner threshold and a histogram for each service. If you have learning accept mode set to automatic and the action set to rotate, a new knowledge base is created every 24 hours and used in the next 24 hours. If you have learning accept mode set to automatic and the action is set to save only, a new knowledge base is created but not loaded, and the current knowledge base is used. If you do not have learning accept mode set to automatic, no knowledge base is created.

**Tip**

Although you can use Security Manager to configure how knowledge bases are generated, you cannot manage the knowledge bases themselves. Use the IPS Device Manager (IDM), or IPS Manager Express (IME) instead. Using IDM (or IME), you can load, delete, and rename knowledge bases, and upload them to or download them from an external server. For more information about what you can do, see the online help for IDM or IME.

**Related Topics**

- [Anomaly Detection Modes, page 41-2](#)
- [Configuring Anomaly Detection, page 41-6](#)
- [Understanding Anomaly Detection Thresholds and Histograms, page 41-9](#)

- 
- Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:
- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
  - (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.
- Step 2** Click the **Learning Accept Mode** tab and configure the following options:
- **Automatically accept learning knowledge base**—Whether to have the sensor automatically update the knowledge base. If you do not select this option, anomaly detection does not automatically create a new knowledge base, and you cannot configure the other options on this tab.
  - **Action**—Whether to rotate or save the knowledge base when it is created.  
If you choose **Rotate** (the default), the new knowledge base is created and loaded according to the schedule you define. If you choose **Save Only**, the new knowledge base is created but not loaded. You can examine it and decide whether to load it into anomaly detection using IDM or IME.
- Step 3** In the **Schedule** field, select the schedule for generating a new knowledge base. The default schedule is periodic starting at 10 AM and running for 24 hours. Options are:
- **Periodic**—Base the schedule on a recurring period. Configure the following options:
    - **Start Time**—The starting time for the learning window in hh:mm:ss format (24-hour clock).
    - **Learning Interval in hours**—How long you want anomaly detection to learn from the network before creating a new knowledge base.
  - **Calendar Schedule**—Base the schedule on specific times of day and days of the week. The dialog box changes to show Time of Day and Days of the Week tables. These times apply to every day selected; you cannot specify different times for different days.
    - To add a time or day, click the **Add Row (+)** button beneath the appropriate table. The time is in hh:mm:ss format (24-hour clock). For day, select the day from the list.
    - To edit an existing time or day, select it and click the **Edit Row (pencil)** button.
    - To delete a time or day, select it and click the **Delete Row (trash can)** button. Ensure that you have at least one time and one day configured.
- 

## Understanding Anomaly Detection Thresholds and Histograms

Anomaly detection uses thresholds and histograms to determine if scanning behavior is an attack.

During learning mode, anomaly detection develops histograms for each TCP and UDP port, and for other protocols, to create a baseline of the normal behavior of your network (see [Anomaly Detection Modes, page 41-2](#)). For example, the histogram for a TCP port lists the “normal” number of source addresses that make incomplete connections to a certain number of destination addresses during a minute. The histograms contain three buckets: low number of destination addresses (5), medium number (20), and high number (100). (The destination buckets are a fixed number.) Separate histograms are kept for each service and zone (see [Anomaly Detection Zones, page 41-3](#)).

For example, learning mode might develop the following histogram for TCP port 80:

| Number of Destination Addresses | Number of Source Addresses |
|---------------------------------|----------------------------|
| Low (5)                         | 18                         |
| Medium (20)                     | 6                          |
| High (100)                      | 2                          |

In addition to these learned histograms, the anomaly detection scanner has a threshold setting that you configure. You configure a general scanner threshold, and you can override the threshold (configuring a different value) for any specific service (TCP port, UDP port, or other protocol). Each zone has its own thresholds.

When anomaly detection moves to detect mode, where it is actively scanning for worms, the thresholds and histograms are used as follows:

- Histograms are ignored until the threshold for the service is exceeded. For example, consider the above table for TCP/80 traffic. If the threshold is set at 200 (the default), a scanner must scan 200 hosts in a minute to trigger a scanner alert. If 7 source addresses scanned 50 hosts (which is an anomaly in the histogram, which expects no more than 6 hosts scanning 20-99 destinations), but a single scanner scanned only 100 addresses, no alert is generated, and no anomaly is detected.
- When the scanner threshold is exceeded, anomaly detection uses the histogram to determine if the service is under worm attack. In this example, if a source scans more than 200 destinations, anomaly detection evaluates the collected activity in the network. Because 7 hosts have scanned 50 hosts, a worm alert is generated.

When under worm attack, anomaly detection stops learning and clears the current learning information. It also temporarily lowers the thresholds.

- When a worm attack is detected, the worm timeout counter is started. When the timeout is reached, the scanner is reset. If the worm attack continues, new alerts are generated. You configure the worm timeout on the Operation Settings tab of the Anomaly Detection policy.

If you leave the defaults in place, anomaly detection generates histograms based on what it learns about your network from the network’s actual behavior. However, if you understand your network you can fine-tune these histograms to reduce false positives, creating your own definition of expected (or desired or tolerated) behavior for each TCP/UDP port or other protocol, for each zone. You can create your own histograms for only those services that interest you, and leave the defaults for all other ports. Additionally, you can configure the general scanner threshold for each zone, and configure different thresholds for specific services.

For information on configuring thresholds and histograms, see [Configuring Anomaly Detection Thresholds and Histograms, page 41-11](#).

## Configuring Anomaly Detection Thresholds and Histograms

Anomaly detection uses thresholds and histograms to determine if scanning behavior is an attack. In most cases, you can use the default thresholds and the histograms that anomaly detection generates during learning mode (see [Anomaly Detection Modes, page 41-2](#)). However, you might want to fine-tune these settings. Changing the thresholds is a more likely change than creating your own histograms.

Before you configure these settings, read [Understanding Anomaly Detection Thresholds and Histograms, page 41-9](#). You must understand how thresholds and histograms are used together to configure them.

- 
- Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:
- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
  - (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.
- Step 2** Click the tab for the zone whose thresholds or histograms you want to change. You configure separate values for each zone: **Internal Zone**, **Illegal Zone**, **External Zone**. For an explanation of the zones, see [Anomaly Detection Zones, page 41-3](#).
- The tabs for each zone contain four sub-tabs: General, TCP Protocol, UDP Protocol, and Other Protocols. The General tab defines the IP addresses for the zone and whether the zone is enabled (the External zone includes all IP addresses not specified for the other zones, you do not configure specific addresses for the External zone).
- The other tabs are where you define thresholds and histograms.
- Step 3** Select the tab for the protocol for which you want to modify thresholds or histograms: **TCP Protocol**, **UDP Protocol**, **Other Protocol**.
- On each tab, configure the following options:
- **Enabled**—Whether anomaly detection is enabled for the protocol. You can turn off detection for all of TCP, UDP, or for all non-TCP/UDP protocols with this option. If you deselect the option, any other settings configured on the tab are ignored.
  - **Destination Port Map** or **Protocol Number Map** table—This table lists the TCP/UDP ports, or other protocols, for which you are configuring non-default mappings. By default, all ports and protocols are enabled and use the default scanner threshold.  
  
Add items to this table only if you want to: disable detection for a port or protocol; set a different threshold value for a port or protocol; or configure an explicit histogram for a port or protocol, which will be used instead of the learned histogram.
    - To add a mapping, click the **Add Row (+)** button and fill in the Add Dest or Protocol Map dialog box. For detailed information, see [Dest Port or Protocol Map Dialog Box, page 41-12](#).
    - To edit a mapping, select it and click the **Edit Row (pencil)** button.
    - To delete a mapping, select it and click the **Delete Row (trash can)** button. Deleting a mapping returns the service to the default settings.
  - **Scanner Threshold**—The threshold for all TCP, UDP, or other protocols. This threshold is used for all services except those for which you configured a scanner override in the mapping table. The range is 5 to 1000. The default is 200.
  - **Threshold Histogram**—The default histogram for all TCP, UDP, or other protocols. This histogram is used for all services except those for which you configured a scanner override in the mapping table.

The content of this table is fixed; you cannot add or delete items. However, you can select a row and click **Edit Row (pencil)** to change the number of source addresses configured for a threshold setting. See [Histogram Dialog Box, page 41-13](#).

- Step 4** Repeat the process for each combination of zone and protocol for which you are defining non-default settings.

## Dest Port or Protocol Map Dialog Box

Use the Add or Modify Dest Port Map dialog box to add or modify destination port scanner settings for TCP or UDP, and the Add or Modify Protocol Map dialog box to add or modify scanner settings for other protocols.

Before you configure these settings, read the following topics:

- [Understanding Anomaly Detection Thresholds and Histograms, page 41-9](#)
- [Configuring Anomaly Detection Thresholds and Histograms, page 41-11](#)

### Tip

You do not need to add a port or protocol to have anomaly detection look for worm attacks against it. By default, all ports and protocols are processed. You need to configure specific settings only if you want to turn off detection on a specific port or protocol, or if you want non-default thresholds or histograms.

### Navigation Path

In the Anomaly Detection policy, on the **TCP Protocol**, **UDP Protocol**, or **Other Protocol** sub tabs on the Internal Zone, Illegal Zone, or External Zone tabs, click the **Add Row** button beneath the Destination Port Map or Protocol Number Map tables, or select a row and click the **Edit Row** button. For more information on the steps required to get here, see [Configuring Anomaly Detection Thresholds and Histograms, page 41-11](#).

If you do not enable the service, the associated port or protocol is not processed by anomaly detection.                                                                                                                                                                                                                        |

**Table 41-2 Destination Port or Protocol Map Dialog Box (continued)**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Override Scanner Settings | Whether to override the scanner settings for this service or protocol. You must select this option to enable the remaining fields on the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Scanner Threshold         | The scanner threshold for this port or protocol. The range is 5 to 1000. The default is 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Threshold Histogram table | <p>The histograms for this port or protocol. If you leave the table empty, the default histograms are used. You can have up to three rows, for low, medium, and high numbers of destination addresses, with different threshold levels (source addresses) for each.</p> <ul style="list-style-type: none"> <li>To add a threshold, click the <b>Add Row</b> button and fill in the <a href="#">Histogram Dialog Box, page 41-13</a>. The Add button is disabled if you already have three rows.</li> <li>To edit a threshold, select it and click the <b>Edit Row</b> button. You cannot change the destination bucket to one that is already defined in the table.</li> <li>To delete a threshold, select it and click the <b>Delete Row</b> button. Any buckets not included in the table use the default histogram for the bucket.</li> </ul> |

## Histogram Dialog Box

Use the Histogram dialog box to create or modify entries in a histogram. The histograms you create or modify override the default histograms that anomaly detection generates. For detailed information about how these histograms are used, see:

- [Understanding Anomaly Detection Thresholds and Histograms, page 41-9](#)
- [Configuring Anomaly Detection Thresholds and Histograms, page 41-11](#)

### Navigation Path

Do one of the following from the Anomaly Detection policy (see [Configuring Anomaly Detection, page 41-6](#)):

- On the TCP Protocol, UDP Protocol, or Other Protocol sub tabs on the Internal Zone, Illegal Zone, or External Zone tabs, select a row in the Threshold Histogram table and click the **Edit Row** button.
- On the Add or Modify Dest or Protocol Map dialog boxes, click the **Add Row** button, or select a row and click the **Edit Row** button. For information on opening the map dialog boxes, see [Dest Port or Protocol Map Dialog Box, page 41-12](#).

## Field Reference

Table 41-3 Histogram Dialog Box

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of Destination IP Addresses | <p>The histogram bucket you are defining. The buckets have a fixed number of destination addresses: Low (5 addresses); Medium (20); High (100).</p> <p><b>Tip</b> A histogram can have a single entry for each destination bucket (low, medium, high). Thus, you cannot change this value to one that is already defined in the histogram you are editing.</p> |
| Number of Source IP Addresses      | <p>The number of source addresses that are allowed to simultaneously scan the associated number of destination addresses. Enter the desired number.</p> <p>The range is 0 to 4096. If you are editing a histogram, the current value is shown.</p>                                                                                                             |

## Configuring Global Correlation

Note

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

You can configure global correlation so that your sensors are aware of network devices with a reputation for malicious activity and can take action against them. Global correlation allows you to dynamically use information about malicious activity collected from networks around the globe to change the risk rating of events that have known bad devices as their source.

To configure global correlation, your sensor must be running IPS 7.0+ software. Global correlation is not available on Cisco IOS IPS devices.

This chapter contains the following topics:

- [Understanding Global Correlation, page 42-1](#)
- [Configuring Global Correlation Inspection and Reputation, page 42-5](#)
- [Configuring Network Participation, page 42-7](#)

## Understanding Global Correlation

You can configure global correlation so that your sensors are aware of network devices with a reputation for malicious activity and can take action against them. Participating IPS devices in a centralized Cisco threat database, the SensorBase, receive and absorb global correlation updates. The reputation data contained in the global correlation updates is factored into the analysis of network traffic, which increases IPS efficacy, because traffic is denied or allowed based on the reputation of the source IP address. The participating IPS devices send data back to the Cisco SensorBase Network, which results in a feedback loop that keeps the updates current and global.

Tip

The Botnet Traffic Filter feature of adaptive security appliances (ASA) is another dynamic feature you can deploy in your network to defend against malicious activity. Configuring global correlation on IPS devices, and Botnet Traffic Filtering on ASA firewalls, can be an effective combined security implementation. For more information about Botnet Traffic Filtering, see [Chapter 19, “Managing Firewall Botnet Traffic Filter Rules”](#).

There are three main features of global correlation:

- **Global Correlation Inspection**—The IPS uses the global correlation reputation knowledge of attackers to influence alert handling and to deny actions when attackers with a bad score are seen on the sensor. For more information about reputation, see [Understanding Reputation, page 42-2](#).
- **Reputation Filtering**—Applies automatic deny actions to packets from known malicious sites.
- **Network Participation**—The sensor sends alert and TCP fingerprint data to the SensorBase Network so that other users can share in the community knowledge. For more information, see [Understanding Network Participation, page 42-3](#).

Global correlation has the following goals:

- Dealing intelligently with alerts thus improving efficacy.
- Improving protection against known malicious sites.
- Sharing telemetry data with the SensorBase Network to improve visibility of alerts and sensor actions on a global scale.
- Simplifying configuration settings.
- Automatic handling of the uploads and downloads of the information.

**Tip**

---

You can use Report Manager to generate reports comparing the number of alerts generated by global correlation to those generated by traditional IPS inspection. For information on the Inspection/Global Correlation report, see [Understanding General IPS Reports, page 70-19](#). For information on generating reports, see [Opening and Generating Reports, page 70-20](#).

---

For information on how to configure global correlation, see the following topics:

- [Global Correlation Requirements and Limitations, page 42-4](#)
- [Configuring Global Correlation Inspection and Reputation, page 42-5](#)
- [Configuring Network Participation, page 42-7](#)

## Understanding Reputation

Similar to human social interaction, reputation is an opinion toward a device on the Internet. Reputation indicates the probability that a particular attacker IP address will initiate malicious behavior based on its known past activity. Reputation enables the installed base of IPS sensors to collaborate using the existing network infrastructure and identify network devices that are likely to be malicious or infected.

By collecting data about devices and assigning reputation scores to them, the global correlation database provides important data that the IPS sensor can use to adjust the risk rating of an attack. Risk rating is the probability that a network event is malicious. Each signature has an associated risk rating. If you enable global correlation, the IPS sensor computes a score based on the reputation of an attacker and adds this score to the risk rating of the event. The updated risk rating is then used by your event action override and filter policies to help determine what actions to take for the event.

Thus, you might have an event that is initially configured to simply produce an alert. But, if the attacker has a bad reputation, the IPS might increase the risk rating to a number high enough that it triggers an event action override rule that adds the Deny Packet Inline action. Thus, for some source devices, the event simply produces an alert, but for others, the event drops the packet in addition to producing the alert.

**Tip**

The Produce Alert action is added to an event whenever global correlation raises the risk rating of the event, or when global correlation adds the Deny Packet Inline or Deny Attacker Inline actions.

Because the global correlation database changes rapidly, the sensor must periodically download global correlation updates from the global correlation servers.

Using reputation scores to adjust the risk rating of an event improves the efficacy of the sensor by improving the following metrics:

- False positives as a percentage of actionable events.
- False negatives as a percentage of threats that do not result in actionable events.
- Actionable events as a percentage of all events.

- [Understanding Network Participation, page 42-3](#)
- [Configuring Global Correlation Inspection and Reputation, page 42-5](#)
- [Configuring Network Participation, page 42-7](#)

## Understanding Network Participation

Network participation lets Cisco collect nearly real-time data from sensors around the world. Sensors installed at customer sites can send data to the SensorBase Network. These data feed in to the global correlation database to increase reputation fidelity. Communication between sensors and the SensorBase Network involves an HTTPS request and response over TCP/IP.

There are three modes for Network Participation:

- **Off**—The Network Participation server does not collect data, track statistics, or try to contact the Cisco SensorBase network.
- **Partial Participation**—The Network Participation server collects data, tracks statistics, and communicates with the SensorBase network. Data considered to be potentially sensitive is filtered out and never sent.

**Note**

Configuring the sensor for partial network participation limits a third party from extracting reconnaissance information about your internal network from the global correlation database.

- **Full Participation**—The Network Participation server collects data, tracks statistics, and communicates with the SensorBase network. All data collected is sent.

If you select partial or full participation, you are prompted to accept a participation agreement. You must accept the agreement to participate or you cannot change the participation mode.

The following table explains the data collected and the purpose of collecting it.

**Table 42-1** Network Participation Data Sharing and Usage

| Participation Level | Type of Data                                                                                                 | Purpose                                                                 |
|---------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Partial             | Protocol attributes (TCP maximum segment size and options string, for example).                              | Tracks potential threats and helps Cisco to understand threat exposure. |
|                     | Attack type (signature fired, including signature ID and version, risk rating, and reputation, for example). | Used to understand current attacks and attack severity.                 |
|                     | Connecting IP address and port.                                                                              | Identifies attack source.                                               |
|                     | Summary IPS performance (CPU utilization, memory usage, inline vs promiscuous, for example).                 | Tracks product efficacy.                                                |
| Full                | Victim IP address and port.                                                                                  | Detects threat behavioral pattern.                                      |

To configure network participation, the IPS device requires at least 100 MB of available memory, a network connection to the sensor, and a network connection to the Internet. For information on configuring network participation, see [Configuring Network Participation, page 42-7](#).

## Global Correlation Requirements and Limitations

The following list explains the requirements that you must meet to configure and successfully use global correlation on IPS devices. It also explains some limitations.

- **Valid license**—You must have a valid sensor license for global correlation features to function. You can still configure and display statistics for the global correlation features, but the global correlation databases are cleared and no updates are attempted. Once you install a valid license, the global correlation features are reactivated. For information on configuring licenses, see [Updating IPS License Files, page 44-1](#).
- **Agree to Network Participation disclaimer**—If you decide to configure network participation, you must accept the disclaimer. For more information, see [Understanding Network Participation, page 42-3](#) and [Configuring Network Participation, page 42-7](#).
- **External connectivity for sensor and a DNS server or HTTP proxy**—Global correlation requires the sensor to connect to the Cisco SensorBase Network. Domain name resolution is also required for these features to function. You can either configure the sensor to connect through an HTTP proxy server that has a DNS client running on it, or you can assign an Internet routeable address to the management interface of the sensor and configure the sensor to use a DNS server. For more information, see [Identifying DNS Servers, page 36-24](#) and [Identifying an HTTP Proxy Server, page 36-24](#).
- **Sensor in inline mode**—The sensor must operate in inline mode so that the global correlation features can increase efficacy by being able to use the inline deny actions.
- **Sensor and IPS version that supports the global correlation features**—The sensor must run IPS 7.0+ software. You cannot configure global correlation on Cisco IOS IPS devices.
- **Sufficient available memory**—To configure network participation, the IPS device requires at least 100 MB of available memory.

- **Firewall access for port 80, 443 traffic**—Because global correlation updates occur through the sensor management interface, any firewall that lies between the sensor and the internet must allow traffic on ports 80 and 443. You can also use an HTTP proxy (see [Identifying an HTTP Proxy Server, page 36-24](#)).
- **Exposure to external traffic**—The global correlation database contains external IP addresses only, so if you position a sensor in an internal lab that has no interaction with outside networks, you might never receive global correlation information. The feature will have no effect.
- **Bypass mode might be triggered during global correlation updates**—As with signature updates, when the sensor applies a global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.
- **No IPv6 address support**—Global correlation inspection and the reputation filtering deny features do not support IPv6 addresses. For global correlation inspection, the sensor does not receive or process reputation data for IPv6 addresses. The risk rating for IPv6 addresses is not modified for global correlation inspection. Similarly, network participation does not include event data for attacks from IPv6 addresses. And finally, IPv6 addresses do not appear in the deny list.

## Configuring Global Correlation Inspection and Reputation

Use the Inspection/Reputation policy to configure the sensor to use updates from the SensorBase Network to adjust the risk rating of events. The global correlation client on the sensor determines which updates are available and applicable to the sensor by communicating with the global correlation update server and a file server. The global correlation update server provides the server manifest document to the sensor, which identifies which updates are available and how to obtain them from a file server. The sensor downloads the update files from the file server using the information in the server manifest.

When you configure global correlation, updates are automatic and happen at regular intervals, approximately every five minutes by default, but this interval can be modified by the global correlation server. The sensor initially gets a full update and then applies an incremental update periodically.

If you turn on global correlation, you can choose how aggressively you want the deny actions to be enforced against malicious hosts. You can then enable reputation filtering to deny access to known malicious hosts. If you only want a report of what could have happened, you can enable Test Global Correlation. This puts the sensor in Audit mode, and actions the sensor would have performed are generated in the events.

**Tip**

When you view IPS events in Event Viewer, there are several columns specific to global correlation that you can add to the event table; these columns are not shown by default, so you must add them to your view. To monitor global correlation in general, use the IPS device manager (IDM) and look at the Sensor Health gadget. Use either the full IDM or open a read-only copy from Security Manager by right-clicking the device in Device view and selecting **Device Manager**.

**Before You Begin**

- You must also configure a DNS server or HTTP proxy for global correlation to function. For details, see [Identifying DNS Servers, page 36-24](#) or [Identifying an HTTP Proxy Server, page 36-24](#).
- There are several configuration requirements and limitations that you should be aware of before configuring global configuration. For details, see [Global Correlation Requirements and Limitations, page 42-4](#).

**Related Topics**

- [Understanding Global Correlation, page 42-1](#)
- [Understanding Reputation, page 42-2](#)
- [Configuring Network Participation, page 42-7](#)

**Step 1**

Do one of the following to open the Inspection/Reputation policy:

- (Device view) Select **IPS > Global Correlation > Inspection/Reputation** from the Policy selector.
- (Policy view) Select **IPS > Global Correlation > Inspection/Reputation** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

Configure the following settings:

- **Global Correlation Inspection**—Whether to enable global correlation inspection. When turned on, the sensor uses updates from the SensorBase Network to adjust the risk rating. Deselect this option to disable inspection.
- **Global Correlation Influence**—How aggressively the sensor uses global correlation information to initiate deny actions. Select one of the following:
  - **Permissive**—Has the least aggressive effect on deny actions.
  - **Standard**—(The default.) Has a moderately aggressive effect on deny actions.
  - **Aggressive**—Has a very aggressive effect on deny actions.
- **Reputation Filtering**—Select whether you want reputation filtering **on** or **off**. When turned on, the sensor denies access to malicious hosts that are listed in the global correlation database.
- **Test Global Correlation**—Whether to place global correlation in audit mode. In audit mode, reputation filtering does not deny access to known malicious hosts; only a report of what could have happened is generated.

Audit mode allows you to test the global correlation features without actually denying any hosts. If you decide the effects are desirable, you can deselect this option to activate reputation filtering.

# Configuring Network Participation

Use the Network Participation policy to configure the sensor to send data to the SensorBase Network. You can configure the sensor to fully participate and send all data to the SensorBase Network, or you can configure the sensor to collect the data but to omit potentially sensitive data, such as the destination IP address of trigger packets. For detailed information about network participation and the data that is collected, see [Understanding Network Participation, page 42-3](#).

## Related Topics

- [Understanding Global Correlation, page 42-1](#)
- [Understanding Reputation, page 42-2](#)
- [Global Correlation Requirements and Limitations, page 42-4](#)
- [Configuring Global Correlation Inspection and Reputation, page 42-5](#)

- 
- Step 1** Do one of the following to open the Network Participation policy:
- (Device view) Select **IPS > Global Correlation > Network Participation** from the Policy selector.
  - (Policy view) Select **IPS > Global Correlation > Network Participation** from the Policy Type selector. Select an existing policy or create a new one.

- Step 2** Select the level of participation from the **Network Participation** list:
- **Off**—No data is contributed to the SensorBase network.
  - **Partial**—Data is contributed to the SensorBase network but potentially sensitive information is withheld.

### Note

Configuring the sensor for partial network participation limits a third party from extracting reconnaissance information about your internal network from the Global Correlation database.

- **Full**—All data is contributed to the SensorBase network.
- Step 3** If you select Full or Partial, when you click Save, the Network Participation Disclaimer dialog box opens, prompting you to read and accept a disclaimer. Carefully read the disclaimer. Click **Agree** if you agree to it.

If you click **Disagree**, you cannot enable network participation. Change the setting to Off and save the policy.

---

# Configuring Attack Response Controller for Blocking and Rate Limiting

**Note**

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

You can configure an IPS device to implement blocks or rate limits to control attacks. Blocking and rate limiting are primarily of use when operating in promiscuous mode. When operating in inline mode, it is much more efficient to have the IPS drop traffic itself. Blocking and rate limiting are actions that other devices implement at the request of the IPS; thus, configuring blocking and rate limiting is a more complex configuration than simple inline denies.

To configure blocking or rate limiting, you must identify the network device that performs the blocking. A network device that performs blocking is called a blocking device. Many network devices can be used to support blocking: Cisco IOS routers and Catalyst 6500 switches, Cisco security appliances (ASA, PIX, and FWSM), and Catalyst 6500/7600 devices running the Catalyst operating system. You can also configure another IPS device to act as a main blocking sensor.

**Note**

IPS blocking and rate limiting works only for IPS appliances and service modules. You cannot configure it for Cisco IOS IPS.

This chapter contains the following topics:

- [Understanding IPS Blocking, page 43-1](#)
- [Configuring IPS Blocking and Rate Limiting, page 43-7](#)
- [Blocking Page, page 43-8](#)

## Understanding IPS Blocking

The Attack Response Controller (ARC) component of the IPS is responsible for managing network devices in response to suspicious events by blocking access from attacking hosts and networks. ARC blocks the IP address on the devices it is managing. It sends the same block to all the devices it is managing, including any other main blocking sensors. ARC monitors the time for the block and removes the block after the time has expired.

**Note**

ARC is formerly known as Network Access Controller. Although the name has been changed, the IPS documentation and configuration interfaces contain references to Network Access Controller, nac, and network-access.

ARC completes the action response for a new block in no more than 7 seconds. In most cases, it completes the action response in less time. To meet this performance goal, you should not configure the sensor to perform blocks at too high a rate or to manage too many blocking devices and interfaces. We recommend that the maximum number of blocks not exceed 250 and the maximum number of blocking items not exceed 10. To calculate the maximum number of blocking items, a security appliance counts as one blocking item per blocking context. A router counts as one blocking item per blocking interface/direction. A switch running Catalyst software counts as one blocking item per blocking VLAN. If the recommended limits are exceeded, ARC might not apply blocks in a timely manner or might not be able to apply blocks at all.

For security appliances configured in multiple-context mode, Cisco IPS does not include VLAN information in the block request. Therefore you must make sure the IP addresses being blocked are correct for each security appliance. For example, the sensor is monitoring packets on a security appliance customer context that is configured for VLAN A, but is blocking on a different security appliance customer context that is configured for VLAN B. Addresses that trigger blocks on VLAN A might refer to a different host on VLAN B.

**Note**

Blocking is not supported on the FWSM on the admin context in multiple-context mode.

There are three types of blocks:

- **Host block**—Blocks all traffic from a given IP address.  
To configure the IPS to initiate automatic host blocks when a signature is triggered, add the **Request Block Host** event action to a signature, or add it to events based on risk rating using the event action override policy. See [Configuring Event Action Overrides, page 40-13](#) and [Configuring Signatures, page 39-4](#).
- **Connection block**—Blocks traffic from a given source IP address to a given destination IP address and destination port. Multiple connection blocks from the same source IP address to either a different destination IP address or destination port automatically switch the block from a connection block to a host block.  
To configure the IPS to initiate automatic connection blocks when a signature is triggered, add the **Request Block Connection** event action to a signature, or add it to events based on risk rating using the event action override policy.
- **Network block**—Blocks all traffic from a given network.  
You can initiate host and connection blocks manually or automatically when a signature is triggered. You can only initiate network blocks manually. You cannot initiate network blocks from within Security Manager; use the IPS Device Manager instead.

**Tip**

Connection blocks and network blocks are not supported on security appliances (firewalls). Security appliances only support host blocks with additional connection information.

**Note**

Do not confuse blocking with the ability of the sensor to drop packets. The sensor can drop packets when the following actions are configured for a sensor in inline mode: deny packet inline, deny connection inline, and deny attacker inline.

On Cisco IOS Software devices (routers and Catalyst 6500 series switches), ARC creates blocks by applying ACLs; on Catalyst 6500/7600 devices that run the Catalyst operating system, ARC creates blocks by applying VACLs. ACLs and VACLs permit or deny passage of data packets through interface directions or VLANs. Each ACL or VACL contains permit and deny conditions that apply to IP addresses. The security appliances use the **shun** command instead of ACLs.

**Tip**

For a list of the specific devices and operating system versions that you can configure as blocking devices, see the supported device information in the chapter “Configuring Attack Response Controller for Blocking and Rate Limiting” in the *Installing and Using Cisco Intrusion Prevention System Device Manager* publication for your IPS software version. These publications are available on Cisco.com at [http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/products_installation_and_configuration_guides_list.html).

The following topics explain more about IPS blocking:

- [Strategies for Applying Blocks, page 43-3](#)
- [Understanding Rate Limiting, page 43-4](#)
- [Understanding Router and Switch Blocking Devices, page 43-4](#)
- [Understanding the Master Blocking Sensor, page 43-6](#)
- [Configuring IPS Blocking and Rate Limiting, page 43-7](#)
- [Blocking Page, page 43-8](#)

## Strategies for Applying Blocks

Blocking is performed only when an event occurs and the event includes the Request Block Connection or Request Block Host event actions. These event actions are not typically needed when you operate the IPS in inline mode, where you use Deny actions to drop undesired traffic.

The following are situations in which you might want to implement blocking actions:

- Promiscuous mode—When running in promiscuous mode, the IPS cannot implement Deny actions. Thus, if you want to prevent traffic from a host, you must implement blocking.
- Inline mode—In inline mode, you can implement Deny actions to immediately drop undesired traffic. However, you might want to add blocking actions to protect other segments of your network.

For example, suppose that your network consists of five subnets, A, B, C, D, and E, and that each of these segments has an inline IPS device monitoring it. If the IPS for subnet A identifies an attack, the IPS can use Deny actions to protect subnet A, but also use Request Block actions to configure the firewalls that protect B, C, D, and E to shun the attacker before the attack can target those other subnets. In this example, you would want to designate a single IPS as the main blocking sensor and have the other four IPS sensors perform blocking through the main blocking sensor.

Use the following techniques to add the request block actions to an event:

- Event Action Override policy—Configure an event action override rule to add the action to all events based on the event's risk rating. This is a simple approach. You could add the request block action for the same risk ratings used for adding Deny actions. For more information, see [Configuring Event Action Overrides](#), page 40-13.
- Signatures policy—You can add the request block actions to individual signatures. This requires editing each signature to add the action. This can be a time-consuming approach, but it allows you to configure blocking for just the types of events that concern you most. For more information, see [Configuring Signatures](#), page 39-4.

- [Configuring IPS Blocking and Rate Limiting](#), page 43-7
- [Blocking Page](#), page 43-8

## Understanding Rate Limiting

Attack Response Controller (ARC) is responsible for rate limiting traffic in protected networks. Rate limiting lets sensors restrict the rate of specified traffic classes on network devices. Rate limit responses are supported for the Host Flood and Net Flood engines, and the TCP half-open SYN signature. ARC can configure rate limits on network devices running Cisco IOS 12.3 or later. Main blocking sensors can also forward rate limit requests to blocking forwarding sensors.

To add a rate limit to a signature, you must add the Request Rate Limit action. You can then edit the signature parameters to set the percentage for these signatures in the Event Actions Settings folder.

#### Tip

You can also manually implement rate limits, but you cannot do so using Security Manager; use the IPS Device Manager instead.

On the blocking device, you must not apply a service policy to an interface/direction that is configured for rate limiting. If you do so, the rate limit action will fail. Before configuring rate limits, confirm that there is no service policy on the interface/direction, and remove it if one exists. ARC does not remove the existing rate limit unless it is one that ARC had previously added.

Rate limits use ACLs, but not in the same way as blocks. Rate limits use ACLs and class-map entries to identify traffic, and policy-map and service-policy entries to police the traffic.

## Understanding Router and Switch Blocking Devices

You can use routers or Catalyst 6500/7600 devices running Cisco IOS Software, or Catalyst 6500/7600 devices running the Catalyst operating system, to implement IPS blocking in your network. When you use routers or switches, Attack Response Controller (ARC) configures extended ACLs (on IOS devices) or VLAN ACLs (on Catalyst OS devices) to implement the blocks. These ACLs and VACLs are created and managed in the same way.

Rate limits also use ACLs, but not in the same way as blocks. Rate limits use ACLs and class-map entries to identify traffic, and policy-map and service-policy entries to police the traffic.

**Tip**

IPS considers Catalyst 6500/7600 devices that run Cisco IOS Software to be equivalent to routers. When you add these devices as blocking devices, add them as routers.

When you configure a router interface or switch VLAN as a blocking interface, you can optionally specify the names of pre- and post-ACLs or VACLs. Although specifying ACL or VACL names is optional, if you have configured ACLs or VACLs on the interface or VLAN, you must identify them to the IPS or ARC will remove them from your device configuration.

The pre- and post-ACL/VACL have the following uses:

- The Pre-Block ACL/VACL is mainly used for permitting what you do not want the sensor to ever block. When a packet is checked against the ACL/VACL, the first line that gets matched determines the action. If the first line matched is a permit line from the Pre-Block ACL/VACL, the packet is permitted even though there may be a deny line (from an automatic block) listed later in the ACL/VACL. The Pre-Block ACL/VACL can override the deny lines resulting from the blocks.
- The Post-Block ACL/VACL is best used for additional blocking or permitting that you want to occur on the same interface or direction. If you have an existing ACL on the interface or direction that the sensor will manage, that existing ACL can be used as a Post-Block ACL/VACL. If you do not have a Post-Block ACL/VACL, the sensor inserts permit ip any any at the end of the new ACL/VACL.

If you are managing the IOS Software blocking device in Security Manager, you can identify the ACL name by selecting the blocking device, then selecting **Tools > Preview Config**. Look for the **ip access-group** command in the interface configuration, and check the direction. For example, the following lines show that there is an ACL named CSM\_FW\_ACL\_GigabitEthernet0/1 in the In direction attached to the GigabitEthernet0/1 interface.

```
interface GigabitEthernet0/1
 ip access-group CSM_FW_ACL_GigabitEthernet0/1 in
```

In this example, if you configure GigabitEthernet0/1 in the In direction as a blocking interface, ensure that you specify CSM\_FW\_ACL\_GigabitEthernet0/1 as a pre- or post-ACL. In most cases, you should specify the ACL as the post-ACL, so that the relatively short IPS blocking ACL first filters out undesirable traffic before the blocking device implements your other access rules.

Because Security Manager does not manage Catalyst OS devices, you must examine a Catalyst OS device configuration outside of Security Manager to determine VACL names. Keep in mind that a Catalyst 6500/7600 device that runs IOS Software can also have VACLs, but the IPS does not do VLAN blocking on Catalyst 6500/7600 VLANs when the device is running IOS Software.

When the sensor starts up, it reads the contents of the two ACL/VACLs. It creates a third ACL/VACL with the following entries in this order, and this combined ACL/VACL is applied to the interface or VLAN:

1. A **permit** line with the sensor IP address or, if specified, the NAT address of the sensor.

If you select the Allow Sensor IP address to be Blocked option on the General tab of the Blocking policy, this permit entry is not added. For more information, see [General Tab, IPS Blocking Policy, page 43-10](#).

2. Pre-Block ACL/VACL, if specified.
3. Any active blocks generated by the IPS (deny statements).
4. The Post-Block ACL/VACL, if specified.

If you do not specify a Post-Block ACL/VACL, a **permit ip any any** entry is added to allow all unfiltered traffic. Note that this negates the normal implicit deny any that ends interface ACLs.

When using Catalyst OS, IDSM-2 inserts **permit ip any any capture** at the end of the new VACL.

If ARC is managing a device and you need to configure the ACL/VACLs on that device, you should disable blocking first. You want to avoid a situation in which both you and ARC could be making a change at the same time on the same device. This could cause the device or ARC to fail. If you need to modify the Pre-Block or Post-Block ACL/VACL, do the following:

1. Disable blocking on the sensor.

Because you are making a temporary change, you can disable and then reenabling blocking by using the IPS Device Manager (IDM) on the device. Alternatively, you can deselect the Enable Blocking option on the General tab of the Blocking policy in Security Manager, then deploy the configuration to the IPS sensor. To reenabling blocking, select the Enable Blocking option again and deploy the configuration to the IPS sensor.

2. Make the changes to the configuration of the device. For example, if you manage the blocking device in Security Manager, deploy the updated configuration and wait for the device to reload.
3. Reenable blocking on the sensor.

## Understanding the Master Blocking Sensor

Multiple sensors (blocking forwarding sensors) can forward blocking requests to a specified main blocking sensor, which controls one or more devices. The main blocking sensor is the ARC running on a sensor that controls blocking on one or more devices on behalf of one or more other sensors. When a signature fires that has blocking or rate limit requests configured as event actions, the sensor forwards the block or rate limit request to the main blocking sensor, which then performs the block or rate limit.

When you add a main blocking sensor, you reduce the number of blocking devices per sensor. For example, if you want to block on 10 firewalls and 10 routers with one blocking interface/direction each, you can assign 10 to the sensor and assign the other 10 to a main blocking sensor.

You configure main blocking sensors on the Master Blocking Sensors tab of the Blocking policy, as described in [Blocking Page, page 43-8](#).

When configuring main blocking sensors, keep the following tips in mind:

- Two sensors cannot control blocking or rate limiting on the same device. If this situation is needed, configure one sensor as the main blocking sensor to manage the devices and the other sensors can forward their requests to the main blocking sensor.
- On the blocking forwarding sensor, identify which remote host serves as the main blocking sensor; on the main blocking sensor you must add the blocking forwarding sensors to its access list using the Allowed Hosts policy. See [Identifying Allowed Hosts, page 36-7](#).
- If the main blocking sensor requires TLS for web connections, you must configure the ARC of the blocking forwarding sensor to accept the X.509 certificate of the main blocking sensor remote host. Sensors by default have TLS enabled, but you can change this option. For more information, see [Master Blocking Sensor Dialog Box, page 43-13](#).
- Typically the main blocking sensor is configured to manage the network devices. Blocking forwarding sensors are not normally configured to manage other network devices, although doing so is permissible.
- Only one sensor should control all blocking interfaces on a device.

# Configuring IPS Blocking and Rate Limiting

If you use the Request Block Host, Request Block Connection, or Request Rate Limit actions on any signatures, or add them to events using the event action override policy, you must configure blocking devices. If you do not use these actions, there is no need to configure blocking devices.

Before you configure blocking, read the following topics:

- [Understanding IPS Blocking, page 43-1](#)
- [Strategies for Applying Blocks, page 43-3](#)
- [Understanding Rate Limiting, page 43-4](#)
- [Understanding Router and Switch Blocking Devices, page 43-4](#)
- [Understanding the Master Blocking Sensor, page 43-6](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Security > Blocking** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one.
- For an overview of the blocking policy, see [Blocking Page, page 43-8](#).
- Step 2** On the General tab, change any settings where you want non-default values. However, the default values are appropriate for most networks. For detailed information about the settings, see [General Tab, IPS Blocking Policy, page 43-10](#).
- Step 3** Click the **User Profiles** tab and create the user profiles that are required to log into the blocking devices.
- To add a profile, click the **Add Row** button and fill in the Add User Profile dialog box (see [User Profile Dialog Box, page 43-12](#)).
  - To edit a profile, select it and click the **Edit Row** button.
  - To delete a profile, select it and click the **Delete Row** button. Before you delete a profile, ensure that it is not currently being used by a blocking device.
- Step 4** If you need to use a main blocking sensor, as described in [Understanding the Master Blocking Sensor, page 43-6](#), click the **Master Blocking Sensors** tab and do the following:
- To add a main blocking sensor, click the **Add Row** button and fill in the Add Master Blocking Sensor dialog box (see [Master Blocking Sensor Dialog Box, page 43-13](#)).
  - To edit a main blocking sensor, select it and click the **Edit Row** button.
  - To delete a main blocking sensor, select it and click the **Delete Row** button.
- Step 5** Identify the blocking devices (unless you will use main blocking sensors only). You must add the devices to the correct tab:
- **Routers** tab—For all Cisco IOS Software devices, including Catalyst 6500 switches that are running IOS Software.
  - **Firewalls** tab—For ASA, PIX, and FWSM.
  - **Catalyst 6K** tab—For Catalyst 6500/7600 devices that are running the Catalyst operating system.
- On each tab, the configuration steps are the same:
- To add a device, click the **Add Row** button and fill in the Add Router, Firewall, or Cat6K Device dialog box (see [Router, Firewall, Cat6K Device Dialog Box, page 43-14](#)).

- To edit a device, select it and click the **Edit Row** button.
- To delete a device, select it and click the **Delete Row** button.

**Step 6** Click the **Never Block Hosts and Networks** tab and identify the hosts and networks that should never be blocked. These lists affect blocking actions, but they do not affect limiting actions. Identify your trusted networks and hosts:

- To add a host or network, click the **Add Row** button beneath the appropriate table and fill in the Add Never Block Host or Network dialog box (see [Never Block Host or Network Dialog Boxes](#), page 43-17).
- To edit a host or network, select it and click the **Edit Row** button.
- To delete a host or network, select it and click the **Delete Row** button.

## Blocking Page

Use the Blocking page to configure IPS sensor blocking properties. Configure the blocking policy only if you use the Request Block Connection, Request Block Host, or Request Rate Limit event actions in your signatures or event actions policies. Blocking hosts are used only for events to which these actions are assigned.

### Tip

The list of hosts and networks to never block applies only to the Request Block Connection and Request Block Host event actions. The list does not affect rate limiting, nor does it affect any of the Deny actions such as Deny Packet Inline. To exempt hosts and networks from Deny or rate limiting actions, use event action filter rules, specify the hosts and networks as Attackers, and remove the actions from events. For more information, see [Configuring Event Action Filters](#), page 40-4.

### Navigation Path

- (Device view) Select **Platform > Security > Blocking** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one.

A main blocking sensor manages blocks for other IPS devices. The table shows the IP address (or network/host object) of the main blocking sensor, the username and password for logging into it, the port used for connections, and whether TLS is used for login.</p> <ul style="list-style-type: none"> <li>To add a main blocking sensor, click the <b>Add Row</b> button and fill in the Add Master Blocking Sensor dialog box (see <a href="#">Master Blocking Sensor Dialog Box, page 43-13</a>).</li> <li>To edit a main blocking sensor, select it and click the <b>Edit Row</b> button.</li> <li>To delete a main blocking sensor, select it and click the <b>Delete Row</b> button.</li> </ul>                                        |
| Router tab                  | <p>The IOS routers and Catalyst 6500/7600 devices (that are running IOS Software) to be used as blocking or rate limiting devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), the name of the profile that is used for logging into the device, and the device's response capabilities (blocking, rate limiting, or both).</p> <ul style="list-style-type: none"> <li>To add a router, click the <b>Add Row</b> button and fill in the Add Router Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box, page 43-14</a>).</li> <li>To edit a router, select it and click the <b>Edit Row</b> button.</li> <li>To delete a router, select it and click the <b>Delete Row</b> button.</li> </ul> |

**Table 43-1** *IPS Blocking Policy (continued)*

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall tab                   | <p>The ASA, PIX, and FWSM devices to be used as blocking devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), and the name of the profile that is used for logging into the device.</p> <ul style="list-style-type: none"> <li>To add a firewall, click the <b>Add Row</b> button and fill in the Add Firewall Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box, page 43-14</a>).</li> <li>To edit a firewall, select it and click the <b>Edit Row</b> button.</li> <li>To delete a firewall, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                                            |
| Catalyst 6K tab                | <p>The Catalyst 6500/7600 devices that are using Catalyst software to be used as blocking devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), and the name of the profile that is used for logging into the device.</p> <p><b>Tip</b> Do not use this tab for Catalyst 6500/7600 devices that run Cisco IOS Software. Instead, use the Router tab.</p> <ul style="list-style-type: none"> <li>To add a Catalyst OS device, click the <b>Add Row</b> button and fill in the Add Cat6K Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box, page 43-14</a>).</li> <li>To edit a Catalyst OS device, select it and click the <b>Edit Row</b> button.</li> <li>To delete a Catalyst OS device, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Never Block Hosts and Networks | <p>The hosts and networks that should never be blocked. Hosts and networks are shown in separate tables. The tables show the IP address or network/host object for the host or network. These lists do not affect rate limiting actions, nor do they apply to Deny actions.</p> <ul style="list-style-type: none"> <li>To add a host or network, click the <b>Add Row</b> button beneath the appropriate table and fill in the Add Never Block Host or Network dialog box (see <a href="#">Never Block Host or Network Dialog Boxes, page 43-17</a>).</li> <li>To edit a host or network, select it and click the <b>Edit Row</b> button.</li> <li>To delete a host or network, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                           |

## General Tab, IPS Blocking Policy

Use the General tab of the Blocking policy to configure the basic settings required to enable blocking and rate limiting.

**Navigation Path**

- (Device view) Select **Platform > Security > Blocking** from the Policy selector. If necessary, select the **General** tab.
- (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one. If necessary, select the **General** tab.

**Field Reference****Table 43-2** *General Tab, IPS Blocking Policy*

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log All Block Events and Errors       | <p>Whether to log events that follow blocks from start to finish and any error messages that occur. When a block is added to or removed from a device, an event is logged. You may not want all these events and errors to be logged. Disabling this option suppresses new events and errors. The default is enabled.</p> <p><b>Note</b> Log all block events and errors also applies to rate limiting.</p>                                                                                                                                                                                                                                                   |
| Enable NVRAM Write                    | <p>Whether to have the router write to non-volatile RAM (NVRAM) when Attack Response Controller (ARC) first connects. If enabled, NVRAM is written each time the ACLs are updated. The default is disabled.</p> <p>Enabling NVRAM writing ensures that all changes for blocking and rate limiting are written to NVRAM. If the router is rebooted, the correct blocks and rate limits will still be active. If NVRAM writing is disabled, a short time without blocking or rate limiting occurs after a router reboot. Not enabling NVRAM writing increases the life of the NVRAM and decreases the time for new blocks and rate limits to be configured.</p> |
| Enable ACL Logging                    | <p>Whether to have ARC append the log parameter to block entries in the access control list (ACL) or VLAN ACL (VACL). This causes the device to generate syslog events when packets are filtered. This option applies to routers and switches only. The default is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                              |
| Allow Sensor IP address to be Blocked | <p>Whether the sensor IP address can be blocked. The default is disabled.</p> <p><b>Tip</b> If you allow the sensor address to be blocked, the IPS does not add an explicit permit entry to the interface ACL to allow the IPS address. You must ensure that the IPS address is permitted by the device ACL or the IPS cannot implement blocking on the device.</p>                                                                                                                                                                                                                                                                                           |
| Enable Blocking                       | <p>Whether to enable the blocking and rate limiting of hosts. The default is enabled.</p> <p><b>Note</b> When you enable blocking, you also enable rate limiting. When you disable blocking, you also disable rate limiting. This means that ARC cannot add new or remove existing blocks or rate limits.</p>                                                                                                                                                                                                                                                                                                                                                 |

**Table 43-2** General Tab, IPS Blocking Policy (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Blocks      | The maximum number of entries to block. The range is 1 to 65535. The default is 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Max Interfaces  | <p>The maximum number of interfaces for performing blocks. For example, a PIX 500 series security appliance counts as one interface. A router with one interface counts as one, but a router with two interfaces counts as two. The maximum number of interfaces is 250 per device. The default is 250.</p> <p>You use Max Interfaces to set an upper limit on the number of devices and interfaces that ARC can manage. The total number of blocking devices (not including main blocking sensors) cannot exceed this value. The total number of blocking items also cannot exceed this value, where a blocking item is one security appliance context, one router blocking interface/direction, or one Catalyst Software switch blocking VLAN.</p> <p><b>Note</b> In addition, the following maximum limits are fixed and you cannot change them: 100 interfaces per device, 250 security appliances, 250 routers, 250 Catalyst Software switches, and 100 main blocking sensors.</p> |
| Max Rate Limits | The maximum number of rate limit entries. The maximum rate limit must be equal to or less than the maximum blocking entries. The range is 1 to 32767. The default value is 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## User Profile Dialog Box

Use the Add or Modify User Profile dialog box to add or modify a user profile for an IPS blocking device. The profile defines a username and passwords that the IPS device can use to log into and configure the router, switch, or firewall that will implement IPS blocking.

Although you can save a profile that has a profile name only, the requirements for username, password, and enable password are determined by the device. You must specify the items required by the device to enter configuration mode, or the IPS cannot configure blocking on the device.

### Navigation Path

From the IPS Blocking policy, select the User Profiles tab and click the **Add Row** button or select an existing sensor and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page, page 43-8](#).

| Element         | Description                                                                       |
|-----------------|-----------------------------------------------------------------------------------|
| Enable Password | The enable password for entering Privileged EXEC Mode (enable mode), if required. |

## Master Blocking Sensor Dialog Box

Use the Add or Modify Master Blocking Sensor dialog box to configure a main blocking sensor. For more information about main blocking sensors, see [Understanding the Master Blocking Sensor](#), page 43-6.

### Navigation Path

From the IPS Blocking policy, select the Master Blocking Sensors tab and click the **Add Row** button or select an existing sensor and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), page 43-8.

**Table 43-4** *Master Blocking Sensor Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | The IP address of the main blocking sensor. Enter the IP address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Username   | The username to use to log in to the main blocking sensor. The user account must be an active account configured on the main blocking sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Password   | The login password for the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Port       | The port on which to connect on the main blocking sensor. The default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TLS        | Whether to use TLS.<br><br>If you select the TLS option, you must configure the ARC of the blocking forwarding sensor to accept the TLS/SSL X.509 certificate of the main blocking sensor remote host. (The blocking forwarding sensor is any device to which you are assigning this blocking policy.)<br><br>The easiest way to configure the blocking forwarding sensor to accept the X.509 certificate is to use the IPS Device Manager (IDM) to log into the sensor, choose <b>Configuration &gt; Sensor Management &gt; Certificates &gt; Trusted Hosts &gt; Add Trusted Host</b> , and add the main blocking sensor as a trusted host. Alternatively, you can log into the sensor CLI, enter configuration mode, and use the <b>tls trusted-host ip-address</b> command. |

## Router, Firewall, Cat6K Device Dialog Box

Use the Add or Modify Router, Firewall, or Cat6K Device dialog box to configure a device as a blocking device for an IPS sensor. The name of the dialog box indicates the type of device you are adding:

- Router—IOS Software routers and Catalyst 6500/7600 devices. These devices can do rate limiting as well as blocking. See [Understanding Router and Switch Blocking Devices](#), page 43-4.
- Firewall—ASA and PIX appliances.
- Cat6K—Catalyst 6500/7600 devices that are running Catalyst OS software.

### Tip

If the Catalyst 6500/7600 runs Cisco IOS Software, add the device as a router on the Router tab. Do not add the device to the Cat6K tab.

### Navigation Path

From the IPS Blocking policy, select the Router, Firewall, or Catalyst 6K tab and click the **Add Row** button or select an existing row and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), page 43-8.

**Table 43-5 Router, Firewall, Cat6K Device Dialog Boxes**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address         | The IP address of the device. Enter the IP address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                       |
| Communication Type | The communication mechanism used to log in to the blocking device (SSH 3DES, SSH DES, Telnet). The default is SSH 3DES.<br><br>If you choose SSH 3DES or SSH DES, you must add the device to the known hosts list. The easiest way to add the device to the known hosts list is to use the IPS Device Manager (IDM) to log into the sensor, choose <b>Configuration &gt; Sensor Management &gt; SSH &gt; Known Host Keys &gt; Add Known Host Key</b> , and add the device address.<br>Alternatively, you can log into the sensor CLI, enter configuration mode, and use the <b>ssh host-key</b> command. |
| NAT Address        | The NAT address of the sensor, if any is used between the sensor and the blocking device. Enter the NAT address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one. Leave the default 0.0.0.0 if NAT is not used.                                                                                                                                                                                                                                                                            |
| Profile Name       | The login profile used to log in to the blocking device. You must create this profile on the User Profiles tab of the blocking policy or the IPS cannot successfully use this blocking device.                                                                                                                                                                                                                                                                                                                                                                                                           |

| Interfaces and directions where blocks will be applied (table)<br>(Routers only.)                                      | <p>The interfaces on the device that should be used for blocking or rate limiting. The table shows the interface name, direction, and the names of existing ACLs that the IPS device should incorporate into the blocking ACL.</p> <p>If the interface already has an ACL configured for the specified direction, you must specify that ACL name as a pre- or post-ACL or the IPS removes the ACL. These ACLs are used for blocking only, not for rate limiting.</p> <ul style="list-style-type: none"> <li>To add an interface, click the <b>Add Row</b> button and fill in the Add Router Block Interface dialog box (see <a href="#">Router Block Interface Dialog Box, page 43-15</a>).</li> <li>To edit an interface, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Response Capabilities<br>(Routers only.)                                                                               | <p>The actions that this router can implement. Use Ctrl+click to select multiple actions (highlighted actions are selected). Options are:</p> <ul style="list-style-type: none"> <li><b>Block</b>—The router can implement blocks in response to Request Block Connection and Request Block Host actions.</li> <li><b>Rate Limit</b>—The router can implement rate limits in response to Request Rate Limit actions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| VLANs where blocks will be applied (table)<br>(Catalyst 6500/7600 devices running the Catalyst operating system only.) | <p>The VLANs on the device that should be used for blocking. The table shows the VLAN name and the names of existing VLAN ACLs (VACL) that the IPS device should incorporate into the blocking VACL.</p> <p>If the VLAN already has a VACL configured, you must specify that VACL name as a pre- or post-VACL or the IPS removes the VACL.</p> <ul style="list-style-type: none"> <li>To add a VLAN, click the <b>Add Row</b> button and fill in the Add Cat6K Block VLAN dialog box (see <a href="#">Cat6k Block VLAN Dialog Box, page 43-16</a>).</li> <li>To edit a VLAN, select it and click the <b>Edit Row</b> button.</li> <li>To delete a VLAN, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                     |

## Router Block Interface Dialog Box

Use the Add or Modify Router Block Interface dialog box to configure a blocking interface on a router or IOS Software Catalyst 6500/7600 device that is configured as an IPS blocking device. The IPS sensor uses the interface for blocking actions.

### Navigation Path

From the Add or Modify Router Device dialog box, click the **Add Row** button beneath the interfaces table, or select a row in the table and click the **Edit Row** button. For information on opening the Router Device dialog box, see [Router, Firewall, Cat6K Device Dialog Box, page 43-14](#).

## Field Reference

Table 43-6 Router Block Interface Dialog Box

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                | The name of the interface on the router that the IPS should use for blocking. Enter the name exactly as it is configured on the router (for example, GigabitEthernet0/1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Direction                     | The direction to apply the blocking ACL, In or Out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Pre ACL Name<br>Post ACL Name | <p>The ACLs to combine with the blocking entries that the IPS creates to implement blocking actions. The Pre ACL is added before the blocking ACL, and the Post ACL is added after the blocking ACL. For more information, see <a href="#">Understanding Router and Switch Blocking Devices</a>, page 43-4.</p> <p><b>Tip</b> If you have configured an ACL on the interface in the specified direction, you must specify the name of the ACL in the Pre or Post ACL Name field or the ACL will be removed from the interface. When you identify an interface and direction as a blocking interface, the IPS takes control of the ACL on that interface/direction.</p> <p>If you are managing the blocking device in Security Manager, you can identify the ACL name by selecting the blocking device, then selecting <b>Tools &gt; Preview Config</b>. Look for the <b>ip access-group</b> command in the interface configuration, and check the direction. For example, the following lines show that there is an ACL named CSM_FW_ACL_GigabitEthernet0/1 in the In direction attached to the GigabitEthernet0/1 interface.</p> <pre>interface GigabitEthernet0/1  ip access-group CSM_FW_ACL_GigabitEthernet0/1 in</pre> <p>In this example, if you configure GigabitEthernet0/1 in the In direction as a blocking interface, ensure that you specify CSM_FW_ACL_GigabitEthernet0/1 as a pre- or post-ACL. In most cases, you should specify the ACL as the post-ACL, so that the relatively short IPS blocking ACL first filters out undesirable traffic before the blocking device implements your other access rules.</p> |

## Cat6k Block VLAN Dialog Box

Use the Add or Modify Cat6k Block VLAN dialog box to configure a blocking VLAN on a Catalyst 6500/7600 device that runs the Catalyst operating system and that is configured as an IPS blocking device. The IPS sensor uses the VLAN for blocking actions.

Tip

If the Catalyst 6500/7600 runs Cisco IOS Software, add the device as a router, not a Cat6K.

## Navigation Path

From the Add or Modify Cat6K Device dialog box, click the **Add Row** button beneath the VLANs table, or select a row in the table and click the **Edit Row** button. For information on opening the Cat6K Device dialog box, see [Router, Firewall, Cat6K Device Dialog Box](#), page 43-14.

**Field Reference****Table 43-7** *Cat6k Block VLAN Dialog Box*

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN                            | The number of the VLAN on the Catalyst 6500/7600 device that the IPS should use for blocking. The number can be 1 to 4094 and must be defined on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Pre VACL Name<br>Post VACL Name | The VLAN ACLs to combine with the blocking entries that the IPS creates to implement blocking actions. The Pre VACL is added before the blocking VACL, and the Post VACL is added after the blocking VACL. For more information, see <a href="#">Understanding Router and Switch Blocking Devices, page 43-4</a> .<br><br><b>Tip</b> If you have configured a VACL on the VLAN, you must specify the name of the VACL in the Pre or Post VACL Name field or the VACL will be removed from the VLAN. When you identify a VLAN as a blocking interface, the IPS takes control of the VACL on that VLAN. Typically, you would specify the VACL name as the post-VACL. |

## Never Block Host or Network Dialog Boxes

Use the Add or Modify Never Block Host or Network dialog boxes to specify a host or network that should never be subject to blocking. The name of the dialog box indicates whether you are adding a host or network address.

Enter the IP address or the name of a network/host policy object that specifies the address. You can also click **Select** to select an object from a list or to create a new object. When selecting objects, the object can contain a single entry of the appropriate type. Host addresses do not have subnet masks (for example, 10.100.10.1), whereas network addresses have masks (for example, 10.100.10.0/24).

**Navigation Path**

From the IPS Blocking policy, select the Never Block Hosts or Networks tab and click the **Add Row** button or select an existing row and click the **Edit Row** button. Hosts and networks are listed in separate tables, so ensure that you click the buttons associated with the desired table. For information on opening the Blocking policy, see [Blocking Page, page 43-8](#).

## Managing IPS Sensors

---

**Note**

From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

To perform day-to-day sensor management, you typically need to use a device manager such as the IPS Device Manager (IDM). Security Manager is focused on policy and event management.

However, the following topics describe some management activities that you can perform using Security Manager:

- [Managing IPS Licenses, page 44-1](#)
- [Managing IPS Updates, page 44-4](#)
- [Managing IPS Certificates, page 44-10](#)
- [Rebooting IPS Sensors, page 44-12](#)

## Managing IPS Licenses

The following topics explain how to manage licenses for IPS devices:

- [Updating IPS License Files, page 44-1](#)
- [Redeploying IPS License Files, page 44-2](#)
- [Automating IPS License File Updates, page 44-3](#)

## Updating IPS License Files

You can use Security Manager to update the licenses for IPS devices. This procedure explains how to update the licenses manually by retrieving them from Cisco.com or from a license file on the Security Manager server. For information about setting up automatic license updates, see [Automating IPS License File Updates, page 44-3](#).

### Before You Begin

If you use Cisco.com, you must first configure the IPS Update server to be Cisco.com, so that you can specify the username and password. You must use Cisco.com for licensing if you are using a device that requires it; for example, an IPS 4270 or an AIP SSM-40 in an ASA device requires a Cisco.com account. For information on configuring Cisco.com as the IPS Update server, see [Configuring the IPS Update Server, page 44-4](#).

If you use local licenses, you must download them directly to the Security Manager server file system. You cannot do this through Security Manager; you must log into Windows on the server to download the licenses.

### Related Topics

- [Redeploying IPS License Files, page 44-2](#)

---

**Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page, page 11-58](#)).

The table lists all IPS devices in the device inventory and displays the status of their licenses. The status can be valid, invalid, expired, no license, or trial license. The expiration date for the license is also shown. Click **Refresh License** to update the table with the latest license information from the devices (you can select one or more devices to limit the scope of the refresh).

To update licenses, do one of the following:

- To update devices with licenses obtained directly from Cisco.com—Select the devices you want to update and click **Update Selected via CCO**. A dialog box opens that lists the devices that can be updated from Cisco.com, which might not be all of the devices you selected. Review the list and click **OK**. The status of the update task is shown in the License Update Status Details dialog box (see [License Update Status Details Dialog Box, page 11-62](#)).

To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.

---

**Tip** The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.

---

- To update devices with licenses that you have copied to the Security Manager server—Click **Update from License File**. A dialog box opens where you can select the license files. Click **Browse** to select them from the Security Manager local file system. You can select more than one license file. When you have selected the desired files, click **OK** to have them applied to the devices.
- 

## Redeploying IPS License Files

If an attempt to apply an IPS license update to a device fails, you can redeploy the update. Redeployment works only if you have already attempted to apply an update and a license file is associated with the IPS device.

### Related Topics

- [Updating IPS License Files, page 44-1](#)

- [Automating IPS License File Updates, page 44-3](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.
- Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page, page 11-58](#)).
- Step 3** Select the devices to which you want to redeploy licenses and click **Redeploy Selected Licenses**. A dialog box opens listing devices whose licenses you are redeploying. Click **OK** to perform the update. The status of the update task is shown in the License Update Status Details dialog box (see [License Update Status Details Dialog Box, page 11-62](#)).
- 

## Automating IPS License File Updates

Security Manager can automatically apply IPS license updates to your IPS devices on a regular schedule. To successfully configure automatic updates, you must have a Cisco.com support contract that includes the serial numbers of your IPS devices.

**Tip**

Security Manager applies new licenses only if the downloaded license has an expiration date further into the future than the one replaced or if the license information is different.

---

### Before You Begin

You must first configure the IPS Update server to be Cisco.com, so that you can specify the Cisco.com username and password. For information on configuring Cisco.com as the IPS Update server, see [Configuring the IPS Update Server, page 44-4](#).

### Related Topics

- [Updating IPS License Files, page 44-1](#)
- [Redeploying IPS License Files, page 44-2](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.
- Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page, page 11-58](#)).
- Step 3** Select **Download and apply licenses** and configure the following settings:
- **Days before the expiration date**—Select the number of days before a license expires that Security Manager should download an updated license. The default is 1 day.
  - **Discover devices daily at**—Select the time of day when Security Manager should download licenses. At this time, Security Manager will check the license status on the devices, and contact Cisco.com for new licenses for devices that have no license, have expired licenses, or that have licenses that will expire within the number of days you selected.
  - **Email License Update Results**—Select whether Security Manager should send e-mail notification of license update results. E-mails are sent with license expiration status and for license update job results. If you select this option, enter one or more e-mail addresses in the **Email Notification** field. Separate multiple addresses with commas.

For the e-mails to be sent, you must configure an SMTP server as described in [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27](#).

**Step 4** Click **Save** to save your changes.

---

## Managing IPS Updates

You can use Security Manager to apply sensor and signature updates to your IPS devices and shared policies. Through Security Manager, you can download updates and either set up automatic updates or apply them manually.

Signature updates are available only for IPS 5.1(4) and later.

### Tip

If you have problems applying patches, service packs, or signature updates, check the time on your IPS sensor. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected and the update may fail. Use the Network Time Protocol (NTP) to maintain accurate time on an IPS sensor. For information on configuring NTP on the sensor, see [Identifying an NTP Server, page 36-23](#).

---

The IPS packages included with Security Manager do not include the package files that are required for updating IPS devices. You must download IPS packages from Cisco.com or your local update server before you can apply any updates. The downloaded versions include all required package files and replace the partial files that are included in the Security Manager initial installation.

The following topics describe how to use Security Manager to manage IPS updates:

- [Configuring the IPS Update Server, page 44-4](#)
- [Checking for IPS Updates and Downloading Them, page 44-5](#)
- [Automating IPS Updates, page 44-6](#)
- [Manually Applying IPS Updates, page 44-7](#)

## Configuring the IPS Update Server

To apply IPS sensor and signature updates, Security Manager must download the updates to the Security Manager server from an identified IPS Update server.

You can use Cisco.com as the IPS Update server. Using Cisco.com ensures that the latest updates are available to you at their earliest availability. However, if you cannot use Cisco.com for some reason, you can set up your own local IPS Update web server, manually download updates to it, and configure Security Manager to obtain the updates from your local server.

### Tip

If you are using a device that requires a Cisco.com login for updating licenses, such as an IPS 4270 or an AIP SSM-40 in an ASA device, you must configure the IPS Update server as Cisco.com. You cannot use a local server.

---

### Related Topics

- [Automating IPS Updates, page 44-6](#)
- [Manually Applying IPS Updates, page 44-7](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page, page 11-47](#)).
- Step 2** In the Update Server area, click **Edit Settings** to open the Edit Update Server Settings dialog box (see [Edit Update Server Settings Dialog Box, page 11-52](#)).
- Step 3** Enter the identifying information for your server. Based on the server type selected in the Update From field:
- Cisco.com—Enter a Cisco.com username and password. The user account you specify must have applied for eligibility to download strong encryption software. To verify the account has the appropriate permissions, go to Cisco.com and try to download an IPS update package. You will be prompted to accept the appropriate agreements if the account is not already qualified.
  - Local server—Enter the IP address or DNS host name of your server, a username and password if you require a log in before allowing access, and the path to the folder that contains the files. For the path, do not enter the entire URL; enter only the path portion of the URL (for example, the path in `http://servername/IPspath` is `IPspath`). Also add IIS configuration settings:
    - Home Directory should have listing enabled.
    - Documents should have Default Content Page disabled.

Enter certificate information. Before you can download an IPS package, you must accept the Cisco.com certificate. You must accept the certificate from both the "Image Meta-data locator" site and the download site of the IPS packages to start downloading images successfully (see [Edit Update Server Settings Dialog Box, page 11-52](#)).

If your network requires a proxy server to get from the Security Manager server to the IPS Update server, select **Enable Proxy Server** and enter the information for the proxy server.

Click **OK** to save your changes.

- Step 4** Click **Save** on the IPS Updates page. Your changes are not completely saved unless you click **Save**.
- Step 5** Test the connectivity to the IPS Update server by clicking **Download Latest Updates**. A dialog box opens. Click **Start** to have Security Manager log into the update server, check for new updates, and download them. The dialog box displays the results of the operation.
- If you are using Cisco.com and experience a download failure, double-check the user account to ensure it has the required permissions for downloading strong encryption software.
- 

## Checking for IPS Updates and Downloading Them

You can use Security Manager to check for IPS sensor and signature updates and download them to the Security Manager server, where you can apply them to your IPS devices and policies.

You can manually download IPS updates, automate IPS update downloads, or download them when you try to manually apply them to a device. The following procedure explains how to manually check for updates and download them. For information on configuring automatic downloads, see [Automating IPS Updates, page 44-6](#). For information on downloading updates while manually applying them to devices or policies, see [Manually Applying IPS Updates, page 44-7](#).

### Before You Begin

You must configure the IPS Update server as described in [Configuring the IPS Update Server, page 44-4](#).

**Related Topics**

- [Automating IPS Updates, page 44-6](#)
- [Manually Applying IPS Updates, page 44-7](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page, page 11-47](#)).
- Step 2** Review the status information in the Update Status group, and do any of the following:
- Click **Check for Updates**. A dialog box opens to display the results of the operation. Click **Start** to have Security Manager log into the IPS Update server and check for updates.
  - Click **Download Latest Updates**. A dialog box opens to display the results of the operation. Click **Start** to have Security Manager log into the IPS Update server, check for updates, and download them to the Security Manager server.

**Tip** If a Cisco.com download fails, ensure that the account you are using has applied for eligibility to download strong encryption software. For details, see the description of User Name in [Edit Update Server Settings Dialog Box, page 11-52](#).

---

## Automating IPS Updates

You can automatically apply sensor image and signature updates to compatible IPS devices to ensure that they are up to date. If desired, you can partially automate the updates to maintain the desired level of control over the process.

**Tip** If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

---

**Tip** If you do not manage IPS devices, consider taking the following performance tuning step. In `$(NMSROOT)\MDC\ips\etc\sensupdate.properties`, change the value of `packageMonitorInterval` from its initial default value of 30,000 milliseconds to a less-frequent value of 600,000 milliseconds. Taking this step will improve performance somewhat. [`$(NMSROOT)` is the full pathname of the Common Services installation directory (the default is `C:\Program Files\CSCOpX`).]

---

**Before You Begin**

You must configure the IPS Update server as described in [Configuring the IPS Update Server, page 44-4](#).

**Related Topics**

- [Checking for IPS Updates and Downloading Them, page 44-5](#)
- [Manually Applying IPS Updates, page 44-7](#)
- [Understanding IPS Network Sensing, page 36-2](#)
- [Deploying Configurations in Non-Workflow Mode, page 8-28](#)

- [Deploying Configurations in Workflow Mode, page 8-34](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page, page 11-47](#)).
- Step 2** In the Auto Update Settings group in the lower portion of the page, select an auto update mode to establish the extent of automation. Choices include:
- **Download, Apply, and Deploy Updates**—Security Manager checks for updates according to your schedule, downloads them to the Security Manager server, applies them to the selected devices and policies, and starts a deployment job to update the affected devices. This choice ensures that your devices are running the latest updates with minimal effort for your operations staff.
  - **Disable Auto Update**—Security Manager does not perform any automatic actions for IPS updates.
  - **Check for Updates**—Security Manager checks for updates according to your schedule and updates the information in the Update Status group. No devices or policies are updated.
  - **Download Updates**—Security Manager checks for updates according to your schedule and downloads any new updates to the Security Manager server.
  - **Download and Apply Updates**—Security Manager checks for updates according to your schedule, downloads them, and applies them to the selected devices and policies. You must separately create a deployment job to deploy the changes to the affected devices.
- Step 3** Click **Edit Update Schedule** to open a dialog box where you can specify the schedule for the operation. Select the starting date, enter the starting time in 24-hour format (hh:mm), and select whether the schedule should be by the hour, day, week, month, or a one-time event. Click **OK** to save the schedule.
- Step 4** (Optional) Enter an e-mail address in the Notify Email field. Security Manager will notify this user when a package is available for download or has been downloaded, applied, or deployed. You can enter more than one address by separating the addresses with commas.
- Step 5** Select the devices and shared policies you want to automatically update in the Apply Update To selector. Use the Type field to toggle between local policies (for devices) and shared policies.
- To select a device or policy, click it in the selector and click the **Edit Row** button (the pencil icon below the selector). This action opens the Edit Auto Update Settings dialog box. Select the types of updates you want to apply: minor sensor updates and service packs or service packs only, and the signature update level. Click **OK** to save your changes. The devices to which the policy apply are added to the Devices to be Auto Updated list. A message will indicate if you need to submit your changes for the change to take effect.
- Step 6** Click **Save**.
- 

## Manually Applying IPS Updates

You can manually apply image and signature updates to compatible IPS devices using the Apply IPS Update wizard. Use this procedure with policies and devices that you did not configure for automatic updates (as described in [Automating IPS Updates, page 44-6](#)).

When applying signature updates, the wizard displays those signatures in the update that are not configured on the target IPS devices. You can configure the new signatures before they are applied.

When applying image and signature updates, only those devices to which the updates can be applied are available for selection. Inapplicable devices are grayed out. If you hover the mouse pointer over a grayed out device, a tooltip displays the reason for graying out the device. A device can be grayed out even if a

signature update applies to it but if the required engine upgrade or generic packages are not available. Following are some of the instances when devices might be grayed out and the corresponding tooltip labels:

- If the version of the selected signature or sensor package is lower than the version of the target IPS device, Security Manager grays out the device and a mouse-over tooltip displays the message "Selected package is inapplicable".
- If you try to use Security Manager to upgrade an IPS device from version 7.2.2, with SNMP policy configured, to version 7.3.1, a mouse-over tooltip displays the message "Selected upgrade is not recommended. Unassign the SNMP policy on the device and deploy it to continue with the upgrade to 7.3.1". This is because SNMPv3 is not supported in IPS version 7.3.1.
- If you try to use Security Manager to perform a signature update that does not contain one or more threat profiles applied to the device, Security Manager grays out the device and a mouse-over tooltip displays the message "Currently applied threat profile is not applicable to this signature version". It does not allow the signature update to be successfully applied. You must remove the existing threat profile and then proceed with the signature update.

#### Tip

If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

#### Before You Begin

Configure the IPS Update server as described in [Configuring the IPS Update Server, page 44-4](#).

#### Related Topics

- [Checking for IPS Updates and Downloading Them, page 44-5](#)
- [Selecting a Signature Category for Cisco IOS IPS, page 45-6](#)

#### Note

This note describes a difference between the update packages for IPS 7.1.3 and those used for earlier versions. When you open the Apply IPS Update wizard (Tools > Apply IPS Update), the first page of the wizard lists the sensor and signature update packages that are available. Beginning with IPS 7.1.3, a single update package is used for all supported platforms, such as IPS-4270 and ASA-SSE-AIP-85; example: IPS-CSM-K9-7.1.3.zip. Prior to IPS 7.1.3, a separate package was used for each supported platform; example: IPS-CS-MGR-SSC\_5-K9-6.2-4-E4.zip.

**Step 1** Select **Tools > Apply IPS Update** to open the Apply IPS Update wizard.

**Step 2** On the first page of the wizard, select the update that you want to apply. This page lists the sensor and signature updates that are available. Do the following on this page:

- To update the list of packages, click **Download Latest Updates**. Security Manager logs into the IPS Update server and downloads the updates that have become available since the last download. This works only if you have configured an update server as described in [Configuring the IPS Update Server, page 44-4](#). You can also update the list of packages by doing the following:
  - Configure automatic downloads on the IPS Updates page (select **Tools > Security Manager Administration > IPS Updates**). For more information, see [IPS Updates Page, page 11-47](#).
  - Manually download the updates to the CSCOpX\MDC\ips\updates folder in the product installation folder (typically Program Files) on the Security Manager server.

You can also check for updates without downloading them by clicking **Check for Updates**. The Update Status information is the same as described in [IPS Updates Page, page 11-47](#).

- Select the signature or sensor update you want to apply to your IPS devices in the Updates Downloaded table. Use the **Type** field to toggle between the types of updates (you can select only one update to apply):
  - **Sensor Updates**—Displays the filename, the major, minor, service pack, and patch versions, as well as the supported engine release. You must apply all major sensor updates, however, minor updates are cumulative.
  - **Signature Updates**—Displays the filename, the signature number, and the supported engine release. Signature updates are cumulative; however, applying them as separate packages allows you to separate your work into more manageable units if you intend to tune the updates to match the specific needs of your network.

---

**Note** The engine package is not listed on the update page, but Security Manager implicitly pushes the engine package automatically in the case of a signature update that requires a higher engine version. (This occurs only when updating a device with the particular version that the engine package requires.)

---

Click **Next** to continue.

- Step 3** On the second page of the wizard, select the local signature policies (representing devices not assigned to any shared signature policy) and shared signature policies you want to update from the Apply Updates To list. Use the **Type** field to toggle between the types of policies. You can select any combination of local and shared policies. When you select a policy, the devices that use the policy are selected for update.

To select all applicable devices or shared policies, click **Select All**. To erase your selection and start over, click **Deselect All**. These buttons apply only to the displayed list.

IPS devices to which the update does not apply are grayed out in the Apply Updates To list, and you cannot select them. When you select a device that can be updated, it is listed in the Devices Assigned to Selected Policies list; these are the only devices that will be updated. If you select a shared policy, all devices that are using the policy appear in the selected policies list, but the devices to which the update does not apply are grayed out.

---

**Tip** The engine release controls which devices you can select for sensor updates; you can apply the update only to devices that use the same engine version, regardless of the release version. For example, if your device is running 6.0(5) E3, you can update to 6.1(1) E3 but not to 6.1(1) E2. You also cannot apply a 6.1(1) E3 update to a device running 6.1(1) E2. If you want to update the engine version, select a signature update with the higher engine version, and Security Manager will update the engine level automatically while updating the signatures. For example, if the device has the 6.1(1) E2 version and needs to have the E3 engine package applied, choose the signature package that requires the E3 engine and apply it to the device; doing so applies the engine package automatically to the device while updating the signatures. Thus, if the device you want to update is grayed out, click **Back** and change your update selection.

---

If you are applying a signature update, and you want to edit the signatures before applying them, click **Next** to continue. Otherwise, click **Finish** to apply your update to the policies.

- Step 4** (Optional) On the third page of the wizard, modify the signatures as desired.

The signatures list displays the new and modified signatures between the signature level of the selected update and the lowest signature level among the selected devices. If the selected devices include both IPS sensors and Cisco IOS IPS devices, the signatures for these devices appear on separate tabs.

Click the link in the ID number to read the description for the signature on Cisco.com. The Status column indicates whether the signature is new or modified (see the visual description of the icons on the wizard page).

To edit a signature, select it in the table and click the Edit button below the table (the pencil icon). For help in understanding the signature, click **Help** in the dialog box that the Edit button opens.

For details on available signature information, see [Signatures Page, page 39-4](#). In the Signature Summary Table, you can also add custom signatures and delete signatures, but you cannot do that on this page of the Apply IPS Update Wizard.

Click **Finish** to apply your update to the policies and to save your edits.

**Step 5** Submit your changes and deploy them to the devices. For information on creating deployment jobs, see these topics:

- [Deploying Configurations in Non-Workflow Mode, page 8-28](#)
  - [Deploying Configurations in Workflow Mode, page 8-34](#)
- 

## Managing IPS Certificates

When you configure Security Manager to use SSL (HTTPS) to communicate with your IPS devices, the certificate configured on the device must match the certificate stored in Security Manager's certificate store. Mismatched certificates will result in communication failures during policy discovery or deployment.

IPS devices use self-signed certificates that have a fixed validity period of about 2 years. When the certificate expires, you need to regenerate the certificate and update the certificate store with the new certificate.

Security Manager includes a utility that you can use to synchronize the certificate store with the certificate defined on the device, to regenerate expired certificates, and to view the status of certificates (including expiration dates) on the IPS devices that you manage.

### Tip

If you are using HTTP for communication with the IPS devices, certificates are not used and you cannot manage them. IPS device communication settings are configured in the Security Manager Administration Device Communication page (see [Device Communication Page, page 11-21](#)).

---

The following procedure explains how to manage your IPS certificates with Security Manager.

### Related Topics

- [Table Columns and Column Heading Features, page 1-49](#)
- [Filtering Tables, page 1-48](#)
- [Manually Adding SSL Certificates for Devices that Use HTTPS Communications, page 9-5](#)
- [Security Certificate Rejected When Discovering Device, page 9-6](#)
- [Invalid Certificate Error During Device Discovery, page 9-7](#)

**Step 1** Select **Manage > IPS > IPS Certificates** to open the IPS Certificates dialog box.

**Tip**

The list shown in this dialog box is not automatically refreshed. Click **Refresh** whenever you open the dialog box to ensure that you are looking at the most current certificate expiration information.

The dialog box lists all IPS sensors that are in the inventory according to their Security Manager display name. Not all columns are displayed (right-click any cell heading to select additional columns). The main columns of interest are the following:

- **Certificate Mismatch?**—Whether the certificate defined on the device is the same as that in Security Manager. This field is blank if the certificate is unavailable or non-retrievable; otherwise, it can have these values:
  - **No**—The device and Security Manager have the same certificate. No action is required.
  - **Yes**—The device and Security Manager have different certificates. If the certificate has not expired, select the device and click **Sync Certificates** to replace the certificate in the Security Manager certificate store with the certificate from the device.
- **Valid Until on Device, Valid From on Device**—These two separate columns show the date range within which the certificate is valid. The certificate expires after the Valid Until date is reached. Consider regenerating the certificate as this date approaches.
- **Certificate Status on Device**—Shows the current status of the certificate as it exists on the device:
  - **Valid Certificate**—The certificate is good and within the validity date range.
  - **Expired Certificate**—The certificate has passed its Valid Until date and is now expired. Select the device and click **Regenerate Certificate** to create a new valid certificate on the device and to have the certificate loaded into the Security Manager certificate store.
  - **Certificate Not Yet Valid**—The certificate has not yet reached its Valid From date and cannot be used yet. This might indicate a mismatch between the time settings on the device and on the Security Manager server. Ensure that the time settings are the same (consider using an NTP server). Consider regenerating the certificate.
  - **Unavailable – Refresh to get Cert Info**—The certificate is not currently in the Security Manager certificate store. Click **Refresh** to have Security Manager retrieve the certificate from the device and load it into the certificate store.
  - **Nonretrievable – Cert Info not available**—Security Manager was not able to log into the device and retrieve the certificate, or you are using HTTP for communications. Select the device and click **Refresh**.

If refresh does not resolve the problem, ensure that the device is operating normally (that it is not down), and then check the device properties to ensure that correct credentials are configured for access (see [Viewing or Changing Device Properties, page 3-41](#)). If credentials are not the problem, also check the Allowed Hosts policy configured on the device and ensure that the Security Manager server is included as an allowed host (see [Identifying Allowed Hosts, page 36-7](#)). You can also log into Windows on the Security Manager server and use ping to see if there is a route between the server and the IPS device.
- **Thumbprint on CSM, Thumbprint on Device**—These separate columns show the thumbprint for the certificate in the certificate store and on the device.

**Step 2** Use any of the following buttons to perform the indicated actions. Except where indicated, if you do not select one or more devices before clicking the button, the action is performed on all listed devices, which can be time-consuming if there are a lot of IPS devices. You are warned before an operation is performed on all devices and given the option to stop it.

- **Sync Certificate**—Synchronize the certificate information in the Security Manager certificate store with the certificate on the device. The device certificate replaces the one in the certificate store.
  - **Regenerate Certificate**—Generate a new certificate on the device and then load the new certificate into the certificate store.
  - **Refresh**—Refresh the status information by having Security Manager contact the devices and retrieve certificate information, such as validity dates, and compare the certificate with the one in the certificate store. This action updates the Certificate Status on Device column and also determines whether there is a certificate mismatch.
  - **Export**—Exports the entire certificates table to a comma-separated values (CSV) file. You cannot export less than the entire table. You are prompted for a file name and folder on the Security Manager server.
- 

## Rebooting IPS Sensors

You can reboot an IPS sensor from Security Manager.

To reboot the sensor, select it in Device view, right-click and select **Reboot Device**. You are asked to confirm that you want to reboot.

Security Manager does not provide status information on the reboot process.

## Configuring IOS IPS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM, and IPS, it does not support any bug fixes or enhancements.

Some Cisco IOS routers, such as integrated services routers (ISRs), include native IPS capabilities based on IPS 5.1 software. You can configure some basic IPS inspection on these devices to supplement IPS sensor inspection or to support small networks.

This chapter contains the following topics:

- [Understanding Cisco IOS IPS, page 45-1](#)
- [Overview of Cisco IOS IPS Configuration, page 45-4](#)

## Understanding Cisco IOS IPS

You can use Cisco Security Manager with the Cisco IOS Intrusion Prevention System (IOS IPS) to manage intrusion prevention on Cisco routers that use supported Cisco IOS Software releases 12.4(11)T2 and later.

The Cisco IOS IPS acts as an in-line intrusion prevention sensor, watching packets and sessions as they flow through the router and scanning each packet to match any of the Cisco IOS IPS signatures. When it detects suspicious activity, it responds before network security can be compromised and logs the event through Cisco IOS syslog messages or Security Device Event Exchange (SDEE).

You can configure Cisco IOS IPS to choose the appropriate response to various threats. The Signature Event Action Processor (SEAP) can dynamically control actions that are to be taken by a signature event on the basis of parameters such as fidelity, severity, or target value rating. You can configure these actions in Security Manager through the Signatures and Event Actions policies.

When packets in a session match a signature, Cisco IOS IPS can take any of the following actions, as appropriate:

- Send an alarm to a syslog server or a centralized management interface.
- Drop the packet.
- Reset the connection.
- Deny traffic from the source IP address of the attacker for a specified amount of time.
- Deny traffic on the connection for which the signature was seen for a specified amount of time.

Cisco developed its Cisco IOS software-based intrusion-prevention capabilities and Cisco IOS Firewall with flexibility in mind, so that individual signatures could be disabled in case of false positives. Generally, it is preferable to enable both the firewall and Cisco IOS IPS to support network security policies. However, each of these features can be enabled independently and on different router interfaces.

For an overall understanding of the Cisco IOS IPS configuration process, see [Overview of Cisco IOS IPS Configuration](#), page 45-4.

This section contains the following topics:

- [Cisco IOS IPS Signature Scanning with Lightweight Signatures](#), page 45-2
- [Router Configuration Files and Signature Event Action Processor \(SEAP\)](#), page 45-3
- [Cisco IOS IPS Limitations and Restrictions](#), page 45-3

## Understanding IPS Subsystems and Support of IOS IPS Revisions

Cisco Security Manager automatically supports minor revisions of IOS IPS. To identify minor revisions that are supported, the IPS subsystem version is needed.

The IPS subsystem version is a version number used to keep track of Cisco IOS IPS feature changes. The subsystem number is show in the device properties (right-click the device and select **Device Properties**). You can also use the command **show subsys name ips** at a command line on the router that is running Cisco IOS IPS to show the detailed Cisco IOS IPS subsystem version. The 3.x subsystems are equivalent to IPS 5.x. For a list of the supported subsystems by Cisco IOS Software release, see the [Supported Devices and Software Versions for Cisco Security Manager](#) on Cisco.com for this release of Security Manager.

An IPS subsystem version is minor if the version difference is limited at postfix. For example, a revision from 3.0.1 to 3.0.2 is considered minor. For another example, 3.0.1 to 3.1.1 is also considered a minor version change. However, minor revisions that include new features are not automatically supported by Cisco Security Manager.

## Cisco IOS IPS Signature Scanning with Lightweight Signatures

The addition of Cisco IOS IPS signature scanning with lightweight signatures in Cisco IOS Release 15.0(1)M is an enhancement to Cisco IOS IPS that allows loading of larger signatures sets, without consuming significant additional memory or reducing the memory consumed by an existing signature set, by loading equivalent lighter-weight signatures. These signatures are referred to as lightweight signatures.

Security Manager can discover and tune custom signatures with LWEs on ISRs and modular access routers. Security Manager supports the following features for signatures with LWEs on ISRs and modular access routers:

- New signature types
- Signature categories
- New default signature category recognition
- New engine update levels
- Licensing status—bypassed, expired, or not installed

## Router Configuration Files and Signature Event Action Processor (SEAP)

As of Cisco IOS Release 12.4(11)T, signature definition files (SDFs) are no longer used by Cisco IOS IPS. Thus, you cannot use the deprecated built-in signature sets, 128.sdf, 256.sdf, and attack-drop.sdf, with Security Manager.

Instead, routers access signature definition information through a directory that contains three configuration files—the default configuration, the delta configuration, and the SEAP configuration. You configure the location using the **IPS > General Settings** policy.

SEAP is the control unit responsible for coordinating the data flow of a signature event. It allows for advanced filtering and signature overrides on the basis of the Event Risk Rating (ERR) feedback. ERR is used to control the level in which a user chooses to take actions in an effort to minimize false positives.

Signatures once stored in NVRAM are now stored in the delta configuration file.

## Cisco IOS IPS Limitations and Restrictions

Cisco IOS IPS routers do not support all the features that are supported by dedicated IPS sensor appliances and service modules. In addition, routers that support IOS IPS might not allocate as much memory to IPS functionality as an IPS sensor does. The following limitations and restrictions are important:

- When configuring an IOS IPS device, select only the signatures that you need. If you select all signatures that are available in Security Manager, you might exceed the memory available on the IOS IPS router and deployment can fail, the device might fail to load all of the signatures, or performance might be significantly degraded. If you encounter deployment failures, select a reduced set of signatures and then redeploy the configuration to the device.
- Security Manager-managed routers being configured to use IOS-IPS for the first time cannot use the auto-update process for signature updates. You must first update the router before you use the auto-update process. Follow these steps:
  - a. Push an E3 signature, for example, S317.
  - b. Push an intermediate signature, for example, S470.
  - c. Push the first E4 signature, for example, S485.
  - d. Push subsequent E4 signatures until you reach the desired level. Note that each delta should be less than 10 MB in size.

After you have updated the router, you can use the auto-update process to update the signatures. The auto-update process will be successful as each incremental change will not exceed the memory available on the router. For information on configuring automatic updates, see [Automating IPS Updates, page 44-6](#).

- Virtual sensors are not supported by IOS IPS.
- When using event action filters with an IOS IPS router, only a subset of IPS actions are available for removal from an event that meets the criteria of the event action filter. For more information on available event actions, see [Filter Item Dialog Box, page 40-9](#) and [Understanding IPS Event Actions, page 40-2](#).
- IOS IPS is based on IPS Software 5.1. Therefore, features introduced in later versions of IPS Software are typically not available in IOS IPS. For example, you cannot configure the following features:
  - Global correlation.

- Anomaly detection.
- OS identification in the event action network identification policy.

## Overview of Cisco IOS IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on a Cisco IOS IPS router. For dedicated IPS devices, including IPS service modules installed in a router, see [Overview of IPS Configuration, page 36-5](#).

Cisco IOS IPS is a more limited feature meant for branch offices and small to medium sized networks, or to distribute IPS throughout a network. You typically cannot employ as many signatures in a Cisco IOS IPS router compared to a dedicated appliance. You also cannot configure advanced features such as global correlation, because Cisco IOS IPS is based on IPS Software version 5.1. When configuring Cisco IOS IPS devices, you are mostly configuring standard router policies, because the device is a router that is running a few IPS features. In comparison, the platform policies for IPS appliances and service modules are specific to IPS software.

### Tip

Before configuring Cisco IOS IPS, read [Cisco IOS Intrusion Prevention System Deployment Guide](#) on Cisco.com.

- 
- Step 1** Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager. For information about required basic settings, see:
- [Setting Up SSL on Cisco IOS Routers, page 2-4](#)
  - [Setting Up SSH, page 2-5](#)
  - [Configuring Licenses on Cisco IOS Devices, page 2-10](#)
  - [Initial Preparation of a Cisco IOS IPS Router, page 45-5](#)
  - [Selecting a Signature Category for Cisco IOS IPS, page 45-6](#)
- Step 2** Add the device to the Security Manager device inventory (see [Adding Devices to the Device Inventory, page 3-7](#)). When you add the device be sure to make the following selections:
- When adding from Network or Export File, ensure that you select **IPS Policies** for policy discovery.
  - When adding from Configuration File or by Manual Definition, ensure that you select **IPS** from the **Options** list, or the device will not be IPS-capable from Security Manager's point of view.
- Step 3** Configure the IPS general settings to specify the location of the IPS files on the router. For more information, see [Configuring General Settings for Cisco IOS IPS, page 45-7](#).
- Step 4** Configure the IPS interface rules to enable IPS and to identify the interfaces on which traffic will be subject to IPS inspection. For more information, see [Configuring IOS IPS Interface Rules, page 45-9](#).
- Step 5** Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:

- [Chapter 40, “Configuring Event Action Rules”](#)
- [Configuring Signatures, page 39-4](#)

**Step 6** Maintain the device:

- Update and redeploy configurations as necessary.
- Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see [Managing IPS Updates, page 44-4](#).

## Initial Preparation of a Cisco IOS IPS Router

Before you add a Cisco IOS IPS router to the Security Manager inventory, you need to perform some preparatory steps. The white paper [Getting Started with Cisco IOS IPS with 5.x Format Signatures](#) on Cisco.com provides a step-by-step explanation of a basic configuration. Although you could do some of the steps after adding the router to Security Manager, such as configuring interface rules, you should do at least the basic steps.

The following procedure explains the steps you are required to complete in the CLI. These steps are required because Security Manager either cannot complete them, or it is simply easier to do it in the CLI (as a one-time configuration). The white paper includes additional steps that you can complete in the CLI, and Security Manager can discover your configuration when you add the device to the inventory. The more you do in CLI, the less you will have to configure in Security Manager.

### Tip

You also must complete the basic router configuration steps as explained in [Setting Up SSL on Cisco IOS Routers, page 2-4](#), [Setting Up SSH, page 2-5](#), and [Configuring Licenses on Cisco IOS Devices, page 2-10](#). The following steps apply to the IPS configuration only.

**Step 1** Create a directory for IPS files on flash. For example, the following command creates a directory named ips:

```
router# mkdir ips
Create directory filename [ips]?
Created dir flash:ips
```

At this point, you can optionally configure the router to use this directory for IPS, or you can do it later in Security Manager (in the IPS > General Settings policy). Use the following commands to configure it in CLI:

```
router# configure terminal
router(config)# ip ips config location flash:ips
```

**Step 2** Configure the Cisco IOS IPS crypto key. The crypto key is used to verify the digital signature for the main signature file (sigdef-default.xml) whose contents are signed by a Cisco private key to guarantee its authenticity and integrity at every release.

You can obtain the CLI required for the key from <http://download-sj.cisco.com/cisco/ciscosecure/ids/sigup/5.0/ios/realms-cisco.pub.key.txt> (login to Cisco.com is required).

**Tip** Configuring the key through the CLI is probably the easiest way to do it. Alternatively, you can configure it in Security Manager by assigning the `IOS_IPS_PUBLIC_KEY` pre-defined FlexConfig object to the router's FlexConfig policy. For more information about FlexConfigs, see [Chapter 7, “Managing FlexConfigs”](#).

- a. Open the text file and copy its contents to the clipboard (select all text then press Ctrl+C).
- b. If necessary, enter **configure terminal** at the router CLI prompt.
- c. Paste the copied text file at the router prompt.
- d. Exit configuration mode.
- e. Enter the **show run** command to confirm that the key was correctly configured.

**Step 3** Syslog is configured for IPS notifications by default. If you want to use SDEE for notifications, enable SDEE:

```
router# configure terminal
router(config)# ip ips notify sdee
```

**Step 4** Select a signature category to compile. For detailed information, see [Selecting a Signature Category for Cisco IOS IPS, page 45-6](#).

## Selecting a Signature Category for Cisco IOS IPS

Cisco IPS appliances and Cisco IOS IPS with IPS 5.x format signatures operate with signature categories. All signatures are grouped into categories; the categories are hierarchical. An individual signature can belong to more than one category. Top-level categories help to define general types of signatures. Subcategories exist beneath each top-level signature category. (For a list of supported top-level categories, use your router CLI help (?) with the **category** command.)

Router memory and resource constraints prevent a router from loading all Cisco IOS IPS signatures. Thus, it is recommended that you load only a selected set of signatures that are defined by the categories. Because the categories are applied in a “top-down” order, you should first retire all signatures, followed by “unretiring” specific categories. Retiring signatures enables the router to load information for all signatures, but the router does not build the parallel scanning data structure.

Retired signatures are not scanned by Cisco IOS IPS, so they do not fire alarms. If a signature is irrelevant to your network or if you want to save router memory, you should retire signatures, as appropriate.

Security Manager does not manage the signature category command. You cannot configure it directly with a policy. However, you can configure the FlexConfig policy to include a FlexConfig object that configures the command. There is a pre-defined object, `IOS_IPS_SIGNATURE_CATEGORY`, that you can use. If you want to configure a different category than basic, make a copy of the object and edit it. For information on how to use FlexConfigs, see [Chapter 7, “Managing FlexConfigs”](#).

**Tip** If you do not use the **category** command to select a subset of IPS signatures that the device will attempt to compile, Security Manager will configure the category command to enable the IOS IPS Basic category to prevent the device resources from being overloaded. You can change the category manually on the

device to select another set of signatures to compile. We recommend that you configure the category before adding the device to Security Manager; however, this is not possible if you add the device through manual definition.

The following example shows how to first retire all signatures, then to configure the basic category and unretire the basic signatures:

```
Router> enable
Router# configure terminal
Router(config)# ip ips signature-category
Router(config-ips-category)# category all
Router(config-ips-category-action)# retired true
Router(config-ips-category-action)# exit
Router(config-ips-category)# category ios_ips basic
Router(config-ips-category-action)# retired false
Router(config-ips-category-action)# exit
```

## Configuring General Settings for Cisco IOS IPS

Use the General Settings page to specify the global settings used for Cisco IOS IPS properties defined for a particular router. The default settings are appropriate for most situations; however, you must specify an IPS configuration file location. If storing the configuration file on the router, you must first create the directory as described in [Initial Preparation of a Cisco IOS IPS Router, page 45-5](#).

### Navigation Path

- (Device view) Select **IPS > General Settings** from the Policy selector.
- (Policy view) Select **IPS (Router) > General Settings**, then select an existing policy or create a new one.

|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Apply Deny Action On                  | <p>Where to apply ACL entries to drop traffic for Deny Attacker Inline or Deny Flow Inline events. Select one of the following values:</p> <ul style="list-style-type: none"> <li><b>Ingress Interface</b> (the default)—Enforce the deny action on the interface attached to the network from which the traffic originated.</li> <li><b>IPS enabled interfaces</b>—Enforce the deny action on the interface on which the triggered IPS rule is applied.</li> </ul> <p>Enabling this option causes IOS IPS to apply the ACLs directly to the IPS interfaces, and not to the interfaces that originally received the attack traffic. If the router is not performing load balancing, do not enable this setting. If the router is performing load balancing, we recommend that you enable this setting.</p>                                                                                                                                                                                                                                                               |
| <b>SDEE Properties</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Maximum Subscriptions                 | <p>The maximum number of concurrent SDEE subscriptions allowed, in the range of 1-3. An SDEE subscription is a live feed of SDEE events. The default is 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Maximum Alerts                        | <p>The maximum number of SDEE alerts that you want the router to store, in the range of 10-2000. Storing more alerts uses more router memory. The default is 200.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Maximum Messages                      | <p>The maximum number of SDEE messages that you want the router to store, in the range of 10-500. Storing more messages uses more router memory. The default is 200.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>IPS Config Location Properties</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IPS Config Location                   | <p>The location where the router will save IOS IPS specific configuration files. These configuration files are automatically updated every time the IOS IPS configuration is changed or updated from Security Manager. When the router reboots, the IOS IPS configuration is retrieved and restored from these configuration files.</p> <p>To specify a location on the router, enter the name of the directory. The directory must already exist; Security Manager does not create it. For example, flash:ips.</p> <p><b>Note</b> If the router has a LEFS-based file system, you will be unable to create a directory in router memory. In this case, flash: is used as the config location.</p> <p>To specify a location on a remote system, specify the protocol and path of the URL needed to reach the location. For example, if you want to save the config files to an HTTP server, then enter http://172.27.108.5/ips-cfg.</p> <p>Supported servers for saving the IOS IPS configuration files are: http://, https://, ftp://, rcp://, scp://, and tftp://.</p> |

| Element                         | Description                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max retries                     | When storing configuration files on a remote system, how many times the router is to attempt to contact the remote system.<br>The default is 1.                         |
| Timeout seconds between retries | When storing configuration files on a remote system, how long the router is to wait before attempting to contact the configuration location again.<br>The default is 1. |

## Configuring IOS IPS Interface Rules

### Note

From version 4.17, though Cisco Security Manager continues to support IOS and IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Interface Rules policy to enable IPS inspection on Cisco IOS IPS routers and to specify the interfaces that will be subject to IPS inspection. You can identify a subset of the traffic on the interface that is subject to inspection by configuring an ACL and by specifying the traffic direction relative to the interface.

### Related Topics

- [Overview of Cisco IOS IPS Configuration, page 45-4](#)
- [Understanding Cisco IOS IPS, page 45-1](#)

**Step 1** Do one of the following to open the Interface Rules policy you want to modify:

- (Device view) Select **IPS > Interface Rules** from the Policy selector.
- (Policy view) Select **IPS (Router) > Interface Rules** from the Policy selector. Select an existing policy or create a new one.

The policy shows any existing interface rules, including the rule name, the name of the ACL that defines which traffic is inspected (if any), and the interface and traffic direction that is inspected. If no ACL is specified, all traffic on the interface in the specified direction is inspected.

Although the rules are numbered, the sequence of rules has no effect on IPS processing.

**Step 2** Select **Enable IPS** to enable the deployment of IOS IPS configuration to the device.

If Enable IPS is unchecked, IPS rules are removed from all the router interfaces, which disables IPS. Also, no signature or event action policy will be deployed.

**Step 3** Configure the interface rules. The rules identify the interfaces, and traffic direction on the interface, that will be inspected by IPS. The rules can optionally include an ACL to identify a subset of traffic for inspection.

- To add a rule, click the **Add Row (+)** button and fill in the Add IPS Rule dialog box. For detailed information, see [IPS Rule Dialog Box, page 45-10](#).
- To edit a rule, select it and click the **Edit Row (pencil)** button.

- To delete a rule, select it and click the **Delete Row (trash can)** button.

## IPS Rule Dialog Box

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the Add or Edit IPS Rule dialog box to identify the traffic flows to be inspected using the active signature policy.

### Navigation Path

From the Interface Rules policy, click the **Add Row** button to add a new rule, or select a rule and click the **Edit Row** button. For information on opening the Interface Rules policy, see [Configuring IOS IPS Interface Rules, page 45-9](#).

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Direction  | <p>The traffic direction, with respect to the interface, on which IPS inspection should be performed. Select one of the following:</p> <ul style="list-style-type: none"> <li><b>In</b> (default)—The IPS rule should be applied to inbound traffic.</li> <li><b>Out</b>—The IPS rule should be applied to outbound traffic.</li> <li><b>Both</b>—The IPS rule should be applied to both inbound and outbound traffic.</li> </ul>                                                                     |
| Interfaces | <p>The interface on which to apply this IPS rule. Enter the name of an interface or interface role object, or click <b>Select</b> to select the interface or interface role from a list or to create a new interface role.</p> <p>If you use interface roles, the rule is applied to all interfaces on the device that are defined by the role. The interfaces that match the role cannot conflict with an existing rule. You cannot specify the same interface for more than one interface rule.</p> |

## **PART 5**

### **PIX/ASA/FWSM Device Configuration**

# Managing Firewall Devices

**Note**

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM, and IPS, it does not support any bug fixes or enhancements.

The following topics describe configuration and management of security services and policies on Cisco security devices: Adaptive Security Appliances (ASAs), PIX Firewalls, and the Catalyst 6500 series switch Services Modules—that is, Firewall Services Modules (FWSMs) and ASA-SMs.

This chapter contains the following topics:

- [Firewall Device Types, page 46-1](#)
- [Default Firewall Configurations, page 46-2](#)
- [Configuring Firewall Device Interfaces, page 46-3](#)
- [VXLAN, page 46-79](#)

## Firewall Device Types

Security Manager can discover and manage a variety of Cisco security appliances or firewall devices, most notably the following:

- PIX 500 Series firewall devices
- ASA 5500 Series security appliances including the Cisco Virtual Security Appliance (ASA<sub>v</sub>)
- Security-specific Catalyst Services Modules

### PIX 500 Series

The Private Internet eXchange (PIX) 500 Series firewall appliances are no longer sold, however they are still supported and a great many are still in use world-wide.

### ASA 5500 Series

The Adaptive Security Appliance (ASA) 5500 Series devices provide comprehensive security services, including context-aware firewall capabilities and real-time threat defense. The ASA 5500 has replaced the PIX 500 as Cisco's primary security appliance. Visit the [Cisco ASA 5500 Series Adaptive Security Appliance page](#) on cisco.com for more information.

The Cisco ASA<sub>v</sub> Virtual Appliance, introduced in ASA 9.2(1), brings full firewall functionality to virtualized environments to secure data center traffic and multi-tenant environments. The ASA<sub>v</sub> runs on VMware vSphere. Although the ASA<sub>v</sub> is a virtual device, it is managed like other ASA devices in

Security Manager. For more information about the ASAv, see <http://www.cisco.com/c/en/us/support/security/virtual-adaptive-security-appliance-firewall/tsd-products-support-series-home.html>.

**Note**

The ASAv does not support the following ASA features: Clustering, Multiple context mode, Active/Active failover, Ether channels, and Shared AnyConnect Premium Licenses.

**Catalyst Services Modules**

A variety of Services Modules (SMs) are available for the Catalyst 6500 switch, including two that provide firewall and security services. These are blade-type modules that are installed directly into the switch chassis.

The Firewall Services module (FWSM) allows any port on the switch to operate as a firewall port, integrating firewall security inside the network structure. See [Cisco Catalyst 6500 Series Firewall Services Module](#) for more information.

The Adaptive Security Appliance service module (ASA-SM) provides high-speed security services across Layers 2 through 7, and you can install up to four ASA-SM blades in a single switch, providing scalability to 64 Gbps. See [Cisco Catalyst 6500 Series ASA Services Module](#) for more information.

**Note**

While the ASA-SM is a blade installed in a Catalyst 6500 switch—much like the FWSM physically—it is an ASA device, and it is documented as such. That is, refer to ASA-related topics for information about the ASA-SM. Where necessary, caveats and differences between the Service Module and the ASA appliance are noted.

## Default Firewall Configurations

Firewall devices are shipped with certain settings already configured. When you manually add a newly installed firewall device to Cisco Security Manager, you should discover (import) the pre-set or default policies for that device. Importing these policies into Security Manager prevents them being unintentionally removed the first time you deploy a configuration to that device. For more information about importing policies, see [Discovering Policies, page 5-12](#).

Cisco Security Manager provides a set of configuration files that contain default policies for a number of device types and versions. These configuration files are located in the directory:

```
<install_dir>\CSCOp\MDC\fwtools\pixplatform\ (for example, C:\Program Files\CSCOp\MDC\fwtools\pixplatform\).
```

The file name indicates device type, operating system version, context support, and operation type. For example, “FactoryDefault\_FWSM2\_2\_MR.cfg” is the configuration file for an FWSM, version 2.2, with support for Multiple contexts, operating in Routed mode. Similarly, “FactoryDefault\_ASA7\_0\_1\_ST.cfg” is the configuration file for an ASA, version 7.0.1, in Single-context, Transparent mode.

Refer to [Interfaces in Single and Multiple Contexts, page 46-5](#) for more about security contexts, and [Interfaces in Routed and Transparent Modes, page 46-5](#) for more about routed and transparent operation.

See [Adding Devices from Configuration Files, page 3-22](#) for information about adding new devices from the supplied configuration files.

# Configuring Firewall Device Interfaces

The Interfaces page displays configured physical interfaces, logical interfaces, and redundant interfaces, as well as hardware ports and bridge groups, for the selected device. From this page, you can add, edit and delete interfaces; enable communication between interfaces on the same security level; and manage VPDN groups and PPPoE users.

**Note**

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: Hardware Ports and Interfaces. Similarly, the Interfaces page displayed for the Catalyst 6500 services modules (ASA-SMs and FWSMs) operating in transparent mode also presents two tabbed panels: Interfaces and Bridge Groups.

**Navigation Path**

To access the Interfaces page, select a security device in Device View and then select **Interfaces** from the Device Policy selector.

This section contains the following topics:

- [Understanding Device Interfaces, page 46-3](#)
- [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#)
- [Advanced Interface Settings \(PIX/ASA/FWSM\), page 46-74](#)

## Understanding Device Interfaces

An interface is a point of connection between a security device and some other network device. Interfaces are initially disabled; thus, as an essential part of firewall configuration, interfaces must be enabled and configured to allow appropriate packet inspection and forwarding.

There are two types of interface: physical and logical, where a physical interface is the actual slot on the device into which a network cable is plugged, and a logical interface is a virtual port assigned to a specific physical port. Generally, physical ports are referred to as interfaces, while logical ports are referred to as subinterfaces, virtual interfaces, VLANs, or EtherChannels, depending on their function. The number and type of interfaces you can define varies with appliance model and type of license purchased.

**Note**

On devices running version 6.3 of the PIX operating system, the labels “physical” and “logical” are used, rather than “interface” and “subinterface.” Also, transparent mode and multiple contexts are not supported on these devices.

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN IDs. Because VLANs keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances. This feature is particularly useful in multiple-context mode, allowing you to assign unique interfaces to each context.

As a general rule, interfaces attach to router-based networks, and subinterfaces attach to switch-based networks. All subinterfaces must be associated with a physical interface that is responsible for routing allowed traffic correctly.

If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. The physical interface must be enabled for the subinterface to pass traffic, but do not name the physical interface to ensure it does not pass traffic. However, if you do want to let the physical interface pass untagged packets, you can name the interface as usual. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#) for information about naming an interface.

**Note**

The ASA 5505, combining switch and security appliance features, is a special case in that you configure both physical switch ports and logical VLAN interfaces. See [Understanding ASA 5505 Ports and Interfaces, page 46-6](#) for more information.

The Catalyst 6500 services modules (ASA-SMs and FWSMs) do not include any external physical interfaces—instead, they use internal VLAN interfaces. For example, assume you assign VLAN 201 to an FWSM inside interface, and VLAN 200 to the outside interface. You assign these VLANs to physical switch ports, and hosts connect to those ports. When communication occurs between VLANs 201 and 200, the FWSM is the only available path between the VLANs, forcing traffic to be statefully inspected.

See the following sections for additional information about device interfaces:

- [Interfaces in Routed and Transparent Modes, page 46-5](#)
- [Interfaces in Single and Multiple Contexts, page 46-5](#)
- [Understanding ASA 5505 Ports and Interfaces, page 46-6](#)
- [Configuring Subinterfaces \(PIX/ASA\), page 46-7](#)
- [Configuring Redundant Interfaces, page 46-8](#)
- [Configuring EtherChannels, page 46-9](#)
- [Configuring VNI Interfaces, page 46-15](#)
- [Configuring Tunnel Interface, page 46-22](#)

**Security Appliance Configurations**

Firewall devices allow a variety of configurations, and the configuration determines how to define the interfaces associated with a specific device. The following table outlines the various configurations.

**Table 46-1 Security Appliance Configurations**

| Device Type                                                   | Operational Mode (Router or Transparent) | Context Support (Single or Multiple)                                                            |
|---------------------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------------------|
| PIX 6.3.x                                                     | N/A                                      | N/A                                                                                             |
| PIX 7.0+/ASA                                                  | Router or Transparent                    | Single                                                                                          |
| PIX 7.0+/ASA, or security context of unmanaged PIX 7.0+/ASA   | Router or Transparent                    | Multiple (see <a href="#">Checklist for Configuring Multiple Security Contexts, page 59-3</a> ) |
| FWSM, or security context of unmanaged switch (multiple mode) | Router or Transparent                    | Single or Multiple                                                                              |

## Interfaces in Routed and Transparent Modes

Beginning with ASA/PIX 7.0 and FWSM 2.2.1, you can configure a security device to operate in one of two modes: *routed* or *transparent*. (The PIX 6.3 operates only in routed mode.)

In routed mode, the security appliance acts as a gateway or router for connected networks: it maintains IP addresses for its interfaces, and inspects and filters traffic traversing these interfaces based on IP address (Layer 3) information. In this mode, each device interface is connected to a different IP subnet, and has its own IP address on that subnet. Routed mode supports up to 256 interfaces in single mode or per context, with a maximum of 1000 interfaces divided between all contexts.

In transparent mode, the security appliance operates as a Layer 2 (data link) device, or transparent bridge, and is often referred to as a “bump in the wire,” or a “stealth firewall.” In this mode, you can define only two interfaces: inside and outside. The interfaces do not require IP addresses; they use VLAN IDs to forward inspected traffic. However, if the device includes a dedicated management interface, you can use it—either the physical interface or a subinterface—as a third interface for device-management traffic.

**Note**

Cisco Security Manager does not populate the interface information for FWSM 2.x devices during discovery.

### Bridge Groups

Beginning with the ASA 8.4.1 and FWSM 3.1, in transparent mode, you can increase the number of interfaces available to a device or context through use of bridge groups. You can configure up to eight bridge groups; on an FWSM each group can contain two interfaces; on an ASA 9.7.1 (Cisco Security Manager 4.13) each group can contain up to 64 interfaces. See [Add/Edit Bridge Group Dialog Box](#), page 46-68 for more information.

### Related Topics

- [Chapter 47, “Configuring Bridging Policies on Firewall Devices”](#)

## Interfaces in Single and Multiple Contexts

Security “contexts” allow a single physical device to operate as multiple, independent firewalls. In multiple-context mode, each context defines a single virtual firewall, complete with its own configuration. Each context acts as a unique virtual firewall that inspects and filters traffic traversing the interfaces allocated to that context. Each context is “unaware” of other contexts defined on the same security appliance.

As with a single-context, routed-mode device, interfaces on a multiple-context device connect to router-based networks, subinterfaces connect to switch-based networks, and each subinterface must be associated with an interface that routes allowed traffic correctly.

However, you cannot define IP addresses, the routed-mode portion of the configuration, or identify the management interface until you have defined and deployed the contexts. But you cannot define a security context until you have defined the necessary interfaces and subinterfaces.

In other words, you must enable and configure the interfaces and subinterfaces on a device that will provide multiple security contexts (in either routed or transparent mode) before you can define and configure the security contexts themselves.

Refer to [Chapter 59, “Configuring Security Contexts on Firewall Devices”](#) for more information.

## About Asymmetric Routing Groups

In some situations, return traffic for a session may be routed through a different interface than the one from which it originated. Similarly, in failover configurations, return traffic for a connection that originated on one unit may return through the peer unit. This most commonly occurs when two interfaces on a single FWSM, or two FWSMs in a failover pair, are connected to different service providers and the outbound connection does not use a NAT address. By default, the FWSM drops the return traffic because there is no connection information for that traffic.

You can prevent return traffic being dropped by assigning the VLAN interfaces on which this is likely to occur to an asymmetric routing (ASR) group. When a member interface receives a packet for which it has no session information, it checks the session information for other interfaces that are members of the same group.

If a match is not found, the packet is dropped. If a match is found, one of the following actions occurs:

- If the incoming traffic originated on a different interface on the same FWSM, some or all of the Layer 2 header is rewritten and the packet is re-injected into the stream.
- If the incoming traffic originated on a peer unit in a failover configuration, some or all of the Layer 2 header is rewritten and the packet is redirected to the other unit. This redirection continues as long as the session is active.

### Note

In failover configurations, you must enable Stateful Failover for session information to be passed from the standby unit or failover group to the active unit or failover group.

To assign an FWSM virtual interface to an asymmetric routing group, simply specify an ASR Group ID in the [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), page 46-45. If the group does not exist, it is created and the interface assigned to it.

You must repeat the assignment for each interface that will participate in this ASR group. You can create up to 32 ASR groups and assign a maximum of eight interfaces to each group.

### Note

The upstream and downstream routers must use one MAC address per VLAN, and have different MAC addresses for different VLANs, to allow the redirection of packets from a standby unit to an active unit in failover configurations.

## Understanding ASA 5505 Ports and Interfaces

The ASA 5505 is unique in that it includes a built-in switch, and there are two kinds of ports and interfaces that you need to configure:

- Physical switch ports – The ASA 5505 has eight Fast Ethernet switch ports that forward traffic at Layer 2, using the switching function in hardware. Two of these ports are power-over-Ethernet (PoE) ports. You can connect these ports directly to user equipment such as PCs, IP phones, or DSL modems. Or you can connect to another switch.
- Logical VLAN interfaces – In routed mode, these interfaces forward traffic between VLAN networks at Layer 3, using the configured security policy to apply firewall and VPN services. In transparent mode, these interfaces forward traffic between the VLANs on the same network at Layer 2, using the configured security policy to apply firewall services.

To segregate the switch ports into separate VLANs, you assign each switch port to a VLAN interface. Switch ports on the same VLAN can communicate with each other using hardware switching. But when a switch port on one VLAN attempts to communicate with a switch port on another VLAN, the ASA 5505 applies the security policy to the traffic, and routes or bridges between the two VLANs.

**Note**

Subinterfaces and redundant interfaces are not available on the ASA 5505.

**Navigation Path**

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: *Hardware Ports* and *Interfaces*. To access these panels, select an ASA 5505 in Device View and then select **Interfaces** from the Device Policy selector.

**Configuring ASA 5505 Switch Ports and Interfaces**

Refer to [Configuring Hardware Ports on an ASA 5505, page 46-66](#) for information about configuring the switch ports.

Refer to [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 46-34](#) for information about configuring the interfaces.

**Related Topics**

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#)

## Configuring Subinterfaces (PIX/ASA)

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN IDs. Because VLANs keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances. This feature is particularly useful in multiple-context mode, letting you assign unique interfaces to each context.

**Note**

If you use subinterfaces, you typically do not also want the physical interface to pass traffic, as the physical interface passes untagged packets. Because the physical interface must be enabled for the subinterface to pass traffic, do not name the physical interface to ensure it does not pass traffic. However, if you do want to let the physical interface pass untagged packets, you can name the interface as usual.

**Note**

This option is available only on PIX 7.0+ and non-5505 ASA devices.

**Defining Subinterfaces**

Follow these steps to configure a subinterface in the Add/Edit Interface (ASA/PIX 7.0+) dialog box, which is accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#)).

1. Choose **Subinterface** as the interface **Type** in the Add/Edit Interface dialog box.

The VLAN ID and Subinterface ID fields appear below the Hardware Port, Name and Security Level fields.

2. Choose the desired **Hardware Port** from the list of previously defined interface ports. If you do not see a desired interface ID, be sure that Interface is defined and enabled.
3. **VLAN ID** – Provide a VLAN ID for this subinterface: enter a value between 1 and 4094. The specified VLAN ID must not be in use on any connected device.

Some VLAN IDs might be reserved on connected switches; see the switch documentation for more information. In multiple-context mode, you can only set the VLAN ID in the system configuration.

4. **Secondary VLAN ID** – Provide a secondary VLAN ID value for this subinterface; this enables the ASA to map the packets that arrive on the ASA on the secondary VLAN to a primary VLAN. configure: Enter a value between 1 and 4090.

The secondary VLAN ID must be unique and not be the same as a VLAN ID. A secondary VLAN is supported on devices running ASA 9.5.2 or later in single context, in routed or firewall mode or as an L2 cluster.

---

**Note** You can add multiple VLAN IDs, separated by a space or a comma. You can also specify a range of VLAN IDs for e.g. 56-78.

---

5. **Subinterface ID** – Provide an integer between 1 and 4294967293 as the Subinterface ID. The number of subinterfaces allowed depends on your platform.

For subinterface port identification, this ID is appended to the chosen Hardware Port. For example, *GigabitEthernet0.4* represents the subinterface assigned an ID of 4, operating on the port GigabitEthernet0.

---

**Note** You cannot change the Subinterface ID after you set it.

---

6. Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34.

## Configuring Redundant Interfaces

Beginning with Security Manager 3.2.2, you can define logical “redundant” interfaces to increase security appliance reliability. A redundant interface is a specific pair of physical interfaces, with one designated as active (or primary) and the other as standby (or secondary). If the active interface fails, the standby interface becomes active and starts passing traffic. This feature is separate from device-level failover, but you can configure redundant interfaces as well as failover, if desired. You can configure up to eight redundant interface pairs.

A redundant interface functions as a single interface (inside, outside, etc.), with only one of the member pair active at any one time. This redundant interface is configured normally, with a unique interface name, security level and IP address. Note that each member interface must be of the same type (e.g., GigabitEthernet), and cannot have a name, security level, or IP address assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.

The redundant interface uses the MAC address of the first physical interface that you specify. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can explicitly assign a MAC

address to the redundant interface; this address is then used regardless of the member interface MAC addresses. In either case, when the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

**Note**

This option is available only on PIX 8.0+ and non-5505 ASA devices.

**Defining Redundant Interfaces**

Follow these steps to configure two physical interfaces as a single logical “redundant interface” in the Add/Edit Interface (ASA/PIX 7.0+) dialog box, which is accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#)).

1. Choose **Redundant** as the interface **Type** in the Add/Edit Interface dialog box.  
The Redundant ID, Primary Interface and Secondary Interface options appear.
2. Provide an identifier for this redundant interface in the **Redundant ID** field; valid IDs are the integers from 1 to 8.
3. **Primary Interface** – Choose the primary member of the redundant interface pair from this list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.
4. **Secondary Interface** – Choose the secondary member of the redundant interface pair from this list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.

**Note**

Member interfaces must be enabled and of the same type (e.g., GigabitEthernet), and cannot have a Name, IP Address, or Security Level assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.

5. Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 46-34](#).

## Configuring EtherChannels

Beginning with ASA 8.4.1, you can define logical EtherChannel interfaces. An EtherChannel, also called a port-channel interface, is a logical interface consisting of a bundle of individual Ethernet links (a channel group). This provides increased bandwidth and fault tolerance compared to the individual links.

An EtherChannel interface is configured and used in the same manner as a single physical interface. You can configure up to 48 EtherChannels, each of which consists of between one and eight active Fast Ethernet, Gigabit Ethernet, or Ten-Gigabit Ethernet ports. For ASA 9.2(1), the number of active interfaces increased to 16.

**Note**

You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the ASA if they do not use the same physical interfaces.

### EtherChannel MAC Addressing

All interfaces that are part of a channel group share the same MAC address. This makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. By default, the EtherChannel uses the MAC address of the lowest-numbered member interface as its MAC address.

Alternatively, you can manually configure a MAC address for the port-channel interface. We recommend doing so in case the channel interface membership changes. For example, if you remove the interface that provides the port-channel MAC address, the port-channel is assigned the MAC address of the next lowest numbered interface, causing traffic disruption. Manually assigning a unique MAC address to the EtherChannel interface prevents this disruption. (Note that in multiple-context mode, you can assign unique MAC addresses to interfaces assigned to an individual context, including EtherChannel interfaces.)

### About Management Only EtherChannel Interfaces

You can specify an EtherChannel group as a management-only interface, but note the following caveats:

- Routed mode – You must explicitly configure the EtherChannel to be Management Only in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34. Any non-management interface added to the management-only port-channel is treated as a management port. If you add an interface already defined as management-only to the management-only group, that attribute is ignored on the physical interface. Similarly, you cannot designate an interface as management-only if it is already a member of a management-only port-channel.
- Transparent mode – In this mode, members of a management-only EtherChannel can themselves only be management-only ports. Thus, when a management-only member is added to a transparent-mode EtherChannel, the channel inherits the management-only designation, while the designation is removed from the member interface. Conversely, when such an interface is removed from the EtherChannel, the designation is restored on the individual interface.

### Using an EtherChannel Interface as a Failover Link

If an EtherChannel interface is specified as a failover link, all state-sync traffic for that link will travel over a single physical interface. Should that physical interface fail, the state-sync traffic will then traverse another physical interface that is part of the EtherChannel aggregated link. If there are no remaining available physical interfaces in the EtherChannel link specified for failover, the ASA falls back to the redundant interface, if one is specified.

While an EtherChannel interface is being used as an active failover link, changes to that EtherChannel configuration are not allowed. You can change the EtherChannel configuration of that link only by disabling either the link or failover, as follows:

- Disable the EtherChannel link while the configuration changes are being made, and then reactivate it (failover will not occur while the link is disabled).
- Disable failover while the configuration changes are being made, and then re-enable it (failover will not occur in the interim).

#### Note

---

As with any other type of interface assigned as a failover link, the EtherChannel interface cannot be named. Further, none of the EtherChannel's member interfaces can be named.

---

### Defining EtherChannels on an ASA

Follow these steps to configure multiple physical interfaces as a single logical EtherChannel interface in the ASA Add Interface or Edit Interface dialog boxes, which are accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26).

- 
- Step 1** Choose **EtherChannel** as the interface Type.
- The EtherChannel ID and interface-selection options appear on the General panel of the dialog box; the Load Balancing, LACP Mode, and Active Physical Interfaces: Minimum and Maximum fields appear on the Advanced panel.
- Step 2** Provide an identifier for this EtherChannel in the EtherChannel ID field; valid IDs are the integers from 1 to 48. This number is appended to “Port-channel” to identify the EtherChannel in the Interface column of the table on the device’s Interfaces page.
- Step 3** **Available Interfaces** – Specify the members of this port-channel group by select one or more interfaces in this list of available interfaces, and then click the >> button to add them to the member list on the right.

---

**Note** All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

---

You can assign up to 16 interfaces to a channel group. For ASA 9.2(1) and later, each channel group can have up to 16 active interfaces. For switches that support only 8 active interfaces and ASA versions earlier than 9.2(1), only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. Alternatively, you can create a static EtherChannel by setting LACP Mode to On (on the Advanced panel, as described below), which means all interfaces in the group can pass traffic.

---

**Note** After assigning interfaces to this EtherChannel group, you can edit the LACP Port parameters for each member interface, as described in [Editing LACP Parameters for an Interface Assigned to an EtherChannel](#), page 46-12.

---

- Step 4** Click the **Advanced** tab to display that panel.
- Step 5** Choose a **Load Balancing** option in the EtherChannel section. See [About EtherChannel Load Balancing](#), page 46-13, for more information about this option.
- Step 6** Select the desired **LACP Mode**; the default is Active, which means up to eight interfaces are active, while up to eight are in stand-by mode, as determined by the Minimum and Maximum values under Active Physical Interfaces.
- If you select On, a static port-channel is created in which all member interfaces are all “on,” meaning you can have up to 16 ports passing traffic, with no stand-by ports. When you select this option, the Mode for all interfaces assigned to this EtherChannel group is switched to On (if the Mode for each is not already On). See [Editing LACP Parameters for an Interface Assigned to an EtherChannel](#), page 46-12, for more information about this mode.
- Step 7** Specify the Minimum and Maximum number of Active Physical Interfaces for this EtherChannel.
- As mentioned, an EtherChannel can consist of between 1 and 8 active links for ASA devices earlier than 9.2(1) or between 1 and 16 active links for ASA 9.2(1)+. Use these fields to indicate the minimum and maximum number of interfaces that can be active in this channel group at any given time. If your switch does not support 16 active interfaces, be sure to set the maximum to 8 or fewer.
- Step 8** Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34.

**Note** The EtherChannel **LACP System Priority** for this device is specified in the [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 46-74 dialog box.

## Editing LACP Parameters for an Interface Assigned to an EtherChannel

After assigning interfaces to an EtherChannel (port-channel) group, you can edit the LACP Port parameters for each member interface, as described here.

**Note** This feature is available only on ASA 8.4.1+ devices.

The Link Aggregation Control Protocol (LACP) directs aggregation of physical Fast Ethernet, Gigabit Ethernet, or Ten-Gigabit Ethernet interfaces into an EtherChannel group, and updating the remote partner device with current information after it finds a compatible set of ports and assigns a unique value called an “operational key” to the group. Note that operational key assignment is automatic; you cannot configure it.

**Caution**

These LACP parameters are not available when the EtherChannel is assigned as a failover link.

### LACP System Priority

Every LACP-enabled device has a unique system ID that is formed by combining a System Priority identifier and the system’s MAC address. In certain situations, two EtherChannel-linked systems may need to change the operational key assigned to a set of ports to allow optimal aggregation. In such a situation, the system with higher priority is allowed to dynamically modify the operational key value assigned to the ports to achieve better aggregation. The system with the lower priority is not allowed to change the operational keys. The System Priority identifier is user-configurable, as described in [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 46-74.

### LACP Port Parameters

Port identification is provided by a unique number assigned to every group interface; this identifier is formed by combining a configurable Port Priority number and the port number assigned to the interface.

The port identifier provides port aggregation priority. Ports are considered for active use in an aggregation starting with the port that has highest aggregation priority in the system, and working down through an ordered list of port identifiers. The use of this port aggregation priority makes aggregation predictable and reproducible by selecting the links for aggregation in the same manner when all links are running LACP concurrently.

In addition, you can configure the priority of each port to administratively control the set of stand-by ports. For example, the port with the lowest priority will be considered last for group aggregation and will become a stand-by port (assuming enough members are assigned to the group to allow stand-by ports).

### Editing LACP Port Parameters for an Existing EtherChannel Interface

Follow these steps to edit an existing EtherChannel-assigned interface:

- 
- Step 1** In the table on the device's Interfaces page, select an interface that is a Member of a Port-channel group. (See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26 for information about accessing and using this table.)
- Step 2** Click **Edit Row** to open the Edit Interface dialog box for that interface.  
Only the Enable Interface check box, the LACP Port parameters, and the Description field can be altered.
- Step 3** Edit the **LACP Port** parameters as necessary:
- **Priority** – This number is combined with the port number assigned to the interface to produce a unique port identification number. This value can be 1 to 65535, with higher numbers signifying lower priorities. The default is 32768. This parameter applies only when the port is in Active or Passive mode.
  - **Mode** – Choose one of these LACP modes:
    - **Active** – In Active mode, a port initiates LACP exchanges with the partner device and periodically sends updates to the partner. Active LACP reflects the port's preference to participate in the protocol regardless of the partner's control mode.
    - **Passive** – A Passive-mode port does not initiate LACP exchanges, but upon receiving a request from the partner, the port will start exchanging LACP information with the partner. Passive mode is useful when it is not clear if the remote port supports LACP.  
  
Some devices may show undesired behavior when they do not have LACP enabled and they receive periodic LACP updates. However, for channeling to operate correctly, at least one port must be configured in Active mode.
    - **On** – Use this mode to configure a static port-channel in which all member interfaces are “on,” with no stand-by ports. No negotiation takes place and most restrictions associated with the other two modes do not apply; for example, the speed and duplex settings do not have to be the same for all member ports, and all member ports remain Active. Note that the remote ports also must be On. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.
  - **VSS or vPC Switch ID** – Identifies the Virtual Switching System (VSS) or Virtual Port Channel (vPC) switch ID to which the interface is connected.
- Step 4** Continue editing this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34.

## About EtherChannel Load Balancing

Traffic in an EtherChannel is distributed across the individual bundled links in a deterministic fashion; however, the load is not necessarily balanced equally across all the links. Instead, frames are forwarded on a specific link as a result of a hashing algorithm. This algorithm uses a specific field or combination of fields in the packet header to produce a fixed Result Bundle Hash (RBH) value that indicates which link to use.

The algorithm can use one or a combination of the following packet-header fields to determine link assignment: source IP address, destination IP address, source MAC address, destination MAC address, TCP/UDP port numbers, or VLAN IDs. The field combination used by the algorithm is chosen from the **Load Balancing** list (on the Advanced tab of the ASA's Add Interface and Edit Interface dialog boxes); these options are described in the following section. For additional information, see [Configuring EtherChannels](#), page 46-9.

For example, suppose source MAC address (*src-mac*) is the chosen field: when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source MAC address of each incoming packet. Therefore, to provide load balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel (and the MAC addresses learned by the device do not change).

Similarly, with destination MAC address forwarding, when packets are forwarded to an EtherChannel, each packet is distributed across the ports in the channel based on the packet's destination host MAC address. Thus, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

Therefore, when choosing a load-balancing option, use the option that provides the greatest variety in your configuration. For example, if most of the traffic on a channel is going only to a single MAC address, choosing the destination MAC address results in most of the traffic always using the same link in the channel. Alternatively, using source addresses or IP addresses might result in better load balancing, while a method that uses the source and destination addresses along with UDP or TCP port numbers can distribute traffic much differently.

**Note**

---

This option is available only on ASA 8.4.1+ devices.

---

**Load Balancing Options**

When defining a single logical EtherChannel interface in the ASA Add/Edit Interface dialog box, choose one of the following **Load Balancing** options (on the [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), page 46-45) to specify the basis of load distribution:

- **dst-ip** – Load distribution is based on the destination-host IP address only; the source of the packets is not considered. Each packet with the same destination IP address is forwarded over the same link.
- **dst-ip-port** – Load distribution is based on the destination-host IP address and TCP/UDP port. This option offers more granularity and a little more complexity than destination IP address alone.
- **dst-mac** – Load distribution is based on the destination host MAC address of incoming packets.
- **dst-port** – Distribution is based on the destination port; that is, a TCP or UDP port and not a physical interface.
- **src-dst-ip** – Distribution is based on source and destination IP addresses—source and destination IP addresses are paired for hash calculations. This method provides more granularity than destination IP address, for example: packets to the same destination can be forwarded over different links in a port-channel if they are coming from a different IP source.
- **src-dst-ip-port** – Distribution calculation considers source and destination IP addresses, and TCP/UDP ports. Provides even greater granularity and distribution.
- **src-dst-mac** – Calculation is based on source and destination MAC address pairing.
- **src-dst-port** – Load distribution is based on source and destination TCP/UDP port.
- **src-ip** – Based on source host IP address only.
- **src-ip-port** – Source IP address and TCP/UDP port.
- **src-mac** – Source MAC address only.
- **src-port** – Source TCP/UDP port only.
- **vlan-dst-ip** – Destination IP address and VLAN ID pairing.
- **vlan-dst-ip-port** – Combination of destination IP address, TCP/UDP port, and VLAN ID.
- **vlan-only** – VLAN ID only.

- **vlan-src-dst-ip** – Source and destination IP address, and VLAN ID.
- **vlan-src-dst-ip-port** – Source and destination IP address, TCP/UDP port, and VLAN ID.
- **vlan-src-ip** – Source IP address and VLAN ID.
- **vlan-src-ip-port** – Source IP address, TCP/UDP port, and VLAN ID.

## Configuring VNI Interfaces

VNI interfaces are similar to VLAN interfaces: they are virtual interfaces that keep network traffic separated on a given physical interface by using tagging. You apply your security policy directly to each VNI interface. All VNI interfaces are associated with the same VTEP interface.

To configure VXLAN, you must first [Configuring VXLAN Policy, page 46-79](#) and then create a VNI interface and associate the configured VXLAN policy to the VNI interface.

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The following sections describe how to configure VNI interfaces using the three tabbed panels:

- [VXLAN, page 46-79](#)
- [VNI Interfaces—General Tab, page 46-15](#)
- [VNI Interfaces—Advanced Tab, page 46-16](#)
- [VNI Interfaces—IPv6 Tab, page 46-17](#)

### VNI Interfaces—General Tab

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **General** panel are described in this section.

#### Navigation Path

You can access the General panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#).

|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VXLAN</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| VNI ID                       | Enter the VNI ID, between 1 and 10000. This ID is just an internal interface identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| VNI Segment ID               | Enter the VNI Segment ID, between 1 and 16777215. The segment ID is used for VXLAN tagging.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Multicast Group IP Address   | (Single Mode) Enter the Multicast Group IP Address.<br><br>If you do not set the multicast group for the VNI interface, the default group from the VTEP source interface configuration is used, if available. If you manually set a VTEP peer IP for the VTEP source interface, you cannot specify a multicast group for the VNI interface. Multicast is not supported in multiple context mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| NVE Mapped to VTEP Interface | Check the NVE Mapped to VTEP Interface check box. This setting associates the VNI interface with the VTEP source interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IP Type                      | Select the IP Type from the available options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Static IP                    | IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. | Use DHCP                     | DHCP Learned Route Metric—(Required)To assign an administrative distance to the learned route, enter a value between 1 and 255 in the DHCP Learned Route Metric field. If this field is left blank, the administrative distance for the learned routes is 1.<br><br>Obtain Default Route using DHCP—(Optional) Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route.<br><br>Enable Tracking for DHCP Learned Route—(Optional) If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking via a specific Service Level Agreement (SLA) monitor. The following option becomes available:<br><br>Tracked SLA Monitor—Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. |
| Description                  | (Optional) Specify a description for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### VNI Interfaces—Advanced Tab

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **Advanced** panel are described in this section.

#### Navigation Path

You can access the Advanced tab in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26.

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active MAC Address                | Use the Active MAC Address field to manually assign a private MAC address to the interface                                                                                                                                                                                                                                                                                                                                                                      |
| Standby MAC Address               | The Standby MAC Address field can be used to set a standby MAC address for use with device-level failover.                                                                                                                                                                                                                                                                                                                                                      |
| Roles                             | All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager. Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. |
| DHCP Relay Servers                | Enter the IP address or select a Networks/Hosts object representing the interface-specific DHCP server to which DHCP requests on this interface are relayed. Use a comma to separate multiple values. You can configure a maximum of 4 interface-specific DHCP relay servers and a maximum of 10 global and interface-specific DHCP relay servers combined.                                                                                                     |
| DHCP Relay Trust Info (Option 82) | Specifies that you want to trust this DHCP client interface. You can configure interfaces as trusted interfaces to preserve DHCP Option 82.                                                                                                                                                                                                                                                                                                                     |

**VNI Interfaces—IPv6 Tab**

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **IPv6** panel are described in this section.

**Navigation Path**

You can access the IPv6 panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#).

Table 46-4 IPv6 tab: Add/Edit Interface Dialog Box (ASA)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPv6    | Check this box to enable IPv6 and configure IPv6 addresses on this interface. You can deselect this option to disable IPv6 on the interface, but retain the configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on an interface, the source addresses of IPv6 packets received on the interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre>%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DAD Attempts        | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre data-bbox="727 835 1442 856">%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval         | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Managed Config Flag | <p>Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other Config Flag | Whether or not to set the flag "other-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable RA         | <p>When checked, IPv6 router advertisement transmissions are enabled on the interface. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>RA Lifetime</b> – The “router lifetime” value specifies how long nodes on the local link should consider the security appliance as the default router on the link. Valid values range from 0 to 9000 seconds; the default is 1800 seconds. Entering 0 indicates that the security appliance should not be considered a default router on the selected interface.</li> </ul> <p>Any non-zero value should not be less than the following RA Interval value.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval</b> – The interval between IPv6 router advertisement transmissions on this interface. Valid values range from 3 to 1800 seconds, (or from 500 to 1800000 milliseconds if the following RA Interval in Milliseconds option is checked); the default is 200 seconds.</li> </ul> <p>The interval between transmissions should be less than or equal to the RA Lifetime value if it is non-zero. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval in Milliseconds</b> – Checking this option indicates that the provided RA Interval value is in milliseconds, rather than seconds.</li> </ul> |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li>• <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field. <p>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</p> </li> <li>• <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address. <ul style="list-style-type: none"> <li>– <b>Trust the DHCP Servers for default gateway</b>– Select this radio button to install a default route from Router Advertisements that come from a trusted source - the directly-connected network.</li> <li>– <b>Ignore trust and accept router advertisements</b> – Select this radio button to install a default route from Router Advertisements that come from another network.</li> </ul> </li> <li>• The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48.</a>) <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box, page 46-56.</a></p> </li> </ul> |
| Interface IPv6 Prefixes  | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48.</a>)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box, page 46-58.</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interface IPv6 DHCP      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring Tunnel Interface

Cisco Security Manager 4.13 supports route based VPN method for the Site-to-Site VPN. This support requires configuration of the static crypto map access list and mapping it to an interface. Due to this requirement, Large Enterprises and Virtual Private Clouds need to track all remote subnets and include them in the crypto map access list. To overcome this challenge, ASA 9.7.1 is enhanced to support the route based VPN method using the VTI (Virtual Tunnel Interface). Thus, beginning with Cisco Security Manager 4.13, you can define tunnel interface for the VPN and its associated IPSec policy.

VTI is supported only for Regular IPsec with Hub and Spoke, and Point to Point VPN topologies. VTI is not supported for other topologies like Full Mesh Topology, Extranet VPN Topology and RAVPN Policies.

In a multi- hub and multi- spoke scenario, for the tunnel interface to establish connectivity from one peer to another peer, ensure interface roles are applied to the hubs and spokes.

### Note

The Advanced tab and IPv6 tab options are not applicable for VTI.

The following sections describe how to configure tunnel interface:

- [Tunnel—General Tab, page 46-22](#)
- [Configuring IPSec Policy for Tunnel Interface, page 46-24](#)

### Tunnel—General Tab

In the Add Interface or Edit Interface dialog box, when you select Tunnel from the Type drop-down, the dialog box displays three tabs: General, Advanced, and IPv6. This section describes the options provided by the **General** panel.

#### Navigation Path

You can access the General panel from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#).

#### Related Topics

| <b>Tunnel Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Tunnel ID               | <p>Enter the unique Tunnel ID, between 0 and 100. This ID is an internal interface identifier. The specified ID is mapped with the interface name. The Name and the ID pair must be unique.</p> <p>This field is mandatory for Regular IPSEC VTI VPN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Source Interface        | <p>Enter the source interface to be used for creating the VTI, IP address shall be picked up from this interface.</p> <p>Click the <b>Select</b> button to choose the source interface from the available interfaces. For more information, see <a href="#">Selecting Objects for Policies, page 6-2</a>.</p> <p><b>Note</b> Tunnel source and destination pair must be unique.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Destination IP/Hostname | <p>The tunnel destination IP address to be used for the VTI. Beginning with 4.14, Cisco Security Manager allows you to specify a Hostname as the destination IP.</p> <p><b>Note</b> Tunnel source and destination pair has to be unique.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IPv4 Mode               | <p>Check the check box to pass IPv4 as the tunnel protection mode, currently, only IPsec is supported. IPv4 network would be encapsulated in the tunnel.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IPSec Profile           | <p>Enter the IPSec profile to be attached to the tunnel interface.</p> <p>A policy object must have been created in the Policy Object Manager. For information on creating Policy Object, refer <a href="#">Configuring IPSec Policy for Tunnel Interface, page 46-24</a>.</p> <p><b>Note</b> If you select IPSec profiles with different IKEV1 transform sets for the peers, Cisco Security Manager will create the tunnel interface, but the connectivity between the two peers will not be established.</p> <p>To choose the profile from the IPSec Object Selector dialog, click the <b>Select</b> button. For more information, see <a href="#">Selecting Objects for Policies, page 6-2</a>.</p> <p><b>Note</b> When you specify the policy, ensure tunnel name is entered. Cisco Security Manager displays error message when the <b>Name</b> field is blank.</p> |
| IP Type                 | <p>From the drop-down, select Static IP.</p> <ul style="list-style-type: none"> <li>IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.</li> <li>Subnet Mask—Specify the Subnet Mask.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description             | (Optional) Specify a description for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Establishing Regular IPsec VPN Tunnel

The following checkpoints (while configuring the Tunnel - [Configuring Tunnel Interface, page 46-22](#)) help you to successfully establish the Regular IPsec VPN Tunnel connectivity:

1. You must enter Tunnel ID value.
2. Source interface must be configured and must be reachable to its peer through ISP or routing.
3. You must enter the peer source interface IP address in the Destination IP field.
4. For the IPsec Profile field:
  - a. Select the same IKEV1 transform set for both the peer devices.
  - b. In Point-to-Point topology, either one of the peers must be the responder.
  - c. In Hub and Spoke topology, select the Hub as the responder; select all spokes as initiators.
5. IPV4 mode must be configured for enabling the interesting traffic.
6. You must enter IP address to establish the VPN, dynamic IP address is not supported.
7. Select Static or BGP routing for enabling the interesting traffic. In case of firewall policy, VTI is supported only in static routing.

**Note** Cisco Security Manager displays error message if BGP/Static route is not configured properly for Point-to-Point topology, and Hub and Spoke topology with one hub and one spoke. For Multi hub/spoke scenario, the error message is not displayed.

## Configuring IPsec Policy for Tunnel Interface

Use the IPsec Policy page to configure the IPsec policy used during IKE Phase 1 and IKE Phase 2 negotiations for Regular IPsec with Hub and Spoke and Point to Point VPN topologies.

### Navigation Path

- Choose **Manage > Policy Objects** to open the Policy Object Manager. Under All Object Types, click **IPsec Profile**. To add a profile, click the **Add** button.

### Field Reference

**Table 46-6** IPsec Profile

| Element     | Description                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | Name of the IPsec policy.                                                                                                                                                               |
| Description | Description for the policy.                                                                                                                                                             |
| IKE Version | Choose the relevant IKE version— IKEv1 or IKEv2.<br><b>Note</b> Beginning with 4.14, Cisco Security Manager supports IKEv2. However, at a time, you can choose only one version of IKE. |

Table 46-6 IPsec Profile

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKEv1 Transform Sets                      | <p>The IKEv1 transform sets to be used for your tunnel policy. Transform sets specify which authentication and encryption algorithms are used to secure the traffic in the tunnel. You can select up to 11 transform sets. For more information, see <a href="#">Understanding Transform Sets, page 26-20</a>.</p> <p>Transform sets may use only tunnel mode IPsec operation.</p> <p>You can associate more than one IKEv1 Transform Sets. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security is used.</p> <p><b>Note</b> For the tunnel to be functional, IKEv1 transform set on both peers should be the same.</p> <p>Click <b>Select</b> to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 26-27</a>.</p> <p>This field is not available for IKEv2.</p> |
| IKEv2 IPsec Proposal (ASA 9.8(1) Onwards) | <p>Click <b>Select</b> to select the IPsec proposals to be used for your tunnel policy. Cisco Security Manager allows you to select more than one proposals. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 26-27</a>.</p> <p>This field is not available for IKEv1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Trustpoint (ASA 9.8(1) Onwards)           | <p>Click <b>Select</b> to select the CA servers for issuing certificates to the participating IPsec network devices. The peers that are configured with this policy obtains digital certificates from the selected CA server. You can specify only one trustpoint.</p> <p>For IKEv1, when trustpoint is used for authentication, the initiator should have the trustpoint specified under IPsec profile's trustpoint configuration; and for responder, the trustpoint should be specified under tunnel-group CLI (similar to non-VTI configuration).</p> <p>For IKEv2, when trustpoint is used for authentication, the trustpoint CLI is specified under tunnel-group CLI for both initiator and responder.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Certificate Chain (ASA 9.8(1) Onwards)    | <p>Select the check box to enable sending of the certificate chain for authorization.</p> <p>A certificate chain includes the root CA certificate, identity certificate, and key pair.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Responder Only                            | <p>Check this check box to set the peer that is associated with this policy acts as the responder. Ensure only one of the peer is configured with the responder only settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 46-6 IPsec Profile

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Perfect Forward Secrecy (PFS)<br>Modulus Group | <p>Whether to enable the use of Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. In IPsec negotiations, PFS ensures that each new cryptographic key is unrelated to any previous key.</p> <p>If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the <b>Modulus Group</b> list. For an explanation of the options, see <a href="#">Deciding Which Diffie-Hellman Modulus Group to Use</a>, page 26-7.</p> <p>The following Modulus Groups are not supported for IKEv1. Ensure you do not select them for IKEv1:</p> <ul style="list-style-type: none"> <li>• group19</li> <li>• group20</li> <li>• group21</li> <li>• group24</li> <li>• group1</li> </ul> <p><b>Note</b> Beginning with Cisco Security Manager 4.19, DH group 1 option is not supported for ASA 9.12(1) and later devices.</p> |
| Lifetime (Seconds)<br>Lifetime (Kilobytes)            | <p>The global lifetime settings for the Crypto IPsec security association (SA). You can specify the IPsec lifetime in seconds, in kilobytes, or both.</p> <ul style="list-style-type: none"> <li>• Seconds—The number of seconds an SA will exist before expiring. Enter a value within the range 120-2147483647 seconds.</li> <li>• Kilobytes—The volume of traffic (in kilobytes) that can pass between IPsec peers using a given SA before it expires. Valid values depend on the device type. Enter a value within the range 10-2147483647.</li> </ul> <p>To allow unlimited you can select Enable Unlimited Lifetime (Kilobytes) check box.</p>                                                                                                                                                                                                                                                                            |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-13.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Allow Value Override per Device                       | <p>Select to allow the properties of this object to be redefined on individual devices.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Note**

DH groups 2, 5, and 24 will not be supported for ASA 9.14.(1) and later devices.

## Configuring VLAN Interface

Beginning with version 4.20, Cisco Security Manager supports L2 hardware switching on Cisco FPR-1010 Adaptive Security Appliance. To avail the L2 switching support, you need to configure the respective VLAN interface.

### VLAN Interface—General Tab

In the Add Interface or Edit Interface dialog box, when you select VLAN Interface from the Type drop-down list, the dialog box displays five tabs: General, Advanced, IPv6, Switch Port, and Power Over Ethernet.

**Note**

You cannot configure Switch Port and Power Over Ethernet for VLAN Interface.

#### Navigation Path

- Select **Interfaces > Add Interface** from the Device Policy selector and choose VLAN Interface from the **Type** drop-down list.

**Table 46-7**      **General tab: Add/Edit Interface Dialog Box**

| Element                      | Description                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface             | Check this box to enable the VLAN interface if not already enabled.                                                                                                                                                                                |
| Management Only              | Check this box to enable the Management Only feature. This reserves the interface for device administration where, traffic for only this device is accepted; pass-through traffic for other interfaces and devices is rejected.                    |
| Name                         | Enter the Interface Name. The name is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value.                                                                           |
| Security Level               | Enter the Security Level, between 0 (lowest) and 100 (highest).                                                                                                                                                                                    |
| L2 VLAN ID                   | Enter the L2 VLAN ID, between 1(lowest) and 4070 (highest). This is a mandatory field.                                                                                                                                                             |
| No Forward Interface VLAN ID | Enter the No Forward Interface VLAN ID, between 1(lowest) and 4070 (highest).<br><br><b>Note</b> To configure a VLAN ID for the No Forward Interface VLAN ID field, you must have initially created a VLAN or SVI interface in the Interface page. |
| IP Type                      | Select the IP Type from the available options: Static IP, Use DHCP, and PPPoE (PIX and ASA 7.2+).                                                                                                                                                  |
| Static IP                    | IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.<br><br>Subnet Mask—Specify the Subnet Mask.                                                                                     |

**Table 46-7** General tab: Add/Edit Interface Dialog Box (continued)

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use DHCP | <p>DHCP Learned Route Metric—(Required) To assign an administrative distance to the learned route, enter a value between 1 and 255 in the DHCP Learned Route Metric field. If this field is left blank, the administrative distance for the learned routes is 1.</p> <p>Obtain Default Route using DHCP—(Optional) Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route.</p> <p>Enable Tracking for DHCP Learned Route—(Optional) If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking through a specific Service Level Agreement (SLA) monitor. The following option becomes available:</p> <p>Tracked SLA Monitor—Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied on this interface.</p> |

Table 46-7 General tab: Add/Edit Interface Dialog Box (continued)

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PPPoE (PIX and ASA 7.2+) | <p>This enables Point-to-Point Protocol over Ethernet (PPPoE) for automatic assignment of an IP address from a PPPoE server on the connected network; this option is not supported with failover. On selecting <b>PPPoE (PIX and ASA 7.2+)</b> from the <b>IP Type</b> drop-down, the following options become available:</p> <p>VPDN Group Name (required)—Choose the Virtual Private Dialup Network (VPDN) group that contains the authentication method and user name/password to use for network connection, negotiation, and authentication. See <a href="#">Managing VPDN Groups, page 46-78</a> for more information.</p> <p>IP Address—If provided, this static IP address is used for connection and authentication, instead of a negotiated address.</p> <p>Subnet Mask—The subnet mask to be used in conjunction with the provided IP Address.</p> <p>PPPoE Learned Route Metric (required)—Assign an administrative distance to the learned route. Valid values are 1 to 255; defaults to 1.</p> <p>All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.</p> <p>Obtain Default Routing Using PPPoE—Select this option to obtain a default route from the PPPoE server. This sets the default routes when the PPPoE client has not yet established a connection. When using this option, you cannot have a statically defined route in the configuration.</p> <p>Enable Tracking for PPPoE Learned Route—If <b>Obtain Default Route using PPPoE</b> is selected, you can select this option to enable route tracking for PPPoE-learned routes. When selected, the following options become available.</p> <p>Dual ISP Interface—If you are defining interfaces for dual ISP support, choose <b>Primary</b> or <b>Secondary</b> to indicate which connection you are configuring.</p> <p>Tracked SLA Monitor—Required if <b>Enable Tracking for DHCP Learned Route</b> is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface.</p> |
| Description              | (Optional) Specify a description for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Managing Device Interfaces, Hardware Ports, and Bridge Groups

The Interfaces page displays the interfaces, subinterfaces, redundant interfaces, virtual interfaces (VLANs), and EtherChannel interfaces, as well as the hardware ports and bridge groups, configured on the selected device, and lets you add, edit and delete them.

The types of interface available depend on device type, operating system version, and mode (routed or transparent). For example, EtherChannel interfaces are available only on ASA 8.4.1 and later devices, in both routed and transparent mode. See [Understanding Device Interfaces, page 46-3](#) for more information.

**Note**

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: Interfaces and **Hardware Ports**. Similarly, the Interfaces page displayed for both Firewall Services Modules (FWSMs), version 3.1 and later, and ASAs version 8.4.1 and later, operating in transparent mode also present two tabbed panels: Interfaces and **Bridge Groups**. Links to configuration information for these features are included in the following procedure.

Each security device must be configured, and each active interface must be enabled. Inactive interfaces can be disabled. When disabled, the interface does not transmit or receive data, but its configuration information is retained.

If you bootstrapped a new security device, the set-up feature configures only the addresses and names associated with the inside interface. You must define the remaining interfaces on that device before you can specify access and translation rules for traffic traversing that security device.

Transparent firewall mode allows only two interfaces to pass traffic; however, if your platform includes a dedicated management interface, you can use it (either the physical interface or a subinterface) as a third interface for management traffic.

Follow these general steps to manage security-device interfaces and related options. You can add, edit and delete configured interfaces, subinterfaces, redundant interfaces, virtual interfaces (VLANs), EtherChannel interfaces, hardware ports, and bridge groups, according to the type of device selected.

- Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

**Note** For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager, page 5-30](#).

- Step 2** Select the security device you want to configure.

- Step 3** Select **Interfaces** in the Device Policy selector.

The Interfaces page is displayed. The information displayed, and the page itself, varies based on the selected device type and version, the operational mode (routed versus transparent), and whether the device hosts single or multiple contexts.

Note that the Interfaces page for ASA 5505 devices presents two tabbed panels: Hardware Ports and Interfaces. Similarly, the Interfaces page displayed for both FWSMs (version 3.1 and later) and ASAs (version 8.4.1 and later), operating in transparent mode also presents two tabbed panels: Interfaces and Bridge Groups.

- Step 4** Add, edit and delete interfaces and related options, as necessary.

The Interfaces pages/panels and the Bridge Groups and Hardware Ports panels present standard Security Manager tables, with Add Row, Edit Row and Delete Row buttons, which are described in [Using Tables, page 1-48](#).

The actual dialog box presented when you click the Add Row or Edit Row button depends on the type of device (and panel) you have selected. Refer to the following topics for device-specific dialog box information:

- [Add/Edit Interface Dialog Box \(PIX 6.3\)](#), page 46-31
  - [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34
  - [Configuring Hardware Ports on an ASA 5505](#), page 46-66
  - [Add/Edit Bridge Group Dialog Box](#), page 46-68
- Step 5** To manage Advanced Interface settings, including enabling communication between interfaces with the same security level, click the Advanced button at the bottom of the Interfaces page to open the Advanced Interface Settings dialog box. See [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 46-74 for more information.
- Step 6** When you are finished adding, editing and deleting interfaces, click **Save** at the bottom of the window to save your interface definitions to the Cisco Security Manager server.

## Add/Edit Interface Dialog Box (PIX 6.3)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

**Table 46-8** Add/Edit Interface Dialog Box (PIX 6.3)

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | <p>Enables this interface to pass traffic. In addition to this setting, you must specify an IP Type and a Name before traffic can pass according to your security policy.</p> <p>You must enable a physical interface before traffic can pass through any enabled subinterfaces.</p>                                                                                                                                                                                                                                               |
| Type             | <p>Choose the type of interface:</p> <ul style="list-style-type: none"> <li>• <b>Physical</b> – VLAN is on the same network as its underlying hardware interface.</li> <li>• <b>Logical</b> – VLAN is associated with a logical interface.</li> </ul>                                                                                                                                                                                                                                                                              |
| Name             | <p>Provide an interface name up to 48 characters in length. The Name should be a memorable name for the interface that relates to its use. Supported interface names are:</p> <ul style="list-style-type: none"> <li>• <b>Inside</b>—Connects to your internal network. Must be most secure interface.</li> <li>• <b>DMZ</b>—Demilitarized zone (Intermediate interface). Also known as a perimeter network.</li> <li>• <b>Outside</b>—Connects to an external network or the Internet. Must be least secure interface.</li> </ul> |

**Table 46-8 Add/Edit Interface Dialog Box (PIX 6.3) (continued)**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware Port    | <p>When defining a physical network interface, this value represents the name identifies the interface type and its slot or port in the device.</p> <p>When you add a logical network interface, you can choose any enabled physical interface to which you want to add a logical interface. If you do not see the desired hardware port, verify that the interface is enabled.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• ethernet0 to ethernet<i>n</i>.</li> <li>• gb-ethernet<i>n</i>.</li> </ul> <p>where <i>n</i> represents the number of network interfaces in the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| IP Type          | <p>The IP Type defines the type of IP addressing used for the interface; choose <b>Static IP</b> or <b>Use DHCP</b>, as described in <a href="#">Device Interface: IP Type (PIX 6.3), page 46-33</a>. (The PPPoE option is not applicable to PIX 6.3 devices.)</p> <p><b>Note</b> You can configure DHCP only on the outside interface of a security appliance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Speed and Duplex | <p>Lists the speed options for a physical interface; not applicable to logical interfaces. Choose one of the following options:</p> <ul style="list-style-type: none"> <li>• auto – Sets Ethernet speed automatically. The auto keyword can be used only with the Intel 10/100 automatic speed-sensing network interface card.</li> <li>• 10baset – 10-Mbps Ethernet half-duplex.</li> <li>• 10full – 10-Mbps Ethernet full-duplex.</li> <li>• 100basetx – 100-Mbps Ethernet half-duplex.</li> <li>• 100full – 100-Mbps Ethernet full-duplex.</li> <li>• 1000auto – 1000-Mbps Ethernet to auto-negotiate full- or half-duplex.</li> </ul> <p><b>Tip</b> We recommend that you do not use this option to maintain compatibility with switches and other devices in your network.</p> <ul style="list-style-type: none"> <li>• 1000full – Auto-negotiate, advertising 1000-Mbps Ethernet full-duplex.</li> <li>• 1000full nonnegotiate – 1000-Mbps Ethernet full-duplex.</li> <li>• aui – 10-Mbps Ethernet half-duplex communication with an AUI cable interface.</li> <li>• bnc – 10-Mbps Ethernet half-duplex communication with a BNC cable interface.</li> </ul> <p><b>Note</b> We recommend that you specify the speed of the network interfaces in case your network environment includes switches or other devices that do not handle autosensing correctly.</p> |

**Table 46-8 Add/Edit Interface Dialog Box (PIX 6.3) (continued)**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTU              | Specify the maximum packet size in bytes; that is, the maximum transmission unit (MTU). The value depends on the type of network connected to the interface. Valid values are 300 to 65535 bytes. Default is 1500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Physical VLAN ID | For a physical interface, enter the VLAN ID, between 1 and 4094. This VLAN ID must not be in use on connected devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Logical VLAN ID  | Provide the alias, a value between 1 and 4094, for the VLAN associated with this logical interface. This value is required if the logical interface Type is selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Security Level   | Specify the security level of the interface: enter a value between 0 (least secure) and 100 (most secure). The security appliance lets traffic flow freely from an inside network to an outside network (lower security level). Many other security features are affected by the relative security level of two interfaces. <ul style="list-style-type: none"> <li>The <i>outside</i> interface is always 0.</li> <li>The <i>inside</i> interface is always 100.</li> <li>DMZ interfaces are between 1 and 99.</li> </ul>                                                                                                                                                                                                                        |
| Roles            | For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects, page 6-73</a> .<br>All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager.<br>Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces.<br>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects, page 6-73</a> . |

**Device Interface: IP Type (PIX 6.3)**

A PIX 6.3 security device requires IP addressing for its interfaces; however, firewall interfaces do not have IP addresses until you assign them.

The Add/Edit Interface dialog box presented for a PIX 6.3 security device includes the section **IP Type**, where you specify the type of IP addressing for the interface and provide related parameters, as described here. See [Add/Edit Interface Dialog Box \(PIX 6.3\), page 46-31](#) for information about the other sections of the dialog box.

**Note**

The IP Type options presented for other security appliances are described in [Device Interface: IP Type \(PIX/ASA 7.0+\), page 46-62](#).

**Step 1**

In the Add/Edit Interface dialog box, choose a method for address assignment from the **IP Type** list, and then provide related parameters, as follows:

- **Static IP** – Provide a static **IP Address** and **Subnet Mask** that represents the security device on this interface’s connected network. The IP address must be unique for each interface.

The Subnet mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24). Beginning from Version 4.13, Cisco Security Manager allows 255.255.255.254 for a point to point interface. Do not use 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface. If you omit the Subnet Mask value, a “classful” network is assumed, as follows:

- The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (i.e., addresses 1.0.0.0 through 126.255.255.255).
- The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (i.e., addresses 128.0.0.0 through 191.255.255.255).
- The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (i.e., addresses 192.0.0.0 through 223.255.255.255).

---

**Note** Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

---

- **Use DHCP** – Enables Dynamic Host Configuration Protocol (DHCP) for automatic assignment of an IP address from a DHCP server on the connected network. The following options become available:
  - **Obtain Default Route using DHCP** – Check this box to obtain a default route from the DHCP server so that you do not need to configure a default static route.
  - **Retry Count** – The number of times the PIX will resend the DHCP request. Valid values are 4 to 16; the default is 2
- **PPPoE (PIX and ASA 7.2+)** – This option does not apply to PIX 6.3 devices.

---

**Note** You can configure DHCP only on the outside interface of a firewall device.

---

## Add/Edit Interface Dialog Box (PIX 7.0+/ASA/FWSM)

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

---

These Add Interface and Edit Interface dialog boxes are used to define and configure interfaces, subinterfaces, redundant, and EtherChannel interfaces on PIX 7.0+, ASA, and FWSM devices. You can access the Add/Edit Interface dialog boxes from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 46-26](#) for more information.

---

**Note** The ASA 5505, combining switch and security appliance features, is a special case in that you configure both physical switch ports and logical VLAN interfaces. Thus, the Interfaces page displayed for ASA 5505 devices presents two tabbed panels: **Hardware Ports** and **Interfaces**. See [Understanding ASA 5505 Ports and Interfaces, page 46-6](#) for more information.

ASA 8.4.1+ and FWSM 3.1+ devices operating in transparent mode also present two tabbed panels: **Interfaces** and **Bridge Groups**. See [Add/Edit Bridge Group Dialog Box, page 46-68](#) for information about configuring bridge groups.

Many of the parameters presented in these dialog boxes vary according to device type and version, operational mode (routed versus transparent), and whether the device hosts a single or multiple contexts.

**Note**

If you intend to use an interface for failover, you can define that interface in the Add Interface dialog box but do not configure it; instead, use the Failover page (see [Chapter 50, “Configuring Failover”](#)). In particular, do not specify an interface Name, as this parameter disqualifies the interface from being used as the failover link.

**Using the Add Interface and Edit Interface Dialog Boxes**

The following steps outline the general use of these dialog boxes:

1. An interface Type drop-down list appears at the top of the Add Interface and Edit Interface dialog boxes.

**Note**

Catalyst 6500 services modules (ASA-SMs and FWSMs) and the ASA 5505 do not present the Type list.

Depending on device type, operating-system version and operating mode (router or transparent), the Type options presented will be two, three or all of the following:

- **Physical Interface** – Choose this option to configure a physical interface on the device.
  - **Sub-Interface** – Choose this option to configure a logical interface (or VLAN connection) associated with a previously defined physical interface. Refer to [Configuring Subinterfaces \(PIX/ASA\), page 46-7](#) for more information.
  - **Redundant** – Choose this option to configure two physical interfaces as a single logical “redundant interface.” Refer to [Configuring Redundant Interfaces, page 46-8](#) for more information.
  - **EtherChannel** – Choose this option to configure a logical interface consisting of a bundle of up to eight individual Ethernet links; this bundle is known as an EtherChannel, or a port-channel interface. (This option is available only on ASA 8.4+ devices.) Refer to [Configuring EtherChannels, page 46-9](#), for more information.
  - **VNI Interface** – Choose this option to configure a VNI interface. They are virtual interfaces that keep network traffic separated on a given physical interface by using tagging. You apply your security policy directly to each VNI interface. All VNI interfaces are associated with the same VTEP interface. Refer to [Configuring VNI Interfaces, page 46-15](#), for more information.
  - **Tunnel** – Choose this option to configure a logical interface -VTI, to support route based VPN method for the Site-to-Site VPN topologies. Refer to [Configuring Tunnel Interface, page 46-22](#), for more information.
  - **VLAN Interface** – Choose this option to configure a VLAN interface. This interface enables L2 hardware switching support on Cisco FPR-1010 Adaptive Security Appliance. Refer to [Configuring VLAN Interface, page 46-27](#), for more information.
2. Below the Type option, the dialog boxes present up to three tabbed panels. Again, this depends on device type, operating-system version and operating mode.

The PIX 7.0+ Add Interface and Edit Interface dialog boxes present two tabbed panels: General and Advanced. The ASA 7.0+ Add Interface and Edit Interface dialog boxes present three tabbed panels: General, Advanced and IPv6.

- Configure the General options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: General Tab \(PIX 7.0+/ASA/FWSM\)](#), page 46-36.
  - Configure the Advanced-panel options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), page 46-45.
  - Configure the IPv6 options, as appropriate. This panel is described in [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), page 46-51.
  - Configure the Switch Port options, as appropriate. For more information on the options, see [Add/Edit Interface Dialog Box: Switch Port Tab](#), page 46-65.
  - Configure the Power Over Ethernet (POE) options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: Power Over Ethernet Tab](#), page 46-66.
3. When you have finished configuring this interface, click **OK** to close the dialog box and return to the device Interfaces page.

### Add/Edit Interface Dialog Box: General Tab (PIX 7.0+/ASA/FWSM)

The [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34, is used to define and configure interfaces, subinterfaces, VLAN interfaces, and redundant, and EtherChannel interfaces on firewall devices. You can access the Add/Edit Interface dialog box from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26 for more information.

#### Note

In the following descriptions, the term “interface” may be used generically to refer to any of these types of interface.

The General panel of this dialog box is used to configure general interface settings, including Name, Security Level and IP Type parameters. Note that many of the parameters presented in this panel vary according to device type and version, operational mode (routed versus transparent), and whether the device hosts a single or multiple contexts. Thus, some of the options in the following table may not appear for the device you are configuring.

**Table 46-9**      **General tab: Add/Edit Interface Dialog Box**

| <b>Element</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | <p>Enables this interface to pass traffic.</p> <p>By default, all physical interfaces are shut down. Traffic cannot traverse an interface of any type if the interface is not enabled. If you are defining a logical interface such as a subinterface, enable the physical interface it will be associated with before defining the subinterface. If you are defining a redundant interface or an EtherChannel interface, enable the member interfaces before defining the group interface.</p> <p>When you check this option, you must also specify a Name and, in routed mode, an IP Type (or IP Address and Subnet Mask on an FWSM or ASA-SM) before traffic can pass according to your security policy.</p> <p>In multiple-context mode, if you allocate a physical or logical interface to a context, the interface is enabled by default in the context. However, before traffic can pass through the context interface, you must also enable the interface in the system configuration. If you shut down an interface in the system execution space, that interface is shut down in all contexts in which it shared.</p> |
| Management Only  | <p>Reserves this interface for device administration. Only traffic for management of this device is accepted; pass-through traffic for other interfaces and devices is rejected.</p> <p>You cannot set a Primary or Secondary ISP interface to be Management Only.</p> <p>Defining a management-only EtherChannel interface has certain member-interface restrictions. See <a href="#">Configuring EtherChannels, page 46-9</a>, for more information.</p> <p><b>Note</b> This is not available on devices in transparent mode. If an interface is assigned as Management Only, then Route Map cannot be assigned to that interface. In other words, either Management Only or Route Map can be assigned to an interface but not both.</p>                                                                                                                                                                                                                                                                                                                                                                                      |

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | <p>On the ASA 5505, the Hardware Port is specified on the Hardware Ports panel (see <a href="#">Configuring Hardware Ports on an ASA 5505, page 46-66</a>). Also, this option is not part of Catalyst 6500 services module (ASA-SM and FWSM) configuration.</p> <p>For a physical interface, provide the specific hardware port assigned to the interface: enter a physical port ID, which includes network type, slot and port number, in the form: <i>type[slot/]port</i>. This is also the name by which subinterfaces can be associated with the interface.</p> <p>The network type specified for the physical interface can be either Ethernet or GigabitEthernet; on the ASA 5580, TenGigabitEthernet is also available. This field provides automatic pattern matching: if you begin typing with the letter e, “Ethernet” is inserted into the field. Similarly, typing the letter g produces “GigabitEthernet.” Therefore, valid values are:</p> <ul style="list-style-type: none"> <li>• Ethernet0 to Ethernet<i>n</i></li> <li>• GigabitEthernet0 to GigabitEthernet<i>n</i></li> <li>• GigabitEthernets/<i>n</i></li> <li>• TenGigabitEthernets/<i>n</i> (ASA 5580 only)</li> </ul> <p>where <i>s</i> represents a slot number, and <i>n</i> represents a port number, up to the maximum number of network ports in the slot or device.</p> <p>For an ASA 5500 series appliance, enter the type and a slot/port pair; for example, <i>gigabitethernet0/1</i>. Ports that are built into the chassis are assigned to slot 0, while ports on the 4-Port Gigabit Ethernet Security Services Module (4GE SSM) are assigned to slot 1. When you enter a slot/port pair, the Media Type options are enabled.</p> <p>The ASA 5500 series appliances also include a <b>management</b> interface type. The management interface is a Fast Ethernet interface designed for device-management traffic only, and is specified as <i>management0/0</i>. You can, however, use this physical interface for through traffic if desired (be sure the Management Only option is not selected). Thus, in transparent firewall mode, you can use the management interface in addition to the two interfaces allowed for through traffic. You can also add subinterfaces to the management interface to provide management in each security context in multiple-context mode.</p> <p>If you are defining a subinterface, you can simply choose the desired Hardware Port from a list of previously defined ports (you must also supply a VLAN ID). If you do not see a desired interface ID, be sure that Interface is defined and enabled.</p> |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name           | <p>Provide an identifier for this interface of up to 48 characters in length. The name should be a memorable name for the interface that relates to its use. However, if you are using failover, do not name interfaces that you are reserving for failover communications; this includes an EtherChannel intended for failover, as well as its member interfaces. Also, do not name interfaces intended for use as a member of a redundant-interface pair.</p> <p>Certain names are reserved for specific interfaces, in accordance with the interface naming conventions of the security appliance. As such, these reserved names enforce default, reserved security levels, as follows:</p> <ul style="list-style-type: none"> <li>• Inside – Connects to your internal network. Must be the most secure interface.</li> <li>• DMZ – “Demilitarized zone” attached to an intermediate interface. DMZ is also known as a perimeter network. You can name a DMZ interface any name you choose. Typically, DMZ interfaces are prefixed with “DMZ” to identify the interface type.</li> <li>• Outside – Connects to an external network or the Internet. Must be the least secure interface.</li> </ul> <p>Similarly, a subinterface name typically identifies its associated interface, in addition to its own unique identifier. For example, <i>DMZoobmgmt</i> could represent an out-of-band management network attached to the DMZ interface.</p> <p><b>Note</b> Again, <b>do not name the interface if you intend to use it for failover, or as a member of a redundant interface.</b> See <a href="#">Chapter 50, “Configuring Failover”</a> and <a href="#">Configuring Redundant Interfaces, page 46-8</a> for more information.</p> |
| Security Level | <p>Specify the security level of the interface: enter a value between 0 (least secure) and 100 (most secure). The security appliance lets traffic flow freely from an inside network to an outside network (lower security level). Many other security features are affected by the relative security level of two interfaces.</p> <ul style="list-style-type: none"> <li>• The <i>outside</i> interface is always 0.</li> <li>• The <i>inside</i> interface is always 100.</li> <li>• DMZ interfaces are between 1 and 99.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Media Type | <p>When Interface is the chosen Type and you enter a hardware port ID with slot/port numbers in the Hardware Port field, these options are enabled. (These options apply to ASA slot/port interfaces only.)</p> <p>For all ASA 5500 series appliances, except the 5505, ports that are built into the chassis are assigned to slot 0, while ports on the 4GE SSM are assigned to slot 1. By default, all connectors used on an ASA are RJ-45 connectors. However, the ports on the 4GE SSM can include fiber SFP connectors. As part of the interface configuration for one of these fiber-based connections, you must change the Media Type setting from the default (RJ45) to the fiber-connector setting (SFP).</p> <p><b>Note</b> For Cisco Security Manager to recognize 1G SFP interface cards whose PIDs are not specified in the "csm.properties file" and in turn support "speed nonegotiate" CLI, you must include the corresponding 1G SFP interface card's PID in the properties file.</p> <p>Fiber-based interfaces do not support duplexing and have a fixed speed, so the Duplex option is disabled, and the Speed options are limited to auto and nonegotiate.</p> <p>Select the connector type used by this slot-1 interface:</p> <ul style="list-style-type: none"> <li>• <b>RJ45</b> – The port uses RJ-45 (copper) connectors.</li> <li>• <b>SFP</b> – The port uses fiber SFP connectors. Required for 10-Gigabit Ethernet cards.</li> </ul> <p><b>Note</b> Security Manager does not support "nonegotiate" speed option for FPR-4K and 9K series devices because of ASA limitations. However, when in need, users are recommended to use Firepower Device Management (FDM) to avail the "nonegotiate" CLI support.</p> |
| VLAN ID    | <p>When Subinterface is the chosen interface Type, or when you are defining a logical interface on a device operating in transparent mode, on an ASA 5505, or on a Catalyst 6500 services module (ASA-SM or FWSM), provide a VLAN ID for this interface.</p> <p>For PIX/ASA devices running operating system 7.2(2)18 or earlier, valid VLAN IDs are 1 to 1001; with version 7.2(2)19 or later, valid IDs are 1 to 4090. For Catalyst 6500 services modules, valid IDs are 1 to 4096. The specified VLAN ID must not be in use on any connected device.</p> <p>Some VLAN IDs might be reserved on connected switches; see the switch documentation for more information. In multiple-context mode, you can only set the VLAN ID in the system configuration.</p> <p>See <a href="#">Configuring Subinterfaces (PIX/ASA)</a>, page 46-7 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 46-9** General tab: Add/Edit Interface Dialog Box (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subinterface ID | <p>When Subinterface is the chosen interface Type, or when defining an interface on a device operating in transparent mode, provide an integer between 1 and 4294967293 as the Subinterface ID.</p> <p>For subinterface port identification, this ID is appended to the chosen Hardware Port. For example, <i>GigabitEthernet0.4</i> represents the subinterface assigned an ID of 4, operating on the port GigabitEthernet0.</p> <p><b>Note</b> You cannot change the Subinterface ID after you set it.</p> |
| Route Map       | <p>Select the Route Map from the Route Map Object Selector dialog box.</p> <p><b>Note</b> Except VNI Interface, all other interface types support Policy Based Routing for ASA devices running the software version 9.4(1) or later. VNI Interface supports Policy Based Routing for ASA devices running the software version 9.5(1) or later.</p>                                                                                                                                                           |
| IP Type         | <p><b>PIX 7.0+ and ASA (except the 5505 in transparent mode) only.</b></p> <p>The IP Type defines the type of IP addressing used for the interface; choose <b>Static IP</b>, <b>Use DHCP</b>, or <b>PPPoE</b> (as described in <a href="#">Device Interface: IP Type (PIX/ASA 7.0+)</a>, page 46-62).</p> <p><b>Note</b> You can configure DHCP and PPPoE only on the outside interface of a security appliance.</p>                                                                                         |

|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Interface<br>Secondary Interface                                     | <p>When Redundant Interface is the chosen interface Type, choose the primary member of the redundant interface pair from the Primary Interface list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.</p> <p>Similarly, choose the secondary member of the redundant interface pair from the Secondary Interface list of available interfaces.</p> <p><b>Note</b> Member interfaces must be enabled and of the same type (e.g., GigabitEthernet), and cannot have a Name, IP Address, or Security Level assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>These options available on ASA 5505 devices only.</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Block Traffic To                                                             | Restricts this VLAN interface from initiating contact with the VLAN chosen here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Backup Interface                                                             | Choose a VLAN interface as a backup interface, for example, to an ISP. The backup interface does not pass traffic unless the default route through the primary interface fails. To ensure that traffic can pass over the backup interface, be sure to configure default routes on both the primary and backup interfaces so that the backup interface can be used when the primary fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Active MAC Address<br>Standby MAC Address                                    | <p>Use the Active MAC Address field to manually assign a private MAC address to the interface; the Standby MAC Address field can be used to set a standby MAC address for use with device-level failover.</p> <p>Refer to <a href="#">Device Interface: MAC Address, page 46-64</a> for more information about these fields.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>EtherChannel Interface options; available on ASA 8.4.1+ devices only.</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EtherChannel ID                                                              | When EtherChannel is the chosen interface Type, enter an identifier for this EtherChannel (also referred to as a “port-channel”). Valid values are 1 to 48—you can define up to 48 port-channel groups. See <a href="#">Configuring EtherChannels, page 46-9</a> , for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Available Interfaces/Members in Group                                        | <p>When EtherChannel is the chosen interface Type, you can assign interfaces to this EtherChannel group by selecting them in the Available Interfaces list and then clicking the &gt;&gt; button to add them to the members list to the right.</p> <p>You can assign up to 16 interfaces to a channel group. For ASA 9.2(1) and later, each channel group can have up to 16 active interfaces. For switches that support only eight active interfaces and for ASA versions earlier than 9.2(1), only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. Alternatively, you can create a static EtherChannel by setting LACP Mode to On (on the Advanced tab, see <a href="#">Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+), page 46-45</a>), which means all interfaces in the group can pass traffic.</p> <p><b>Note</b> All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the type and speed for the group.</p> <p>See <a href="#">Configuring EtherChannels, page 46-9</a>, for more information.</p> |

## Add/Edit Interface Dialog Box: Cisco Firepower 9000 (General and Advanced tabs)

For the elements supported in Cisco Firepower 9000 devices for the General and Advanced tabs, see the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34. In addition, the following changes are applicable only to Cisco Firepower 9000 devices.

**Table 46-10 Add/Edit Interface Dialog Box Cisco Firepower 9000**

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                       | Choose the type of interface. Redundant Interfaces are not supported in Cisco Firepower 9000 devices.                                                                                                                                                                                                                                                                                                                                                                             |
| Management Only Individual | Applicable only in Cisco Firepower 9000 devices and only if the device is in cluster mode.<br><br><div style="text-align: center;"> <br/> <b>Note</b> </div> You cannot enable both Management Only and Management Only Individual check boxes at the same time. You can configure Cluster pool only when Management Only Individual check box is selected.                                      |
| Name                       | Provide an interface name up to 48 characters in length. The Name should be a memorable name for the interface that relates to its use.<br><br>The Interface name must begin with “Ethernet” and must have the following format:<br>Ethernet[slot]/[port]/sub-port, where, <ul style="list-style-type: none"> <li>• slot is between 1 and 3</li> <li>• port is between 1 and 8</li> <li>• sub-port is between 1 and 4</li> <li>• sub-port is not applicable for slot 1</li> </ul> |

**The following elements are not supported in Cisco Firepower 9000 devices:**

Media Type (General Tab)

Duplex(Advanced Tab)

Speed (Advanced Tab)

Available Interfaces/Members in Group (General Tab)

Load Balancing (Advanced Tab)

LACP Mode (Advanced Tab)

VSS or vPC Switch ID (Advanced Tab)

Active Physical Interfaces (Advanced Tab)

Span EtherChannel across the ASA Cluster (Advanced Tab)

Enable load balancing between switch pairs in VSS or vPC mode (Advanced Tab)

Member Interface Configuration (Advanced Tab)

### Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+)

The [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34, is used to define and configure interfaces, subinterfaces, redundant, and EtherChannel interfaces on ASA and PIX 7.0+ devices. You can access the Add/Edit Interface dialog box from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26 for more information.

The Advanced panel of this dialog box is used to configure basic interface settings, including Duplex, Speed, and maximum transmission unit (MTU) parameters, as described in the following table.

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Roles       | <p>All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager.</p> <p>Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces.</p> <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects, page 6-73</a>.</p> |
| MAC Address | Site specific MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Site ID     | Site ID to specify the site the current unit belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Beginning with Security Manager version 4.9 for ASA devices running the software version 9.5(1) or later, you can use inter-site clustering for Spanned EtherChannels in routed mode. To avoid MAC address flapping, configure a site ID for each cluster member so that a site-specific MAC address for each interface can be shared among a site's units.

**EtherChannel Interface options; available on ASA 8.4.1+ devices only.**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Load Balancing | When EtherChannel is the chosen interface Type (on the General panel), choose a load-balancing method for the channel links. See <a href="#">About EtherChannel Load Balancing, page 46-13</a> , for more information about this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LACP Mode      | <p>Select the desired <b>LACP Mode</b>; the default is Active, which means up to eight interfaces are active, while up to eight are in stand-by mode, as determined by the Minimum and Maximum values under Active Physical Interfaces.</p> <p>If you select On, a static port-channel is created in which all member interfaces are all “on,” meaning you can have up to 16 ports passing traffic, with no stand-by ports. When you select this option, the Mode for all interfaces assigned to this EtherChannel group is switched to On (if the Mode for each is not already On). See <a href="#">Editing LACP Parameters for an Interface Assigned to an EtherChannel, page 46-12</a>, for more information about this mode.</p> |

| Element                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active Physical Interfaces                                          | <p>When EtherChannel is the chosen interface Type (on the General panel), specify the minimum and maximum number of interfaces that can be active for this EtherChannel group:</p> <ul style="list-style-type: none"> <li> <b>Minimum</b> – Specify the minimum number of active interfaces for this group. For ASA 9.2(1)+, you can specify a value from 1 to 16; for earlier versions, enter a value from 1 to 8. </li> </ul> <p>If the active interfaces in the channel group falls below this value, then the port-channel interface goes down, and could trigger a device-level failover.</p> <ul style="list-style-type: none"> <li> <b>Maximum</b> – Specify the maximum number of interfaces that can be active. For ASA 9.2(1)+, you can specify a value from 1 to 16; for earlier versions, enter a value from 1 to 8. </li> </ul> <p>For 16 active interfaces, be sure that your switch supports the feature (for example, the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module). If your switch does not support 16 active interfaces, be sure to set this command to 8 or fewer.</p> <p>Interfaces available to the channel are selected on the General tab of this dialog box (<a href="#">Add/Edit Interface Dialog Box: General Tab (PIX 7.0+/ASA/FWSM)</a>, page 46-36).</p> <p>Specifying 3, 5, 6, or 7 active ports in an EtherChannel bundle provides poor load balancing, because some ports get up to twice the load of others. We recommend specifying 2, 4, or 8 active ports per EtherChannel to achieve effective load balancing. (A value of 1 provides no load balancing at all.)</p> |
| <b>DHCP Relay options; available on ASA-SM 9.1.2+ devices only.</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DHCP Relay Servers                                                  | <p>Enter the IP address or select a Networks/Hosts object representing the interface-specific DHCP server to which DHCP requests on this interface are relayed. Use a comma to separate multiple values. You can configure a maximum of 4 interface-specific DHCP relay servers and a maximum of 10 global and interface-specific DHCP relay servers combined.</p> <p><b>Note</b> IPv6 is not supported for interface-specific servers.</p> <p>When a DHCP request enters an interface, the DHCP servers to which the ASA relays the request depends on your configuration. You can configure the following types of servers:</p> <ul style="list-style-type: none"> <li> <b>Interface-specific DHCP servers</b>—When a DHCP request enters a particular interface, then the ASA relays the request only to the interface-specific servers. </li> <li> <b>Global DHCP servers</b>—When a DHCP request enters an interface that does not have interface-specific servers configured, the ASA relays the request to all global servers. If the interface has interface-specific servers, then the global servers are not used. For more information, see <a href="#">DHCP Relay Page</a>, page 52-5. </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 46-11** Advanced tab: Add/Edit Interface Dialog Box (ASA/PIX 7.0+) (continued)

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Relay Trust Info (Option 82) | <p>Specifies that you want to trust this DHCP client interface. You can configure interfaces as trusted interfaces to preserve DHCP Option 82.</p> <p><b>Note</b> You can also trust all DHCP client interfaces. For more information, see <a href="#">DHCP Relay Page, page 52-5</a>.</p> <p>DHCP Option 82 is used by downstream switches and routers for DHCP snooping and IP Source Guard. Normally, if the ASA DHCP relay agent receives a DHCP packet with Option 82 already set, but the giaddr field (which specifies the DHCP relay agent address that is set by the relay agent before it forwards the packet to the server) is set to 0, then the ASA will drop that packet by default. You can now preserve Option 82 and forward the packet by identifying an interface as a trusted interface.</p> |

**Secure Group Tagging options; available on ASA 9.3.1+ devices only.**

SGT plus Ethernet Tagging, also called Layer 2 SGT Imposition, enables the ASA to send and receive security group tags on Ethernet interfaces using Cisco proprietary Ethernet framing (EtherType 0x8909), which allows the insertion of source security group tags into plain-text Ethernet frames. The ASA inserts security group tags on the outgoing packet and processes security group tags on the incoming packet, based on a manual per-interface configuration. This feature allows inline hop-by-hop propagation of endpoint identity across network devices and provides seamless Layer 2 SGT Imposition between each hop.

**Note** Supported only on physical interfaces, VLAN interfaces, port channel interfaces, and redundant interfaces. Not supported on logical interfaces or virtual interfaces, such as BVI, TVI, and VNI.

Does not support failover links or cluster control links.

|                                                         |                                                                                                                                                          |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable secure group tagging for Cisco TrustSec          | Enables SGT plus Ethernet Tagging (also called Layer 2 SGT Imposition).                                                                                  |
| Tag egress packets with secure group tags               | Enables propagation of a security group tag (called sgt) on an interface.                                                                                |
| Assign a static secure group tag to all ingress packets | Applies a static security group tag to incoming traffic from the peer. If enabled, you must specify the SGT number to use in the Secure Group Tag field. |
| Secure Group Tag                                        | Specifies the SGT number to apply to incoming traffic from the peer. Valid values are from 2-65519.                                                      |
| Trusted Interface                                       | Indicates that ingress traffic on the interface should not have its existing SGT overwritten with the static SGT specified.                              |

**ASA Cluster (Layer 3); available on ASA 5580 and 5585 devices in cluster mode only.**

Supported by all interfaces when ASA cluster is in Router mode and supported by management interface when ASA cluster is in Transparent mode.

|                   |                                                                                       |
|-------------------|---------------------------------------------------------------------------------------|
| IPv4 Address Pool | Enter or select the IPv4 Pool object that represents the pool of addresses to use.    |
| MAC Address Pool  | Enter or select the MAC Pool object that represents the pool of MAC addresses to use. |

| <b>ASA Cluster (Layer 2); available on ASA 5580 and 5585 devices in cluster mode only.</b>                                            |                                                                                                                                                                                                                                                                                                                                                                                           |
| Supported on EtherChannel interfaces for ASA clusters. Not supported on Management interface when ASA cluster is in Transparent mode. |                                                                                                                                                                                                                                                                                                                                                                                           |
| Span EtherChannel across the ASA Cluster                                                                                              | Select to configure an EtherChannel that spans all ASAs in the cluster, and provides load balancing as part of the EtherChannel operation.                                                                                                                                                                                                                                                |
| Enable load balancing between switch pairs in VSS or vPC mode                                                                         | (Optional) If you are connecting the ASA to two switches in a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you should enable load balancing by checking the <b>Enable load balancing between switch pairs in VSS or vPC mode</b> check box. This feature ensures that the physical link connections between the ASAs to the VSS (or vPC) pair are balanced.         |
| Member Interface Configuration                                                                                                        | Identifies the LACP mode for the interface and the Virtual Switching System (VSS) or Virtual Port Channel (vPC) switch to which a given interface is connected, 1 or 2.                                                                                                                                                                                                                   |
| <b>Advanced tab options specific to ASA 5505 devices (routed mode only)</b>                                                           |                                                                                                                                                                                                                                                                                                                                                                                           |
| Block Traffic To                                                                                                                      | Restricts this VLAN interface from initiating contact with the VLAN chosen here.                                                                                                                                                                                                                                                                                                          |
| Backup Interface                                                                                                                      | Choose a VLAN interface as a backup interface, for example, to an ISP. The backup interface does not pass traffic unless the default route through the primary interface fails. To ensure that traffic can pass over the backup interface, be sure to configure default routes on both the primary and backup interfaces so that the backup interface can be used when the primary fails. |
| <b>Advanced tab options specific to FWSM 3.1+ devices</b>                                                                             |                                                                                                                                                                                                                                                                                                                                                                                           |
| Bridge Group                                                                                                                          | For an FWSM 3.1+ operating in transparent mode, this read-only field indicates the Bridge group to which this interface is assigned. See <a href="#">Add/Edit Bridge Group Dialog Box, page 46-68</a> for more information.                                                                                                                                                               |
| ASR Group                                                                                                                             | To add this interface to an asymmetric routing group, enter the ASR group number in this field. Stateful failover must be enabled for asymmetric routing support to function properly between units in failover configurations. Valid values for ASR group range from 1 to 32. See <a href="#">About Asymmetric Routing Groups, page 46-6</a> for more information.                       |

| <b>Pause Frame for Flow Control options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p>When a network interface gets over loaded, flow control allows it to send PAUSE requests to the devices sending it data to allow the over loaded condition to clear. If flow control is not enabled and an over loaded condition occurs, the device will drop packets.</p> <p>When the receiving part of the interface reaches the high water mark, the transmitting part of the interface starts to generate pause frames. The remote device is expected to stop / reduce the transmission of packets for the pause time mentioned in the pause frame. If the receiving part of the interface is able to clear its queue or reaches the low water mark within the pause time, the transmitting part of the interface sends out a special pause frame that mentions the pause time as zero. This enables the remote device to start to transmit packets. If the receiving part of the interface still works on the queue, once the pause time expires, the transmitting part of the interface sends a new pause frame again with a new pause time.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>Note</b> Pause Frame for flow control is supported only on physical interfaces on ASA 8.2 and above, in the single and multi-context mode. It is not supported on logical interfaces or virtual interfaces, such as BVI, TVI, and VNI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Pause Frame                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | (Optional) Enables transmission of pause frame for flow control.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Low Watermark (in Kilobytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Enter a value for the low-water mark. After the interface sends a pause frame, when the buffer usage is reduced below the low-water mark, the interface sends an “transmission on” frame. The remote device can resume transmitting data.                                                                                                                                                                                                                                                                                  |
| High Watermark (in Kilobytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Enter a value for the high-water mark. When the buffer usage exceeds the high-water mark, the interface sends a pause frame.                                                                                                                                                                                                                                                                                                                                                                                               |
| Pause Time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Enter a value for the pause refresh threshold value, between 0 and 65535 slots. Each slot is the amount of time to transmit 64 bytes, so the time per unit depends on your link speed. The remote device can resume traffic after receiving an transmission on frame, or after the transmission off frame expires, as controlled by this timer value in the pause frame. If the buffer usage is consistently above the high-water mark, pause frames are sent repeatedly, controlled by the pause refresh threshold value. |

### Configuring IPv6 Interfaces (ASA/FWSM)

When Interface, Subinterface, Redundant, or EtherChannel is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **IPv6** panel are described in this section.

#### Note

These options are available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

#### Navigation Path

You can access the IPv6 panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA or FWSM Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26.

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on an interface, the source addresses of IPv6 packets received on the interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre data-bbox="688 598 1398 621">%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DAD Attempts        | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre data-bbox="727 835 1442 856">%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval         | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Managed Config Flag | <p>Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other Config Flag | Whether or not to set the flag "other-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable RA         | <p>When checked, IPv6 router advertisement transmissions are enabled on the interface. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>RA Lifetime</b> – The “router lifetime” value specifies how long nodes on the local link should consider the security appliance as the default router on the link. Valid values range from 0 to 9000 seconds; the default is 1800 seconds. Entering 0 indicates that the security appliance should not be considered a default router on the selected interface.</li> </ul> <p>Any non-zero value should not be less than the following RA Interval value.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval</b> – The interval between IPv6 router advertisement transmissions on this interface. Valid values range from 3 to 1800 seconds, (or from 500 to 1800000 milliseconds if the following RA Interval in Milliseconds option is checked); the default is 200 seconds.</li> </ul> <p>The interval between transmissions should be less than or equal to the RA Lifetime value if it is non-zero. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval in Milliseconds</b> – Checking this option indicates that the provided RA Interval value is in milliseconds, rather than seconds.</li> </ul> |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li>• <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field. <p>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</p> </li> <li>• <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address. <ul style="list-style-type: none"> <li>– <b>Trust the DHCP Servers for default gateway</b>– Select this radio button to install a default route from Router Advertisements that come from a trusted source - the directly-connected network.</li> <li>– <b>Ignore trust and accept router advertisements</b> – Select this radio button to install a default route from Router Advertisements that come from another network.</li> </ul> </li> <li>• The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48.</a>) <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box, page 46-56.</a></p> </li> </ul> |
| Interface IPv6 Prefixes  | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48.</a>)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box, page 46-58.</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 DHCP | <p>Use this section to enable the DHCPv6 Prefix Delegation client on one or more interfaces. The ASA obtains one or more IPv6 prefixes that it can subnet and assign to inside networks. Typically, the interface on which you enable the prefix delegation client obtains its IP address using the DHCPv6 address client; only other ASA interfaces use addresses derived from the delegated prefix.</p> <p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Server Pool</b> – Select this to configure the IPv6 DHCP pool that contains the information you want the DHCPv6 server to provide. You can configure separate pools for each interface if you want, or you can use the same pool on multiple interfaces. Use the Add Row and Edit Row buttons in the <b>DHCP Pool Selector</b> dialog to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48.</a>)<br/>Add Row and Edit Row open the <a href="#">Add or Edit DHCPv6 Pool Dialog Box, page 46-60.</a></li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• <b>Client Prefix Delegation Name</b> – Enable the DHCPv6 Prefix Delegation client by entering a name for the prefix(es) obtained on this interface. Valid values are a string not exceeding 200 characters. <ul style="list-style-type: none"> <li>– <b>DHCPv6 Prefix Hint</b> – Use the Add Row button to provide one or more hints about the delegated prefix that you want to receive. Typically you want to request a particular prefix length, such as <code>::/60</code>, or if you have received a particular prefix before and want to ensure you get it again when the lease expires, you can enter the whole prefix as the hint. If you enter multiple hints (different prefixes or lengths), then it is up to the DHCP server which hint to honor, or whether to honor the hint at all.</li> </ul> </li> </ul> <p><b>Note</b> If the prefix suggested as the hint is a valid prefix in the associated local prefix pool and is not assigned elsewhere, the server delegates the client-suggested prefix. Otherwise, the hint is ignored and a prefix is delegated from the free list in the pool.</p> <ul style="list-style-type: none"> <li>– <b>Enable DHCP</b> – Select this to obtain an address using DHCPv6. Optionally, select <b>Enable Default Route</b> to obtain a default route from Router Advertisements.</li> </ul> |
| <b>Note</b>         | If a DHCPv6 client or Server Pool is configured on an IPv6 Interface, the same interface cannot be used to configure DHCPv6 Relay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## IPv6 Address for Interface Dialog Box

This dialog box is used to add or edit an IPv6 address assigned to an ASA or FWSM interface. Multiple IPv6 addresses can be assigned to the interface in the IPv6 panel of the Add Interface or Edit Interface dialog box.

**Note**

This dialog box is available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

**Navigation Path**

You can access the IPv6 Address for Interface dialog box:

- From the IPv6 panel of the ASA or FWSM Add Interface and Edit Interface dialog boxes.
- From the Management IPv6 page of an ASA 5505 in transparent firewall mode (version 8.2 and 8.3 devices only).

Click the Add Row or Edit Row buttons beneath the table in the Interfaces IPv6 Addresses section to open the dialog box.

| Prefix Name | <p>(Optional) Enter a prefix name to use a delegated prefix. Valid values are a string not exceeding 200 characters.</p> <p><b>Tip</b> ‘DHCP’ is a reserved word; Cisco Security Manager will not accept it as Prefix Name.</p> <p><b>Note</b> Make sure that the DHCPv6 Prefix Delegation Client is enabled on this ASA Interface. For more information, see the Interface IPv6 DHCP element in the <a href="#">Table 46-13IPv6 tab: Add/Edit Interface Dialog Box (ASA/FWSM), page 46-51</a>&gt;</p> |

**Table 46-14 IPv6 Address for Interface Dialog Box (continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Prefix Length | <p>Enter an IPv6 network address to be assigned to the interface, with its Prefix Length appended, where the Prefix Length integer indicates how many of the high-order, contiguous bits of the address comprise network portion of the address. A slash (/) must precede the Prefix Length. For example, 3FFE:C00:0:1::/64.</p> <p>Typically, the delegated prefix will be /60 or smaller so you can subnet to multiple /64 networks. /64 is the supported subnet length if you want to support SLAAC for connected clients. You should specify an address that completes the /60 subnet, for example ::1:0:0:0:1.</p> <p>Enter :: before the address in case the prefix is smaller than /60. For example, if the delegated prefix is 2001:DB8:1234:5670::/60, then the global IP address assigned to this interface is 2001:DB8:1234:5671::1/64. The prefix that is advertised in router advertisements is 2001:DB8:1234:5671::/64. In this example, if the prefix is smaller than /60, the remaining bits of the prefix will be 0's as indicated by the leading ::. For example, if the prefix is 2001:DB8:1234::/48, then the IPv6 address will be 2001:DB8:1234::1:0:0:0:1/64.</p> |
| EUI-64                | <p>If this box is checked, the EUI-64 interface ID will be used in the low-order 64 bits of the IPv6 address. If the value specified for the Prefix Length is greater than 64 bits, the prefix bits have precedence over the interface ID. An error occurs if another host is using the specified address.</p> <p>The Modified EUI-64 format interface ID is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64 bit interface ID of 02E0:B6FF:FE01:3B7A.</p>                                                                                                                                                                                                                                                                                       |
| IPv6 Address Pool     | Enter or select the IPv6 Pool object that represents the pool of addresses to use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### IPv6 Prefix Editor Dialog Box

This dialog box is used to add or edit an IPv6 prefix (that is, the network portion of an IPv6 address), providing control over individual parameters, including whether the prefix should be included in IPv6 router advertisements. Multiple prefixes can be configured in the IPv6 panel of the ASA or FWSM Add Interface or Edit Interface dialog box.

#### Note

This dialog box is available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

By default, prefixes configured as addresses on an interface are advertised in router advertisements. If you configure specific prefixes for advertisement, then only those prefixes are advertised. The valid and preferred lifetimes are counted down in real time. Alternately, a date can be set to specify the expiration of a prefix. When the expiration is reached, the prefix is no longer advertised.

### Navigation Path

You can access the IPv6 Prefix Editor dialog box from the IPv6 panel of the Add Interface and Edit Interface dialog boxes: click the Add Row or Edit Row buttons beneath the table in the Interfaces IPv6 Prefixes section in either of those dialog boxes.

**Table 46-15** IPv6 Prefix Editor Dialog Box

| Element               | Description                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Prefix Length | Enter an IPv6 network address, with its Prefix Length appended, where the Prefix Length integer indicates how many of the high-order, contiguous bits of the address represent the network portion of the address. A slash (/) must precede the Prefix Length. For example, 3FFE:C00:0:1::/64.                    |
| Default               | If this box is checked, the settings in this dialog box will apply to all prefixes, rather than a single address. (When checked, the Address/Prefix Length field is disabled.)                                                                                                                                    |
| No Advertisements     | When checked, hosts on the local link cannot use the specified prefix in advertisements.                                                                                                                                                                                                                          |
| Off Link              | When checked, the specified prefix is “off-link”; that is, not locally reachable on the link.<br><br>When on-link (the default), the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. |
| No Auto-Configuration | When checked, hosts on the local link cannot use the specified prefix for IPv6 autoconfiguration.<br><br>When auto-configuration is on (the default), hosts on the local link can use the specified prefix for IPv6 autoconfiguration.                                                                            |

Table 46-15 IPv6 Prefix Editor Dialog Box (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefix Lifetime | <p>You can expand this section of the dialog box to display the following expiration options:</p> <ul style="list-style-type: none"> <li>• <b>Lifetime Duration</b> – Select this option to define prefix expiration as a length of time; the following options are enabled: <ul style="list-style-type: none"> <li>– <b>Valid Lifetime</b> – The amount of time (in seconds) that the specified IPv6 prefix is advertised as being valid. Enter a value from 0 to 4294967295 seconds. The maximum value represents infinity (that is, the lifetime does not expire), which can also be specified by the checking the <b>Infinite</b> box. The default is 2592000 (30 days).</li> <li>– <b>Preferred Lifetime</b> – The amount of time (in seconds) that the specified IPv6 prefix is advertised as being preferred. Enter a value from 0 to 4294967295 seconds. The maximum value represents infinity (that is, the lifetime does not expire), which can also be specified by the checking the <b>Infinite</b> box. The default is 604800 (7 days). The Preferred Lifetime must be less than or equal to the Valid Lifetime.</li> </ul> </li> <li>• <b>Lifetime Expiration Date</b> – Select this option to define prefix expiration as a specific date. Note that acceptable values for this date can range from today's date to one year from today's date. The following options are enabled: <ul style="list-style-type: none"> <li>– <b>Valid</b> – The prefix is advertised as being valid until this date and time are reached. Enter a date in the form <code>Mmm dd yyyy</code> (that is, three-letter month abbreviation, two-digit date, and four-digit year), or click the calendar icon to select a date from a scrolling calendar. Also, enter the time of expiration on the specified date, in the form <code>hh:mm</code>, based on a 24-hour clock.</li> <li>– <b>Preferred</b> – The prefix is advertised as being preferred until this date and time are reached. Enter a date in the form <code>Mmm dd yyyy</code> (that is, three-letter month abbreviation, two-digit date, and four-digit year), or click the calendar icon to select a date from a scrolling calendar. Also, enter the time of expiration on the specified date, in the form <code>hh:mm</code>, based on a 24-hour clock. The Preferred date and time must be earlier than or equal to the Valid date and time.</li> </ul> </li> </ul> |

### Add or Edit DHCPv6 Pool Dialog Box

This dialog box is used to add or edit the DHCPv6 Server Pool. For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature, you can configure the ASA to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the ASA. The ASA only accepts IR packets, and does not assign addresses to the clients.

**Navigation Path**

- Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > DHCPv6 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

OR

- You can access the Add DHCPv6 Pool dialog box from DHCPv6 Pool Selector dialog box: click the Add Row or Edit Row buttons beneath the Available DHCPv6 Pool table. The DHCPv6 Pool Selector dialog box can be accessed from the Server Pool radio button in the Interface IPv6 DHCP section of the IPv6 panel of the Add Interface and Edit Interface dialog box.

| Name        | The DHCPv6 Pool name should not exceed 200 characters. Object names are not case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|             | <ul style="list-style-type: none"> <li>• Configure parameters on one or more tabs, to provide responses to IR messages to clients.</li> <li>• For each of these tabs, specify the following as appropriate: <ul style="list-style-type: none"> <li>– DNS/SIP/ NIS/ NISP/ SNTP Server: Enter a server name. Make sure that the IPv6 addresses are in the correct format. For more information on IPv6 address format, see <a href="http://www.ietf.org/rfc/rfc2373.txt">http://www.ietf.org/rfc/rfc2373.txt</a>.</li> <li>– DNS/ SIP/NIS/NISP Domain Name: Enter a domain name. Domain names must begin and end with a digit/letter, only letters, digits and hyphen are allowed as internal characters, labels are separated by a dot.Each label must be up to 63 characters and the entire host name has a maximum of 255 characters. For more information on domain names format, see <a href="http://www.ietf.org/rfc/rfc1123.txt">http://www.ietf.org/rfc/rfc1123.txt</a>.</li> </ul> </li> </ul> |
| <b>Note</b> | The import command uses one or more parameters that the ASA obtained from the DHCPv6 server on the Prefix Delegation client interface. You can mix and match manually-configured parameters with imported parameters; however, you cannot configure the same parameter manually and in the import command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Server tab  | (Optional) Specify DNS Server Name and Domain Name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SIP tab     | (Optional) Specify SIP Server Name and SIP Domain Name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| NIS tab     | (Optional) Specify NIS Server Name and NIS Domain Name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| NISP tab    | (Optional) Specify NISP Server Name and NISP Domain Name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SNTP tab    | (Optional) Specify SNTP Server Name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Category    | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 46-16 Add DHCPv6 Pool Dialog Box (continued)**

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

**Device Interface: IP Type (PIX/ASA 7.0+)**

A security device operating in single-context, routed mode requires IP addressing for its interfaces; however, firewall interfaces do not have IP addresses until you assign them. Note that in transparent mode, the device acts as an access-control bridge (a “bump in the wire”)—you assign different VLANs to each interface, but IP addressing is not necessary.

The Add/Edit Interface dialog box presented for an independent ASA or PIX 7.0+ device in single-context, routed mode includes the section **IP Type**, where you specify the type of IP addressing for the interface and provide related parameters, as described here. (The IP Type section of the Add/Edit Interface dialog box for PIX 6.3 devices is described in [Device Interface: IP Type \(PIX 6.3\), page 46-33](#).)

In multiple-context mode, interface IP addresses are set in the context configuration.

**Note**

Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

Also, do not specify IP Type information for an interface you intend to use as a redundant interface.

**Step 1**

In the Add/Edit Interface dialog box, choose a method for address assignment (**Static IP, Use DHCP, or PPPoE (PIX and ASA 7.2+)**) from the **IP Type** list, and then provide related parameters, as follows:

- **Static IP** – Provide a static **IP Address** and **Subnet Mask** that represents the security device on this interface’s connected network. The IP address must be unique for each interface.

The Subnet mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24). Beginning from Version 4.13, Cisco Security Manager allows you to use 255.255.255.254 for point to point interface. Do not use 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface. If you omit the Subnet Mask value, a “classful” network is assumed, as follows:

- The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (i.e., addresses 1.0.0.0 through 126.255.255.255).
- The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (i.e., addresses 128.0.0.0 through 191.255.255.255).
- The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (i.e., addresses 192.0.0.0 through 223.255.255.255).

**Note**

Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

- **Use DHCP** – Enables Dynamic Host Configuration Protocol (DHCP) for automatic assignment of an IP address from a DHCP server on the connected network. The following options become available:
  - **DHCP Learned Route Metric** (required) – Assign an administrative distance to the learned route. Valid values are 1 to 255. The administrative distance for learned routes defaults to 1.  
All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.
  - **Obtain Default Route using DHCP** – Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route. See also [Configuring Static Routes, page 56-131](#).
  - **Enable Tracking for DHCP Learned Route** – If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking via a specific Service Level Agreement (SLA) monitor. The following option becomes available:
    - **Tracked SLA Monitor** – Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 51-8](#) for more information.
- **PPPoE (PIX and ASA 7.2+)** – Enables Point-to-Point Protocol over Ethernet (PPPoE) for automatic assignment of an IP address from a PPPoE server on the connected network; this option is not supported with failover. The following options become available:
  - **VPDN Group Name** (required) – Choose the Virtual Private Dialup Network (VPDN) group that contains the authentication method and user name/password to use for network connection, negotiation and authentication. See [Managing VPDN Groups, page 46-78](#) for more information.
  - **IP Address** – If provided, this static IP address is used for connection and authentication, instead of a negotiated address.
  - **Subnet Mask** – The subnet mask to be used in conjunction with the provided IP Address.
  - **PPPoE Learned Route Metric** (required) – Assign an administrative distance to the learned route. Valid values are 1 to 255; defaults to 1.  
All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.
  - **Obtain Default Route using PPPoE** – Select this option to obtain a default route from the PPPoE server; sets the default routes when the PPPoE client has not yet established a connection. When using this option, you cannot have a statically defined route in the configuration.
  - **Enable Tracking for PPPoE Learned Route** – If Obtain Default Route using PPPoE is selected, you can select this option to enable route tracking for PPPoE-learned routes. The following options become available:
    - **Dual ISP Interface** – If you are defining interfaces for dual ISP support, choose Primary or Secondary to indicate which connection you are configuring.
    - **Tracked SLA Monitor** – Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 51-8](#) for more information.

---

**Note** You can configure DHCP and PPPoE only on the outside interface of a firewall device. If you have already configured PPPoE on the outside interface, it is no longer available as an option.

---

- Step 2** Continue configuring the device interface in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34.
- 

## Device Interface: MAC Address

By default, a physical interface uses its “burned-in” MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then its MAC address changes to match the MAC address of the interface that is now listed first. If you manually assign a MAC address to the redundant interface, that is used regardless of the physical-interface MAC addresses.

Similarly, all interfaces assigned to an EtherChannel group share the same MAC address. By default, the EtherChannel uses the MAC address of the lowest-numbered member interface. However, you can manually configure a MAC address for the EtherChannel to prevent traffic disruption should the low-numbered interface be removed from the group.

You also might want to assign unique MAC addresses to subinterfaces. For example, your service provider might control access based on MAC addresses.

Further, if you use failover, you can provide a standby MAC address. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

---

**Note** The following options appear only on the Advanced tab of the Add Interface and Edit Interface dialog boxes presented by PIX 7.2+ and ASA 7.2+ devices.

---

(Optional) To manually assign a private MAC address to the current interface:

- Step 1** In the Add/Edit Interface dialog box, provide the desired MAC address in the **Active MAC Address** field.

MAC addresses are provided in *H.H.H* format, where *H* is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 00C.F142.4CDE.

---

**Note** In some cases, you may have to press the Tab key after entering the Active MAC Address to activate the Standby MAC Address field.

---

- Step 2** If desired, provide a **Standby MAC Address** for use with device-level failover.

If the active unit fails over and the standby unit becomes active, the new active unit begins using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

- Step 3** Continue configuring the device interface in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34.

### Add/Edit Interface Dialog Box: Switch Port Tab

The Switch Port panel in the Add/Edit Interface dialog box is used to configure settings such as Mode, Access VLAN ID, Trunk Type, Enable Protected, and VLAN ID on Firepower 1010 devices.

#### Navigation Path

You can access the Add/Edit Interface dialog box from the Interfaces page. Select the Enable Switchport check box to configure these settings.

#### Field Reference

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Switchport | <p>Check this box to enable switchport on the selected interface. Unchecking this option disables the switchport on the interface but retains the configuration information.</p> <p>When enabling Switch Port option, keep in mind the following points:</p> <ul style="list-style-type: none"> <li>Enabling the Switch Port option clears all the configuration settings from General, Advanced, and IPv6 tabs. When the next edit is made, all the cleared fields will become non-editable except Description and Enable Interface from General Tab.</li> <li>If you enable the Switch Port option and configure Enable Interface and Description at the same time, after deployment, the preview configuration generated will have both Enable Interface and Description. To overcome this, you must either redeploy the configuration or deploy Enable Switch Port configuration first and then configure Enable Interface and Description.</li> </ul> |
| Mode              | Select one of the two modes available: Access or Trunk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Access VLAN ID    | This dialog box gets enabled only when Access mode is selected. Enter a value between 1 and 4070. The VLAN ID configured in the interface is entered here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Trunk Type        | This field is enabled only when Trunk mode is selected. Select from one of the two trunk types available: Allowed or Native.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID           | <p>Enter the VLAN ID(s) for this port, according to the chosen trunk type.</p> <p><b>Note</b> To configure VLAN ID for Switch Port, you must initially create the VLAN or SVI Interface in the Interface page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable Protected  | Select this option to prevent this port from communicating with other switch ports on the same VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Add/Edit Interface Dialog Box: Power Over Ethernet Tab

The Power Over Ethernet (POE) in the Add/Edit Interface dialog box can be used to configure power consumption mode and wattage. Beginning with ASA 9.13(1), this feature is supported on Firepower 1010 devices and is a part of physical interface for ports Ethernet1/7 and Ethernet1/8.

The POE feature allows you to configurations to the physical interface such that the power is delivered automatically to the connected device, in accordance to the class limiting wattage; the power is cut off from the specified port, Ethernet1/7 or Ethernet1/8; and the wattage required for the specified port is preset in milliwatts, without LLDP negotiation.

| Element             | Description                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable POE         | Check this check box to cut off the power to the specified port (Ethernet1/7 or Ethernet1/8).                                                                                                                                                                                                                                                           |
| Consumption Mode    | Select the power consumption mode: <ul style="list-style-type: none"> <li>• <b>Auto</b> (default) – Select this to deliver the power automatically to the connected device as per the class limiting wattage.</li> <li>• <b>Configure</b> – Select this to specify the consumption wattage manually, that is required for the selected port.</li> </ul> |
| Consumption Wattage | Specify the consumption wattage (4000 - 30000 mW) required for the selected port.                                                                                                                                                                                                                                                                       |

## Configuring Hardware Ports on an ASA 5505

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: *Hardware Ports* and *Interfaces*. The table on the Hardware Ports panel displays currently configured switch ports for the selected ASA 5505.

Use the Configure Hardware Ports dialog box to configure the switch ports on an ASA 5505, including setting the mode, assigning a switch port to a VLAN, and setting the Protected option. (The following dialog-box parameter descriptions also describe the fields in the Hardware Ports table.)

### Caution

The ASA 5505 does not support Spanning Tree Protocol for loop detection in the network. Therefore, you must ensure that any connection with the appliance does not end up in a network loop.

### Navigation Path

You can access the Configure Hardware Ports dialog box by clicking Add Row or Edit Row on the Hardware Ports panel of the ASA 5505 Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 46-26 for more information.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | Select this option to enable this switch port. You can deselect this option to disable the port, but retain its configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Isolated         | Select this option to prevent this port from communicating with other isolated or “protected” switch ports on the same VLAN.<br><br>You might want to prevent switch ports from communicating with each other if the devices on those ports are primarily accessed from other VLANs, if you do not need to allow intra-VLAN access, and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three Web servers, you can isolate the Web servers from each other if you apply the Isolated option to each switch port. The inside and outside networks can both communicate with all three Web servers, and vice versa, but the Web servers cannot communicate with each other. |
| Hardware Port    | Choose the switch port that you are configuring; all device ports are listed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Mode             | Choose a mode for this port: <ul style="list-style-type: none"> <li>• <b>Access Port</b> – Sets the port to access mode. Each access port can be assigned to one VLAN.</li> <li>• <b>Trunk Port</b> – Sets the port to trunk mode using 802.1Q tagging. Trunk ports can carry multiple VLANs using 802.1Q tagging.</li> </ul> <p>Trunk mode is available only with the Security Plus license. Trunk ports do not support untagged packets, there is no native VLAN support, and the appliance drops all packets that do not contain a tag.</p>                                                                                                                                                                                                                     |
| VLAN ID          | Enter VLAN ID(s) for this port, according to the chosen Mode: <ul style="list-style-type: none"> <li>• For Access Port mode, enter the ID of the VLAN to which this switch port is to be assigned.</li> <li>• For Trunk Port mode, you can enter multiple VLAN IDs, and multiple ID ranges (such as 4-8), separated by commas.</li> </ul> <p><b>Note</b> For devices running operating system 7.2(2)18 or earlier, valid VLAN IDs are 1 to 1001; with version 7.2(2)19 or later, valid IDs are 1 to 4090.</p>                                                                                                                                                                                                                                                      |
| Duplex           | Choose a duplex option for the port: <b>Full</b> , <b>Half</b> , or <b>Auto</b> . The Auto setting is recommended, and the default.<br><br>If you set Duplex to anything other than Auto for PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed   | <p>Choose a speed for the port: <b>10</b>, <b>100</b>, or <b>Auto</b>. The Auto setting is recommended, and the default.</p> <p>If you set Speed to anything other than Auto for PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.</p> <p>The default Auto setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either Speed or Duplex must be set to Auto to enable Auto-MDI/MDIX for the interface. If you explicitly set both Speed and Duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled.</p> |

## Add/Edit Bridge Group Dialog Box

A transparent firewall connects the same network on its inside and outside interfaces, and supports only the two interfaces per context. However, you can increase the number of interfaces available to a context through use of bridge groups. You can configure up to eight bridge groups; on an FWSM each group can contain two interfaces; on an ASA 9.6.1 each group can contain 64 interfaces.

Each bridge group connects to a separate network. Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the security appliance—traffic must exit the security appliance to be routed by an external router back to another bridge group in the security appliance.

You might want to use more than one bridge group if you do not want the overhead of security contexts, or want to maximize your use of security contexts. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration. For complete security policy separation, use security contexts with one bridge group in each context.

Starting from Cisco Security Manager 4.13, the Bridge-group Virtual Interface (BVI) feature is extended to the routed firewall mode. Routed firewalls are implemented by means of configuring bridge-groups. A user can configure up to eight bridge groups and on an ASA 9.7.1 (Cisco Security Manager 4.13) each group can contain upto 64 interfaces. On versions prior to Cisco Security Manager 4.13, a user can configure a maximum of two bridge groups; with each group containing a maximum limit of four interfaces. In addition to the BVI features supported in the transparent mode, the routed firewall mode includes support for the following additional communication modes:

- Inter BVI communication
- BVI to Data Port communication (Layer 2 to Layer 3) and vice versa

For FWSM 3.1+ and ASA 8.4.1+ devices in transparent mode, the Interfaces page displays two tabbed panels: Interfaces and Bridge Groups. The following information applies to the Bridge Groups panel and the Add/Edit Bridge Group dialog box; refer to [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 46-34 for information about the Interfaces panel.

**Navigation Path**

You can access the Add/Edit Bridge Group dialog box from the Bridge Groups panel of the Interfaces page.

| Bridge Group       | Enter a name for this bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Name               | <p>Provide an identifier for this interface of up to 48 characters in length. The name should be a memorable name for the interface that relates to its use. However, if you are using failover, do not name interfaces that you are reserving for failover communications; this includes an EtherChannel intended for failover, as well as its member interfaces. Also, do not name interfaces intended for use as a member of a redundant-interface pair.</p> <p>Certain names are reserved for specific interfaces, in accordance with the interface naming conventions of the security appliance. As such, these reserved names enforce default, reserved security levels, as follows:</p> <ul style="list-style-type: none"> <li>• Inside – Connects to your internal network. Must be the most secure interface.</li> <li>• DMZ – “Demilitarized zone” attached to an intermediate interface. DMZ is also known as a perimeter network. You can name a DMZ interface any name you choose. Typically, DMZ interfaces are prefixed with “DMZ” to identify the interface type.</li> <li>• Outside – Connects to an external network or the Internet. Must be the least secure interface.</li> </ul> <p>Similarly, a subinterface name typically identifies its associated interface, in addition to its own unique identifier. For example, <i>DMZoobmgmt</i> could represent an out-of-band management network attached to the DMZ interface.</p> <p><b>Note</b> Again, <b>do not name the interface if you intend to use it for failover, or as a member of a redundant interface.</b> See <a href="#">Chapter 50, “Configuring Failover”</a> and <a href="#">Configuring Redundant Interfaces, page 46-8</a> for more information.</p> |
| ID                 | Enter an identifier for this bridge group; can be an integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Security Level     | Assign a security level to the VLAN interface. Valid values are from 0-100; 100 is the most secure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available Interfaces | Choose from a list of available interfaces or VLANs to assign to this bridge group; all available interfaces are listed.<br><b>Note</b> Starting from ASA 9.7.1(Cisco Security Manager 4.13), a maximum of 64 interfaces are supported per bridge group.                                                                                                                                                                                                                                             |
| Members in Group     | Displays the number of interfaces in the current bridge group                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IP Type              | Select the IP type for the interface. <ul style="list-style-type: none"> <li>• <b>Static IP</b> - Assign an IP address and subnet mask for the bridge-group interface.</li> <li>• <b>DHCP</b> - Use DHCP to obtain an IP address for the interface. <ul style="list-style-type: none"> <li>– <b>Obtain Default Route using DHCP</b> - When selected, Cisco Security Manager uses the default route supplied by the DHCP server.</li> </ul> </li> </ul>                                               |
| IP Address           | Enter or Select a management IP address for the bridge group. A transparent firewall does not participate in IP routing. Thus, the only IP configuration required for a bridge group is this management IP address. This address is the source address for traffic originating on the security appliance, such as system messages or communications with AAA servers. You can also use this address for remote management access.<br><b>Note</b> IPv6 addresses are not supported for bridge groups. |
| Netmask              | Network mask for the specified IP address. You can express the value in dotted decimal format (for example, 255.255.255.0) or by entering the number of bits in the network mask (for example, 24).<br><b>Note</b> Do not use 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface.                                                                                                                                                            |
| Description          | You can enter an optional description for this bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>IPv6 Tab</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable IPv6          | Check this box to enable IPv6 and configure IPv6 addresses on this bridge group. You can deselect this option to disable IPv6 on the bridge group, but retain the configuration information.                                                                                                                                                                                                                                                                                                         |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on a bridge group, the source addresses of IPv6 packets received on the bridge group interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre>%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p> |

|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DAD Attempts        | <p>To specify the number of consecutive neighbor solicitation messages that are sent on a bridge group interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre>%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval         | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Managed Config Flag | Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the bridge group interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li>• <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field.<br/><br/>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</li> <li>• <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address. <ul style="list-style-type: none"> <li>– <b>Trust the DHCP Servers for default gateway</b>– Select this radio button to install a default route from Router Advertisements that come from a trusted source - the directly-connected network.</li> <li>– <b>Ignore trust and accept router advertisements</b> – Select this radio button to install a default route from Router Advertisements that come from another network.</li> </ul> </li> <li>• The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48</a>.)<br/><br/>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box, page 46-56</a>.</li> </ul> |
| Interface IPv6 Prefixes  | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48</a>.)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box, page 46-58</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Advanced Interface Settings (PIX/ASA/FWSM)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Advanced configuration options are available for interfaces on FWSMs and ASA/PIX 7.0+ devices operating in single-context mode and for ASA 9.0+ devices operating in single-context mode or multi-context mode.

These are general device-related settings; that is, they are not applied to individual interfaces.

**Note**

The information in this section does not apply to PIX 6.3 devices, nor to security devices in multiple-context mode.

The Advanced Interface Settings dialog box includes the following elements:

- **MAC Address Auto** - Enable this option to automatically assign private MAC addresses to each shared context interface. You can also, optionally, set a user-defined prefix as part of the MAC address. The prefix is a decimal value between 0 and 65535. If you do not enter a prefix, then the ASA generates a default prefix. This prefix is converted to a 4-digit hexadecimal number. The prefix ensures that each ASA uses unique MAC addresses (using different prefix values), so you can have multiple ASAs on a network segment, for example.
- **Traffic between interfaces with same security levels** – This parameter controls communication between interfaces and subinterfaces on the same security level. If you enable same security interface communication, you can still configure interfaces at different security levels as usual. Refer to [Enabling Traffic between Interfaces with the Same Security Level, page 46-76](#) for more information.
- **PPPoE Users button** – Click this button to open the PPPoE Users dialog box, where you can add, edit and delete PPPoE users, as described in [Managing the PPPoE Users List, page 46-77](#). This option is available only for ASA and PIX 7.0+ devices.
- **VPDN Groups (PIX and ASA 7.2+)** – This table lists currently defined VPDN Groups. The buttons below the table are used to add, edit and delete VPDN group entries, as described in [Managing VPDN Groups, page 46-78](#).
- **LACP System Priority (ASA 8.4.1+)** – All systems participating in EtherChannel link aggregation require a Link Aggregation Control Protocol (LACP) System Priority. The value can be 1 to 65535, with the higher number signifying lower priority. The default is 32768.

This value is combined with the system MAC address to form the system's LACP identifier, and thus is applicable only for EtherChannel interfaces. See [Configuring EtherChannels, page 46-9](#), for more information.

**Note**

Additional LACP parameters are available in the Edit Interface dialog box for individual interfaces assigned to an EtherChannel; see [Editing LACP Parameters for an Interface Assigned to an EtherChannel, page 46-12](#), for more information.

**Note**

LACP System Priority is not supported in Cisco Firepower 9000 devices.

- **Static Port Priority (ASA 9.2.1+ Cluster in Spanned mode)** – Disables dynamic port priority in LACP. Some switches do not support dynamic port priority, so this parameter improves switch compatibility. Enabling static port priority enables support of 16 active spanned EtherChannel members. Without this parameter, only 8 active members and 8 standby members are supported. If you enable this parameter, then you cannot use any standby members; all members are active. This parameter is not part of the bootstrap configuration, and is replicated from the control unit to the data units.

---

**Note** If you enable Static Port Priority, 16 nodes can be part of a cluster instead of 8 nodes.

---

- **Director-Localization** – In Geo clustering where, multiple Data Center sites are supported, the inter-cluster round-trip time (RTT) latency is higher than intra-DC. This delay impacts the performance of applications like the VoIP media stream. Beginning with 4.13, the director localization is used to minimize the RTT latency and the delays in performance lookup messages. Enabling this option makes the flow owner and director to be in the same DC site, so that the flow owner lookup is done in local DC site, and the traffic is contended within the same site.

---

**Note** Director-localization is not supported in Cisco Firepower 2100 Series, Firepower 4000 Series, and Firepower 9000 Series devices.

---

- **Enable Site Redundancy**—Beginning with 4.16, you can enable site redundancy to protect flows from a failed site. The site redundancy can be enabled only on the Control unit and will be replicated to the data units in the cluster group. If the connection backup owner is at the same site as the owner, then an additional backup owner will be chosen from another site to protect flows from a failed site. Director localization and site redundancy are separate features; you can configure one or the other, or configure both.

---

**Note** Site redundancy is not supported in Cisco Firepower 2100 Series, Firepower 4000 Series, and Firepower 9000 Series devices.

---

### Navigation Path

You can open the Advanced Interface Settings dialog box by clicking the Advanced button at the bottom of the Interfaces page (for non-5505 ASAs, PIX 7.0+ devices, and FWSMs), or at the bottom of the Interfaces tab on the ASA 5505 Ports and Interfaces page.

## Enabling Traffic between Interfaces with the Same Security Level

The [Advanced Interface Settings \(PIX/ASA/FWSM\), page 46-74](#) dialog box presented for a single-context security device includes the “Traffic between interfaces with the same security level” drop-down list, as described in this section.

By default, interfaces or subinterfaces on the same security level cannot communicate with each other. Allowing communication between same-security interfaces provides the following benefits:

- You can configure more than 101 communicating interfaces.  
If you use different levels for each interface and do not assign any interfaces to the same security level, you can configure only one interface per level (0 to 100).
- You can allow traffic to flow freely between all same-security interfaces without access lists.

---

**Note** If you enable NAT control, you do not need to configure NAT between same-security-level interfaces.

---

- Step 1** In the Advanced Interface Settings dialog box, choose the option that identifies how you want this device to handle **Traffic between interfaces with the same security levels**:
- **Disabled**—Communication between interfaces on the same security level is not allowed.
  - **Inter-interface**—Enables traffic flows between interfaces with the same security level setting. When this option is enabled, you are not required to define translation rules to enable traffic flow between interfaces in the firewall device.
  - **Intra-interface**—Enables traffic flows between subinterfaces with the same security level setting. When this option is enabled, you are not required to define translation rules to enable traffic flow between subinterfaces assigned to an interface.
  - **Both**—Allows both intra- and inter-interface communications among interfaces and subinterfaces with the same security level.
- Step 2** Continue with [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 46-74 configuration, or click OK to close the Advanced Interface Settings dialog box.

## Managing the PPPoE Users List

Point-to-Point Protocol over Ethernet (PPPoE) allows standard PPP communication between a security device and an external ISP, via an Ethernet interface on the device. To establish a communication link, the device must provide authentication credentials and obtain network parameters. This is accomplished using a Virtual Private Dialup Network (VPDN) group, which basically consists of established PPPoE user credentials (i.e., a user name and password) and an authentication protocol. See [Managing VPDN Groups](#), page 46-78 for more information about VPDN groups.

The PPPoE user credentials available for use with VPDN groups are maintained in the PPPoE Users dialog box, which you can access from the [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 46-74 dialog box, and from the Add/Edit VPND Group dialog boxes.

### Adding and Editing PPPoE Users

The PPPoE Users dialog box presents a table of currently defined PPPoE users, along with standard Add Row, Edit Row, and Delete Row buttons. The Add Row button opens the Add PPPoE User dialog box; the Edit Row button opens the virtually identical Edit PPPoE User dialog box.

Enter or edit the following PPPoE user parameters, and then click OK to close the Add (Edit) PPPoE User dialog box and return to the Advanced Interface Settings dialog box.

#### Note

PPPoE user options are not available on Firewall Service Modules (FWSMs).

|----------|------------------------------------------------------------------------------------------|
| Username | The name assigned to this user account; generally provided by the external ISP.          |
| Password | The password assigned to this user account; also generally provided by the external ISP. |

**Table 46-21 Add and Edit PPPoE User Dialog Boxes (continued)**

| Element                                    | Description                                                                                                                                 |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Confirm                                    | Re-enter the password.                                                                                                                      |
| Store Username and Password in Local Flash | If checked, this PPPoE user information will be stored in the device's local flash memory, ensuring it cannot be inadvertently overwritten. |

## Managing VPDN Groups

A Virtual Private Dialup Network (VPDN) group—basically an established PPPoE user and an authentication protocol—is used by a security device to contact an external ISP and authenticate itself, in order to establish a PPPoE communications link and obtain network parameters. (See [Managing the PPPoE Users List, page 46-77](#) for information about establishing PPPoE users.)

Available VPDN groups are maintained in the Advanced Interface Settings dialog box, which opens when you click the Advanced button at the bottom of the Interfaces page, as described in [Advanced Interface Settings \(PIX/ASA/FWSM\), page 46-74](#).

### Adding and Editing VPDN Groups

The Advanced Interface Settings dialog box includes a table of currently defined VPDN groups, and standard Add Row, Edit Row, and Delete Row buttons. The Add Row button opens the Add VPDN Group dialog box; the Edit Row button opens the virtually identical Edit VPDN Group dialog box.

Enter or edit the following VPDN group parameters, and then click OK to close the Add (Edit) VPDN Group dialog box and return to the Advanced Interface Settings dialog box.

#### Note

VPDN group options are not available on Firewall Service Modules (FWSMs).

# VXLAN

Virtual eXtensible LANs (VXLAN) act as Layer 2 virtual networks over Layer 3 physical networks to stretch Layer 2 networks. VXLAN provides the same Ethernet Layer 2 network services as VLAN does, but with greater extensibility and flexibility. Compared to VLAN, VXLAN offers the following benefits:

- Flexible placement of multitenant segments throughout the data center.
- Higher scalability to address more Layer 2 segments—up to 16 million VXLAN segments.

Beginning with version 4.9, Security Manager supports VXLAN for ASA, ASA v, and ASASM devices on version 9.4(1) and later.

**Note**

VxLAN is not supported on IOS, FWSM, ASR, or ISR devices.

To configure VXLAN, follow these steps:

1. [Configuring VXLAN Policy, page 46-79](#)
2. Create a [Configuring VNI Interfaces, page 46-15](#) and associate the configured VXLAN policy to the VNI interface.

## Configuring VXLAN Policy

To configure VXLAN you must first configure VXLAN policy and then create a VNI interface and associate the configured VXLAN policy to the VNI interface. This section describes how to configure VXLAN policy.

### Navigation Path

To access the VXLAN page, go to **Device View**, select an ASA, ASA v, or ASASM device and then click **VxLAN** from **Policies**.

## About Bridging on Firewall Devices

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 device that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. The security appliance connects the same network on its inside and outside ports, acting as an access-control bridge; you assign different VLANs to each interface, and IP addressing is not used.

Thus, you can easily introduce a transparent firewall into an existing network—IP re-addressing is unnecessary—and maintenance is facilitated because there are no complicated routing patterns to troubleshoot and no NAT configuration.

Although the transparent-mode device acts as a bridge, Layer 3 traffic, such as IP traffic, cannot pass through the security appliance unless you explicitly permit it with specific access rules. The only traffic allowed through a firewall without an access list is ARP traffic, which you can control using ARP inspection, and IPv6 neighbor discovery.

When the security appliance runs in transparent mode, the outgoing interface of a packet is determined by performing a MAC address lookup instead of a route lookup. Route statements can still be configured, but they apply only to security appliance-originated traffic. For example, if your syslog server is located on a remote network, you must use a static route so the security appliance can reach that subnet.

Starting from Cisco Security Manager 4.13, the Bridge-group Virtual Interface (BVI) feature is extended to the routed firewall mode. Routed firewalls are implemented by means of configuring bridge-groups. A user can configure up to eight bridge groups and on an ASA 9.7.1 (Cisco Security Manager 4.13) each group can contain up to 64 interfaces. On versions prior to Cisco Security Manager 4.13, a user can configure a maximum of two bridge groups; with each group containing a maximum limit of four interfaces. In addition to the BVI features supported in the transparent mode, the routed firewall mode includes support for the following additional communication modes:

- Inter BVI communication
- BVI to Data Port communication (Layer 2 to Layer 3) and vice versa

To configure a transparent firewall, use the following policies. When configuring an ASA/PIX/FWSM device in multiple-context mode, configure these policies on each transparent security context.

- **Firewall > Access Rules**—Access rules control layer 3 and higher traffic using extended access control lists. In routed mode, some types of traffic cannot pass through the security appliance even if you allow it in an access list. For example, you can establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on access rules. Likewise, protocols like HSRP or VRRP can pass through the security appliance. However, the transparent-mode security appliance does not pass CDP packets.

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can provide those functions. For example, by using access rules, you can allow DHCP traffic to pass (instead of the unsupported DHCP relay feature), or multicast traffic such as that created by IP/TV.

For more information, see [Understanding Access Rules, page 16-1](#) and [Configuring Access Rules, page 16-7](#).

- **Firewall > Transparent Rules**—Transparent rules control non-IP layer 2 traffic using Ethertype access control lists. For example, you can configure rules to allow AppleTalk, IPX, BPDUs, and MPLS to pass through the device. For more information, see [Configuring Transparent Firewall Rules, page 23-1](#).
- **Platform > Bridging > ARP Table, ARP Inspection and IPv6 Neighbor Cache**—Use these policies to control the types of ARP and IPv6 traffic allowed through the bridge. If desired, you can configure static ARP and IPv6 neighbor cache entries and drop any traffic not defined by those static rules. Enable ARP inspection so that if a mismatch between the MAC address, the IP address, or the interface occurs, the security appliance drops the packet. This helps prevent ARP spoofing. For more information, see [ARP Table Page, page 47-3](#) and [ARP Inspection Page, page 47-5](#).

---

**Note** The ARP Table and IPv6 Neighbor Cache are the only bridging policies available for non-transparent ASA/PIX/FWSM devices.

---

- **Platform > Bridging > MAC Address Table and MAC Learning**—Use these policies to configure static MAC-IP address mappings and to enable or disable MAC learning. MAC learning is enabled by default, which allows the appliance to add MAC-IP address mappings as traffic passes through the interface. If you want to prevent all traffic except from static entries, you can disable MAC learning. For more information, see [MAC Address Table Page, page 47-8](#) and [MAC Learning Page, page 47-9](#).
- **Platform > Bridging > Management IP and Platform > Bridging > Management IPv6**—Use these policies to configure a management IP address that Security Manager can use to communicate with the device.

**Note** The Management IP and Management IPv6 pages are not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

If you change the management IP address, you also need to update the device properties for the device or security context. Follow these steps:

- Change the management IP address, save and submit your changes.
- Deploy your changes to the device.
- In Device view, select the device or security context, then select **Tools > Device Properties**. On the General page, enter the new management IP address in the IP Address field. On the Credentials tab, update the username and password fields with account credentials that can log into the management interface. Security Manager will now use this address and user account for subsequent deployments and device communication.

For more information, see [Management IP Page, page 47-10](#).

## Bridging Support for FWSM 3.1

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

Although FWSM 3.1 can support multiple L2 interface pairs, Security Manager lets you specify no more than two L2 interfaces (a single interface pair), and one associated management IP address. That means only one bridge group with two named interfaces associated is provisioned with a management IP address. If the device configuration contains a maximum of one bridge group and two named interfaces, it is valid for discovery. All other scenarios result in an error message and the commands are ignored during discovery. Furthermore, discovery will not show any bridge-group information in Security Manager, although the bridge-group commands will be generated during deployment. Bridge group 1 will be deployed and used in transparent rule policies if no bridge group exists in the device configuration.

## ARP Table Page

Use the ARP Table page to add static ARP entries that map a MAC address to an IP address and identifies the interface through which the host is reached.

**Navigation Path**

- (Device view) Select **Platform > Bridging > ARP Table** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > ARP Table** from the Policy Type selector. Right-click **ARP Table** to create a policy, or select an existing policy from the Shared Policy selector.

|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout (seconds) | <p>The amount of time, between 60 and 4294967 seconds, before the security appliance rebuilds the ARP table. The default is 14400 seconds.</p> <p>Rebuilding the ARP table automatically updates new host information and removes old host information. You might want to reduce the timeout because the host information changes frequently.</p> <p><b>Note</b> The timeout applies to the <i>dynamic</i> ARP table, and not the static entries contained in the ARP table.</p>                                                                                                                                                                                             |
| <b>ARP Table</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Interface         | The interface to which the host is attached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP Address        | The IP address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAC Address       | The MAC address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Alias Enabled     | <p>Indicates whether the security appliance performs proxy ARP for this mapping. If this setting is enabled and the security appliance receives an ARP request for the specified IP address, it responds with the security appliance MAC address. When the security appliance receives traffic destined for the host belonging to the IP address, the security appliance forwards the traffic to the host MAC address that you specify in this command. This feature is useful if you have devices that do not perform ARP, for example.</p> <p><b>Note</b> In transparent firewall mode, this setting is ignored and the security appliance does not perform proxy ARP.</p> |

## Add/Edit ARP Configuration Dialog Box

Use the Add/Edit ARP Configuration dialog box to add a static ARP entry that maps a MAC address to an IP address and identifies the interface through which the host is reached.

### Navigation Path

You can access the Add/Edit ARP Configuration dialog box from the ARP Table page. For more information about the ARP Table page, see [ARP Table Page, page 47-3](#).

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | The name of the interface to which the host network is attached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IP Address   | The IP address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MAC Address  | The MAC address of the host; for example, 00e0.1e4e.3d8b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Alias | When selected, enables proxy ARP for this mapping. If the security appliance receives an ARP request for the specified IP address, it responds with the security appliance MAC address. When the security appliance receives traffic destined for the host belonging to the IP address, the security appliance forwards the traffic to the host MAC address that you specify in this command. This feature is useful if you have devices that do not perform ARP, for example.<br><br><b>Note</b> In transparent firewall mode, this setting is ignored and the security appliance does not perform proxy ARP. |

## ARP Inspection Page

Use the ARP Inspection page to configure ARP inspection for a transparent firewall. ARP inspection is used to prevent ARP spoofing.

### Navigation Path

- (Device view) Select **Platform > Bridging > ARP Inspection** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > ARP Inspection** from the Policy Type selector. Right-click **ARP Inspection** to create a policy, or select an existing policy from the Shared Policy selector.

| Interface                   | The name of the interface to which the ARP inspection setting applies.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ARP Inspection Enabled      | Indicates whether ARP inspection is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Flood Enabled               | Indicates whether packets that do not match any element of a static ARP entry should be flooded out all interfaces except the originating interface. If there is a mismatch between the MAC address, the IP address, or the interface, the security appliance drops the packet. If you do not select this check box, all non-matching packets are dropped.<br><br><b>Note</b> The dedicated management interface, if present, never floods packets even if this parameter is set to flood. |

## Add/Edit ARP Inspection Dialog Box

Use the Add/Edit ARP Inspection dialog box to enable or disable ARP inspection for a transparent firewall interface.

### Navigation Path

You can access the Add/Edit ARP Inspection dialog box from the ARP Inspection page. For more information about the ARP Inspection page, see [ARP Inspection Page, page 47-5](#).

| Enable ARP Inspection on this interface | When selected, enables ARP inspection on the specified interface.                 |

**Table 47-4 Add/Edit ARP Inspection dialog box (continued)**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flood ARP packets | When selected, packets that do not match any element of a static ARP entry are flooded out all interfaces except the originating interface. If there is a mismatch between the MAC address, the IP address, or the interface, the security appliance drops the packet. If you do not select this check box, all non-matching packets are dropped.<br><br><b>Note</b> The dedicated management interface, if present, never floods packets even if this parameter is set to flood. |

## Managing the IPv6 Neighbor Cache

Use the IPv6 Neighbor Cache page to manage static IPv6 neighbor entries that map a MAC address to an IPv6 address, and identify the interface through which the neighbor host is reached, to provide address-resolution functions for IPv6. This is available on ASA 7.0+ devices only.

**Note**

The IPv6 Neighbor Cache entries are the IPv6 equivalent of the static ARP entries, managed on the [ARP Table Page, page 47-3](#).

If an entry for a specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry. Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

The IPv6 Neighbor Cache page is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons. (These are standard buttons, as described in [Using Tables, page 1-48](#).) The Add Row button opens the Add IPv6 Neighbor Cache Configuration dialog box, and Edit Row opens the Edit IPv6 Neighbor Cache Configuration dialog box. Other than the titles, the two dialog boxes are identical.

**Note**

Ensure that IPv6 is enabled on at least one interface before trying to add a neighbor.

**Field Reference****Table 47-5 Add/Edit IPv6 Neighbor Cache Configuration dialog boxes**

| Element     | Description                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface   | Enter or Select the name of the interface on which to add the neighbor.                                                                                                                                                                                                         |
| IP Address  | Enter the IPv6 address that corresponds to the local data-link address. (If an entry for the specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry.) |
| MAC Address | Enter the local data-line (hardware) MAC address of the host; for example, 00e0.1e4e.3d8b.                                                                                                                                                                                      |

# MAC Address Table Page

Use the MAC Address Table page to add static MAC address entries to the MAC Address table. The table associates the MAC address with the source interface so that the security appliance knows to send any packets addressed to the device out the correct interface.

## Navigation Path

- (Device view) Select **Platform > Bridging > MAC Address Table** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > MAC Address Table** from the Policy Type selector. Right-click **MAC Address Table** to create a policy, or select an existing policy from the Shared Policy selector.

**Field Reference****Table 47-7** Add/Edit MAC Table Entry dialog box

| Element     | Description                                           |
|-------------|-------------------------------------------------------|
| Interface   | The interface to which the MAC address is associated. |
| MAC Address | The MAC address; for example, 00e0.1e4e.3d8b.         |

## MAC Learning Page

Use the MAC Learning page to enable or disable MAC address learning on an interface. By default, each interface learns the MAC addresses of entering traffic, and the security appliance adds corresponding entries to the MAC address table. You can disable MAC address learning if desired; however, unless you statically add MAC addresses to the table, no traffic can pass through the security appliance.

**Navigation Path**

- (Device view) Select **Platform > Bridging > MAC Learning** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > MAC Learning** from the Policy Type selector. Right-click **MAC Learning** to create a policy, or select an existing policy from the Shared Policy selector.

**Field Reference**

**Table 47-9**     *Add/Edit MAC Learning dialog box*

| Element              | Description                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------|
| Interface            | The interface to which the MAC learning setting applies.                                        |
| MAC Learning Enabled | When selected, the security appliance learns MAC addresses from traffic entering the interface. |

## Management IP Page

A transparent firewall does not participate in IP routing. The only IP configuration required for the device is specification of a management IP address, which is used as the source address for traffic originating on the device, such as system messages or communications with AAA servers. You can also use this address for remote-management access.

For IPv4 traffic, the management IP address is required to pass any traffic.

**Note**

In addition to the management IP address for the device, you can configure an IP address for the Management 0/0 or 0/1 management-only interface. This IP address can be on a separate subnet from the main management IP address.

Use the Management IP page to set the management IP address for a security device, or for a context in transparent firewall mode.

**Navigation Path**

- (Device view) Select **Platform > Bridging > Management IP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > Management IP** from the Policy Type selector. Right-click **Management IP** to create a policy, or select an existing policy from the Shared Policy selector.

**Field Reference****Table 47-10 Management IP Page**

| Element               | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| Management IP Address | The management IP address.                                     |
| Subnet Mask           | The subnet mask that corresponds to the management IP address. |

## Management IPv6 Page (ASA 5505)

A transparent firewall does not participate in IP routing. The only IP configuration required for the device is specification of a management IP address, which is used as the source address for traffic originating on the device, such as system messages or communications with AAA servers. You can also use this address for remote-management access.

For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations. If you configure the global address, a link-local address is automatically configured on each interface, so you do not also need to specifically configure a link-local address. However, if you do not configure a global management address, you need to configure interface link-local addresses, as described in [Configuring IPv6 Interfaces \(ASA/FWSM\), page 46-51](#). Note that you can configure both IPv6 and IPv4 management addresses on a device.

On an ASA 5505 in transparent mode, use the Management IPv6 page to enable IPv6, configure neighbor solicitation, and manage IPv6 interface addresses.

**Note**

This page is available only on ASA 5505 version 8.2 and 8.3 devices in transparent mode.

**Navigation Path**

- (Device view) Select **Platform > Bridging > Management IPv6** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > Management IPv6** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DAD Attempts             | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre>%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval              | The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Reachable Time           | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Interface IPv6 Addresses | <p>The IPv6 address(es) assigned to the management interface are listed in this table. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-48.</a>)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box, page 46-56.</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

# Configuring Device Administration Policies on Firewall Devices

---

The Device Admin section contains pages for configuring device administration policies for firewall devices.

This chapter contains the following topics:

- [About AAA on Security Devices, page 48-1](#)
- [Configuring Banners, page 48-9](#)
- [Configuring Boot Image/Configuration Settings, page 48-10](#)
- [Configuring CLI Prompt, page 48-12](#)
- [Setting the Device Clock, page 48-14](#)
- [Enabling/Disabling FIPS, page 48-15](#)
- [Enabling Customer Success Network, page 48-16](#)
- [Configuring Umbrella Global Policy, page 48-17](#)
- [Configuring Device Credentials, page 48-17](#)
- [Managing Mount Points, page 48-19](#)
- [IP Client, page 48-21](#)
- [App Agent, page 48-22](#)

## About AAA on Security Devices

Authentication-Authorization-Accounting (AAA) enables the security appliance to determine who a user is (authentication), what the user can do (authorization), and what the user did (accounting). You can use authentication alone, or with authorization and accounting. Authorization always requires a user to be authenticated first. You also can use accounting alone, or with authentication and authorization.

Authentication-Authorization-Accounting provides an extra level of protection and control for user access beyond access lists alone. For example, you can create an ACL that allows all outside users to access Telnet on a server on the DMZ network. If you want to limit user access to the server when you may not always know the IP addresses of these users, you can enable AAA to allow only authenticated and/or authorized users to make it through the security appliance. (The Telnet server enforces authentication, too; the security appliance prevents unauthorized users from attempting to access the server.)

- **Authentication**—Authentication grants access based on user identity. Authentication establishes user identity by requiring valid user credentials, which are typically a user name and password. You can configure the security appliance to authenticate the following items:
  - Administrative connections to the security appliance using Telnet, SSH, HTTPS/ASDM, or serial console.
  - The **enable** command.
- **Authorization**—Authorization controls user capabilities after users are authenticated. Authorization controls the services and commands available to each authenticated user. If you do not enable authorization, authentication alone would provide the same access to services for all authenticated users.
 

If you need the control that authorization provides, you can configure a broad authentication rule, and then have a detailed authorization configuration. For example, you might authenticate inside users who attempt to access any server on the outside network, and then use authorization to limit the outside servers that a particular user can access.

The security appliance caches the first 16 authorization requests per user, so if the user accesses the same services during the current authentication session, the security appliance does not resend the request to the authorization server.
- **Accounting**—Accounting tracks traffic that passes through the security appliance, providing a record of user activity. If you enable authentication for that traffic, you can account for traffic per user. If you do not authenticate the traffic, you can account for traffic per IP address. Accounting information includes when sessions start and stop, user name, the number of bytes that pass through the security appliance for the session, the service used, and the duration of each session.

## Preparing for AAA

AAA services depend upon the use of the Local database or at least one AAA server. You can also use the Local database as a fallback for most services provided by an AAA server. Before you implement AAA, you should configure the Local database and configure AAA server groups and servers.

Configuration of the Local database and AAA servers depends upon the AAA services you want the security appliance to support. Regardless of whether you use AAA servers, you should configure the Local database with user accounts that support administrative access, to prevent accidental lock-outs and, if so desired, to provide a fallback method when AAA servers are unreachable. For more information, see [Configuring User Accounts, page 51-7](#).

The following table provides a summary of AAA service support by each AAA server type and by the Local database. You manage the Local database by configuring user accounts on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts, page 51-7](#)). You establish AAA server groups and add individual AAA servers to the server groups using the **Platform > Device Admin > AAA** page.

**Table 48-1 Summary of AAA Support**

| AAA Service          | Database Type |        |         |     |     |          |      | HTTP Form        |
|----------------------|---------------|--------|---------|-----|-----|----------|------|------------------|
|                      | Local         | RADIUS | TACACS+ | SDI | NT  | Kerberos | LDAP |                  |
| Authentication of... |               |        |         |     |     |          |      |                  |
| VPN users            | Yes           | Yes    | Yes     | Yes | Yes | Yes      | Yes  | Yes <sup>1</sup> |

Table 48-1 Summary of AAA Support (continued)

| AAA Service         | Database Type    |                  |         |     |    |          |      |           |
|---------------------|------------------|------------------|---------|-----|----|----------|------|-----------|
|                     | Local            | RADIUS           | TACACS+ | SDI | NT | Kerberos | LDAP | HTTP Form |
| Firewall sessions   | Yes              | Yes              | Yes     | No  | No | No       | No   | No        |
| Administrators      | Yes              | Yes              | Yes     | No  | No | No       | No   | No        |
| Authorization of... |                  |                  |         |     |    |          |      |           |
| VPN users           | Yes              | Yes              | No      | No  | No | No       | Yes  | No        |
| Firewall sessions   | No               | Yes <sup>2</sup> | Yes     | No  | No | No       | No   | No        |
| Administrators      | Yes <sup>3</sup> | No               | Yes     | No  | No | No       | No   | No        |
| Accounting of...    |                  |                  |         |     |    |          |      |           |
| VPN connections     | No               | Yes              | Yes     | No  | No | No       | No   | No        |
| Firewall sessions   | No               | Yes              | Yes     | No  | No | No       | No   | No        |
| Administrators      | No               | Yes              | Yes     | No  | No | No       | No   | No        |

<sup>1</sup> HTTP Form protocol supports single sign-on authentication for WebVPN users only.

<sup>2</sup> For firewall sessions, RADIUS authorization is supported with user-specific ACLs only, which are received or specified in a RADIUS authentication response.

<sup>3</sup> Local command authorization is supported by privilege level only.

## Local Database

The security appliance maintains a Local database that you can populate with user accounts, which contain, at a minimum, a user name. Typically, you assign a password and a privilege level to each user name, although passwords are optional. You can manage Local user accounts on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts, page 51-7](#)).

If you enable command authorization using the Local database, the security appliance refers to the assigned user privilege level to determine what commands are available. By default, all commands are assigned either privilege level 0 or level 15.

### Note

If you add users to the Local database with access to the CLI and whom you do not want to enter privileged mode, you should enable command authorization. Without command authorization, users can access privileged mode (and all commands) at the CLI using their own password if their privilege level

is 2 or greater (2 is the default). Alternatively, you can use RADIUS or TACACS+ authentication for console access so the user will not be able to use the login command, or you can set all local users to level 1 so you can control who can use the system enable password to access privileged mode.

You cannot use the local database for network access authorization.

The user accounts in the Local database can provide fallback support for console and enable-password authentication, for command authorization, and for VPN authentication and authorization. This behavior is designed to help you prevent accidental lock-out from the security appliance.

For users who need fallback support, we recommend that their user names and passwords in the Local database match their user names and passwords on the AAA servers. This provides transparent fallback support. Because the user cannot determine whether a AAA server or the local database is providing the service, using user names and passwords on AAA servers that are different than the user names and passwords in the Local database means that the user cannot be certain which user name and password should be given.

For multiple-context mode, you can configure user names in the system execution space to provide individual logins at the CLI using the **login** command; however, you cannot configure any **aaa** commands that use the local database in the system execution space.

**Note**

VPN functions are not supported in multiple mode.

## AAA for Device Administration

You can authenticate all administrative connections to the security appliance, including:

- Telnet
- SSH
- Serial console
- ASDM
- VPN management access

You can also authenticate administrators who attempt to enter enable mode. You can authorize administrative commands. You can have accounting data for administrative sessions and for commands issued during a session sent to an accounting server.

You can configure AAA for device administration using the **Platform > Device Admin > AAA** page (see [About AAA on Security Devices, page 48-1](#)).

## AAA for Network Access

You can configure rules for authenticating, authorizing, and accounting for traffic passing through the firewall by using the **Firewall > AAA Rules** page (see [Chapter 15, “Managing Firewall AAA Rules”](#)). The rules you create are similar to access rules, except that they specify whether to authenticate, authorize, or perform accounting for the traffic defined; and which AAA server group the security appliance is to use to process the AAA service request.

## AAA for VPN Access

AAA services for VPN access include the following:

- User account settings for assigning users to VPN groups, configured on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts, page 51-7](#)).
- VPN group policies that can be referenced by many user accounts or tunnel groups, configured on the **Remote Access VPN > RA VPN Policies > User Group Policy** or **Site to Site VPN > User Group Policy** page.
- Tunnel group policies, configured on the **Remote Access VPN > RA VPN Policies > PIX7.0/ASA Tunnel Group Policy** or **Site to Site VPN > PIX7.0/ASA Tunnel Group Policy** page.

## Configuring AAA - Authentication Tab

The AAA page presents three tabbed panels; the **Authentication** panel is presented when you navigate to the AAA page. Use these options to control privileged access to the device console, to restrict access by connection type, and to define access messages.

Use the [Authorization Tab, page 48-7](#) to control the services and commands available to authenticated users.

Use the [Accounting Tab, page 48-8](#) to activate tracking of console traffic, providing a record of user activity.

### Navigation Path

- (Device view) Select **Platform > Device Admin > AAA** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > AAA** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

- [Configuring User Accounts, page 51-7](#)

### Using the Authentication Tab

Use the Authentication tab to enable authentication for administrator access to the security appliance. The Authentication tab also lets you configure the prompts and messages a user sees when authenticated by an AAA server.

The device will prompt for a user name and password before you can enter commands. If the authentication server is offline, wait until the console login request times out. You can then access the console with the firewall username and the enable password.

| Element                                                               | Description                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Require AAA Authentication to allow use of privileged commands</b> |                                                                                                                                                                                                                                                                                                      |
| Enable                                                                | Requires authentication from an AAA server to allow a user to access EXEC mode on the firewall. This option allows up to three attempts to access the firewall console. If this number is exceeded, an “access denied” message is displayed.<br><br>When checked, the Server Group field is enabled. |

**Table 48-2 Authentication Tab (continued)**

| Element                           | Description                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Group                      | Enter or Select the name of an AAA server to contact for user authentication.                                                                    |
| Use LOCAL when server group fails | Check this box to use the LOCAL database as back-up if the selected server fails. (This option is not enabled until you provide a Server Group.) |

**Require AAA Authentication for the following types of connections**

Select the connections that require authentication. For each type, users are allowed up to three attempts to access the firewall console. If this number is exceeded, an “access denied” message is displayed.

Select each connection option individually:

- **HTTP** – Require AAA authentication when a user initiates an HTTPS connection to the firewall console.
- **Serial** – Require AAA authentication when a user initiates a connection to the firewall console via the serial console cable.
- **SSH** – Require AAA authentication when a user initiates a Secure Shell (SSH) connection to the console.
- **Telnet** – Require AAA authentication when a user initiates a Telnet connection to the firewall console.

For each selected connection, provide a Server Group and indicate whether the LOCAL database is used as a back-up:

- **Server Group** – Enter or Select the name of an AAA server to contact for user authentication.
- **Use LOCAL when server group fails** – Check this box to use the LOCAL database as back-up if the selected server fails. (This option is not enabled until you provide a Server Group.)

**Authentication Prompts**

|                                              |                                                                                                                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Login Prompt                                 | Enter the prompt a user will see when logging in to the security appliance.                                                                                                                                               |
| Accepted Message                             | Enter the message displayed when successfully authenticated.                                                                                                                                                              |
| Rejected Message                             | Enter the message displayed when authentication fails for any reason.                                                                                                                                                     |
| Rejected Message for Invalid Credentials     | Enter the message displayed when authentication fails following entry of unknown or invalid credentials.<br><br>Available only on FWSM 3.2+ devices.                                                                      |
| Rejected Message for Expired Password        | Enter the message displayed when authentication fails following entry of an expired password.<br><br>Available only on FWSM 3.2+ devices.                                                                                 |
| Maximum Local Authentication Failed Attempts | Specify the number of times the device will try to authenticate a user in the LOCAL database before that account is locked; valid values are 1 through 16.<br><br>Available only on ASA/PIX 7.01+ and FWSM 3.11+ devices. |

**Table 48-2 Authentication Tab (continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Login History       | <p>Check this to enable the login history reporting feature. When enabled, information about all the administrative login attempts is collected and displayed on the ASA, immediately after a successful login. This includes the following information:</p> <ul style="list-style-type: none"> <li>• Date and time of the last login</li> <li>• Location of last login (terminal or IP address)</li> <li>• Number of unsuccessful login attempts since the last successful login.</li> <li>• Number of successful login attempts occurring during an organization-defined time period.</li> </ul> <p><b>Note</b> This feature is enabled by default.</p> |
| Duration (Optional) | <p>Enter the number of days for which login events will be saved. When no value is specified here, the login history is unbounded.</p> <p><b>Note</b> The default value is 90 days.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Authorization Tab

The Authorization tab allows you to configure authorization for accessing firewall commands.

### Navigation Path

You can access the Authorization tab from the AAA page; see [Configuring AAA - Authentication Tab, page 48-5](#).

### Field Reference

**Table 48-3 Authorization Tab**

| Element                                 | Description                                                     |
|-----------------------------------------|-----------------------------------------------------------------|
| Enable Authorization for Command Access | Requires authorization for accessing firewall commands.         |
| Server Group                            | Specify the server group to use for authorization.              |
| Use LOCAL when server group fails       | Uses the LOCAL server group if the selected server group fails. |

**Table 48-3 Authorization Tab (continued)**

| Element                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Authorization for exec shell access<br>(ASA 8.0(2)+ only)                                                    | When selected, enables management authorization.<br>After enabling management authorization, specify whether to use the remote server or the local database for authorization: <ul style="list-style-type: none"> <li>• <b>Local Server</b>—the local user database is the source for the username entered and the Service-Type and Privilege-Level attributes assigned.</li> <li>• <b>Remote Server</b>—the same server is used for both authentication and authorization.</li> </ul>                                                                                                                                                                                                       |
| Auto Enable Authorization for exec shell access<br>(ASA 9.1(5)+ only)                                               | Allows users with sufficient privileges from the login authentication server to be placed directly in privileged EXEC mode. Otherwise, users are placed in user EXEC mode. These privileges are determined by the Service-Type and Privilege-Level attributes that are required to enter each EXEC mode. To enter privileged EXEC mode, users must have a Service-Type attribute of Administrative and a Privilege Level attribute of greater than 1 assigned to them.<br><br>This option is not supported in the system context. However, if you configure Telnet or serial authentication in the admin context, then authentication also applies to sessions from the switch to the ASASM. |
| Enable Authorization for HTTP Connection<br>Server Group<br>Use LOCAL when server group fails<br>(ASA 9.4(1)+ only) | When selected, authorization via HTTP is enabled. Authorization of username is disabled by default.<br><br>Select the server group to use for authorization.<br><br>Uses the LOCAL server group if the selected server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Accounting Tab

Use the Accounting tab to enable accounting for access to the firewall device and for access to commands on the device.

### Navigation Path

You can access the Accounting tab from the AAA page; see [Configuring AAA - Authentication Tab, page 48-5](#).

| Server Group                                                         | Specify the server or group of RADIUS or TACACS+ servers to which accounting records are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Require Accounting for command access</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable                                                               | When selected, enables the generation of accounting records for commands entered by an administrator/user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Server Group                                                         | Provides a drop-down menu from which you can choose the server or group of RADIUS or TACACS+ servers to which accounting records are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Privilege Level                                                      | Minimum privilege level that must be associated with a command for an accounting record to be generated. The default privilege level is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring Banners

You can use the Banner page to specify Session (exec), Login, and Message-of-the-Day (motd) banners for a security appliance or shared policy.

**Note**

If you use the token `$(hostname)` or `$(domain)` in a banner, it is replaced with the host name or domain name of the security appliance. When you enter the `$(system)` token in a context configuration, the context uses the banner configured in the system configuration.

Spaces in banner text are preserved; however, tabs cannot be entered. Multiple lines in a banner are created by entering a separate line of text for each line you wish to add. Each line is then appended to the end of the existing banner. If the line is empty, a carriage return (CR) is added to the banner.

There is no limit on the length of a banner other than RAM and flash-memory limits. You can only use ASCII characters, including new-line (press the Enter key), which counts as two characters. When accessing the security appliance through Telnet or SSH, the session closes if there is not enough system memory available to process the banner messages, or if a TCP write error occurs when attempting to display the banner messages.

**Related Topics**

- [Chapter 52, “Configuring Server Access Settings on Firewall Devices”](#)

- 
- Step 1** To configure banners, access the Banner page:
- (Device view) Select **Platform > Device Admin > Banner** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Banner** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.
- Step 2** In the **Session (exec) Banner** field, enter the text you want the system to display as a banner before displaying the enable prompt.
- Step 3** In the **Login Banner** field, enter the text you want the system to display as a banner before the password login prompt when accessing the security appliance using Telnet.
- Step 4** In the **Message-of-the-Day (motd) Banner** field, enter the text you want the system to display as a message-of-the-day banner.
- Step 5** To replace a banner, change the contents of the appropriate box.
- Step 6** To remove a banner, clear the contents of the appropriate box.
- 

## Configuring Boot Image/Configuration Settings

Use the Boot Image/Configuration page to specify which configuration file the security appliance will use at start-up. You can also specify the path to an Adaptive Security Device Manager (ASDM) configuration file.

If you do not specify a boot-image location, the first valid image on internal flash memory will be chosen to launch the system.

**Note**

This page is available only on ASA and PIX 7.0+ devices

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Boot Image/Configuration** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Boot Image/Configuration** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Boot Config Location | <p>Enter the path to and name of the configuration file to be used when the system is loaded. On an ASA, you can use any of the following syntactical constructs:</p> <ul style="list-style-type: none"> <li>• <b>disk0:/[path/]filename</b><br/>The value “disk0” represents the internal flash card. You can also use “flash” instead of “disk0,” as they are aliased: <ul style="list-style-type: none"> <li>– <b>flash:/[path/]filename</b></li> </ul> </li> <li>• <b>disk1:/[path/]filename</b><br/>The value “disk1” represents the external flash card.</li> </ul> <p>On a PIX device, you can use only the “flash” syntax; that is:</p> <ul style="list-style-type: none"> <li>• <b>flash:/[path/]filename</b></li> </ul>                                                                                                                                                                    |
| ASDM Image Location  | <p>The location and name of the ASDM software image to be used when ASDM sessions are initiated. (You can use ASDM to monitor both ASA and PIX devices.)</p> <p>On a PIX device, as with the Boot Config Location, you are restricted to only the “flash” syntax.</p> <p>On an ASA, as with the Boot Config Location, you can use the “disk0,” “flash,” or “disk1” constructs. In addition, you can specify an image file on a TFTP server, as follows</p> <ul style="list-style-type: none"> <li>• <b>tftp://[user[:password]@]server[:port]/[path/]filename</b></li> </ul>                                                                                                                                                                                                                                                                                                                         |
| Boot Images Table    | <p>This table lists any alternate configuration files you have defined; you can specify up to four. The first available image in this list is used if you did not specify a primary file in the Boot Config Location field, or if that file is unavailable.</p> <p>This is a standard Security Manager table; use the up-arrow, down-arrow, Add Row, Edit Row, and Delete Row buttons below the table to manage these entries, as described in <a href="#">Using Tables, page 1-48</a>.</p> <p>The Add Row and Edit Row open the <a href="#">Images Dialog Box, page 48-12</a>, used to add and edit the paths to alternate configuration files.</p> <p><b>Note</b> On an ASA, the first (and only the first) entry in this table can refer to an ASDM configuration file on a TFTP server. If the device cannot reach the TFTP server, it will attempt to load the next image file in the list.</p> |

## Images Dialog Box

Use the Images dialog box to add or edit a configuration file entry in the Boot Images table on the Boot Image/Configuration page.

### Navigation Path

You can access the Images dialog box from the Boot Image/Configuration page. For more information, see [Configuring Boot Image/Configuration Settings, page 48-10](#).

### Field Reference

The Images dialog box contains one field, used to define the path to a boot image or configuration file, as follows:

**Table 48-6 Images Dialog Box**

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Image File | <p>Enter the path to and name of the configuration file to add to the ordered Boot Images list.</p> <p>On a PIX device, you can use only the “flash” syntax; that is:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b>/<i>[path]/filename</i></li> </ul> <p>On an ASA, you can use any of the following syntactical constructs:</p> <ul style="list-style-type: none"> <li>• <b>disk0:</b>/<i>[path]/filename</i></li> </ul> <p>The value “disk0” represents the internal flash card. You can also use “flash” instead of “disk0,” as they are aliased:</p> <ul style="list-style-type: none"> <li>– <b>flash:</b>/<i>[path]/filename</i></li> <li>• <b>disk1:</b>/<i>[path]/filename</i></li> </ul> <p>The value “disk1” represents the external flash card.</p> <p>In addition, on an ASA, you can specify an ASDM image file on a TFTP server, as follows</p> <ul style="list-style-type: none"> <li>• <b>tftp:</b>//<i>[user[:password]@]server[:port]/[path]/filename</i></li> </ul> <p>Note that you can specify only one TFTP location, and it must be listed first in the Boot Images table on the Boot Image/Configuration page.</p> |

## Configuring CLI Prompt

You can use the CLI Prompt page to customize the prompt used by ASA 7.2(1)+ devices during CLI sessions. By default, the prompt shows the hostname of the ASA. In multiple context mode, the prompt also displays the context name. You can display the following items in the CLI prompt:

**Note**

The attributes that are available differ by ASA version:

|                                          |                                                                                |
|------------------------------------------|--------------------------------------------------------------------------------|
| <b>cluster-unit</b><br>(ASA 9.1.1+ only) | Displays the cluster unit name. Each unit in a cluster can have a unique name. |
|------------------------------------------|--------------------------------------------------------------------------------|

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>context</b>                              | (Multiple mode only) Displays the name of the current context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>domain</b>                               | Displays the domain name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>hostname</b>                             | Displays the hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>management-mode</b><br>(ASA 9.2.1+ only) | Displays the management mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>priority</b>                             | Displays the failover priority as pri (primary) or sec (secondary).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>state</b>                                | <p>Displays the traffic-passing state or role of the unit.</p> <p>For failover, the following values appear for the state:</p> <ul style="list-style-type: none"> <li>act—Failover is enabled, and the unit is actively passing traffic.</li> <li>stby— Failover is enabled, and the unit is not passing traffic and is in a standby, failed, or another inactive state.</li> <li>actNoFailover—Failover is not enabled, and the unit is actively passing traffic.</li> <li>stbyNoFailover—Failover is not enabled, and the unit is not passing traffic. This condition might occur when there is an interface failure above the threshold on the standby unit.</li> </ul> <p>For clustering, the following values are displayed for state:</p> <ul style="list-style-type: none"> <li>master</li> <li>slave</li> </ul> <p>For example, in the prompt ciscoasa/cl2/slave, the hostname is ciscoasa, the unit name is cl2, and the state is slave.</p> |

**Step 1** Access the CLI Prompt page by doing one of the following:

- (Device view) Select **Platform > Device Admin > CLI Prompt** from the Device Policy selector.

**Note** For devices in multiple context mode, the CLI Prompt page is only available in the system context. In the admin context, the CLI Prompt page is not available.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > CLI Prompt** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.

**Step 2** Customize the CLI prompt by doing the following:

- To add an attribute to the prompt, select the attribute in the Available Members list and then click >>. The attribute is moved from the Available Members list to the Selected Members list.

You can add multiple attributes to the prompt. The order in which the attributes are added to the Selected Members list will dictate the order in which they are shown in the CLI prompt.

**Note** For ASA 9.1.1+, you can configure up to six attributes for the CLI prompt. For earlier ASA versions, you can only configure up to five attributes.

- To remove an attribute from the prompt, select the attribute in the Selected Members list and then click <<. The attribute is moved from the Selected Members list to the Available Members list.

## Setting the Device Clock

Use the Clock page to set the date and time on the selected device.

### Note

This page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

To dynamically set the time using an NTP server, see [NTP Page, page 52-21](#); time derived from an NTP server overrides any time set manually on the Clock page.

### Note

In multiple-context mode, set the time in the system context only.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Clock** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Clock** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Date                                                                                                                                               | Enter the date on which daylight savings time begins or ends, in MMM DD YYYY format (for example, Jul 15 2011). You also can click the calendar icon to select the date from a pop-up calendar.                                                                                                                                   |
| Hour                                                                                                                                               | Choose the hour, from 00 to 23, in which daylight savings time begins or ends.                                                                                                                                                                                                                                                    |
| Minute                                                                                                                                             | Choose the minute, from 00 to 59, at which daylight savings time begins or ends.                                                                                                                                                                                                                                                  |
| <b>Set by Day</b>                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                   |
| Specify Recurring Time                                                                                                                             | Check this box to enable the Start and End parameters, which are used to set a recurring start and end for daylight savings time that you do not need to alter yearly.                                                                                                                                                            |
| The following five parameters appear in a Start section and an End section. Use the two sets to define when daylight savings time starts and ends. |                                                                                                                                                                                                                                                                                                                                   |
| Month                                                                                                                                              | Choose the month in which daylight savings time begins or ends.                                                                                                                                                                                                                                                                   |
| Week                                                                                                                                               | Choose the week of the month in which daylight savings time begins or ends. You can select a numerical value that corresponds to the week—1 through 4—or you can specify the first or last week in the month by choosing <b>first</b> or <b>last</b> . For example, if the day might fall in the partial fifth week, choose last. |
| Weekday                                                                                                                                            | Choose the day of the week on which daylight savings time begins or ends.                                                                                                                                                                                                                                                         |
| Hour                                                                                                                                               | Choose the hour, from 0 to 23, in which daylight savings time begins or ends.                                                                                                                                                                                                                                                     |
| Minute                                                                                                                                             | Choose the minute, from 00 to 59, at which daylight savings time begins or ends.                                                                                                                                                                                                                                                  |

## Enabling/Disabling FIPS

Beginning with 4.15, Cisco Security Manager provides an option to enable or disable the Federal Information Processing Standards (FIPS) mode on the ASA devices. When you enable FIPS mode with FOM, instead of legacy methods implemented in Cisco SSL versions, the FIPS 140-2 standard compliant cryptographic methods implemented in the FOM is used for signature and verification purposes. This feature is supported only on ASA 9.8.2 or later devices.

### Note

To configure FIPS mode on a device, you must reboot the device manually.

Before you enable FIPS, ensure the following are configured on ASA:

1. DH group is set to 14 or ECDH group is set to 19, 20, or 21.
2. The Device Identity Certificate key type is set to RSA and the key size is 2048 or above.

### Navigation Path

- (Device view) Select **Platform > Device Admin > FIPS** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FIPS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 48-8** *FIPS Page*

| Element | Description                                                                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIPS    | Select the check box to enable FIPS on the device. This option is available only for ASA 9.8.2 or above.<br><br><b>Note</b> You must reboot the device after enabling or disabling FIPS for the configuration to take effect. |

## Enabling Customer Success Network

Beginning with version 4.20, Cisco Security Manager provides an option to enable Customer Success Network, which helps avail the features enabled on FPR-4000 and FPR-9000 series for ASA 9.13.1 devices and leverage the same mechanism of Smart Call Home (SCH). Because the data SCH collects are mostly outdated and the features added since the release of SCH do not report the exact status, Customer Success Network is being introduced. This feature is supported only on FPR-4000 and FPR-9000 series for ASA 9.13.1 and later devices.

### Note

A feature must be considered “enabled” only when it is configured and ready to use. If a feature is configured but does not work, it must not be considered “enabled”.

### Note

You must configure Smart License in the device to enable the Customer Success Network.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Customer Success Network** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Customer Success Network Policy** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 48-9** *Customer Success Network Page*

| Element                  | Description                                                                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customer Success Network | Select the <b>Enable Customer Success Network</b> check box to enable it on the device. This option is available only on FPR-4000 and FPR-9000 series for ASA 9.13.1 and later devices. |

# Configuring Umbrella Global Policy

Beginning with version 4.18, Cisco Security Manager supports configuring Umbrella global policy. Cisco Umbrella Branch is a cloud based security service, which first inspects the DNS traffic, and then examines suspicious HTTP(S) traffic. The Umbrella connector intercepts DNS packets and redirects the interesting DNS queries to the Umbrella resolver for resolution. Once the DNS response is received, it forwards the response to the host. This feature is supported only on ASA 9.10.1 or later devices.

After configuring Umbrella service, ensure that the Umbrella DNS policy-map is also configured.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Umbrella** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Umbrella** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

**Table 48-10** Umbrella Page

| Element                  | Description                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Umbrella                 | Select the check box to apply the global Umbrella configuration for the selected device (ASA 9.10.1 or later).                                                                                                    |
| Token                    | The token value of the ASA device on registering with the Umbrella server. Cisco Security Manager throws an error message if this value is less than 64 characters.                                               |
| Public Key               | The public key value of the ASA device on registering with the Umbrella server. This value must be 64 hexa-decimal digits and less than 80 characters, else Cisco Security Manager will display an error message. |
| EDNS Flow Timeout        | The configured EDNS timeout value. The Umbrella time-out for edns-flow must be between <0:0:0> and <1193:0:0>, else Cisco Security Manager will display error message.                                            |
| IPv4 Resolver            | The IPv4 address of the non-default Cisco Umbrella DNS servers that you want to use to resolve DNS requests. Ensure a valid IPv4, else Cisco Security Manager will display an error message.                      |
| IPv6 Resolver            | The IPv6 address of the non-default Cisco Umbrella DNS servers that you want to use to resolve DNS requests. Ensure a valid IPv6, else Cisco Security Manager will display an error message.                      |
| Regular Expression Class | Use regular expression class to match the local domain bypass for which Umbrella should be bypassed.                                                                                                              |
| Regular Expression       | Use regular expression to match the local domain bypass for which Umbrella should be bypassed.                                                                                                                    |

# Configuring Device Credentials

Use the Credentials page to specify the user credentials Security Manager will use when contacting this device. You can also change the Enable password and the Telnet/SSH password on the device.

This user name-password combination lets you log into the device (in EXEC mode) if you connect to the security appliance using an HTTP, HTTPS, Telnet, or SSH session. You also can specify a separate password specifically for Telnet and SSH sessions. (Further, you can define separate credentials for HTTP/HTTPS connections on the [Device Credentials Page, page 3-46](#) in the Device Properties window.)

The Enable password lets you access privileged EXEC mode after you log in.

**Tip**

The Username, Password, and Enable Password on this page are linked to the Credentials settings in the Device Properties window. When you update these parameters and then deploy the changes to the device, Security Manager uses the existing credentials defined in the Device Properties to log into the device and deploy changes. After successful deployment, the Device Properties credentials are updated to match these settings. For more information about Credentials in Device Properties, see [Device Credentials Page, page 3-46](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Credentials** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Credentials** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Warning**

**Since several user accounts may exist on each device, applying a shared Credentials policy to multiple devices will update only the Enable Password on each device; the Username and Password provided in the shared policy are not applied (nor is the Telnet/SSH password). The Enable Password is sufficient for subsequent access to PIX/ASA/FWSM devices, unless external authentication such as AAA or TACACS+ is configured, in which case the Enable Password alone is not sufficient. In this situation, you must manually update the Username, Password and Enable Password on each device that uses external authentication.**

| Element             | Description                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username            | Enter a user name for logging into the device. The name must be at least four characters; the maximum is 64 characters. Entries are case-sensitive.                                                                                                                                                                                    |
| Password<br>Confirm | Provide a password for logging into the device (EXEC mode) with the specified Username. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.<br><br>Re-enter the user password in the Confirm field.<br><br><b>Note</b> We recommend a password length of at least 8 characters. |
| Privilege Level     | Choose a privilege level for this user; available values are 1 through 15. Level 1 allows EXEC-mode access only, the default level for log-in; level 15 allows Privileged EXEC-mode access; that is, access to the Enable mode. Other levels must be explicitly defined on the device.                                                 |
| Enable password     |                                                                                                                                                                                                                                                                                                                                        |

Table 48-11 Credentials Page (continued)

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password as encrypted          | Select Plain Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Password encrypt type          | Select MD5 or PBKDF2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable Password<br>Confirm     | <p>You can specify an Enable password that lets this user access Privileged EXEC mode after logging in. Entries are case-sensitive.</p> <p>Re-enter the Enable password in the Confirm field.</p> <p><b>Note</b> For Plain Text passwords:</p> <ul style="list-style-type: none"> <li>– The length of MD5 password should be three to 32 characters.</li> <li>– The length of PBKDF2 password should be 33 to 127 characters.</li> </ul> <p><b>Note</b> If you configure user authentication for Enable access, each user has their own password and this password is not used. See <a href="#">Configuring AAA - Authentication Tab, page 48-5</a> for more information.</p> |
| Telnet/SSH Password<br>Confirm | <p>You can specify a password that provides access to EXEC mode when connecting to the device via a Telnet or SSH session. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.</p> <p>Re-enter the Telnet/SSH password in the Confirm field.</p> <p><b>Note</b> If you configure user authentication for Telnet or SSH access, each user has their own password and this password is not used. ## Managing Mount Points

Use the Mount Points page to make a Common Internet File System (CIFS) or a File Transfer Protocol (FTP) file system accessible to the security appliance.

**Note**

When you create an FTP-type mount point, the FTP server must have a UNIX directory listing style. Microsoft FTP servers have the MS-DOS directory listing style as their default.

The File Mount Point Configuration table lists the configured mount points. The File Mount Point Configuration table is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons. (These are standard buttons, as described in [Using Tables, page 1-48](#).) The Add Row button opens the Add Mount Point Configuration dialog box, and Edit Row opens the Edit Mount Point Configuration dialog box. Other than the titles, the two dialog boxes are identical. For more information, see [Add/Edit Mount Point Configuration Dialog Box, page 48-20](#).

**Note**

This feature is available only on ASA 8.0(2)+ devices. Mount points are supported in router mode only. For ASA versions between 8.0(2) and 9.x, mount points are not supported in multiple-context mode. Mount points are supported in the Admin context on ASA 9.x+ devices in multiple-context, routed mode.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Mount Points** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Mount Points** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit Mount Point Configuration Dialog Box

Use the Add/Edit Mount Point Configuration dialog box to add or edit a mount point entry in the File Mount Point Configuration table on the Mount Points page. You use mount points to make a Common Internet File System (CIFS) or a File Transfer Protocol (FTP) file system accessible to the security appliance.

**Navigation Path**

You can access the Add/Edit Mount Point Configuration dialog box from the Mount Points page. For more information, see [Managing Mount Points, page 48-19](#).

**Field Reference****Table 48-12 Add/Edit Mount Point Configuration Dialog Box**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Mount Point        | Whether the file system is mounted or unmounted (available or unavailable).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Connection Type           | Select the type of file system to mount: <ul style="list-style-type: none"> <li>• <b>cifs</b>—Specifies that the file system being mounted is CIFS, a file system that provides volume-mounting capabilities for CIFS-shared directories.</li> <li>• <b>ftp</b>—Specifies that the file system being mounted is FTP, a Linux kernel module, enhancing the Virtual File System (VFS) with FTP volume-mounting capabilities that allow you to mount FTP-shared directories.</li> </ul> <p><b>Note</b> When you create an FTP-type mount point, the FTP server must have a UNIX directory listing style. Microsoft FTP servers have the MS-DOS directory listing style as their default.</p> |
| Mount Point Name          | Specifies the name of the mount point. The mount point name is used when other CLI commands refer to the filesystem already mounted on the security appliance. A maximum of 31 characters are allowed for the mount point name.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Server Name/IP Address    | Specifies the predefined name (or the IP address in dotted decimal notation) of the CIFS or FTP file-system server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Username                  | Specifies the authorized username for file-system mounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Password                  | Identifies the authorized password for file-system mounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Confirm                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Encrypt Password          | Select to indicate that the password supplied is in encrypted format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Share Name<br>(CIFS only) | Explicitly identifies a specific server share (a folder) by name to access file data within a server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 48-12 Add/Edit Mount Point Configuration Dialog Box (continued)**

| Element                    | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain Name<br>(CIFS only) | For CIFS file systems only, this argument specifies the Windows NT domain name. A maximum of 63 characters is permitted.                                    |
| Mode<br>(FTP only)         | Identifies the FTP transfer mode as either active or passive.                                                                                               |
| Path<br>(FTP only)         | Specifies the directory pathname to the specified FTP file-system server. Question marks and spaces are not allowed in the pathname and will be suppressed. |

## IP Client

The IP Client page lists the interface name and the IP version. You can use the configured IP Client for integrated routing and bridging support on Firepower 2100 Series devices. The IP Client page has the standard options to Add, Edit and Delete the entries.

**Note**

This feature is available only on ASA 9.8.2+ Firepower 2100 Series single context devices. No multi context support for IP-Client.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > IP Client** from the Device Policy selector.

**Note**

The menu appears only for a Firepower 2100 Series device.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > IP Client** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit IP Client Dialog Box

Use the Add/Edit IP Client dialog box to add or edit a IP Client entry in the IP Client table on the IP Client page. You use IP Client settings to support integrated routing and bridging on Firepower 2100 Series devices.

**Navigation Path**

You can access the Add/Edit IP Client dialog box from the IP Client page. For more information, see [IP Client, page 48-21](#).

**Field Reference**
**Table 48-13 Add/Edit IP Client Dialog Box**

| Element    | Description                                                         |
|------------|---------------------------------------------------------------------|
| IP Version | The IP address of the device. It can be an IPv4 or an IPv6 address. |

**Table 48-13 Add/Edit IP Client Dialog Box (continued)**

| Element   | Description                                                          |
|-----------|----------------------------------------------------------------------|
| Interface | Select the interface pertaining to the Firepower 2100 Series device. |

The preview configuration page displays the IP Client configuration with IPv6 suffixed for IPv6 interfaces. For IPv4 interfaces, only the interface name is displayed.

## App Agent

Use the App Agent page to configure the App Agent settings. You can specify the heartbeat interval and retry count.

### Note

App-Agent is available only on Firepower 2100 Series, Firepower 4000 Series, and Firepower 9000 Series devices. In Cisco Security Manager, App-Agent in Firepower 2100 Series device is supported from 9.8.2+; App-Agent in Firepower 4000 Series, and Firepower 9000 Series device is supported from 9.6.2+.

### Navigation Path

- (Device view) Select **Platform > Device Admin > App Agent** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > App Agent** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 48-14 App Agent Page**

| Element     | Description                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interval    | Enter the app agent heartbeat interval. From ASA 9.6.2 to ASA 9.8.1, App-Agent heartbeat value can be between 300 to 6000 ms.<br>For ASA 9.8.2+ devices, App-Agent heartbeat interval value can be between 100 to 6000 ms.<br><b>Note</b> Cisco Security Manager will display an error message if you do not enter values in multiples of 100. |
| Retry Count | Enter the retry count between 3 to 10.                                                                                                                                                                                                                                                                                                         |
| Save        | Click to save the configuration.                                                                                                                                                                                                                                                                                                               |

# Configuring Device Access Settings on Firewall Devices

---

The Device Access section, located under the Device Admin folder in the Policy selector, contains pages for defining access to firewall devices.

This chapter contains the following topics:

- [Configuring Console Timeout, page 49-1](#)
- [HTTP Page, page 49-2](#)
- [Configuring ICMP, page 49-4](#)
- [Configuring Management Access, page 49-6](#)
- [Configuring Management Session Quota Limits, page 49-7](#)
- [Configuring Secure Shell Access, page 49-7](#)
- [Configuring SSL - Basic and Advanced tabs, page 49-9](#)
- [Reference Identities, page 49-13](#)
- [Configuring SNMP, page 49-14](#)
- [Telnet Page, page 49-29](#)

## Configuring Console Timeout

Use the Console page to specify a timeout value for inactive console sessions. When the time limit you specify is reached, the console session is closed.

In the **Console Timeout** field, enter the number of minutes a console session can remain idle before the device closes it. Valid values are 0 to 60 minutes. To prevent a console session from timing out, enter 0.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Console** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Console** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [Chapter 49, “Configuring Device Access Settings on Firewall Devices”](#)

# HTTP Page

Use the table on the HTTP page to manage the interfaces configured to access the HTTP server on a device, as well as HTTP redirect to HTTPS on those interfaces. You also can enable or disable the HTTP server on the device from this page. Administrative access by the specific device manager requires HTTPS access.

**Note**

To redirect HTTP, the interface requires an access list that permits HTTP. Otherwise, the interface cannot listen to port 80, or to any other port that you configure for HTTP.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.
