| MRRU Remote Peer        | <p>The maximum receive reconstructed unit (MRRU) value of the remote peer. This value represents the maximum size packet that the remote peer is capable of receiving.</p> <p>Valid values range from 128 to 16384 bytes. The default is 1524 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Maximum FIFO Queue Size | <p>The maximum queue depth when the bundle uses first-in, first-out (FIFO) queuing. Valid values range from 2 to 255 packets. The default is 8.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Maximum QoS Queue Size  | <p>The maximum queue depth when the bundle uses non-FIFO queuing. Valid values range from 2 to 255 packets. The default is 2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Router Device Administration

---

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

## AAA on Cisco IOS Routers

**Note**

---

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

Authentication, authorization, and accounting (AAA) network security services provide the primary framework through which you set up access control on your Cisco IOS router. Use the AAA policy in Security Manager to enable AAA functionality on Cisco IOS routers and to configure default AAA settings. The default settings that you define in this policy can be used in other policies, such as HTTP and line access (console and VTY) policies. Enabling AAA functionality is a prerequisite for any device policy that makes use of AAA, including NAC, SDP, and 802.1x.

For more information about AAA, see:

- [Supported Authorization Types, page 63-2](#)
- [Supported Accounting Types, page 63-3](#)
- [Understanding Method Lists, page 63-3](#)

To configure a AAA policy, see:

- [Defining AAA Services, page 63-4](#)

- [Line Access on Cisco IOS Routers, page 63-35](#)

## Supported Authorization Types

AAA authorization enables you to limit the services available to an authenticated user. Security Manager supports the following types of authorization:

- **Network**—Authorizes various types of network connections, such as PPP, SLIP, and ARAP.
- **EXEC**—Authorizes the launching of EXEC (CLI) sessions.
- **Command**—Authorizes the use of all EXEC mode commands that are associated with specific privilege levels.

When authorization is enabled, the router uses information retrieved from the user's profile to configure the user session. The profiles are located either in the local user database or on a security server. Users are granted access to a requested service only if the profile allows it.

## Supported Accounting Types

AAA accounting enables you to track the services the users are accessing and the amount of network resources that they are consuming. Security Manager supports the following accounting types:

- **Connection**—Records information about all outbound connections made from this device, such as Telnet, local-area transport (LAT), TN3270, packet assembler/disassembler (PAD), and rlogin connections.

For example, a RADIUS connection accounting record for an outbound Telnet connection includes such information as the port and IP address of the network access server (NAS), the start and end times of the connection, the identity of the user, and the number of packets that were transmitted during the session.

- **EXEC**—Records information about user EXEC (CLI) sessions on the devices, including the username, date, start and stop times, and the IP address of the NAS. For dial-in users, the record includes the telephone number from which the call originated.
- **Command**—Records information about the EXEC commands executed on the device by users with specific privilege levels. Each command accounting record includes a list of the commands executed for that privilege level, the date and time each command was executed, and the name of the user who executed it.

For each accounting type, you can choose whether you want to generate an accounting record at the start and end of each user session or only at the end.

When AAA accounting is enabled, the router sends accounting records of user activity to the TACACS+ or RADIUS security server. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can later be analyzed for network management, client billing, and auditing purposes.

## Understanding Method Lists

A method list is a sequential list describing the methods to use to perform a particular AAA function. In Security Manager, you define method lists by selecting AAA server groups, which are reusable objects that typically contain one or more AAA servers running the same protocol, such as RADIUS or TACACS+. Method lists enable you to designate one or more security protocols to be used for each AAA function, thus ensuring a backup system if the initial method fails.

**Note**

Security Manager also contains predefined AAA server group objects for using the enable password or a local database. See [Predefined AAA Authentication Server Groups, page 6-30](#).

For each AAA function, the device initially uses the first method defined in the list. If that method fails to respond, the device selects the next method in the list. This process continues until there is successful communication with a listed method, or all methods defined in the method list are exhausted.

**Note**

The device attempts to communicate with the next listed method only when there is no response from the previous method. If the AAA service fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access or services—the process stops and no other methods are attempted.

## Defining AAA Services

To define AAA services on a Cisco IOS router, you must first enable AAA functionality on the router. After you do this, you can define the kind of functionality (authentication, authorization, and accounting) that you want the device to implement. You must define a method list for each function, including lists for each type of authorization and accounting that you enable.

For example, if you want to configure EXEC authorization and command authorization, you must define one method list for EXEC authorization and other method lists for each privilege level on which command authorization is performed.

**Note**

If you use RADIUS for authentication, you must use the same RADIUS server group for authorization as well.

**Related Topics**

- [Understanding Method Lists, page 63-3](#)
- [AAA on Cisco IOS Routers, page 63-2](#)
- [Understanding AAA Server and Server Group Objects, page 6-27](#)

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > AAA** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > AAA** from the Policy Type selector. Select an existing policy or create a new one.

The AAA page is displayed. See [AAA Policy Page, page 63-6](#) for a description of the fields on this page.

- Step 2** Define which login authentication methods to use on users who access the device:
- On the Authentication tab (see [AAA Page—Authentication Tab, page 63-6](#)), select the **Enable Device Login Authentication** check box.
  - Enter the names of one or more AAA server group objects (up to four) in the Prioritized Method List field, or click **Select** select the object from a list or to create a new one. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used.

---

**Note** If you select None as a method, it must appear as the last method in the list.

---

- Step 3** (Optional) In the Maximum Number of Attempts field, define the maximum number of unsuccessful authentication attempts to allow before a user is locked out.

- Step 4** (Optional) Define which authorization methods to use on users who have been successfully authenticated:

- Click the **Authorization** tab on the AAA page. See [Table 63-3 on page 63-8](#) for a description of the fields on this tab.
- Define method lists for one or more of the following types of authorization:
  - Network
  - EXEC
  - Command—Click the **Add** button to display the Command Authorization dialog box (see [Command Authorization Dialog Box, page 63-10](#)). From here, you can select a privilege level and the method list to apply to it.

For more information about these authorization types, see [Supported Authorization Types, page 63-2](#).

---

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

---

- Step 5** (Optional) Define which accounting methods to use on the activities performed by users:

- Click the **Accounting** tab on the AAA page. See [Table 63-5 on page 63-11](#) for a description of the fields on this tab.
- Define method lists for one or more of the following types of accounting:
  - Connection
  - EXEC
  - Command—Click the **Add** button to display the Command Accounting dialog box (see [Command Accounting Dialog Box, page 63-13](#)). From here, you can select a privilege level and the method list to apply to it.

For more information about these accounting types, see [Supported Accounting Types, page 63-3](#).

- For each accounting type defined above, select a value from the Accounting Process Notices list. This defines when to create an accounting record, at the beginning and end of the user process or only at the end.

- d. For each accounting type defined above, select the **Enable broadcast to multiple servers** check box if you want accounting information sent simultaneously to the first server in each AAA server group defined in the method list.

## AAA Policy Page

Use the AAA page to define the default authentication, authorization, and accounting methods to use on the router. You do this by configuring method lists, which define which methods to use and the sequence in which to use them.

### Note

You can use the method lists defined in this policy as default settings when you configure AAA on the router's console port and VTY lines. See [Console Policy Page, page 63-42](#) and [VTY Policy Page, page 63-50](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > AAA** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > AAA** from the Policy Type selector. Right-click **AAA** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

**Table 63-1**     *AAA Page*

| Element            | Description                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication tab | Defines the login authentication methods to use and the sequence in which to use them. See <a href="#">AAA Page—Authentication Tab, page 63-6</a> .                        |
| Authorization tab  | Defines the types of network, EXEC, and command authorization to perform and the methods to use for each type. See <a href="#">AAA Page—Authorization Tab, page 63-8</a> . |
| Accounting tab     | Defines types of connection, EXEC, and command accounting to perform and the methods to use for each type. See <a href="#">AAA Page—Accounting Tab, page 63-10</a> .       |

## AAA Page—Authentication Tab

Use the Authentication tab of the AAA page to define the methods used to authenticate users who access the device. Authentication methods are defined in a method list, which define the security protocols to use, such as LDAP, RADIUS, and TACACS+.

**Note**

You can use the method list defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page, page 63-42](#) and [VTY Line Dialog Box—Authentication Tab, page 63-55](#).

**Navigation Path**

Go to the [AAA Policy Page, page 63-6](#), then click the **Authentication** tab.

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Device Login Authentication | <p>When selected, enables the authentication of all users when they log in to the device, using the methods defined in the method list.</p> <p>When deselected, authentication is not performed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Prioritized Method List            | <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include Line, Local, Kerberos, LDAP, RADIUS, TACACS+, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Maximum Number of Attempts         | <p>The maximum number of unsuccessful authentication attempts before a user is locked out. This feature is disabled by default. Valid values range from 1 to 65535.</p> <p><b>Note</b> From the standpoint of the user, there is no distinction between a normal authentication failure and an authentication failure due to being locked out. The system administrator has to explicitly clear the status of a locked-out user using <b>clear</b> commands.</p>                                                                                                                                                                                                                                                                                                                                                        |

## AAA Page—Authorization Tab

Use the Authorization tab of the AAA page to define the type of authorization services to enable on the device and the methods to use for each type. Security Manager supports the following types of authorization:

- Network—Authorizes various types of network connections, such as PPP.
- EXEC—Authorizes the launching of EXEC sessions.
- Command—Authorizes the use of all EXEC mode commands that are associated with specific privilege levels.

**Note** You can use the method lists defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page, page 63-42](#) and [VTY Line Dialog Box—Authentication Tab, page 63-55](#).

### Navigation Path

Go to the [AAA Policy Page, page 63-6](#), then click the **Authorization** tab.

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List                  | <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include LDAP, RADIUS, TACACS+, Local, and None.</p> <p><b>Note</b> RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| EXEC Authorization settings              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable CLI/EXEC Operations Authorization | <p>When selected, this type of authorization determines whether the user is permitted to open an EXEC (CLI) session, using the methods defined in the method list.</p> <p>When deselected, EXEC authorization is not performed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Prioritized Method List                  | <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p>                                                                                                                                                                                                                                                                                                                                                                                               |
| Command Authorization settings           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Privilege Level                          | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Prioritized Method List                  | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Add button                               | Opens the <a href="#">Command Authorization Dialog Box, page 63-10</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Edit button                              | Opens the <a href="#">Command Authorization Dialog Box, page 63-10</a> . From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Delete button                            | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Command Authorization Dialog Box

Use the Command Authorization dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege level. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [AAA Page—Authorization Tab, page 63-8](#), click the **Add** button beneath the Command Authorization table.

| Privilege Level         | The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Prioritized Method List | <p>Defines a sequential list of methods to be used when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include TACACS+, Local, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## AAA Page—Accounting Tab

Use the Accounting tab of the AAA page to define the type of accounting services to enable on the device and the methods to use for each type. Security Manager supports the following types of accounting:

- **Connection**—Records information about all outbound connections made from this device.
- **EXEC**—Records information about user EXEC sessions on the devices, including the username, date, start and stop times, and the IP address.
- **Command**—Records information about the EXEC commands executed on the device by users with specific privilege levels.

In addition, you use the Accounting page to determine when accounting records should be generated and whether they should be broadcast to more than one AAA server.

**Note**

You can use the method lists defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page, page 63-42](#) and [VTY Line Dialog Box—Authentication Tab, page 63-55](#).

**Navigation Path**

Go to the [AAA Policy Page, page 63-6](#), then click the **Accounting** tab.

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Broadcast to Multiple Servers  | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                      |
| <b>EXEC Accounting Settings</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable CLI/EXEC Operations Accounting | <p>When selected, enables the recording of basic information about user EXEC sessions, using the methods defined in the method list.</p> <p>When deselected, EXEC accounting is not performed.</p>                                                                                                                                                                                                                                                                               |
| Generate Accounting Records for       | See description <a href="#">Table 43-7 on page 43-17</a> .                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Prioritized Method List               | Defines a sequential list of methods to be queried when creating connection accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Enable Broadcast to Multiple Servers  | When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.                                                                                                                                                                    |
| <b>Command Accounting settings</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Privilege Level                       | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Generate Accounting Records for       | The points in the process where the device sends an accounting notice to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Broadcast                      | Whether accounting records are broadcast to multiple servers simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Prioritized Method List               | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Add button                            | Opens the <a href="#">Command Accounting Dialog Box, page 63-13</a> . From here you can configure a command accounting definition.                                                                                                                                                                                                                                                                                                                                               |
| Edit button                           | Opens the <a href="#">Command Accounting Dialog Box, page 63-13</a> . From here you can edit the command accounting definition.                                                                                                                                                                                                                                                                                                                                                  |
| Delete button                         | Deletes the selected command accounting definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                              |

## Command Accounting Dialog Box

Use the Command Accounting dialog box to define which methods to use when recording information about the EXEC commands that are executed for a given privilege level. Each accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the name of the user who executed it.

### Navigation Path

From the [AAA Page—Accounting Tab, page 63-10](#), click the **Add** button beneath the Command Accounting table.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level                 | The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Generate Accounting Records for | <p>Defines when the device sends an accounting notice to the accounting server:</p> <ul style="list-style-type: none"> <li>• <b>Start and Stop</b>—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record.</li> <li>• <b>Stop Only</b>—Generates an accounting record at the end of the user process only.</li> <li>• <b>None</b>—No accounting records are generated.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                    |
| Prioritized Method List         | <p>Defines a sequential list of methods to be used when creating accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>TACACS+ is the only supported method, but you can select multiple AAA server groups configured with TACACS+.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

**Table 63-6** Command Accounting Dialog Box (continued)

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Broadcast to Multiple Servers | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p> |

## User Accounts and Device Credentials on Cisco IOS Routers

Accounts and credential policies define the contact information for accessing the router, including the privilege level provided to each user account. You can configure as many user accounts as required. However, the user account that Security Manager uses to connect to the router is always the one configured in the Device Properties page.

Additionally, you use device access policies to define the enable or enable secret password required to access privileged EXEC mode. This is the mode required to make any configuration changes on the router.

### Note

If you use this policy to define a password, be careful later not to unassign this policy without assigning a replacement policy before your next deployment. If you deploy a device access policy that removes this password and the device contains a different type of password not known to Security Manager, such as a line console password, you will not be able to configure this device in the future. This is because the device reverts to this unknown password if Security Manager removes the enable password that it had previously configured.

### Related Topics

- [Defining Accounts and Credential Policies, page 63-14](#)

## Defining Accounts and Credential Policies

This procedure describes how to define a device access policy on a Cisco IOS router. If the username that you configured on the Device Properties page to connect to the router (see [Viewing or Changing Device Properties, page 3-41](#)) matches one of the user accounts you defined in this policy, Security Manager updates the device credentials according to your policy definition.

If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, or change the enable password, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see [Device Credentials Page, page 3-46](#).

### Note

You can discover encrypted passwords, but any password you enter must be in clear text. If you discover an encrypted password and then modify it, the password is saved as clear text.

**Related Topics**

- [User Accounts and Device Credentials on Cisco IOS Routers, page 63-14](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Accounts and Credentials** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Accounts and Credentials** from the Policy Type selector. Select an existing policy or create a new one.

The Accounts and Credentials page is displayed. See [Table 63-7 on page 63-16](#) for a description of the fields on this page.

**Step 2** Enter the password for switching to privileged EXEC mode on the router:

- Select **Enable Password** or **Enable Secret Password**. The Enable Secret Password option offers better security than the Enable Password option by storing the password using MD5 encryption. This option is useful in environments in which the password crosses the network or is stored on a TFTP server.

**Note** After you set an enable secret password, you can switch to an enable password only if the enable secret is disabled or an older version of Cisco IOS software is being used, such as when running an older rxboot image.

- Enter a password, then enter it again in the Confirm field. The password that you enter must be in clear text. If you are configuring the enable secret password, the password is encrypted on deployment.

**Step 3** (Optional) Select the **Enable Password Encryption Service** check box to encrypt all passwords on the device. This includes, for example, the enable password, username passwords, authentication key passwords, console and VTY line access passwords, and BGP neighbor passwords.

We recommend using this feature to help prevent unauthorized individuals from viewing the passwords in your configuration file.

**Note** This option does not provide a high level of security and should not be used as a substitute for additional network security measures.

**Step 4** To define new user accounts for the router:

- Click the **Add** button under the table to display the User Accounts dialog box.
- Enter the details for the new user. See [Table 63-8 on page 63-18](#) for a description of the available fields.
- Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the User Accounts table.

**Note** To edit a user account, select it from the User Accounts table, then click **Edit**. To remove a user account, select it, then click **Delete**.

**Caution**

While deleting a user account, Cisco Security Manager times out and deployment fails. To avoid this, you can set up Security Manager to download despite an error. Enable **Allow Download on Error** in **Tools > Administrator > Deployments** in the Configuration Manager.

## Accounts and Credentials Policy Page

Use the Accounts and Credentials page to define the enable password or enable secret password assigned to the router. In addition, you can define a list of usernames that can be used to access the router.

For more information, see [Defining Accounts and Credential Policies, page 63-14](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Accounts and Credentials** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Accounts and Credentials** from the Policy Type selector. Right-click **Accounts and Credentials** to create a policy, or select an existing policy from the Shared Policy selector.

| Username                           | The username that can be used to access the router. The username must be a single word up to 64 characters in length. Spaces and quotation marks are not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Encryption                         | Indicates whether password information for the user is encrypted using MD5 encryption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Privilege Level                    | The privilege level assigned to the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Add button                         | Opens the <a href="#">User Account Dialog Box, page 63-17</a> . From here you can define a user account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit button                        | Opens the <a href="#">User Account Dialog Box, page 63-17</a> . From here you can edit the selected user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Delete button                      | Deletes the selected user accounts from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## User Account Dialog Box

Employ the User Account dialog box to define a username and password combination that can be used by Security Manager to access the router. You can also define the privilege level of the user account, which determines whether you can configure all commands on this router or only a subset of them.

### Note

Remember—there may be additional user accounts defined on the router using other methods, such as the CLI.

### Navigation Path

Go to the [Accounts and Credentials Policy Page, page 63-16](#), then click the **Add** or **Edit** button beneath the table.

| Username                   | The username for accessing the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password                   | The password for accessing the router with this user account.<br><b>Note</b> You can discover an encrypted password, but any password you enter must be in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Confirm                    | Confirms the password for this user account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Encrypt password using MD5 | When selected, uses MD5 encryption to encrypt the password for this user account. This is the default.<br>When deselected, the password is sent to the router unencrypted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Privilege Level            | The privilege level assigned to the user account. Valid values range from 0 to 15: <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig. |

## Bridging on Cisco IOS Routers

Bridging policies enable you to perform transparent bridging (as specified in RFC 1286) on selected interfaces that you have configured to function as a bridge group. Security Manager supports integrated routing and bridging, which makes it possible to route a specific protocol between routed interfaces and bridge groups, or route a specific protocol between bridge groups. Local or unroutable traffic can be bridged among the bridged interfaces in the same bridge group, while routable traffic can be routed to other routed interfaces or bridge groups, as shown in [Figure 63-1](#).

Using integrated routing and bridging, you can:

- Switch packets from a bridged interface to a routed interface.
- Switch packets from a routed interface to a bridged interface.

- Switch packets within the same bridge group.

**Figure 63-1** *Transparent Bridging*

## Bridge-Group Virtual Interfaces

Because bridging takes place at the data link layer and routing takes place at the network layer, they have different protocol configuration models. With IP, for example, bridge group interfaces belong to the same network and have a collective IP network address. In contrast, each routed interface represents a distinct network and has its own IP network address. Integrated routing and bridging uses the concept of a bridge-group virtual interface (BVI) to enable these interfaces to exchange packets for a given protocol. As shown in [Figure 63-2](#), the interface number assigned to the BVI corresponds to the bridge group that the BVI represents. This number serves as the link between the virtual interface and the bridge group.

**Figure 63-2** *Bridge-Group Virtual Interface*

When you enable routing for a given protocol on the BVI, packets coming from a routed interface that are destined for a host in a bridged domain are routed to the BVI and then forwarded to the corresponding bridged interface. All traffic routed to the BVI is forwarded to the corresponding bridge group as bridged traffic. All routable traffic received on a bridged interface is routed to other routed interfaces as if it is coming directly from the BVI.

**Note**

BVI interfaces are configured using the Interfaces policy. See [Defining Basic Router Interface Settings, page 62-4](#). The BVI interface must have a corresponding bridge group with the same number; otherwise, deployment will fail.

**Note**

When the bridge group contains more than two interfaces, add a BVI interface to the group to help prevent unicast flooding, which is a potential security issue.

## Defining Bridge Groups

You define a bridge group by selecting the L3 interfaces that are part of the bridge group and assigning the group a number. All bridge groups in Security Manager perform integrated routing and bridging on IP traffic only and use the standard Spanning Tree Protocol (IEEE 802.1D).

**Note**

Use CLI commands or FlexConfigs to bridge other protocols, such as AppleTalk or IPX, and to use other spanning tree protocols, such as VLAN-Bridge. Concurrent routing and bridging is not supported.

**Related Topics**

- [Bridging on Cisco IOS Routers, page 63-18](#)
- [Bridge-Group Virtual Interfaces, page 63-19](#)

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > Bridging** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Bridging** from the Policy Type selector. Select an existing policy or create a new one.

The Bridging page is displayed. See [Table 63-9 on page 63-21](#) for a description of the fields on this page.

**Step 2**

Click the **Add** button under the table to display the Bridge Group dialog box. See [Table 63-10 on page 63-22](#) for a description of the fields in this dialog box. From here you can define a bridge group.

**Step 3**

Enter a number to identify the bridge group.

**Step 4**

Enter the names of the interfaces and interface roles that are part of the bridge group, or click **Select** to select an interface role or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).

You can select most Layer 3 interfaces, except X.25 and Integrated Services Digital Network (ISDN) bridged interfaces and certain types of logical interfaces (such as loopback, tunnel, null, and BVI). Each interface can be included in only one bridge group.

You can select a LAN subinterface only if the parent interface is configured with Inter-Switch Link (ISL) or 802.1Q encapsulation.

- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. The bridge group is displayed in the table on the Bridging page.

**Note** To edit a bridge group, select it from the Groups table, then click **Edit**. To remove a bridge group, select it, then click **Delete**.

## Bridging Policy Page

Use the Bridging page to define bridge groups that can perform integrated routing and bridging on the router. For more information, see [Defining Bridge Groups, page 63-20](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Bridging** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Bridging** from the Policy Type selector. Right-click **Bridging** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

**Table 63-9** *Bridging Page*

| Element          | Description                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------|
| Group Number     | The number that identifies the bridge group.                                                             |
| Group Interfaces | The interfaces and interface roles that are included in the bridge group.                                |
| Add button       | Opens the <a href="#">Bridge Group Dialog Box, page 63-21</a> . From here you can define a bridge group. |
| Edit button      | Opens the <a href="#">Bridge Group Dialog Box, page 63-21</a> . From here you can edit the bridge group. |
| Delete button    | Deletes the selected bridge groups from the table.                                                       |

## Bridge Group Dialog Box

Use the Bridge Group dialog box to define bridge groups on the router. Each bridge group can contain multiple Layer 3 interfaces of various types, including serial interfaces.

**Note** All bridge groups use the standard Spanning Tree Protocol (IEEE 802.1D). Use CLI commands or FlexConfigs to bridge other protocols, such as AppleTalk or IPX, and to use other spanning tree protocols, such as VLAN-Bridge.

**Navigation Path**

Go to the [Bridging Policy Page, page 63-21](#), then click the **Add** or **Edit** button beneath the table.

|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Number     | The number assigned to the bridge group. Valid values range from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Group Interfaces | <p>The interfaces that are included in the bridge group. Enter the name of one or more interfaces and interface roles, or click <b>Select</b> to select them. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>You can select most Layer 3 interfaces, including serial interfaces, provided the serial interface is configured with high-level data link control (HDLC) or Frame Relay encapsulation. Each interface can belong to only one bridge group.</p> <p>You can select a LAN subinterface only if the parent interface is configured with Inter-Switch Link (ISL) or 802.1Q encapsulation.</p> <p><b>Note</b> Certain types of interfaces, such as loopback, tunnel, null, and BVI, cannot be bridged.</p> <p><b>Note</b> Make sure that your bridge group does not prevent Security Manager from communicating with the device.</p> |

## Time Zone Settings on Cisco IOS Routers

The local time on a Cisco IOS router is typically set using the clock set command in the CLI command or by dynamically deriving the time from an NTP server. You can adjust these time settings by defining the time zone in which the router resides and the start and end dates of Daylight Saving Time (DST) in that time zone.

**Related Topics**

- [Defining Time Zone and DST Settings, page 63-22](#)
- [NTP on Cisco IOS Routers, page 63-96](#)

### Defining Time Zone and DST Settings

Security Manager enables you to define the time zone in which a Cisco IOS router is located. You can also define the start and end dates for Daylight Saving Time (DST).

**Related Topics**

- [Defining NTP Servers, page 63-97](#)
- [Time Zone Settings on Cisco IOS Routers, page 63-22](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Clock** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Clock** from the Policy Type selector. Select an existing policy or create a new one.
- The Clock page is displayed. See [Table 63-11 on page 63-24](#) for a description of the fields on this page.
- Step 2** Select the time zone in which the router is located. Time zones are listed according the number of hours behind or ahead of Greenwich Mean Time (GMT).
- Step 3** (Optional) Select the method for determining the start and end dates for DST:
- Set by Date—Select this option when DST starts and ends on fixed dates. Continue with [Step 4](#).
  - Set by Day—Select this option when DST starts and ends on days whose specific dates vary from year to year. Continue with [Step 5](#).
  - None—Select this option when DST is not used.
- Step 4** (When Set by Date is selected) Define the fixed dates when DST starts and ends:
- a. Under Start, click the calendar icon, then click the appropriate date.
  - b. Select the hour and minute from the displayed lists.
  - c. Repeat steps a and b to configure the end date and time.
- Step 5** (When Set by Day is selected) Select the **Specify Recurring Time** check box if you want to define a DST period *other* than the default, which is the period used throughout most of the United States.
- Step 6** (When Specify Recurring Time is selected) Define the start and end of DST:
- a. Under Start, select the month when DST begins.
  - b. Select the week of the month (1, 2, 3, 4, first, or last).
  - c. Select the day of the week.
  - d. Select the hour and minute from the displayed lists. For example, if DST begins at 1:00 a.m. on the last Sunday of each March, select March, last, Sunday, 1, and 00.
  - e. Repeat Steps a through d to configure the end date and time.
- 

## Clock Policy Page

Use the Clock page to configure the time zone in which the router is located and the settings for Daylight Saving Time (DST). For more information, see [Time Zone Settings on Cisco IOS Routers, page 63-22](#).

**Tip**

You can configure the local time on the router by defining an NTP policy or by configuring the **clock set** command using the CLI.

---

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Clock** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Clock** from the Policy Type selector. Right-click **Clock** to create a policy, or select an existing policy from the Shared Policy selector.

**Related Topics**

## CPU Utilization Settings on Cisco IOS Routers

The CPU policy configures settings relating to CPU utilization. This policy provides you with methods for monitoring CPU resources and tracking processes that exceed a predetermined level of utilization.

**Note**

The CPU policy is supported on routers running Cisco IOS Software Release 12.3(14)T or later.

### Related Topics

- [Defining CPU Utilization Settings, page 63-25](#)

## Defining CPU Utilization Settings

You can use Security Manager to modify the following default CPU utilization settings:

- The size of the CPU history table.
- The size of the extended CPU load history table.
- Whether to enable the automatic CPU Hog profiling.

In addition, you can optionally define:

- The CPU utilization level that causes a process to be included in the history table.

- The types of CPU utilization thresholds to enable. For each type of threshold, you can determine the threshold values that trigger notifications.

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > CPU** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > CPU** from the Policy Type selector. Select an existing policy or create a new one.
- The CPU page is displayed.
- Step 2** (Optional) Define the CPU utilization settings of the router, as required. See [Table 63-12 on page 63-26](#) for a description of the available fields.
- 

## CPU Policy Page

Use the CPU page to configure settings related to router CPU utilization, including the thresholds for sending log messages, the size of the CPU history table, and whether to enable automatic CPU Hog profiling.

For more information, see [Defining CPU Utilization Settings, page 63-25](#).

#### Navigation Path

- (Device view) Select **Platform > Device Access > CPU** from the Policy selector.
- (Policy view) Select **Router Platform > Device Access > CPU** from the Policy Type selector. Right-click **CPU** to create a policy, or select an existing policy from the Shared Policy selector.

| Enable Automatic CPU Hog Profiling | <p>When selected, automatic CPU Hog profiling is enabled. This is the default.</p> <p>When deselected, automatic CPU Hog profiling is disabled.</p> <p>This feature predicts when a process could hog the CPU and begins profiling that process.</p> <p><b>Note</b> To view the CPU Hog profile data, use the <b>show processes cpu autoprofile hog</b> command in the CLI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## HTTP and HTTPS on Cisco IOS Routers

Security Manager enables you to configure HTTP and HTTPS over Secure Socket Layer (known as HTTP over SSL or HTTPS) server functionality on Cisco IOS routers. This feature provides SSL version 3.0 support for the HTTP 1.1 server.

A secure HTTP connection means that data sent to and received from an HTTP server are encrypted before being sent out over the internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a router from a web browser.

In addition to providing access to the device via the Cisco web browser user interface, HTTP and HTTPS are used by device management applications, such as the Cisco Router and Security Device Manager (SDM), to communicate with the device.

## Defining HTTP Policies

When you define an HTTP policy, you can:

- Enable and disable HTTP and SSL functionality on the router.
- Specify the ports used by each protocol.
- Optionally define a standard, numbered ACL that restricts access to the device using these protocols.

In addition, you can define the methods of AAA authentication and authorization methods to perform on users.

You must use caution when defining an HTTP policy, as your settings may affect communication between Security Manager (as well as other management applications that use these protocols) and the device.

**Note**

As a general rule, Cisco IOS routers that have been discovered by Security Manager already have HTTPS enabled because Security Manager uses SSL as the default protocol for communicating with them. See [Setting Up SSL on Cisco IOS Routers, page 2-4](#).

**Before You Begin**

- Enable AAA services on the router. See [Defining AAA Services, page 63-4](#).

**Related Topics**

- [HTTP and HTTPS on Cisco IOS Routers, page 63-28](#)

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Policy selector, then click the **Setup** tab in the work area.
- (Policy view) Select **Router Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Select an existing policy or create a new one.

The HTTP Setup tab is displayed. See [Table 63-13 on page 63-32](#) for a description of the fields on this tab.

**Step 2**

Select the check boxes to enable HTTP and SSL (HTTPS) server functionality on the router.

**Note**

If SSL is disabled (or if the HTTP policy as a whole is unassigned), Security Manager cannot communicate with the device after deployment unless you change the transport protocol for this device to SSH. This setting can be found in Device Properties. See [Managing Device Communication Settings and Certificates, page 9-4](#).

**Tip**

We recommend that you disable HTTP when SSL is enabled. This is required to ensure only secure connections to the server.

**Step 3**

(Optional) Modify the default ports used by HTTP (80) and HTTPS (443).

- Step 4** (Optional) In the Allow Connection From field, enter the name of the standard, numbered ACL object that specifies which addresses can use HTTP and HTTPS on this device, or click **Select** to select the ACL object from a list or to create a new one. Use this option to restrict access to these protocols. For more information about creating standard ACL objects, see [Creating Standard Access Control List Objects, page 6-56](#)

---

**Note** Make sure that the ACL you select permits the Security Manager server; otherwise, communication with the device is lost.

---

- Step 5** (Optional) On the AAA tab, modify the default type of authentication to perform on users who attempt to access the device using HTTP or HTTPS. Options include AAA, Enable Password (default), Local Database, and TACACS.

If you select AAA, continue with [Step 6](#); otherwise, continue with [Step 8](#).

---

**Note** The TACACS option applies only to devices using an IOS software version prior to 12.3(8).

---

See [Table 63-14 on page 63-33](#) for a description of the fields on the AAA tab.

- Step 6** Select the authentication method to perform on users:

- If you want to use the default AAA login authentication methods defined in the device's AAA policy (see [Defining AAA Services, page 63-4](#)), do *not* select the Enable Device Login Authentication check box. Continue with [Step 7](#).
- If you want to define a method list especially for this policy, do the following:
  - a. Select the **Enable Device Login Authentication** check box.
  - b. Under Prioritized Method List, enter the names of the AAA server groups to use for authentication, or click **Select** to select the AAA server groups from a list or to create new ones. Use the up and down arrows in the selector to define the order in which you want to apply these authentication methods.

---

**Note** Make sure that Security Manager users are defined on the AAA servers; otherwise communication with the device is lost.

---

- Step 7** Select the authorization method to perform on users who use HTTP or HTTPS to begin an EXEC session:

- If you want to use the default AAA authorization methods defined in the device's AAA policy, do *not* select the Enable CLI/EXEC Operations Authorization check box. Continue with [Step 8](#).
- If you want to define a method list especially for this policy, select the **Enable CLI/EXEC Operations Authorization** check box, then define the method list.

---

**Note** If you leave this option deselected, make sure that EXEC authorization is enabled in the router's AAA policy. Otherwise, you will be unable to connect to the device via HTTP or HTTPS (SSL). This applies to Security Manager as well as other applications, such as SDM. See [Defining AAA Services, page 63-4](#).

---

- Step 8** (Optional) Create command authorization definitions for specific privilege levels:
- Click the **Add** button under the Command Authorization Override table. The Command Authorization Override dialog box is displayed. See [Table 63-15 on page 63-34](#) for a description of the fields in this dialog box.
  - Configure the command authorization definition as required.
  - Click **OK**. The dialog box closes and the authorization method is displayed in the Command Authorization Override table.
  - Repeat [a.](#) through [c.](#) to create additional command authorization definitions.
- 

## HTTP Policy Page

Use the HTTP page to configure HTTP and HTTPS access on the router. You can configure HTTP policies on a Cisco IOS router from the following tabs on the HTTP policy page:

- [HTTP Page—Setup Tab, page 63-31](#)
- [HTTP Page—AAA Tab, page 63-32](#)

For more information, see [HTTP and HTTPS on Cisco IOS Routers, page 63-28](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Right-click **HTTP** to create a policy, or select an existing policy from the Shared Policy selector.

## HTTP Page—Setup Tab

Use the Setup tab of the HTTP page to enable HTTP and HTTP over Secure Socket Layer (HTTP over SSL or HTTPS) on the router. You can optionally limit access to these protocols to the addresses defined in an access control list.

### Note

As a general rule, Cisco IOS routers that have been discovered by Security Manager already have HTTPS enabled because Security Manager uses SSL as the default protocol for communicating with them. See [Setting Up SSL on Cisco IOS Routers, page 2-4](#).

---

### Navigation Path

Go to the [HTTP Policy Page, page 63-31](#), then click the **Setup** tab.

| Prioritized Method List                  | <p>Applies only when the Enable Device Login Authentication check box is selected.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| EXEC Authorization settings              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable CLI/EXEC Operations Authorization | <p>Applies only when AAA is selected as the authentication method.</p> <p>When selected, EXEC authorization is based on the methods defined in the Prioritized Method List field. This type of authorization determines whether the user is permitted to open an EXEC (CLI) session.</p> <p>When deselected, the default EXEC authorization list defined in the router's AAA policy is used. See <a href="#">AAA Page—Authorization Tab, page 63-8</a>.</p> <p><b>Note</b> If you leave this option deselected, make sure that EXEC authorization is enabled in the router's AAA policy. Otherwise, you will be unable to connect to the device via HTTP or HTTPS (SSL). This applies to Security Manager as well as other applications, such as SDM and the device's web interface.</p>                              |

| Command Authorization settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Privilege Level                | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prioritized Method List        | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Add button                     | Opens the <a href="#">Command Authorization Override Dialog Box, page 63-34</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Edit button                    | Opens the <a href="#">Command Authorization Override Dialog Box, page 63-34</a> . From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Delete button                  | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Command Authorization Override Dialog Box

Use the Command Authorization Override dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [HTTP Page—AAA Tab, page 63-32](#), click the **Add** button beneath the Command Authorization Override table.

Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include TACACS+, Local, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## Line Access on Cisco IOS Routers

Security Manager enables you to configure command line access (also called EXEC access) to a router using the following methods:

- Console port—Physical connection via a standard RS232 cable for local access. For more information, see:
  - [Defining Console Port Setup Parameters, page 63-35](#)
  - [Defining Console Port AAA Settings, page 63-37](#)
- VTY lines—Virtual terminal lines for remote access, typically using protocols such as Telnet, SSH, or rlogin. For more information, see:
  - [Defining VTY Line Setup Parameters, page 63-38](#)
  - [Defining VTY Line AAA Settings, page 63-40](#)

After you configure and deploy these policies, you can use these lines to communicate with individual devices directly when you want to configure or diagnose them using the CLI.

### Defining Console Port Setup Parameters

The console port on a router is generally used for local system access by an administrator with physical access to the device. By default, the console port is set up as follows:

- All permitted users have privileged access to the router, including all configuration commands (privilege level 15).
- The line is disconnected after 10 minutes without user input.
- Incoming connections are not permitted.
- Outgoing connections support Telnet only.

In addition to modifying any of the default settings, you can optionally define the following settings:

- The password for accessing the console.
- Whether to disable all EXEC sessions on the console.

- Incoming and outgoing ACLs that restrict the connections that are permitted on the console.
- Whether VRF connections are permitted on the console.

### Related Topics

- [Line Access on Cisco IOS Routers, page 63-35](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector, then click the **Setup** tab in the work area.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.

The Console Setup tab is displayed. See [Table 63-16 on page 63-42](#) for a description of the fields on this tab.

- Step 2** (Optional) Enter the password for accessing the console port, then enter it again in the Confirm field.
- Step 3** (Optional) Modify the default (15) granted to users of the console port. See [Console Page—Authorization Tab, page 63-45](#).
- Step 4** (Optional) Select the **Disable all the EXEC sessions to the router via this line** check box to prevent any incoming connections via the console.

---

**Note** Selecting this option blocks all access to the device via the console port.

---

- Step 5** (Optional) Modify the default timeout after which the line is disconnected if no user input is detected.

---

**Note** Setting this value to 0 disables the timeout. Disabling the timeout could compromise the security of your network.

---

- Step 6** (Optional) Specify which protocols can be used for outbound connections on the console port:
- All—All supported protocols are permitted.
  - None—No protocols are permitted.
  - Protocol—Enables one or more of the following protocols: SSH, Telnet, and rlogin.

---

**Note** You must configure AAA authentication on devices where the console port permits the SSH and rlogin protocols. See [Defining Console Port AAA Settings, page 63-37](#).

---

- Step 7** (Optional) Enter the names of ACLs that restrict incoming and outgoing connections between the device and the addresses in these lists, or click **Select** to select the ACL object or to create a new one. At the top of the selector, in the Type field, select the ACL type as either Standard or Extended.
- Step 8** (Optional) Click the **AAA** tab to define authentication, authorization, and accounting settings for the console port. See [Defining Console Port AAA Settings, page 63-37](#).
-

## Defining Console Port AAA Settings

By default, authentication, authorization, and accounting are not performed on the console port. When you configure one or more of these access control options, you can either make use of the default method lists defined in the device's AAA policy or define a custom method list containing one or more AAA methods.

### Related Topics

- [Defining Console Port Setup Parameters, page 63-35](#)
- [Line Access on Cisco IOS Routers, page 63-35](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector, then click the **Authentication** tab in the work area.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Authentication** tab.

The Console Authentication tab is displayed.

- Step 2** (Optional) Select the authentication method to perform on users who attempt to access the console line. See [Table 63-17 on page 63-45](#) for a description of the fields on the Authentication tab.

---

**Note** If you select local authentication, preview the full configuration before deployment to make sure that the **aaa new-model** command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.

---

- Step 3** (Optional) On the Authorization tab, select the authorization method to perform on users who access the console line and begin an EXEC session.

See [Table 63-18 on page 63-46](#) for a description of the fields on the Authorization tab.

---

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

---

- Step 4** (Optional) Create command authorization definitions for specific privilege levels:
- a. Click the **Add** button under the Commands Authorization table. The Command Authorization dialog box is displayed. See [Table 63-26 on page 63-61](#) for details.
  - b. Configure the command authorization definition as required.
  - c. Click **OK**. The dialog box closes and the authorization method is displayed in the Commands Authorization table.
  - d. Repeat **a.** through **c.** to create additional command authorization definitions.

- Step 5** (Optional) On the Accounting tab, select the EXEC and connection accounting methods to perform on users who access the console line.

See [Table 63-19 on page 63-47](#) for a description of the fields on this tab.

- Step 6** (Optional) Create command accounting definitions for specific privilege levels:
- Click the **Add** button under the Commands Accounting table. The [Command Accounting Dialog Box—Line Access, page 63-61](#) is displayed.
  - Configure the command accounting definition as required.
  - Click **OK**. The dialog box closes and the accounting method is displayed in the Commands Accounting table.
  - Repeat [a.](#) through [c.](#) to create additional command accounting definitions.
- 

## Defining VTY Line Setup Parameters

All Cisco IOS routers are configured by default with five VTY lines (labeled 0-4) that have the following settings:

- All permitted users have privileged access to the router, including all configuration commands (privilege level 15).
- VTY lines are disconnected after 10 minutes without user input.
- Incoming connections are not permitted.
- Outgoing connections support Telnet only.

You can use Security Manager to modify the default settings on these five VTY lines or to configure additional lines (up to a maximum of 16). In addition, you can optionally configure the following settings on each line:

- The password for accessing the line.
- Whether to disable all EXEC sessions on the line.
- Incoming and outgoing ACLs that restrict the connections that are permitted on the line.
- Whether VRF connections are permitted on the line.

### Defining Groups of VTY Lines

You can configure multiple VTY lines as a contiguous group, which enables you to define identical settings for all the lines in the group with one procedure. All the lines within the group must fall within one of two ranges, 0-4 or 6-15. The group cannot overlap these two ranges.

The rules for configuring VTY line 5 are as follows. Line 5 can be part of the same definition as lines 0-4 only when there are no lines configured above line 5. If there are lines configured above line 5, you cannot include line 5 in the definition for lines 0-4, even if their configurations are the same. Line 5 *can* be included in the definition of the lines above line 5 if their configurations are the same.

For example, if lines 0-5 all share one configuration and lines 6-9 have a different configuration, you need to create three definitions—one definition for lines 0-4, a second definition for line 5, and a third definition for lines 6-9.

#### Note

When you configure VTY lines, bear in mind that users are assigned a line at random when they connect to the device.

---

**Note** You can create only one definition per VTY line. An error is displayed if you create a VTY line definition that overlaps an existing definition.

**Note** If you use Security Manager to configure the default VTY lines (0-4), your definition overrides the default settings on the device. If you later delete this definition from Security Manager, the input protocol settings are retained and the other default settings are restored. This ensures that you always have VTY lines available for remote access to the device.

**Note** You can use the CLI or FlexConfigs to configure additional VTY lines on devices that support more than 16 lines.

### Related Topics

- [Line Access on Cisco IOS Routers, page 63-35](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Select an existing policy or create a new one.
- The VTY page is displayed. See [Table 63-20 on page 63-50](#) for a description of the fields on this page.
- Step 2** Click the **Add** button beneath the Lines table, or select a line definition and then click the **Edit** button. The Setup tab of the VTY Lines dialog box is displayed. See [Table 63-21 on page 63-51](#) for a description of the fields on this tab.
- Step 3** Enter the relative line number of the VTY line. If you are configuring a group of VTY lines, enter the first and last numbers of the group in the fields provided.
- Step 4** (Optional) Enter the password for accessing the console line, then enter it again in the Confirm field.
- Step 5** (Optional) Modify the default Privilege (15) granted to users of this VTY line (or group of lines).
- Step 6** (Optional) Select the **Disable all the EXEC sessions to the router via this line** check box to prevent any incoming connections over this VTY line (or group of lines).
- Step 7** (Optional) Modify the default timeout after which the line is disconnected if no user input is detected.

**Note** Setting this value to 0 to disables the timeout. Disabling the timeout could cause abandoned sessions to block available VTY lines. It can also compromise the security of your network.

- Step 8** (Optional) Specify which protocols can be used for inbound and outbound connections on this VTY line (or group of lines):
- All—All supported protocols are permitted.
  - None—No protocols are permitted.
  - Protocol—Enables one or more of the following protocols: SSH, Telnet, and rlogin.

**Caution**

Setting the inbound connections setting to None might prevent Security Manager from connecting to the device after deployment.

**Note**

You must configure AAA authentication when the VTY line permits the SSH and rlogin protocols. See [Defining VTY Line AAA Settings, page 63-40](#).

- Step 9** (Optional) Enter the names of ACLs that restrict incoming and outgoing connections between the device and the addresses in these lists, or click **Select** to select an ACL object from a list or to create a new one. You can choose from standard or extended ACLs.

**Tip**

Defining an inbound ACL is a good way to reserve a VTY line for administrative access only.

- Step 10** (Optional) Click the **AAA** tab to define authentication, authorization, and accounting settings for this VTY line (or group of lines). See [Defining VTY Line AAA Settings, page 63-40](#).

- Step 11** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Lines table.

**Note**

To remove a VTY line definition, select it, then click **Delete**. If you delete a VTY line from an IOS device, any subsequent lines are also deleted. For example, if the device contains lines 0-9 and you delete line 5, lines 6-9 are deleted as well. If you delete the definition for lines 0-4 from Security Manager, the router retains the inbound protocol definition and restores the other default settings for these lines on the device. This ensures that five VTY lines are always available.

## Defining VTY Line AAA Settings

By default, authentication, authorization, and accounting are not performed on VTY lines. When you configure one or more of these access control options, you can either make use of the default method lists defined in the device's AAA policy or define a custom method list containing one or more AAA methods.

### Before You Begin

- Define the basic parameters of the VTY line or group of VTY lines. See [Defining VTY Line Setup Parameters, page 63-38](#).

### Related Topics

- [Defining VTY Line Setup Parameters, page 63-38](#)
- [Line Access on Cisco IOS Routers, page 63-35](#)

- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Select an existing policy or create a new one.

The VTY page is displayed. See [Table 63-20 on page 63-50](#) for a description of the fields on this page.

**Step 2** Select a VTY line definition in the Lines tables, click the **Edit** button to display the VTY Line dialog box, then click the **Authentication** tab.

**Step 3** (Optional) Select the authentication method to perform on users who attempt to access the VTY line.

See [Table 63-23 on page 63-55](#) for a description of the fields on this tab.

---

**Note** If you select local authentication, preview the full configuration before deployment to make sure that the **aaa new-model** command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.

---

**Step 4** (Optional) On the Authorization tab, select the authorization method to perform on users who access the VTY line and begin an EXEC session.

See [Table 63-24 on page 63-56](#) for a description of the fields on the Authorization tab.

---

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

---

**Step 5** (Optional) Create command authorization definitions for specific privilege levels:

- a. Click the **Add** button under the Commands Authorization table. The [Command Authorization Dialog Box—Line Access, page 63-60](#) is displayed.
- b. Configure the command authorization definition as required.
- c. Click **OK**. The dialog box closes and the authorization method is displayed in the Commands Authorization table.
- d. Repeat [a.](#) through [c.](#) to create additional command authorization definitions.

**Step 6** (Optional) On the Accounting tab, select the EXEC and connection accounting methods to perform on users who attempt to access the VTY line.

See [Table 63-25 on page 63-58](#) for a description of the fields on the Accounting tab.

**Step 7** (Optional) Create command accounting definitions for specific privilege levels:

- a. Click the **Add** button under the Commands Accounting table. The [Command Accounting Dialog Box—Line Access, page 63-61](#) is displayed.
  - b. Configure the command accounting definition as required.
  - c. Click **OK**. The dialog box closes and the accounting method is displayed in the Commands Accounting table.
  - d. Repeat [a.](#) through [c.](#) to create additional command accounting definitions.
-

# Console Policy Page

Use the Console page to configure access to the router over the console port. You can configure console policies on a Cisco IOS router from the following tabs on the Console policy page:

- [Console Page—Setup Tab, page 63-42](#)
- [Console Page—Authentication Tab, page 63-44](#)
- [Console Page—Authorization Tab, page 63-45](#)
- [Console Page—Accounting Tab, page 63-47](#)

For more information, see [Line Access on Cisco IOS Routers, page 63-35](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Right-click **Console** to create a policy, or select an existing policy from the Shared Policy selector.

|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level                                           | <p>The privilege level assigned to users connected to the console port. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p> |
| Disable all the EXEC sessions to the router via this line | <p>When selected, disables EXEC sessions over this line. Select this option when you want to allow only an outgoing connection on the console. This option is useful for keeping the console port free from unsolicited incoming data that can tie up the line.</p> <p>When deselected, EXEC sessions are enabled on the console port. This is the default.</p> <p><b>Note</b> Selecting this option blocks all access to the device via the console port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Exec Timeout                                              | <p>The amount of time (in seconds) that the EXEC command interpreter waits to detect user input on the console port. If no input is detected, the line is disconnected. Valid values range from 0 to 2147483. The default is 600 (10 minutes). Setting the value to 0 disables the timeout.</p> <p><b>Note</b> Although the timeout is defined in seconds, it appears in the CLI in the format [mm ss].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 63-16 Console Page—Setup Tab (continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output Protocols                 | <p>The protocols that you can use for outgoing connections on the console port:</p> <ul style="list-style-type: none"> <li>All—All supported protocols are permitted. Supported protocols include LAT, MOP, NASI, PAD, rlogin, SSH, Telnet, and V.120.</li> <li>None—No protocols are permitted. This makes the port unusable by outgoing connections.</li> <li>Protocol—Enables one or more of the following protocols: <ul style="list-style-type: none"> <li>SSH—Secure Shell protocol.</li> <li>Telnet—Standard TCP/IP terminal emulation protocol.</li> <li>rlogin—UNIX rlogin protocol.</li> </ul> </li> </ul> <p><b>Note</b> SSH and rlogin require that you configure AAA authentication. See <a href="#">Console Page—Authentication Tab, page 63-44</a>.</p> <p><b>Note</b> Not all IOS Software Versions support rlogin as an output protocol.</p> |
| Inbound Access List              | <p>The name of the ACL object that restricts incoming connections on the console port. Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Permit VRF Interface Connections | <p>Applies only when an inbound ACL is defined on the console port. When selected, accepts incoming connections from interfaces that belong to a VRF. When deselected, rejects incoming connections from interfaces that belong to a VRF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Outbound Access List             | <p>The name of the ACL object that restricts outgoing connections on the console port. Enter the name of an ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Console Page—Authentication Tab

Use the Authentication tab of the Console page to define the AAA authentication methods to perform on users who attempt to access the console port.

### Navigation Path

Go to the [Console Policy Page, page 63-42](#), then click the **Authentication** tab.

|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authenticate Using      | <p>Authentication settings for the console port:</p> <ul style="list-style-type: none"> <li>• None—Authentication is not performed. This is the default.</li> <li>• Local Database—Uses the local username database for authentication.</li> <li>• AAA Policy Default List—Uses the default authentication method list that is defined in the device's AAA policy. See <a href="#">AAA Page—Authentication Tab, page 63-6</a>.</li> <li>• Custom Method List—Uses the authentication methods specified in the Authentication Method List field.</li> </ul> <p><b>Note</b> If you select local authentication, preview the full configuration before deployment to make sure that the <b>aaa new-model</b> command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.</p> |
| Prioritized Method List | <p>Applies only when Custom Method List is selected as the authentication method.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p>                                                   |

## Console Page—Authorization Tab

Use the Authorization tab of the Console page to define the EXEC and command authorization methods to perform on users who access the console port.

**Note**

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services, page 63-4](#).

**Navigation Path**

Go to the [Console Policy Page, page 63-42](#), then click the **Authorization** tab.

| Delete button | Deletes the selected command authorization definitions from the table.                                                                            |

## Console Page—Accounting Tab

Use the Accounting tab of the Console page to define the EXEC, connection, and command accounting methods to perform on users who access the console port.

### Note

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services](#), page 63-4.

### Navigation Path

Go to the [Console Policy Page](#), page 63-42, then click the **Accounting** tab.

| Edit button   | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 63-61</a> . From here you can edit the command accounting definition.    |
| Delete button | Deletes the selected command accounting definitions from the table.                                                                            |

## VTY Policy Page

Use the VTY page to configure up to 16 VTY lines for remote access to the router. In addition to configuring individual lines, you can configure a group of lines that share the same definition.

For more information, see [Line Access on Cisco IOS Routers, page 63-35](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Right-click **VTY** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                    | Description                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Line                       | The relative line number of the VTY line. This field may also contain multiple VTY lines configured as a contiguous group. |
| Line/Line Group Parameters |                                                                                                                            |
| Input Protocols            | The protocols that you can use for incoming connections on the VTY line.                                                   |
| Output Protocols           | The protocols that you can use for outgoing connections on the VTY line.                                                   |
| Privilege Level            | The privilege level assigned to users.                                                                                     |
| Exec Timeout               | The amount of time the EXEC command interpreter waits until user input is detected.                                        |
| Inbound ACL                | The ACL used to limit inbound traffic.                                                                                     |

**Table 63-20** VTY Lines Page (continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Outbound ACL          | The ACL used to limit outbound traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Authentication        | The type of AAA authentication used.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Authorization         | The types of AAA authorization used.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Accounting            | The types of AAA accounting used.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VTY Line Page Buttons |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Add button            | Opens the <a href="#">VTY Line Dialog Box, page 63-51</a> . From here you can define a VTY line or line group.                                                                                                                                                                                                                                                                                                                                                                              |
| Edit button           | Opens the <a href="#">VTY Line Dialog Box, page 63-51</a> . From here you can edit the VTY line or line group.                                                                                                                                                                                                                                                                                                                                                                              |
| Delete button         | Deletes the selected VTY lines from the table.<br><br>If you delete a VTY line from an IOS device, any subsequent lines are also deleted. For example, if the device contains lines 0-9 and you delete line 5, lines 6-9 are deleted as well.<br><br><b>Note</b> If you delete any of the default VTY lines (0-4) on the device, the input protocol settings are retained and the other default settings are restored. This helps prevent you from cutting off remote access to the device. |

## VTY Line Dialog Box

Use the VTY Line dialog box to configure one or more VTY lines (up to 16) that enable remote users to access the router. When you configure a VTY line, you can define the type of authentication and authorization to perform on users who access the lines.

### Navigation Path

Go to the [VTY Policy Page, page 63-50](#), then click the **Add** or **Edit** button beneath the table.

## VTY Line Dialog Box—Setup Tab

Use the Setup tab of the VTY Line dialog box to define the basic parameters of the VTY line. This includes the password for accessing the line, the privilege level assigned to users, the protocols that are permitted on the line, and the ACLs that limit access.

### Navigation Path

Go to the [VTY Line Dialog Box, page 63-51](#), then click the **Setup** tab.

| Password                                                  | <p>The password for accessing this VTY line.</p> <p>The password is case sensitive and can contain up to 80 alphanumeric characters. The first character cannot be a number. Spaces are not allowed.</p> <p>Enter the password again in the Confirm field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Privilege Level                                           | <p>The privilege level assigned to users on this VTY line. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p> |
| Disable all the EXEC sessions to the router via this line | <p>When selected, EXEC sessions are disabled over this line. Select this option when you want to allow only an outgoing connection on this line. This option is useful for keeping a particular line free from unsolicited incoming data that can tie up the line.</p> <p>When deselected, EXEC sessions are enabled over this line. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Exec Timeout                                              | <p>The amount of time (in seconds) that the EXEC command interpreter waits to detect user input on the line. If no input is detected, the line is disconnected. Valid values range from 0 to 2147483. The default is 600 (10 minutes). Setting the value to 0 disables the timeout.</p> <p><b>Note</b> Although the timeout is defined in seconds, it appears in the CLI in the format [mm ss].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## VTY Line Dialog Box—Authentication Tab

Use the Authentication tab of the VTY Line dialog box to define the authentication methods to perform on users who attempt to access the selected VTY line or group of lines.

### Navigation Path

Go to the [VTY Line Dialog Box](#), page 63-51, then click the **Authentication** tab.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List | <p>Applies only when Custom Method List is selected as the authentication method.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## VTY Line Dialog Box—Authorization Tab

Use the Authorization tab of the VTY Line dialog box to define the EXEC and command authorization methods to perform on users who access the selected VTY line or group of lines.

### Note

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services, page 63-4](#).

### Navigation Path

Go to the [VTY Line Dialog Box, page 63-51](#), then click the **Authorization** tab.

| Authorize EXEC Operations Using | <p>The authorization method that determines whether a user is allowed to run an EXEC session:</p> <ul style="list-style-type: none"> <li>• None—Authorization is not performed. This is the default.</li> <li>• AAA Policy Default List—Uses the default authorization method list that is defined in the device's AAA policy. See <a href="#">AAA Page—Authorization Tab, page 63-8</a>.</li> <li>• Custom Method List—Uses the authorization methods specified in the Prioritized Method List field.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Prioritized Method List         | <p>Applies only when Custom Method List is selected as the EXEC method.</p> <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> <p><b>Note</b> RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.</p> |
| Command Authorization settings  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Privilege Level                 | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Prioritized Method List         | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Add button                      | Opens the <a href="#">Command Authorization Dialog Box—Line Access, page 63-60</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit button                     | Opens the <a href="#">Command Authorization Dialog Box—Line Access, page 63-60</a> . From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Delete button                   | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## VTY Line Dialog Box—Accounting Tab

Use the Accounting tab of the VTY Line dialog box to define the EXEC, connection, and command accounting methods to perform on users who access the selected VTY line or group of lines.

**Note**

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services, page 63-4](#).

**Navigation Path**

Go to the [VTY Line Dialog Box, page 63-51](#), then click the **Accounting** tab.

The user process begins regardless of whether the accounting server receives the “start” accounting record. This is the default.</li> <li>• Stop Only—Generates an accounting record at the end of the user process only.</li> <li>• None—No accounting records are generated.</li> </ul>                                                              |

Table 63-25 VTY Line Dialog Box—Accounting Tab (continued)

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List              | <p>Applies only when Custom Method List is selected as the EXEC method.</p> <p>Defines a sequential list of methods to be queried when creating accounting methods for a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Enable Broadcast to Multiple Servers | <p>Applies only when Method List is selected as the EXEC method.</p> <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                            |
| Connection Accounting settings       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Perform Connection Accounting Using  | <p>The accounting method to use for recording information about outbound connections made over the VTY line:</p> <ul style="list-style-type: none"> <li>• None—Accounting is not performed. This is the default.</li> <li>• AAA Policy Default List—Uses the default connection accounting method list that is defined in the device’s AAA policy. See <a href="#">AAA Page—Accounting Tab, page 63-10</a>.</li> <li>• Custom Method List—Uses the accounting methods specified in the Prioritized Method List field.</li> </ul> <p>Connection accounting records details about outgoing connections over the line, such as Telnet and rlogin connections.</p>                                                                                                                                                              |
| Generate Accounting Records for      | <p>Applies only when Custom Method List is selected as the connection method.</p> <p>Defines when the device sends an accounting notice to the accounting server:</p> <ul style="list-style-type: none"> <li>• Start and Stop—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record. This is the default.</li> <li>• Stop Only—Generates an accounting record at the end of the user process only.</li> <li>• None—No accounting records are generated.</li> </ul>                                                                                                                                                                                                                      |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List              | <p>Applies only when Custom Method List is selected as the connection method.</p> <p>Defines a sequential list of methods to be queried when creating accounting methods for a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Enable Broadcast to Multiple Servers | <p>Applies only when Custom Method List is selected as the connection method.</p> <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                     |
| Command Accounting settings          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Privilege Level                      | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Generate Accounting Records for      | The points in the process where the device sends an accounting notice to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Broadcast                     | Whether accounting records are broadcast to multiple servers simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Prioritized Method List              | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Add button                           | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 63-61</a> . From here you can configure a command accounting definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit button                          | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 63-61</a> . From here you can edit the command accounting definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Delete button                        | Deletes the selected command accounting definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Command Authorization Dialog Box—Line Access

Use the Command Authorization dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

**Navigation Path**

From the [Console Page—Authorization Tab, page 63-45](#) or the [VTY Line Dialog Box—Authorization Tab, page 63-56](#), click the **Add** button beneath the Command Authorization table.

| Privilege Level         | The privilege level for which you want to define a command authorization list. Valid values range from 0 to 15.<br><br><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AAA Policy Default List | Select this option to apply the default authorization list defined in the device's AAA policy to the EXEC commands associated with this privilege level. See <a href="#">Command Accounting Dialog Box, page 63-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Custom Method List      | Select this option to define an authorization method list for this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Prioritized Method List | Applies only when the Custom Method List option is selected.<br><br>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.<br><br>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.<br><br><b>Note</b> If you select None as a method, it must appear as the last method in the list. |

**Command Accounting Dialog Box—Line Access**

Use the Command Accounting dialog box to define which methods to use when recording information about the EXEC commands that are executed for a given privilege. Each accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the name of the user who executed it.

**Navigation Path**

From the [Console Page—Accounting Tab, page 63-47](#) or the [VTY Line Dialog Box—Accounting Tab, page 63-57](#), click the **Add** button beneath the Command Accounting table.

| Generate Accounting Records for      | <p>Applies only when Custom Method List is selected.</p> <p>Defines when the device sends an accounting notice to the accounting server:</p> <ul style="list-style-type: none"> <li>• <b>Start and Stop</b>—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record. This is the default.</li> <li>• <b>Stop Only</b>—Generates an accounting record at the end of the user process only.</li> <li>• <b>None</b>—No accounting records are generated.</li> </ul>                                                                                                                                                                                                                          |
| Prioritized Method List              | <p>Applies only when the Custom Method List option is selected.</p> <p>Defines a sequential list of accounting methods to be used when creating accounting records for a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Enable Broadcast to Multiple Servers | <p>Applies only when Custom Method List is selected.</p> <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                                        |

# Optional SSH Settings on Cisco IOS Routers

Secure Shell (SSH) is an application and a protocol that uses encryption to provide secure communication between a client and server. You can use SSH to connect remotely to a Cisco IOS router over a VTY line and establish an EXEC session. SSH is the recommended replacement for other protocols, such as Telnet and rlogin, in environments where security is a concern.

All Cisco IOS routers are required to have SSH configured before they can be added to Security Manager. This is because Security Manager uses SSH (in addition to SSL) to communicate with them. The SSH policy provides a way to modify selected default settings and configure selected optional settings.

## Related Topics

- [Defining Optional SSH Settings, page 63-63](#)
- [Chapter 2, “Preparing Devices for Management”](#)
- [Setting Up SSH, page 2-5](#)

## Defining Optional SSH Settings

SSH is configured by default with the following settings:

- Both SSH version 1 and SSH version 2 are supported.
- The negotiation phase is terminated if not completed successfully after 120 seconds.
- The router tries 3 times to authenticate SSH clients before disconnecting.

You can use Security Manager to modify these default settings and optionally configure the following settings:

- The source interface for SSH packets.
- The name of the RSA key pair to use.
- Whether to regenerate the key during the next deployment.

## Before You Begin

- Make sure that SSH is enabled on the router. See [Chapter 2, “Preparing Devices for Management”](#).
- Make sure that the VTY lines on the router allow inbound SSH traffic. See [Defining VTY Line Setup Parameters, page 63-38](#).
- Make sure that a hostname and domain name are configured on the router (unless you plan to use a different RSA key pair). You can use the CLI or the Hostname policy in Security Manager for this purpose. See [Hostnames and Domain Names on Cisco IOS Routers, page 63-77](#).

## Related Topics

- [Optional SSH Settings on Cisco IOS Routers, page 63-63](#)
- [Setting Up SSH, page 2-5](#)

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Select an existing policy or create a new one.

The Secure Shell page is displayed. See [Table 63-28 on page 63-65](#) for a description of the fields on this page.

**Step 2** (Optional) Modify the following default settings:

- The version of SSH to support.
- The timeout for completing the negotiation phase of the SSH connection.
- The number of times to attempt authentication of the SSH client.

**Step 3** (Optional) In the Source Interface field, enter the name of the interface or interface role whose address should be used as the source interface for all SSH packets sent to SSH clients, or click **Select** to select an interface role object from a list or to create a new one. The source interface must have an IP address.

If you do not enter a value in this field, the address of the closest interface to the destination is used.

**Step 4** (Optional) Enter the name of the RSA key pair to use for SSH connections. If you do not enter a value in this field, the router uses the key pair that is based on the hostname and domain name.

**Tip** Use the CLI command `show crypto key mypubkey rsa` to display the names and values of each key pair configured on the device.

**Step 5** (Optional) Select the **Regenerate Key During Deployment** check box if you want the router to regenerate the RSA key pair used for SSH. This option is useful if you believe that the secrecy of the keys might be compromised. Enter the size of the modulus to use to regenerate the keys.

**Note** You must remember to return to this policy after deployment to deselect the check box. If you do not do this, a new key is generated during each deployment.

**Note** This option requires interaction with the device during deployment. Therefore, you should use it only when deploying to live devices, not when deploying to a file.

**Note** A key pair must already exist on the device *before* you select this option; otherwise, deployment will fail. (This will typically be the case, since IOS routers must have SSH enabled to be added to Security Manager.)

## Secure Shell Policy Page

Use the Secure Shell page to change the default SSH settings on the router and to define additional optional settings, if required.

For more information, see [Optional SSH Settings on Cisco IOS Routers, page 63-63](#).

**Note**

You must configure SSH on the device using CLI commands before adding the device to Security Manager. This is because Security Manager uses SSH (as well as SSL) to communicate with Cisco IOS routers. For more information, see [Setting Up SSH, page 2-5](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Right-click **Secure Shell** to create a policy, or select an existing policy from the Shared Policy selector.

|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSA Key Pair                     | <p>The name of the RSA key pair to use for SSH connections.</p> <p>If you do not enter a value, the router uses the RSA key pair generated from its hostname and domain name. This is the default.</p> <p><b>Tip</b> Use the CLI command <b>show crypto key mypubkey rsa</b> to display the names and values of each key pair configured on the device. These are the valid names that can be entered in this field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Regenerate Key During Deployment | <p>When selected, regenerates the RSA key pair on the router during the next deployment. This option is useful if you are concerned that the secrecy of the keys might be compromised.</p> <p>When deselected, a new key pair is not generated.</p> <p><b>Note</b> This check box is <i>not</i> deselected automatically after deployment. If you do not return to this policy to deselect the check box, the key is regenerated each time you deploy.</p> <p><b>Note</b> This option requires interaction with the device during deployment. Therefore, you should use it only when deploying to live devices, not when deploying to a file.</p> <p><b>Note</b> A key pair must already exist on the device <i>before</i> you select this option; otherwise, deployment will fail. (This will typically be the case, since IOS routers must have SSH enabled in order to be added to Security Manager.)</p> |
| Modulus Size                     | <p>Applies only when the Regenerate Key check box is selected.</p> <p>The size of the modulus used to generate a new key pair. A larger modulus is more secure but takes longer to generate. Valid values range from 360 to 2048 bits. The default is 1024 bits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## SNMP on Cisco IOS Routers

Simple Network Management Protocol (SNMP) defines a standard way for network management stations or workstations to monitor the health and status of many types of devices, including switches, routers, and firewall devices. It comprises a protocol, a database-structure specification, and a set of management data objects. Each SNMP device or member is part of a *community*, which determines the access that each device has (read-only or read-write).

SNMP obtains information from the managed device through a Management Information Base (MIB). The MIB is a database of code blocks called MIB objects, each of which controls one specific function. The MIB object comprises MIB variables, which define the MIB object name, description, default value, and so forth. MIB objects are structured hierarchically in a MIB tree.

SNMP policies enable you to configure the behavior of the SNMP agent running on the router. The agent sends unsolicited information back to the SNMP host as events occur. These unsolicited messages, which are generated in response to significant, predetermined events on the router, are called traps.

The following topics describe the tasks you perform to create SNMP policies on Cisco IOS routers:

- [Defining SNMP Agent Properties, page 63-67](#)

- [Enabling SNMP Traps, page 63-68](#)

## Defining SNMP Agent Properties

When you define the properties of the SNMP agent, you must define the community string and community string type, as well as the address and properties of the SNMP host that receives the traps.

SNMP community strings are embedded passwords to MIBs, which store data about the router's operation and are meant to be available to authenticated remote users. Two types of community strings exist: "public" community strings, which provide read-only access to all objects in the MIB (except community strings themselves), and "private" community strings, which provide read-write access to all objects in the MIB (except community strings).

SNMP hosts receive the traps generated by the router. You must define the address, password, and port number for accessing the SNMP host, as well as the SNMP version being used. Security Manager supports SNMP version 1, version 2c (also called "community-based SNMP") and version 3, which offers authentication and encryption.

### Related Topics

- [SNMP on Cisco IOS Routers, page 63-66](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Select an existing policy or create a new one.
- The SNMP page is displayed. See [Table 63-29 on page 63-69](#) for a description of the fields on this page.
- Step 2** Define the community string needed to access the MIB:
- a. Under Permissions, click **Add** to display the Permission dialog box.
  - b. Define the string. See [Table 63-30 on page 63-70](#) for a description of the available fields.
  - c. Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Permissions table.
-  **Note** A warning is displayed if you attempt to edit or delete a community string that is in use by an SNMP host. If you continue with the operation, the device creates a private, read-only string that matches the definition for the host in the Trap Receiver table.
- 
- Step 3** Define the SNMP host that receives the traps generated by the SNMP agent:
- a. Under Trap Receiver, click **Add** to display the Trap Receiver dialog box.
  - b. Define the host. See [Table 63-31 on page 63-71](#) for a description of the available fields.
  - c. Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Trap Receiver table.
- Step 4** Under SNMP Server Properties, enter the location and contact information for the administrator responsible for routers configured with this SNMP policy.

This definition, which is text-only and does not affect the operation of the router, provides useful information to the manager of the SNMP host when the manager investigates a particular trap.

- Step 5** Click **Configure Traps** to display the SNMP Traps dialog box, which is used to select which traps to enable on the router. For more information, see [Enabling SNMP Traps, page 63-68](#).
- 

## Enabling SNMP Traps

The router immediately sends notifications, also called SNMP traps, to the designated SNMP host (management station) when a defined condition occurs, such as a link up, link down, or a syslog event. To enable SNMP traps, select the check box next to each relevant trap. Certain check boxes activate multiple, related traps.

**Note** Each trap that you enable consumes system resources. To lessen the impact on system performance, select only those traps that you need for network monitoring.

---

### Related Topics

- [SNMP on Cisco IOS Routers, page 63-66](#)
- 

- Step 1** Open the SNMP page for defining SNMP server policies on Cisco IOS routers, as described in [Defining SNMP Agent Properties, page 63-67](#).
- Step 2** On the SNMP page, click **Configure Traps**. The SNMP Traps dialog box is displayed.
- Step 3** Select the check box next to each type of trap to enable. The traps are divided into the following four categories:
- Standard SNMP traps (for example, Authentication, Cold Start, and Warm Start).
  - ISAKMP traps (related to Phase 1 of the IPsec process).
  - IPsec traps (related to Phase 2 of the IPsec process).
  - Other traps (includes syslog messages, protocol-related notifications, and CPU usage warnings).

See [Table 63-32 on page 63-73](#) for a description of the available traps.

**Note** You must add command-line interface (CLI) commands to fully implement the IP multicast and CPU traps. One method available for entering these commands is by using FlexConfigs. See [Chapter 7, “Managing FlexConfigs”](#).

---

**Tip** Click **Select All** to enable all traps displayed in the dialog box or **Deselect All** to disable all the traps.

---

- Step 4** Click **OK** to save your definitions locally on the client and close the dialog box.

**Tip** To configure SNMP traps not included in this dialog box, define a FlexConfig. See [Chapter 7, “Managing FlexConfigs”](#) for more information.

---

# SNMP Policy Page

Use the SNMP page to configure the parameters necessary to send traps from the router to a designated SNMP host. These traps are unsolicited messages that notify the SNMP host of important events occurring on the router.

For more information, see [Defining SNMP Agent Properties, page 63-67](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Right-click **SNMP** to create a policy, or select an existing policy from the Shared Policy selector.

| Community String              | The community string used for accessing the router's MIB.                                                                                                |
| Type                          | The community string type—read-only or read-write.                                                                                                       |
| ACL                           | The standard ACL that defines the IP addresses permitted to access the router's MIB.                                                                     |
| Add button                    | Opens the <a href="#">Permission Dialog Box, page 63-70</a> . From here you can enter the community string and type required to generate traps.          |
| Edit button                   | Opens the <a href="#">Permission Dialog Box, page 63-70</a> . From here you can edit the selected permissions profile.                                   |
| Delete button                 | Deletes the selected permissions profiles from the table.                                                                                                |
| Trap Receiver table           |                                                                                                                                                          |
| Host IP Address               | The IP address of the SNMP host receiving the traps generated by the router.                                                                             |
| SNMP Version                  | The SNMP version being used by the router.                                                                                                               |
| UDP Port                      | The UDP port that is being used by the SNMP host.                                                                                                        |
| Add button                    | Opens the <a href="#">Trap Receiver Dialog Box, page 63-71</a> . From here you can define the SNMP host that receives the traps generated by the router. |
| Edit button                   | Open the <a href="#">Trap Receiver Dialog Box, page 63-71</a> . From here you can edit the selected SNMP host.                                           |
| Delete button                 | Deletes the selected SNMP hosts from the table.                                                                                                          |
| Additional fields and buttons |                                                                                                                                                          |

**Table 63-29** *SNMP Page (continued)*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP Server Properties | <p>The name and contact information of the system administrator responsible for the SNMP server/agent (that is, the router). The person managing the SNMP host can use this information when tracking down the source of unusual events.</p> <p>The maximum length of each of these properties is 255 characters, including spaces.</p> <p><b>Note</b> The values entered in these fields are text-only and do not affect the operation of the router.</p> |
| Configure Traps button | Opens a dialog box for selecting which SNMP traps the router should generate. See <a href="#">SNMP Traps Dialog Box, page 63-72</a> .                                                                                                                                                                                                                                                                                                                      |

## Permission Dialog Box

Use the Permission dialog box to define the community string and string type required by the SNMP policy. The community string is an embedded password for accessing the Management Information Base (MIB) that stores operational data about the router.

### Navigation Path

Go to [SNMP Policy Page, page 63-69](#), then click the **Add** or **Edit** button beneath the Permissions table.

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Community String     | The community string for accessing the router's MIB. String length ranges from 1 to 128 characters.                                                                                                                                                                                                                                                                                                                                                                         |
| Access Control Lists | <p>Applies only to routers running Cisco IOS Software Release 12.3(2)T and up (T-train) or any 12.4 version.</p> <p>The standard ACL containing the IP addresses that can access the router's MIB. Defining an ACL provides an additional layer of security by limiting the source addresses that can make use of the community string.</p> <p>Enter the name of a standard ACL object, or click <b>Select</b> to select the object from a list or to create a new one.</p> |

**Table 63-30** *Permission Dialog Box (continued)*

| Element    | Description                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| Read-Write | This community string type provides read-write access to all objects in the MIB (except community strings).                     |
| Read-Only  | This community string type provides read-only access to all objects in the MIB (except community strings). This is the default. |

## Trap Receiver Dialog Box

Use the Trap Receiver dialog box to define the SNMP hosts that receive traps generated by the router. This includes defining the version of SNMP to use.

### Navigation Path

Go to the [SNMP Policy Page, page 63-69](#), then click the **Add** or **Edit** button beneath the Trap Receiver table.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host IP Address  | The IP address of the SNMP host receiving the traps generated by the router. Enter an IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new one.                                                                                                                                                                                                                                  |
| SNMP Version     | The version of SNMP to use—version 1, version 2c, or version 3.                                                                                                                                                                                                                                                                                                                                                                                         |
| Community String | Applies only when version 1 or version 2c is selected.<br>The password required to access the SNMP host. Enter the string again in the Confirm field.<br><b>Note</b> We recommend that you use one of the strings defined in the Permissions table as the password to the SNMP host. You may, however, enter a different password. String length ranges from 1 to 128 characters. Your entry does not appear in the Permissions table and is read-only. |

**Table 63-31** Trap Receiver Dialog Box (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name       | <p>Applies only when version 3 is selected.</p> <p>The password required to access the SNMP host. Enter the string again in the Confirm field.</p> <p><b>Note</b> We recommend that you use one of the strings defined in the Permissions table as the password to the SNMP host. You may, however, enter a different password. String length ranges from 1 to 128 characters. Your entry does not appear in the Permissions table and is read-only.</p> |
| SNMPv3 Security | <p>Applies only when version 3 is selected.</p> <p>The level of security to apply to SNMP traffic:</p> <ul style="list-style-type: none"> <li>• No MD5, No DES—No packet authentication.</li> <li>• MD5 (auth)—MD5 authentication, but no encryption.</li> <li>• DES (priv)—MD5 authentication and DES encryption.</li> </ul>                                                                                                                            |
| UDP Port        | <p>The port number for the SNMP host. The default is 162. Valid values range from 0 to 65535.</p>                                                                                                                                                                                                                                                                                                                                                        |

## SNMP Traps Dialog Box

Use the SNMP Traps dialog box to select the events in the router that should generate SNMP traps. To lessen possible degradation of system performance, select only those traps that are needed for network monitoring purposes.

### Tip

You can configure SNMP traps not included in this dialog box by defining FlexConfigs. For more information, see [Understanding FlexConfig Policies and Policy Objects, page 7-2](#).

### Navigation Path

Go to the [SNMP Policy Page, page 63-69](#), then click **Configure Traps**.

| Other Traps         | <p>Enables or disables additional SNMP traps. Options are:</p> <ul style="list-style-type: none"> <li>• Syslog—Sends syslog messages to the SNMP host.</li> <li>• TTY—Sends Cisco-specific notifications when a Transmission Control Protocol (TCP) connection closes.</li> <li>• BGP—Sends notifications when Border Gateway Protocol (BGP) state changes occur. See <a href="#">BGP Routing on Cisco IOS Routers, page 67-1</a>.</li> <li>• IP Multicast—(Applicable to multicast routers only) Sends a trap if the router fails to receive a defined number of heartbeat packets from heartbeat sources within a defined time interval.<br/><br/>If you select IP Multicast, you must also manually configure the <b>ip multicast heartbeat</b> command on the device to configure the multicast address and heartbeat limits. You can use FlexConfigs to do this.</li> <li>• CPU—Sends a trap when CPU usage rises and remains above an upper threshold or falls and remains below a lower threshold.<br/><br/>If you select CPU, you must also manually configure the <b>process cpu threshold type</b> command on the device to configure the thresholds. You can use FlexConfigs to do this.</li> <li>• HSRP—Sends Hot Standby Routing Protocol (HSRP) notifications.</li> </ul> |
| Select All button   | Enables all the SNMP traps displayed in the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Deselect All button | Disables all the SNMP traps displayed in the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## DNS on Cisco IOS Routers

The Domain Name System (DNS) is a distributed database in which you can map hostnames to IP addresses through the DNS protocol from a DNS server. Each unique IP address can have an associated hostname. DNS is what makes it possible to connect to hosts without having to know the 32-bit IP address of that host. The DNS server takes the provided hostname and translates it into the appropriate IP address.

In addition to the translation provided by remote DNS servers, you can configure Cisco IOS routers with a local host table containing static mappings of hosts to IP addresses. When commands such as connect, telnet, and ping are used, the router checks this host table before querying the DNS servers, which speeds the translation process.

By default, the DNS feature is enabled on all Cisco IOS routers.

## Defining DNS Policies

When you define a DNS policy in Security Manager, you can specify the remote DNS servers used by the router for hostname-to-address translations. In addition, you can define a static host table that contains local translations used exclusively by this device. Having selected addresses in this type of cache can speed the translation process by eliminating the need to query the DNS servers.

### Related Topics

- [DNS on Cisco IOS Routers, page 63-74](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > DNS** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > DNS** from the Policy Type selector. Select an existing policy or create a new one.

The DNS page is displayed. See [Table 63-33 on page 63-76](#) for a description of the fields on this page.

- Step 2** In the Servers field, enter the addresses of the DNS servers (up to 6) that can perform hostname-to-address translations for the router. You can use a combination of addresses and network/host objects, or click **Select** to display a selector. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).

**Tip** If the network you want is not listed in the selector, click the **Create** button or the **Edit** button in the selector to display the [Add or Edit Network/Host Dialog Box, page 6-83](#). From here you can create a network/host object to use in the policy.

- Step 3** (Optional) In the Hosts field, enter the static host mappings that you want to define in the router's host table:
- a. Click **Add** to display the [IP Host Dialog Box, page 63-76](#).
  - b. Enter the hostname to translate.
  - c. Enter up to three addresses or network/host objects, or click **Select** to display a selector. These are the addresses to which the router translates the hostname.
  - d. Click **OK**. The mapping is displayed in the Hosts field on the DNS page.
  - e. Repeat **a.** through **d.** to add more hosts to the host table.

**Note** To edit a host mapping, select the definition from the Hosts field, then click **Edit**. To remove a host mapping, select it, then click **Delete**.

- Step 4** (Optional) Deselect the **Domain Lookup** check box to disable DNS functionality on the router.
-

# DNS Policy Page

Use the DNS policy page to define the local IP host table and the Domain Name System (DNS) servers that the router should use for translating hostnames to IP addresses. You can also prevent the router from performing DNS lookups by disabling the DNS feature.

## Navigation Path

- (Device view) Select **Platform > Device Admin > DNS** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > DNS** from the Policy Type selector. Right-click **DNS** to create a policy, or select an existing policy from the Shared Policy selector.

|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Servers       | The DNS servers used by the router to perform DNS lookups. Enter one or more addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one. You can define a maximum of six DNS servers.                                                                                                                                                                                                                                                                                 |
| Hosts         | <p>The local host table configured on the router. When a user types in a hostname, the router checks this table first before querying the DNS servers defined in the Servers field.</p> <p>Click <b>Add</b> to display the <a href="#">IP Host Dialog Box, page 63-76</a>. From here you can define a hostname and the IP addresses to associate with that hostname.</p> <p><b>Note</b> To edit an entry in the host table, select it, then click <b>Edit</b>. To remove an entry, select it, then click <b>Delete</b>.</p> |
| Domain Lookup | <p>When selected, the router performs lookups on the defined DNS servers. This is the default.</p> <p>When deselected, lookups on remote DNS servers are disabled.</p>                                                                                                                                                                                                                                                                                                                                                      |

## IP Host Dialog Box

Use the IP Host dialog box to configure the host table on the router. This is the table of static, local mappings that the router uses to translate hostnames to IP addresses. If the router does not find the required entry in the host table, it queries the DNS servers that are defined on the DNS page.

## Navigation Path

Go to the [DNS Policy Page, page 63-76](#), then click **Add** under Hosts.

| Host Name | The hostname to include in the router's local host table.                                                                                                                                                                                      |
| Addresses | The addresses to associate with the hostname. Enter one or more addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new object. You can define a maximum of three addresses per hostname. |

## Hostnames and Domain Names on Cisco IOS Routers

The Hostname policy configures the hostname and domain name of the selected router. After you deploy this policy, any changes that you made to the hostname and domain name are reflected in the Device Properties page (see [Viewing or Changing Device Properties, page 3-41](#)).

**Related Topics**

- [Defining Hostname Policies, page 63-77](#)

## Defining Hostname Policies

When you define a hostname policy, Security Manager updates the hostname and domain name fields in the Device Properties dialog box after deployment. See [Viewing or Changing Device Properties, page 3-41](#).

**Related Topics**

- [Hostnames and Domain Names on Cisco IOS Routers, page 63-77](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Hostname** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Hostname** from the Policy Type selector. Select an existing policy or create a new one.
- The Hostname page is displayed. See [Table 63-35 on page 63-78](#) for a description of the fields on this page.
- Step 2** Enter the hostname for the router. Names must start with a letter, end with a letter or digit, and include only letters, digits, and hyphens. The maximum length is 63 characters.
- Step 3** Enter the domain name for the router. The router uses this domain name for RSA key generation and in policies when you do not enter the fully-qualified domain name.
-

# Hostname Policy Page

Use the Hostname page to define the hostname and domain name assigned to the router. For more information, see [Defining Hostname Policies, page 63-77](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Hostname** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Hostname** from the Policy Type selector. Right-click **Hostname** to create a policy, or select an existing policy from the Shared Policy selector.

# Memory Settings on Cisco IOS Routers

The Memory policy configures settings relating to router memory. This policy provides you with methods for monitoring memory consumption, including the ability to generate notification messages when available memory drops below predefined thresholds.

### Note

The Memory policy is supported on routers running Cisco IOS Software Release 12.3(14)T or later.

## Related Topics

- [Defining Router Memory Settings, page 63-78](#)

# Defining Router Memory Settings

You can use Security Manager to modify the following default memory settings:

- The number of hours that the router maintains the log of memory consumption.
- Whether to enable the Memory Allocation Lite feature.
- The amount of memory to reserve for critical system log messages.

In addition, you can define:

- The lower thresholds for processor and I/O memory. Log messages are sent when available memory drops below these thresholds.
- The types of sanity checks to perform.

## Field Reference

Table 63-36 Memory Page

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maintain Memory Log                      | <p>The number of hours that the router should maintain the log containing the history of memory consumption on the device. Valid values range from 12 to 72 hours. The default is 24 (1 day).</p> <p><b>Note</b> The memory log is enabled by default and cannot be disabled.</p>                                                                                                                                                                                                                                                                        |
| Processor Threshold                      | <p>The processor memory threshold in kilobytes. When available processor memory falls below this threshold, a notification message is triggered. Valid values range from 1 to 4294967295 kilobytes (4096 gigabytes).</p> <p><b>Note</b> Another notification message is generated when available free memory rises to 5% above the threshold.</p>                                                                                                                                                                                                        |
| I/O Threshold                            | <p>The I/O memory threshold in kilobytes. When available processor memory falls below this threshold, a notification message is triggered. Valid values range from 1 to 4294967295 kilobytes (4096 gigabytes).</p> <p><b>Note</b> Another notification message is generated when available free memory rises to 5% above the threshold.</p>                                                                                                                                                                                                              |
| Memory Allocation Lite                   | <p>When selected, the “memory-allocation lite” (malloc_lite) feature on the router is enabled. This feature avoids excessive memory allocation overhead for situations where less than 128 bytes are required. This is the default.</p> <p>When deselected, the “memory-allocation lite” feature is disabled.</p> <p><b>Note</b> This feature is supported for processor memory pools only.</p>                                                                                                                                                          |
| Memory Region For Critical Notifications | <p>The amount of memory (in kilobytes) reserved for critical system log messages. Valid values range from 1 to 4294967295 kilobytes (4096 gigabytes), but the value you specify cannot exceed 25% of total memory.</p> <p>This option reserves a region of memory on the router so that the router can issue critical system log messages even when system resources are overloaded.</p>                                                                                                                                                                 |
| Perform Sanity Checks                    | <p>The types of sanity checks to perform:</p> <ul style="list-style-type: none"> <li>• Buffer—When selected, performs sanity checks on all buffers. Sanity checks are performed when a packet buffer is allocated and when the packet buffer is returned to the buffer pool.</li> <li>• Queue—When selected, performs sanity checks on all queues.</li> <li>• All—When selected, performs sanity checks on all buffers and queues.</li> </ul> <p><b>Note</b> Enabling any of these options may result in a slight degradation of router performance.</p> |

# Secure Device Provisioning on Cisco IOS Routers

Secure Device Provisioning (SDP) offers an integrated solution for streamlining VPN and network security deployment. SDP (previously called Easy Secure Device Deployment, or EzSDD) enables remote-site users to securely bootstrap their VPN device through an easy-to-use web interface, thereby easing the deployment burden, lowering costs, and shortening the network development cycle. For example, a telecommuter or small branch office user can remove a new device from its shipping package, plug it in, open a simple web management interface, and establish VPN connectivity, all within a period of just a few minutes.

For more information about SDP, see *Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI*, which can be found in *Cisco IOS Security Configuration Guide, Release 12.4T*.

## Note

SDP requires Cisco IOS Software Release 12.3(8)T or later. Attempting to deploy this policy to a router running an earlier version could result in deployment failure. You also cannot configure the policy on NO-VPN router models (those that do not allow VPN configurations, such as the 3845 NOVPN).

Trusted Transitive Introduction (TTI) is the protocol that acts as the primary mechanism for implementing SDP. As shown in [Figure 63-3](#), TTI comprises the following three entities:

- **Introducer**—A mutually trusted device that introduces the petitioner to the registrar. Introducers can be end users who use SDP to deploy VPN devices associated with themselves to the PKI network, or an administrator/management system that uses SDP to deploy many VPN devices to the PKI network. This latter type is known as an administrative introducer. For more information, see [Configuring a AAA Server Group for Administrative Introducers, page 63-84](#).
- **Petitioner**—A remote-site device that is joined to the secure domain. The petitioner serves web pages to the introducer and receives the bootstrap configuration from the introducer's web browser. The petitioner component is enabled by default on all Cisco IOS devices.
- **Registrar**—A server that authorizes the petitioner by communicating directly with an authentication, authorization, and accounting (AAA) server to verify user credentials, permit or deny enrollment, and retrieve user-specific configuration information.

Use the SDP policy in Security Manager to configure the router as a registrar.

**Figure 63-3 Secure Device Provisioning**

For more information about Secure Device Provisioning, see:

- [Contents of Bootstrap Configuration, page 63-82](#)
- [Secure Device Provisioning Workflow, page 63-82](#)

- [Defining Secure Device Provisioning Policies, page 63-83](#)

## Contents of Bootstrap Configuration

The bootstrap configuration provided by SDP typically does the following:

- Sets the petitioner's hostname.
- Synchronizes the petitioner's system clock with the registrar.
- Sets the petitioner's trustpoint.
- Sets the petitioner's authentication and authorization mechanism.
- Pushes the CA certificate.
- Enrolls the petitioner with the PKI server.
- Sets other VPN configurations, such as the configuration required to establish a management tunnel.
- Sets Cisco Networking Services (CNS) configuration.
- Sets the petitioner's DHCP pool.

### Related Topics

- [Secure Device Provisioning Workflow, page 63-82](#)
- [Secure Device Provisioning on Cisco IOS Routers, page 63-81](#)

## Secure Device Provisioning Workflow

The following illustrates the steps required to use SDP to register a remote-site device in a secure network:

1. Unpack the router and connect the power, LAN, and WAN cables.
2. Turn on a computer (introducer) that is assigned an IP address from the DHCP server on the router, open a web browser, and go to the petitioner URL (<http://device/ezsdd/welcome>) on the router. The router responds with a registration page (also called the local login dialog box).
3. Enter the username and password, then click **OK**. On the welcome page, enter the URL for the registrar. The following actions occur:
  - a. The browser opens an HTTPS-secured session to the central-site registrar, which verifies the username with the AAA server and returns the appropriate bootstrap configuration to the browser.
  - b. The browser feeds the bootstrap configuration to the remote-site router, configuring PKI trustpoint enrollment and IPsec VPN connectivity, and provisioning system attributes and other information.
  - c. You are notified that bootstrap configuration is complete.

- [Secure Device Provisioning on Cisco IOS Routers, page 63-81](#)

## Defining Secure Device Provisioning Policies

The petitioner component is automatically enabled on all Cisco IOS routers. The SDP policy in Security Manager enables the registrar. To define an SDP policy you must define:

- The AAA server group containing the AAA server that the registrar uses to authenticate and authorize the introducer.
- The CA server to which the petitioner enrolls during the bootstrap process.
- The location of the introduction page that is displayed after authorization was performed.
- The location of the bootstrap configuration to be provided to the petitioner.

### Related Topics

- [Secure Device Provisioning Workflow, page 63-82](#)
- [Configuring a AAA Server Group for Administrative Introducers, page 63-84](#)
- [Secure Device Provisioning on Cisco IOS Routers, page 63-81](#)

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Secure Device Provisioning** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Secure Device Provisioning** from the Policy Type selector. Select an existing policy or create a new one.

The Secure Device Provisioning page is displayed. See [Table 63-37 on page 63-85](#) for a description of the fields on this page.

**Step 2** Under Introducer Authentication, enter the name of the AAA server group containing the relevant AAA server, or click **Select** to select it from a list or to create a new object.

The selected AAA server determines whether the username and password supplied by the introducer represent an authorized user. The AAA server must use TACACS+, RADIUS, or be local.

**Note** Each AAA server in the selected group must be configured to communicate with an interface that exists on the router; otherwise, validation fails. If you want to configure a different AAA server group for authenticating and authorizing administrative introducers, see [Configuring a AAA Server Group for Administrative Introducers, page 63-84](#).

**Step 3** Under Petitioner Authentication, define the CA server that authenticates the identity of the petitioner by doing one of the following:

- Select **Local CA Server**, then enter the local CA name in the field provided. If you have already configured the CA server locally on the registrar, a trustpoint is generated automatically.

**Note** If you have not configured the router as the CA server, enter the command **Crypto pki server [name]** using the CLI or FlexConfigs. This command is mandatory when you deploy an SDP policy configured with a local CA server.

- Select Remote CA Server, then enter the name of a PKI enrollment object, or click **Select** to select it from a list or to create a new object.

The PKI enrollment object defines the external CA server used in the SDP policy.

**Step 4** Select the source of the introduction page that is displayed after you log in to the registrar. The introduction page indicates whether authorization was successfully completed and contains a button for completing the process of obtaining the bootstrap configuration.

If you do not select the default welcome page, you must enter the URL required to access a different welcome page that you prepared elsewhere.

**Step 5** Select the source of the bootstrap configuration provided to the petitioner to implement its first-time configuration:

- If the source of the bootstrap configuration is a non-Security Manager URL, enter the URL and also the username and password for accessing the URL, if required.
- If the source of the configuration file is a Security Manager URL:
  - Enter the name of a FlexConfig, or click **Select** to select it from a list or to create a new object. The FlexConfig contains the device commands required to retrieve the appropriate bootstrap configuration. For more information, see [Add or Edit FlexConfig Dialog Box, page 7-30](#).
  - Enter the device name formula required by the FlexConfig to derive the device name of the petitioner from the username submitted by the introducer. (The two names typically have a fixed relationship.) The default formula is \$n, which uses the introducer name to determine the device name.
 

The device name determines which bootstrap configuration the petitioner should receive. The resulting URL contains the name of the FlexConfig you selected, as well as the parameters and formula you defined.
  - Enter a username and password for accessing the Security Manager server containing the FlexConfig. The password can contain alphanumeric characters, but cannot consist of a single digit.

## Configuring a AAA Server Group for Administrative Introducers

Administrative introducers are administrators or management systems that introduce many devices to the PKI network. You can configure a AAA server group for authenticating and authorizing administrative introducers by appending the following FlexConfig to the configuration of the router:

```
aaa new-model
radius-server host 1.2.3.4 auth-port 1645 acct-port 1646 key key
aaa group server radius default-radius-group2
server 1.2.3.4 auth-port 1645 acct-port 1646
exit
aaa authentication login CSM_SDP2 group default-radius-group2
crypto provisioning registrar
administrator authentication list CSM_SDP2
administrator authorization list CSM_SDP2
exit
```

This FlexConfig serves two functions—it configures the AAA server group to use and it associates this server group with the SDP crypto.

For more information about administrative introducers, see *Administrative Secure Device Provisioning Introducer* on Cisco.com at this URL:

[http://www.cisco.com/en/US/docs/ios/12\\_3t/12\\_3t14/feature/guide/gtadintr.html](http://www.cisco.com/en/US/docs/ios/12_3t/12_3t14/feature/guide/gtadintr.html)

## Secure Device Provisioning Policy Page

Secure Device Provisioning (SDP) policies (formerly known as Easy Secure Device Deployment or EzSDD) enable you to configure a Cisco IOS router as a *registrar*. This is the SDP component that retrieves bootstrap configurations for *petitioners*, which are remote-site devices that are enrolling in the network security infrastructure. These devices use the bootstrap configuration for first-time configuration purposes. The registrar also verifies the identity of the *introducer*, which is the user who introduces the petitioner to the registrar.

For more information, see [Defining Secure Device Provisioning Policies, page 63-83](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Secure Device Provisioning** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Secure Device Provisioning** from the Policy Type selector. Create a new policy or select an existing one.

**Table 63-37 Secure Device Provisioning Page (continued)**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bootstrap Configuration | <p>The source of the bootstrap configuration to provide to the petitioner for first-time configuration:</p> <ul style="list-style-type: none"> <li>• Non-Security Manager URL—Used when the bootstrap configuration is located externally to Security Manager. Enter its location in the URL field.</li> </ul> <p>If required, enter a username and password to access the server containing the bootstrap configuration.</p> <ul style="list-style-type: none"> <li>• Security Manager URL—Used when Security Manager is providing the bootstrap configuration. Enter information in the following fields: <ul style="list-style-type: none"> <li>– FlexConfig—The FlexConfig that contains the basic CLI structure required to create the bootstrap configuration. Enter the name of a FlexConfig object, or click <b>Select</b> to display a selector.</li> </ul> <p>After selecting the FlexConfig, you must enter a username and password to access the Security Manager server that contains the FlexConfig.</p> <li>– Device name formula—The formula required by Security Manager to determine the device name of the petitioner from the username that the introducer supplied.</li> </li></ul> <p>Typically a fixed relationship exists between the username and the device name, which enables a formula like this to be established. The default formula is \$n, which uses the introducer name to determine the device name. The device name is required to determine the configuration file that the petitioner should receive.</p> <p>If required, enter a username and password to access the server containing the bootstrap configuration. The password can contain alphanumeric characters, but cannot consist of a single digit.</p> |

## DHCP on Cisco IOS Routers

In Security Manager, certain security features, such as Easy VPN and 802.1x, require Dynamic Host Configuration Protocol (DHCP) client/server configuration. DHCP is widely used in LAN environments to dynamically assign host IP addresses from a centralized server, which significantly reduces the overhead of administering IP addresses.

DHCP servers assign and manage IP addresses from specified address pools within a router to DHCP clients. If the DHCP server cannot satisfy a DHCP request from its own database, it can forward the request to one or more secondary DHCP servers defined by the network administrator.

Security Manager enables you to configure a Cisco IOS device as a DHCP server for clients (hosts) that are connected to the device's inside interface. When you configure a DHCP server, you use IP pools (a range of IP addresses reserved for a DHCP server). The IP pools you select determine the range of IP

addresses the server can use. These addresses are provided to client devices for a defined period of time called a lease. When this lease expires, the address is returned to the address pool, enabling the DHCP server to assign it to a different device.

For more information about DHCP, see:

- [Understanding DHCP Database Agents, page 63-88](#)
- [Understanding DHCP Relay Agents, page 63-88](#)
- [Understanding DHCP Option 82, page 63-89](#)
- [Understanding Secured ARP, page 63-89](#)

To configure a DHCP policy, see:

- [Defining DHCP Policies, page 63-90](#)
- [Defining DHCP Address Pools, page 63-91](#)

## Understanding DHCP Database Agents

A DHCP database agent is any external host—for example, an FTP, TFTP, or RCP server—that stores the DHCP bindings database. You can include one or more DHCP database agents in each DHCP policy, as well as configure the interval between database updates to the agent.

**Note**

If you configure an external DHCP database agent, it is not necessary to define IP address pools, but you may do so. For more information about IP address pools, see [Defining DHCP Address Pools, page 63-91](#).

- [DHCP on Cisco IOS Routers, page 63-87](#)

## Understanding DHCP Relay Agents

A DHCP relay agent is any host that forwards DHCP packets between clients and servers when they do not reside on the same physical subnet. Relay agents receive DHCP messages and then generate a new DHCP message to send on another interface. You can configure a reforwarding policy that determines what the DHCP relay agent should do if a forwarded message already contains relay information.

DHCP relay options in Security Manager include:

- Drop—The relay agent discards messages with existing relay information if Option 82 information is also present.
- Keep—The relay agent retains existing relay information.
- Replace—The relay agent overwrites existing information with its own relay information.

For example, you can have the DHCP relay agent replace the forwarded message with a new relay message. Additionally, you can choose whether to have the relay agent check the validity of relay information contained within forwarded BOOTREPLY messages.

## Understanding DHCP Option 82

DHCP option 82 enables the DHCP relay agent to include information about itself and its attached client when it forwards requests from a DHCP client to a DHCP server. The DHCP server can use this information to assign IP addresses, perform access control, and set quality of service (QoS) and security policies for each of its subscribers. When the DHCP option 82 feature is enabled, a subscriber is identified by the switch port through which it connects to the networks, instead of by its MAC address. Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified. Option 82 also enhances security on access switches by providing the ability to use a user's IP address to locate the port on which a user is attached.

## Understanding Secured ARP

The DHCP Secure IP Address Assignment feature (also called DHCP Authorized ARP) enables you to secure Address Resolution Protocol (ARP) table entries to DHCP leases in the DHCP database. This feature secures and synchronizes the client's MAC address to the DHCP binding, preventing unauthorized clients or hackers from spoofing the DHCP server and taking over a DHCP lease of an authorized client.

When you enable this feature and the DHCP server assigns an IP address to the DHCP client, the DHCP server adds a secure ARP entry to the ARP table with the assigned IP address and the MAC address of the client. These ARP entries cannot be updated by any other dynamic ARP packets, and they exist in the ARP table for as long as the lease is active.

Secure ARP entries can be deleted only by an explicit termination message from the DHCP client or by the DHCP server when the binding expires. To detect when a client has logged out, Secured ARP sends periodic ARP messages to which only authorized users can respond. Unauthorized responses are blocked at the DHCP server, providing an additional level of security.

**Note**

---

Secured ARP disables dynamic ARP learning on an interface.

- [DHCP on Cisco IOS Routers, page 63-87](#)

## Defining DHCP Policies

When you configure a DHCP policy, you must define the IP address pools for the server to use to provide addresses to DHCP clients. In addition, you can optionally define the following:

- External DHCP database agent.
- IP ranges to exclude from DHCP.
- DHCP relay parameters.

**Note**

---

When configuring DHCP on a Cisco IOS router, make sure that the router does not contain an access rule denying Bootstrap Protocol (BootP) traffic. Having such a rule blocks DHCP traffic from being transmitted.

---

**Related Topics**

- [DHCP on Cisco IOS Routers, page 63-87](#)

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > Server Access > DHCP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Server Access > DHCP** from the Policy Type selector. Select an existing policy or create a new one.

The DHCP Policy page is displayed. See [Table 63-38 on page 63-92](#) for a description of the fields on this page.

**Step 2**

(Optional) Under Databases, click the **Add** button to display the [DHCP Database Dialog Box, page 63-94](#). From here you can define external DHCP database agents. For more information, see [Understanding DHCP Database Agents, page 63-88](#).

**Step 3**

(Optional) Under Excluded IPs, enter the IP addresses or address ranges within a DHCP address pool that should not be made available to DHCP clients. You can use a combination of addresses and network/host objects, or click **Select** to display a selector. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).

**Tip**

---

If the network you want is not listed in the selector, click the **Create** button to display the [Add or Edit Network/Host Dialog Box, page 6-83](#). From here you can create a network/host object.

---

- Step 4** Under IP Pools, click the **Add** button to display the [IP Pool Dialog Box, page 63-94](#). From here you can define the address pools to be used by the DHCP server. For more information, see [Defining DHCP Address Pools, page 63-91](#).
- Step 5** (Optional) When you use a relay agent to manage requests from DHCP clients located on a different subnet from the DHCP server, define the following DHCP relay options:
- Select the relay agent information reforwarding policy (Drop, Keep, or Replace). DHCP relay agents implement this policy when they receive messages already containing relay information.
  - Select the **Option** check box to enable the insertion of Option 82 data in requests that the relay agent forwards to the DHCP server.
  - Select the **Check** check box to validate DHCP Option 82 reply packets sent by the DHCP server.  
When you enable this option, invalid messages are dropped. Valid messages are stripped of the option-82 field before they are forwarded to the DHCP client. When you disable this option, the option-82 field is removed from the packet without being checked first for validity.  
See [Understanding DHCP Relay Agents, page 63-88](#) for more information.
- 

## Defining DHCP Address Pools

When you configure a DHCP policy that does not include an external database agent, you must define at least one IP address pool. This pool contains the addresses that the DHCP server can dynamically assign to DHCP clients. Additionally, you can define the following IP pool-specific options:

- The default routers, DNS servers, WINS servers, and domain used by DHCP clients.
- Whether to use the Secured ARP feature.
- Whether to import information regarding IP pool options from a centralized DHCP server.
- The length of the lease.
- The location of the TFTP server that IP telephony devices require to use addresses from this pool.

### Related Topics

- [Defining DHCP Policies, page 63-90](#)
- [DHCP on Cisco IOS Routers, page 63-87](#)

- 
- Step 1** On the DHCP page, click the **Create** button under IP Pools. The IP Pool dialog box is displayed.
- Step 2** Define the address pool. See [Table 63-40 on page 63-95](#) for a description of the available fields.
- Step 3** Click **OK** to save your definitions locally on the client and close the dialog box. The IP pool appears in the table displayed under IP Pools on the DHCP page.
- Step 4** Repeat [Step 1](#) through [Step 3](#) to define additional address pools, if required.

**Note** To edit an IP pool, select it from the table, then click the **Edit** button. To delete an IP pool, select it from the table, then click the **Delete** button. You cannot delete a pool whose addresses have been assigned to DHCP clients.

---

# DHCP Policy Page

Use the DHCP policy page to define a DHCP server policy on the selected router. This includes specifying the address pools used by the DHCP server when assigning addresses to requesting clients.

For more information, see [Defining DHCP Policies, page 63-90](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Server Access > DHCP** from the Policy Type selector. Right-click **DHCP** to create a policy, or select an existing policy from the Shared Policy selector.

| Databases Table           |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Database URL              | The URL of the external DHCP database agent.                                                                                                                                                                                                                                                                                                                                                                            |
| Timeout                   | The amount of time to wait (in seconds) for a response from the external DHCP database agent before aborting a database transfer.                                                                                                                                                                                                                                                                                       |
| Write Delay               | The interval (in seconds) between DHCP assignment updates sent to the external DHCP database agent.                                                                                                                                                                                                                                                                                                                     |
| Add button                | Opens the <a href="#">DHCP Database Dialog Box, page 63-94</a> . From here you can define a DHCP database agent.                                                                                                                                                                                                                                                                                                        |
| Edit button               | Opens the <a href="#">DHCP Database Dialog Box, page 63-94</a> . From here you can edit the selected DHCP database agent.                                                                                                                                                                                                                                                                                               |
| Delete button             | Deletes the selected DHCP database agents.                                                                                                                                                                                                                                                                                                                                                                              |
| Excluded IPs              |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Excluded IPs or IP Ranges | The IP addresses or address ranges to exclude from DHCP. These addresses are not assigned by the DHCP server to DHCP clients requesting addresses.<br><br>Enter one or more network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new object.<br><br>For more information, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a> . |
| IP Pools Table            |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Name                      | The name of the IP pool.                                                                                                                                                                                                                                                                                                                                                                                                |
| Network                   | The IP address and subnet mask of the IP pool.                                                                                                                                                                                                                                                                                                                                                                          |

**Table 63-38** DHCP Policy Page (continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Router        | The IP addresses of the default routers used by DHCP clients.                                                                                                                                                                                                                                                                                                                                                                                              |
| DNS Server            | The IP addresses of the DNS servers used by DHCP clients.                                                                                                                                                                                                                                                                                                                                                                                                  |
| NetBIOS (WINS) Server | The IP addresses of the Windows Internet Naming Service (WINS) servers used by Microsoft DHCP clients.                                                                                                                                                                                                                                                                                                                                                     |
| Domain Name           | The domain name for DHCP clients.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Import All            | Indicates whether the remote DHCP server imports certain DHCP options from a centralized DHCP server.                                                                                                                                                                                                                                                                                                                                                      |
| Secured ARP           | Indicates whether secured ARP is enabled on this IP pool to help prevent IP spoofing by unauthorized users.                                                                                                                                                                                                                                                                                                                                                |
| Lease                 | The duration of the lease for each IP address assigned by the DHCP server from this IP pool.                                                                                                                                                                                                                                                                                                                                                               |
| Option 150            | The IP address of the TFTP server required by IP phones for configuration, as defined using DHCP option 150.                                                                                                                                                                                                                                                                                                                                               |
| Option 66             | The IP address of the TFTP server required by IP phones for configuration, as defined using DHCP option 66.                                                                                                                                                                                                                                                                                                                                                |
| Add button            | Opens the <a href="#">IP Pool Dialog Box, page 63-94</a> . From here you can define a DHCP IP address pool.                                                                                                                                                                                                                                                                                                                                                |
| Edit button           | Opens the <a href="#">IP Pool Dialog Box, page 63-94</a> . From here you can edit the selected IP pool.                                                                                                                                                                                                                                                                                                                                                    |
| Delete button         | Deletes the selected IP pools.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Relay parameters      |                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Policy                | The policy that DHCP relay agents implement when they receive messages already containing relay information: <ul style="list-style-type: none"> <li>• Drop—The relay agent discards messages with existing relay information if option-82 information is also present.</li> <li>• Keep—The relay agent retains existing relay information.</li> <li>• Replace—The relay agent overwrites existing information with its own relay information.</li> </ul>   |
| Option                | When selected, enables DHCP Option 82 data insertion in message requests forwarded from the DHCP client to the server. DHCP Option 82 provides the DHCP server with both the switch and port ID of the requesting client. This option makes it possible to locate where a user is physically connected to the network and prevent spoofing. See <a href="#">Understanding DHCP Option 82, page 63-89</a> .<br>When deselected, DHCP Option 82 is disabled. |
| Check                 | When selected, DHCP Option 82 reply packets received from the DHCP server are validated. Invalid messages are dropped; valid messages are stripped of the option-82 field before being forwarded to the DHCP client.<br>When deselected, the option-82 field is removed from the packet without being checked first for validity.                                                                                                                          |

## DHCP Database Dialog Box

Use the DHCP Database dialog box to define external DHCP database agents that contain the automatic bindings. Each database URL that you define must be unique.

For more information, see [Understanding DHCP Database Agents, page 63-88](#).

### Navigation Path

Go to the [DHCP Policy Page, page 63-92](#), then click the **Add** or **Edit** button beneath the Databases table.

### Field Reference

**Table 63-39** *DHCP Database Dialog Box*

| Element      | Description                                                                                                                                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Database URL | The URL of the external DHCP database agent containing the automatic bindings. The URL can be in HTTP, FTP, TFTP, or RCP format.<br><b>Note</b> If you define a URL, it is not necessary to define an IP address pool. However, you may do so.  |
| Timeout      | The amount of time (in seconds) the DHCP server should wait for a response from the external DHCP database agent before aborting a database transfer. The default is 300 seconds (5 minutes).<br><b>Note</b> A value of 0 disables the timeout. |
| Write Delay  | The interval (in seconds) between updates sent from the DHCP server to the external DHCP database agent. The minimum delay is 60 seconds. The default is 300 seconds (5 minutes).                                                               |

## IP Pool Dialog Box

Use the IP Pool dialog box to define one or more address pools, which the DHCP server uses to assign dynamic addresses to DHCP clients. You must define at least one address pool, unless you have defined an external DHCP database agent.

### Navigation Path

Go to the [DHCP Policy Page, page 63-92](#), then click the **Add** or **Edit** button beneath the IP Pools table.

Table 63-40 IP Pool Dialog Box

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool Name                       | The name of the IP pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Network                         | <p>The IP address and subnet mask of the IP pool. This subnet contains the range of available IP addresses that the DHCP server may assign to clients.</p> <p>Enter an address and mask or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new one.</p> <p><b>Tip</b> You can exclude specific addresses within the range by defining them in the Excluded IPs field. See <a href="#">DHCP Policy Page, page 63-92</a>.</p> |
| Default Router Addresses        | <p>The IP addresses of the default routers for DHCP clients using this IP pool. After a DHCP client is booted, it begins sending packets to this router, which should be located on the same subnet as the client.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p>                                                                                                        |
| DNS Server Addresses            | <p>The IP addresses of the DNS servers that DHCP clients using this IP pool should query when they need to correlate hostnames to IP addresses.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p>                                                                                                                                                                           |
| NetBIOS (WINS) Server Addresses | <p>The IP addresses of the Windows Internet Naming Service (WINS) servers used by Microsoft DHCP clients to correlate hostnames to IP addresses within a general grouping of networks.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p>                                                                                                                                    |
| Domain Name                     | The domain name for DHCP clients using this IP pool. This name places these clients in the general grouping of networks that make up the domain.                                                                                                                                                                                                                                                                                                                                     |
| Import All                      | <p>When selected, enables remote DHCP servers to import specific DHCP options (such as the DNS server) from a centralized server. Use this option to enable configuration information to be updated automatically.</p> <p>When deselected, all DHCP options are local to this specific server.</p>                                                                                                                                                                                   |
| Secured ARP                     | <p>When selected, enables the DHCP Authorized ARP feature, which limits the leasing of IP addresses to authorized mobile users. This feature helps prevent IP spoofing by unauthorized users. See <a href="#">Understanding Secured ARP, page 63-89</a>.</p> <p>When deselected, the DHCP Authorized ARP feature is disabled.</p> <p><b>Note</b> This feature also disables dynamic ARP learning on an interface.</p>                                                                |

**Table 63-40** IP Pool Dialog Box (continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lease Never Expires       | <p>When selected, the DHCP server permanently assigns IP addresses to its clients.</p> <p>When deselected, addresses are leased for a predefined amount of time, as defined in the Time Length field.</p>                                                                                                                                                                                                                                                      |
| Time Length (DD:HH:MM)    | <p>Applies only when the Lease Never Expires check box is deselected.</p> <p>The duration of the lease provided to each IP address assigned from this IP pool (using the format DD:HH:MM). After the lease expires, the assigned IP address is no longer valid and is returned to the pool.</p>                                                                                                                                                                |
| Option 66 (IP Addresses)  | <p>The IP address of the TFTP server used to provide configuration files to IP phones. These configuration files define parameters required by IP phones to connect to Cisco CallManager.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p> <p><b>Note</b> This option is functionally similar to option 150. Either or both options may be used.</p> |
| Option 150 (IP Addresses) | <p>The IP address of the TFTP server used to provide configuration files to IP phones. These configuration files define parameters required by IP phones to connect to Cisco CallManager.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p> <p><b>Note</b> This option is functionally similar to option 66. Either or both options may be used.</p>  |

## NTP on Cisco IOS Routers

The Network Time Protocol (NTP) is the standard for time synchronization between network devices. Synchronized time enables you to correlate syslog and other debug output to specific events, which is essential for troubleshooting, fault analysis, and security incident tracking. Time comparisons are not possible without precise time synchronization between the logging, management, and AAA functions occurring in your network.

NTP uses the concept of a stratum to describe how far removed a machine is from an authoritative time source. For example, a stratum 1 time server is directly attached to a radio or atomic clock. NTP then distributes the time from this authoritative time source across the network. A stratum 2 time server synchronizes with a stratum 1 time server; a stratum 3 time server synchronizes with a stratum 2 time server and so on. One NTP transaction per minute is sufficient to synchronize two machines to within a millisecond.

NTP runs over the User Datagram Protocol (UDP) using port 123. Security Manager supports NTP version 3, as defined in RFC 1305.

## Defining NTP Servers

This procedure describes how to define the NTP servers that the routers users to synchronize time. After the NTP policy is deployed, the router uses an algorithm (based on factors such as delay, dispersion, and jitter) to determine which NTP server is the most accurate and synchronizes to that one.

At the global level, you can enable MD5 authentication and specify a source address to use on all NTP packets sent from the router.

To add an NTP server to the policy, all you need to do is enter its IP address. In addition, you can optionally define authentication parameters and determine whether a particular server should be preferred over other NTP servers of similar accuracy.

### Related Topics

- [NTP on Cisco IOS Routers, page 63-96](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Server Access > NTP** from the Policy Type selector. Select an existing policy or create a new one.

The NTP page is displayed. See [Table 63-41 on page 63-98](#) for a description of the fields on this page.

- Step 2** (Optional) In the Source Interface field, enter the name of the interface or interface role whose address should be used as the source interface for all NTP packets sent from the router, or click **Select** to select an interface role from a list or to create a new one. The source interface must have an IP address.

This option is useful when the NTP server cannot reach the address from which the connection originated (for example, due to a firewall). If you do not enter a value in this field, the address of the outgoing interface is used.

**Note** You can override this global setting for individual NTP servers, as described in [Step 5](#).

- Step 3** (Optional) Select the **Enable NTP Authentication** check box to authenticate all associations between this router and the NTP servers defined in this policy.
- Step 4** Click the **Add** button under the Servers table to display the NTP Server dialog box. From here you can define an NTP server.
- Step 5** Define an NTP server. See [Table 63-42 on page 63-100](#) for a description of the available fields.
- Step 6** (Optional) Define authentication parameters for this NTP server.

**Note** If you modify the value of a previously defined authentication key, the change affects all NTP servers that share this key.

**Note** When you define an authentication key in Security Manager, the value 0 is automatically appended to the end of the CLI command. This value, which represents the default authentication key encryption type, can be modified using the CLI.

- Step 7** Repeat [Step 5](#) and [Step 6](#) to define additional NTP servers.

- Step 8** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Servers table.

**Note** To edit an NTP server, select it from the Servers table, then click **Edit**. To remove an NTP server, select it, then click **Delete**. If the key defined on the server you delete is not defined on a different NTP server, the key is also deleted.

## NTP Policy Page

Use the NTP page to define one or more NTP servers that the router can use for time synchronization. This includes enabling authentication, if required, and defining a global source interface for all traffic sent to these servers.

For more information, see [Defining NTP Servers, page 63-97](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Server Access > NTP** from the Policy Type selector. Right-click **NTP** to create a policy, or select an existing policy from the Shared Policy selector.

| Enable NTP Authentication | When selected, enables authentication using MD5 when connecting to an NTP server.<br>When deselected, authentication is disabled.                                      |
| Servers Table             |                                                                                                                                                                        |
| IP Address                | The IP address of the NTP server.                                                                                                                                      |
| Source Interface          | The source address for all packets sent to this NTP server. This setting overrides the global setting defined at the top of the page.                                  |
| Preferred                 | Indicates whether this NTP server is preferred over other NTP servers of similar accuracy.<br><b>Note</b> By default, preferred servers are listed first in the table. |
| Key Number                | The ID number of the key used for authentication with this NTP server.                                                                                                 |
| Trusted                   | Indicates whether the authentication key defined for this NTP server is a trusted key.                                                                                 |
| Add button                | Opens the <a href="#">NTP Server Dialog Box, page 63-99</a> . From here you can define an NTP server.                                                                  |
| Edit button               | Opens the <a href="#">NTP Server Dialog Box, page 63-99</a> . From here you can edit the selected NTP server.                                                          |
| Delete button             | Deletes the selected NTP server from the table.<br>If the key defined on the server you delete is not defined on a different NTP server, the key is also deleted.      |

## NTP Server Dialog Box

Use the NTP Server dialog box to define the address of an NTP server that the router can use to perform time synchronization. In addition, you can use this dialog box to define a default source interface for NTP packets sent to this server and authentication parameters.

### Navigation Path

Go to the [NTP Policy Page, page 63-98](#), then click the **Add** or **Edit** button beneath the table.

| Source Interface   | <p>The source address for all packets sent to this NTP server. This setting might be necessary when the NTP server cannot respond to the address from which the packet originated (for example, due to a firewall). The source interface must have an IP address.</p> <p>If you do not define a value in this field and there is no global setting, the address of the outgoing interface is used.</p> <p><b>Note</b> This setting overrides the global setting you defined on the <a href="#">NTP Policy Page, page 63-98</a>.</p> <p>Enter the name of an interface or interface role, or click <b>Select</b> to select the object from a list or to create a new one.</p>                                                                                                                                                                                                                                     |
| Preferred          | <p>When selected, this NTP server is preferred over other NTP servers of similar accuracy. If this server is used for synchronization, the time offset used to correct the local clock is calculated from this server only.</p> <p><b>Note</b> If a different NTP server is significantly more accurate than the preferred server (for example, stratum 2 versus stratum 3), the router synchronizes to the more accurate server.</p> <p>When deselected, this NTP server is not given preference over other NTP servers of similar accuracy. The time offset used to correct the local clock is calculated by taking the combined offset of all NTP servers.</p> <p>We recommend that you configure an NTP server as preferred only when multiple servers have the same stratum and you can rely on the accuracy of the preferred server.</p>                                                                   |
| Authentication Key | <p>The MD5 key that is used to authenticate associations with the NTP server.</p> <ul style="list-style-type: none"> <li>Key Number—The ID number of the authentication key. Enter the key number or select a previously defined number from the list.</li> <li>Key Value—An arbitrary string of up to 32 characters that defines the authentication key. Enter the string again in the Confirm field.</li> <li>Trusted—When selected, this key authenticates the identity of systems attempting to synchronize with this server. When deselected, this key is not used for authentication.</li> </ul> <p>If you select a key number from the list and then change the key value, you are warned that saving this change affects any other NTP servers using the same authentication key.</p> <p><b>Note</b> To use authentication, you must enable it from the <a href="#">NTP Policy Page, page 63-98</a>.</p> |

## Configuring Identity Policies

This chapter contains the following topics:

- [802.1x on Cisco IOS Routers, page 64-1](#)
- [802.1x Policy Page, page 64-5](#)
- [Network Admission Control on Cisco IOS Routers, page 64-8](#)
- [Network Admission Control Policy Page, page 64-14](#)

### 802.1x on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

The IEEE 802.1x standard defines 802.1x port-based authentication as a client-server based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through public ports. The authentication server validates each client connected to an interface before making available any services offered by the router or the LAN.

Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL) traffic through the interface to which the client is connected. If authentication is successful, normal traffic can pass through the interface.

802.1x authentication provides VPN access control, enabling unauthenticated traffic to access the Internet while preventing it from accessing the VPN tunnel. This solution is especially useful for enterprises whose workers access the corporate VPN through a home access router that other family members use to access the Internet. When you use 802.1x, you create a virtual interface to carry unauthenticated traffic while authenticated traffic continues to pass through the physical interface.

802.1x requires that you use DHCP to provide IP addresses to the clients that request authentication. We recommend that you use two IP address pools, one for authenticated traffic and the other for unauthenticated traffic. If you use two pools, the DNS server in the corporate DHCP pool should point to the corporate DNS server. The DNS server for the noncorporate DHCP pool should use the DNS server provided by the ISP on the public interface. You configure DHCP by selecting a DHCP policy. See [DHCP on Cisco IOS Routers, page 63-87](#) for more information.

**Note**

802.1x is supported on the following platforms—Cisco 800, 1700, 1800, 1900, 2600, 2800, 2900, 3600, 3700, 3800, 3900 Series Routers.

For more information about 802.1x, see:

- [Understanding 802.1x Device Roles, page 64-2](#)
- [802.1x Interface Authorization States, page 64-2](#)
- [Topologies Supported by 802.1x, page 64-3](#)
- [Defining 802.1x Policies, page 64-4](#)

## Understanding 802.1x Device Roles

802.1x port-based authentication uses the following device roles:

- **Client**—The workstation requesting access to the VPN. It must be running 802.1x-compliant client software, such as that offered with the Microsoft Windows XP operating system.
- **Authentication server**—Authenticates clients. The authentication server validates the client's identity and notifies the router whether the client is authorized to access the network. The Remote Authentication Dial-In User Service (RADIUS) security system with EAP extensions is the only supported authentication server. In Security Manager, a AAA (authentication, authorization, and accounting) server, as defined in a AAA server object, is the authentication server for 802.1x policies.
- **Router (edge router or wireless access point)**—Controls physical access to the network based on the authentication status of the client. The router is an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. In Security Manager, the router on which you configure an 802.1x policy acts as the switch.

## 802.1x Interface Authorization States

When you use 802.1x, the interface state determines whether to grant the client network access. By default, the interface starts in the unauthorized state. While in this state, the interface disallows all traffic in both directions, except for EAPOL packets. After a client is authenticated, the interface transitions to the authorized state, enabling all client traffic to flow normally.

If a client that does not support 802.1x is connected to an unauthorized 802.1x interface, the router requests the client's identity. In this situation, the client does not respond to the request, the interface remains in the unauthorized state, and the client is not granted access to the network. In contrast, when an 802.1x-enabled client connects to an interface that is not running the 802.1x protocol, the client initiates the authentication process by sending the EAPOL-Start frame. If no response is received, the client sends the request a fixed number of times. Because no response is received, the client begins sending frames as if the interface were in the authorized state.

You can control the interface authorization state by selecting one of the following options:

- **Auto**—Enables 802.1x authentication, which causes the interface to start in the unauthorized state. Only EAPOL frames are sent and received through the interface. Authentication begins when the link state of the interface transitions from down to up or when an EAPOL-Start frame is received. The router requests the client's identity and begins relaying authentication messages between the client and the authentication server. The router uses the MAC address of each client trying to access the network as unique client identifiers.
- **Force authorized**—Disables 802.1x authentication, which causes the interface to move to the authorized state without authenticating the client.

After a client is successfully authenticated, the interface state changes to authorized, which enables all frames from the client to enter the network. If authentication fails, the interface remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the router can retransmit the request. If the authentication server does not respond after the defined number of attempts, authentication fails and network access is denied to the client.

When a client logs off, it sends an EAPOL-Logoff message, which causes the interface to return to the unauthorized state.

## Topologies Supported by 802.1x

802.1x port-based authentication supports two topologies:

- Point-to-point
- Wireless LAN

In a point-to-point configuration, only one client can be connected to the 802.1x-enabled interface. The router detects the client when the interface state changes from down to up. If a client leaves the network or is replaced by another client, the interface state changes from up to down, which returns the interface to the unauthorized state.

**Figure 64-1** 802.1x Topology

In a wireless LAN configuration, the 802.1x interface is configured in multihost mode, which is authorized as soon as one client is authenticated. After the interface is authorized, all other clients indirectly attached to the interface are granted access to the network. If the port becomes unauthorized (either because reauthentication fails or an EAPOL-Logoff message is received), the router denies access to the network to all attached clients. In this topology, the wireless access point is a client to the router and is responsible for authenticating the clients attached to it.

## Defining 802.1x Policies

You configure an 802.1x policy by defining:

- The AAA server group containing the AAA server that authenticates hosts that are trying to connect to the network.
- The virtual interface that carries unauthenticated traffic and the physical interface that carries authenticated traffic.
- (Optional) Properties of the physical interface, including the control type, automatic reauthentication, and several timeout values.

If the router on which you are defining the 802.1x policy is not part of a VPN (for example, if it is directly connected to the corporate network to which you want to restrict access), you must manually define an access list. You can do this by defining an access rules policy (see [Chapter 16, “Managing Firewall Access Rules”](#)).

#### Before You Begin

- Configure the selected router with a DHCP policy that contains two IP address pools, one for authenticated clients and one for unauthenticated clients. See [Defining DHCP Policies, page 63-90](#).
- Make sure the router can route packets to the configured AAA (RADIUS) server. You can verify this by pinging the server from the router.

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Identity > 802.1x** from the Policy selector.
- (Policy view) Select **Router Platform > Identity > 802.1x** from the Policy Type selector. Select an existing policy or create a new one.

The 802.1x page is displayed. See [Table 64-1 on page 64-6](#) for a description of the fields on this page.

**Step 2** Enter the name of the AAA server group containing the AAA server to use for authenticating clients using 802.1x, or click **Select** to select a server group from a list or to create a new one. The selected AAA server must use RADIUS with EAP extensions.

**Note** Each AAA server in the selected group must be configured to communicate with an interface that exists on the router; otherwise, validation fails.

**Step 3** In the Virtual Template field, enter the name of the interface or interface role that serves as the untrusted, virtual interface for carrying unauthenticated traffic, or click **Select** to select an interface role from a list or to create a new role. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).

**Note** Integrated Services Routers (ISRs), such as the Cisco 800, 1800, 1900, 2800, 2900, 3800, and 3900 Series, automatically use VLANs to carry unauthenticated traffic. If you define a virtual template, however, it is used in place of the VLAN.

**Note** Deployment might fail if PPP is defined on the virtual template defined here. See [Defining PPP Connections, page 62-72](#).

**Step 4** Enter the name of the interface or interface role that serves as the trusted, physical interface for carrying authenticated traffic, or click **Select** to select a role from a list.

The interface role you select should represent the internal protected interface that was configured as part of the VPN topology and no other physical interface on the selected router. For more information, see [Defining the Endpoints and Protected Networks, page 25-34](#).

**Step 5** (Optional) Modify the defaults of the physical interface used for 802.1x authentication. See [Table 64-1 on page 64-6](#) for details.

## 802.1x Policy Page

Use the 802.1x policy page to create policies that limit VPN access to authorized users. Authenticated traffic is allowed to pass through a designated physical interface on the router. Unauthenticated traffic is allowed to pass through a virtual interface to the Internet but is not allowed to access the VPN.

For more information, see [Defining 802.1x Policies, page 64-4](#).

**Note** 802.1x policies require DHCP address pools in order to assign IP addresses to clients. You define these pools by defining a DHCP policy on the same router. See [DHCP Policy Page, page 63-92](#).

### Navigation Path

- (Device view) Select **Platform > Identity > 802.1x** from the Policy selector.
- (Policy view) Select **Router Platform > Identity > 802.1x** from the Policy Type selector. Right-click **802.1x** to create a policy, or select an existing policy from the Shared Policy selector.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA Server Group  | <p>The RADIUS AAA server group that authenticates the credentials of users trying to access a VPN tunnel. Enter the name of a AAA server group object, or click <b>Add</b> to select one from a list or to create a new AAA server group object.</p> <p><b>Note</b> Each AAA server in the selected group must be configured to communicate with an interface that exists on the router; otherwise, validation fails.</p>                                                                                                                                                                                                                                                             |
| Virtual Template  | <p>Mandatory for all routers except Integrated Services Routers (ISRs).</p> <p>The untrusted, virtual interface that provides Internet access to unauthenticated traffic. Enter the name of an interface or interface role, or click <b>Select</b> to select one from a list or to create a new group object.</p> <p><b>Note</b> You do not need to configure a virtual template for ISRs, because they automatically use VLANs to provide access. If you do define a virtual template, however, it is used instead of the VLAN.</p> <p><b>Note</b> Deployment might fail if PPP is defined on the virtual template defined here. See <a href="#">PPP Dialog Box, page 62-77</a>.</p> |
| Interface         | <p>The trusted, physical interface that provides VPN access to authenticated traffic. Enter the name of an interface or interface role, or click <b>Select</b> to select one from a list or to create a new group object.</p> <p>If you use an interface role, the pattern defined in the interface role must represent only one physical interface on the selected device. This interface should be the internal protected interface that you configured as part of the VPN topology. For more information, see <a href="#">Defining the Endpoints and Protected Networks, page 25-34</a>.</p>                                                                                       |
| Number of retries | <p>The number of times the physical interface resends an Extensible Authentication Protocol (EAP) request/identity frame to a client if a response is not received before restarting authentication.</p> <p>Valid values range from 1 to 10. The default is 2.</p> <p><b>Note</b> You should change the default only to adjust for unusual circumstances, such as unreliable links or specific problems with certain clients and authentication servers.</p>                                                                                                                                                                                                                          |

Table 64-1 802.1x Page (continued)

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Control type                           | <p>The control state of the interface, which determines whether the host is granted access to the network. Options are:</p> <ul style="list-style-type: none"> <li>• Force Authorize—Disables 802.1x authentication and causes the interface to move to the authorized state without requiring any authentication exchange. This means the interface transmits and receives normal traffic without 802.1x-based authentication of the host. This is the default.</li> <li>• Auto—Enables 802.1x authentication and causes the interface to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the interface. If a host is successfully authenticated, the interface state changes to authorized, which enables all frames from the host through the interface.</li> </ul> |
| Enable client reauthentication         | <p>When selected, enables periodic reauthentication of client PCs on the 802.1x interface. Reauthentication is performed after the interval defined in the Client reauthentication period timeout field. The default period is 3600 seconds (1 hour).</p> <p>When deselected, periodic reauthentication is not performed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Client reauthentication period timeout | <p>Applies only when the Enable client reauthentication check box is selected.</p> <p>The number of seconds between client reauthentication attempts. Valid values range from 1 to 65535 seconds. The default is 3600 seconds (1 hour).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Quiet period                           | <p>The amount of time the router remains in a quiet state after a failed authentication exchange with the client. Authentication exchanges might fail, for example, because the client provided an invalid password.</p> <p>Valid values range from 1 to 65535 seconds. The default is 120 seconds.</p> <p><b>Note</b> Entering a value smaller than the default provides a faster response time to the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| Rate Limit period                      | <p>The interval after which the interface throttles the EAP-Start packets it receives from malfunctioning client PCs. Use this setting, called rate limiting, to prevent these clients from wasting router processing power.</p> <p>Valid values range from 1 to 65535 seconds. By default, rate limiting is disabled.</p> <p><b>Note</b> To disable an existing rate limit, delete the value defined in this field and leave the field blank.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| AAA Server timeout                     | <p>The number of seconds the router waits before retransmitting packets to the AAA server. If the router sends an 802.1x packet to the AAA server and the server does not respond, the router sends another packet after this interval elapses.</p> <p>Valid values range from 1 to 65535 seconds. The default is 30 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 64-1 802.1x Page (continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Supplicant period | The number of seconds the router waits before retransmitting EAP-Request/Identity packets to the supplicant (client PC). If the router sends an EAP-Request/Identity packet to the client PC (supplicant) and the supplicant does not respond, the router sends the packet again after this interval elapses.<br><br>Valid values range from 1 to 65535 seconds. The default is 30 seconds. |

## Network Admission Control on Cisco IOS Routers

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Network Admission Control (NAC), an industry initiative sponsored by Cisco Systems, uses the network infrastructure to enforce security-policy compliance on all devices seeking to access network computing resources, thereby limiting damage from viruses and worms. By using NAC, organizations can provide network access to endpoint devices such as PCs, PDAs, and servers that are verified to be fully compliant with established security policy. NAC can also identify noncompliant devices and deny them access, place them in a quarantined area, or give them restricted access to computing resources.

Network access decisions are made through a process of posture validation, which evaluates the posture credentials presented by the endpoint device. These credentials can include such information as the endpoint's antivirus state, operating system version, operating system patch level, or Cisco Security Agent version and settings.

You can use NAC to enforce security policy compliance in many types of deployments, including branch offices, remote access, and dial-in access.

NAC policies in Security Manager enable a Cisco IOS router to act as a Network Access Device (NAD) for enforcing policy compliance on devices seeking to access the network. The following topics describe additional details about NAC:

- [Understanding NAC Components, page 64-9](#)
- [Understanding NAC System Flow, page 64-9](#)

The following topics describe the tasks you perform to create NAC policies on Cisco IOS routers:

- [Defining NAC Setup Parameters, page 64-10](#)
- [Defining NAC Interface Parameters, page 64-11](#)
- [Defining NAC Identity Parameters, page 64-13](#)

## Router Platforms Supporting NAC

To configure NAC policies on a router, the router must be running Cisco IOS Software Release 12.3(8)T images and later (with the Advanced Security feature set). However, the following routers do not support NAC:

- Cisco 7600 Series (7603, 7604, 7606, 7609, 7613)

- Cisco 7300 Series (7301, 7304)
- Cisco 7100 Series VPN Routers (7120, 7140, 7160)
- Cisco 3600 Series Multiservice Platforms (3620, 3631, 3661, 3662)
- Cisco 1700 Series Modular Access Routers (1710, 1720, 1750)
- Cisco 1600 Series (1601, 1602, 1603, 1604, 1605)
- Cisco ASR 1000 Series Aggregation Services Routers (all models)
- Cisco 800 Series (801, 803, 805, 811, 813, 828, 851, 857, 871, 876, 877, 878)
- Cisco SOHO 90 Series Secure Broadband Routers (91, 96, 97)
- Cisco SOHO 77 Series (71, 76, 77 ADSL, 77 H ADSL, 78)

## Understanding NAC Components

NAC contains the following components:

- Cisco Trust Agent (CTA)—The CTA acts as the NAC client. It provides posture credentials for the endpoint device on which it is installed, including the type of operating system and the version of antivirus software installed.
- Network access device (NAD)—The NAD initiates posture validation with the CTA when its Intercept ACL is triggered. It relays posture credentials received from the CTA to a AAA server. In return, the NAD receives configuration information from the AAA server, which it enforces on the selected interface. The NAD also:
  - Periodically polls the CTA to confirm that it is communicating with the same client at this IP address.
  - Revalidates all current sessions.
  - Sends username and password information from devices lacking a CTA (clientless hosts) to the AAA server for authentication.
  - Supports an exception list of predefined actions applied to specific devices, based on the device IP address or MAC address.

When you configure NAC policies in Security Manager, you are configuring the behavior of the Cisco IOS router acting as the NAD.

- AAA server—The AAA server obtains and validates posture credentials received from the CTA and returns the access policy to be enforced on the NAD. The AAA server must be a Cisco Secure Access Control Server (ACS), running the RADIUS protocol. Existing ACS authorization support can be used to provide access to clientless hosts. Posture validation rules and the access policies resulting from those rules are configured on the ACS.

## Understanding NAC System Flow

As shown in [Figure 64-2](#), the system flow for NAC is:

1. An IP packet from a connecting device triggers the Intercept ACL configured on the NAD.

2. The NAD triggers posture validation with the CTA configured on the device using the Extensible Authentication Protocol over User Datagram Protocol, otherwise known as EAP over UDP, or simply EoU.
3. The CTA sends its posture credentials to the NAD using EAP over UDP.
4. The NAD sends these posture credentials to the ACS using RADIUS.
5. The ACS performs posture validation, which determines whether to allow the device to access the network. (If necessary, the ACS requests additional posture validation from a third-party server. For example, if the CTA forwards credentials that are specific to a particular antivirus application, the ACS forwards this information via the HCAP protocol to a vendor server for validation.) If the device is a clientless host, the ACS checks the username and password it receives against its locally stored list.
6. The ACS directs the NAD to enforce the appropriate access policy on the requesting device. Access may be granted, denied, redirected, or restricted.

## Defining NAC Setup Parameters

You configure NAC setup parameters by selecting the AAA server groups that obtain and validate the posture credentials received from devices trying to connect to the network. You can configure an option that allows devices lacking the Cisco Trust Agent (CTA) to be authenticated by a predefined username and password stored on a Cisco Secure Access Control Server (ACS). Additionally, you can modify default settings for EAP over UDP. This is the protocol used for posture validation communications between the Cisco IOS router serving as the network access device (NAD) and the device trying to access your network.

#### Related Topics

- [Defining NAC Interface Parameters, page 64-11](#)
- [Defining NAC Identity Parameters, page 64-13](#)
- [Network Admission Control on Cisco IOS Routers, page 64-8](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Identity > Network Admission Control** from the Policy selector, then click the **Setup** tab in the work area.
- (Policy view) Select **Router Platform > Identity > Network Admission Control** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.

The NAC Setup tab is displayed. See [Table 64-2 on page 64-15](#) for a description of the fields on this tab.

- Step 2** Enter the name of the AAA server group containing the AAA server that performs posture validation, or click **Select** to select the server group from a list or to create a new one. The selected AAA server group must contain ACS devices running RADIUS.

**Note** Each AAA server in the selected group must be configured to communicate with an interface that exists on the router; otherwise, validation fails.

- Step 3** (Optional) Select up to two AAA server groups as backups to the main server group. If all the servers in the main server group go down, the servers in the backup server group perform NAC.

Both backup server groups must consist of ACS devices running RADIUS.

- Step 4** (Optional) Under EAP over UDP, select one or both of the following Allow parameters:

- a. Select the **Allow IP Station ID** check box to include IP addresses in the RADIUS requests sent to the ACS.
- b. Select the **Allow Clientless** check box to provide access to devices that do not have the CTA installed. In such cases, the ACS authenticates these devices by checking the username and password against a predefined list.

If you do not select this check box, devices without CTA are prevented from accessing the network if their traffic matches the Intercept ACL. This is because without CTA, posture validation cannot be performed.

**Note** This feature is not supported on routers running Cisco IOS Software Release 12.4(6)T or later.

- Step 5** (Optional) Under EAP over UDP, modify the default settings related to the EAP over UDP (EoU) protocol, if required. See [Table 64-2 on page 64-15](#) for details.

## Defining NAC Interface Parameters

You configure NAC interface parameters by selecting the interfaces on which NAC is performed. You must also define the Intercept ACL, which determines which traffic on these interfaces is subject to posture validation. Additionally, you can optionally override the device-level setting for initiating EAP over UDP sessions and subject all sessions to periodic revalidation (see [Defining NAC Setup Parameters, page 64-10](#)).

A NAC policy must include at least one interface definition to function.

### Before You Begin

- Select the AAA server group containing the ACS device performing posture validation. See [Defining NAC Setup Parameters, page 64-10](#).
- Define an ACL object that defines the traffic to subject to posture validation in NAC policies. See [Creating Access Control List Objects, page 6-53](#).
- Define an ACL object that defines the default access on the selected interface (default ACL). See [Creating Access Control List Objects, page 6-53](#).

**Related Topics**

- [Defining NAC Setup Parameters, page 64-10](#)
- [Defining NAC Identity Parameters, page 64-13](#)
- [Network Admission Control on Cisco IOS Routers, page 64-8](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Identity > Network Admission Control** from the Policy selector, then click the **Interfaces** tab in the work area.
  - (Policy view) Select **Router Platform > Identity > Network Admission Control** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Interfaces** tab.

The NAC Interfaces tab is displayed. See [Table 64-3 on page 64-16](#) for a description of the fields on this tab.

- Step 2** On the NAC Interfaces tab, select an interface definition from the table, then click **Edit**, or click **Add** to create a definition. The NAC Interface Configuration dialog box appears. See [Table 64-4 on page 64-17](#) for a description of the fields in this dialog box.

- Step 3** Enter the name of the interface or interface role on which NAC is performed, or click **Select** to select an interface role from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).

- Step 4** (Optional) Enter the name of the ACL object that acts as the intercept ACL, or click **Select** to select it from a list or to create a new object.

The intercept ACL determines which traffic on the selected interfaces is subject to posture validation before being granted access to the network. If you do not select an ACL, all traffic on the selected interfaces is subject to posture validation.

---

**Note** If you defined an authentication proxy on the same interface as a NAC interface, you must use the same intercept ACL in both policies. Otherwise, deployment might fail. For more information about authentication proxies, see [Configuring AAA Rules for IOS Devices, page 15-7](#).

---

- Step 5** (Optional) To override the device-level value defined for maximum attempts to initiate an EAP over UDP session, enter a new value in the EAP over UDP Max Retries field.

- Step 6** (Optional) Deselect the **Enable EOU Session Revalidation** check box if you do not want the NAD to periodically revalidate all EAP over UDP sessions.

---

**Note** Subinterfaces support default values only for the options described in [Step 5](#) and [Step 6](#).

---

- Step 7** Click **OK** to save your definitions locally on the client and close the dialog box. Your interface definitions appear in the table on the NAC Interfaces tab.
-

## Defining NAC Identity Parameters

By default, any traffic over the selected interfaces that match the intercept ACL is subjected to posture validation before it is permitted to enter the network. However, you can create an exception list of predefined actions to apply to specific devices. You use identity profiles to create this exception list. Each profile contains two elements:

- A profile definition, identifies the device to which the profile applies. Devices can be identified by their IP addresses, MAC addresses, or types (for Cisco IP phones).
- An action, which defines the result when this device tries to access the network. Each action can include an ACL, a redirect URL, or both. If you do not specify an action, the default ACL is applied.

When you configure NAC identity parameters, you first define one or more identity actions and then create the identity profiles to which these actions apply. You can apply each action to multiple profiles.

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Identity > Network Admission Control** from the Policy selector, then click the **Identities** tab in the work area.
  - (Policy view) Select **Router Platform > Identity > Network Admission Control** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Identities** tab.
- The NAC Identities tab is displayed. See [Table 64-5 on page 64-18](#) for a description of the fields on this tab.
- Step 2** Define one or more identity actions:
- a. On the NAC Identities tab, select an identity action from the lower table, then click **Add**. The NAC Identity Action dialog box appears.
  - b. Define an identity action. See [Table 64-7 on page 64-20](#) for a description of the available fields.
  - c. Click **OK** to save your definitions and close the dialog box. The action appears in the Identity Actions table in the NAC Identities tab.
  - d. (Optional) Repeat [a.](#) through [c.](#) to define additional identity actions, as required.
- Step 3** Define identity profiles:
- a. Select an identity profile from the upper table on the NAC Identities tab, then click **Add**. The NAC Identity Profile dialog box appears. See [Table 64-6 on page 64-19](#) for a description of the fields in this dialog box.
  - b. Enter the name of an identity action (as defined in [Step 2](#)) or click **Select** to display a selector.
  - c. Select and define a profile definition, which identifies the device to which the profile should apply.
  - d. Click **OK** to save your definitions and close the dialog box. The profile appears in the Identity Profiles table in the NAC Identities tab.
  - e. (Optional) Repeat [a.](#) through [d.](#) to define additional identity profiles, as required.
-

# Network Admission Control Policy Page

Network Admission Control (NAC) policies enable Cisco IOS routers acting as network access devices (NADs) to enforce access privileges when an endpoint tries to connect to a network. Access decisions are made on the basis of information provided by the endpoint device, such as its current antivirus state, thus keeping insecure nodes from infecting the network.

You can configure NAC policies on a Cisco IOS router from the following tabs on the Network Admission Control policy page:

- [Network Admission Control Page—Setup Tab, page 64-14](#)
- [Network Admission Control Page—Interfaces Tab, page 64-16](#)
- [Network Admission Control Page—Identities Tab, page 64-18](#)

For more information, see [Network Admission Control on Cisco IOS Routers, page 64-8](#).

## Navigation Path

- (Device view) Select **Platform > Identity > Network Admission Control** from the Policy selector.
- (Policy view) Select **Router Platform > Identity > Network Admission Control** from the Policy Type selector. Right-click **Network Admission Control** to create a policy, or select an existing policy from the Shared Policy selector.

## Network Admission Control Page—Setup Tab

Use the Network Admission Control Setup tab to select the Cisco Secure Access Control Servers used for authentication during the NAC process, as well as to define the EAP over UDP settings for communications between the NAD and the client seeking access to the network.

## Navigation Path

Go to the [Network Admission Control Policy Page, page 64-14](#), then click the **Setup** tab.

| AAA Server Group            | <p>The AAA server group used for NAC authentication. You must select a server group consisting of Cisco Secure Access Control Server (ACS) devices running the RADIUS protocol. Enter the name of a AAA server group object, or click <b>Select</b> to select the object from a list or to create a new one.</p> <p><b>Note</b> Each AAA server in the selected group must be configured to communicate with an interface that exists on the router; otherwise, validation fails.</p>                                                                                                                                                    |
| Backup AAA Server Group 1   | The backup AAA server group in case the AAA servers in the main group are down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Backup AAA Server Group 2   | The secondary backup AAA server group in case the AAA servers in the main group and the first backup group are down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| EAP over UDP (EoU) settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Allow IP Station ID         | <p>When selected, enables an IP address to be included in the calling-station-id field of RADIUS requests sent to the ACS.</p> <p>When deselected, IP addresses are not included in the calling-station-id field of RADIUS requests sent to the ACS.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| Allow Clientless            | <p>When selected, enables devices that do not have the Cisco Trust Agent (CTA) installed to be authenticated through the use of a username and password configured on the ACS.</p> <p>If you select this check box, enter the username and password (including confirmation) in the fields provided.</p> <p>When deselected, NAC prevents devices lacking the CTA from accessing the network, if their traffic matches the intercept ACL (see <a href="#">NAC Interface Configuration Dialog Box, page 64-17</a>).</p> <p><b>Note</b> This feature is not supported on routers running Cisco IOS Software Release 12.4(6)T or later.</p> |
| Max Retry                   | <p>The maximum number of retries that all NAC interfaces on this router should make when initiating an EAP over UDP session with a connecting device.</p> <p>Valid values range from 1 to 3. The default is 3.</p> <p><b>Note</b> You can override this global value on a specific interface, if required. See <a href="#">Network Admission Control Page—Interfaces Tab, page 64-16</a>.</p>                                                                                                                                                                                                                                            |
| Rate Limit                  | <p>The number of EAP over UDP posture validations that the router can handle simultaneously. Additional devices cannot be validated until one or more devices drop off.</p> <p>Valid values range from 1 to 200. The default is 20. If you set this value to 0, rate limiting is turned off.</p>                                                                                                                                                                                                                                                                                                                                         |

**Table 64-2** Network Admission Control Setup Tab (continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port           | <p>The UDP port to use for EAP over UDP sessions.</p> <p>Valid values range from 1 to 65535. The default is 21862.</p> <p><b>Note</b> For NAC to work, the default ACL on this router must permit UDP traffic over the port designated here for EAP over UDP traffic. For more information, see <a href="#">Chapter 16, “Managing Firewall Access Rules”</a>.</p> |
| Enable Logging | <p>When selected, EAP over UDP events on this router are logged to the device.</p> <p>When deselected, EAP over UDP logging is disabled. This is the default.</p>                                                                                                                                                                                                 |

## Network Admission Control Page—Interfaces Tab

Use the Network Admission Control Interfaces tab to select and configure the router interfaces on which to perform NAC. This includes configuring the Intercept ACL and selected EoU interface parameters. A NAC policy must include at least one interface definition in order to function.

### Navigation Path

Go to the [Network Admission Control Policy Page, page 64-14](#), then click the **Interfaces** tab.

### Field Reference

**Table 64-3** Network Admission Control Interfaces Tab

| Element         | Description                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces      | The name of the interface on which NAC is being performed.                                                                           |
| Intercept ACL   | The name of the Intercept ACL, which determines the incoming traffic that triggers the interface to make a posture validation check. |
| EoU Max Retries | The maximum number of retries that this interface should perform when it initializes an EoU session with a connecting device.        |
| Revalidate      | Indicates whether the interface revalidates its EoU sessions to make sure they are still active.                                     |
| Add button      | Opens the <a href="#">NAC Interface Configuration Dialog Box, page 64-17</a> . From here you can define a NAC interface.             |

**Table 64-3** *Network Admission Control Interfaces Tab (continued)*

| Element       | Description                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Edit button   | Opens the <a href="#">NAC Interface Configuration Dialog Box, page 64-17</a> . From here you can edit the selected NAC interface. |
| Delete button | Deletes the selected NAC interfaces from the table.                                                                               |

## NAC Interface Configuration Dialog Box

Use the NAC Interface Configuration dialog box to add or edit the router interfaces on which NAC is being performed.

### Navigation Path

Go to the [Network Admission Control Page—Interfaces Tab, page 64-16](#), then click the **Add** or **Edit** button beneath the table.

|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                       | The interface that will perform NAC on connecting devices. Enter the name of an interface or interface role, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                           |
| Intercept ACL                   | The ACL that defines the traffic requiring posture validation. Enter the name of an ACL object, or click <b>Add</b> to select an object from a list or to create a new one.<br><br><b>Note</b> If an authentication proxy is configured on the same interface as NAC, the same Intercept ACL must be used in both policies. Otherwise, deployment may fail. For more information about authentication proxies, see <a href="#">Configuring AAA Rules for IOS Devices, page 15-7</a> . |
| EAP over UDP Max Retries        | The maximum number of times that the router should try to initiate an EoU session with a connecting device. Valid values range from 1 to 3. The default is 3.<br><br><b>Note</b> Subinterfaces support the default value only.                                                                                                                                                                                                                                                        |
| Enable EoU Session Revalidation | When selected, the router revalidates its EoU sessions as required. This is the default.<br><br>When deselected, EoU session revalidation is not performed.<br><br><b>Note</b> Subinterfaces support the default value only.                                                                                                                                                                                                                                                          |

## Network Admission Control Page—Identities Tab

Use the Network Admission Control Identities tab to view, create, edit, and delete NAC identity profiles and identity actions. Identity profiles define a specific action to perform on traffic received from selected devices, as identified by their IP address, MAC address, or device type. In this way, devices with identity profiles are handled by NAC without having to undergo posture validation against an ACS.

### Navigation Path

Go to the [Network Admission Control Policy Page, page 64-14](#), then click the **Interfaces** tab.

| Profile Definition      | The type of identity profile—device IP address, MAC address, or device type (IP phone).                                     |
| Action Name             | The name of the action (defined in the Identity Actions table) that is assigned to this NAC identity profile.               |
| Add button              | Opens the <a href="#">NAC Identity Profile Dialog Box, page 64-19</a> . From here you can define an identity profile.       |
| Edit button             | Opens the <a href="#">NAC Identity Profile Dialog Box, page 64-19</a> . From here you can edit a selected identity profile. |
| Delete button           | Deletes the selected identity profiles from the table.                                                                      |
| Identity Actions Table  |                                                                                                                             |
| Action Name             | The name of the identity action.                                                                                            |
| ACL                     | The ACL applied to profiles to which this identity action is assigned.                                                      |
| Redirect URL            | The URL to which traffic from devices to which this identity action is assigned are redirected.                             |
| Add button              | Opens the <a href="#">NAC Identity Action Dialog Box, page 64-19</a> for defining a NAC identity action.                    |
| Edit button             | Opens the <a href="#">NAC Identity Action Dialog Box, page 64-19</a> for editing a selected NAC identity action.            |
| Delete button           | Deletes the selected identity actions from the table.                                                                       |

## NAC Identity Profile Dialog Box

Use the NAC Identity Profile dialog box to add or edit the NAC profiles assigned to devices that match a specific identity. Identity profiles define a NAC action to apply to all traffic coming from a specific device, based on its IP address, MAC address, or device type (for IP phones).

### Navigation Path

Go to the [Network Admission Control Page—Identities Tab, page 64-18](#), then click the **Add** or **Edit** button beneath the Identity Profiles table.

|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                 | A descriptive name for the identity action. Use this name when you select an action to assign to a NAC identity profile. See <a href="#">NAC Identity Profile Dialog Box, page 64-19</a> .                                                                                                                                                                                                                        |
| Access Control Lists | The ACL that defines how to handle traffic received from a device which is assigned a profile that includes this action. Enter the name of an ACL object, or click <b>Add</b> to select an object from a list or to create a new one.<br><br><b>Note</b> You cannot select the same ACL object that is being used for the intercept ACL. See <a href="#">NAC Interface Configuration Dialog Box, page 64-17</a> . |
| Redirect URL         | The address of the remediation server to which traffic from the device should be redirected. Redirect URLs are usually of the form <b>http://URL</b> or <b>https://URL</b> .                                                                                                                                                                                                                                      |

# Configuring Logging Policies

This chapter contains the following topics:

- [Logging on Cisco IOS Routers, page 65-1](#)
- [Syslog Logging Setup Policy Page, page 65-7](#)
- [Syslog Servers Policy Page, page 65-10](#)
- [NetFlow Policy Page, page 65-12](#)

## Logging on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Security Manager provides the following policies for configuring logging on a Cisco IOS router:

- **Syslog Logging Setup**—Enable the syslog-logging feature, and define basic logging parameters. For more information, see [Defining Syslog Logging Setup Parameters, page 65-1](#).
- **Syslog Servers**—Define the remote servers to which syslog messages are sent. For more information, see [Defining Syslog Servers, page 65-3](#).
- **NetFlow**—Enable NetFlow logging by providing parameters and interfaces. See [Defining NetFlow Parameters, page 65-6](#) for more information.

**Note**

We strongly recommend configuring a Network Time Protocol (NTP) policy on all routers on which logging is enabled. NTP synchronization provides accurate timestamps for syslog messages, which is essential for comparing logs on multiple devices.

## Defining Syslog Logging Setup Parameters

This procedure describes enabling syslog logging on the router, and defining which messages are sent to a syslog server. In addition, you can optionally define:

- The source interface for all syslog messages sent from this device.
- The messages that are saved to a local buffer.

- An origin identifier added to each message.
- A rate limit on the number of messages that can be sent.

**Note**

To send syslog messages from the router to a syslog server, you must also define the IP address of the syslog server. For more information, see [Defining Syslog Servers, page 65-3](#).

- [Defining Syslog Servers, page 65-3](#)
- [Understanding Log Message Severity Levels, page 65-4](#)
- [Logging on Cisco IOS Routers, page 65-1](#)

**Step 1** Do one of the following to access the router's Syslog Logging Setup page:

- (Device view) Select **Platform > Logging > Syslog Logging Setup** from the Policy selector.
- (Policy view) Select **Router Platform > Logging > Syslog Logging Setup** from the Policy Type selector. Select an existing policy or create a new one.

The Syslog Logging Setup page is displayed. See [Table 65-2 on page 65-8](#) for a description of the fields on this page.

**Step 2** Select **Enable Logging** to turn on the syslog logging feature. If this option is not selected, no log messages are created.

**Tip**

To use the device's default logging settings, or to restore the default settings, simply select **Enable Logging**, ensure all other fields are blank, then click **Save**. The default settings vary by device. See your router documentation for more details.

**Step 3** (Optional) In the Source Interface field, enter the name of the interface or interface role whose address should be used as the source interface for all log messages sent to a syslog server; or click **Select** to select an interface role from a list or to create a new one. The source interface must have an IP address.

This option is useful when the syslog server cannot reach the address from which the connection originated (for example, due to a firewall). If you do not enter a value in this field, the address of the outgoing interface is used.

**Step 4** (Optional) To send log messages to a syslog server:

- Select **Enable Trap**. This option is selected by default.
- Select a value from the Trap Level list. All messages of this severity or greater (that is, having the same or a lower severity-level number) are sent to the syslog server; messages of a lesser severity are ignored. For more information about severity levels, see [Table 65-1 on page 65-4](#).

**Step 5** (Optional) To save log messages locally to a buffer on the router:

- Select **Enable Buffer**. This option is selected by default.
- Enter the Buffer Size in bytes.
- Select the lowest severity level for messages to be saved to the buffer. All messages of that severity level or greater are saved to the buffer.
- Select **Use XML Format** to save messages in XML format. (You can configure both the regular buffer and the XML buffer in the same policy.) If you select this option, enter the size of the XML buffer in bytes.

**Note** Make sure not to make buffers so large that the router runs out of memory for other tasks. If this happens, deployment may fail.

**Step 6** (Optional) Define a rate limit to prevent a flood of output messages:

- a. Select **Enable Rate Limit**. This option is selected by default.
- b. Enter the maximum number of messages that can be sent per second.
- c. Select the severity levels to *exclude* from the rate limit. For example, if you select 2 (critical), all syslog messages of severity levels 0-2 are sent to the syslog server regardless of the defined rate limit.
- d. Select **All Messages** to apply the rate limit to all syslog messages *except* console messages (and excepting those severity levels specifically excluded above).
- e. Select **Console Messages** to apply the rate limit to console messages only.

**Note** If you enable rate limiting without specifying any options, the default settings (10 messages per second, applied to console messages only) are applied.

**Step 7** (Optional) To add an origin identifier to the beginning of each syslog message:

- a. Select the type of origin ID to send—the IP address of the router, its host name, or a text string that you provide.
- b. If you select String, enter the desired text in the field provided. Spaces are permitted.

The origin identifier is useful for identifying the source of syslog messages in cases where you send output from multiple devices to a single syslog server.

**Note** The origin identifier is not added to messages sent to local destinations, such as the buffer, the console, and the monitor.

## Defining Syslog Servers

This procedure describes how to define the servers to which the router should send syslog messages. When you define a syslog server, you can choose whether the logging messages it receives should be forwarded as plain text or in XML format.

If you define multiple syslog servers, logging messages are sent to all of them.

### Before You Begin

- Enable syslog logging and define basic logging parameters on the Syslog Logging Setup page. For more information, see [Defining Syslog Logging Setup Parameters, page 65-1](#).

### Related Topics

- [Defining Syslog Logging Setup Parameters, page 65-1](#)
- [Understanding Log Message Severity Levels, page 65-4](#)
- [Logging on Cisco IOS Routers, page 65-1](#)

- Step 1** Do one of the following to access the router's Syslog Servers page:
- (Device view) Select **Platform > Logging > Syslog Servers** from the Policy selector.
  - (Policy view) Select **Router Platform > Logging > Syslog Servers** from the Policy Type selector. Select an existing policy or create a new one.
- The Syslog Servers page is displayed. See [Table 65-3 on page 65-11](#) for a description of the fields on this page.
- Step 2** To define a server to receive syslog messages from this router, click the **Add** button below the table to open the Syslog Server dialog box. See [Table 65-4 on page 65-12](#) for more about this dialog box.
- Step 3** In the IP Address field, enter the address of the desired syslog server, or click **Select** to select a network/host object from a list or to create a new one. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 4** (Optional) Select **Forward Messages in XML Format** to forward received syslog messages in XML format instead of plain text.
- Step 5** Click **OK** to save your definition and close the dialog box. The syslog server you defined is displayed in the table.

**Note** To edit a syslog server, select it from the table, then click **Edit**. To remove a syslog server, select it, then click **Delete**.

## Understanding Log Message Severity Levels

Syslog messages on Cisco IOS routers are classified into eight severity levels. Each severity level is identified by a number and a corresponding name. The lower the number, the greater the severity, as shown in the following table.

**Table 65-1 Syslog Message Severity Levels**

| Level Number | Level Name    | Description                      |
|--------------|---------------|----------------------------------|
| 0            | emergency     | System unusable                  |
| 1            | alert         | Immediate action needed          |
| 2            | critical      | Critical conditions              |
| 3            | errors        | Error conditions                 |
| 4            | warnings      | Warning conditions               |
| 5            | notifications | Normal but significant condition |
| 6            | informational | Informational messages only      |
| 7            | debugging     | Debug messages                   |

## NetFlow on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

The ability to characterize IP traffic and understand how and where it flows is critical for network availability, performance and troubleshooting. Monitoring IP traffic flows facilitates accurate capacity planning, and ensures that network resources are used appropriately in support of organizational goals.

NetFlow is a logging feature available on IOS devices for recording, caching and transmitting IP traffic-flow information on a per-interface basis. The basic output of NetFlow is a flow record, where a “flow” is defined as a unidirectional stream of packets between a given source and destination—both defined by a network-layer IP address and transport-layer source and destination port numbers.

On the IOS device, NetFlow consists of two key components—a NetFlow cache which stores IP flow data, and the NetFlow export mechanism that transmits the NetFlow records to a collection server for data reporting. Thus, when enabled, NetFlow records and caches statistics for incoming and outgoing traffic flows, periodically transmitting these records from the device to a NetFlow collector, in the form of User Datagram Protocol (UDP) datagrams.

Several different formats for the export packet, or flow record, have evolved as NetFlow has matured, and these formats are commonly referred to as the NetFlow version. These versions are well documented, and include versions 1, 5, 7, and 9. The most commonly used format is NetFlow version 5, but version 9 is the latest format and has some advantages for extensibility, security, traffic analysis and multicasting.

Security Manager currently supports Traditional NetFlow on IOS devices. Traditional NetFlow provides a fixed flow record, even for version 9, meaning the device will use certain flags and predefined record combinations in generating the flow. The device configuration settings define export destinations, export interface, and certain version-specific transmission options.

### More About Traffic Flows and NetFlow

Each packet that passes into or out of a router or switch is examined for a set of IP packet attributes. These attributes are the IP packet identity or “fingerprint,” and they define whether the packet is unique, or related to other packets.

All packets with the same source/destination IP address, source/destination ports, protocol interface, and class of service are grouped into a flow and the packets and bytes are tallied. This method of flow determination (or “fingerprinting”) is scalable because a large amount of network information can be condensed into a database of NetFlow information called the NetFlow cache.

In general, the NetFlow cache is constantly filling with flows, and software in the router or switch is searching the cache for flows that have terminated or expired, and these flows are exported to the NetFlow collector. (Unlike SNMP polling, NetFlow export periodically transmits information to the NetFlow collector.) The NetFlow collector has the job of assembling and organizing the exported flows to produce the real-time or historical reports used for traffic and security analysis.

### NetFlow Summary

To summarize, the following steps outline NetFlow:

- NetFlow is configured on the router or switch to capture IP traffic flows

- Flow records are stored in the local NetFlow cache
- Periodically, approximately 30 to 50 flow records are bundled together and exported to a NetFlow collector server
- The collector software creates reports from the NetFlow data

## Defining NetFlow Parameters

This procedure describes enabling NetFlow logging on the router.

#### Related Topics

- [NetFlow on Cisco IOS Routers, page 65-5](#)
- [NetFlow Policy Page, page 65-12](#)
- [Logging on Cisco IOS Routers, page 65-1](#)

- 
- Step 1** To access the router's NetFlow page, do one of the following:
- (Device view) Select **Platform > Logging > NetFlow** from the Policy selector.
  - (Policy view) Select **Router Platform > Logging > NetFlow** from the Policy Type selector. Select an existing policy or create a new one.
- The router's NetFlow page is displayed. See [NetFlow Policy Page, page 65-12](#) for complete descriptions of the fields on this page.
- Step 2** On the **Setup** tab of the NetFlow page, specify global NetFlow parameters for the router:
- **Primary Destination** – Choose IP Address or Hostname from this list to enable NetFlow collection and to specify how the primary NetFlow collector will be defined. You can choose the blank entry to disable this option.
    - **IP Address** – Enter the IP address of the device hosting the primary NetFlow Collection Engine, and then enter the number of the **UDP Port** monitored by that flow collector (port numbers can range from 1 to 65535)
    - **Hostname** – Enter the fully qualified domain name of the device hosting the primary NetFlow Collection Engine, and then enter the number of the **UDP Port** monitored by that flow collector (port numbers can range from 1 to 65535)
  - **Redundant Destination** – Choose IP Address or Hostname from this list to specify how the back-up NetFlow collector will be defined. You can choose the blank entry to disable this option.
    - **IP Address** – Enter the IP address of the device hosting the secondary NetFlow Collection Engine, and then enter the number of the **UDP Port** monitored by that flow collector (port numbers can range from 1 to 65535)
    - **Hostname** – Enter the fully qualified domain name of the device hosting the secondary NetFlow Collection Engine, and then enter the number of the **UDP Port** monitored by that flow collector (port numbers can range from 1 to 65535)

**Note**

If you define a Primary and a Redundant Destination, flow data is transmitted to both.

- **Source Interface** – Specify the router interface through which flow data will be transmitted to the collector destination(s).
- **Version** – Define the record format to be used for flow data by choosing the appropriate NetFlow version number from this drop-down list. You can choose the blank entry to disable this option.
  - **1** – The original record format. No additional parameters are required.
  - **5** – The most widely adopted format; includes Border Gateway Protocol (BGP) autonomous system (AS) information and flow sequence numbers.

If BGP is configured on your network, you can include either origin or peer AS information in the NetFlow records. Choose **origin-as** or **peer-as** from the AS Type drop-down list. You can choose the blank entry to disable this option.

Check **Enable BGP Nexthop** to include BGP next hop information in the flow caches. (Note that with version 5, this information is visible in the caches, but it is not exported.)

- **9** – The most-recent, template-based version; not yet fully supported.

If BGP is configured on your network, you can include either origin or peer AS information in the NetFlow records. Choose **origin-as** or **peer-as** from the AS Type drop-down list. You can choose the blank entry to disable this option.

Check **Enable BGP Nexthop** to include BGP next hop information in the flow records.

**Note**

AS information collection is resource intensive, especially for origin-as. If you are not interested in monitoring peering arrangements, disabling AS collection may improve performance.

**Step 3** On the **Interfaces** tab, define the interfaces for which traffic flows are to be reported.

- To add an interface, click the Add Row button to open the Add NetFlow Interface Settings dialog box. This dialog box is described in [Adding and Editing NetFlow Interface Settings, page 65-15](#).
- To edit an existing interface, select the appropriate entry in the Interfaces table and then click the Edit Row button to open the Edit NetFlow Interface Settings dialog box (described in [Adding and Editing NetFlow Interface Settings, page 65-15](#)).
- To delete an existing interface, select that entry in the Interfaces table and then click the Delete Row button, and then confirm the deletion.

**Note**

You can disable NetFlow data collection on an interface without deleting it. Refer to [Adding and Editing NetFlow Interface Settings, page 65-15](#) for more information.

## Syslog Logging Setup Policy Page

Use the Syslog Logging Setup page to enable syslog logging and define basic logging parameters on the selected Cisco IOS router.

For more information, see [Defining Syslog Logging Setup Parameters, page 65-1](#).

**Note**

We strongly recommend that you define an NTP policy on all routers on which logging is enabled in order to create accurate timestamps for each log message. For more information, see [NTP Policy Page, page 63-98](#).

**Note**

If you unassign a logging setup policy, the default logging configuration is restored on the device upon deployment.

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog Logging Setup** from the Policy selector.
- (Policy view) Select **Router Platform > Logging > Syslog Logging Setup** from the Policy Type selector. Right-click **Syslog Logging Setup** to create a policy, or select an existing policy from the Shared Policy selector.

|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Logging   | <p>When selected, syslog logging is enabled on the device.</p> <p>When deselected, logging is disabled on the device. This is the default.</p> <p><b>Tip</b> To use the device's default syslog logging settings, select the Enable Logging check box, then click <b>Save</b>, without entering additional values.</p>                                                                                                                                                                |
| Source Interface | <p>The source address for all outgoing log messages sent to a syslog server. This setting may be necessary when the syslog server cannot respond to the address from which the log message originated (for example, due to a firewall).</p> <p>If you do not define a value in this field, the address of the outgoing interface is used.</p> <p>Enter the name of an interface or interface role, or click <b>Select</b> to select an object from a list or to create a new one.</p> |

Table 65-2 Syslog Logging Setup Page (continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trap           | <p>Defines which log messages are forwarded to a syslog server:</p> <ul style="list-style-type: none"> <li>• <b>Enable Trap</b>—When selected, log messages are sent to the syslog server. This is the default. When deselected, log messages are not sent.</li> <li>• <b>Trap Level</b>—The lowest severity level of messages that are logged and sent to the syslog server. All messages of this severity and greater are logged. Severity levels are identified by a name and a number. For more information, see <a href="#">Table 65-1 on page 65-4</a>.</li> </ul> <p><b>Tip</b> To restore the router's default trap settings, select <b>Enable Trap</b>, then select the blank setting from the Trap Level list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Logging Buffer | <p>Defines whether log messages are saved locally to a buffer on the device.</p> <ul style="list-style-type: none"> <li>• <b>Enable Buffer</b>—When selected, log messages are saved to a buffer on the device. This is the default. When deselected, a log buffer is not maintained on the device.</li> <li>• <b>Buffer Size</b>—The size of the buffer in bytes. Valid values range from 4096 to 4294967295 bytes (4 kilobytes to 4 gigabytes). The default size varies by platform. Make sure not to make the buffer so large that the router runs out of memory for other tasks; otherwise, deployment might fail.</li> </ul> <p><b>Note</b> The maximum buffer size might be smaller on some devices.</p> <ul style="list-style-type: none"> <li>• <b>Severity Level</b>—The lowest severity level of messages that are saved in the buffer. All messages of this severity and greater are saved. On most Cisco IOS routers, the default severity level is 7 (debugging). Severity levels are identified by a name and a number. For more information, see <a href="#">Table 65-1 on page 65-4</a>.</li> <li>• <b>Use XML Format</b>—When selected, log messages are saved to a buffer in XML format. (You can configure both the regular buffer and the XML buffer in the same policy.) When deselected, an XML buffer is not maintained on the device.</li> <li>• <b>Buffer Size</b>—The size of the XML buffer in bytes. Valid values range from 4096 to 4294967295 bytes (4 kilobytes to 4 gigabytes).</li> </ul> <p><b>Note</b> The maximum buffer size might be smaller on some devices.</p> <p><b>Tip</b> To restore the router's default buffer settings, select <b>Enable Trap</b>, erase the buffer size setting, then select the blank setting from the Severity Level list.</p> |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rate Limit | <p>Limits the rate of log messages sent to the syslog server.</p> <ul style="list-style-type: none"> <li>• <b>Enable Rate Limit</b>—When selected, the rate limit is enabled. When deselected, the rate limit is disabled.</li> <li>• <b>Messages per Sec.</b>—The maximum number of logging messages that can be sent per second. Valid values range from 1 to 10000. The default is 10 messages per second.</li> <li>• <b>Exclude</b>—The types of messages to <i>exclude</i> from the rate limit. This setting excludes the severity level you select as well as all messages with a lower severity level number (that is, more severe). The default is 3 (errors), which excludes all log messages with a severity level of 3, 2 (critical), 1 (alerts), or 0 (emergencies) from the rate limit. For more information about severity levels, see <a href="#">Table 65-1 on page 65-4</a>.</li> <li>• <b>All Messages</b>—When selected, the rate limit applies to all messages except console messages.</li> <li>• <b>Console Messages</b>—When selected, the rate limit applies to console messages only.</li> </ul> <p><b>Tip</b> To restore the router's default rate limit settings, select the <b>Enable Rate Limit</b> check box, then erase the rate limit value setting.</p> |
| Origin ID  | <p>The origin identifier that is added to the beginning of all syslog messages sent from this device to the remote syslog server. The origin identifier is useful in cases where you send output from multiple devices to a single syslog server.</p> <ul style="list-style-type: none"> <li>• <b>ID Type</b>—The type of origin identifier added to the beginning of each syslog message. Options are: <ul style="list-style-type: none"> <li>– <b>IP Address</b>—The IP address of the source device.</li> <li>– <b>Hostname</b>—The hostname of the source device.</li> <li>– <b>String</b>—User-defined text.</li> </ul> </li> <li>• <b>Value</b>—Applies only when you select String as the ID type. Enter the text of the user-defined string. Spaces are permitted, except for the first character.</li> </ul> <p><b>Note</b> The origin identifier is not added to messages sent to local destinations, such as the buffer, the console, and the monitor.</p>                                                                                                                                                                                                                                                                                                                    |

## Syslog Servers Policy Page

Use the Syslog Servers page to create, edit, and delete servers that collect log messages from the router. For more information, see [Defining Syslog Servers, page 65-3](#).

**Note**

To enable logging to the syslog servers defined on this page, you must enable logging and define basic parameters on the [Syslog Logging Setup Policy Page, page 65-7](#).

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog Servers** from the Policy selector.
- (Policy view) Select **Router Platform > Logging > Syslog Servers** from the Policy Type selector. Right-click **Syslog Servers** to create a policy, or select an existing policy from the Shared Policy selector.

**Related Topics**

| Element       | Description                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------|
| IP Address    | The name of the syslog server, as represented by a network/host object, or its IP address.                          |
| XML           | Indicates whether the syslog server receives log messages in XML format.                                            |
| Add button    | Opens the <a href="#">Syslog Server Dialog Box, page 65-11</a> . From here you can define a syslog server.          |
| Edit button   | Opens the <a href="#">Syslog Server Dialog Box, page 65-11</a> . From here you can edit the selected syslog server. |
| Delete button | Deletes the selected syslog server from the table.                                                                  |

## Syslog Server Dialog Box

Use the Syslog Server dialog box to define the server that collects syslog messages from the router. You can also define whether the log messages it receives are in XML format or plain text.

**Note**

To enable logging to the syslog servers defined on this page, you must enable logging and define basic parameters on the [Syslog Logging Setup Policy Page, page 65-7](#).

**Navigation Path**

Go to the [Syslog Servers Policy Page, page 65-10](#), then click the **Add** or **Edit** button beneath the table.

| IP Address                     | The IP address of the syslog server. Enter an IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new one. |
| Forward Messages in XML Format | When selected, log messages are sent to the syslog server in XML format.<br>When deselected, log messages are sent to the syslog server as plain text.                         |

## NetFlow Policy Page

Use the NetFlow page to enable NetFlow recording and define its parameters on the selected Cisco IOS router.

The NetFlow page consists of two tabbed panels: Setup and Interfaces. The Setup tab provides global configuration parameters for NetFlow collection on the router. The Interfaces tab lists router interfaces for which NetFlow data collection is configured, and allows enabling and disabling ingress and egress accounting on a per-interface basis.

### Note

We strongly recommend that you define an NTP policy on all routers on which logging is enabled in order to create accurate timestamps for each log message. For more information, see [NTP Policy Page, page 63-98](#).

### Navigation Path

- (Device view) Select **Platform > Logging > NetFlow** from the Policy selector.
- (Policy view) Select **Router Platform > Logging > NetFlow** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **NetFlow** to create a new policy.

|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version               | <p>The NetFlow version number, which defines the record format to be used for flow. You can choose the blank entry to disable this option.</p> <ul style="list-style-type: none"> <li>• <b>1</b>—The original record format. No additional parameters are required.</li> <li>• <b>5</b>—The most widely adopted format; includes Border Gateway Protocol (BGP) autonomous system (AS) information and flow sequence numbers.</li> </ul> <p>If BGP is configured on your network, you can include either origin or peer AS information in the NetFlow records. Choose <b>origin-as</b> or <b>peer-as</b> from the AS Type drop-down list. You can choose the blank entry to disable this option.</p> <p>Check <b>Enable BGP Nexthop</b> to include BGP next hop information in the flow caches. (Note that with version 5, this information is visible in the caches, but it is not exported.)</p> <ul style="list-style-type: none"> <li>• <b>9</b>—The most-recent, template-based version; not yet fully supported.</li> </ul> <p>If BGP is configured on your network, you can include either origin or peer AS information in the NetFlow records. Choose <b>origin-as</b> or <b>peer-as</b> from the AS Type drop-down list. You can choose the blank entry to disable this option.</p> <p>Check <b>Enable BGP Nexthop</b> to include BGP next hop information in the flow records.</p> <p><b>Note</b> AS information collection is resource intensive, especially for origin-as. If you are not interested in monitoring peering arrangements, disabling AS collection might improve performance.</p> |
| <b>Interfaces tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Interface             | The names of the interfaces on which NetFlow collection is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Ingress        | “Enabled” indicates flow recording is enabled on this interface for incoming traffic; “Disabled” indicates incoming traffic is not recorded for this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Egress         | “Enabled” indicates flow recording is enabled on this interface for outgoing traffic; “Disabled” indicates outgoing traffic is not recorded for this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Add Row               | Click this button to open the Add NetFlow Interface Settings dialog box. Adding a NetFlow interface is described in <a href="#">Adding and Editing NetFlow Interface Settings, page 65-15</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Edit Row              | Click this button to open the Edit NetFlow Interface Settings dialog box for the selected interface. Editing NetFlow interfaces is described in <a href="#">Adding and Editing NetFlow Interface Settings, page 65-15</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Delete Row            | Click this button to delete the selected interface. You will be asked to confirm the deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Adding and Editing NetFlow Interface Settings

Use the Add NetFlow Interface Settings and Edit NetFlow Interface Settings dialog boxes to enable and disable NetFlow ingress and egress reporting for specific router interfaces.

**Note**

Except for their titles, these two dialog boxes are identical. The following information applies to both.

**Navigation Path**

Go to the [NetFlow Policy Page, page 65-12](#), then click the **Add Row** or **Edit Row** button beneath the table.

**Related Topics**

## Configuring Quality of Service

---

This chapter contains the following topics:

- [Quality of Service on Cisco IOS Routers, page 66-1](#)
- [Quality of Service Policy Page, page 66-19](#)

### Quality of Service on Cisco IOS Routers

**Note**

---

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

Quality of service (QoS) refers to the ability of a network to provide priority service to selected network traffic over various underlying technologies, including Frame Relay, ATM, Ethernet and 802.1 networks, SONET, and IP-routed networks. QoS features enhance the predictability of network service by:

- Supporting dedicated bandwidth.
- Improving loss characteristics.
- Avoiding and managing network congestion.
- Shaping network traffic.
- Setting traffic priorities across the network.

QoS is generally used at entry points to service providers, as well as at consolidation points where multiple lines converge. QoS is also useful where speed mismatches occur (for example, at the boundary between a WAN and a LAN), as these places are often traffic congestion points.

QoS policies in Security Manager are based on the Cisco Systems Modular QoS CLI (MQC). MQC standardizes the CLI and semantics for QoS features across all platforms supported by Cisco IOS software, which provides a modular and highly extensible framework for deploying QoS. Security Manager provides an easy-to-use interface for MQC that concentrates key QoS features inside a single dialog box, streamlining the creation of QoS policies for selected traffic entering and leaving the router.

For a description of the procedure for defining a QoS policy in Security Manager, see [Defining QoS Policies, page 66-10](#).

## Quality of Service and CEF

Cisco Express Forwarding (CEF) is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks. It defines the fastest method by which a Cisco IOS router forwards packets from ingress to egress interfaces.

Certain QoS features configurable in Security Manager, such as Class-Based Policing and Class-Based Weighted Random Early Detection, are supported only on routers that run CEF. All routers from the Cisco 800 Series to the Cisco 7200 Series require CEF for these QoS features; the Cisco 7500 Series requires distributed CEF (dCEF).

**Note**

For a complete list, see *When is CEF Required for Quality of Service* on Cisco.com at this URL: [http://www.cisco.com/en/US/tech/tk39/tk824/technologies\\_tech\\_note09186a0080094978.shtml](http://www.cisco.com/en/US/tech/tk39/tk824/technologies_tech_note09186a0080094978.shtml)

By default, CEF is enabled as part of the router's initial configuration. To verify whether CEF is enabled on your router, use the **show ip cef** command. You can configure CEF using the CEF interface settings policy (see [CEF Interface Settings on Cisco IOS Routers, page 62-25](#)). Be aware, however, that if your router does not have CEF enabled, activating CEF could have a significant impact on your router's packet streaming. Consult your router documentation before enabling CEF.

## Understanding Matching Parameters

You define matching parameters by identifying the traffic on which QoS is performed, that is, classifying the interesting packets. Various classification tools are available, including protocol type, IP precedence (IPP) value, Differentiated Service Code Point (DSCP) value, and ACLs.

Traffic classes consist of a series of match criteria and a means of evaluating these criteria. For example, you might define a class with matching criteria based on several specified protocols and a DSCP value. You can then specify that a packet must match only one of these defined criteria to be considered part of this class. Your other option is to specify that packets must match all defined criteria considered part of the traffic class.

Packets that are members of a defined traffic class are forwarded according to the QoS specifications that you defined in the policy map. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class.

For information about defining matching parameters in a QoS policy, see [Defining QoS Class Matching Parameters, page 66-13](#).

## Understanding Marking Parameters

Marking parameters enable you to classify packets, which entails using a traffic descriptor to categorize a packet within a specific group. This defines the packet and makes it accessible for QoS handling on the network. Both traffic policers and traffic shapers use the packet classification to ensure adherence to the contracted level of service agreed upon between the source and your network. Additionally, marking parameters enable you to take packets that might have arrived at the device with one QoS classification and reclassify them. Downstream devices use this new classification to identify the packets and apply the appropriate QoS functions to them.

Security Manager uses two types of marking for IPv4 packets—one based on IPP classes and one based on DSCP values. IPP is based on the three most significant bits in the Type of Service (ToS) byte of each packet, which means you can partition traffic into eight classes. For historical reasons, each precedence value corresponds with a name, as defined in RFC 791. [Table 66-1 on page 66-3](#) lists the numbers and their corresponding names, from least to most important.

**Table 66-1** IP Precedence Classes

| Class | Name           |
|-------|----------------|
| 0     | routine        |
| 1     | priority       |
| 2     | immediate      |
| 3     | flash          |
| 4     | flash-override |
| 5     | critical       |
| 6     | internet       |
| 7     | network        |

**Note**

Classes 6 and 7 are generally reserved for network control information, such as routing updates.

DSCP is based on the six most significant bits in the ToS byte (the remaining two bits are used for flow control), with values ranging from 0 to 63. The DSCP bits contains the IPP bits, which makes DSCP backward-compatible with IPP.

Marking is generally used on devices that are close to the network edge or administrative domain so that subsequent devices can provide service based on the classification mark.

For information about defining marking parameters in a QoS policy, see [Defining QoS Class Marking Parameters, page 66-15](#).

## Understanding Queuing Parameters

Queuing manages congestion on traffic leaving a Cisco IOS router by determining the order in which to send packets out over an interface, based on priorities you assign to those packets. Queuing makes it possible to prioritize traffic to satisfy time-critical applications, such as desktop video conferencing, while still addressing the needs of less time-dependent applications, such as file transfer.

During periods of light traffic, that is, when no congestion exists, packets are sent out as soon as they arrive at an interface. However, during periods of transmission congestion at the outgoing interface, packets arrive faster than the interface can send them. By using congestion management features such as queuing, packets accumulating at the interface are queued until the interface is free to send them. They are then scheduled for transmission according to their assigned priority and the queuing mechanism configured for the interface. The router determines the order of packet transmission by controlling which packets are placed in which queue and how queues are serviced with respect to one another.

Security Manager uses a form of queuing called Class-Based Weighted Fair Queuing (CBWFQ). With CBWFQ, you define traffic classes based on match criteria. Packets matching the criteria constitute the traffic for this class. A queue is reserved for each class, containing the traffic belonging to that class. You assign characteristics to queues, such as the bandwidth (fixed or minimum) assigned to it and the queue limit, which is the maximum number of packets allowed to accumulate in the queue.

When you use CBWFQ, the sum of all bandwidth allocation on an interface cannot exceed 75 percent of the total available interface bandwidth. The remaining 25 percent is used for other overhead, including Layer 2 overhead, routing traffic, and best-effort traffic. Bandwidth for the CBWFQ default class, for instance, is taken from the remaining 25 percent.

For more information about queuing, see:

- [Tail Drop vs. WRED, page 66-4](#)
- [Low-Latency Queuing, page 66-5](#)
- [Default Class Queuing, page 66-6](#)

For information about defining queuing parameters in a QoS policy, see [Defining QoS Class Queuing Parameters, page 66-16](#).

- [Quality of Service on Cisco IOS Routers, page 66-1](#)

## Tail Drop vs. WRED

After a queue reaches its configured queue limit, the arrival of additional packets causes tail drop or packet drop to take effect, depending on how you configured the QoS policy. Tail drop, which is the default response, treats all traffic equally and does not differentiate between different classes of service. When tail drop is in effect, packets are dropped from full queues until the congestion is eliminated and the queue is no longer full. This often leads to global synchronization, in which a period of congestion is followed by a period of underutilization, as multiple TCP hosts reduce their transmission rates simultaneously.

A more sophisticated approach to managing queue congestion is offered by Cisco's implementation of Random Early Detection, called Weighted Random Early Detection, or WRED. As shown in [Figure 66-1](#), WRED reduces the chances of tail drop by selectively dropping packets when the output

interface begins to show signs of congestion. By dropping some packets early instead of waiting until the queue is full, WRED avoids dropping large numbers of packets at once and allows the transmission line to be used fully at all times.

**Figure 66-1** *Weighted Random Early Detection*

WRED is useful only when the bulk of the traffic is TCP/IP traffic, because TCP hosts reduce their transmission rate in response to congestion. With other protocols, packet sources might not respond, or might resend dropped packets at the same rate. As a result, dropping packets does not decrease congestion.

**Note**

WRED treats non-IP traffic as precedence 0, the lowest precedence value. Therefore, non-IP traffic is more likely to be dropped than IP traffic.

- [Understanding Queuing Parameters, page 66-4](#)

## Low-Latency Queuing

The low-latency queuing (LLQ) feature brings strict priority queuing to CBWFQ. Strict priority queuing gives delay-sensitive data, such as voice traffic, preference over other traffic.

**Note**

Although it is possible to assign various types of real-time traffic to the strict priority queue, we strongly recommend that you direct only voice traffic to it.

LLQ defines the maximum bandwidth that you can allocate to priority traffic during times of congestion. Setting a maximum ensures that nonpriority traffic does not starve (meaning that this traffic is also provided with bandwidth). When the device is not congested, the priority class traffic is allowed to exceed its allocated bandwidth. Policing drops packets from the priority queue; therefore, neither WRED nor tail drop (as configured in the Queue Limit field) is used.

When LLQ is not used, CBWFQ provides weighted fair queuing based on defined classes, with no strict priority queue available for real-time traffic.

## Default Class Queuing

You use the Fair Queue field to define the number of dynamic queues that should be reserved for the default class to use. This is the class to which traffic that does not satisfy the match criteria of other classes is directed. By default, the number of queues that are created is based on the interface bandwidth.

[Table 66-2 on page 66-6](#) lists the default number of dynamic queues that CBWFQ uses when it is enabled on an interface:

**Table 66-2**      *Default Number of Queues for Default Class*

| Bandwidth Range                                       | Number of Dynamic Queues |
|-------------------------------------------------------|--------------------------|
| Less than or equal to 64 kbps                         | 16                       |
| More than 64 kbps and less than or equal to 128 kbps  | 32                       |
| More than 128 kbps and less than or equal to 256 kbps | 64                       |
| More than 256 kbps and less than or equal to 512 kbps | 128                      |
| More than 512 kbps                                    | 256                      |

## Understanding Policing and Shaping Parameters

Security Manager offers two kinds of traffic regulation mechanisms:

- The rate-limiting feature of Class-Based Policing for policing traffic. Policing limits traffic flow to a configured rate. Policing can be performed on a selected interface or on the control plane. See [Understanding Control Plane Policing, page 66-9](#).

- Distributed Traffic Shaping (DTS) for shaping traffic. Traffic shaping enables you to control the traffic leaving an interface (output traffic) in order to match its flow to the speed of the remote target interface and to ensure that the traffic conforms to the policies defined for it. By shaping traffic to meet downstream requirements, you can eliminate bottlenecks in topologies with data-rate mismatches. Shaping can either be performed on selected QoS classes or at the interface level (hierarchical shaping).

Both policing and shaping mechanisms use the traffic descriptor for a packet—indicated by the classification of the packet (see [Understanding Marking Parameters, page 66-3](#))—to ensure adherence to the agreed upon level of service. Although policers and shapers usually identify traffic descriptor violations in the same way, they differ in the way they respond to violations, as shown in [Figure 66-2](#):

- A policer typically drops excess traffic. In other cases, it transmits the traffic with a different (usually lower) priority.
- A shaper typically delays excess traffic using a buffer, or queuing mechanism, to hold packets and shape the flow when the data rate of the source is later than expected.

**Figure 66-2 Traffic Policing vs. Traffic Shaping**

For information about defining policing and shaping parameters in a QoS policy, see [Defining QoS Class Policing Parameters, page 66-17](#) and [Defining QoS Class Shaping Parameters, page 66-18](#).

## Understanding the Token-Bucket Mechanism

Both policing and shaping use a token-bucket mechanism to regulate data flow. A token bucket is a formal definition of a rate of transfer. It has three components: a burst size, a mean rate, and a time interval (Tc). Any two values may be derived from the third using this formula:

$$\text{mean rate} = \text{burst size} / \text{time interval}$$

These terms are defined as follows:

- **Mean rate**—Also called the committed information rate (CIR), it specifies how much data can be sent or forwarded per unit time on average. The CIR is defined either as an absolute value or as a percentage of the available bandwidth on the interface. When defined as a percentage, the equivalent value in bits per second (bps) is calculated after deployment based on the interface bandwidth and the percent value defined in the policy.

---

**Note** If the interface bandwidth changes (for example, more bandwidth is added), the bps value of the CIR is recalculated based on the revised amount of bandwidth.

---

- **Burst size**—Also called the committed burst (Bc) size, it specifies for each burst how much data can be sent within a given time without creating scheduling concerns. When you use percentages to calculate the CIR, burst size is measured in milliseconds.
- **Time interval**—Also called the measurement interval, it specifies the amount of time in seconds per burst. Over any integral multiple of this interval, the bit rate of the interface does not exceed the mean rate. The bit rate, however, might be arbitrarily fast within the interval.

In the token-bucket metaphor, tokens are put into the bucket at a certain rate. These tokens represent permission for the source to send a certain number of bits into the network. To send a packet, the regulator (policer or shaper) must remove a number of tokens from the bucket that equals the packet size.

Security Manager uses a two-bucket algorithm, as shown in [Figure 66-3](#). The first bucket is the conform bucket and the second bucket is the exceed bucket. The full size of the conform bucket is the number of bytes specified as the normal burst size. The full size of the exceed bucket is the number of bytes specified in the maximum burst size. Both buckets are initially full, and they are updated based on the token arrival rate, which is determined by the CIR. If the number of bytes in the arriving packet is less than the number of bytes in the conform bucket, the packet conforms. The required number of tokens are removed from the conform bucket and the defined conform action is taken (for example, the packet is transmitted). The exceed bucket is unaffected.

If the conform bucket does not contain sufficient tokens, the excess token bucket is checked against the number of bytes in the packet. If enough tokens are present in the two buckets combined, the exceed action is taken on the packet and the required number of bytes are removed from each bucket. If the exceed bucket contains an insufficient number of bytes, the packet is in violation of the burst limits and the violate action is taken on the packet.

When you use traffic policing, the token-bucket algorithm provides three actions for each packet: a conform action, an exceed action, and an optional violate action. For instance, packets that conform can be configured to be transmitted, packets that exceed can be configured to be sent with a decreased priority, and packets that violate can be configured to be dropped.

Traffic policing is often configured on interfaces at the edge of a network to limit the rate of traffic entering or leaving the network. In the most common traffic policing configurations, traffic that conforms is transmitted and traffic that exceeds is sent with a decreased priority or is dropped. You can change these configuration options to suit your network needs.

When you use traffic shaping, the token-bucket mechanism includes a data buffer for holding packets that cannot be sent immediately. (Policers do not have such a buffer.) The token buckets permit packets to be sent in bursts, but places bounds on this capability so that the flow is never faster than the capacity of the buckets plus the time interval multiplied by the refill rate. The buffer also guarantees that the long-term transmission rate does not exceed the CIR.

## Understanding Control Plane Policing

The Control Plane Policing feature enables you to manage input traffic entering the control plane (CP) of the router. The CP is a collection of processes that run at the process level on the route processor. These processes collectively provide high-level control for most Cisco IOS functions. Control plane policing protects the CP of Cisco IOS routers and switches against reconnaissance and denial-of-service (DoS) attacks, enabling the CP to maintain packet forwarding and protocol states despite an attack or heavy traffic load on the router or switch.

The Control Plane Policing feature treats the CP as a separate entity with its own ingress (input) and egress (output) ports, enabling you to use Security Manager to configure QoS policies on input. These policies are applied when a packet enters the CP. You can configure a QoS policy to prevent unwanted

packets from progressing after a specified rate limit is reached. For example, a system administrator can limit all TCP/SYN packets that are destined for the CP to a maximum rate of 1 megabit per second. Additional packets beyond this limit are silently discarded.

The following types of Layer 3 packets are forwarded to the CP and processed by aggregate control plane policing:

- Routing protocol control packets
- Packets destined for the local IP address of the router
- Packets from management protocols, such as SNMP, Telnet, and secure shell (SSH).

---

**Note** Support for output policing is available only in Cisco IOS Release 12.3(4)T and later T-train releases.

---

For information about how to define Control Plane Policing, see [Defining QoS on the Control Plane, page 66-12](#). For more information about this feature, refer to the document, *Control Plane Policing* on Cisco.com at this URL:

[http://www.cisco.com/en/US/docs/ios/qos/configuration/guide/ctrl\\_plane\\_policng.html](http://www.cisco.com/en/US/docs/ios/qos/configuration/guide/ctrl_plane_policng.html)

## Defining QoS Policies

When you define QoS policies, you must first decide whether to configure the policy on specific interfaces or on the control plane. This initial choice determines how you configure the rest of the policy, as described in the following topics:

- [Defining QoS on Interfaces, page 66-10](#)
- [Defining QoS on the Control Plane, page 66-12](#)

---

**Note** If you define a QoS policy on both the interfaces and the control plane of the same device, only the control plane configuration is deployed.

---

#### Related Topics

- [Quality of Service on Cisco IOS Routers, page 66-1](#)

## Defining QoS on Interfaces

You can create multiple QoS interface definitions, each of which applies to either input traffic (entering the router) or output traffic (exiting the router).

When you create a QoS interface definition on output traffic, you have the option of configuring hierarchical shaping on the interface as a whole instead of configuring shaping on individual QoS classes.

After you create your interface definitions, you must define one or more QoS classes on each interface. QoS classes contain the matching criteria that determine which packets are included in the class and the QoS functions (marking, queuing, policing, and shaping) to apply to that traffic. You can configure each interface (or interface role) with up to 16 QoS classes, each containing its own set of matching criteria and a defined set of QoS functions to apply to the traffic in that class.

For each interface, we recommend that for each interface you define at least one QoS class and a default class. If you do not configure a default class, packets that do not match the criteria of the other defined classes are treated as members of a default class that has no configured QoS functionality. Packets assigned to this class are placed in a simple first-in first-out (FIFO) queue, and are forwarded at a rate determined by the available underlying link bandwidth. This FIFO queue is managed by tail drop, which avoids congestion by dropping packets from the queue until it is no longer full.

**Note**

QoS is applied to packets on a first-match basis. The router examines the table of QoS classes starting from the top and applies the properties of the first class whose matching criteria matches the packet. Therefore, it is important that you define and order your classes carefully. The default class should be placed last to prevent traffic that matches a specific class from being treated as unmatched traffic.

**Before You Begin**

Ensure that Cisco Express Forwarding (CEF) is enabled on the router. For more information, see [CEF Interface Settings on Cisco IOS Routers, page 62-25](#).

**Related Topics**

- [Defining QoS Policies, page 66-10](#)
- [Defining QoS on the Control Plane, page 66-12](#)
- [Quality of Service on Cisco IOS Routers, page 66-1](#)

- Step 1** Do one of the following:
- (Device view) Select **Platform > Quality of Service** from the Policy selector.
  - (Policy view) Select **Router Platform > Quality of Service** from the Policy Type selector. Select an existing policy or create a new one.
- The Quality of Service page is displayed. See [Table 66-3 on page 66-20](#) for a description of the fields on this page.
- Step 2** In the Applied to field, select **Interfaces** to define QoS parameters for specific interfaces on the selected router.
- Step 3** Click the **Add** button under the upper table to display the QoS Policy dialog box. See [Table 66-4 on page 66-21](#) for a description of the fields in this dialog box.
- Step 4** In the Interface field, enter the name of an interface or interface role, or click **Select** to display a selector.

**Tip**

If the interface role you want is not listed in the selector, click the **Create** button or the **Edit** button to open the [Interface Role Dialog Box, page 6-75](#). From here you can define an interface role to use in the policy.

- Step 5** Select the traffic direction on which you want to apply the QoS definition, Output (traffic exiting the interface) or Input (traffic entering the interface). Queuing and shaping can be applied only to output traffic.

**Step 6** (Optional) Define interface-level (hierarchical) shaping parameters. See [Table 66-4 on page 66-21](#) for details.

**Note** When you enable hierarchical shaping on an interface, you cannot define shaping parameters for specific QoS classes. Shaping can be used only on output traffic. See [Understanding Policing and Shaping Parameters, page 66-6](#) for more information about shaping.

**Step 7** Click **OK**. The QoS interface definition is displayed in the upper table of the Quality of Service page.

**Note** To edit a QoS interface definition, select an interface from the upper table, then click the **Edit** button. To remove an interface definition, select it from the table, then click the **Delete** button. You cannot delete an interface that has defined classes.

**Step 8** With the interface selected in the upper table, click the **Add** button beneath the QoS Classes table. The QoS Class dialog box is displayed. See [Table 66-5 on page 66-23](#) for a description of the fields in this dialog box.

The QoS Class dialog box enables you to determine which traffic over the selected interface is included in the QoS class and how to handle that traffic.

**Step 9** (Optional) Select the **Default class** check box if you are defining the properties of the default QoS class for this interface. The default class is assigned to all traffic that does not match the criteria of the other defined classes.

**Step 10** Define the QoS class using one or more tabs in the QoS Class dialog box, as described in:

- [Defining QoS Class Matching Parameters, page 66-13](#)
- [Defining QoS Class Marking Parameters, page 66-15](#)
- [Defining QoS Class Queuing Parameters, page 66-16](#)
- [Defining QoS Class Policing Parameters, page 66-17](#)
- [Defining QoS Class Shaping Parameters, page 66-18](#)

**Step 11** Repeat [Step 8](#) through [Step 10](#) to add QoS classes to the interface defined in [Step 3](#). If required, use the **Up Row** and **Down Row** buttons to reorder the classes.

**Note** To edit a QoS class, select the relevant interface from the upper table to display its defined classes in the QoS Class table. Select the class to edit, then click the **Edit** button. To remove a class, select it from the table, then click the **Delete** button.

**Step 12** Repeat [Step 3](#) through [Step 11](#) to define QoS classes for a different interface on the selected router.

## Defining QoS on the Control Plane

When you configure QoS on input traffic entering the control plane, you can define multiple QoS classes, including a default class for traffic that does not match the criteria you define for the other classes. After defining the matching criteria for a particular class, you can configure a policing definition for that class. (Marking, queuing, and shaping are not available.) For more information, see [Understanding Control Plane Policing, page 66-9](#).

QoS policies defined on the control plane override any QoS parameters defined on an interface of the same device.

**Note**

QoS is applied to packets on a first-match basis. The router examines the table of QoS classes starting from the top and applies the properties of the first class whose matching criteria matches the packet. Therefore, it is important that you define and order your classes carefully. The default class should be placed last to prevent traffic that matches a specific class from being treated as unmatched traffic.

**Before You Begin**

Ensure that Cisco Express Forwarding (CEF) is enabled on the router. For more information, see [CEF Interface Settings on Cisco IOS Routers, page 62-25](#).

**Related Topics**

- [Defining QoS Policies, page 66-10](#)

- [Quality of Service on Cisco IOS Routers, page 66-1](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Quality of Service** from the Policy selector.
  - (Policy view) Select **Router Platform > Quality of Service** from the Policy Type selector. Select an existing policy or create a new one.
- The Quality of Service page is displayed. See [Table 66-3 on page 66-20](#) for a description of the fields on this page.
- Step 2** In the Applied to field, select **Control Plane** to define QoS policing on input traffic entering the control plane.
- Step 3** Click the **Add** button beneath the Control Plane QoS Classes table. The QoS Class dialog box is displayed. See [Table 66-5 on page 66-23](#) for a description of the fields in this dialog box.
- The QoS Class dialog box enables you to determine which traffic over the selected interface is included in the QoS class and how to handle that traffic.
- Step 4** (Optional) Select the **Default class** check box if you are defining the properties of the default QoS class for the control plane. The default class is assigned to all traffic that does not match the criteria of the other defined classes.
- Step 5** Define the QoS class using the tabs in the QoS Class dialog box, as described in the following sections:
- [Defining QoS Class Matching Parameters, page 66-13](#)
  - [Defining QoS Class Policing Parameters, page 66-17](#)
- Step 6** Repeat [Step 3](#) through [Step 5](#) to add QoS classes to the control plane. If required, use the **Up Row** and **Down Row** buttons to reorder the classes.
- 

## Defining QoS Class Matching Parameters

When you define matching parameters, you must define matching criteria and specify whether packets must meet one or all of the criteria to be considered part of the class. See [Understanding Matching Parameters, page 66-2](#) for more information.

**Note**

---

You do not define matching parameters when configuring the default class.

---

**Related Topics**

- [Defining QoS Class Marking Parameters, page 66-15](#)
- [Defining QoS Class Queuing Parameters, page 66-16](#)
- [Defining QoS Class Policing Parameters, page 66-17](#)
- [Defining QoS Class Shaping Parameters, page 66-18](#)
- [Defining QoS Policies, page 66-10](#)
- [Quality of Service on Cisco IOS Routers, page 66-1](#)

- 
- Step 1** On the Quality of Service page, click the **Add** button beneath the QoS Classes table, or select a class and then click the **Edit** button. The QoS Class dialog box is displayed.
- Step 2** Click the **Matching** tab. See [Table 66-6 on page 66-24](#) for a description of the fields on this tab.
- Step 3** Select a matching method:
- Any—Traffic matching any of the defined parameters is included in this class.
  - All—Only traffic matching all of the defined parameters is included in this class.
- Step 4** (Optional) Under Protocol, click **Add** to display a selector for choosing the protocols to include in this class. Select one or more items from the Available Protocols list, then click >> to add them to the Selected Protocols list.

**Note**

---

When configuring QoS on the control plane, only the ARP protocol can be selected.

---

When you finish, click **OK** to save your definitions and return to the QoS Class dialog box. Your selections are displayed in the Protocol field.

- Step 5** (Optional) Under Precedence, click **Add** to display a selector for choosing which IP precedence values (from 0 to 7) to include in this class. Select one or more items from the Available Precedences list, then click >> to add them to the Selected Precedences list. Traffic that arrives marked with one of these values matches this criterion.

**Note**

---

For more information about IP precedence values, see [Table 66-1 on page 66-3](#).

---

When you finish, click **OK** to save your definitions and return to the QoS Class dialog box. Your selections are displayed in the Precedences field.

- Step 6** (Optional) Under DSCP, click **Add** to display a selector for choosing which DSCP values (from 0 to 63) to include in this class. Select one or more items (up to eight) from the Available DSCPs list, then click >> to add them to the Selected DSCPs list. Traffic that arrives marked with one of these values matches this criterion.

When you finish, click **OK** to save your definitions and return to the QoS Class dialog box. Your selections are displayed in the DSCP field.

- Step 7** (Optional) Under ACL, define ACLs as part of the matching criteria for this class:
- a. Click **Edit** to display the Edit ACLs dialog box. Use this dialog box to define which ACLs to include in this class.

- b. Enter one or more ACLs, or click **Select** to select an ACL object from a list or to create a new one. Traffic that matches these ACL definitions matches this criterion.
- c. When you finish, click **OK** twice to save your definitions and return to the QoS Class dialog box. Your selections are displayed in the ACL field.

**Tip** Use the up and down arrows to order the ACLs. We recommend placing more frequently used ACLs at the top of the list to optimize the matching process.

- Step 8** Go to another tab or click **OK** to save your definitions locally on the client and close the dialog box. The defined class is displayed in the QoS Classes table on the Quality of Service page.
- Step 9** Do one of the following:
- When defining QoS on interfaces, continue as described in [Defining QoS on Interfaces, page 66-10](#).
  - When defining control plane policing, continue as described in [Defining QoS on the Control Plane, page 66-12](#).

## Defining QoS Class Marking Parameters

When you define marking parameters, you can mark the packets in this QoS class with either a precedence value or a DSCP value. See [Understanding Marking Parameters, page 66-3](#) for more information.

**Note** Marking is not available when you configure QoS on the control plane.

### Related Topics

- Step 1** On the Quality of Service page, click the **Add** button beneath the QoS Classes table, or select a class and then click the **Edit** button. The QoS Class dialog box is displayed.
- Step 2** Click the **Marking** tab. See [Table 66-7 on page 66-26](#) for a description of the fields on this tab.
- Step 3** Select the **Enable Marking** check box.
- Step 4** Select one of the following marking options:
- Precedence—Select an IP precedence value (0 to 7) from the displayed list. For more information about these values, see [Table 66-1 on page 66-3](#).
  - DSCP—Select a DSCP value (0 to 63) from the displayed list.
- Step 5** Go to another tab or click **OK** to save your definitions locally on the client and close the dialog box. The defined class is displayed in the QoS Classes table on the Quality of Service page.

**Step 6** Continue as described in [Defining QoS Policies, page 66-10](#).

---

## Defining QoS Class Queuing Parameters

When you define queuing parameters, you can specify the amount of available bandwidth to provide to the traffic in this QoS class. You can also define a fixed amount of bandwidth that must be provided to high-priority traffic; you can define the priority parameter on only one class per interface. In addition, you must specify the type of queue management to perform on this class. See [Understanding Queuing Parameters, page 66-4](#) for more information.

### Note

Queuing is not available when you configure QoS on the control plane.

---

### Related Topics

- [Defining QoS Class Matching Parameters, page 66-13](#)
  - [Defining QoS Class Marking Parameters, page 66-15](#)
  - [Defining QoS Class Policing Parameters, page 66-17](#)
  - [Defining QoS Class Shaping Parameters, page 66-18](#)
  - [Defining QoS Policies, page 66-10](#)
  - [Quality of Service on Cisco IOS Routers, page 66-1](#)
- 

**Step 1** On the Quality of Service page, click the **Add** button beneath the QoS Classes table, or select a class and then click the **Edit** button. The QoS Class dialog box is displayed.

**Step 2** Click the **Queuing and Congestion Avoidance** tab. See [Table 66-8 on page 66-27](#) for a description of the fields on this tab.

**Step 3** Click the **Enable Queuing and Congestion Avoidance** check box.

Queuing options depend on whether you are defining the default class or a different class:

- When you define any class other than the default class, select one of the following queuing options:
  - Priority—Define the amount of bandwidth to make available to high-priority traffic. [Low-Latency Queuing, page 66-5](#) (LLQ) ensures that this traffic receives this fixed amount of bandwidth at all times. This is particularly useful for voice traffic, which requires low latency. You can define this amount by percentage or by an absolute value of kilobits per second.

**Note** You can define this option for only one class per interface.

---

- Bandwidth—Enter the amount of bandwidth to allocate to this class. You can define this amount by percentage or by an absolute value of kilobits per second.

**Note** The sum of all class bandwidth allocations on an interface cannot exceed 100 percent of the total available bandwidth.

---

- When you define the default class, select one of the following queuing options:

- Fair queue—Enter the number of queues to reserve for the default class. Values range in powers of 2 from 16 to 4096. By default, the number of queues is based on the available bandwidth of the selected interface. For more information, see [Table 66-2 on page 66-6](#).
- Bandwidth—Enter the amount of bandwidth to allocate to this class. You can define this amount by percentage or by an absolute value of kilobits per second.

**Step 4** (Optional) Define *one* of the following queue length management options:

- Queue Limit—(Default) Specify the maximum number of packets allowed. If you select this option, tail drop drops excess packets when the queue reaches its capacity.
- WRED Weight for Mean Queue Depth—WRED proactively drops packets until the transmitting protocol (usually TCP) responds by dropping its transmission rate, thereby alleviating congestion. Configure WRED by entering an exponential weight factor that is used to calculate the average queue size.

For more information, see [Tail Drop vs. WRED, page 66-4](#).

---

**Note** You should change the default only if you are certain that your applications will benefit from a different value.

---

---

**Note** Do not use WRED with protocols that are not sufficiently robust to reduce their transmission rates in response to packet loss, such as IPX or AppleTalk. WRED cannot be configured when you select the Priority percent option.

---

**Step 5** Go to another tab or click **OK** to save your definitions locally on the client and close the dialog box. The defined class is displayed in the QoS Classes table on the Quality of Service page.

**Step 6** Continue as described in [Defining QoS Policies, page 66-10](#).

---

## Defining QoS Class Policing Parameters

When you define policing parameters, you must specify the average data rate, which determines the amount of traffic that can be transmitted. In addition, you must specify the action to take on traffic bursts that exceed this data rate.

You can configure policing for all QoS classes, including the default class. For more information about policing, see [Understanding Policing and Shaping Parameters, page 66-6](#).

You can also configure policing on the control plane. For more information, see [Understanding Control Plane Policing, page 66-9](#).

### Related Topics

- 
- Step 1** On the Quality of Service page, click the **Add** button beneath the QoS Classes table, or select a class and then click the **Edit** button. The QoS Class dialog box is displayed.
- Step 2** Click the **Policing** tab. See [Table 66-9 on page 66-29](#) for a description of the fields on this tab.
- Step 3** Select the **Enable Policing** check box.
- Step 4** Define CIR, confirm burst, and excess burst values. You can define the CIR by percentage or by an absolute value of bits per second. The option you choose determines how you define the burst values.
- Step 5** Select the action to perform on packets that conform to the rate limit:
- transmit—Transmit the packet.
  - set-prec-transmit—Set the IP precedence to a defined value, then send the packet. This option is not available when configuring QoS on the control plane.
  - set-dscp-transmit—Set the DSCP to a defined value, then send the packet. This option is not available when configuring QoS on the control plane.
  - drop—Drop the packet.
- Step 6** Select the action to perform on exceed packets. The list of available actions depends on the selected conform action.
- For example, if transmit is performed on conforming packets, you can select any of the actions listed in [Step 5](#) for exceeding packets. However, if you selected one of the set actions for conforming packets, you can select only a set action or the drop action for exceeding packets. If you selected drop as the conform action, you must select drop as the exceed action.
- Step 7** Select the action to perform on violate packets. The list of available actions depends on the selected exceed action.
- For example, if transmit is performed on exceeding packets, you can select any of the actions listed in [Step 5](#) for violating packets. However, if you selected one of the set actions for exceeding packets, you can select only a set action or the drop action for violating packets. If you selected drop as the exceed action, you must select drop as the violate action.
- Step 8** Go to another tab, or click **OK** to save your definitions locally on the client and close the dialog box. The defined class is displayed in the QoS Classes table on the Quality of Service page.
- Step 9** Do one of the following:
- When defining QoS on interfaces, continue as described in [Defining QoS Policies, page 66-10](#).
  - When defining control plane policing, continue as described in [Defining QoS on the Control Plane, page 66-12](#).
- 

## Defining QoS Class Shaping Parameters

When you define shaping parameters, you must specify whether to base traffic shaping on the average data rate or on the average data rate plus the excess burst rate that occurs during traffic peaks. In both cases, traffic that exceeds these definitions is buffered until the rate lowers, allowing the packets to be sent.

The following conditions pertain:

- Shaping can be used only on output traffic.
- Shaping can be configured for all QoS classes, including the default class.
- Shaping is not available when you configure the QoS class for priority traffic.

- Shaping is not available when you configure QoS on the control plane.

For more information about shaping, see [Understanding Policing and Shaping Parameters, page 66-6](#).

**Tip**

To configure shaping on all the QoS classes defined for the interface (hierarchical shaping), see [Defining QoS on Interfaces, page 66-10](#).

- 
- Step 1** On the Quality of Service page, click the **Add** button beneath the QoS Classes table, or select a class and then click the **Edit** button. The QoS Class dialog box is displayed.
- Step 2** Click the **Shaping** tab. See [Table 66-10 on page 66-31](#) for a description of the fields on this tab.
- Step 3** Select the **Enable Shaping** check box.
- Step 4** Select the shaping type (Average or Peak).
- Step 5** Define CIR, sustained burst, and excess burst values. You can define the CIR by percentage or by an absolute value of bits per second. The option you choose determines how you define the burst values.
- Step 6** Proceed to another tab or click **OK** to save your definitions locally on the client and close the dialog box. The defined class is displayed in the QoS Classes table on the Quality of Service page.
- Step 7** Continue as described in [Defining QoS Policies, page 66-10](#).
- 

## Quality of Service Policy Page

Use the Quality of Service page to view, create, and edit QoS classes on specific interfaces of the selected device or on the control plane. QoS policies enable you to define techniques for managing the delay, delay variation (jitter), bandwidth, and packet loss parameters on a network. In addition, you can use the Quality of Service page to configure hierarchical shaping on an interface as an alternative to configuring shaping parameters for individual QoS classes.

For more information, see [Quality of Service on Cisco IOS Routers, page 66-1](#).

**Navigation Path**

- (Device view) Select **Platform > Quality of Service** from the Policy selector.
- (Policy view) Select **Router Platform > Quality of Service** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

See <a href="#">Understanding Control Plane Policing</a>, page 66-9.</li> </ul> <p><b>Note</b> If you configure QoS on both the interfaces and the control plane of the same device, only the control plane configuration is deployed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interface Table   | <p>If you are defining classes on interfaces, the upper table lists the interfaces on which you are defining QoS classes. The direction column indicates the direction of traffic through the interface to which the classes apply (Output or Input). The classes you can define vary based on the direction.</p> <p>The other fields indicate whether you defined shaping on the interface, and if shaping is defined, the type of hierarchical shaping (average or peak), the committed information rate (CIR), and the sustained and excess burst size. For detailed information about the attributes, see <a href="#">QoS Policy Dialog Box</a>, page 66-21.</p> <ul style="list-style-type: none"> <li>• To add an interface to the table, click the Add button.</li> <li>• To edit the settings for an interface, select it and click the Edit button.</li> <li>• To delete an interface, select it and click the Delete button.</li> </ul>                                                                                                                                                                                                                                  |
| QoS Classes Table | <p>The classes defined for the interface selected in the upper table, or for the control plane. Each row represents a separate class. The No. column indicates the order of the classes, and is very important: QoS is applied to packets on a first-match basis, based on class order.</p> <p>The Default Class column indicates whether this class is the default for all packets on the interface that do not match the criteria of the other defined classes. Make this the last class in the list.</p> <p>The remaining columns indicate the match criteria for the class, and the packet marking, queuing and congestion avoidance, policing, and shaping defined for the class, if any. For detailed information about the attributes, see <a href="#">QoS Class Dialog Box</a>, page 66-23.</p> <ul style="list-style-type: none"> <li>• To add class to the table, click the Add button.</li> <li>• To edit the settings for a class, select it and click the Edit button.</li> <li>• To delete a class, select it and click the Delete button.</li> <li>• To change the order of a class, select it and click the Up and Down arrow buttons to reposition it.</li> </ul> |

## QoS Policy Dialog Box

Use the QoS Policy dialog box to select an interface on which you want to define QoS parameters. In addition, you can use this dialog box to configure a single set of shaping parameters for all the traffic on the selected interface (known as hierarchical shaping). Using hierarchical shaping eliminates the need to configure shaping parameters for each QoS class defined on the interface.

### Note

This dialog box is not applicable when defining a QoS policy on the control plane. For more information, see [Defining QoS on the Control Plane, page 66-12](#).

After you create your QoS interface definitions, you can define one or more QoS classes for each interface. For more information, see [QoS Class Dialog Box, page 66-23](#).

### Navigation Path

Go to the [Quality of Service Policy Page, page 66-19](#), then click the **Add** or **Edit** button beneath the upper table to define a QoS interface definition.

| Enable Shaping                | When selected, configures hierarchical traffic shaping on the selected interface.<br>When deselected, hierarchical shaping is not used.<br><b>Note</b> Shaping can be performed only on output traffic.  |

Table 66-4 QoS Policy Dialog Box (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type            | <p>The type of shaping to perform:</p> <ul style="list-style-type: none"> <li>• Average—Limits the data rate for each interval to the sustained burst rate (also known as the Committed Burst rate or Bc), achieving an average rate no higher than the committed information rate (CIR). Additional packets are buffered until they can be sent.</li> <li>• Peak—Limits the data rate for each interval to the sustained burst rate plus the excess burst rate (Be). Additional packets are buffered until they can be sent.</li> </ul>                                                                                                                                                                                                           |
| CIR             | <p>The average data rate (also known as the committed information rate or CIR). You can define this amount by:</p> <ul style="list-style-type: none"> <li>• Percentage—Valid values range from 0 to 100% of the overall available bandwidth.</li> <li>• Bit/sec—Valid values range from 8000 to 1000000000 bits per second, and must be in multiples of 8000.</li> </ul> <p>Although data bursts during an interval may exceed this rate, the average data rate over any multiple integral of the interval will not exceed this rate.</p>                                                                                                                                                                                                          |
| Sustained Burst | <p>The normal burst size. If you select average as the shaping type, data bursts during an interval are limited to this value.</p> <p>The range of valid values is determined by the CIR:</p> <ul style="list-style-type: none"> <li>• When the CIR is defined by percentage—Valid values range from 10 to 2000 milliseconds.</li> <li>• When the CIR is defined by an absolute value—Valid values range from 1000 to 154400000 bytes, in multiples of 128 bytes.</li> </ul> <p><b>Note</b> We recommend that you leave this field blank when the CIR is defined by an absolute value. This allows the algorithms used by the device to determine the optimal sustained burst value.</p>                                                           |
| Excess Burst    | <p>The excess burst size. If you select peak as the shaping type, data bursts during an interval can equal the sum of the sustained burst value plus this value. The average data rate over multiple intervals, however, will continue to conform to the CIR.</p> <p>The range of valid values is determined by the CIR:</p> <ul style="list-style-type: none"> <li>• When the CIR is defined by percentage—Valid values range from 10 to 2000 milliseconds.</li> <li>• When the CIR is defined by an absolute value—Valid values range from 1000 to 154400000 bytes, in multiples of 128 bytes.</li> </ul> <p><b>Note</b> If you do not configure this field when the CIR is defined by an absolute value, the sustained burst value is used.</p> |

## QoS Class Dialog Box

Use the QoS Class dialog box to create or edit a QoS class on a selected interface or control plane of a Cisco IOS router. You can define up to 16 classes on a single interface and 256 classes for the device as a whole.

### Note

QoS is applied to packets on a first-match basis. The router examines the table of QoS classes starting from the top and applies the properties of the first class whose matching criteria matches the packet. Therefore, it is important that you define and order your classes carefully. The default class should be placed last to prevent traffic that matches a specific class from being treated as unmatched traffic.

### Navigation Path

Go to the [Quality of Service Policy Page, page 66-19](#). Complete the options at the top of the page, then do one of the following:

- To create a QoS class, select an interface from the upper table, then click the **Add** button beneath the QoS Class table. When creating a QoS class for the control plane, just click the **Add** button beneath the table.
- To edit a QoS class:
  - Select the interface whose class you want to edit from the upper table (Not required when selecting the control plane.).
  - Select the relevant class defined for that interface in the QoS Classes table. (Not required when selecting the control plane.)
  - Click the **Edit** button under the QoS Class table.

| Element                              | Description                                                                                                                                                                            |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Marking tab                          | Marks the traffic in this class so that downstream devices can properly identify it. See <a href="#">QoS Class Dialog Box—Marking Tab, page 66-26</a> .                                |
| Queuing and Congestion Avoidance tab | Defines how to queue the output traffic in this class. See <a href="#">QoS Class Dialog Box—Queuing and Congestion Avoidance Tab, page 66-27</a> .                                     |
| Policing tab                         | Limits the traffic flow for this class to a configured rate. See <a href="#">QoS Class Dialog Box—Policing Tab, page 66-29</a> .                                                       |
| Shaping tab                          | Controls the flow of output traffic for this class so that it conforms with the requirements of downstream devices. See <a href="#">QoS Class Dialog Box—Shaping Tab, page 66-31</a> . |

**Note**

When you configure a QoS policy on the control plane, only the Matching tab and Policing tab are available.

## QoS Class Dialog Box—Matching Tab

Use the Matching tab of the QoS Class dialog box to define which traffic over the selected interface is considered to be part of this class.

**Note**

When you define the default class, the Matching tab is disabled.

### Navigation Path

Go to the [QoS Class Dialog Box, page 66-23](#), then click the **Matching** tab.

|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol   | <p>One or more protocols included in this class map. Click <b>Add</b> to display a selector. Select one or more items from the Available Protocols list, then click &gt;&gt; to add them to the Selected Protocols list.</p> <p>The only protocol available for the control plane is ARP; ARP and CDP are not available for input classes configured on an interface.</p> <p>When you finish, click <b>OK</b> to return to the QoS Class dialog box. Your selections are displayed in the Protocol field.</p> <p><b>Note</b> To remove a protocol from the QoS class, select it from the Protocol field, then click <b>Delete</b>.</p> |
| Precedence | <p>One or more IP Precedence (IPP) values included in this class map. Click <b>Add</b> to display a selector. Select one or more items from the Available Precedences list, then click &gt;&gt; to add them to the Selected Precedences list. For more information about IP precedence values, see <a href="#">Table 66-1 on page 66-3</a>.</p> <p>When you finish, click <b>OK</b> to return to the QoS Class dialog box. Your selections are displayed in the Precedence field.</p> <p><b>Note</b> To remove an IPP value from the QoS class, select it from the Precedence field, then click <b>Delete</b>.</p>                     |
| DSCP       | <p>One or more Differentiated Services Code Point (DSCP) values included in this class map. Click <b>Add</b> to display a selector. Select one or more items (up to eight) from the Available DSCPs list, then click &gt;&gt; to add them to the Selected DSCPs list.</p> <p>When you finish, click <b>OK</b> to return to the QoS Class dialog box. Your selections are displayed in the DSCP field.</p> <p><b>Note</b> To remove a DSCP value from the QoS class, select it from the DSCP field, then click <b>Delete</b>.</p>                                                                                                       |
| ACL        | <p>The ACLs that are used for defining which traffic requires QoS. Click <b>Edit</b> to add or remove ACL objects.</p> <p>Use the up and down arrows to order the ACLs in the list. We recommend that you place frequently used ACLs at the top of the list to optimize the matching process.</p>                                                                                                                                                                                                                                                                                                                                      |

## Edit ACLs Dialog Box—QoS Classes

When configuring a QoS policy on a Cisco IOS router, use the Edit ACLs dialog box to specify which ACLs should be included in the matching criteria for the selected QoS class. Traffic matching this criteria is included as part of the class.

Enter the names of the extended ACLs or click **Select** to select an ACL object from a list or to create a new one. Separate multiple ACL objects with commas and place them in priority order.

For more information, see [Creating Extended Access Control List Objects, page 6-54](#).

### Navigation Path

Go to the [QoS Class Dialog Box—Matching Tab, page 66-24](#), then click **Edit** in the ACL field.

**QoS Class Dialog Box—Marking Tab**

Use the Marking tab of the QoS Class dialog box to classify packets. Traffic policers and shapers use these classifications to ensure adherence to the contracted level of service. Downstream devices use this classification to identify the packets and apply the appropriate QoS functions to them.

**Note**

---

The Marking tab is unavailable when you define a QoS policy on the control plane.

---

**Navigation Path**

Go to the [QoS Class Dialog Box, page 66-23](#), then click the **Marking** tab.

**Table 66-7**      *QoS Class Dialog Box—Marking Tab*

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Marking | <p>When selected, enables you to mark the traffic in this QoS class with a specific precedence or DSCP value (regardless of any value the traffic might have had when it first entered the device). This mark enables downstream devices to identify the traffic and apply the appropriate QoS features to it.</p> <p>When deselected, disables all marking options for the selected QoS class. The traffic in this QoS class maintains its original precedence or DSCP value, if any.</p> |

**Table 66-7 QoS Class Dialog Box—Marking Tab (continued)**

| Element    | Description                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precedence | The precedence value with which to mark the traffic in this class: <ul style="list-style-type: none"> <li>• network (7)</li> <li>• internet match (6)</li> <li>• critical (5)</li> <li>• flash-override (4)</li> <li>• flash (3)</li> <li>• immediate (2)</li> <li>• priority (1)</li> <li>• routine (0)</li> </ul> |
| DSCP       | The DSCP value (0 to 63) with which to mark the traffic in this class.                                                                                                                                                                                                                                              |

## QoS Class Dialog Box—Queuing and Congestion Avoidance Tab

Use the Queuing and Congestion Avoidance tab of the QoS Class dialog box to perform Class-Based Weighted Fair Queuing (CBWFQ) on the output traffic in the selected QoS class. Queuing prioritizes traffic and manages congestion on your network by determining the order in which packets are sent out over an interface. Queuing and congestion avoidance applies only to interface classes for output traffic.

The fields displayed in the Queuing tab depend on whether you are defining a specific QoS class or the default class (by selecting **Set as Default Class**), and also by the type of router and the Cisco IOS software version.

### Navigation Path

Go to the [QoS Class Dialog Box](#), then click the **Queuing and Congestion Avoidance** tab.

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority<br>(Non-default classes only.)                         | <p>Configure low-latency queuing (LLQ) in this class to ensure that priority traffic, such as voice traffic, receives the defined bandwidth (see <a href="#">Low-Latency Queuing, page 66-5</a>). Specify the amount of bandwidth allocated to high-priority traffic on this interface by:</p> <ul style="list-style-type: none"> <li>Percentage—Valid values range from 1 to 100%.</li> <li>Kbit/sec—Valid values range from 8-2000000 kilobits per second.</li> </ul> <p><b>Note</b> You can define this option for one class only per interface. If you select this option, the Shaping tab is disabled.</p>                                                                                                                                                   |
| Fair Queue<br>Number of Dynamic Queues<br>(Default class only.) | <p>Configure class-based weighted fair queuing in this class.</p> <p>If the device is running an IOS software version lower than 12.4(20)T, you must specify the number of dynamic queues to reserve for this class. You should base your number on the available bandwidth of the interface. You can specify a number between 16 and 4096 that is a power to 2. For information on the default number of queues the device uses, see <a href="#">Default Class Queuing, page 66-6</a>. Available bandwidth is evenly distributed among the queues unless you configure a queue limit.</p> <p><b>Tip</b> Failure to provide a sufficient number of queues for the default class (a condition known as starvation) could result in the traffic not being sent.</p> |
| Bandwidth                                                       | <p>Configure the minimum bandwidth to guarantee to this class. You can define this amount by:</p> <ul style="list-style-type: none"> <li>Percentage—Valid values range from 1 to 100% of the total available bandwidth.</li> <li>Kbit/sec—Valid values range from 8-2000000 kilobits per second.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Fair Queue<br>(Non-default class only.)                  | <p>When you configure bandwidth for a non-default class, whether to also enable class-based weighted fair queuing (CBWFQ). The device calculates the number of queues to configure based on the available bandwidth, and distributes the bandwidth evenly among the queues unless you configure a queue limit.</p> <p>This option is available only for Aggregation Services Routers (ASR) and for routers running 12.4(20)T and later.</p>                                                                                                                                                                                                                                                                                                                       |
| Queue Limit                                                     | <p>The maximum number of packets that can be queued for the class. Any additional packets are dropped using tail drop until the congestion is gone.</p> <p>This is the default option for limiting queue size unless Weighted Random Early Detection (WRED) is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 66-8** QoS Class Dialog Box—Queuing and Congestion Avoidance Tab (continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRED Weight for Mean Queue Depth | <p>The exponential weight factor to use to calculate the average queue size. Use this option when defining WRED instead of tail drop (queue limit) for this class. When the queue size exceeds the value determined by this weight factor, WRED randomly discards packets until the transmitting protocol decreases its transmission rate to ease congestion. Exponent values range from 1 to 16. The default is 9.</p> <p>This option is best suited for protocols like TCP, which respond to dropped packets by decreasing the transmission rate. We recommend that you do not change the default unless you determine that your applications would benefit from the change.</p> |

## QoS Class Dialog Box—Policing Tab

Use the Policing tab of the QoS Class dialog box to configure rate limits on the traffic in a selected QoS class. Excess traffic is either dropped or transmitted with a different (typically lower) priority.

### Navigation Path

Go to the [QoS Class Dialog Box, page 66-23](#), then click the **Policing** tab.

### Field Reference

**Table 66-9** QoS Class Dialog Box—Policing Tab

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Policing | <p>When selected, enables you to configure Class-Based Policing to control the maximum rate of traffic for this class. Security Manager uses a two-token bucket algorithm, which includes a defined violate action that is performed when neither bucket can accommodate the incoming packet.</p> <p>When deselected, disables all policing options for the selected QoS class.</p> |

**Table 66-9 QoS Class Dialog Box—Policing Tab (continued)**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CIR            | <p>The average data rate (also known as the committed information rate or CIR). You can define this amount by:</p> <ul style="list-style-type: none"> <li>• Percentage—Valid values range from 0 to 100% of the overall available bandwidth.</li> <li>• Bit/sec—Valid values range from 8000 to 2000000000 bits per second.</li> </ul> <p>In the token bucket algorithm, this rate represents the token arrival rate for filling both token buckets. Traffic that falls under this rate always conforms.</p> <p><b>Note</b> When you configure <a href="#">Understanding Control Plane Policing, page 66-9</a>, you must define the CIR in bits per second.</p> |
| Conform Burst  | <p>The normal burst size, which determines how large traffic bursts can be before some traffic exceeds the rate limit. In the token bucket algorithm, it represents the full size of the first (conform) token bucket.</p> <p>The range of valid values is determined by the CIR:</p> <ul style="list-style-type: none"> <li>• When the CIR is defined by percentage—Valid values range from 1 to 2000 milliseconds.</li> <li>• When the CIR is defined by an absolute value—Valid values range from 1000-512000000 bytes.</li> </ul>                                                                                                                           |
| Excess Burst   | <p>The excess burst size, which determines how large traffic bursts can be before all traffic exceeds the rate limit. In the token bucket algorithm, it represents the full size of the second (exceed) token bucket.</p> <p>The range of valid values is determined by the CIR:</p> <ul style="list-style-type: none"> <li>• When the CIR is defined by percentage—Valid values range from 1 to 2000 milliseconds.</li> <li>• When the CIR is defined by an absolute value—Valid values range from 1000-512000000 bytes.</li> </ul>                                                                                                                            |
| Conform action | <p>The action to take on packets that conform to the rate limit:</p> <ul style="list-style-type: none"> <li>• transmit—Transmits the packet.</li> <li>• set-prec-transmit—Sets the IP precedence to a value you specify (0 to 7) and then sends the packet. Not available on the control plane.</li> <li>• set-dscp-transmit—Sets the DSCP to a value you specify (0 to 63) and then sends the packet. Not available on the control plane.</li> <li>• drop—Drops the packet.</li> </ul>                                                                                                                                                                         |
| Exceed action  | <p>The action to take on packets that exceed the rate limit, but can be handled using the second (exceed) token bucket.</p> <p>The actions available for selection depend on the defined conform action. For example, if you select one of the set options as the conform action, you cannot select transmit as the exceed action. If you select drop as the conform action, then you must also select drop as the exceed action.</p>                                                                                                                                                                                                                           |

**Table 66-9** QoS Class Dialog Box—Policing Tab (continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Violate action | <p>The action to take on packets that cannot be serviced by either the conform bucket or the exceed bucket.</p> <p>The actions available for selection depend on the defined exceed action. For example, if you select one of the set options as the exceed action, you cannot select transmit as the violate action. If you select drop as the exceed action, then you must also select drop as the violate action.</p> |

## QoS Class Dialog Box—Shaping Tab

Use the Shaping tab of the QoS Class dialog box to control the rate of output traffic for the selected QoS class. Shaping typically delays excess traffic by using a buffer, or queuing mechanism, to hold packets and shape the flow when the data rate of the source is higher than expected.

### Note

The Shaping tab is unavailable when you define a QoS policy on the control plane, use hierarchical shaping on the interface, define a QoS class for input traffic, or perform queuing on priority traffic.

### Navigation Path

Go to the [QoS Class Dialog Box](#), page 66-23, then click the **Shaping** tab.

### Field Reference

**Table 66-10** QoS Class Dialog Box—Shaping Tab

| Element        | Description                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Shaping | <p>When selected, enables you to configure Distributed Traffic Shaping (DTS) to control the rate of traffic for this class. DTS uses queues to buffer traffic surges that can congest the network.</p> <p>When deselected, disables all shaping options for the selected QoS class.</p> <p><b>Note</b> Shaping can be performed only on output traffic.</p> |

Table 66-10 QoS Class Dialog Box—Shaping Tab (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type            | <p>The type of shaping to perform:</p> <ul style="list-style-type: none"> <li>• Average—Limits the data rate for each interval to the sustained burst rate (also known as the committed burst rate or Bc), achieving an average rate no higher than the committed information rate (CIR). Additional packets are buffered until they can be sent.</li> <li>• Peak—Limits the data rate for each interval to the sustained burst rate plus the excess burst rate (Be). Additional packets are buffered until they can be sent.</li> </ul>                                                                                                                                                                                                           |
| CIR             | <p>The average data rate (also known as the committed information rate or CIR). You can define this amount by:</p> <ul style="list-style-type: none"> <li>• Percentage—Valid values range from 0 to 100% of the overall available bandwidth.</li> <li>• Bit/sec—Valid values range from 8000 to 1000000000 bits per second, and must be in multiples of 8000.</li> </ul> <p>Although data bursts during an interval may exceed this rate, the average data rate over any multiple integral of the interval will not exceed this rate.</p>                                                                                                                                                                                                          |
| Sustained Burst | <p>The normal burst size. If you select average as the shaping type, data bursts during an interval are limited to this value.</p> <p>The range of valid values is determined by the CIR:</p> <ul style="list-style-type: none"> <li>• When the CIR is defined by percentage—Valid values range from 10 to 2000 milliseconds.</li> <li>• When the CIR is defined by an absolute value—Valid values range from 1000 to 154400000 bytes, in multiples of 128 bytes.</li> </ul> <p><b>Note</b> We recommend that you leave this field blank when the CIR is defined by an absolute value. This allows the algorithms used by the device to determine the optimal sustained burst value.</p>                                                           |
| Excess Burst    | <p>The excess burst size. If you select peak as the shaping type, data bursts during an interval can equal the sum of the sustained burst value plus this value. The average data rate over multiple intervals, however, will continue to conform to the CIR.</p> <p>The range of valid values is determined by the CIR:</p> <ul style="list-style-type: none"> <li>• When the CIR is defined by percentage—Valid values range from 10 to 2000 milliseconds.</li> <li>• When the CIR is defined by an absolute value—Valid values range from 1000 to 154400000 bytes, in multiples of 128 bytes.</li> </ul> <p><b>Note</b> If you do not configure this field when the CIR is defined by an absolute value, the sustained burst value is used.</p> |

## Configuring Routing Policies

---

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

## BGP Routing on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

BGP is an Exterior Gateway Protocol (EGP) that guarantees the loop-free exchange of routing information between autonomous systems (ASs). The *primary* function of a BGP system is to exchange information with other BGP systems about the networks it can reach, including AS path information. This information can be used to construct a graph of AS connectivity from which routing loops can be pruned and with which AS-level policy decisions can be enforced.

BGP is the routing protocol used on the Internet and is commonly used between Internet service providers. To achieve scalability at this level, BGP uses several route parameters (attributes) to define routing policies and maintain a stable routing environment. Additionally, BGP uses classless interdomain routing (CIDR) to greatly reduce the size of Internet routing tables.

A BGP route consists of a network number, a list of ASs through which information has passed (called the *autonomous system path*), and the defined path attributes.

A BGP router exchanges routing information only with those routers that you define as its neighbors. BGP neighbors exchange complete routing information when the TCP connection between them is established. Updates are sent to neighbors only when changes to the routing table are detected. BGP routers do not send regular, periodic updates.

The following topics describe the tasks you perform to create a BGP routing policy:

- [Defining BGP Routes, page 67-2](#)
- [Redistributing Routes into BGP, page 67-3](#)

**Note**

---

Security Manager supports versions 2, 3 and 4 of BGP, as defined in RFCs 1163, 1267 and 1771.

## Defining BGP Routes

As with all EGPs, when you configure a BGP routing policy, you must define the relationship the router has with its neighbors. BGP supports two kinds of neighbors: internal (located in the same AS) and external (located in a different AS). Typically, external neighbors are adjacent to each other and share a subnet; internal neighbors can be anywhere in the same AS.

In addition, you can select whether to enable the following optional features:

- Auto-summarization
- Synchronization
- Neighbor logging

If enabled, *auto-summarization* injects only the network route when a subnet is redistributed from an Interior Gateway Protocol (IGP) such as OSPF or EIGRP into BGP. *Synchronization* is useful if your AS acts as an intermediary, passing traffic from one AS to another AS, because it ensures that your AS is consistent about the routes it advertises. For example, if BGP were to advertise a route before all routers in your network had learned about the route through your IGP, your AS might receive traffic that some routers cannot yet route. *Neighbor logging* enables the router to keep track of messages issued by BGP neighbors when they reset, become unreachable, or restore their connection to the network.

This procedure describes how to define a BGP route. You can define only one BGP route on each router.

**Related Topics**

- [Redistributing Routes into BGP, page 67-3](#)
- [BGP Routing on Cisco IOS Routers, page 67-1](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > BGP** from the Policy selector, then click the **Setup** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > BGP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.
- The BGP Setup is displayed. See [Table 67-1 on page 67-5](#) for a description of the fields on this tab.
- Step 2** On the BGP Setup tab, enter the AS number to which the router belongs.
- Step 3** (Optional) Enter the addresses of the networks that are local to this AS. You can use a combination of addresses and network/host objects, or click **Select** to select an object from a list or to create a new one. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 4** Define external and internal BGP neighbors for the routers:
- a. Click **Add** under Neighbors to display the BGP Neighbors dialog box. See [Table 67-2 on page 67-6](#) for a description of the fields in this dialog box.
  - b. Enter an AS number and then click **Select** to select the hosts that are neighbors within the defined AS. Internal neighbors are located in the same AS as the router; external neighbors are located in a different AS.
  - c. Click **OK** to save your definitions and return to the BGP Neighbors dialog box.
  - d. (Optional) Repeat **b.** and **c.** to define neighbors in additional ASs.
-  **Note** When you define BGP neighbors, the IP addresses cannot belong to an interface on the selected router. In addition, you cannot define the same IP address in more than one AS.
- When you finish, click **OK** in the BGP Neighbors dialog box to return to the BGP Setup tab. Your selections are displayed in the Neighbors field.
- Step 5** (Optional) Select the Auto-Summary check box to enable automatic summarization. If automatic summarization is enabled, only the network route is injected into the BGP table when a subnet is redistributed from an IGP (such as OSPF or EIGRP) into BGP.
- Step 6** (Optional) Select the **Synchronization** check box to synchronize BGP with the IGP. Enabling this feature causes BGP to wait until the IGP propagates routing information across the AS.
- You do not need synchronization if your AS does not pass traffic it receives from one AS to another AS, or if all the routers in your AS run BGP. Disabling synchronization enables BGP to converge more quickly.
- Step 7** (Optional) Select the **Log-Neighbor** check box to enable the logging of messages generated when a BGP neighbors resets, comes up, or goes down.
- 

## Redistributing Routes into BGP

Redistribution refers to using a routing protocol, such as BGP, to advertise routes that are learned by some other means, such as a different routing protocol, static routes, or directly connected routes. For example, you can redistribute routes from the OSPF routing protocol into your BGP autonomous system (AS). Redistribution is necessary in networks that operate in multiple-protocol environments and can be applied to all IP-based routing protocols.

**Before You Begin**

- Define a BGP AS. See [Defining BGP Routes, page 67-2](#).

**Related Topics**

- [Defining BGP Routes, page 67-2](#)
- [BGP Routing on Cisco IOS Routers, page 67-1](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > BGP** from the Policy selector, then click the **Redistribution** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > BGP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Redistribution** tab.
- The BGP Redistribution tab is displayed. See [Table 67-3 on page 67-7](#) for a description of the fields on this tab.
- Step 2** On the BGP Redistribution tab, select a row from the BGP Redistribution Mappings table, then click **Edit**, or click **Add** to create a mapping. The BGP Redistribution Mapping dialog box appears. See [Table 67-4 on page 67-8](#) for a description of the fields in this dialog box.
- Step 3** Select the protocol whose routes you want to redistribute into BGP.
-  **Note** You can create a single mapping for each static route, RIP route, EIGRP AS, and OSPF process.
- 
- Step 4** (Optional) Modify the default metric (cost) of the redistributed routes. The metric determines the priority of the routes.
- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. The redistribution mapping appears in the Redistribution Mapping table in the BGP Redistribution tab.
- 

## BGP Routing Policy Page

Border Gateway Protocol (BGP) is an exterior gateway protocol (EGP) that performs routing between multiple autonomous systems or domains and exchanges routing and reachability information with other BGP systems. BGP is used to exchange routing information on the Internet and is the protocol used between Internet service providers.

You can configure BGP routing policies from the following tabs on the BGP Routing page:

- [BGP Page—Setup Tab, page 67-5](#)
- [BGP Page—Redistribution Tab, page 67-7](#)

For more information, see [BGP Routing on Cisco IOS Routers, page 67-1](#).

**Navigation Path**

- (Device view) Select **Platform > Routing > BGP** from the Policy selector.
- (Policy view) Select **Router Platform > Routing > BGP** from the Policy Type selector. Right-click **BGP** to create a policy, or select an existing policy from the Shared Policy selector.

## BGP Page—Setup Tab

Use the BGP Setup tab to define the number of the autonomous system (AS) in which the selected router is located. You must then define which networks are included in the AS and which networks are the internal and external neighbors of the router. Additionally, you can enable or disable options that govern the interaction between BGP and Interior Gateway Protocols (IGPs), such as OSPF and EIGRP. Use a third option to enable the logging of messages from BGP neighbors.

### Navigation Path

Go to the [BGP Routing Policy Page, page 67-4](#), then click the **Setup** tab.

**Table 67-1** BGP Setup Tab

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AS Number    | <p>The number of the autonomous system in which the router is located. Valid values range from 1 to 65535. This number enables a BGP routing process.</p> <p>If BGP is already configured on the device, you cannot successfully change and deploy this number. If you need to change the AS number, first unassign the BGP policy, deploy your change (thus removing the BGP configuration from the device), then configure the BGP policy with the new number and redeploy the configuration.</p> |
| Networks     | <p>The networks associated with the BGP route. Enter one or more network addresses or network/host objects, or click <b>Select</b> to select the object from a list or to create a new one.</p> <p><b>Note</b> To remove a network from the route, select it from the Network field, then click <b>Delete</b>.</p>                                                                                                                                                                                  |
| Neighbors    | <p>The <i>internal</i> neighbors (those located in the same AS as the router) and <i>external</i> neighbors (located in different ASs) of the router. See <a href="#">Neighbors Dialog Box, page 67-6</a>.</p>                                                                                                                                                                                                                                                                                      |
| Auto-Summary | <p>When selected, automatic summarization is enabled. When a subnet is redistributed from an IGP (such as RIP, OSPF or EIGRP) into BGP, this BGP version 3 feature injects only the network route into the BGP table. Automatic summarization reduces the size and complexity of the routing table that the router must maintain.</p> <p>When deselected, automatic summarization is disabled. This is the default.</p>                                                                             |

**Table 67-1** BGP Setup Tab (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronization | <p>When selected, synchronization is enabled. Use this feature to ensure that all routers in your network are consistent about the routes they advertise. Synchronization forces BGP to wait until the IGP propagates routing information across the AS.</p> <p>When deselected, synchronization is disabled. You can disable synchronization if this router does not pass traffic from a different AS to a third AS, or if all the routers in the AS are running BGP. Disabling this feature has the benefit of reducing the number of routes the IGP must carry, which improves convergence times. This is the default.</p> |
| Log-Neighbor    | <p>When selected, enables the logging of messages that are generated when a BGP neighbors resets, connects to the network, or is disconnected. This is the default.</p> <p>When deselected, message logging is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |

## Neighbors Dialog Box

Use the Neighbors dialog box to define the internal and external neighbors of the selected router.

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol to Redistribute | <p>The routing protocol that is being redistributed:</p> <ul style="list-style-type: none"> <li>• <b>Static</b>—Redistributes IP or OSI static routes. You can define a single mapping for each route.</li> <li>• <b>EIGRP</b>—Redistributes an EIGRP autonomous system. Enter the AS number in the displayed field. You can define a single mapping for each AS.</li> <li>• <b>RIP</b>—Redistributes RIP routes. You can define a single mapping for each route.</li> <li>• <b>OSPF</b>—Redistributes a different OSPF process. You can define a single mapping for each process. Select a process from the displayed list, then select one or more match criteria: <ul style="list-style-type: none"> <li>– <b>Internal</b>—Routes that are internal to a specific AS.</li> <li>– <b>External1</b>—Routes that are external to the AS and imported into OSPF as a Type 1 external route.</li> <li>– <b>External2</b>—Routes that are external to the AS and imported into the selected process as a Type 2 external route.</li> <li>– <b>NSAAExternal1</b>—Not-So-Stubby Area (NSSA) routes that are external to the AS and imported into the selected process as Type 1 external routes.</li> <li>– <b>NSAAExternal2</b>—(NSSA) routes that are external to the AS and imported into the selected process as Type 2 external routes.</li> </ul> </li> <li>• <b>Connected</b>—Redistributes routes that are established automatically by virtue of having enabled IP on an interface. These routes are redistributed as external to the AS.</li> </ul> |
| Metric                   | A value representing the cost of the redistributed route. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## EIGRP Routing on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Enhanced Interior Gateway Routing Protocol (EIGRP) is an enhanced distance vector protocol developed by Cisco Systems that integrates the capabilities of link-state protocols. EIGRP is suited for many different topologies and media. Key capabilities that distinguish EIGRP from other routing protocols are fast convergence, support for variable-length subnet masks, partial updates, and multiple network-layer protocols.

The metric that the router uses to reach the destination, and to advertise to other routers, is the sum of the best-advertised metrics from all neighbors and the link cost to the best neighbor.

EIGRP uses neighbor tables to store address and interface information about each of the router's neighbors. Hello packets advertise hold times, which is the length of time a neighbor can be considered reachable and operational. Topology tables contain all destinations advertised by neighboring routers. For each neighbor, the entry records the advertised metric, which the neighbor stores in its routing table.

A router running EIGRP stores all its neighbors' routing tables so that it can quickly adapt to alternate routes. If no appropriate route exists, EIGRP queries its neighbors to discover an alternate route. These queries propagate until an alternate route is found. EIGRP sends incremental updates when the state of a destination changes, instead of sending the entire contents of the routing table. EIGRP ensures that only those routers needing the information are updated. This feature minimizes the bandwidth required for EIGRP packets.

EIGRP supports both internal and external routes. Internal routes originate within an EIGRP Autonomous System (AS). Therefore, a directly attached network that is configured to run EIGRP is considered an internal route and is propagated with this information throughout the AS. External routes are learned by another routing protocol or reside in the routing table as static routes. These routes are tagged individually with the identity of their origin.

The following topics describe the tasks you perform to create an EIGRP routing policy:

- [Defining EIGRP Routes, page 67-9](#)
- [Defining EIGRP Interface Properties, page 67-10](#)
- [Redistributing Routes into EIGRP, page 67-12](#)

- [BGP Routing on Cisco IOS Routers, page 67-1](#)

## Defining EIGRP Routes

To configure an EIGRP routing policy, you must assign each autonomous system a number, which identifies the autonomous system to other routers. You then must select the networks to which routes will be created. In addition, you can select which interfaces should be passive. Unlike other routing protocols, passive interfaces in EIGRP neither send nor receive routing updates from their neighbors, resulting in the loss of their neighbor relationship.

When you configure EIGRP routing policies, you can also decide whether to enable auto-summarization, which greatly simplifies routing tables and the exchange of routing information by having many subnets represented by a single network entry.

- [Redistributing Routes into EIGRP, page 67-12](#)
- [EIGRP Routing on Cisco IOS Routers, page 67-8](#)

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Routing > EIGRP** from the Policy selector, then click the **Setup** tab in the work area.

- (Policy view) Select **Router Platform > Routing > EIGRP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.

The EIGRP Setup tab is displayed (see [EIGRP Page—Setup Tab, page 67-13](#)).

- Step 2** On the EIGRP Setup tab, select an EIGRP route from the table, then click **Edit**, or click **Add** to create a route. The EIGRP Setup dialog box appears. See [Table 67-6 on page 67-14](#) for a description of the fields in this dialog box.
- Step 3** Enter the autonomous system number for the route. This number identifies the autonomous system to other routers.
- Step 4** Enter the addresses of the networks to include in the EIGRP route. You can use a combination of addresses and network/host objects; separate addresses with commas. Click **Select** to select network/host objects from a list of existing objects, or to create new network/host objects. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 5** Enter the addresses of the passive interfaces, which are interfaces that should not send routing updates to their neighbors, if any. Enter the names of one or more interfaces or interface roles; separate addresses with commas. Click **Select** to select interface names or roles from a list of existing objects, or to create new interface role objects. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
- Step 6** (Optional) Select **Auto-Summary** to enable the auto summarization of subnet routes into network-level routes. Summarization reduces the size of routing tables, thereby reducing the complexity of the network.
- Step 7** Click **OK** to save your definitions. The EIGRP route appears in the table displayed in the EIGRP Setup tab.
- 

## Defining EIGRP Interface Properties

You can optionally modify the default values of the following two interface properties in a selected EIGRP autonomous system:

- Hello interval.
- Split horizon.

The hello interval defines the interval between hello packets. Routing devices periodically send these packets to each other to dynamically learn of other routers on their directly attached networks. This information is used to discover neighbors and to learn when neighbors become unreachable or inoperative. By default, hello packets are sent every 5 seconds. The default interval for low speed (T1 or slower), nonbroadcast multiaccess (NBMA) media is every 60 seconds.

Split horizon is a feature that prevents route information from being sent back in the direction from which that information originated. If you enable split horizon on an interface (this is the default), update and query packets are not sent to destinations for which this interface is the next hop. This helps to prevent routing loops.

For example, as shown in [Figure 67-1](#), if Router One is connected to Routers Two and Three through a single multipoint interface, and Router One learned about Network A from Router Two, Router One does not advertise the route to Network A over that same multipoint interface to Router Three. Router One assumes that Router Three would learn about Network A directly from Router Two.

**Figure 67-1 EIGRP Split Horizon Example**

Split horizon is enabled by default on all EIGRP interfaces, because it typically optimizes communications among multiple routing devices. However, in certain cases with nonbroadcast networks (such as Frame Relay and SMDS), you might want to disable split horizon.

If you decide to disable split horizon on an EIGRP interface, keep the following in mind:

- In a hub-and-spoke network, you should disable split horizon only at the hub. This is because disabling split horizon on the spokes greatly increases EIGRP memory consumption on the hub router, as well as the amount of traffic generated on the spoke routers.
- Changing the split horizon setting on an interface resets all adjacencies with the EIGRP neighbors that are reachable over that interface.

#### Before You Begin

- Define at least one EIGRP autonomous system. See [Defining EIGRP Routes, page 67-9](#).

#### Related Topics

- [Defining EIGRP Routes, page 67-9](#)
- [Redistributing Routes into EIGRP, page 67-12](#)
- [EIGRP Routing on Cisco IOS Routers, page 67-8](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > EIGRP** from the Policy selector, then click the **Interfaces** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > EIGRP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Interfaces** tab.
- The EIGRP Interfaces tab is displayed. See [Table 67-7 on page 67-15](#) for a description of the fields on this tab.
- Step 2** On the EIGRP Interfaces tab, select an interface from the table, then click **Edit**, or click **Add** to create an interface definition. The EIGRP Interface dialog box appears. See [Table 67-8 on page 67-16](#) for a description of the fields in this dialog box.
- Step 3** Select the AS number of the autonomous system whose interface properties you want to modify. See [Defining EIGRP Routes, page 67-9](#) for more information about defining an autonomous system.

- Step 4** Enter the name of the interface or interface role to define, or click **Select** to select an interface role from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
- Step 5** (Optional) In the Hello Interval field, modify the default interval between hello packets sent over the selected interfaces.  
The default is 5 seconds for all interfaces, except for low-speed (T1 or less) NBMA media, for which the default interval is 60 seconds.
- Step 6** (Optional) Deselect the **Split Horizon** check box to disable the split horizon feature. If you disable this feature, the selected interfaces can advertise a route out of the interface from which they learned the route.
-  **Note** In general, we recommend that you not disable split horizon unless you are certain that your application requires the change to properly advertise routes. If you disable split horizon on a serial interface, and that interface is attached to a packet-switched network, you must disable split horizon for all routers and access servers in all relevant multicast groups on that network.
- Step 7** Click **OK** to save your definitions locally on the client and close the dialog box. The interface definition appears in the table on the EIGRP Interfaces tab.

## Redistributing Routes into EIGRP

Redistribution refers to using a routing protocol, such as EIGRP, to advertise routes that are learned by some other means, such as a different routing protocol, static routes, or directly connected routes. For example, you can redistribute routes from the RIP routing protocol into your EIGRP autonomous system (AS). Redistribution is necessary in networks that operate in multiple-protocol environments and can be applied to all IP-based routing protocols.

### Before You Begin

- Define at least one EIGRP autonomous system. See [Defining EIGRP Routes, page 67-9](#).

### Related Topics

- [Defining EIGRP Routes, page 67-9](#)
- [Defining EIGRP Interface Properties, page 67-10](#)
- [EIGRP Routing on Cisco IOS Routers, page 67-8](#)

- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > EIGRP** from the Policy selector, then click the **Redistribution** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > EIGRP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Redistribution** tab.
- The EIGRP Redistribution tab is displayed. See [Table 67-9 on page 67-17](#) for a description of the fields on this tab.

**Step 2** On the EIGRP Redistribution tab, select a row from the EIGRP Redistribution Mappings table, then click **Edit**, or click **Add** to create a mapping. The EIGRP Redistribution Mapping dialog box appears. See [Table 67-10 on page 67-18](#) for a description of the fields in this dialog box.

**Step 3** Select an existing EIGRP AS from the displayed list.

**Step 4** Select the protocol whose routes you want to redistribute into the selected EIGRP AS.

**Note** You can create a single mapping for each static route, RIP route, BGP AS, EIGRP AS, and OSPF process.

**Step 5** (Optional) Under Metrics, modify the default metric (cost) of the redistributed routes by entering values in the fields used to calculate the metric. The metric determines the priority of the routes.

**Note** Entering a metric is optional, but if you do specify a value, you must enter values for all five parameters. You need not define metric values when redistributing one EIGRP process into another.

**Step 6** Click **OK** to save your definitions locally on the client and close the dialog box. The redistribution mapping appears in the Redistribution Mapping table in the EIGRP Redistribution tab.

## EIGRP Routing Policy Page

Enhanced Interior Gateway Routing Protocol (EIGRP) is a scalable interior gateway protocol that provides extremely quick convergence times with minimal network traffic.

You can configure EIGRP routing policies from the following tabs on the EIGRP Routing page:

- [EIGRP Page—Setup Tab, page 67-13](#)
- [EIGRP Page—Interfaces Tab, page 67-15](#)
- [EIGRP Page—Redistribution Tab, page 67-17](#)

For more information, see [EIGRP Routing on Cisco IOS Routers, page 67-8](#).

### Navigation Path

- (Device view) Select **Platform > Routing > EIGRP** from the Policy selector.
- (Policy view) Select **Router Platform > Routing > EIGRP** from the Policy Type selector. Right-click **EIGRP** to create a policy, or select an existing policy from the Shared Policy selector.

## EIGRP Page—Setup Tab

Use the EIGRP Setup tab to view, create, edit, and delete EIGRP routes.

### Navigation Path

Go to the [EIGRP Routing Policy Page, page 67-13](#), then click the **Setup** tab.

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks           | The networks associated with the EIGRP route. Enter one or more network addresses or network/host objects, separated by commas. Click <b>Select</b> to select network/host objects from a list of existing objects, or to create new objects.                                                                                                                                                                                                                                                                                                              |
| Passive Interfaces | The interfaces that do not send updates to their routing neighbors. Enter one or more interface names or roles, separated by commas. Click <b>Select</b> to select interface names or roles from a list of existing objects, or to create new interface role objects.<br><br><b>Note</b> When you make an interface passive, EIGRP suppresses the exchange of hello packets between routers, resulting in the loss of their neighbor relationship. This not only stops routing updates from being advertised but also suppresses incoming routing updates. |
| Auto-Summary       | When selected, enables the automatic summarization of subnet routes into network-level routes. Summarization reduces the size of routing tables, thereby reducing the complexity of the network.<br><br>When deselected, automatic summarization is disabled.                                                                                                                                                                                                                                                                                              |

## EIGRP Page—Interfaces Tab

Use the EIGRP Interfaces tab to create, edit, and delete interface properties for selected EIGRP autonomous systems. This includes modifying the default hello interval and disabling split horizon.

### Note

You can access the EIGRP Interfaces tab only after defining at least one EIGRP autonomous system in the Setup tab. See [EIGRP Page—Setup Tab, page 67-13](#).

### Navigation Path

Go to the [EIGRP Routing Policy Page, page 67-13](#), then click the **Interfaces** tab.

**Table 67-8 EIGRP Interface Dialog Box**

| Element        | Description                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AS Number      | Selects the EIGRP autonomous system number whose interface properties you want to modify. For more information about EIGRP autonomous systems, see <a href="#">EIGRP Setup Dialog Box, page 67-14</a> .                                                                   |
| Interface      | Specifies the EIGRP interface you wish to configure. Enter the name of an interface or interface role, or click <b>Select</b> to select an interface role object from a list or to create a new one.                                                                      |
| Hello Interval | The default interval between hello packets sent by the router to its neighbors. Routers send hello packets to each other to dynamically learn of other routers on their directly attached networks. Valid values range from 1 to 65535 seconds. The default is 5 seconds. |

**Table 67-8 EIGRP Interface Dialog Box (continued)**

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split Horizon | <p>When selected, the split horizon feature is used to prevent routing loops.</p> <p>When deselected, split horizon is disabled. When split horizon is disabled, the router can advertise a route out of the same interface through which it learned the route.</p> <p>Disabling split horizon is often useful when dealing with nonbroadcast networks, such as Frame Relay and SMDS.</p> <p><b>Note</b> Changing the split horizon setting on an interface resets all adjacencies with EIGRP neighbors that are reachable over that interface.</p> |

## EIGRP Page—Redistribution Tab

Use the EIGRP Redistribution tab to create, edit, and delete EIGRP redistribution mappings.

### Navigation Path

Go to the [EIGRP Routing Policy Page, page 67-13](#), then click the **Redistribution** tab.

**Table 67-10** EIGRP Redistribution Mapping Dialog Box

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EIGRP AS Numbers         | The EIGRP AS into which other routes are being redistributed. You must select an ID number from the list of EIGRP autonomous systems defined in the <a href="#">EIGRP Page—Setup Tab, page 67-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Protocol to Redistribute | The routing protocol that is being redistributed: <ul style="list-style-type: none"> <li>• Static—Redistributes static routes. You can define a single mapping for each route.</li> <li>• EIGRP—Redistributes an EIGRP autonomous system. Enter the AS number in the displayed field. You can define a single mapping for each AS.</li> <li>• BGP—Redistributes a BGP autonomous system. You can define a single BGP mapping on each device. If you configured a BGP AS in the BGP Setup tab, the AS number is displayed. Otherwise, a message is displayed indicating that no BGP AS was defined. See <a href="#">BGP Page—Redistribution Tab, page 67-7</a>.</li> </ul> |

Table 67-10 EIGRP Redistribution Mapping Dialog Box (continued)

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol to Redistribute (continued) | <ul style="list-style-type: none"> <li>• OSPF—Redistributes a different OSPF process. You can define a single mapping for each process. Select a process from the displayed list, then select one or more match criteria:               <ul style="list-style-type: none"> <li>– Internal—Routes that are internal to a specific AS.</li> <li>– External1—Routes that are external to the AS and imported into OSPF as a Type 1 external route.</li> <li>– External2—Routes that are external to the AS and imported into the selected process as a Type 2 external route.</li> <li>– NSAAExternal1—Not-So-Stubby Area (NSSA) routes that are external to the AS and imported into the selected process as Type 1 external routes.</li> <li>– NSAAExternal2—(NSSA) routes that are external to the AS and imported into the selected process as Type 2 external routes.</li> </ul> </li> <li>• RIP—Redistributes RIP routes.</li> <li>• Connected—Redistributes routes that are established automatically by virtue of having enabled IP on an interface. These routes are redistributed as external to the AS.</li> </ul> |
| Metrics                              | <p>The default metric (cost) of the redistributed route. Metric parameters include:</p> <ul style="list-style-type: none"> <li>• Bandwidth—The minimum bandwidth of the path in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• Delay—The mean latency of the path in units of 10 microseconds. Valid values range from 0 to 4294967295.</li> <li>• Reliability—A value expressing the estimated reliability of the link. Valid values range from 0 to 255, where 255 represents 100% reliability.</li> <li>• Effective Bandwidth—A value expressing the effective load on the link. Valid values range from 1 to 255, where 255 represents 100% utilization.</li> <li>• MTU of Path—The maximum transmission unit of the path. Valid values range from 1 to 65535 bytes.</li> </ul>                                                                                                                                                                                                                                                                                                              |

## OSPF Routing on Cisco IOS Routers

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states instead of distance vectors to distribute routing information within a single autonomous system (AS). OSPF propagates link-state advertisements (LSAs) instead of routing table updates, which allows OSPF networks to converge more quickly than RIP networks. You define areas to limit the number of LSAs that need to be propagated to changes that occur within the area.

A router that has interfaces in multiple OSPF areas is called an Area Border Router (ABR). An ABR uses LSAs to send information about available routes to other OSPF routers. A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR). Any router can act as an ABR or ASBR.

The following topics describe the tasks you perform to create an OSPF routing policy:

- [Defining OSPF Process Settings, page 67-20](#)
- [Defining OSPF Area Settings, page 67-21](#)
- [Redistributing Routes into OSPF, page 67-22](#)
- [Defining OSPF Interface Settings, page 67-25](#)

#### Related Topics

- [Static Routing on Cisco IOS Routers, page 67-50](#)
- [RIP Routing on Cisco IOS Routers, page 67-42](#)
- [EIGRP Routing on Cisco IOS Routers, page 67-8](#)
- [BGP Routing on Cisco IOS Routers, page 67-1](#)

## Defining OSPF Process Settings

You configure OSPF process parameters by specifying a process ID number, which identifies the OSPF process to other routers, and by deciding whether any interfaces should be passive. Passive interfaces do not send routing updates to their neighbors.

#### Related Topics

- [Defining OSPF Area Settings, page 67-21](#)
- [Defining OSPF Interface Settings, page 67-25](#)
- [Redistributing Routes into OSPF, page 67-22](#)
- [OSPF Routing on Cisco IOS Routers, page 67-19](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform** > **Routing** > **OSPF Process** from the Policy selector, then click the **Setup** tab in the work area.
  - (Policy view) Select **Router Platform** > **Routing** > **OSPF Process** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.
- The OSPF Process Setup tab is displayed. See [Table 67-13 on page 67-35](#) for a description of the fields on this tab.
- Step 2** On the OSPF Process Setup tab, select an OSPF process from the table, then click **Edit**, or click **Add** to create a process. The OSPF Setup dialog box appears. See [Table 67-14 on page 67-36](#) for a description of the fields in this dialog box.

- Step 3** Enter the process ID number in the field provided. The process ID defined here does not need to match the process ID on any other devices.
- Step 4** Define which interfaces should not send routing updates to its neighbors:
- Click **Edit** under Passive Interfaces to display the Edit Interfaces dialog box. Use this dialog box to define which interfaces should *not* send routing updates to its neighbors.
  - Enter the names of one or more interfaces or interface roles, or click **Select** to select an interface role from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
  - Click **OK** to save your changes and return to the OSPF Setup dialog box.
- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box.
- 

## Defining OSPF Area Settings

You configure OSPF area settings by associating an area ID with a particular OSPF process, selecting the networks included in the area, and selecting the type of authentication used by the routers in the area.

Each OSPF process that you define should contain at least one defined area. If you define more than one area, one area must be area 0. This is called the backbone. All other areas must be physically connected to the backbone. This enables other areas to inject routing information into the backbone, which the backbone distributes to the remaining areas.

You must configure at least one OSPF process before defining OSPF area/network settings for that process.

### Related Topics

- [Defining OSPF Process Settings, page 67-20](#)
  - [Defining OSPF Interface Settings, page 67-25](#)
  - [Redistributing Routes into OSPF, page 67-22](#)
  - [OSPF Routing on Cisco IOS Routers, page 67-19](#)
- 

- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > OSPF Process** from the Policy selector, then click the **Area** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > OSPF Process** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Area** tab.
- The OSPF Process Area tab is displayed. See [Table 67-15 on page 67-37](#) for a description of the fields on this tab.
- Step 2** On the OSPF Process Area tab, select an OSPF area from the table, then click **Edit**, or click **Add** to create an area. The OSPF Area dialog box appears. See [Table 67-16 on page 67-37](#) for a description of the fields in this dialog box.
- Step 3** Select a process ID from the displayed list.
- Step 4** Enter an area ID to associate with the selected OSPF process.

- Step 5** Enter the addresses of the networks to include in the OSPF area. You can enter a combination of addresses and network/host objects, or click **Select** to select a network/host object from a list or to create a new one. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 6** Select the authentication type to use in the OSPF area: MD5, clear text, or none. We recommend MD5 when security is of concern. Please note the following:
- The authentication type must be the same for all routers and access servers in the same area.
  - Specifying clear-text authentication for an area sets the authentication to Type 1 (simple password). All routers on a network must use the same clear-text password to communicate with each other using OSPF.
  - MD5 passwords need not be the same throughout an area, but they must be the same between neighbors.
  - If you use interface authentication (see [Defining OSPF Interface Settings, page 67-25](#)), the authentication type used for the area must match the authentication type used for the interface.
- Step 7** Click **OK** to save your definitions. The OSPF area appears in the table displayed on the OSPF Area tab.
- 

## Redistributing Routes into OSPF

Redistribution refers to using a routing protocol, such as OSPF, to advertise routes that are learned by some other means, such as a different routing protocol, static routes, or directly connected routes. For example, you can redistribute routes from the RIP routing protocol into your OSPF domain. Redistribution is necessary in networks that operate in multiple-protocol environments and can be applied to all IP-based routing protocols.

Redistributing routes into OSPF from other routing protocols or from static routes causes these routes to become OSPF external routes (Type 1 or Type 2).

Redistributing routes into OSPF involves:

- [Defining OSPF Redistribution Mappings, page 67-22](#)
- [Defining OSPF Maximum Prefix Values, page 67-24](#)

### Related Topics

- [Defining OSPF Process Settings, page 67-20](#)

- [Defining OSPF Interface Settings, page 67-25](#)
- [OSPF Routing on Cisco IOS Routers, page 67-19](#)

## Defining OSPF Redistribution Mappings

When you define OSPF redistribution mappings, you must select the protocol to redistribute and the OSPF process into which routes from that protocol are redistributed. Additionally, you can manually define the metric, which determines the priority of the redistributed routes, and the type of external OSPF route to create, Type 1 or Type 2.

You can create multiple mappings to the same OSPF process. For example, you can redistribute both RIP and EIGRP routes into the same OSPF process. You can also redistribute routes from other OSPF processes.

**Note**

Redistribution into an OSPF Not-So-Stubby Area (NSSA) creates a special type of link-state advertisement (LSA) called type 7, which can exist only in an NSSA area. An NSSA autonomous system router (ASBR) generates this LSA, and an NSSA area border router (ABR) translates it into a type 5 LSA, which is propagated into the OSPF domain.

**Type 1 versus Type 2 External Routes**

Two types of OSPF external routes exist, Type 1 and Type 2. The difference between the two is related to how the cost (metric) of the route is calculated. The cost of a Type 1 route is the sum of the external cost and the internal cost used to reach that route. The cost of a Type 2 route is based on the external cost only. By default, external routes are defined as Type 2. However, a Type 1 route is always preferred over a Type 2 route to the same destination.

**Before You Begin**

- Define at least one OSPF process. See [Defining OSPF Process Settings, page 67-20](#).

**Related Topics**

- [Defining OSPF Maximum Prefix Values, page 67-24](#)
- [Redistributing Routes into OSPF, page 67-22](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > OSPF Process** from the Policy selector, then click the **Redistribution** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > OSPF Process** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Redistribution** tab.
- The OSPF Process Redistribution tab is displayed. See [Table 67-17 on page 67-38](#) for a description of the fields on this tab.
- Step 2** On the OSPF Process Redistribution tab, select a row from the OSPF Redistribution Mappings table, then click **Edit**, or click **Add** to create a mapping. The OSPF Redistribution Mapping dialog box is displayed. See [Table 67-18 on page 67-40](#) for a description of the fields in this dialog box.
- Step 3** Select an existing OSPF process from the displayed list.
- Step 4** Select the protocol whose routes you want to redistribute into the selected OSPF process.

**Note**

You can create a single mapping for each static route, RIP route, BGP AS, EIGRP AS, and OSPF process.

- Step 5** (Optional) Modify the default metric (cost) of the redistributed routes. The metric determines the priority of the routes.
- Step 6** Select the Metric Type of external route to create, Type 1 or Type 2. The default is Type 2.
- Step 7** (Optional) Select the **Limit to Subnets** check box to redistribute only subnetted routes. By default, this option is not selected.
- Step 8** Click **OK** to save your definitions. The redistribution mapping appears in the Redistribution Mapping table on the OSPF Process Redistribution tab.
-

## Defining OSPF Maximum Prefix Values

You can define a maximum number of prefixes (routes) that may be redistributed from other protocols or OSPF processes into a selected OSPF process. Setting a limit helps prevent the router from being flooded by too many redistributed routes. For example, without a defined maximum, flooding can occur when BGP is redistributed into OSPF.

When you define a maximum prefix value, you can decide whether to prevent additional routes from being redistributed once this maximum is reached, or whether to only issue a warning.

The redistribution limit applies to all IP redistributed prefixes, including summarized ones. The limit does not apply to default routes or prefixes that are generated as a result of type 7 to type 5 translations.

### Before You Begin

- Define at least one OSPF process. Define at least one OSPF process. See [Defining OSPF Process Settings, page 67-20](#).
- Define at least one OSPF redistribution mapping. See [Defining OSPF Redistribution Mappings, page 67-22](#).

### Related Topics

- [Defining OSPF Redistribution Mappings, page 67-22](#)
- [Redistributing Routes into OSPF, page 67-22](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > OSPF Process** from the Policy selector, then click the **Redistribution** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > OSPF Process** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Redistribution** tab.
- The OSPF Process Redistribution tab is displayed. See [Table 67-17 on page 67-38](#) for a description of the fields on this tab.
- Step 2** On the OSPF Process Redistribution tab, select a row from the Max Prefix Mapping table, then click **Edit**, or click **Add** to create a definition. The Max Prefix Mapping dialog box appears. See [Table 67-19 on page 67-41](#) for a description of the fields in this dialog box.
- Step 3** Select an existing OSPF process from the displayed list.
- Step 4** In the Max Prefix field, enter the maximum number of routes that can be redistributed into the selected OSPF process.
- Step 5** (Optional) Modify the default threshold percentage. When the number of redistributed routes reaches this threshold, a warning is issued. By default, the threshold value is 75% of the defined maximum prefix value.
- Step 6** (Optional) Select what should happen when the maximum prefix value is reached:
- Enforce Maximum Route—Prevents additional routes from being redistributed to the selected process.
  - Warning Only—Issues an additional warning, but allows route redistribution to continue even after the maximum prefix value is reached.

**Note** Flooding can result if you allow route redistribution to continue after exceeding the maximum prefix value.

- Step 7** Click **OK** to save your definitions. The maximum prefix definition appears in the Maximum Prefix table on the OSPF Process Redistribution tab.
- 

## Defining OSPF Interface Settings

You can modify a variety of interface-specific OSPF parameters. This procedure describes how to define these parameters. For more information about a particular parameter, see the following topics:

- [Understanding Interface Cost, page 67-26](#)
- [Understanding Interface Priority, page 67-26](#)
- [Disabling MTU Mismatch Detection, page 67-27](#)
- [Understanding OSPF Timer Settings, page 67-28](#)
- [Blocking LSA Flooding, page 67-28](#)
- [Understanding the OSPF Network Type, page 67-29](#)
- [Understanding OSPF Interface Authentication, page 67-29](#)

### Related Topics

- [Defining OSPF Process Settings, page 67-20](#)
  - [Defining OSPF Area Settings, page 67-21](#)
  - [Redistributing Routes into OSPF, page 67-22](#)
  - [OSPF Routing on Cisco IOS Routers, page 67-19](#)
- 

- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > OSPF Interface** from the Policy selector.
  - (Policy view) Select **Router Platform > Routing > OSPF Interface** from the Policy Type selector. Select an existing policy or create a new one.

The OSPF Interface page is displayed. See [Table 67-11 on page 67-30](#) for a description of the fields on this page.

- Step 2** On the OSPF Interface page, select an interface definition from the table, then click **Edit**, or click **Add** to create a definition. The OSPF Interface dialog box appears. See [Table 67-12 on page 67-32](#) for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role to define, or click **Select** to select an interface role from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
- Step 4** Define interface authentication. The authentication type you select for the interface must match the authentication type you select for the area (see [Defining OSPF Area Settings, page 67-21](#)).

All neighboring routers on the same network must have the same password to be able to exchange OSPF information. For more information, see [Understanding OSPF Interface Authentication, page 67-29](#).

The key ID number can be associated with multiple passwords. This is an easy and secure way to migrate passwords. For example, to migrate from one password to another, configure a password under a different key ID, then remove the first key.

**Tip**

The key ID number can be associated with multiple passwords. This is an easy and secure way to migrate passwords. For example, to migrate from one password to another, configure a password under a different key ID, then remove the first key.

**Note**

Do not use clear text authentication in OSPF packets for security purposes, because the unencrypted authentication key is sent in every packet. Use clear text authentication only when security is not an issue, for example, to ensure that misconfigured hosts do not participate in routing.

- Step 5** (Optional) Under **Properties**, configure interface parameters as required. See [Table 67-12 on page 67-32](#) for information about each parameter.
- Step 6** Click **OK** to save your definitions. The defined interfaces appear on the OSPF Interface page.
- Step 7** Repeat the process to define interface-specific parameters on additional OSPF interfaces.

## Understanding Interface Cost

The cost of an OSPF interface is a metric representing the cost of sending a packet over that interface. By default, this cost is calculated using this formula:

$$10^8 / \text{bandwidth [bits per second]}$$

For example, if the bandwidth of a Fast Ethernet interface is 10 Mbps (equal to  $10^7$ ), the cost of sending packets over that interface is calculated as  $10^8 / 10^7$  or 10. This formula establishes an inverse relationship between the bandwidth of an interface and its cost; the greater the bandwidth, the lower the cost.

Although cost is a calculated value, you can manually enter the cost of a selected interface.

## Understanding Interface Priority

Routers that share a common segment are elected through the Hello protocol to be neighbors on that segment. Election occurs as soon as the routers see themselves listed in their neighbor's hello packet. Adjacency is the next step. Adjacent routers are routers that proceed beyond the simple Hello exchange to a database exchange.

On each multiaccess (as opposed to point-to-point) segment, OSPF elects one router as the designated router (DR) for that segment. The DR acts as a central point of contact to minimize information exchange. Each router in the segment sends updates to the DR, which in turn relays the information to the other routers. A second router is elected as the backup designated router (BDR) in case the DR goes down.

DR and BDR election is performed via the Hello protocol. The router with the highest OSPF priority becomes the DR for that segment. The same process is then repeated for the BDR. In the case of a tie, the router with the higher router ID (RID) is elected. By default, each interface is given a priority of 1, but you can assign a higher priority to selected interfaces, as required.

**Note**

---

The priority setting does not apply to point-to-point, nonbroadcast interfaces.

---

- [Defining OSPF Interface Settings, page 67-25](#)

## Disabling MTU Mismatch Detection

The MTU is the largest packet size that a particular interface can handle. If one router sends a DBD packet that is larger than the MTU setting on a neighboring router, the neighboring router ignores the packet. In many cases, an MTU mismatch causes the two routers to become stuck in exstart/exchange state, which prevents OSPF adjacency from being established. This is why it is important that all neighboring routers share the same MTU setting and that MTU mismatch detection be enabled.

You can, however, disable MTU mismatch detection. This is useful in cases where mismatch detection is preventing adjacency from taking place in an otherwise valid setup between two devices with different MTUs.

- [Defining OSPF Interface Settings, page 67-25](#)

## Blocking LSA Flooding

By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. Although some redundancy is desirable, too much redundancy can waste bandwidth. In certain topologies, such as full mesh, LSA flooding can destabilize the network because of excessive link and CPU usage. Therefore, you can block LSA flooding to selected interfaces on broadcast, nonbroadcast, and point-to-point networks.

## Understanding OSPF Timer Settings

OSPF uses a series of timers during operation:

- **Hello Interval**—Determines how often an interface sends hello packets, which are used to acquire neighbors and act as indicators that the router is still functioning. The smaller the interval, the faster topological changes on the network are detected. However, a smaller interval also results in more traffic being sent over the interface. The hello interval must be the same on all routers and access servers on a specific network.
- **Transmit Delay**—Determines the delay before an LSA is flooded over the link. The transmit delay setting should take into account the transmission and propagation delays for the interface. These factors are particularly important when configuring low-speed and on-demand links.
- **Retransmit Interval**—Determines how long to wait before retransmitting an unacknowledged database description (DBD) packet to its neighbors. The retransmit interval setting should be low enough to prevent excessive retransmissions.

---

**Note** You should increase the retransmit interval for serial lines and virtual links.

---

- **Dead Interval**—Determines how long an interface should wait before declaring its neighbor to be down. This declaration is caused by an absence of hello packets from the neighbor during this interval. The dead interval setting must be the same for all routers and access servers on a specific network. By default, this interval is four times the hello interval.

- [Defining OSPF Interface Settings, page 67-25](#)

## Understanding the OSPF Network Type

You can manually configure the OSPF network type on an interface as either broadcast or nonbroadcast multiaccess (NBMA), regardless of the default media type. For example, you can use this feature to configure broadcast networks (such as Ethernet, Token Ring, and FDDI) as NBMA when your network contains routers that do not support multicast addressing. You can also configure NBMA networks (such as X.25, Frame Relay, and SMDs) as broadcast networks, which eliminates the need to configure neighbors.

Configuring NBMA networks as either broadcast or nonbroadcast assumes the existence of virtual circuits (VCs) from every router to every router (fully meshed network). If VCs do not exist between each router, due to cost constraints or the existence of an only partially meshed network, you can configure the OSPF network type as point-to-multipoint. An OSPF point-to-multipoint interface is defined as a numbered point-to-point interface having one or more neighbors. It creates multiple host routes.

If you use the point-to-multipoint network type, routing between two routers that are not directly connected go through a third router that has VCs to both routers. You do not need to configure neighbors when using this feature. OSPF point-to-multipoint networks have the following benefits compared to NBMA and point-to-point networks:

- Point-to-multipoint is easier to configure because it consumes only one IP subnet and does not require neighbor configuration or designated router election.
- It costs less because it does not require a fully meshed topology.
- It is more reliable because it maintains connectivity in the event of VC failure.

**Note**

For point-to-multipoint, broadcast networks, you can optionally define neighbors, in which case you should specify the cost to each neighbor. For point-to-multipoint, nonbroadcast networks, you must identify neighbors, but specifying a cost to each neighbor is optional. In both cases, you define neighbors using FlexConfig. See [Chapter 7, “Managing FlexConfigs”](#) for more information.

- [Understanding OSPF Timer Settings, page 67-28](#)
- [Understanding OSPF Interface Authentication, page 67-29](#)
- [Defining OSPF Interface Settings, page 67-25](#)

## Understanding OSPF Interface Authentication

You define neighbor authentication settings for OSPF interfaces by selecting the interfaces and selecting an authentication type, either MD5 or clear text.

When you use MD5 authentication, neighboring routers must share the same password. When you use clear-text authentication, all routers on the network using OSPF must share the same password.

Whenever you configure an interface with a new key, the router sends multiple copies of the same packet, each authenticated by different keys. The router stops sending duplicate packets when it detects that all of its neighbors have adopted the new key.

**Note**

You should use authentication with all routing protocols when possible, because attackers can use route redistribution between OSPF and other protocols (such as RIP) to subvert routing information.

**Table 67-11** *OSPF Interface Page*

| Element        | Description                                                                          |
|----------------|--------------------------------------------------------------------------------------|
| Interfaces     | The name of an interface (as defined by an interface role) on which OSPF is enabled. |
| Authentication | The type of OSPF neighbor authentication enabled for the selected interface.         |

**Table 67-11** *OSPF Interface Page (continued)*

| Element             | Description                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Key ID              | The identification number of the authentication key used for MD5 authentication.                                                        |
| Cost                | The cost of sending packets over the selected interface, if this value is different from the cost as normally calculated.               |
| Priority            | The priority of the selected interface.                                                                                                 |
| MTU Ignore          | Indicates whether Maximum Transmission Rate (MTU) detection is disabled on the selected interface.                                      |
| Database Filter     | Indicates whether link-state advertisement (LSA) flooding is disabled on the selected interface.                                        |
| Hello Interval      | The interval between hello packets (in seconds) sent over this interface.                                                               |
| Transmit Delay      | The amount of time OSPF waits (in seconds) before flooding an LSA over the link.                                                        |
| Retransmit Interval | The interval between LSA retransmissions (in seconds) over the selected interface.                                                      |
| Dead Interval       | The interval OSPF waits (in seconds) before declaring a neighboring router dead because of an absence of hello packets.                 |
| Network Type        | The network type configured for the selected interface, if it differs from the default medium.                                          |
| Add button          | Opens the <a href="#">OSPF Interface Dialog Box, page 67-31</a> . From here you can define the properties of an OSPF interface.         |
| Edit button         | Opens the <a href="#">OSPF Interface Dialog Box, page 67-31</a> . From here you can edit the properties of the selected OSPF interface. |
| Delete button       | Deletes the selected OSPF interface definitions from the table.                                                                         |

## OSPF Interface Dialog Box

Use the OSPF Interface dialog box to add or edit the properties of OSPF interfaces.

### Navigation Path

Go to the [OSPF Interface Policy Page, page 67-30](#), then click the **Add** or **Edit** button beneath the table.

Table 67-12 OSPF Interface Dialog Box

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | The OSPF interface to configure. Enter the name of an interface or interface role, or click <b>Select</b> to select the object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Authentication | <p>Type—The authentication type used by the selected interface:</p> <ul style="list-style-type: none"> <li>MD5—Uses the MD5 hash algorithm for authentication. This is the default.</li> <li>Clear Text—Uses a clear text password for authentication.</li> <li>None—Uses no authentication.</li> </ul> <p><b>Note</b> The authentication type used on an interface must match the authentication type defined for the area.</p> <p><b>Note</b> Use plain text authentication only when security is not an issue, for example, to ensure that misconfigured hosts do not participate in routing.</p> <ul style="list-style-type: none"> <li>Key ID—Available only when MD5 is selected as the authentication type.<br/>The identification number of the authentication key. This number must be shared with all other devices sending updates to, and receiving updates from, the selected device. Valid values range from 1 to 255.</li> <li>Key—The shared key used for authentication (MD5 or clear text). This key must be shared with all other devices sending updates to, and receiving updates from, the selected device. Enter this key again in the Confirm field.<br/>When using clear text, the key can include any continuous string of characters that can be entered from the keyboard (up to 8 bytes).<br/>When using MD5, the key can include alphanumeric characters only (up to 16 bytes).</li> </ul> |
| Cost           | <p>The cost of sending packets over this interface. A value entered here overrides the default calculated cost (<math>10^8</math> / bandwidth in bits per second).</p> <p>Valid values range from 1 to 65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Priority       | <p>The default priority of the interface. The priority is used to determine which routers become the designated router (DR) and backup designated router (BDR) for that segment. The higher the number, the higher the priority.</p> <p>The default priority is 1. Valid values range from 0 to 255.</p> <p><b>Note</b> To exclude the interface from election as DR or BDR, assign a priority of 0. Configure router priority only for interfaces to multiaccess networks, not point-to-point networks.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 67-12 OSPF Interface Dialog Box (continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTU Ignore          | <p>When selected, ignores MTU mismatches between neighboring routers.</p> <p>When deselected, MTU mismatch detection is enabled.</p> <p><b>Note</b> Typically, this option is not used, because it can cause routers to become stuck in exstart/exchange state, which prevents OSPF adjacency from being established.</p>                                                   |
| Database Filter     | <p>When selected, blocks link-state advertisement (LSA) flooding to the selected interface.</p> <p>When deselected, LSA flooding is permitted.</p> <p><b>Note</b> We recommend that you enable this option on fully-meshed networks. This option is not available for point-to-multipoint networks.</p>                                                                     |
| Hello Interval      | <p>The default interval (in seconds) between hello packets sent over the selected interface. These packets are used by neighboring routers to confirm the router sending the packets is still operating. Valid values range 1 to 65535 seconds.</p> <p><b>Note</b> The hello interval must be the same for all routers and access servers in the network.</p>               |
| Transmit Delay      | <p>The amount of time OSPF waits (in seconds) before flooding an LSA over the link.</p> <p>The default is 1 second. Valid values range from 1 to 65535 seconds.</p> <p><b>Note</b> When you configure slow links or on-demand links that queue traffic before sending it in bursts, we recommend that you take these link delays into account when defining this value.</p> |
| Retransmit Interval | <p>The interval between LSA retransmissions (in seconds) over the selected interface.</p> <p>The default is 5 seconds. Valid values range from 1 to 65535 seconds.</p> <p><b>Note</b> We recommend that you increase this value for serial lines and virtual links.</p>                                                                                                     |
| Dead Interval       | <p>The interval (in seconds) after which an interface declares its neighbor dead if no hello packets are received. Valid values range from 1 to 65535 seconds.</p> <p><b>Note</b> The value of the dead interval is typically the hello interval value multiplied by 4. The dead interval must be the same for all routers and access servers in the network.</p>           |

**Table 67-12 OSPF Interface Dialog Box (continued)**

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configure Network Type | <p>When selected, enables you to select a network type that differs from the default medium used by the interface.</p> <p>When deselected, the network type is equivalent to the default medium used by the interface.</p> <p>For nonbroadcast multiaccess (NBMA) networks (such as ATM and Frame Relay), options are:</p> <ul style="list-style-type: none"> <li>• Broadcast—Treats the NBMA network as a broadcast network, which eliminates the need to configure neighbors. Use this option when there are virtual circuits from every router to every router (fully meshed network).</li> <li>• Point-to-Multipoint—Treats the nonbroadcast network as a series of point-to-point links. This option is easier to configure, less costly, and more reliable than NBMA or point-to-point networks.</li> <li>• Point-to-Multipoint Non-Broadcast—Statically maintains the known neighbors of the network. Selecting this option helps avoid the problem of losing neighbors that were learned dynamically through the reception of hello packets.</li> </ul> <p><b>Note</b> Another option for NBMA networks is to configure neighbors manually using FlexConfigs. See <a href="#">Understanding FlexConfig Policies and Policy Objects</a>, page 7-2.</p> <p>For broadcast networks (such as Ethernet, Token Ring, and FDDI), you can select:</p> <ul style="list-style-type: none"> <li>• Non-Broadcast—Treats the broadcast network as a nonbroadcast network.</li> <li>• Point-to-Point—Treats the broadcast network as a point-to-point network. You can use this option, for example, to configure a broadcast network (such as Ethernet) as a nonbroadcast multiaccess (NBMA) network if not all routers in the network support multicast addressing.</li> </ul> |

## OSPF Process Policy Page

OSPF is an interior gateway routing protocol that uses link states instead of distance vectors for path selection. OSPF propagates link-state advertisements (LSAs) instead of routing table updates, which enables OSPF networks to converge quickly.

You can configure OSPF process policies from the following tabs on the OSPF Process page:

- [OSPF Process Page—Setup Tab](#), page 67-35
- [OSPF Process Page—Area Tab](#), page 67-36
- [OSPF Process Page—Redistribution Tab](#), page 67-38

For more information, see [OSPF Routing on Cisco IOS Routers](#), page 67-19.

**Note**

For more information about OSPF interface policies, see [OSPF Interface Policy Page, page 67-30](#).

**Navigation Path**

- (Device view) Select **Platform > Routing > OSPF Process** from the Policy selector.
- (Policy view) Select **Router Platform > Routing > OSPF Process** from the Policy Type selector. Right-click **OSPF Process** to create a policy, or select an existing policy from the Shared Policy selector.

## OSPF Process Page—Setup Tab

Use the OSPF Process Setup tab to create, edit, and delete OSPF processes. This includes selecting those interfaces that will remain passive, which means that they will not send routing updates to their neighbors. You can create as many processes for each router as required.

**Navigation Path**

Go to the [OSPF Process Policy Page, page 67-34](#), then click the **Setup** tab.

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID         | The process ID number for the OSPF process. This number identifies the OSPF process to other routers. It does not need to match the process ID on other devices. Valid values are from 1 to 65535.                                                                                                                                                                                                                        |
| Passive Interfaces | The interfaces that do not send updates to their routing neighbors. Click <b>Edit</b> to display the <a href="#">Edit Interfaces Dialog Box—OSPF Passive Interfaces</a> , page 67-36. From here you can define these interfaces.<br><b>Note</b> When you make an interface passive, OSPF suppresses the sending of hello packets to neighboring routers. The interface will continue to receive routing updates, however. |

**Edit Interfaces Dialog Box—OSPF Passive Interfaces**

When you configure an OSPF routing policy on a Cisco IOS router, use the Edit Interfaces dialog box to specify which interfaces will not send updates to their routing neighbors. Separate multiple names or roles with commas. Click **Select** to select interface names or roles from a list of existing objects, or to create new interface role objects.

**Navigation Path**

Go to the [OSPF Setup Dialog Box](#), page 67-35, then click the **Edit** button in the Passive Interfaces field.

### Field Reference

**Table 67-15** *OSPF Process Area Tab*

| Element        | Description                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------|
| Area ID        | The ID number of the area associated with the process.                                                      |
| Process ID     | The process ID that identifies the OSPF routing process to other routers.                                   |
| Networks       | The networks included in the area.                                                                          |
| Authentication | The authentication type used by the area—MD5, clear text, or none.                                          |
| Add button     | Open the <a href="#">OSPF Area Dialog Box, page 67-37</a> . From here you can define an OSPF area.          |
| Edit button    | Opens the <a href="#">OSPF Area Dialog Box, page 67-37</a> . From here you can edit the selected OSPF area. |
| Delete button  | Deletes the selected OSPF areas from the table.                                                             |

## OSPF Area Dialog Box

Use the OSPF Area dialog box to add or edit the properties of an OSPF area. You should define at least one area for each OSPF process (see [OSPF Setup Dialog Box, page 67-35](#)), but deployment will not fail if you do not.

### Navigation Path

Go to the [OSPF Process Page—Area Tab, page 67-36](#), then click the **Add** or **Edit** button beneath the table.

|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metric Type                   | The external link type associated with the default route advertised into the OSPF routing domain.                                                                 |
| Subnets                       | Indicates whether routes that are subnetted are also being redistributed.                                                                                         |
| Add button                    | Opens the <a href="#">OSPF Redistribution Mapping Dialog Box, page 67-39</a> . From here you can define OSPF redistribution mappings.                             |
| Edit button                   | Opens the <a href="#">OSPF Redistribution Mapping Dialog Box, page 67-39</a> . From here you can edit the selected OSPF redistribution mapping.                   |
| Delete button                 | Deletes the selected redistribution mappings from the table.                                                                                                      |
| OSPF Max Prefix Mapping Table |                                                                                                                                                                   |
| OSPF Process ID               | The ID of the OSPF routing domain for which a maximum prefix values has been defined.                                                                             |
| Max Prefix                    | The maximum number of prefixes (routes) that may be redistributed to the selected OSPF process.                                                                   |
| Threshold                     | The percentage of the maximum prefix value that acts as a threshold for triggering a warning message.                                                             |
| Action                        | Indicates whether redistribution to this OSPF process will stop when the maximum is reached, or whether only a warning is displayed.                              |
| Add button                    | Opens the <a href="#">OSPF Max Prefix Mapping Dialog Box, page 67-41</a> . From here you can define maximum prefix values for OSPF processes.                     |
| Edit button                   | Opens the <a href="#">OSPF Max Prefix Mapping Dialog Box, page 67-41</a> . From here you can edit the maximum prefix value defined for the selected OSPF process. |
| Delete button                 | Deletes the selected max prefix mappings from the table.                                                                                                          |

## OSPF Redistribution Mapping Dialog Box

Use the OSPF Redistribution Mapping dialog box to add or edit the properties of an OSPF redistribution mapping.

### Navigation Path

Go to the [OSPF Process Page—Redistribution Tab, page 67-38](#), then click the **Add** or **Edit** button beneath the Redistribution Mapping table.

### Note

You must create at least one OSPF process before you can access the OSPF Redistribution dialog box. See [OSPF Process Page—Setup Tab, page 67-35](#).

Table 67-18 OSPF Redistribution Mapping Dialog Box

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID                           | The OSPF process into which other routes are being redistributed. You must select a process ID number from the list of OSPF processes defined in the <a href="#">OSPF Process Page—Setup Tab, page 67-35</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Protocol to Redistribute             | The routing protocol that is being redistributed: <ul style="list-style-type: none"> <li>• Static—Redistributes static routes. You can define a single mapping for each route.</li> <li>• EIGRP—Redistributes an EIGRP autonomous system. Enter the AS number in the displayed field. You can define a single mapping for each AS.</li> <li>• BGP—Redistributes a BGP autonomous system. You can define a single BGP mapping on each device. If you configured a BGP AS in the BGP Setup tab, the AS number is displayed. Otherwise, a message is displayed indicating that no BGP AS was defined. See <a href="#">BGP Page—Redistribution Tab, page 67-7</a>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Protocol to Redistribute (continued) | <ul style="list-style-type: none"> <li>• OSPF—Redistributes a different OSPF process. You can define a single mapping for each process. Select a process from the displayed list, then select one or more match criteria: <ul style="list-style-type: none"> <li>– Internal—Routes that are internal to a specific AS.</li> <li>– External1—Routes that are external to the AS and imported into OSPF as a Type 1 external route.</li> <li>– External2—Routes that are external to the AS and imported into the selected process as a Type 2 external route.</li> <li>– NSAAExternal1—Not-So-Stubby Area (NSSA) routes that are external to the AS and imported into the selected process as Type 1 external routes.</li> <li>– NSAAExternal2—(NSSA) routes that are external to the AS and imported into the selected process as Type 2 external routes.</li> </ul> </li> <li>• RIP—Redistributes RIP routes. You can define a single mapping for each route.</li> <li>• Connected—Redistributes routes that are established automatically by virtue of having enabled IP on an interface. These routes are redistributed as external to the AS.</li> </ul> |
| Default Metric                       | A value representing the cost of the redistributed route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Metric Type                          | The external link type that is associated with the route being redistributed into the OSPF routing domain: <ul style="list-style-type: none"> <li>• 1—Type 1 external route. The metric is the sum of the external redistributed cost and the internal OSPF cost.</li> <li>• 2—Type 2 external route. The metric is equal to the external redistributed cost, as defined in the Metric field. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 67-18** OSPF Redistribution Mapping Dialog Box (continued)

| Element          | Description                                              |
|------------------|----------------------------------------------------------|
| Limit to Subnets | When selected, only subnetted routes are redistributed.  |
|                  | When deselected, subnetted routes are not redistributed. |

## OSPF Max Prefix Mapping Dialog Box

Use the OSPF Max Prefix Mapping dialog box to add or edit the maximum number of routes that can be redistributed into an OSPF process.

### Navigation Path

Go to the [OSPF Process Page—Redistribution Tab, page 67-38](#), then click the **Add** or **Edit** button beneath the Prefix Mapping table.

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID                  | The OSPF process into which other routes are being redistributed. The list contains the OSPF processes defined in the <a href="#">OSPF Process Page—Setup Tab, page 67-35</a> .                                                                                                                                                                                                                                                             |
| Max Prefix                  | The maximum number of prefixes (routes) that can be redistributed into the selected OSPF process. Limiting the number of redistributed routes helps prevent the router from being flooded by an excessive number of routes.                                                                                                                                                                                                                 |
| Threshold                   | The percentage of the maximum prefix value that acts as a threshold for triggering warning messages. The default is 75%.<br><b>Note</b> This warning is triggered whether or not the Warning-Only check box is selected.                                                                                                                                                                                                                    |
| When maximum routes reached | The action to take when the maximum number of redistributed routes is reached: <ul style="list-style-type: none"> <li>• Enforce Maximum Route—Prevents additional routes from being redistributed when the defined maximum prefix value is reached. This is the default.</li> <li>• Warning Only—Issues a warning when the maximum number of routes is reached, but does not prevent additional routes from being redistributed.</li> </ul> |

# RIP Routing on Cisco IOS Routers

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that was created for use in small, homogeneous networks. RIP is a distance-vector protocol that sends routing-update messages at regular intervals (in a process called *advertising*) and whenever the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by the non-updating router as being unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router. Routing information is exchanged using UDP packets.

RIP evaluates routes by measuring the number of hops (the number of routers traversed) from the source to the destination. A directly connected network has a metric of zero. The maximum hop count allowed by RIP is 15. Any route with a hop count greater than 15 is considered unreachable.

Security Manager supports RIP version 2 only, which is described in RFC 1723. RIP 2 improves on the original RIP by enabling RIP messages to carry more information, which permits the use of a simple authentication mechanism (clear text or MD5) to secure table updates. RIP 2 also supports subnet masks, a critical feature that was not available in the original version of RIP.

The following topics describe the tasks you perform to create a RIP routing policy:

- [Defining RIP Setup Parameters, page 67-42](#)
- [Defining RIP Interface Authentication Settings, page 67-43](#)
- [Redistributing Routes into RIP, page 67-44](#)

**Related Topics**

- [Static Routing on Cisco IOS Routers, page 67-50](#)
- [OSPF Routing on Cisco IOS Routers, page 67-19](#)
- [EIGRP Routing on Cisco IOS Routers, page 67-8](#)
- [BGP Routing on Cisco IOS Routers, page 67-1](#)

## Defining RIP Setup Parameters

You configure RIP setup parameters by selecting the networks to include in the route and deciding whether any interfaces should be passive. These interfaces do not send routing updates to their neighbors. Additionally, you can enable auto-summarization, which reduces the size and complexity of the routing tables the router must maintain.

**Related Topics**

- [Defining RIP Interface Authentication Settings, page 67-43](#)
- [Redistributing Routes into RIP, page 67-44](#)
- [RIP Routing on Cisco IOS Routers, page 67-42](#)

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Routing > RIP** from the Policy selector, then click the **Setup** tab in the work area.
- (Policy view) Select **Router Platform > Routing > RIP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.

The RIP Setup tab is displayed (see [RIP Page—Setup Tab, page 67-45](#)).

- Step 2** Enter the addresses of the directly connected networks whose interfaces are to receive RIP updates. You can use a combination of addresses and network/host objects; separate addresses with commas. Click **Select** to select network/host objects from a list of existing objects, or to create new network/host objects. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 3** Enter the addresses of the passive interfaces, which are interfaces that should not send routing updates to their neighbors, if any. These interfaces continue to receive RIP routing broadcasts, which they use to populate their routing tables. Enter the names of one or more interfaces or interface roles; separate addresses with commas. Click **Select** to select interface names or roles from a list of existing objects, or to create new interface role objects. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).
- Step 4** (Optional) Select the **Auto Summary** check box to enable the automatic summarization of subnet routes into network-level routes. Summarization reduces the size of routing tables, thereby reducing the complexity of the network.

Disable automatic summarization when you perform routing between disconnected subnets. When automatic summarization is turned off, subnets are advertised.

---

## Defining RIP Interface Authentication Settings

You define neighbor authentication settings for RIP interfaces by selecting the interfaces and then selecting an authentication type, either MD5 or clear text.

### Related Topics

- [Defining RIP Setup Parameters, page 67-42](#)
  - [Redistributing Routes into RIP, page 67-44](#)
  - [RIP Routing on Cisco IOS Routers, page 67-42](#)
- 

- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > RIP** from the Policy selector, then click the **Authentication** tab in the work area.
  - (Policy view) Select **Router Platform > Routing > RIP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Authentication** tab.
- The RIP Authentication tab is displayed. See [Table 67-21 on page 67-46](#) for a description of the fields on this tab.
- Step 2** On the RIP Authentication tab, select an interface definition from the table, then click **Edit**, or click **Add** to create a definition. The RIP Authentication dialog box appears. See [Table 67-22 on page 67-47](#) for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role for which authentication is defined, or click **Select** to select an interface role from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-76](#).

**Step 4** Define interface authentication (MD5 or clear text).

**Note** We do not recommend that you use clear text authentication in RIP packets, because the unencrypted authentication key is sent in every packet. Use plain text authentication only when security is not an issue, for example, to ensure that misconfigured hosts do not participate in routing.

**Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. The defined interface appears on the RIP Authentication tab.

## Redistributing Routes into RIP

Redistribution refers to using a routing protocol, such as RIP, to advertise routes that are learned by some other means, such as a different routing protocol, static routes, or directly connected routes. For example, you can redistribute routes from the OSPF routing protocol into your RIP route. Redistribution is necessary in networks that operate in multiple-protocol environments and can be applied to all IP-based routing protocols.

When you redistribute into RIP, you can maintain the original metric of the route by redistributing it transparently.

### Before You Begin

- Define at least one RIP route. See [Defining RIP Setup Parameters, page 67-42](#).

### Related Topics

- [Defining RIP Setup Parameters, page 67-42](#)
- [Defining RIP Interface Authentication Settings, page 67-43](#)
- [RIP Routing on Cisco IOS Routers, page 67-42](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Routing > RIP** from the Policy selector, then click the **Redistribution** tab in the work area.
- (Policy view) Select **Router Platform > Routing > RIP** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Redistribution** tab.

The RIP Redistribution tab is displayed. See [Table 67-23 on page 67-48](#) for a description of the fields on this tab.

**Step 2** On the RIP Redistribution tab, select a row from the RIP Redistribution Mappings table, then click **Edit**, or click **Add** to create a mapping. The RIP Redistribution Mapping dialog box appears. See [Table 67-24 on page 67-49](#) for a description of the fields in this dialog box.

**Step 3** Select the protocol whose routes you want to redistribute into RIP.

**Note** You can create a single mapping for each static route, BGP AS, EIGRP AS, and OSPF process.

**Step 4** Define the metric (cost) of the redistributed routes by doing one of the following:

- Select the **Default Metric** check box, then enter the default metric of the redistributed routes. The metric determines the priority of the routes.
- Select the **Transparent** check box to maintain the original metric of the routes being redistributed into RIP.

**Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. The redistribution mapping appears in the Redistribution Mapping table on the RIP Redistribution tab.

---

## RIP Routing Policy Page

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection. Security Manager supports RIP version 2 only, which includes support for neighbor authentication when routing updates are exchanged.

You can configure RIP routing policies from the following tabs on the RIP Routing page:

- [RIP Page—Setup Tab, page 67-45](#)
- [RIP Page—Authentication Tab, page 67-46](#)
- [RIP Page—Redistribution Tab, page 67-48](#)

For more information, see [RIP Routing on Cisco IOS Routers, page 67-42](#).

### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Policy selector.
- (Policy view) Select **Router Platform > Routing > RIP** from the Policy Type selector. Right-click **RIP** to create a policy, or select an existing policy from the Shared Policy selector.

## RIP Page—Setup Tab

Use the RIP Setup tab to create, edit, and delete RIP routes.

### Navigation Path

Go to the [RIP Routing Policy Page, page 67-45](#), then click the **Setup** tab.

| Element            | Description                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Transparent Metric | When selected, maintains the original metric of the route being redistributed. When deselected, the value specified in the Metric field is used. |

## Static Routing on Cisco IOS Routers

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

You can configure static routing policies to ensure that the router correctly forwards packets to their destination when a route cannot be built dynamically. By default, static routes have a default administrative distance of 1 (implying a directly connected network), which causes them to override any dynamic routes discovered for the same host or network. You can, however, define a larger administrative distance to a static route so that it does not take precedence over a corresponding dynamic route.

For example, EIGRP routes have a default administrative distance of 5. To have a static route that can be overridden by an EIGRP route, you must specify an administrative distance greater than 5. This feature is useful when you define the static route as a “floating” route, which is inserted into the routing table only when the preferred route is unavailable.

### Tip

When you use the static route as a backup, “floating” route, specify the interface through which the next hop IP address can be reached instead of entering a specific IP address. Otherwise, the “floating” route is not inserted in the routing table if the primary link fails. For more information, see *Specifying a Next Hop IP Address for Static Routes* on Cisco.com at this URL:

## Defining Static Routes

To define a static route, you must define the IP address (and optionally, the metric) of the hop gateway to which the router forwards packets destined to the selected host or network. You can define as many static routes as required.

### Related Topics

- [Static Routing on Cisco IOS Routers, page 67-50](#)
- [RIP Routing on Cisco IOS Routers, page 67-42](#)
- [OSPF Routing on Cisco IOS Routers, page 67-19](#)
- [EIGRP Routing on Cisco IOS Routers, page 67-8](#)
- [BGP Routing on Cisco IOS Routers, page 67-1](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Routing > Static Routing** from the Policy selector.
  - (Policy view) Select **Router Platform > Routing > Static Routing** from the Policy Type selector. Select an existing policy or create a new one.
- The Static Routing page is displayed. See [Table 67-25 on page 67-52](#) for a description of the fields on this page.
- Step 2** On the Static Routing page, select a static route from the table, then click **Edit**, or click **Add** to create a route. The Static Routing dialog box appears. See [Table 67-26 on page 67-53](#) for a description of the fields in this dialog box.
- Step 3** (Optional) Select the **Use as Default Route** check box to make this route the default route for all unknown outbound packets.
- Step 4** In the Prefix field, enter the address for the destination network, or click **Select** to select a network/host object from a list or to create a new one. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 5** Select a forwarding option:
- To define the router interface that forwards packets to the remote network, select **Forwarding Interface** and enter the name of an interface or interface role. You can click **Select** to select an interface role from a list or to create a new one. See [Understanding Interface Role Objects, page 6-73](#) and [Selecting Objects for Policies, page 6-2](#).
  - To specify the next hop router that receives and forwards packets to the remote network, select **Forwarding IP**, then enter the address in the field provided, or click **Select** to select a network/host object from a list or to create a new one. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Step 6** (Optional) In the Distance Metric field, enter the number of hops to the next hop address for this router. This metric identifies the priority of the static route. If two routing entries specify the same network, the route with the lower metric value (that is, the lower cost) is given a higher priority and is selected.
- If no value is specified, the default is 1, which implies a directly connected network.
- Step 7** (Optional) Select the **Permanent route** check box to prevent this static route entry from being deleted, even in cases in which the interface is shut down or the router cannot communicate with the next router.
- Step 8** Click **OK** to save your definitions locally on the client and close the dialog box. The static route appears in the table on the Static Routing page.
- 

## Static Routing Policy Page

Use the Static Routing page to create, edit, and delete static routes. For more information, see [Defining Static Routes, page 67-50](#).

### Navigation Path

- (Device view) Select **Platform > Routing > Static Routing** from the Policy selector.
- (Policy view) Select **Router Platform > Routing > Static Routing** from the Policy Type selector. Right-click **Static Routing** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefix                  | The destination IP address of the static route.                                                                                                                                                                                                                                                                                             |
| Prefix Mask             | The net mask of the selected IP address.                                                                                                                                                                                                                                                                                                    |
| Default Route           | Indicates whether the static route is the default route for unknown packets being forwarded by this router.                                                                                                                                                                                                                                 |
| Interface or IP Address | The IP address or the interface name associated with the gateway router that is the next hop address for this router.                                                                                                                                                                                                                       |
| Distance                | The number of hops from the gateway IP to the destination. The metric determines the priority of this route. The fewer the hops, the higher the priority assigned to the route, based on lower costs.<br><br>When two routing entries specify the same network, the entry with the lower metric (that is, the higher priority) is selected. |
| Permanent Route         | Indicates whether the static route is defined as a permanent route, which means that it will not be removed even if the interface is shut down or if the router is unable to communicate with the next router.                                                                                                                              |
| Add button              | Opens the <a href="#">Static Routing Dialog Box, page 67-52</a> . From here you can create a static route.                                                                                                                                                                                                                                  |
| Edit button             | Opens the <a href="#">Static Routing Dialog Box, page 67-52</a> . From here you can edit the selected static route.                                                                                                                                                                                                                         |
| Delete button           | Deletes the selected static routes from the table.                                                                                                                                                                                                                                                                                          |

## Static Routing Dialog Box

Use the Static Routing dialog box to add or edit static routes.

**Navigation Path**

Go to the [Static Routing Policy Page, page 67-51](#), then click the **Add** or **Edit** button beneath the table.

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Network   | <p>Address information for the destination network defined by this static route.</p> <ul style="list-style-type: none"> <li>• <b>Use as Default Route</b>—When selected, makes this the default route on this router. A default route is used when the route from a source to a destination is unknown or when it is not feasible for the router to maintain many routes in its routing table. All unknown outbound packets are forwarded over the default route.</li> </ul> <p>When deselected, this static route is not the default route.</p> <ul style="list-style-type: none"> <li>• <b>Prefix</b>—The IP address of the destination network. Enter an IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new one.</li> </ul> <p>The prefix must be a class A, B, or C network or host IP. A host IP can begin with 0 unless it contains a discontinuous mask. All subnet addresses are valid.</p>                                                         |
| Forwarding (Next Hop) | <p>The method of forwarding data to the destination network:</p> <ul style="list-style-type: none"> <li>• <b>Forwarding Interface</b>—The router interface that forwards packets to the remote network. Enter the name of an interface or interface role, or click <b>Select</b> to select the object from a list or to create a new one.</li> <li>• <b>Forwarding IP</b>—The IP address of the next hop router that receives and forwards packets to the remote network. Enter an IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new one.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                       |
| Distance Metric       | <p>The number of hops to the destination network (gateway IP). The default is 1 if no value is specified. The range is from 1 to 255.</p> <p>This metric (also known as <i>administrative distance</i>) is a measurement of route expense based on the number of hops to the network on which a specified host resides. This hop count includes all the networks a packet must traverse, including the destination network. Therefore, all directly connected networks have a metric of 1.</p> <p>Because the metric is based on expense, it is used to identify the priority of the static route. If two routing entries specify the same network, the route with the lower metric value (that is, the lower cost) is given a higher priority and is selected.</p> <p><b>Note</b> Under certain circumstances, it is useful to assign a static route a lower priority (larger distance metric) than a dynamic route. This enables the static route to act as a backup, “floating,” route when the dynamic route is unavailable.</p> |
| Permanent route       | <p>When selected, prevents this static route entry from being deleted, even in cases where the interface is shut down or the router cannot communicate with the next router.</p> <p>When deselected, this static route can be deleted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Managing Cisco Catalyst Switches and Cisco 7600 Series Routers

**Note**

---

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any bug fixes or enhancements.

---

Cisco Security Manager supports the management and configuration of security services and other platform-specific services on Cisco Catalyst switches and Cisco 7600 Series routers.

You can manage Catalyst switches and 7600 devices configured in VTP transparent or VTP client/server mode. Security Manager manages switches configured in client/server mode by bypassing VLAN database management on the device (including VLAN creation, deletion, and monitoring VLANs in the VLAN database on switches).

This chapter contains the following topics:

## Discovering Policies on Cisco Catalyst Switches and Cisco 7600 Series Routers

**Note**

---

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any bug fixes or enhancements.

---

You can discover the configurations of your Cisco Catalyst switches and Cisco 7600 Series Routers (as well as the configurations of the services modules and security contexts associated with them) and import the configurations as policies into Security Manager. This makes it possible to add existing devices and manage them with Security Manager without having to configure each device manually, policy by policy. For more information, see [Adding Devices to the Device Inventory, page 3-7](#).

You can discover any command that Security Manager can configure. Discovery ignores unsupported commands, which means that they are left intact on the device even after subsequent deployments. Additionally, in cases where Security Manager can discover the command, but not all the subcommands and keywords related to that command, the unsupported elements are ignored and left intact on the device.

At any time, you can also *rediscover* the configurations of devices that you are already managing with Security Manager. Be aware, however, that we do not recommend rediscovery generally because performing rediscovery overwrites the policies that you have defined in Security Manager. For more information, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

**Note**

We recommend that you perform deployment immediately after you discover policies, *before* you make any changes to policies or unassign policies from the device. (This recommendation also applies to any services module or security context hosted by the device.) Otherwise, the changes that you configure in Security Manager might not be deployed to the device. See [Working with Deployment and the Configuration Archive, page 8-25](#).

## Viewing Catalyst Summary Information

Use the Catalyst Summary Info page to view high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered.

To view Catalyst summary information, in Device view, right-click a Catalyst switch or Cisco 7600 Series router, then select **Catalyst Summary Info**, or select **Tools > Catalyst Summary Info**.

**Note**

If Security Manager has not completed discovery for a particular Cisco Catalyst switch or Cisco 7600 Series router, the Catalyst Summary Info page for that device displays this message: “No information is available. This information is acquired during device discovery.”

| <b>Element</b>              | <b>Description</b>                                                                                                                                                                                                                     |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hostname                    | Displays the configured hostname of the device.                                                                                                                                                                                        |
| Device Type                 | Displays the device type.                                                                                                                                                                                                              |
| Serial Number               | Displays the serial number of the device.                                                                                                                                                                                              |
| OS Version                  | Displays the Cisco IOS image version the device is running.                                                                                                                                                                            |
| Image                       | Displays the name of the image running on the device.                                                                                                                                                                                  |
| Last Update                 | Displays a time stamp for the most recent discovery.                                                                                                                                                                                   |
| Total Ports                 | Displays the total number of configured ports, combining access ports, routed ports, and trunk ports.                                                                                                                                  |
| Access Ports                | Displays the number of configured access ports on the chassis.                                                                                                                                                                         |
| Trunk Ports                 | Displays the number of configured trunk ports on the chassis.                                                                                                                                                                          |
| Routed Ports                | Displays the number of configured routed ports on the chassis.                                                                                                                                                                         |
| Total VLANs                 | Displays the total number of configured VLANs on the chassis and all its services modules.                                                                                                                                             |
| Layer 2 VLANs               | Displays the number of VLANs that run on Layer 2.                                                                                                                                                                                      |
| Layer 3 VLANs               | Displays the number of VLANs that run on Layer 3.                                                                                                                                                                                      |
| <b>Service Module Table</b> |                                                                                                                                                                                                                                        |
| Slot                        | Identifies the slot to which a service module is attached.                                                                                                                                                                             |
| Device Type                 | Displays a brief description of the service module.                                                                                                                                                                                    |
| Serial Number               | Displays the serial number of the service module.                                                                                                                                                                                      |
| Model                       | Displays the model type of the service module.                                                                                                                                                                                         |
| OS Version                  | Identifies the OS version that is installed and running on the service module.                                                                                                                                                         |
| Assigned VLANs              | Displays the total number of VLANs to which an FWSM is assigned.<br><b>Tip</b> Click the Summary tab of the Interfaces/VLANs policy to learn which VLANs are assigned to an IDSM or a VPNSM.                                           |
| Contexts                    | Displays the total number of configured security contexts for an FWSM that runs in multicontext mode.<br><b>Tip</b> Click the Summary tab of the Interfaces/VLANs policy to learn how many virtual sensors are configured for an IDSM. |

## Viewing a Summary of Catalyst Interfaces, VLANs, and VLAN Groups

Use the Summary tab of the Interfaces/VLAN policy to view attributes of all VLANs, VLAN groups, interfaces, and subinterfaces configured on supported Catalyst 6500 Series and 7600 Series chassis and their associated services modules.

To view summary interface information, in Device view, select **Interfaces/VLANs** from the Policy selector, then click the **Summary** tab.

**Note**

The Summary tab is available only for Cisco Catalyst 6500 Series switches and Cisco 7600 Series routers.

**Field Reference**

**Table 68-2** *Interfaces/VLANs Page—Summary Tab*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID          | The VLAN ID associated with an interface or subinterface. The VLAN ID specifies where 802.1Q tagged packets are sent and received on the specified an interface or subinterface; without a VLAN ID, the interface or subinterface cannot send or receive traffic.<br><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface. |
| VLAN Name        | Name of the VLAN that corresponds to an interface or subinterface. For example, VLAN003 or Trunk1.                                                                                                                                                                                                                                                                              |
| VLAN Group       | Numeric identity of a VLAN group that is configured on the VLAN that a table row describes.                                                                                                                                                                                                                                                                                     |
| VLAN Type        | Specifies whether a VLAN has access to Layer 2 or Layer 3.                                                                                                                                                                                                                                                                                                                      |
| IP Address/Mask  | The IP address and corresponding subnet mask of the VLAN configured on an interface or subinterface.                                                                                                                                                                                                                                                                            |
| Access Port      | Displays the assigned name, if a name is assigned, of the access port that a VLAN uses.                                                                                                                                                                                                                                                                                         |
| Trunk Port       | Specifies which VLANs are permitted to carry traffic over the trunk.                                                                                                                                                                                                                                                                                                            |
| Slot (-Port)     | Associates the chassis slot number (in which the relevant services module is installed) with the port number, as a hyphenated pair in the format <i>x -y</i> , for example 3-1.                                                                                                                                                                                                 |
| Blade Type       | Identifies the kind of services module on which a particular VLAN is configured, such as FWSM or VPNSM.                                                                                                                                                                                                                                                                         |
| Security Context | Identifies the security context associated with an interface, but only if Multiple Mode is active on the installed module and an Admin context is configured for the module.                                                                                                                                                                                                    |

**Table 68-2** Interfaces/VLANs Page—Summary Tab (continued)

| Element                    | Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Context Interface | Displays the physical interface and subinterface IDs for which a security context inspects traffic. The displayed ID can represent a physical interface, a single sub-interface (defined as a range of one), or a range of sub-interfaces.                                                                                                                |
| Security Level             | Displays the security level of an interface, where values range from 0 (the lowest security) to 100 (the highest): <ul style="list-style-type: none"> <li>• For an outside interface, the default is 0.</li> <li>• For an inside interface, the default is 100.</li> <li>• For an interface in the DMZ, the default is typically from 1 to 99.</li> </ul> |

## Interfaces

You use the Interfaces tab on the Interfaces/VLANs page to view and manage the following types of ports:

- **Access ports**—A switching port that is used to connect host machines or servers. An access port belongs to and carries the traffic of only one VLAN. Traffic is received and sent in native formats with no VLAN tagging.
- **Trunk ports**—A switching port operating at Layer 2 to carry the traffic of multiple VLANs. Traffic is tagged with a VLAN number to differentiate traffic from each VLAN. A trunk port is used to connect switches to switches or to connect switches to routers.
- **Routed ports**—A physical port that acts like a port on a router. A routed port is not associated with a particular VLAN, and it behaves like a regular router interface. You can configure a routed port with a Layer 3 routing protocol.
- **Dynamic ports**—A port that can change dynamically to a trunk port if the neighboring port is configured as a trunk port.
- **Unsupported ports**—Ports on the Catalyst device that are not supported by Security Manager.

To display the Interfaces tab, select a Catalyst device in Device view, select **Interfaces/VLANs** from the Policy selector, then click the **Interfaces** tab in the work area.

The following topics describe the actions you can perform when defining interfaces on Catalyst devices:

- [Creating or Editing Ports on Cisco Catalyst Switches and Cisco 7600 Series Routers, page 68-6](#)
- [Deleting Ports on Cisco Catalyst Switches and Cisco 7600 Series Routers, page 68-7](#)
- [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#)

### Related Topics

## Creating or Editing Ports on Cisco Catalyst Switches and Cisco 7600 Series Routers

### Note

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any bug fixes or enhancements.

You can create access ports, routed ports, or trunk ports on Cisco Catalyst Switches and Cisco 7600 Series Routers, with these restrictions:

- Each interface must have a name.
- You can associate an access port with only one VLAN.
- You can associate a trunk port with one or more VLANs.

### Related Topics

- [Deleting Ports on Cisco Catalyst Switches and Cisco 7600 Series Routers, page 68-7](#)
- [Creating or Editing VLANs, page 68-26](#)
- [Creating or Editing VLAN Groups, page 68-32](#)
- [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#)
- [Interfaces, page 68-5](#)

**Step 1** (Device view) Select a Catalyst device, select **Interfaces/VLANs** from the Policy selector, then click the Interfaces tab in the work area.

The Interfaces tab is displayed. For a description of the fields on this tab, see [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#).

**Step 2** Do one of the following:

- To define the attributes of a new interface, click **Add Row**.
- To edit the attributes of an interface, select it in the list, then click **Edit Row**.

**Step 3** (Optional) Deselect the **Enable Interface** check box if you want this interface to be in shutdown mode.

**Step 4** From the Type list, select **Interface** or **Subinterface**:

**Step 5** (Interfaces only) Enter a name for the interface. You can click **Select** to open a dialog box that will help you generate a standard name based on interface type and details about the interface's location, such as card, slot, and subinterface. For more information on using the dialog box to generate an interface name, see [Interface Auto Name Generator Dialog Box, page 62-12](#).

**Step 6** (Interfaces only) Select an option from the **Mode** list to specify the port configuration type. The fields in the dialog box vary according to your selection.

**Step 7** (Subinterfaces only) Select the parent interface of the subinterface, then enter the ID number.

**Step 8** Define or configure the settings for the type that you selected:

- Access Port—See [Create and Edit Interface Dialog Boxes—Access Port Mode, page 68-9](#) for a description of the fields.
- Routed Port—See [Create and Edit Interface Dialog Boxes—Routed Port Mode, page 68-12](#) for a description of the fields.

- Trunk Port—See [Create and Edit Interface Dialog Boxes—Trunk Port Mode, page 68-14](#) for a description of the fields.
  - Dynamic Port—See [Create and Edit Interface Dialog Boxes—Dynamic Mode, page 68-18](#) for a description of the fields.
  - Subinterface—See [Create and Edit Interface Dialog Boxes—Subinterfaces, page 68-22](#) for a description of the fields.
  - Unsupported—See [Create and Edit Interface Dialog Boxes—Unsupported Mode, page 68-24](#) for a description of the fields.
- Step 9** From the **Speed** list, select an option to define the speed of the interface.
- Step 10** If you defined a specific speed for the interface, and therefore the Duplex list is enabled, select a duplexing option.
- Step 11** In the MTU field, enter the maximum transmission unit value.
- Step 12** Configure whether to use flow control on inbound (Receive) and outbound (Send) traffic.
- Step 13** (Optional) Enter a description for the interface in the **Description** field.
- Step 14** Click **OK** to save your definitions locally on the client and close the dialog box.
- 

## Deleting Ports on Cisco Catalyst Switches and Cisco 7600 Series Routers

### Note

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any bug fixes or enhancements.

---

Although you can delete the definition of an interface at any time, use this option with great care. If the relevant device includes the interface definition in any policy definitions, deleting the interface causes these policy definitions to fail when they are deployed to the device.

  - [Interfaces, page 68-5](#)
- 

- Step 1** (Device view) Select a Cisco Catalyst switch or Cisco 7600 Series router from the Device selector.
- Step 2** Select **Interfaces/VLANs** from the Policy selector.
- Step 3** Click the Interfaces tab in the work area.
- The Interfaces tab is displayed. For a description of the fields on this tab, see [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#).
- Step 4** Select an interface from the table, then click **Delete Row**. The interface is deleted.
-

## Interfaces/VLANs Page—Interfaces Tab

Use the Interfaces tab to view and configure interfaces and subinterfaces on supported Cisco Catalyst switches and Cisco 7600 Series routers and their associated services modules (blades).

### Navigation Path

(Device view) Select **Interfaces/VLANs** from the Device selector, then click the **Interfaces** tab.

### Field Reference

**Table 68-3** Interfaces/VLANs Page—Interfaces Tab

| Element         | Description                                                                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | Interface type, chassis slot, and the number of the interface card. For example, <i>FastEthernet 2/7</i> means Fast Ethernet, slot 2, interface 7.                                                               |
| Mode            | Configuration mode for physical ports: <ul style="list-style-type: none"> <li>• Access</li> <li>• Routed</li> <li>• Trunk</li> <li>• Dynamic Auto</li> <li>• Dynamic Desirable</li> <li>• Unsupported</li> </ul> |
| VLAN ID         | The VLAN ID associated with the described subinterface, displayed only for Ethernet interfaces and VLAN interfaces.                                                                                              |
| IP Address      | The IP address of the interface.                                                                                                                                                                                 |
| Enabled         | Indicates whether the interface is enabled or disabled (shutdown state).                                                                                                                                         |
| Interface Roles | The interface roles whose naming patterns match this interface. See <a href="#">Understanding Interface Role Objects, page 6-73</a> .                                                                            |
| Description     | An optional description of the interface.                                                                                                                                                                        |

**Table 68-3** Interfaces/VLANs Page—Interfaces Tab (continued)

## Create and Edit Interface Dialog Boxes—Access Port Mode

Use the Create Interface dialog box (or the Edit Interface dialog box) to configure the attributes of physical and virtual interfaces that run in access port mode.

### Navigation Path

Go to the [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#), click **Add** or **Edit** to open the Create/Edit Interface dialog box, then select **Access Port** from the Mode list.

| Enable Interface            | When selected, enables the interface.<br>When deselected, disables the interface using the shutdown command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Type                        | Specifies whether the definitions apply to an interface or a subinterface.<br>For details about defining a subinterface, see <a href="#">Create and Edit Interface Dialog Boxes—Subinterfaces</a> , page 68-22.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Name (Select button)        | Displays the generated interface name, if the name has been set.<br>Click <b>Select</b> to open the <a href="#">Interface Auto Name Generator Dialog Box</a> , page 62-12. From here, you can enter or edit the details that Security Manager uses to generate an interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mode                        | The port configuration type for this interface.<br>Select <b>Access Port</b> to display the configuration options that are relevant for access ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Access Port settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VLAN ID (Select button)     | Displays the interface-specific identity of the VLAN to use in access port mode, if you have selected a VLAN. Otherwise, click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box</a> , page 68-35.<br>The VLAN ID specifies where 802.1Q tagged packets are sent and received on the subinterface; without a VLAN ID, the subinterface cannot send or receive traffic. Valid values range from 1 to 4094. Some VLAN IDs might be reserved on connected devices, so see the device documentation for more information. For multiple context mode, you can only set the VLAN in the system configuration.<br><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.<br><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the device. |
| Enable Port Security        | When selected, enables you to restrict input to an interface by limiting the MAC addresses that are allowed to access the port.<br>When deselected, disables port security.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Max. MAC Addresses          | Applies only when Enable Port Security is selected.<br>The maximum number of secure MAC addresses for the interface. Valid values range from 1 to 4097.<br><b>Note</b> Secure MAC addresses are configured dynamically using the MAC addresses of connected devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 68-4 Create and Edit Interface Dialog Boxes—Access Port Mode (continued)**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Violation Policy                 | <p>The action to take if a security violation occurs:</p> <ul style="list-style-type: none"> <li>• Port Security Protect—Drops packets with unknown source addresses until you remove a sufficient number of secure MAC addresses and the count drops below the maximum value.</li> <li>• Port Security Restrict—Drops packets with unknown source addresses until you remove a sufficient number of secure MAC addresses and the count drops below the maximum value. In addition, it causes the SecurityViolation counter to increment.</li> <li>• Port Security Shutdown—Immediately puts the interface into the error-disabled state and sends an SNMP trap notification.</li> </ul> <p>A security violation occurs if a workstation whose MAC address is not in the address table attempts to access the interface after the maximum number of secure MAC addresses is configured.</p> |
| Enable VACL Capture              | <p>When selected, enables VACL capture. If the capture bit is set, ports with the capture function enabled can receive forwarded packets.</p> <p>When deselected, disables VACL capture.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Capture VLANs (Select button)    | <p>Enables you to identify the VLANs where VACLs should receive forwarded VLAN packets. This option is available if you selected the Enable VACL Capture check box.</p> <p>Enter a comma-separated list of VLAN IDs or click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>.</p> <p>VACLs can capture VLAN packets only when they are initially routed or bridged into the VLAN. Only forwarded packets can be captured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Common interface settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Speed                            | <p>The speed of the physical interface:</p> <ul style="list-style-type: none"> <li>• 10—Transmits at 10 Mbps.</li> <li>• 100—Transmits at 100 Mbps.</li> <li>• 1000—Transmits at 1,000 Mbps.</li> <li>• 10000—Transmits at 10,000 Mbps.</li> <li>• Auto—If Speed is set to Auto, both Speed and Duplex are autonegotiated.</li> <li>• Non-Negotiate—Disables link negotiation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Duplex                           | <p>The duplex setting of the interface:</p> <ul style="list-style-type: none"> <li>• Auto—Autonegotiates the duplex.</li> <li>• Half—Sends and receives data, but not at the same time</li> <li>• Full—Sends and receives data at the same time.</li> </ul> <p>If the speed is set to Auto, the duplex setting must also be set to Auto.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MTU                              | <p>The maximum transmission unit, which refers to the largest packet size (in bytes) that can be handled by the interface. The range of valid values depends on the interface type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description          | <p>A text description of the interface. Enter up to 240 characters on a single line, without using carriage returns.</p> <p><b>Note</b> For multiple context mode, the system description is independent of the context description.</p>                                                                                                                                                                                                                                                                                                       |
| Flow Control Receive | <p>The flow control setting for incoming frames:</p> <ul style="list-style-type: none"> <li>Off—The port does not use flow control, regardless of whether the neighboring port requests flow control.</li> <li>On—The port uses flow control, as dictated by the neighboring port.</li> <li>Desired—The port allows, but does not require, flow control frames.</li> </ul> <p>Flow control frames (also called pause frames) are special packets that signal a source to stop sending frames for a defined interval when buffers are full.</p> |
| Flow Control Send    | <p>The flow control setting for outgoing frames:</p> <ul style="list-style-type: none"> <li>Off—The port does not send flow control frames to the neighboring port.</li> <li>On—The port sends flow control frames to the neighboring port.</li> <li>Desired—The port allows, but does not require, flow control frames.</li> </ul>                                                                                                                                                                                                            |
| Roles                | <p>Lists the interface roles associated with the interface. Interface roles are objects that are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. See <a href="#">Understanding Interface Role Objects, page 6-73</a>.</p>                                                                                                                                                                              |

## Create and Edit Interface Dialog Boxes—Routed Port Mode

Use the Create Interface dialog box (or the Edit Interface dialog box) to configure the attributes of physical interfaces that run in routed port mode on Layer 3.

### Navigation Path

Go to the [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#), click **Add** or **Edit** to open the Create/Edit Interface dialog box, then select **Routed Port** from the Mode list.

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface                    | When selected, enables the interface.<br>When deselected, disables the interface using the shutdown command.                                                                                                                                                                                                                                                                                                                                                |
| Type                                | Specifies whether the definitions apply to an interface or a subinterface.<br>For details about defining a subinterface, see <a href="#">Create and Edit Interface Dialog Boxes—Subinterfaces, page 68-22</a> .                                                                                                                                                                                                                                             |
| Name (Select button)                | Displays the generated interface name, if the name has been set.<br>Click <b>Select</b> to open the <a href="#">Interface Auto Name Generator Dialog Box, page 62-12</a> . From here, you can enter or edit the details that Security Manager uses to generate an interface name.                                                                                                                                                                           |
| Mode                                | The port configuration type for this interface.<br>Select <b>Routed Port</b> to display the configuration options that are relevant for routed ports.                                                                                                                                                                                                                                                                                                       |
| <b>Routed Port settings</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IP Type                             | The type of IP address used by the port: <ul style="list-style-type: none"> <li>Static IP—Specifies that the interface uses a permanent IP address and activates related GUI elements.</li> </ul>                                                                                                                                                                                                                                                           |
| IP Address (Select button)          | Enables you to enter an IP address, or you can click <b>Select</b> to open the Networks/Hosts Selector, where you can select an IP address.                                                                                                                                                                                                                                                                                                                 |
| Helper IP Addresses (Select button) | Enables you to assign a helper IP address to the interface. A helper IP address converts broadcast DHCP requests to unicast requests that are directed exclusively to the DHCP server.                                                                                                                                                                                                                                                                      |
| Mask                                | Enables you to specify the subnet mask. You can enter a netmask value or you can select a netmask from the list. If you enter a netmask, you can express its value in dotted decimal format (for example, 255.255.255.0) or you can enter the number of bits (for example, 24).<br><b>Note</b> Do not use 255.255.255.254 or 255.255.255.255 for any interface that is connected to your network; these netmasks cause all traffic on an interface to stop. |
| <b>Common interface settings</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Speed                               | The speed of the physical interface: <ul style="list-style-type: none"> <li>10—Transmits at 10 Mbps.</li> <li>100—Transmits at 100 Mbps.</li> <li>1000—Transmits at 1,000 Mbps.</li> <li>10000—Transmits at 10,000 Mbps.</li> <li>Auto—If Speed is set to Auto, both Speed and Duplex are autonegotiated.</li> <li>Non-Negotiate—Disables link negotiation.</li> </ul>                                                                                      |

**Table 68-5 Create and Edit Interface Dialog Boxes—Routed Port Mode (continued)**

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Duplex               | <p>The duplex setting of the interface:</p> <ul style="list-style-type: none"> <li>• Auto—Autonegotiates the duplex.</li> <li>• Half—Sends and receives data, but not at the same time</li> <li>• Full—Sends and receives data at the same time.</li> </ul> <p>If the speed is set to Auto, the duplex setting must also be set to Auto.</p>                                                                                                                                                                                                         |
| MTU                  | The maximum transmission unit, which refers to the largest packet size (in bytes) that can be handled by the interface. The range of valid values depends on the interface type.                                                                                                                                                                                                                                                                                                                                                                     |
| Description          | <p>A text description of the interface. Enter up to 240 characters on a single line, without using carriage returns.</p> <p><b>Note</b> For multiple context mode, the system description is independent of the context description.</p>                                                                                                                                                                                                                                                                                                             |
| Flow Control Receive | <p>The flow control setting for incoming frames:</p> <ul style="list-style-type: none"> <li>• Off—The port does not use flow control, regardless of whether the neighboring port requests flow control.</li> <li>• On—The port uses flow control, as dictated by the neighboring port.</li> <li>• Desired—The port allows, but does not require, flow control frames.</li> </ul> <p>Flow control frames (also called pause frames) are special packets that signal a source to stop sending frames for a defined interval when buffers are full.</p> |
| Flow Control Send    | <p>The flow control setting for outgoing frames:</p> <ul style="list-style-type: none"> <li>• Off—The port does not send flow control frames to the neighboring port.</li> <li>• On—The port sends flow control frames to the neighboring port.</li> <li>• Desired—The port allows, but does not require, flow control frames.</li> </ul>                                                                                                                                                                                                            |
| Roles                | Lists the interface roles associated with the interface. Interface roles are objects that are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. See <a href="#">Understanding Interface Role Objects, page 6-73</a> .                                                                                                                                                                                          |

## Create and Edit Interface Dialog Boxes—Trunk Port Mode

Use the Create Interface dialog box (or the Edit Interface dialog box) to configure the attributes of physical and virtual interfaces that run in trunk port mode.

### Navigation Path

Go to the [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#), click **Add** or **Edit** to open the Create/Edit Interface dialog box, then select **Trunk Port** from the Mode list.

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface           | When selected, enables the interface.<br>When deselected, disables the interface using the shutdown command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Type                       | Specifies whether the definitions apply to an interface or a subinterface.<br>For details about defining a subinterface, see <a href="#">Create and Edit Interface Dialog Boxes—Subinterfaces, page 68-22</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Name (Select button)       | Displays the generated interface name, if the name has been set.<br>Click <b>Select</b> to open the <a href="#">Interface Auto Name Generator Dialog Box, page 62-12</a> . From here, you can enter or edit the details that Security Manager uses to generate an interface name.                                                                                                                                                                                                                                                                                                                                                                                    |
| Mode                       | The port configuration type for this interface.<br>Select <b>Trunk Port</b> to display the configuration options that are relevant for trunk ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Trunk Port settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Encapsulation              | Select one of the following: <ul style="list-style-type: none"> <li>• DOT1Q—Specifies VLAN encapsulation on the trunk link, as defined by the IEEE 802.1Q standard. Applies only to Ethernet subinterfaces.</li> <li>• ISL—Specifies ISL encapsulation on the trunk link. 10-Gigabit Ethernet ports do not support ISL encapsulation.</li> </ul> <p><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.</p> |

**Table 68-6 Create and Edit Interface Dialog Boxes—Trunk Port Mode (continued)**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Native VLAN (Select button)   | <p>Enables you to select the Native VLAN to associate with this interface, using the ID specified in the VLAN ID field. (If no VLAN ID is specified for the Native VLAN, the default is 1.) This option applies to you only if you are configuring a physical interface that is meant to serve as an 802.1Q trunk interface.</p> <p>You must first specify DOT1Q as the encapsulation type.</p> <p>The Native VLAN of a trunk interface is the VLAN to which all untagged VLAN packets are logically assigned. This includes the management traffic associated with the VLAN.</p> <p>When deselected, the Native VLAN is not associated with this interface.</p> <p><b>Note</b> The Native VLAN cannot be configured on a subinterface of the trunk interface. Be sure to configure the same Native VLAN value at both ends of the link; otherwise, traffic may be lost or sent to the wrong VLAN.</p> <p>Click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>. From here, you can associate a native VLAN with the described interface.</p> |
| Enable DTP negotiation        | <p>When selected, enables Dynamic Trunking Protocol (DTP) negotiation. DTP manages trunk auto-negotiation (ISL and 802.1Q) between devices.</p> <p>When deselected, disables DTP negotiation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Allowed VLANs (Select button) | <p>Enables you to specify which VLANs are allowed on the trunk. Enter the VLAN IDs. Use commas to separate multiple VLANs or use a hyphen to indicate a range of VLANs (for example, 12,17,22 or 2-200). Valid IDs range from 1 to 4094.</p> <p>Or, click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>. From here, you can select the VLANs to include on the trunk.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Prune VLANs (Select button)   | <p>Enables you to specify which VLANs are eligible for pruning. Enter the VLAN IDs. Use commas to separate multiple VLANs or use a hyphen to indicate a range of VLANs (for example, 12,17,22 or 2-200.)</p> <p>Or, click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>. From here, you can select the VLANs that are eligible for pruning.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable VACL Capture           | <p>When selected, enables VACL capture. If the capture bit is set, ports with the capture function enabled can receive forwarded packets.</p> <p>When deselected, disables VACL capture.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Capture VLANs (Select button) | <p>Enables you to identify the VLANs where VACLs should receive forwarded VLAN packets. This option is available if you selected the Enable VACL Capture check box.</p> <p>Enter a comma-separated list of VLAN IDs, or click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>.</p> <p>VACLs can capture VLAN packets only when they are initially routed or bridged into the VLAN. Only forwarded packets can be captured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Port Security             | <p>Applies only to devices running IOS Software Version 12.2(18)SXE2 or later.</p> <p>When selected, enables you to restrict input to an interface by limiting the MAC addresses that are allowed to access the port.</p> <p>When deselected, disables port security.</p> <p><b>Note</b> If you select this option, the Enable DTP Negotiation option is automatically deselected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Max. MAC Addresses               | <p>Applies only when Enable Port Security is selected.</p> <p>The maximum number of secure MAC addresses for the interface. Valid values range from 1 to 4097.</p> <p><b>Note</b> Secure MAC addresses are configured dynamically using the MAC addresses of connected devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Violation Policy                 | <p>The action to take if a security violation occurs:</p> <ul style="list-style-type: none"> <li>• Port Security Protect—Drops packets with unknown source addresses until you remove a sufficient number of secure MAC addresses and the count drops below the maximum value.</li> <li>• Port Security Restrict—Drops packets with unknown source addresses until you remove a sufficient number of secure MAC addresses and the count drops below the maximum value. In addition, it causes the SecurityViolation counter to increment.</li> <li>• Port Security Shutdown—Immediately puts the interface into the error-disabled state and sends an SNMP trap notification.</li> </ul> <p>A security violation occurs if a workstation whose MAC address is not in the address table attempts to access the interface after the maximum number of secure MAC addresses is configured.</p> |
| <b>Common interface settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Speed                            | <p>The speed of the physical interface:</p> <ul style="list-style-type: none"> <li>• 10—Transmits at 10 Mbps.</li> <li>• 100—Transmits at 100 Mbps.</li> <li>• 1000—Transmits at 1,000 Mbps.</li> <li>• 10000—Transmits at 10,000 Mbps.</li> <li>• Auto—If Speed is set to Auto, both Speed and Duplex are autonegotiated.</li> <li>• Non-Negotiate—Disables link negotiation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Duplex                           | <p>The duplex setting of the interface:</p> <ul style="list-style-type: none"> <li>• Auto—Autonegotiates the duplex.</li> <li>• Half—Sends and receives data, but not at the same time</li> <li>• Full—Sends and receives data at the same time.</li> </ul> <p>If the speed is set to Auto, the duplex setting must also be set to Auto.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 68-6 Create and Edit Interface Dialog Boxes—Trunk Port Mode (continued)**

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTU                  | The maximum transmission unit, which refers to the largest packet size (in bytes) that can be handled by the interface. The range of valid values depends on the interface type.                                                                                                                                                                                                                                                                                                                                                 |
| Description          | A text description of the interface. Enter up to 240 characters on a single line, without using carriage returns.<br><b>Note</b> For multiple context mode, the system description is independent of the context description.                                                                                                                                                                                                                                                                                                    |
| Flow Control Receive | The flow control setting for incoming frames: <ul style="list-style-type: none"> <li>Off—The port does not use flow control, regardless of whether the neighboring port requests flow control.</li> <li>On—The port uses flow control, as dictated by the neighboring port.</li> <li>Desired—The port allows, but does not require, flow control frames.</li> </ul> Flow control frames (also called pause frames) are special packets that signal a source to stop sending frames for a defined interval when buffers are full. |
| Flow Control Send    | The flow control setting for outgoing frames: <ul style="list-style-type: none"> <li>Off—The port does not send flow control frames to the neighboring port.</li> <li>On—The port sends flow control frames to the neighboring port.</li> <li>Desired—The port allows, but does not require, flow control frames.</li> </ul>                                                                                                                                                                                                     |
| Roles                | Lists the interface roles associated with the interface. Interface roles are objects that are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. See <a href="#">Understanding Interface Role Objects, page 6-73</a> .                                                                                                                                                                      |

## Create and Edit Interface Dialog Boxes—Dynamic Mode

Use the Create Interface dialog box (or the Edit Interface dialog box) to configure the attributes of physical and virtual interfaces that run in dynamic mode. Dynamic ports can convert the link into a trunk link based on the settings of the neighboring port.

### Navigation Path

Go to the [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#), click **Add** or **Edit** to open the Create/Edit Interface dialog box, then select **Dynamic** from the Mode list.

| Element                      | Description                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface             | When selected, enables the interface.<br>When deselected, disables the interface using the shutdown command.                                                                                                                                                                                                             |
| Type                         | Specifies whether the definitions apply to an interface or a subinterface.<br>For details about defining a subinterface, see <a href="#">Create and Edit Interface Dialog Boxes—Subinterfaces</a> , page 68-22.                                                                                                          |
| Name (Select button)         | Displays the generated interface name, if the name has been set.<br>Click <b>Select</b> to open the <a href="#">Interface Auto Name Generator Dialog Box</a> , page 62-12. From here, you can enter or edit the details that Security Manager uses to generate an interface name.                                        |
| Mode                         | The port configuration type for this interface.<br>Select <b>Dynamic</b> to display the configuration options that are relevant for dynamic ports.                                                                                                                                                                       |
| <b>Dynamic Port settings</b> |                                                                                                                                                                                                                                                                                                                          |
| Dynamic Mode                 | The dynamic trunk mode: <ul style="list-style-type: none"> <li>• Auto—Allows the port to convert the link to a trunk link. The port becomes a trunk port if the neighboring port is set to Trunk or Desirable mode.</li> <li>• Desirable—Makes the port actively attempt to convert the link to a trunk link.</li> </ul> |
| Access VLAN ID               | The access VLAN ID to use when the port does <i>not</i> function as a trunking link. This can occur when the neighboring interface is not set to trunk, auto, or desirable mode.<br>Valid values range from 1 to 4094.                                                                                                   |

**Table 68-7 Create and Edit Interface Dialog Boxes—Dynamic Mode (continued)**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encapsulation                 | <p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• DOT1Q—Specifies VLAN encapsulation on the trunk link, as defined by the IEEE 802.1Q standard. Applies only to Ethernet subinterfaces.</li> <li>• ISL—Specifies ISL encapsulation on the trunk link. 10-Gigabit Ethernet ports do not support ISL encapsulation.</li> <li>• Negotiate—Specifies that the interface negotiates with the neighboring interface to become either an ISL or 802.1Q trunk, based on the configuration and capabilities of the neighboring interface.</li> </ul> <p><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.</p>                                                                                                                                                                                   |
| Native VLAN (Select button)   | <p>Enables you to select the Native VLAN to associate with this interface, using the ID specified in the VLAN ID field. (If no VLAN ID is specified for the Native VLAN, the default is 1.) This option applies to you only if you are configuring a physical interface that is meant to serve as an 802.1Q trunk interface.</p> <p>You must first specify DOT1Q as the encapsulation type.</p> <p>The Native VLAN of a trunk interface is the VLAN to which all untagged VLAN packets are logically assigned. This includes the management traffic associated with the VLAN.</p> <p>When deselected, the Native VLAN is not associated with this interface.</p> <p><b>Note</b> The Native VLAN cannot be configured on a subinterface of the trunk interface. Be sure to configure the same Native VLAN value at both ends of the link; otherwise, traffic may be lost or sent to the wrong VLAN.</p> <p>Click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>. From here, you can associate a native VLAN with the described interface.</p> |
| Allowed VLANs (Select button) | <p>Enables you to specify which VLANs are allowed on the trunk. Enter the VLAN IDs. Use commas to separate multiple VLANs or use a hyphen to indicate a range of VLANs (for example, 12,17,22 or 2-200). Valid IDs range from 1 to 4094.</p> <p>Alternatively, click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>. From here, you can select the VLANs to include on the trunk.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 68-7 Create and Edit Interface Dialog Boxes—Dynamic Mode (continued)**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prune VLANs (Select button)      | <p>Enables you to specify which VLANs are eligible for pruning. Enter the VLAN IDs. Use commas to separate multiple VLANs or use a hyphen to indicate a range of VLANs (for example, 12,17,22 or 2-200.)</p> <p>Alternatively, click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>. From here, you can select the VLANs that are eligible for pruning.</p>                                                                  |
| Enable VACL Capture              | <p>When selected, enables VACL capture. If the capture bit is set, ports with the capture function enabled can receive forwarded packets.</p> <p>When deselected, disables VACL capture.</p>                                                                                                                                                                                                                                                                 |
| Capture VLANs (Select button)    | <p>Enables you to identify the VLANs where VACLs should receive forwarded VLAN packets. This option is available if you selected the Enable VACL Capture check box.</p> <p>Enter a comma-separated list of VLAN IDs or click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box, page 68-35</a>.</p> <p>VACLs can capture VLAN packets only when they are initially routed or bridged into the VLAN. Only forwarded packets can be captured.</p> |
| <b>Common interface settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Speed                            | <p>The speed of the physical interface:</p> <ul style="list-style-type: none"> <li>• 10—Transmits at 10 Mbps.</li> <li>• 100—Transmits at 100 Mbps.</li> <li>• 1000—Transmits at 1,000 Mbps.</li> <li>• 10000—Transmits at 10,000 Mbps.</li> <li>• Auto—If Speed is set to Auto, both Speed and Duplex are autonegotiated.</li> <li>• Non-Negotiate—Disables link negotiation.</li> </ul>                                                                    |
| Duplex                           | <p>The duplex setting of the interface:</p> <ul style="list-style-type: none"> <li>• Auto—Autonegotiates the duplex.</li> <li>• Half—Sends and receives data, but not at the same time</li> <li>• Full—Sends and receives data at the same time.</li> </ul> <p>If the speed is set to Auto, the duplex setting must also be set to Auto.</p>                                                                                                                 |
| MTU                              | <p>The maximum transmission unit, which refers to the largest packet size (in bytes) that can be handled by the interface. The range of valid values depends on the interface type.</p>                                                                                                                                                                                                                                                                      |
| Description                      | <p>A text description of the interface. Enter up to 240 characters on a single line, without using carriage returns.</p> <p><b>Note</b> For multiple context mode, the system description is independent of the context description.</p>                                                                                                                                                                                                                     |

**Table 68-7 Create and Edit Interface Dialog Boxes—Dynamic Mode (continued)**

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow Control Receive | <p>The flow control setting for incoming frames:</p> <ul style="list-style-type: none"> <li>• Off—The port does not use flow control, regardless of whether the neighboring port requests flow control.</li> <li>• On—The port uses flow control, as dictated by the neighboring port.</li> <li>• Desired—The port allows, but does not require, flow control frames.</li> </ul> <p>Flow control frames (also called pause frames) are special packets that signal a source to stop sending frames for a defined interval when buffers are full.</p> |
| Flow Control Send    | <p>The flow control setting for outgoing frames:</p> <ul style="list-style-type: none"> <li>• Off—The port does not send flow control frames to the neighboring port.</li> <li>• On—The port sends flow control frames to the neighboring port.</li> <li>• Desired—The port allows, but does not require, flow control frames.</li> </ul>                                                                                                                                                                                                            |
| Roles                | <p>Lists the interface roles associated with the interface. Interface roles are objects that are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. See <a href="#">Understanding Interface Role Objects, page 6-73</a>.</p>                                                                                                                                                                                    |

## Create and Edit Interface Dialog Boxes—Subinterfaces

Use the Create Interface dialog box (or the Edit Interface dialog box) to configure the attributes of subinterfaces defined on Catalyst 6500/7600 devices.

### Navigation Path

Go to the [Interfaces/VLANs Page—Interfaces Tab, page 68-8](#), click **Add** or **Edit** to open the Create/Edit Interface dialog box, then select **Subinterface** from the Type list.

## Field Reference

Table 68-8 Create and Edit Interface Dialog Boxes—Subinterfaces

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface    | When selected, enables the subinterface.<br>When deselected, disables the subinterface using the shutdown command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Type                | Specifies whether the definitions apply to an interface or a subinterface. Select <b>Subinterface</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Parent              | Identifies the parent interface of the subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Subint. ID          | Specifies the ID for the subinterface. The numeric ID string cannot exceed 10 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IP Type             | The type of IP address used by the subinterface: <ul style="list-style-type: none"> <li>• Static IP—Specifies that the subinterface uses a permanent IP address and activates related GUI elements.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IP Address          | Enables you to enter an IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Helper IP Addresses | Enables you to assign a helper IP address to the subinterface. A helper IP address converts broadcast DHCP requests to unicast requests that are directed exclusively to the DHCP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Mask                | Enables you to specify the subnet mask. You can enter a netmask value or you can select a netmask from the list. If you enter a netmask, you can express its value in dotted decimal format (for example, 255.255.255.0) or you can enter the number of bits (for example, 24).<br><br><b>Note</b> Do not use 255.255.255.254 or 255.255.255.255 for any interface that is connected to your network; these netmasks cause all traffic on an interface to stop.                                                                                                                                                                                                                                                                       |
| Encapsulation       | The encapsulation type defined for the subinterface: <ul style="list-style-type: none"> <li>• [blank]—No encapsulation is defined.</li> <li>• DOT1Q—Specifies VLAN encapsulation on the trunk link, as defined by the IEEE 802.1Q standard. Applies only to Ethernet subinterfaces.</li> <li>• ISL—Specifies ISL encapsulation on the trunk link. 10-Gigabit Ethernet ports do not support ISL encapsulation.</li> </ul> <b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router. |
| VLAN ID             | Applies only when encapsulation is defined for the subinterface.<br>The VLAN ID associated with the subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description         | A text description of the interface. Enter up to 240 characters on a single line, without using carriage returns.<br><br><b>Note</b> For multiple context mode, the system description is independent of the context description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Create and Edit Interface Dialog Boxes—Unsupported Mode

If you discover an interface configured with a mode that is not supported by Security Manager (such as dot1q-tunnel or private-vlan), the interface is displayed in Unsupported mode. You can view the attributes of this interface, but you cannot make any changes to the configuration unless you first change the mode. All definition fields, other than Mode, are read-only.

### Navigation Path

Go to the [Interfaces/VLANs Page—Interfaces Tab](#), page 68-8, select an interface whose mode is defined as Unsupported, then click **Add** or **Edit** to open the Create/Edit Interface dialog box.

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface     | When selected, indicates that the interface is enabled.<br>When deselected, indicates that the interface has been disabled using the shutdown command.                                                                                                                                                                                                                                      |
| Type                 | Specifies whether the definitions apply to an interface or a subinterface.                                                                                                                                                                                                                                                                                                                  |
| Name (Select button) | Displays the name of the interface.                                                                                                                                                                                                                                                                                                                                                         |
| Mode                 | Displays Unsupported, which designates an interface whose mode is not supported by Security Manager.<br>Select a different option to change the interface mode.<br><b>Note</b> If you change the interface mode, you can then modify the other settings in this dialog box.                                                                                                                 |
| Speed                | Displays the speed of the physical interface: <ul style="list-style-type: none"> <li>• 10—Transmits at 10 Mbps.</li> <li>• 100—Transmits at 100 Mbps.</li> <li>• 1000—Transmits at 1,000 Mbps.</li> <li>• 10000—Transmits at 10,000 Mbps.</li> <li>• Auto—If Speed is set to Auto, both Speed and Duplex are autonegotiated.</li> <li>• Non-Negotiate—Disables link negotiation.</li> </ul> |

**Table 68-9 Create and Edit Interface Dialog Boxes—Unsupported Mode (continued)**

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Duplex               | <p>Displays the duplex setting of the interface:</p> <ul style="list-style-type: none"> <li>• Auto—Autonegotiates the duplex.</li> <li>• Half—Sends and receives data, but not at the same time</li> <li>• Full—Sends and receives data at the same time.</li> </ul> <p>If the speed is set to Auto, the duplex setting must also be set to Auto.</p>                                                                                                                                                                                                         |
| MTU                  | <p>Displays the maximum transmission unit, which refers to the largest packet size (in bytes) that can be handled by the interface. The range of valid values depends on the interface type.</p>                                                                                                                                                                                                                                                                                                                                                              |
| Description          | <p>Displays a text description of the interface. For multiple context mode, the system description is independent of the context description.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flow Control Receive | <p>Displays the flow control setting for incoming frames:</p> <ul style="list-style-type: none"> <li>• Off—The port does not use flow control, regardless of whether the neighboring port requests flow control.</li> <li>• On—The port uses flow control, as dictated by the neighboring port.</li> <li>• Desired—The port allows, but does not require, flow control frames.</li> </ul> <p>Flow control frames (also called pause frames) are special packets that signal a source to stop sending frames for a defined interval when buffers are full.</p> |
| Flow Control Send    | <p>Displays the flow control setting for outgoing frames:</p> <ul style="list-style-type: none"> <li>• Off—The port does not send flow control frames to the neighboring port.</li> <li>• On—The port sends flow control frames to the neighboring port.</li> <li>• Desired—The port allows, but does not require, flow control frames.</li> </ul>                                                                                                                                                                                                            |
| Roles                | <p>Lists the interface roles associated with the interface. Interface roles are objects that are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. See <a href="#">Understanding Interface Role Objects, page 6-73</a>.</p>                                                                                                                                                                                             |

## VLANs

A VLAN is a switched network that is segmented logically instead of on the basis of geography. For example, a VLAN might interconnect members of a geographically dispersed workgroup. VLANs offer a practical convenience for many organizations because they reduce the need to rearrange the physical placement of personnel, equipment, and network infrastructure. Properly configured VLANs are scalable, secure, and can simplify the tasks of network management.

A VLAN consists of hosts and network devices (such as bridges and routers), connected by a single bridging domain. Traffic between VLANs must be routed.

Security Manager helps you to create VLANs and define VLAN settings for the defined interfaces on Cisco Catalyst switches and Cisco 7600 Series routers, their supported services modules, and their security contexts.

The following topics describe the actions you can perform when defining VLANs on Catalyst devices:

- [Creating or Editing VLANs, page 68-26](#)
- [Deleting VLANs, page 68-27](#)
- [Interfaces/VLANs Page—VLANs Tab, page 68-27](#)

#### Related Topics

- [VLAN Groups, page 68-31](#)
- [VLAN ACLs \(VACLs\), page 68-36](#)
- [Chapter 68, “Managing Cisco Catalyst Switches and Cisco 7600 Series Routers”](#)

## Creating or Editing VLANs

You can create a VLAN or reconfigure the attributes of a VLAN.

#### Related Topics

- [Deleting VLANs, page 68-27](#)
- [Creating or Editing VLAN Groups, page 68-32](#)
- [Creating or Editing VACLs, page 68-37](#)
- [Create and Edit VLAN Dialog Boxes, page 68-28](#)
- [VLANs, page 68-25](#)

- 
- Step 1** (Device view) Select a Catalyst device, select Interfaces/VLANs from the Policy selector, then click the VLANs tab in the work area.
- The VLANs tab is displayed. For a description of the fields on this tab, see [Interfaces/VLANs Page—VLANs Tab, page 68-27](#).
- Step 2** Do one of the following:
- To define the attributes of a new VLAN, click **Add Row**.
  - To edit the attributes of a VLAN, select it in the list, then click **Edit Row**.
- See [Create and Edit VLAN Dialog Boxes, page 68-28](#), for a description of the fields in the dialog box.
- Step 3** In the VLAN ID field, enter a unique ID number for the VLAN. The number that you enter must not be assigned to any other VLAN in the bridging group.
- Step 4** (Optional) Enter a name for the VLAN.
- Step 5** (Optional) If the VLAN is part of a VLAN group, select the group ID, or select **Add Group** to open the Create VLAN Group dialog box. For more information, see [Creating or Editing VLAN Groups, page 68-32](#).
- Step 6** From the Status list, specify the status of the VLAN (active or suspended).
- Step 7** From the Type list, select either **Layer 2** or **Layer 3**.

- Step 8** (Optional) For a Layer 3 VLAN, define a switched virtual interface (SVI):
- To make the SVI active, select the **Enable Interface** check box. An SVI enables routing between VLANs and provides IP host connectivity to the switch. If you do not select this check box, the SVI is created in shutdown mode.
  - Enter the IP address for the SVI.
  - Enter the SVI subnet mask by typing it, or select a netmask value from the Subnet Mask list.
  - Enter an optional description, if required.
- Step 9** Do one or both of the following:
- To associate access ports with the VLAN, enter their names in the Access Ports text box or click **Select** to open an interface selector.
  - To associate trunk ports with the VLAN, enter their names in the Trunk Ports text box or click **Select** to open an interface selector.
- See [Interface Selector Dialog Box—VLAN ACL Content, page 68-42](#) for a description of the fields in the dialog box. For more information about defining ports, see [Creating or Editing Ports on Cisco Catalyst Switches and Cisco 7600 Series Routers, page 68-6](#).
- Step 10** Click **OK** to save your definitions locally on the client and close the dialog box.
- 

## Deleting VLANs

You can delete a VLAN. However, deleting a VLAN does not delete it from any policy that might reference it. Ensure that your other policies do not use the VLAN before you delete it. When you submit your changes to the database, Security Manager points out any undefined VLANs that are referenced by other policies.

  - [VLANs, page 68-25](#)
- 

- Step 1** (Device view) Select a Cisco Catalyst switch or Cisco 7600 Series router from the Device selector.
- Step 2** Select **Interfaces/VLANs** from the Policies selector.
- Step 3** Click the VLANs tab in the work area.
- The VLANs tab is displayed. For a description of the fields on this tab, see [Interfaces/VLANs Page—VLANs Tab, page 68-27](#).
- Step 4** Select a VLAN from the table, then click **Delete Row**.
- The VLAN is deleted.
- 

## Interfaces/VLANs Page—VLANs Tab

Use the VLANs tab to view and configure VLANs on supported Cisco Catalyst switches and Cisco 7600 Series routers.

**Navigation Path**

- (Device view) Select **Interfaces/VLANs** from the Device selector, then click the **VLANs** tab.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID           | Interface-specific identity of the VLAN that a table row describes. The VLAN ID specifies where 802.1Q tagged packets are sent and received on the subinterface; without a VLAN ID, the subinterface cannot send or receive traffic. Valid values range from 2 to 4094 (VLAN ID 1 is reserved).<br><br><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.<br><br><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the device. |
| Name              | Name of the corresponding VLAN for an interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interface         | Identifies the logical name of the interface (interface role) or physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Type              | Specifies whether a VLAN has access to Layer 2 or Layer 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Status            | Indicates whether a VLAN is active or suspended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Add Row button    | Opens the Create VLAN dialog box to define a new VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Edit Row button   | Opens the Edit VLAN dialog box to edit the selected VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Delete Row button | Deletes the selected VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Create and Edit VLAN Dialog Boxes**

Use the Create VLAN dialog box (or the Edit VLAN dialog box) to configure or reconfigure VLAN settings and attributes.

**Navigation Path**

Go to the [Interfaces/VLANs Page—VLANs Tab, page 68-27](#), then click the **Add** or **Edit** button beneath the table.

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID | <p>Displays the VLAN ID if one is configured. Otherwise, enter the ID manually. The VLAN ID specifies where 802.1Q tagged packets are sent and received on an interface or subinterface; without a VLAN ID, the interface or subinterface cannot send or receive traffic. Each VLAN must have an ID. Valid values range from 1 to 4094.</p> <p><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.</p> <p><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the device.</p> |
| Name    | Enter a name for the VLAN, or view the VLAN name if you entered one previously. Each VLAN must have an ID, and can optionally have a name. The maximum length is 32 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Group   | <p>The VLAN group to which the VLAN belongs. A VLAN can be associated with one group only.</p> <p>You can associate the VLAN with an existing group, or select <b>Add Group</b> to open the Create VLAN Group dialog box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Status  | <p>The current status of the VLAN:</p> <ul style="list-style-type: none"> <li>• Active—The VLAN carries traffic.</li> <li>• Suspended—The VLAN does not pass packets.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Type    | <p>Indicates whether the specified VLAN is configured for Layer 2 or Layer 3, and enables you to choose the kind of VLAN that you prefer.</p> <p>A Layer 3 VLAN requires an IP address and creates a VLAN interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|-----------------------|-------------------------------------------------------------------------------------------------------|
| Available Trunk Ports | Displays all available trunk ports.                                                                   |
| Add >> button         | Adds interfaces that are selected in the Available Trunk Ports list to the Selected Trunk Ports list. |
| Remove << button      | Removes selected interfaces from the Selected Trunk Ports list.                                       |
| Selected Trunk Ports  | Displays the interface objects that are selected.                                                     |
| Add Row button        | Opens the Create Interface dialog box to define a new interface.                                      |
| Edit Row button       | Opens the Edit Interface dialog box to edit the selected interface.                                   |

**VLAN Groups**

A VLAN group defines a logical collection of VLANs. The VLAN Groups tab on the Interfaces/VLANs page displays:

- All VLAN groups that are defined on the selected device.
- The service module slots to which a VLAN group is bound.

- Which VLANs belong to each VLAN group.

VLAN groups can be used when assigning VLANs to an FWSM security context. A VLAN group can be assigned to multiple FWSMs, and each FWSM can have multiple VLAN groups assigned to it. To perform this assignment, see [Add/Edit Security Context Dialog Box \(FWSM\)](#), page 59-8.

The following topics describe the actions you can perform when defining VLAN groups on Catalyst devices:

- [Creating or Editing VLAN Groups](#), page 68-32
- [Deleting VLAN Groups](#), page 68-33
- [Interfaces/VLANs Page—VLAN Groups Tab](#), page 68-33

#### Related Topics

- [Interfaces](#), page 68-5

- [VLAN ACLs \(VACLs\)](#), page 68-36
- [Chapter 68, “Managing Cisco Catalyst Switches and Cisco 7600 Series Routers”](#)

## Creating or Editing VLAN Groups

You can create VLAN groups. When you create a VLAN group, remember that:

- Each group must have an ID.
- You can associate a VLAN group with one or more FWSM modules.
- Each VLAN can be a member of only one VLAN group.

#### Related Topics

- [Deleting VLAN Groups](#), page 68-33
- [Creating or Editing VLANs](#), page 68-26
- [Creating or Editing VACLs](#), page 68-37
- [Interfaces/VLANs Page—VLAN Groups Tab](#), page 68-33
- [VLAN Groups](#), page 68-31

---

**Step 1** (Device view) Select a Catalyst device, select **Interfaces/VLANs** from the Policy selector, then click the VLAN Groups tab in the work area.

The VLAN Groups tab is displayed. For a description of the fields on this tab, see [Interfaces/VLANs Page—VLAN Groups Tab](#), page 68-33.

**Step 2** Do one of the following:

- To define the attributes of a new VLAN group, click **Add Row**.
- To edit the attributes of a VLAN group, select it in the list, then click **Edit Row**.

See [Create and Edit VLAN Group Dialog Boxes](#), page 68-34, for a description of the fields in this dialog box.

**Step 3** In the VLAN Group ID field, enter a unique ID number for the VLAN group. The number that you enter must not be assigned to any other VLAN group.

- Step 4** To associate the VLAN group with specific service module slots, enter their slot numbers in the Service Module Slots text box, or click **Select** to open a selector.

**Note** Defining this association makes it possible to later assign this VLAN group to a security context on the FWSM. See [Add/Edit Security Context Dialog Box \(FWSM\), page 59-8](#).

- Step 5** Enter the VLANs to add to the VLAN group, or click **Select** to open a selector.
- Step 6** Click **OK** to save your definitions locally on the client and close the dialog box.

## Deleting VLAN Groups

You can delete VLAN groups. Deleting a VLAN group has no effect on the VLANs in the group.

### Related Topics

- [Creating or Editing VLAN Groups, page 68-32](#)
- [VLAN Groups, page 68-31](#)

- Step 1** (Device view) Select a Catalyst 6500 Series switch or Cisco 7600 Series router from the Device selector.
- Step 2** Select **Interfaces/VLANs** from the Policy selector.
- Step 3** Click the VLAN Groups tab in the work area.
- The VLANs tab is displayed. For a description of the fields on this tab, see [Interfaces/VLANs Page—VLAN Groups Tab, page 68-33](#).
- Step 4** Select a VLAN group from the table, then click **Delete Row**. The VLAN group is deleted.

## Interfaces/VLANs Page—VLAN Groups Tab

Use the VLAN Groups tab to view and configure VLAN groups on supported 6500 Series switches and 7600 Series routers.

**Note** The VLAN Groups tab is available only for Cisco Catalyst 6500 Series switches and Cisco 7600 Series routers.

### Navigation Path

- (Device view) Select **Interfaces/VLANs** from the Device selector, then click the **VLAN Groups** tab.

**Table 68-14** *Interfaces/VLANs Page—VLAN Groups Tab*

| Element              | Description                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN Group           | Numeric ID of a VLAN group that is configured on the selected device.                                                                                                      |
| Service Module Slots | Associates the chassis slot number (in which the relevant services module is installed) with the interface through which a particular VLAN participates in the VLAN group. |
| VLAN IDs             | The VLAN IDs associated with this group. Valid values range from 1 to 65535.                                                                                               |
| Add Row button       | Opens the Create VLAN Group dialog box to define a new VLAN group.                                                                                                         |
| Edit Row button      | Opens the Edit VLAN Group dialog box to edit the selected VLAN group.                                                                                                      |
| Delete Row button    | Deletes the selected VLAN group.                                                                                                                                           |

## Create and Edit VLAN Group Dialog Boxes

Use the Create and Edit VLAN Group dialog box to configure or reconfigure the attributes of VLAN groups, which are logical groups of VLANs that you want to associate with one another when you define VLAN port policies.

### Navigation Path

Do one of the following:

- Go to the [Interfaces/VLANs Page—VLAN Groups Tab](#), page 68-33, then click the **Add** or **Edit** button beneath the table.
- Go to the [Interfaces/VLANs Page—VLANs Tab](#), page 68-27, click the **Add** or **Edit** button beneath the table, then select **Add Group** from the Group list.

### Related Topics

| Available VLANs  | Displays defined VLANs that are available to be associated with the object you are configuring.<br><br><b>Note</b> The VLANs that are available will depend on the type of object you are configuring and other settings defined on the device. For example, when selecting VLANs to assign to a VLAN group, the Available VLANs list will only contain VLANs that have not been assigned to another VLAN group. When selecting VLANs to assign to a security context, the Available VLANs list will only contain VLANs that are part of a VLAN group that has been assigned to the service module you are configuring. |
| Add >> button    | Moves selected VLANs from the Available VLANs list to the Selected VLANs list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Remove << button | Removes selected VLANs from the Selected VLANs list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Selected VLANs   | Displays the selected VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| VLAN Ranges      | The VLAN ranges entered manually before the selector was opened, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## VLAN ACLs (VACLs)

Cisco IOS standard or extended ACLs are configured on router interfaces only, and are applied on routed packets only. In contrast, Cisco Catalyst switches and Cisco 7600 Series routers can use VLAN ACLs (VACLs) to control the access of all packets that are bridged within a VLAN or that are routed to or from a VLAN for VACL capture through a WAN interface. VACLs:

- Are processed in hardware.
- Use Cisco IOS ACLs.
- Ignore any Cisco IOS ACL fields that are not supported in hardware.

**Note**

Security Manager does not support the creation or configuration of MAC ACLs (MACLs), which are named ACLs that are sometimes used with VACLs to filter IPX, DECnet, AppleTalk, VINES, or XNS traffic based on MAC addresses.

When you configure a VACL and apply it to a VLAN, all packets entering the VLAN are checked against the VACL.

If you apply a VACL to a VLAN and you apply an ACL to a routed interface in that same VLAN, any packet coming into the VLAN is first checked against the VACL. Then, if permitted, the packet is checked against the input ACL before it reaches the routed interface.

When a packet is routed from one VLAN to another, it is first checked against the output ACL that is applied to the routed interface. Then, if permitted, the packet is checked against any VACLs that are configured for the destination VLAN.

If a VACL is configured for a packet type, and a packet of that type does not match the VACL, the default action is deny.

### VLAN Access Maps

Security Manager uses *VLAN access maps* to configure VACLs. Conceptually similar to a route map, a VLAN access map is a container in which you place one or more *statements* (conditions that match an action) and number them by their order of importance. A VLAN access map must also identify the VLANs to which it is applied, contain the map name, and identify at least one VACL sequence.

A VACL sequence must have a sequence number and at least one action, and must match at least one ACL.

Devices evaluate map statements in sequence and you can associate more than one VLAN access map with any device chassis.

To manage a VACL, select a Catalyst device in Device View, then select **Platform > VLAN Access Lists**. You use VLAN access maps to configure VACLs for IP traffic.

The following topics describe the actions you can perform when defining VACLs on Catalyst devices:

- [Creating or Editing VACLs, page 68-37](#)
- [Deleting VACLs, page 68-38](#)
- [VLAN Access Lists Page, page 68-39](#)

### Related Topics

- [VLANs, page 68-25](#)
- [VLAN Groups, page 68-31](#)
- [Chapter 68, “Managing Cisco Catalyst Switches and Cisco 7600 Series Routers”](#)

## Creating or Editing VACLs

When you can create or edit a VACL, you must:

- Name the VACL.
- Define the VLANs to which the VACL applies.
- Define a sequence map containing at least one VACL sequence.

### Related Topics

- [Deleting VACLs, page 68-38](#)
- [Creating or Editing VLANs, page 68-26](#)
- [Creating or Editing VLAN Groups, page 68-32](#)
- [Create and Edit VLAN ACL Dialog Boxes, page 68-41](#)

- [VLAN Access Lists Page, page 68-39](#)

**Step 1** Do one of the following:

- (Device view) Select a Catalyst device, then select **Platform > VLAN Access Lists** from the Policy selector.
- (Policy view) Select **Catalyst Platform > VLAN Access Lists**.

The VLAN Access Lists page is displayed. For a description of the fields on this page, see [VLAN Access Lists Page, page 68-39](#).

**Step 2** Do one of the following:

- To define the attributes of a new VACL, click **Add Row**.
- To edit the attributes of a VACL, select it in the list, then click **Edit Row**.

A dialog box opens. See [Create and Edit VLAN ACL Dialog Boxes, page 68-41](#), for a description of the fields in the dialog box.

**Step 3** Enter a name for the VACL in the **VLAN ACL Name** field.

**Step 4** In the VLANs field, specify the VLANs to which the VACL should be applied, or click **Select** to open a VLAN selector.

**Step 5** Define the sequence map:

- Click **Add Row** or **Edit Row** beneath the Sequence Map table. A dialog box opens. See [Create and Edit VLAN ACL Content Dialog Boxes, page 68-41](#).
- Enter a number to identify the sequence.
- Specify the standard and extended ACLs to assign to the sequence, or click **Select** to select the ACL object from a list or to create a new ACL object. For more information about ACL objects, see [Creating Access Control List Objects, page 6-53](#).
- Specify the action to perform on traffic that matches the ACLs defined in this sequence. (When you select Redirect as the action, you must specify the physical destination interfaces, or click **Select** to display a selector. See [Specifying Interfaces During Policy Definition, page 6-76](#).)
- Click **OK** to save your definitions locally on the client and close the dialog box. The sequence is displayed in the Sequence Map table.
- Repeat the process to add sequences to the sequence map.
- Use the up and down arrows to reorder the sequences, if required.

**Note**

The order in which you place the sequences is significant. When a flow matches a permit ACL entry, the associated action is taken without checking the remaining sequences. When a flow matches a deny ACL entry, it is checked against the next ACL in the same sequence or the next sequence. If a flow does not match any ACL entry and at least one ACL is configured for that packet type, the packet is denied.

## Deleting VACLs

You can delete a VACL if it is not being used by any device, policy, or object.

**Before You Begin**

You must delete all references to the VACL before you can remove it from the database. To locate all references to the VACL, run an object usage report for it. See [Generating Object Usage Reports](#), page 6-15.

**Related Topics**

- [Creating or Editing VACLs](#), page 68-37
- [Interfaces/VLANs Page—VLANs Tab](#), page 68-27
- [VLAN ACLs \(VACLs\)](#), page 68-36

- 
- Step 1** Do one of the following:
- (Device view) Select a Catalyst device, then select **Platform > VLAN Access Lists** from the Policy selector.
  - (Policy view) Select **Catalyst Platform > VLAN Access Lists**.
- The VLAN Access Lists page is displayed. For a description of the fields on this page, see [VLAN Access Lists Page](#), page 68-39.
- Step 2** Click in a row to select a VACL, then click **Delete**.
- Step 3** Click **OK** to save your changes.
- 

## VLAN Access Lists Page

Use the VLAN Access Lists page to view and configure VLAN access lists for Cisco Catalyst switches and Cisco 7600 Series routers.

**Navigation Path**

You can access this page from:

- (Device view) Select **Platform > VLAN Access Lists** from the Device Policy selector.
- (Device view) Select **Catalyst Platform > VLAN Access Lists** from the Policy Types selector.

**Related Topics**

- [Creating Access Control List Objects](#), page 6-53

| Sequence                 | Specifies the map sequence number. VACL sequences are applied in order of sequence, from lowest number to highest.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Matching                 | Displays the Match ACLs, if any are defined. VACL matching occurs only when an ACL permit is encountered. ACL denies are ignored.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Action                   | Specify whether the action is to drop, drop and log, forward, forward and capture, or redirect packets.<br><br><b>Note</b> The redirect action helps you to specify as many as five interfaces, which can be physical interfaces or EtherChannels. You cannot redirect packets to an EtherChannel member or a VLAN interface.                                                                                                                                                                                                                           |
| VLAN IDs                 | Interface-specific identity of the VLAN that a table row describes. The VLAN ID specifies where 802.1Q tagged packets are sent and received on the subinterface; without a VLAN ID, the subinterface cannot send or receive traffic.                                                                                                                                                                                                                                                                                                                    |
| Add Row button           | Opens the Create VLAN ACL dialog box, where you can define a new VACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Edit Row button          | Opens the Edit VLAN ACL dialog box, where you can edit the selected VACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Delete Row button        | Deletes the selected access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Additional fields</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Log Table Size           | Displays the log table size.<br><br>Valid sizes range from 0 to 2048 and the default is 500. Logged packets from new flows are dropped when the table is full.                                                                                                                                                                                                                                                                                                                                                                                          |
| Max. Packet Rate         | Displays the maximum redirect VACL logging packet rate per second.<br><br>Valid rates range from 10 to 5000 packets per second and the default rate is 2000. Packets that exceed the limit are dropped.                                                                                                                                                                                                                                                                                                                                                 |
| Logging Threshold        | Displays the logging threshold if one is set. By default, no threshold is set.<br><br>When you configure VACL logging, IP packets that are denied generate log messages on a per-flow basis if the threshold for a flow is reached in any interval of less than 5 minutes. Only dropped IP packets can be logged.                                                                                                                                                                                                                                       |
| Capture Interfaces       | Identifies the interface that captures forwarded packets in which the capture bit is set. You can configure any interface as the capture interface.<br><br>The capture action sets the capture bit for the forwarded packets so that ports with the capture function enabled can receive the packets. Only forwarded packets can be captured.<br><br><b>Note</b> The information shown here is read-only. To define capture interfaces, use the Create/Edit Interface dialog box. See <a href="#">Interfaces/VLANs Page—Interfaces Tab, page 68-8</a> . |

## Create and Edit VLAN ACL Dialog Boxes

Use the Create VLAN ACL dialog box (or the Edit VLAN ACL dialog box) to configure or reconfigure VACL attributes.

### Navigation Path

Go to the [VLAN Access Lists Page](#), page 68-39, then click the **Add** or **Edit** button beneath the table.

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ACL Name         | The user-defined name for the VACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| VLANs (Select button) | Enables you to designate the VLANs to which the VACL should be applied. Do one of the following: <ul style="list-style-type: none"> <li>• Enter VLAN IDs. You can use commas to separate multiple VLANs or use a hyphen to indicate a range of VLANs. For example: 12,17,22 or 2-200. Valid IDs range from 1 to 4094.</li> <li>• Click <b>Select</b> to open the <a href="#">VLAN Selector Dialog Box</a>, page 68-35.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Sequence Map table    | The sequence maps included in the VLAN access map.<br>A VLAN access map can consist of one or more map sequences, where each sequence pairs a <i>match clause</i> , which specifies an ACL object for traffic filtering, to an <i>action clause</i> , which specifies the action to take on packets that meet the criteria defined in the match ACLs. <ul style="list-style-type: none"> <li>• To add a sequence map, click the Add Row (+) button and fill in the Create VLAN ACL Content dialog box (see <a href="#">Create and Edit VLAN ACL Content Dialog Boxes</a>, page 68-41).</li> <li>• To edit a sequence map, select it and click the Edit Row button.</li> <li>• To delete a sequence map, select it and click the Delete Row button.</li> <li>• To change the order of a map, select it and click the Up or Down arrow buttons until it is in the desired position. The sequence number changes as you move it.</li> </ul> |

## Create and Edit VLAN ACL Content Dialog Boxes

Use the Create VLAN ACL Content dialog box (or the Edit VLAN ACL Content dialog box) to configure or reconfigure VACL sequences.

### Navigation Path

Go to the [Create and Edit VLAN ACL Dialog Boxes](#), page 68-41, then click the **Add** or **Edit** button beneath the Sequence Map table.

## IDSMS Settings

When you select a Catalyst device in Device view, then select **Platform > IDSMS Settings** from the Policy selector, a list is displayed that:

- Displays the settings for data ports on Intrusion Detection System Service Modules (IDSMSs).
- Helps you to organize IDSMS data ports in channel groups.

The IDSMS card detects and stops security threats on network connections. The card inspects the traffic that enters its two data ports and drops packets if a security threat is detected. The data port settings define:

- Which traffic is received by the data ports, as defined by the VLAN IDs.
- The sensing mode used by the data ports:
  - Trunk (IPS)—The IDSMS performs VLAN bridging between pairs of VLANs within the same data port, operating as an 802.1q trunk. The IDSMS inspects the traffic it receives on each VLAN in a VLAN pair and can either forward the packets on the other VLAN in the pair or drop the packet if an intrusion attempt is detected.
  - Capture (IDS)—The IDSMS passively monitors network traffic that was copied to the data ports by the Catalyst switch using either VACL capture or SPAN. The data ports operate as 802.1q trunks that can be configured to trunk different VLANs. When operating in this passive mode, the IDSMS cannot drop packets in response to a network intrusion attempt, but it can send TCP resets over the data ports in an attempt to block the intrusion.

**Note**

Security Manager supports a subset of IDSMS settings on chassis running IOS 12.2(18)SXF4 or later. Trunk (IPS) and Capture (IDS) modes are supported; inline mode is not supported. Security Manager cannot manage IDSMS data ports that are part of a spanning tree or access VLAN.

For high-traffic networks, EtherChannel is used to perform load balancing among multiple data ports. These data ports might be located on different IDSMS cards within the same Catalyst device.

EtherChannel is also used to redirect traffic in the event of port failure to the remaining ports within the channel group. This resiliency help preserve intrusion detection and prevention without user intervention and with minimum packet loss.

The following topics describe the actions you can perform when defining IDSM settings:

- [Creating or Editing EtherChannel VLAN Definitions, page 68-44](#)
- [Deleting EtherChannel VLAN Definitions, page 68-45](#)
- [Creating or Editing Data Port VLAN Definitions, page 68-46](#)
- [Deleting Data Port VLAN Definitions, page 68-47](#)
- [IDSM Settings Page, page 68-47](#)

## Creating or Editing EtherChannel VLAN Definitions

When defining an EtherChannel VLAN definition, you must:

- Define the slot-port combination containing the data ports to include in the channel group.
- Select the sensing mode used by the data ports.
- Define which VLANs are forwarded to the data ports.

The following restrictions apply:

- You can have a single definition only for each channel group.
- You can have a single definition only for each slot-data port combination. This means that you cannot create an EtherChannel VLAN definition if a data port definition already exists for this slot-data port.

#### Related Topics

- [Creating or Editing Data Port VLAN Definitions, page 68-46](#)
- [IDSM Settings, page 68-43](#)

---

**Step 1** Do one of the following:

- (Device view) Select a Catalyst device, then select **Platform > IDSM Settings** from the Policy selector.
- (Policy view) Select **Catalyst Platform > IDSM Settings**.

The IDSM Settings page is displayed. For a description of the fields on this page, see [IDSM Settings Page, page 68-47](#).

**Step 2** Do one of the following:

- To create an IDSM EtherChannel VLAN definition, click **Add Row** beneath the EtherChannel VLANs table.
- To edit an IDSM EtherChannel VLAN definition, select it in the list, then click **Edit Row** beneath the table.

The IDSM EtherChannel VLAN dialog box is displayed. For a description of the fields in this dialog box, see [Create and Edit IDSM EtherChannel VLANs Dialog Boxes, page 68-49](#).

- Step 3** To assign a channel group number to the Ethernet interface for the VLAN, or to change the channel group number, enter a number in the **Channel Group** text box.
- Step 4** To associate the VLAN with the numbered chassis slot where you installed your IDSM services module and to associate one module data port with the VLAN, do one of the following:
- Enter the slot-port number in the **Slot-Ports** text box.
  - Click **Select** to open the IDSM Slot-Port Selector dialog box.

---

**Note** Associating one module data port with the VLAN enables you to configure the port at the group level instead of configuring it manually.

---

- Step 5** From the Mode list, select the running mode of the EtherChannel VLAN. If you select Capture, select the check box to configure the specified channel group as a capture destination.

---

**Note** If you do not select this check box, the capture port is created in shutdown mode.

---

- Step 6** To include a VLAN in the specified channel group, do one of the following:
- Enter its numeric ID in the VLAN IDs text box.
  - Click **Select** to open the VLAN Selector dialog box.

You can enter or select more than one VLAN ID.

- Step 7** Click **OK** to save your definitions locally on the client and close the dialog box.
- 

## Deleting EtherChannel VLAN Definitions

You can delete an EtherChannel VLAN definition on the IDSM.

| Edit Row button                 | Opens the Edit IDSM EtherChannel VLANs dialog box. From here you can modify the attributes of an EtherChannel VLAN definition.                                                                                                                                                                                                  |
| Delete Row button               | Deletes the selected VLAN from the IDSM.                                                                                                                                                                                                                                                                                        |
| <b>Data Port VLANs table</b>    |                                                                                                                                                                                                                                                                                                                                 |
| Module Slot-Data Port           | Identifies the IDSM service module data port by number (1 or 2), to distinguish between the two ports.                                                                                                                                                                                                                          |
| Mode                            | Indicates whether the running mode is trunk (IPS) or capture (IDS). To change the mode, select and edit the relevant table row.                                                                                                                                                                                                 |
| Capture Enabled                 | Indicates whether the specified data port is configured as a capture destination.                                                                                                                                                                                                                                               |
| Allowed VLANs                   | Lists which VLANs are allowed for the specified data port.                                                                                                                                                                                                                                                                      |
| Add Row button                  | Opens the Create IDSM Data Port VLANs dialog box. From here you can define which traffic is directed to a specific data port and which sensing mode is used.                                                                                                                                                                    |
| Edit Row button                 | Opens the Edit IDSM Data Port VLANs dialog box. From here you can modify the attributes of a data port VLAN definition.                                                                                                                                                                                                         |
| Delete Row button               | Deletes the selected VLAN from the IDSM.                                                                                                                                                                                                                                                                                        |

## Create and Edit IDSM EtherChannel VLANs Dialog Boxes

Use the Create IDSM EtherChannel VLANs dialog box (or the Edit IDSM EtherChannel VLANs dialog box) to configure or reconfigure the attributes of an IDSM EtherChannel VLAN.

### Navigation Path

Go to the [IDSMS Settings Page, page 68-47](#), then click the **Add** or **Edit** button beneath the EtherChannel VLANs table.

| Selected IDSMS Slot-Ports list  | Displays the IDSMS slot-port objects that are selected for an association with a data port or an EtherChannel group.                                                                           |

## **PART 7**

### **Monitoring, Reporting, and Diagnostics**

## Viewing Events

---

Event Viewer enables you to selectively monitor, view, and examine events from ASA (including ASA-SM), FWSM and IPS devices. Events are organized into views that you can filter or search to find events that interest you. You can create customized views and filters to fit your needs, or use the predefined views included in the application.

This chapter contains the following topics:

- [Introduction to Event Viewer Capabilities, page 69-1](#)
- [Overview of Event Viewer, page 69-7](#)
- [Preparing for Event Management, page 69-27](#)
- [Managing the Event Manager Service, page 69-30](#)
- [Using Event Viewer, page 69-37](#)
- [Examples of Event Analysis, page 69-58](#)

### Introduction to Event Viewer Capabilities

Event Viewer monitors your network for syslog (system log) events from ASA and FWSM devices and security contexts and SDEE (Secure Device Event Exchange) events from IPS devices and virtual sensors. Event Viewer collects these events and provides an interface by which you can view them, group them, and examine their details.

#### Note

---

Beginning with version 4.5, Security Manager enables you to forward syslogs to one local collector and two remote collectors. For more information, see [Event Management Page, page 11-27](#).

---

#### Tip

---

Event Viewer and its related applications, Report Manager and Health and Performance Monitor, are useful for operational monitoring and troubleshooting of certain types of Cisco devices in your network. These applications do not provide extensive event correlation, compliance reporting, long-term forensics, or the integrated monitoring of both Cisco and non-Cisco devices.

---

When working with IPS events, the Report Manager component of Cisco Security Manager reports events individually; the Event Viewer component of Cisco Security Manager displays alerts. In the Event Viewer component, the IPS Summarizer groups events into a single alert, thus decreasing the number of alerts that the IPS sensor sends out.

**Tip**

Cisco IPS Manager Express (IME) and Cisco Security Manager do not summarize events in precisely the same way.

This section briefly describes some key activities that Event Viewer facilitates:

- [Historical View, page 69-2](#)
- [Real-Time View, page 69-2](#)
- [Views and Filters, page 69-3](#)
- [Policy Navigation, page 69-3](#)
- [Understanding Event Viewer Access Control, page 69-4](#)
- [Scope and Limits of Event Viewer, page 69-4](#)
- [Deeply Parsed Syslogs, page 69-6](#)

## Historical View

An historical view is one that displays events from a selected period of time (for example, the last 10 minutes) and does not automatically update as new events are collected. You must refresh the view to see newer events.

Consider the following activities among the many possibilities for employing Event Viewer with an historical view:

- **Troubleshoot Connectivity**—When a report comes in that a user cannot reach a particular server, you can set an historical view (for example, the last 10 minutes) that displays all events that affect that user’s IP address as a source or destination. Then, you can go from a particular displayed event to the policy denying that user’s access to the resource.
- **Tune Signatures**—After setting a view of all IPS messages, or all IPS messages of a given category, you might decide that an event is actually a false positive. You can then cross launch into the associated policy and either tune the signature to exclude the host or lessen the reported severity of the particular event.

Also consider creating an event action filter to modify how the alert is handled. Frequently, event action filters are a better way of dealing with false positives than editing the actual signature. For more information, see [Configuring Event Action Filters, page 40-4](#).

- **Validate Policy Deployment**—After deploying a new or changed policy, you might want to confirm that it is operating effectively by selecting events corresponding to the given policy. For example, you could identify firewall-deny messages triggered by the new policy.

## Real-Time View

A real-time view displays events as they are received and automatically updates the Event Table in waterfall fashion. Keep in mind that the term “real-time” is not precise. System latency and other factors prevent true real-time system response.

Consider the following activities among the many possibilities for employing Event Viewer with a real-time view:

- **Investigate Attacks in Near Real-time**—By isolating details of a particular source IP address, or a source/destination pair, Event Viewer can provide details about attacks on your monitored devices, or attacks that are going through those devices.
- **Validate Device Activity**—You can examine a device in your network and determine whether it is present and whether it is sending events.
- **View High Threat IPS Events**—You can filter a view to display all events that exceed a certain threat level. On a properly tuned IPS sensor, this should be a manageable flow of events to watch in a real-time view.

## Views and Filters

When you view events in Event Viewer, you open a view. A *view* is a set of filters and other properties, including color rules, selected columns and their positions and widths, and the default time window, that let you define a subset of events. Views help to limit the scope of the events list so that you can more easily find what you are looking for.

Event Viewer includes a number of predefined views. Although you cannot change the filter rules for these views, you can create copies of the views and change the filter rules in your copy. Views you create are called custom views. For more information, see [Creating Custom Views, page 69-41](#).

Using filters is key to getting the most from Event Viewer. You can distill from all the events being received a view of only the information that you need or want. You can use the various methods of filtering to reduce the events list, filtering lists that have already been filtered. The following list explains the general filtering features; for more information, see [Filtering and Querying Events, page 69-43](#).

- **Time filters**—You can use time filters to limit the events that are loaded into your client as well as to limit the events displayed in the Event Table. With time filtering you can select predefined values, such as **the last hour**, or specify a particular time range by dates and times. For more information, see [Selecting the Time Range for Events, page 69-43](#).
- **Column filters**—You can use column filters to filter events based on a particular value of an event. For example, you could filter on a particular source or destination, or both. For certain columns you can also filter on a range of values or on a policy object. Column filters are part of the view settings for a view. For more information, see [Creating Column-Based Filters, page 69-45](#).
- **Quick filters**—You can use quick filters to execute a text-based filter on events listed in the event table. The search is not column-sensitive, showing all events in which the string appears in any column. You can use the Quick Filter drop-down list (shown as a magnifier) to modify the scope of the filter. For more information, see [Filtering on a Text String, page 69-47](#).
- **Drilling down with filters**—Aggregating additional filters allows you to become more and more selective, to “drill down” until you can view a particular event or set of events that meet your requirements. The View Settings pane at the top of the Event Monitoring window updates with each additional filter choice you make to show the current aggregate filter definition of the view selected.

## Policy Navigation

You can navigate from a particular event to the policy within Security Manager that governs that event. You can also navigate from certain policies to events associated with those policies. For more information, see [Looking Up a Security Manager Policy from Event Viewer, page 69-54](#) and [Looking Up Events for a Security Manager Policy, page 69-55](#).

## Understanding Event Viewer Access Control

The user privileges assigned to your username control what you can do in Event Viewer. If you use local users, or other types of non-ACS access control, then all users have access to Event Viewer. However, the following access limits are imposed:

- You must have system administrator, network administrator, or approver privileges to select or deselect devices for monitoring. See [Selecting Devices to Monitor, page 69-34](#).
- You must have system administrator privileges to change the Event Management administrative settings page, where you enable or disable the service and configure storage location and other settings, as described in [Starting, Stopping, and Configuring the Event Manager Service, page 69-30](#) and [Event Management Page, page 11-27](#)

If you use ACS to control access to Security Manager, you can also control the following:

- You can control access to the Event Viewer application using the View Event Viewer privilege. Using this privilege, you could prevent certain users from accessing Event Viewer, or create roles that allow access to Event Viewer without allowing access to Report Manager. All default ACS roles are permitted to use Event Viewer.
- You can control which users can enable or disable monitoring for devices using the Modify > Manage Event Monitoring privilege. A user must have this privilege to select devices for monitoring as described in [Selecting Devices to Monitor, page 69-34](#). The default ACS roles that have this permission are system administrator, network administrator, approver, security administrator, and security approver.
- You can control the use of the policy lookup feature. Users must have View Device privileges to the device, and also View privileges to the firewall or IPS policy, to perform policy lookup. If users do not have all permissions, they will get an “Unable to Find Matching Rule” error if they try to look up a matching rule. For more information about policy lookup, see [Looking Up a Security Manager Policy from Event Viewer, page 69-54](#).
- Users can view events on devices only if they have at least View privileges to the device.
- You can control access to the Event Management administrative settings page, where you enable or disable the service and configure storage location and other settings, as described in [Starting, Stopping, and Configuring the Event Manager Service, page 69-30](#) and [Event Management Page, page 11-27](#). The user must have Admin privileges to access this page (or any other administrative settings page). All default ACS roles except help desk can view the page, but only system administrators can change settings.
- You can control the use of network/host and service policy objects for column filters (such as the Device, Source, Destination, Source Service, and Destination Service columns). Users must have the appropriate View Object permissions for network/host, network/host-IPv6, and service objects to use them in filters. For more information on creating column filters, see [Creating Column-Based Filters, page 69-45](#).

For information on integrating Security Manager with Cisco Secure ACS, see the [Installation Guide for Cisco Security Manager](#).

## Scope and Limits of Event Viewer

The following table provides details on the functional scope and limits of Event Viewer:

**Table 69-1 Event Viewer Scope and Limits**

| Item                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Support                     | <p>You can view events collected from the following types of devices. Although Event Viewer has been tested with the indicated software releases, you might be able to use it with older software releases.</p> <ul style="list-style-type: none"> <li>• <b>ASA devices (including ASA-SM) and security contexts</b>—All 8.x releases.</li> <li>• <b>FWSM devices and security contexts</b>—Releases 3.1.17, 3.2.17, 4.0.10, and 4.1.1 and later.</li> <li>• <b>IPS devices and virtual sensors</b>—Releases 6.1 and later.</li> </ul> <p>IPS support does not include IOS IPS.</p>                                                                                                                                                          |
| Event Data Store Size and Location | <p>You can control the location and disk space allocated to holding events collected from monitored devices. After the Event Data Store is 90 percent filled, newest events replace oldest events.</p> <p>You can also configure an extended storage, or archive, location on attached storage devices. Security Manager automatically copies events into the extended storage; when you view historical events, they are automatically retrieved from extended storage if they no longer reside on the local disk.</p> <p>For more information on configuring these settings, see the <a href="#">Event Management Page, page 11-27</a></p>                                                                                                 |
| Event Limit                        | <p>You can control the maximum number of events that can be viewed at one time in the events table using the Event Data Pagination Size option. For information on configuring the option, see <a href="#">Event Management Page, page 11-27</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Policy Objects                     | <p>You can use some types of policy objects, such as network/host and services objects, when creating column filters.</p> <p>You can also view host object names instead of IP addresses in the source and destination columns by selecting <b>View &gt; Show Network Host Objects</b>. This option is selected by default.</p> <p>IP address to host name mapping is supported only for the source and destination of events. Also, the mapping applies to Host objects only; Event Viewer will not show an object name when the source or destination of an event matches a Network object, Group object, or Address Range object.</p> <p><b>Tip</b> Hover over a host object name to view the IP address associated with that object.</p> |
| Views                              | <p>A single Event Viewer client can open at most four historical views and one real-time view at a time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Clients                            | <p>For a single Security Manager server, a maximum of 5 Security Manager clients can open Event Viewer at one time, and a Security Manager client can open one copy of Event Viewer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Deeply Parsed Syslogs

The structure and contents of standard syslogs and the elements comprised by each are detailed in the System Logs documentation for the device and software version you are using.

You can find the documentation on Cisco.com at these locations:

- ASA Devices:  
[http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html)
- FWSM Devices:  
[http://www.cisco.com/en/US/products/hw/modules/ps2706/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/modules/ps2706/products_system_message_guides_list.html)

Syslogs other than those listed here are presented as raw syslogs. Only deeply parsed syslogs present the full content carried by the syslog.

The deeply parsed syslogs in Security Manager are detailed in the following table.

**Table 69-2**      *Deeply Parsed Syslogs*

| Syslog Category       | Syslog ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Total Number of Syslogs |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Flow, Session Syslogs | 110002-110003, 209003-209005, 302003-302004, 302009-302010, 302012-302018, 302020-302021, 302035-302036, 302303-302306, 302033-302034, 303002-302005, 313001, 313004, 313005, 313008, 324000-324006, 337001-337009, 431001-431002, 407001-407002, 416001, 418001-418002, 419001-419003, 424001-424002, 450001, 448001, 609001-609002<br><br><b>Note</b> The 302303-302306 state-bypass syslog has been deep parsed only for event manager. However, the event description in the event manager for TCP, UDP, and SCTP state-bypass syslogs, does not display the "State-bypass" keyword.<br><br><b>Note</b> Reporting, Event to Policy, and Policy to Event are not supported for state-bypass syslog. | 66                      |
| Botnet                | 338001-338004, 338101-338104, 338201-338202, 338301                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 11                      |
| ACL                   | 106100, 106023, 106002, 106006, 106018                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 5                       |

## Overview of Event Viewer

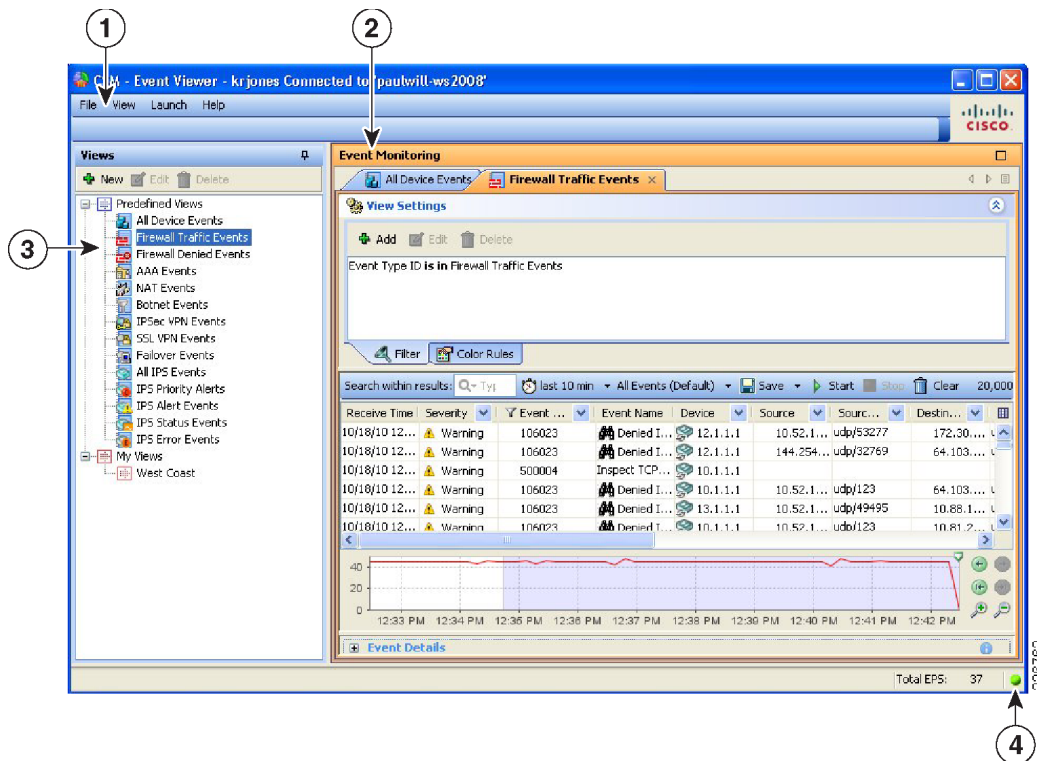

Use Event Viewer to view events and alerts collected from monitored firewall and IPS devices. For more information about selecting devices for monitoring, see [Selecting Devices to Monitor, page 69-34](#).

To open Event Viewer, do any of the following:

- Select **Start > All Programs > Cisco Security Manager Client > Event Viewer** from the Windows Start menu (your exact command path might differ), or double-click the Event Viewer icon on the desktop. You are prompted to log in. For more information about starting a Security Manager client application, see [Logging In to and Exiting the Security Manager Client, page 1-12](#).
- Select **Launch > Event Viewer** from the Configuration Manager or Report Manager applications, or click the Event Viewer button on the Configuration Manager toolbar. Event Viewer is opened using the same user account that you used to log into the other application.

The following illustration and subsequent list explain the basics of Event Viewer.

Figure 69-1 Event Viewer Main Window

The following list explains the main Event Viewer window in more detail.

- **(1) Menu Bar**—General commands for performing actions in Event Viewer, including the following menus:
  - File, for operations on views. For information on the commands, see [Event Viewer File Menu, page 69-9](#).
  - View, for operations within a view and general system management. For information on the commands, see [Event Viewer View Menu, page 69-10](#).
  - Launch, for opening the Configuration Manager or Report Manager applications.
  - Help, for opening the online help or for viewing copyright and licensing information.
- **(2) Event Monitoring Window**—The right pane shows the open views. Each open view is represented on separate tabs (you can have up to four open historical views and one real-time view). Note that you can arrange views horizontally or vertically in this space, or even make a view float to a separate window. For more information about how you can arrange or float views, see [Floating and Arranging Views, page 69-38](#).  
For detailed information about the many parts of the event monitoring window, see [Event Monitoring Window, page 69-14](#).
- **(3) View List**—The left pane is a list of views. The list is organized into folders that separate the predefined views from the custom views, which are listed in the My Views folder. The simplest way to open a view is to double-click it, which replaces the currently open view. To open a view without replacing the currently open view, right-click the view and select **Open in New Tab**. For more information on opening views, see [Opening Views, page 69-38](#).

For information about other things you can do with the view list pane, see [View List, page 69-12](#).

- **(4) Status Information**—The lower right portion of the status bar shows the current events per second (EPS) rate and an icon that indicates the current health of the monitoring system. Click the alert status icon to open a bubble that shows statistics for the past five minutes and any current system alerts. From this view, you can click the Details link to see more detailed information; click the alert status icon again to close the bubble. For more information, see [Monitoring the Event Manager Service, page 69-31](#).

**Note**

The Events per Second (EPS) information that is displayed on the Status Bar is calculated based on the number of events received every two seconds. Whereas, the EPS information that is displayed on the Time Slider graph is calculated by performing an aggregation of all the events that are available in a selected time range. Therefore, the numbers displayed on the Status Bar and the Time Slider graph might differ.

*See an example below:*

**Example of EPS information display on the Status Bar**

Assume at time T1, the Event Viewer application received 192 events. The Events per second (EPS) that will be displayed on the Status Bar is  $192 / 2 = 96$ . This is because Security Manager collects events every 2 seconds and displays the Events per Second on the Status Bar. Let us say at T1 + 2 seconds, the Event Viewer application received 384 events. The EPS that will be displayed on the Status Bar is equal to  $(384 - 192) / 2 = 96$ . This is the difference between current and previous value divided by 2.

**Example of EPS information display on the Time Slider graph**

Security Manager persists the events per second at an interval of 10 seconds. For example, if the Event Viewer application received 352 events in 10 seconds interval, the EPS is equal to  $352 / 10 = 35$ . This value is persisted by Security Manager. For the next 10 seconds interval, if the Event Viewer receives 1056 events, the EPS will be equal to  $(1056 - 352) / 10 = 70$ , which is persisted by Security Manager.

**Displaying values on the Time Slider graph**

The Time Slider graph displays the information for a period of time which has a Start Time and an End Time. All events per second that were collected in the given time interval are aggregated and plotted on the graph. In the given example, 35 and 70 are the values stored every 10 seconds. Therefore the Time Slider graph displays EPS as 35 and 70, which are different from the values displayed in the Status Bar.

## Event Viewer File Menu

The following table describes the commands on the File menu in Event Viewer.

**Table 69-3** File Menu in Event Viewer

| Command  | Description                                                                                                                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New View | Creates a new custom view. You are prompted for a name and description. See <a href="#">Creating Custom Views, page 69-41</a> .<br>Alternatively, click the <b>New (+)</b> button in the view list. |

**Table 69-3** File Menu in Event Viewer (continued)

| Command         | Description                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open View       | <p>Opens a view on a new tab. You are prompted to select the view to open. You can open at most four historical views and one real-time view. See <a href="#">Opening Views, page 69-38</a>.</p> <p><b>Tip</b> You can double-click in the view list to open the view and replace the view that is displayed.</p>                                                    |
| Save            | <p>Saves changes made to the active view, including filters (for custom views only), table preferences such as selected columns, column width, and sort order, the time range, and color rules. See <a href="#">Saving Views, page 69-42</a>.</p> <p>If you want to save filter changes for a predefined view, you must use Save As to create a new custom view.</p> |
| Save As         | Saves as a custom view the changes you have made to the displayed view. See <a href="#">Saving Views, page 69-42</a> .                                                                                                                                                                                                                                               |
| Close View      | Closes the displayed view.                                                                                                                                                                                                                                                                                                                                           |
| Close All Views | Closes all open views.                                                                                                                                                                                                                                                                                                                                               |
| Exit            | Closes Event Viewer. Exiting the application closes any floating Event Viewer window that is open.                                                                                                                                                                                                                                                                   |

## Event Viewer View Menu

The following table describes the commands on the View menu in Event Viewer.

**Table 69-4 View Menu in Event Viewer**

| Command            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode               | <p>Specifies the time interval for selecting the events to display in the event table. From the submenu, select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>last 10 minutes</b></li> <li>• <b>last 1 hour</b></li> <li>• <b>last 12 hours</b></li> <li>• <b>last 1 day</b></li> <li>• <b>last 1 week</b></li> <li>• <b>is today</b></li> <li>• <b>is yesterday</b></li> <li>• <b>is on . . .</b> (Opens a calendar on which you click to specify a single date.)</li> <li>• <b>is between</b> (Opens two calendars on which to specify a beginning and ending date and time.)</li> <li>• <b>Real Time</b> (Sets the mode to display events as they are received.)</li> </ul> <p>Alternatively, click the <b>Time Selector</b> control on the toolbar and select from the same options. See <a href="#">Event Table Toolbar, page 69-16</a>.</p> |
| Customize Column   | <p>Changes the columns shown in the event table. The Choose Columns to Display dialog box opens, where you can select the columns that you want to display. For details on the columns available, see <a href="#">Columns in Event Table, page 69-18</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Start              | <p>Initiates retrieving events to update the current view's event table. The event table then displays events received from the moment you clicked <b>Start</b> back to either the limit of the time mode or the event table pagination limit.</p> <p>Alternatively, click the <b>Start</b> button on the event table toolbar.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Stop               | <p>Stops event retrieval. The event table then displays the events received until the moment you clicked Stop.</p> <p>Alternatively, click the <b>Stop</b> button on the event table toolbar.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Show View Settings | <p>Opens the View Settings pane, which displays the filters and color settings for the current view. You can alter these settings using the View Settings pane.</p> <p>Alternatively, click anywhere in the View Settings pane title bar, such as on the icon, on the text, or on the double arrow on the right side of the title bar. Clicking the heading opens and closes the pane.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 69-4** View Menu in Event Viewer (continued)

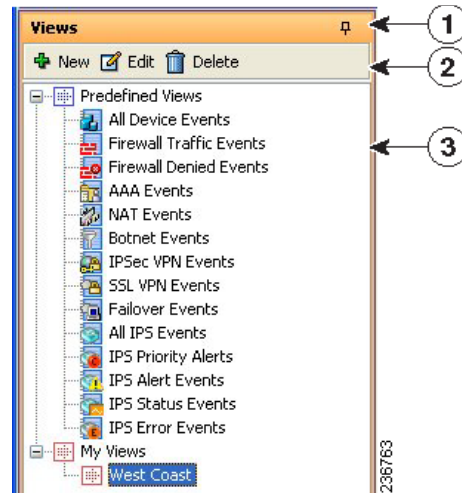

| Command                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show Event Details          | <p>Opens the Event Details pane and displays the selected event's details.</p> <p>Alternatively:</p> <ul style="list-style-type: none"> <li>Click the expand icon (+) on the left of the Event Details pane title bar.</li> <li>Double-click an event in the event table to display the event details data in a pop-up window.</li> </ul> <p><b>Tip</b> From the Event Details dialog box you can print the event details or you can copy one or more of the detail rows to your clipboard. You can also scroll through the events list using the Next and Previous buttons.</p> |
| Manage Monitored Devices    | <p>Allows you to select which devices, or groups of devices, can have events displayed in Event Viewer. For more information, see <a href="#">Selecting Devices to Monitor</a>, page 69-34.</p> <p><b>Note</b> By default, any ASA, FWSM, or IPS device added to the Security Manager inventory is monitored.</p>                                                                                                                                                                                                                                                                |
| Show Event Store Disk Usage | <p>Opens a window that displays the amount of disk space used as well as the age of the oldest event stored. See <a href="#">Monitoring Event Data Store Disk Space Usage</a>, page 69-35.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| Show Network Host Objects   | <p>When selected, the host object name is displayed, if available, instead of the Source or Destination IP address. This option is selected by default.</p> <p><b>Tip</b> Hover over a host object name to view the IP address associated with that object.</p>                                                                                                                                                                                                                                                                                                                  |
| Reset Layout                | <p>Re-establishes the width of the view list pane to its original setting after it has been hidden or manually narrowed or widened</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## View List

The left pane of the Event Viewer main window displays a list of available views as shown in the following illustration. A *view* is a set of filters and other properties, including color rules, selected columns and their positions and widths, and the default time window, that let you define a subset of events.

Figure 69-2 Event Viewer View List

The view list includes the following controls:

- **(1) Push Pin button**—Click the Push Pin icon to control whether the view list pane is opened or closed. If the pin is vertical, the view list remains open unless you maximize the event monitoring window (the right pane). If the pin is horizontal, the view list collapses to the left margin, and you must click the Views heading in the left margin to open the list.
- **(2) Toolbar**—The toolbar contains these buttons:
  - **New button**—Click the New button to create a new custom view. You are prompted for a view name and description. For more information, see [Creating Custom Views, page 69-41](#).
  - **Edit button**—Click the Edit button to change the name or description of the selected custom view. You can edit custom views only. For more information, see [Editing a Custom View Name or Description, page 69-41](#).
  - **Delete button**—Click the Delete button to delete the selected custom view. You can delete custom views only. For more information, see [Deleting Custom Views, page 69-43](#)
- **(3) List of views**—The list is organized into folders that separate the predefined views from the custom views, which are listed in the My Views folder. The simplest way to open a view is to double-click it, which replaces the currently open view. To open a view without replacing the currently open view, right-click the view and select **Open in New Tab**. For more information on opening views, see [Opening Views, page 69-38](#).
- **Right-click shortcut menu**—If you right-click on a view, you get a list of additional commands that you can perform:
  - **Open**—Opens the view and uses it to replace the currently active view. If the currently active view contains unsaved changes, you are prompted to save them. If the view is already open, it is brought to the foreground. See [Opening Views, page 69-38](#).
  - **Open in New Tab**—Opens the view in a new tab, so that no existing open views are closed. See [Opening Views, page 69-38](#).
  - **Save As**—Saves the view as a new custom view. See [Saving Views, page 69-42](#).
  - **Edit**—Edits the custom view name and description. See [Editing a Custom View Name or Description, page 69-41](#).
  - **Delete**—Deletes the custom view. See [Deleting Custom Views, page 69-43](#).

- View Description—Displays the description for the view.

## Event Monitoring Window

The Event Monitoring window shows the event views that you have opened. From this window, you can configure views and analyze and filter events.

Figure 69-3 Event Monitoring Window

|   |                       |   |                                    |
|---|-----------------------|---|------------------------------------|
| 1 | View tabs.            | 6 | Time slider.                       |
| 2 | View Settings pane.   | 7 | Event Details pane.                |
| 3 | Event table toolbar.  | 8 | Column selector button.            |
| 4 | Filtered column icon. | 9 | Open view scroll buttons and list. |
| 5 | Event table.          |   |                                    |

The Event Monitoring window contains these main elements:

- **View tabs (1, 9)**—When you open a view, it is represented as a tab in the window. To change views, click the tab, click the left or right arrow buttons to scroll through the tabs, or click the Open View List button and select the desired view. You can arrange views to be side by side or to float to separate windows by right-clicking the tab name and selecting an appropriate command; for more details, see [Floating and Arranging Views](#), page 69-38.

**Note** You can open at most four historical views and one real-time view.

- **View Settings pane (2)**—Use the View Settings pane to define the column filters and color rules to use in a view. You can open and close the pane by clicking anywhere in the heading or by toggling the **View > Show View Settings** command.

The View Settings pane contains two tabs: Filter and Color Rules. These tabs are shown along the bottom of the pane. On each tab, the body of the tab shows the current filter or rules; to change a rule, you select it and click the Edit or Delete buttons along the top of the pane, as appropriate. To create new rules, click the Add button.

You can also add filters using the column filtering controls in the events table, as described in [Creating Column-Based Filters, page 69-45](#). For more information on color rules, see [Configuring Color Rules for a View, page 69-40](#).

- **Event Table Toolbar (3)**—The toolbar above the event table includes shortcut buttons and other controls that relate specifically to the events listed in the table. For a description of the toolbar controls, see [Event Table Toolbar, page 69-16](#).
- **Event Table (4, 5, 8)**—The event table shows the events that match your filter criteria, one event per row. These events might be retrieved from the primary or the extended data store; you do not have to explicitly request data from the extended data store. To see events from a device, you must have View Device privileges to the device.

The columns that make up the event table can be hidden, resized, reordered, and sorted upon as described in [Customizing the Event Table Appearance, page 69-39](#). For a description of the columns, and how to use the column selector button to choose which columns are shown, see [Columns in Event Table, page 69-18](#).

If a column has a filter applied to it, an icon appears in the column heading.

- **Time Slider (6)**—For historical views, the time slider shows the current slice of time displayed in the table and the events per second rate as a linear graph. For more information about using the time slider, see [Time Slider, page 69-25](#).
- **Event Details Pane (7)**—The event details pane shows detailed information about the currently selected event. You can open and close the pane by clicking anywhere in the heading or by toggling the **View > Show Event Details** command. For more information, see [Event Details Pane, page 69-26](#).

## Event Table Toolbar

The following illustration and table explain the elements in the toolbar that resides immediately above the event table in Event Viewer.

Table 69-5 Event Table Toolbar Elements

| Callout | Name                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1       | Search Within Results Field<br>(Quick Filter)                               | This tool is also known as the <i>Quick Filter</i> . Use it to search for a word or phrase as well as to limit the scope of the search to certain columns. Further, you can select whether the search term used should be considered case sensitive, whether wildcards may be used, and whether a match may be partial, case sensitive, exact, or anywhere within a string. This search operates only on the selected view and within the data loaded. For more information, see <a href="#">Filtering on a Text String, page 69-47</a> .                                                                                                                                                                                                        |
| 2       | Time Selector (Mode)<br>(Equivalent to <b>View &gt; Mode</b> .)             | You use the time selector to do the following: <ul style="list-style-type: none"> <li>Filter the events shown in the event table pane according to the time they were received. See <a href="#">Selecting the Time Range for Events, page 69-43</a>.</li> <li>Select between a real-time view or historical views. See <a href="#">Switching Between Real-Time and Historical Views, page 69-42</a>.</li> <li>Determine the time interval loaded in the client. If you are using one of the modes that shows events from the current time into the past, hovering the pointer over the field shows the start and end times for the displayed events. If you are using a specific time interval, the interval is shown in the toolbar.</li> </ul> |
| 3       | Events by IP Address Type Selector                                          | You use the events by IP address type selector to filter the list based on the type of IP address included in the events. Options are: <ul style="list-style-type: none"> <li><b>All Events (Default)</b>—Show all events regardless of the address type. This is the default option.</li> <li><b>IPv4 Events Only</b>—Show events only if all addresses in the event are in IPv4 format.</li> <li><b>IPv6 Events Only</b>—Show events only if at least one address in the event is in IPv6 format.</li> </ul> <p><b>Tip</b> You cannot save your selection. The next time you open the view, you need to reselect your option if you want something other than the default.</p>                                                                 |
| 4       | Save<br>(Equivalent to <b>File &gt; Save</b> or <b>File &gt; Save As</b> .) | Click <b>Save</b> to save changes to the current view, including filters (for custom views only), table preferences such as selected columns, column width, and sort order, the time range, and color rules.<br><br>Alternatively, click the down arrow and select <b>Save As</b> to save changes as a new custom view. If you want to save filter changes for a predefined view, you must use <b>Save As</b> to create a new custom view. For more information, see <a href="#">Creating Custom Views, page 69-41</a> .                                                                                                                                                                                                                         |

**Table 69-5 Event Table Toolbar Elements (continued)**

| Callout | Name                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5       | Start<br>(Equivalent to <b>View &gt; Start.</b> ) | Click <b>Start</b> to reload or restart the listing of events in the Event Table. Clicking Start retrieves any events that have occurred since you originally loaded the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 6       | Stop<br>(Equivalent to <b>View &gt; Stop.</b> )   | Click <b>Stop</b> to halt the listing of events in the Event Table. If you are in a real-time view, the Time Selector indicates the time stopped as well as the time interval that is loaded. Clicking on stop can also halt a query and display the set of events currently loaded in event viewer.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 7       | Clear                                             | Click <b>Clear</b> to empty the event table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 8       | Event Enumerator and messages                     | The number shown on the right of the toolbar indicates how many events are loaded onto the Event Viewer client. The number grows as events are loaded until either all events matching the filter criteria are displayed, or the pagination limit is reached, whichever is lowest. If you change the pagination limit (see <a href="#">Event Management Page, page 11-27</a> ), you must exit Event Viewer and open it again for the new limit to be in effect.<br><br>If your query requires that events be retrieved from the extended event storage area, a message such as “Data being fetched from extended store” appears. Fetching events from the extended storage area typically takes longer than fetching them from the primary storage area. |

## Columns in Event Table

The following table lists alphabetically, and describes, all the columns that you can display in a view in Event Viewer. The columns applicable to a particular device vary, as does the presence or absence of event data for a particular event type.

When you save a view, the columns you selected, and their order, are preserved and displayed the next time you open the view. To select which columns to display in the open (and active) view, do one of the following:

- (Preferred method.) Click the **Column Chooser** icon in the far right of the event table header row (see [Event Monitoring Window, page 69-14](#)). The Choose Columns to Display dialog box that opens lists the columns in alphabetical order. You can select or deselect the columns either individually or by using the **Select/Unselect All** check box. Also, you can click Revert to return to the default column selection for the view.
- Select **View > Customize Columns**.
- Right-click any column heading and select or deselect a column individually, or select More to open the same dialog box that is used by the View > Customize Columns command.

### Note

Most columns other than Description, Event Name, and Receive Time include a filtering function. For more information, see [Creating Column-Based Filters, page 69-45](#).

**Table 69-6** *Event Viewer Column Descriptions*

| <b>Column Label</b>          | <b>Description</b>                                                                                                                                                                                                                                            |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA Group                    | The AAA group policy.                                                                                                                                                                                                                                         |
| AAA Server                   | The server that handles user requests for access; it performs authentication, authorization, and accounting.                                                                                                                                                  |
| AAA User                     | The AAA username.                                                                                                                                                                                                                                             |
| ACE Hash1<br>ACE Hash2       | The hashcode1 and hashcode2 of the access control list entry (ACE). Hash codes are required for successful policy lookups from syslog 106023 and 106100 events. These hash codes are available only if you deployed the configuration using Security Manager. |
| ACL Name                     | The name or ID of the access control list (ACL).                                                                                                                                                                                                              |
| Action                       | The action performed on the flow. For example: Terminated or denied.                                                                                                                                                                                          |
| Alert Details                | The details regarding the alerts.                                                                                                                                                                                                                             |
| App Name                     | The name of the application originating the event.                                                                                                                                                                                                            |
| App Stop Reason              | An explanation of how or why the application was shut down.                                                                                                                                                                                                   |
| App Version                  | The version of the application originating the event.                                                                                                                                                                                                         |
| Attack Relevance Rating      | A numerical value used to indicate an attack's relevance to its destination target or targets.                                                                                                                                                                |
| Backplane Interface          | The backplane interface, which is identified only when the backplane interface differs from the physical interface.                                                                                                                                           |
| Botnet Category              | The category showing the reason a domain name is added to the block list, for example, botnet, Trojan, spyware, and so on.                                                                                                                                    |
| Botnet Domain                | The domain name or IP address in the dynamic filter database to which the traffic was initiated. It can be part of the block list, allow list, or grey list.                                                                                                  |
| Build Time                   | The date and time of the software build.                                                                                                                                                                                                                      |
| Build Type                   | The type of build. Typically this is a word such as "release" or "debug." In some cases, it is the ID of the builder of the application.                                                                                                                      |
| Byte Count                   | The number of bytes in the data transfer of the connection.                                                                                                                                                                                                   |
| Call Id                      | The peer's Call ID for the session to which this packet belongs.                                                                                                                                                                                              |
| Class Map                    | The class map name.                                                                                                                                                                                                                                           |
| Connection Duration          | The lifetime of the connection.                                                                                                                                                                                                                               |
| Connection ID                | A unique identifier for the connection.                                                                                                                                                                                                                       |
| Connection Limit             | The maximum number of connections or sessions.                                                                                                                                                                                                                |
| Connection Termination Value | A factor for which the connection is terminated, for example, incorrect version or invalid payload-type.                                                                                                                                                      |
| Current Connection Count     | The number of current connections.                                                                                                                                                                                                                            |
| Description                  | For syslogs this shows the raw message, for IPS it shows a description of the event.                                                                                                                                                                          |

**Table 69-6** Event Viewer Column Descriptions (continued)

| Column Label              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination               | <p>The IP Address or hostname of the traffic destination (for ASA and FWSM) or the attack target (for IPS). It can be multi-valued and contain IPv4 or IPv6 addresses.</p> <p>If View &gt; Show Network Host Objects is selected and a host object is defined that matches the destination IP address, the host object name is displayed.</p> <p><b>Tip</b> Hover over a host object name to view the IP address associated with that object.</p> |
| Destination Context Data  | Context buffer indicating the data that was sent just prior to, and immediately after, the alert was triggered. A Base64-encoded representation of the stream data that was sourced by the target.                                                                                                                                                                                                                                                |
| Destination FQDN          | The fully-qualified domain name of the destination IP address, if any.                                                                                                                                                                                                                                                                                                                                                                            |
| Destination Interface     | <p>The destination interface.</p> <p>For Etherchannel alerts (426001-426003), this is the name of the Etherchannel interface for which this event occurred. The member interface is identified in the Source Interface column.</p>                                                                                                                                                                                                                |
| Destination Locality      | Whether the target address is located inside or outside of a given network as specified by the intrusion.                                                                                                                                                                                                                                                                                                                                         |
| Destination OS            | The target's operating system information.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Destination OS Relevance  | A numerical value indicating the relevance of the destination target OS value.                                                                                                                                                                                                                                                                                                                                                                    |
| Destination OS Source     | The source of the Target OS data. Possible values are: learned, imported, or configured.                                                                                                                                                                                                                                                                                                                                                          |
| Destination Service       | The destination port. It can be multi-valued.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Destination User Identity | The user name for the traffic destination, if any.                                                                                                                                                                                                                                                                                                                                                                                                |
| Device                    | <p>The source of the event; usually the device ID.</p> <p>A device identified as Not Available has been deleted from the Security Manager inventory.</p>                                                                                                                                                                                                                                                                                          |

**Table 69-6** Event Viewer Column Descriptions (continued)

| Column Label                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Identifier                | <p>For a cluster of ASA devices, the ID of the event's source node, which is based on the "Enable Syslog Device ID" configuration on the <a href="#">Server Setup Page, page 54-21</a>.</p> <p>You can use a "Device Identifier" to filter the syslogs generated by a failover device. In the event of a failover, the IP address of the failover device, that generated the syslog messages is displayed here. However, the Device Identifier column will be blank for syslog messages generated by failover device managed in Cisco Security Manager.</p> <p><b>Note</b> Enable the <b>Process Syslogs from Failover Standby Device</b> check box in the <b>Event Management Page</b> in <b>Tools &gt; Cisco Security Manager Administration</b>.</p> <p>A cluster is managed by Security Manager as a single device with multiple nodes. Thus, all the node's events are mapped to the cluster virtual IP and are displayed with the cluster virtual IP in Event Viewer. You can use "Device Identifier" to filter the syslogs generated by a specific cluster member of a node.</p> |
| Direction                        | The direction of the traffic: inbound or outbound.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Event ID                         | A unique sequential number for each event, assigned internally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Event Name                       | A user-friendly name given to the event.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Event Summary                    | Specifies that this is a summary alert, representing one or more alerts with common characteristics. The numeric value indicates the number of times the signature fired since the last summary alert with a matching initialAlert attribute value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Execution State                  | The execution status of the application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Final Alert                      | Applies to a summary alert, representing one or more alerts with common characteristics. It indicates whether this is the last event alert containing the same value in the initialAlert attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Generation Time                  | Represents device local event generation time (available only for IPS events).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Global Correlation Audit Mode    | Whether the alert was handled with audit mode processing: true or false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Global Correlation Deny Attacker | Whether a deny-attacker action occurred (or would have occurred) because an internal override was exceeded due to the calculated risk rating: true or false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Global Correlation Deny Packet   | Whether a deny-packet action occurred (or would have occurred) because an internal override was exceeded due to the calculated risk rating: true or false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 69-6 Event Viewer Column Descriptions (continued)**

| Column Label                            | Description                                                                                                                                                                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global Correlation Modified Risk Rating | Whether the risk rating was adjusted by adding the reputation risk delta due to the risk rating: true or false.                                                                                                                        |
| Global Correlation Other Overrides      | Whether any other defensive actions were taken because an override threshold was exceeded due to the calculated risk rating: true or false.                                                                                            |
| Global Correlation Risk Delta           | A value from 0 to 99 that indicates how much the risk rating was increased due to the reputation score. If audit-mode is enabled, then it indicates how much the risk rating would have been adjusted had audit-mode not been enabled. |
| Hit Count                               | The number of times the flow was permitted or denied by the ACL entry in the configured time interval. The value is 1 when the ASA or FWSM generates the first syslog message for a particular flow.                                   |
| Hit Count Info                          | ACL Hit Count information, for example, <i>First hit</i> .                                                                                                                                                                             |
| Host ID                                 | The globally unique identifier for the host that originated the event.                                                                                                                                                                 |
| ICMP Code                               | The code of the ICMP type. For example, ICMP Type 3 and Code 0 is Net Unreachable or Code 1 is Host Unreachable.                                                                                                                       |
| ICMP Type                               | The type of ICMP message. For example, 3 for Destination unreachable, 8 for Echo.                                                                                                                                                      |
| Initial Alert                           | This field applies to a summary alert, representing one or more alerts with common characteristics. The value of InitialAlert provides the event ID of the last non-summary evIdsAlert with the same characteristic (sigid/subsigid).  |
| Ip Log ID                               | The IP Log Identifier that uniquely identifies (with host-scope) an iplog document.                                                                                                                                                    |
| IpLog Address                           | The IPv4 or IPv6 address associated with the IP log.                                                                                                                                                                                   |
| IpLog Alert Reference                   | The global event ID of the evAlert event that triggered the log to be initiated.                                                                                                                                                       |
| IpLog Begin Time                        | The start of the time range that is currently available in the log document.                                                                                                                                                           |
| IpLog Bytes Captured                    | The total bytes captured. Note that some packets that were captured may have already been deleted from the log due to memory limitations.                                                                                              |
| IpLog Bytes Remaining                   | The number of bytes remaining until the log will be terminated.                                                                                                                                                                        |
| IpLog End Time                          | The end of the time range that is currently available in the log document.                                                                                                                                                             |
| IpLog Minutes Remaining                 | The minutes remaining until the log will be terminated.                                                                                                                                                                                |
| IpLog Packets Captured                  | The total number of packets captured and logged.                                                                                                                                                                                       |
| IpLog Packets Remaining                 | The packets remaining until the log will be terminated.                                                                                                                                                                                |
| IpLog Status                            | A string that represents the log status.                                                                                                                                                                                               |
| IPS Category                            | The SEE event category.                                                                                                                                                                                                                |
| IPS User                                | The username of the user initiating the operation.                                                                                                                                                                                     |
| License Limit                           | The maximum number of licenses.                                                                                                                                                                                                        |

**Table 69-6 Event Viewer Column Descriptions (continued)**

| Column Label            | Description                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| List Name               | The list that includes the domain name, administrator allow list, block list, or IronPort list.                                                                                                                          |
| Login Action            | The login action that occurred: loggedIn, loggedOut, or loginFailed.                                                                                                                                                     |
| Malicious Host          | The hostname of the malicious host.                                                                                                                                                                                      |
| Malicious IP            | The IP address of malicious device.                                                                                                                                                                                      |
| Max Connection          | The maximum number of NAT connections.                                                                                                                                                                                   |
| MaxEmbryonic Connection | The maximum number of embryonic connections.                                                                                                                                                                             |
| NAT Destination         | The translated (also called natted) destination IP address.<br>The host name of the translated destination.                                                                                                              |
| NAT Destination Service | The translated (or natted) destination port.                                                                                                                                                                             |
| NAT Global IP           | The global address. It can contain IPv4 or IPv6 addresses.                                                                                                                                                               |
| NAT Source              | The translated (or natted) source IP address. It can contain IPv4 or IPv6 addresses.<br>The host name of the translated source.                                                                                          |
| NAT Source Service      | The translated (or natted) source port.                                                                                                                                                                                  |
| NAT Type                | The type of network address translation, for example <i>Static</i> or <i>Dynamic</i> .                                                                                                                                   |
| New Time                | The time to which the device clock was changed.                                                                                                                                                                          |
| New Version             | The system software version after an upgrade installation.                                                                                                                                                               |
| No.                     | The number of the event (row) in the current display. This is a simple sequential number and is not related to the content of the event. See the Event ID and Event Name fields for information about the type of event. |
| Old Time                | The device clock time prior to a change.                                                                                                                                                                                 |
| Old Version             | The system software version before an upgrade was uninstalled.                                                                                                                                                           |
| Operation Successful    | Indicates whether an operation was successfully performed.                                                                                                                                                               |
| Package File            | The name of package file to be auto-downloaded and installed.                                                                                                                                                            |
| Physical Interface      | The physical interface, which is identified only if physical interface is different from the respective value in the Interface column.                                                                                   |
| Policy Map              | The policy map name.                                                                                                                                                                                                     |
| Protocol                | The Level-3 or Level-4 protocol.                                                                                                                                                                                         |
| Protocol Version        | The protocol version.                                                                                                                                                                                                    |
| Protocol (Non L3)       | Some non-Level-3 or -4 protocol seen in the event, for example, TACACS, RADIUS, FTP, or H245.                                                                                                                            |
| Reason                  | A rationale associated with certain events. For example, a connection tear down may have an associated reason.                                                                                                           |
| Receive Time            | The time the event was received by Security Manager.                                                                                                                                                                     |

**Table 69-6** Event Viewer Column Descriptions (continued)

| Column Label        | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reputation          | The attacker's reputation score in the range -10.0 to +10.0. A lower (more negative) score indicates a greater likelihood that the host is malicious.                                                                                                                                                                                                                                                                              |
| Result Status       | The status of an operation, which indicates whether the operation successfully completed.                                                                                                                                                                                                                                                                                                                                          |
| Risk Rating         | A value that represents the calculated risk associated with the event.                                                                                                                                                                                                                                                                                                                                                             |
| Role in Cluster     | The role of this member of an ASA load-balancing cluster: Cluster, Master, or Slave.                                                                                                                                                                                                                                                                                                                                               |
| Security Context    | The security context with which the named interface, specified in the corresponding Interface column, is associated.                                                                                                                                                                                                                                                                                                               |
| Sensor Event ID     | The serial number for an event, which is guaranteed unique within the scope of the originating host.                                                                                                                                                                                                                                                                                                                               |
| Severity            | The firewall or IPS severity values.                                                                                                                                                                                                                                                                                                                                                                                               |
| SIA Event Name      | The event that occurred for the service identified in the SIA Service Name field.                                                                                                                                                                                                                                                                                                                                                  |
| SIA Service Name    | The name of the Service Insertion Architecture (SIA) service for which this event occurred.                                                                                                                                                                                                                                                                                                                                        |
| Sig Details         | The details of the reported signature that was triggered and resulted in the generation of the alert.                                                                                                                                                                                                                                                                                                                              |
| Sig ID              | The Sig ID value is used by the alert originator to identify the activity. It identifies the pre-defined signature defined for this activity.                                                                                                                                                                                                                                                                                      |
| Signature Version   | The version of the signature definition used to generate an alert.                                                                                                                                                                                                                                                                                                                                                                 |
| Source              | <p>The IP Address or hostname of the traffic source (for ASA and FWSM) or the attacker (for IPS). It can be multi-valued and contain IPv4 or IPv6 addresses.</p> <p>If View &gt; Show Network Host Objects is selected and a host object is defined that matches the source IP address, the host object name is displayed.</p> <p><b>Tip</b> Hover over a host object name to view the IP address associated with that object.</p> |
| Source Context Data | The context buffer indicating the data that was sent just prior to and immediately after the alert was triggered. A Base64-encoded representation of the data stream that was sourced by the attacker.                                                                                                                                                                                                                             |
| Source FQDN         | The fully-qualified domain name of the source IP address, if any.                                                                                                                                                                                                                                                                                                                                                                  |
| Source Interface    | <p>The source interface.</p> <p>For Etherchannel alerts (426001-426003), this is the name of the interface that is part of the Etherchannel bundle for which this event occurred. The Etherchannel interface is identified in the Destination Interface column.</p>                                                                                                                                                                |
| Source Locality     | Identifies whether the attacker address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.                                                                                                                                                                                                                                                                           |

**Table 69-6** *Event Viewer Column Descriptions (continued)*

| Column Label         | Description                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Service       | The source port.                                                                                                                                               |
| Source User Identity | The username associated with the traffic source, if any.                                                                                                       |
| SSO Server           | The single sign-on (SSO) server name.                                                                                                                          |
| SSO Server Type      | The single sign-on (SSO) server type, for example, SiteMinder.                                                                                                 |
| Sub SigId            | The sub-sig ID value, which is used by the alert originator in combination with the signature ID (sigId) to identify the activity.                             |
| Summary Type         | Defines the common characteristics of all alerts in a summary alert.                                                                                           |
| Target Value Rating  | The asset values associated with targets identified in alerts.                                                                                                 |
| Threat Level         | Shows one of the following values, if any threat level pertains: none, very-low, low, moderate, high, or very-high.                                            |
| Threat Rating        | The threat rating of the event, if any.                                                                                                                        |
| Time Zone            | The local time zone at the originating host's location.                                                                                                        |
| Translated Call ID   | The peer's Translated Call ID for the session to which this packet belongs.                                                                                    |
| Trigger Packet       | The single, complete packet (in base64 binary format) that triggered the alert.                                                                                |
| Truncated            | Whether the trigger packet contained in the event is truncated.                                                                                                |
| Tunnel Type          | The VPN tunnel type.                                                                                                                                           |
| Type                 | The AAA type, for example authentication, authorization, or accounting.                                                                                        |
| Upgrade Name         | The name of the upgrade package that was uninstalled.                                                                                                          |
| URI                  | The URI of the auto-upgrade server directory.                                                                                                                  |
| UTC Offset           | The offset attribute of sensor local time indicates the number of minutes that must be added to the UTC time to convert to local time at the originating host. |
| Virtual Sensor       | The name of the virtual sensor associated with the event.                                                                                                      |
| VLAN Id              | The VLAN number associated with packets involved in the activity that triggered the alert.                                                                     |
| VPN Group            | The VPN group policy.                                                                                                                                          |
| VPN IPSec SPI        | The IPSec Security Parameter Index.                                                                                                                            |
| VPN User             | The VPN username.                                                                                                                                              |
| Watchlist Delta      | The amount that the risk rating value was increase due to the source of the activity associated with the alert being on a watchlist.                           |

## Time Slider

The time slider resides below the events table when you are using an historical view; it is not used with real-time views. The following illustration explains the time slider; the pagination controls on the right are explained in [Table 69-7](#).

**Figure 69-4** Time Slider Elements

You can use the time slider to do the following:

- View the EPS (events per second) trends for the server. You can use the controls on the right to zoom in or out to get a better view of the EPS trends over the time frame that concerns you.  
You can also click and drag the background of the time slider to position the time ranges within the window. Moving the background does not affect the selected time range.
- Select a slice of time for displaying events in the table, either by moving the vertical slider or by using the pagination controls. The position of the vertical slider determines the most recent event displayed in the event table. Whenever you alter the time slice, the event table is reloaded with the events that match the time period.

The time range of the events displayed in the event table is determined by the selected time interval. For more information, see [Selecting the Time Range for Events, page 69-43](#).

The following table explains the pagination controls to the right of the time slider.

**Table 69-7** Time Slider Paging Controls

| Element                                                                             | Description                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Previous page (earlier) and next page (later). The size of page varies according to the selected time mode.<br><br><b>Note</b> Using the page controls alternately, for example forward and then back, causes the sort order in the event table to reverse. That is, the latest events go from the top of the table to the bottom, or from the bottom to the top. |
|  | First page (earliest) and last page (most recent).                                                                                                                                                                                                                                                                                                                |
|  | Zoom in (smaller total time interval shown) and zoom out (greater time interval shown).<br><br>Zooming does not change the content of the event table. A shaded blue area indicates the time interval currently displayed in the event table.                                                                                                                     |

## Event Details Pane

The Event Details pane (illustrated in [Event Monitoring Window, page 69-14](#)) presents information contained within a single event. The information, which is displayed in multiple tabs within the pane, varies according to the richness of the event and the capability of Event Viewer to parse the data. Components include:

- **Displayed Fields Tab**—Displays the fields shown in the Event Table.
- **Details Tab**—Displays all available fields for the selected event. The fields are presented in alphabetical order.

- **Explanation Tab**—Displays a generic explanation for this event type.
- **Related Threats Tab**—Displays threats correlated to the event. (IPS Events only.)
- **Recommended Action Tab**—Displays a generic recommendation for an event of this type. (Syslogs only.)
- **Trigger Packet Tab**—Displays trigger packet data. (IPS Events only.)
- **Context Packet Tab**—Displays context packet data from the Source (Attacker) and Destination (Target). (IPS events only.)
- **Notes**—Enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. For more detailed information, refer to [Signatures Page, page 39-4](#)

**Note**

The notes added here will be persistent when you cross-launch to Configuration Manager.

**Note**

If you have more than one event for a particular signature, then annotating one event will annotate all the events related to that signature.

## Preparing for Event Management

Before you can view events generated from a device, you must configure the device to work with Event Viewer.

## Ensuring Time Synchronization

Standard network management practice includes consideration of time differences and network device synchronization. Typically, this includes the use of a Network Time Protocol (NTP) server. Event Viewer is most easily used with a common time standard. However, it is worth noting that you can view the time an event is received by Security Manager (Receive Time), and for IPS devices, the time the event was generated by a device (Generation Time).

Whenever possible, configure the Security Manager server and the devices it is monitoring with the same NTP server.

Differences between the clock on the Security Manager server and the clock on a Security Manager client at the time the client is opened are taken into account while translating/mapping event data from the server time to the client time. If the time difference changes dynamically due to the Security Manager server time moving ahead, for example, the data retrieved from the server will show an updated timestamp, but the client will continue to map the time difference based on the times on the server and the client when the client was opened. In such a situation, no data will be seen on Event Viewer for a brief interval that corresponds to the time change on the server. For this reason, we recommend that Security Manager server clock changes are done less frequently and at a time that would be the least impacting.

## Configuring ASA and FWSM Devices for Event Management

**Note**

From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

Before you can use Event Viewer, or any other application that analyzes syslog events, to view events generated from an ASA (including ASA-SM) or FWSM device, you must configure the logging policies on the device to generate and transmit syslog messages.

**Note**

A cluster device with a Virtual IP address (beginning with Security Manager version 4.4) can be added if configured in both Security Manager and on the virtual device.

**Tip**

Although you can configure devices individually to specify the appropriate logging configuration, it is likely that more than one ASA or FWSM device in your network would use the same logging configuration. Although this topic describes how to configure an individual device, you can also create shared policies and assign them to multiple devices. For more information about configuring and assigning shared policies, see [Creating a New Shared Policy, page 5-54](#) and [Modifying Policy Assignments in Policy View, page 5-54](#).

Besides the logging configuration described here, you can also configure logging for individual access control entries when you configure them either in firewall policies or ACL policy objects. The default is to log denied access only, but you can configuring ACL logging options to provide increased logging.

**Note**

To reliably report events from contexts in multiple-context mode, Cisco Event Viewer requires an IP address for the management interface of each context.

**Step 1** (Device view) Select the ASA or FWSM device or security context, then select **Platform > Logging > Syslog > Logging Setup** from the Policies selector.

In the policy, select **Enable Logging**. You can configure other options as needed. For detailed information about the options, see [Logging Setup Page, page 54-15](#).

**Step 2** Select **Platform > Logging > Syslog > Syslog Servers**.

Add the Security Manager server’s IP address to the syslog servers table. Configure the server to use the UDP protocol. The default port, 514, is correct unless you configure a different port on the Security Manager Administration [Event Management Page, page 11-27](#).

If you are using other event management applications, such as CS-MARS, also add those servers to this policy.

**Note**

You can use EMBLEM message format if you desire; both traditional and EMBLEM formats are supported. Keep in mind that EMBLEM is not supported by CS-MARS, so do not send EMBLEM-formatted messages to a CS-MARS server.

For detailed information about the options in the Syslog Servers policy, see [Syslog Servers Page, page 54-27](#).

- Step 3** If you want to configure non-default syslog server settings, such as adding time stamps to syslog messages, changing the severity level of messages, or suppressing the generation of specific messages altogether, configure the **Platform > Logging > Syslog > Server Setup** policy. For detailed information, see [Server Setup Page, page 54-21](#).
- Step 4** (Optional) You can configure the **Platform > Logging > Syslog > Logging Filters** policy to fine-tune the kinds of messages sent to syslog servers. For detailed information about this policy, see [Logging Filters Page, page 54-12](#) and [Edit Logging Filters Dialog Box, page 54-13](#).
- Following are some tips for configuring this policy:
- When adding the logging filter, select **Syslog Servers** for Logging Destination.
  - You can create a simple filter based on message severity, or you can configure a much more complex filter based on event classes. If you elect to use event classes, you can do the configuration directly in the Logging Filters policy, or you can configure event lists separately in the **Event Lists** policy (see [Event Lists Page, page 54-9](#)).
- Step 5** (Optional) You can configure the **Platform > Logging > Syslog > Rate Limit** policy to limit the quantity of messages generated per time interval, either by message severity or message number. This can help you avoid flooding the syslog server. See [Rate Limit Page, page 54-18](#).
- Step 6** (Optional, but recommended) You can configure the **Platform > Device Admin > Server Access > NTP** policy to specify a network time protocol server for ASA devices. Using NTP ensures consistent date and time information for easy event correlation. Specify the same NTP server you use for the Security Manager server. If you use different servers, ensure the servers are synchronized. See [NTP Page, page 52-21](#).
- 

## Configuring IPS Devices for Event Management

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

---

Before you can use Event Viewer to view events generated from an IPS device, you must configure the Allowed Hosts policy on the device to allow the Security Manager server access to the device. Because Security Manager also needs to be configured in the Allowed Hosts policy to allow configuration access, your IPS devices might already be configured correctly. You should also configure the network time protocol (NTP).

Configure the following policies for IPS devices in Device view to enable effective event management on those devices:

- **Platform > Device Admin > Device Access > Allowed Hosts**—(Required) Add the Security Manager server to the table. You can either identify the Security Manager server by its host IP address (for example, 10.100.10.10), or you can specify the network that it is on (for example, 10.100.10.0/24).

If you are using other event management applications with the device, such as CS-MARS, ensure that you also add those servers to the policy.

For more information about configuring the Allowed Hosts policy, see [Identifying Allowed Hosts, page 36-7](#).

- **Platform > Device Admin > Server Access > NTP**—(Recommended) Configure the same NTP server that you use for the Security Manager server to ensure consistent date and time information for easy event correlation. If you use different servers, ensure the servers are synchronized. For more information, see [Identifying an NTP Server, page 36-23](#).

**Tip**

Although you can configure devices individually to specify the appropriate allowed hosts and NTP configuration, it is likely that more than one IPS device in your network would use the same configuration. Although this topic describes how to configure an individual device, you can also create shared versions of these policies and assign them to multiple devices. For more information about configuring and assigning shared policies, see [Creating a New Shared Policy, page 5-54](#) and [Modifying Policy Assignments in Policy View, page 5-54](#).

## Managing the Event Manager Service

The Event Manager service enables the use of the Event Viewer application. For Event Viewer to function, the service must be started. There are several tasks that you can perform to configure and manage the overall functioning of the service.

This section contains the following topics:

- [Starting, Stopping, and Configuring the Event Manager Service, page 69-30](#)
- [Monitoring the Event Manager Service, page 69-31](#)
- [Selecting Devices to Monitor, page 69-34](#)
- [Monitoring Event Data Store Disk Space Usage, page 69-35](#)
- [Archiving or Backing Up and Restoring the Event Data Store, page 69-36](#)

## Starting, Stopping, and Configuring the Event Manager Service

The Event Manager service must be running for you to use Event Viewer or Report Manager.

When you install Security Manager, the Event Manager service is automatically enabled unless the server does not meet the minimum memory requirements that are documented in the [Installation Guide for Cisco Security Manager](#). Although you can manually start the service on a system that does not meet the minimum memory requirements, you might find the performance to be dissatisfactory. The key factors are the number of devices managed and their rate of event generation.

**Tip**

If you get a message that Event Viewer is unavailable when you select Launch > Event Viewer, but the **Enable Event Management** option is selected in the Tools > Security Manager Administration > Event Management page, try restarting the Event Manager Service. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening Event Viewer again.

The following procedure explains how to start, stop, and configure the Event Manager service.

### Related Topics

- [Monitoring Event Data Store Disk Space Usage, page 69-35](#)

---

**Step 1** In the main Security Manager window (not Event Viewer), select **Tools > Security Manager Administration** and select **Event Management** from the table of contents.

**Step 2** Do one of the following:

- To enable, or start, the Event Manager service, select **Enable Event Management**.
- To disable, or stop, the Event Manager service, deselect **Enable Event Management**.

You can also change the other settings, such as the event data store location and maximum size, the syslog port to which devices should send events, and the pagination size (which determines the maximum number of events loaded into the event table). You can also configure an extended event storage location to augment your primary storage location. For detailed information about these settings, see [Event Management Page, page 11-27](#).

---

**Note** Beginning with version 4.5, Security Manager enables you to forward syslogs to one local collector and two remote collectors. For more information, see [Event Management Page, page 11-27](#).

---

**Step 3** Click **Save** to save your changes.

If you changed the Enable Event Management option, you are prompted to confirm that you want to start or stop the Event Manager Service. If you click **Yes**, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.

If you change other settings, with the exception of the pagination size, the Event Manager service must be briefly stopped and restarted. You are shown a progress indicator.

---

## Monitoring the Event Manager Service

The Event Manager service processes incoming syslog messages and retrieves SDEE alerts from monitored IPS devices. The amount of data processed varies depending on network activity. There can be times when the events per second (EPS) generated in the network is higher than the service can handle, in which case the service goes into throttle mode, selectively dropping events.

You can monitor the status of the service to identify congestion and address problems that arise. The status of the service is shown in an icon in the lower right corner of the status bar in Event Viewer, as shown in [Overview of Event Viewer, page 69-7](#). The Total EPS indicates the current events per second rate that the service is experiencing. The alert status icon color indicates the following:

- Green dot—There are no problems. All events are being processed normally.
- Yellow dot—There are some warnings, for example, low severity events are being dropped.
- Orange dot—There are more serious issues, for example, low and medium severity events are being dropped.
- Red dot—There is a critical situation, for example, high severity events are being dropped or there is a significant problem with the system, such as problems with the syslog port or with the event data store location.

- **Disconnected network wire**—The Event Manager service is disabled, either intentionally or due to some server problem; no events are being stored or retrieved. If this is not intentional, restart the Event Manager service as described in [Starting, Stopping, and Configuring the Event Manager Service, page 69-30](#).

To view detailed information, click on the alert status icon. A bubble opens that shows summary statistics for the past five minutes, including the number of events received and dropped and event server alert messages, if any. Click the alert status icon again to close the bubble.

When the bubble is open, you can click the **Details** link in the bubble to view more detailed information. Clicking the Details link opens the Event Statistics Details dialog box, which shows the following information:

- **Last 5 Minutes Statistics:**

- **Events Received**—The total number of syslog events Received and SDEE alerts retrieved in the past five minutes by the service.
- **Events Dropped**—The total number of events or alerts that the service had to drop due to congestion. This number indicates drops from monitored devices only, so the number should be zero in normal circumstances. A non-zero number indicates that the service is in throttle mode; look for messages in the Event Server Alerts section.
- **Events from Unmonitored Devices**—The number of syslog messages sent to the server that came from devices that are not selected for monitoring (as described in [Selecting Devices to Monitor, page 69-34](#)).

Events from unmonitored devices are always dropped, but they do place a load on the service. The IP address of the last unmonitored device detected is shown; use the IP address to determine the source of the messages. You can then determine if the device should be added to the monitored devices list, or if you need to alter the device's configuration to remove the Security Manager server from its list of syslog servers.

If the device that is sending messages is outside of your network, adjust the firewall configuration to prevent this syslog traffic from entering your network.

- **Status Information:**

- **Total Events Per Second (EPS)**—The rate at which events are currently being processed. This measure does not include dropped events.
- **Event Buffer Used**—The percentage of the shared event buffer that is currently being used to process events. The bar is color-coded to indicate the throttle level:

Green—Not in throttle mode.

Yellow—Low severity events are being dropped.

Orange—Low and medium severity events are being dropped.

Red—High severity events are being dropped.

- **Event Server Alerts**—These messages indicate specific status problems that you might need to address. [Table 69-8](#) explains the messages that you might see with possible solutions.
- **Copy button**—Click the Copy button to copy the information to the clipboard. The copied information includes HTML markup. You can paste the information into an HTML file.

**Table 69-8** *Event Manager Status Messages*

| <b>Alert Message</b>                                                               | <b>Alert Level</b> | <b>Possible Action</b>                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP port <514> could not be acquired, therefore syslog events cannot be collected. | High               | Some external application might already be using the indicated port (the default syslog port is 514). You might need to stop that external application. You can use the netstat command to identify the PID of the process, for example, <b>netstat -ao   findstr 514</b> .                                                                                |
| The event data store location does not exist, therefore events cannot be stored.   | High               | The event data store location as configured in the Security Manager Administrative Settings does not exist or the Security Manager server does not have the required read/write permissions to the location. For more information about configuring the location, see <a href="#">Event Management Page, page 11-27</a> .                                  |
| Low severity events are being dropped.                                             | Low                | Either events are being received at a very high rate or the system is under a heavy load.                                                                                                                                                                                                                                                                  |
| Low and medium severity events are being dropped.                                  | Medium             | To identify if a device is sending events too frequently, you can open the All Device Events view and switch to real-time mode, as described in <a href="#">Switching Between Real-Time and Historical Views, page 69-42</a> .                                                                                                                             |
| All events are being dropped.                                                      | High               | To identify if the server is under a heavy load, log into Windows on the server and use Task Manager or another tool to see if there is an application other than Security Manager that is taxing the system. If possible, disable or stop the application. If the problem occurs frequently, consider uninstalling the other application from the server. |

**Table 69-8** Event Manager Status Messages (continued)

| Alert Message                                                       | Alert Level | Possible Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Events from unknown devices are being received.                     | Low         | Syslog events are being sent to the Security Manager server from devices that are not selected for monitoring as described in <a href="#">Selecting Devices to Monitor</a> , page 69-34. These devices might not be supported device types for monitoring and they might not even be in the Security Manager inventory.<br><br>The message varies based on the EPS rate for these devices. A low severity message indicates the EPS rate is between 500 and 5,000; a medium indicates an EPS rate between 5,000 and 10,000; a high indicates an EPS rate greater than 10,000.<br><br><b>The Events from Unmonitored Devices</b> statistic in the Last 5 Minutes Statistics shows the number of these events and the IP address of the last unsupported device. Either select the device for monitoring or change the syslog policy for the device to remove the address of the Security Manager server. You will need to repeat the process if more than one unmonitored device is sending messages. |
| Events from unknown devices are being received at a high rate.      | Medium      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Events from unknown devices are being received at a very high rate. | High        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Selecting Devices to Monitor

All ASA and FWSM devices and security contexts, and IPS devices and virtual sensors, that are added to the Security Manager database are automatically selected for monitoring in Event Viewer.

### Note

To reliably report events from contexts in multiple-context mode, Cisco Event Viewer requires an IP address for the management interface of each context.

### Note

Beginning with version 4.17, Cisco Security Manager receives events from non-management interfaces also, with following limitations:

- Only Static IP address Interface is supported.
- The events from cluster devices will not be displayed because cluster pool IP ranges for syslog would be used.
- Only after deployment of syslog server configuration, the device event manager is notified to get the non-managed interface IP. Hence, there can be initial event drop.
- This enhancement is not supported in syslog relay services.

If you do not want to use Event Viewer with a device, you can deselect the device for monitoring. Note that if an ASA or FWSM device or security context is not configured to use the Security Manager server as a syslog server, you will not get events from the device or security context anyway, so you might not need to deselect an ASA or FWSM that you do not want to monitor.

**Tip**

You cannot monitor Cisco IOS IPS devices in Event Viewer.

**Related Topics**

- [Adding Devices to the Device Inventory, page 3-7](#)
- [Configuring ASA and FWSM Devices for Event Management, page 69-28](#)
- [Configuring IPS Devices for Event Management, page 69-29](#)

- 
- Step 1** In Event Viewer, select **View > Manage Monitored Device** to open the Manage Monitored Devices dialog box.
- The device list shows all devices in the Security Manager inventory to which you have view permissions. You cannot see any devices for which you have no permissions. Any selections you make are limited to the displayed devices. If you do not have permission to select or deselect any devices, the list is read-only and you cannot select devices for monitoring. For more information on access permissions, see [Understanding Event Viewer Access Control, page 69-4](#).
- Step 2** Ensure that only those devices whose events you want to monitor in Event Viewer are selected. Deselect any undesired devices.
- You can change the selection status for all devices in a device group by selecting or deselecting the group.
- Step 3** Click **OK**.
- You might need to wait for the changes take effect in Event Viewer.
- 

## Monitoring Event Data Store Disk Space Usage

The Event Manager service uses a specified amount of disk space for the primary and extended event data stores. This ensures that the service does not overwhelm the server computer or the extended storage location. You configure the size of the primary and extended event data stores on the **Tools > Security Manager Administration > Event Management** page as described in [Event Management Page, page 11-27](#).

For both the primary and extended locations, when the allocated space is 90% full, the oldest event data is deleted from storage to make room for new data. Data is copied from the primary store to the extended store, if you configure one, so in most cases events deleted from the primary storage continue to be available for querying from the extended storage location, until they are rotated out of the extended storage. (The timing of the copy from the primary to extended data store depends on a number of factors, including the events per second (EPS) rate, the relative size of the primary store to the extended store, and the percentage of the primary data that has already been copied to the extended store.)

You can monitor how much of the allocated space is currently being used, and the age of the oldest event, by selecting **View > Show Event Store Disk Usage** in Event Viewer. The information is displayed as a pie chart that shows the used and unused space in gigabytes (GB) for each location. There is also an indication of the oldest event currently stored in each location.

You can use this information to help you decide whether to increase or decrease the space allocated to each location.

**Tip**

If you decrease the size of either location, and your new size is less than the amount of space currently being used, the oldest events are immediately deleted until your new target size is reached.

## Archiving or Backing Up and Restoring the Event Data Store

The event data store is not included with the regular Security Manager database backup. If you want to archive or back up the event data store, whether the primary or extended location, you must do so separately. You can restore the backups if necessary.

This procedure explains the steps required for backup and restore for the event data store.

**Tip**

When you disable the Event Manager service, events are not written to the data store, so you will miss any events generated during the backup or restore process.

**Step 1** To back up the event data store:

- a. Using the Security Manager client, select **Tools > Security Manager Administration**, and select **Event Management** from the table of contents.
- b. Determine the name of the event data store folder. The folder is shown in the Event Data Store Location field; the default is *NMSROOT\MDC\eventing\database*, where NMSROOT is the installation directory (usually C:\Program Files\CSCOPx).  
  
If you are backing up the extended data store, the location is identified in the Extended Data Store Location field.
- c. Deselect the Enable Event Management check box to stop the Event Manager service. Click **Save** to save your changes. You are prompted to verify that you want to stop the service; click **Yes** and wait until you are notified that the service has stopped.
- d. Outside of Security Manager, make a copy of the *NMSROOT\MDC\eventing\config\collector.properties* file and the event data store folder. Place the copy on a separate server so that the backup is available in case of hardware failure.  
  
If you are also backing up the extended data store, make a copy of that folder as well.
- e. In the Security Manager client's **Tools > Security Manager Administration > Event Management** page, select the **Enable Event Management** check box and click **Save**. You are prompted to verify that you want to start the service; click **Yes** and wait until you are notified that the service has started.

**Step 2** To restore the event data store, use the same process you used to back up the data with the following exceptions:

- Instead of making a copy of the existing event data store, copy the backup into the event data store location. You can optionally delete the existing data before copying in the backup data. However, as long as you do not exceed the data store size limit, you can mix the backup and existing data. (The data store limit is configured in the **Tools > Security Manager Administration > Event Management** page.)

**Note**

Mixing old and new data works only if you are preserving the existing copy of collector.properties (that is, you are not restoring the file), and the new and old data are from the same server. You cannot merge the data store from two or more separate servers.

- Do not restore collector.properties unless you are recovering from a hardware failure or some other event that required you to reinstall Security Manager.

## Using Event Viewer

Use Event Viewer to help troubleshoot network problems involving monitored devices. Using views and filtering, you can analyze problems to help identify the cause and possible remedies.

This section contains the following topics:

- [Using Event Views, page 69-37](#)
- [Filtering and Querying Events, page 69-43](#)
- [Performing Operations on Specific Events, page 69-49](#)
- [Looking Up a Security Manager Policy from Event Viewer, page 69-54](#)
- [Looking Up Events for a Security Manager Policy, page 69-55](#)

## Using Event Views

When you view events in Event Viewer, you open a view. A *view* is a set of filters and other properties, including color rules, selected columns and their positions and widths, and the default time window, that let you define a subset of events. Views help to limit the scope of the events list so that you can more easily find what you are looking for.

This section contains the following topics:

- [Opening Views, page 69-38](#)
- [Floating and Arranging Views, page 69-38](#)
- [Customizing the Event Table Appearance, page 69-39](#)
- [Switching Between Source/Destination IP Addresses and Host Object Names, page 69-39](#)
- [Configuring Color Rules for a View, page 69-40](#)
- [Creating Custom Views, page 69-41](#)
- [Editing a Custom View Name or Description, page 69-41](#)
- [Switching Between Real-Time and Historical Views, page 69-42](#)
- [Saving Views, page 69-42](#)
- [Deleting Custom Views, page 69-43](#)

## Opening Views

You can open up to four historical views and one real-time view in Event Viewer. When you open a view, Event Viewer uses the view settings and time range to retrieve events from the event data store and display them in the event table.

- To open a view so that it replaces the currently active open view, do one of the following in Event Viewer:
  - Double-click the view in the views list.
  - Right-click the view in the view list and select **Open**.
- To open a view in a new tab, do one of the following:
  - Select **File > Open View** from the menu bar. The Open a View dialog box opens, which is essentially the same as the view list. Select the view and click **OK**.
  - Right-click the view in the views list and select **Open In New Tab**.

## Floating and Arranging Views

You can open up to four historical views and one real-time view at one time. When you have multiple views open, they are opened as tabbed windows in the right pane of the main Event Viewer window, in the most recently used area (“tabbed group”) if there is more than one area. The commands to arrange the windows appear if you right-click the tab for the view window as shown in the following illustration.

You have many options for arranging view windows based on your requirements. For example, you might want to compare two views side-by-side, or remove a view from the main window without closing it.

You can use the following techniques to arrange the view windows to get the display that you desire:

- Floating a view—To remove a view from the main Event Viewer window without closing it, right-click the view tab and select **Floating**. The view is moved to its own window.
  - If you have already floated a view, you can select **Floating to** and choose one of the already-floated windows. The view becomes a new tab in that window.
- Docking a view—To move a floating view back to the main Event Viewer window, right-click the view tab and select **Docking**.
- Arranging views horizontally or vertically for side-to-side comparison—To create a vertical or horizontal arrangement of views to allow for easy comparison, without floating the views, right-click the view tab and select **New Horizontal Group** or **New Vertical Group**. These

commands split the current tabbed group into the selected layout. You must have at least two views open to use these commands. If you have more than two open views, and you want all of them in separate windows, you need to use the command multiple times.

- Move views to different tabbed groups—If you have several open views, and you have arranged them into horizontal or vertical groups, you can move views among the groups by right-clicking the view tab and selecting **Move to Next Tab Group** or **Move to Previous Tab Group**. The commands appear only if views are arranged in a manner where such movement is possible:
- Change the orientation of groups—You can switch between horizontal and vertical layouts by right-clicking the view tab and selecting **Change Tab Groups Orientation**.

## Customizing the Event Table Appearance

You can customize the appearance of predefined or custom views in the event table to meet your requirements. You can save these changes even in the predefined views.

You can do the following to customize the event table:

- Create column filters to limit the type of events listed. Use the down arrows in the column heading to define the filter as described in [Creating Column-Based Filters](#), page 69-45.
- Create color rules to highlight events based on severity, as described in [Configuring Color Rules for a View](#), page 69-40.
- Change which columns appear in the table by clicking the Column Selector icon to the right of the table heading row, as described in [Columns in Event Table](#), page 69-18.
- Change the width of a column by clicking the right edge of the column heading and dragging it to the desired size.
- Change the order of the columns by clicking the column heading and dragging the column to the position you want.
- Sort the events list by a column by clicking the column heading. The column sorts based on a three-click cycle: ascending, descending, and default order (which is by event reception time).
- Reset the width of the View Selector and Event Monitoring window to their default values by selecting **View > Reset Layout**.
- Change whether the source and destination columns show IP addresses or host object names, as described in [Switching Between Source/Destination IP Addresses and Host Object Names](#), page 69-39.

### Related Topics:

## Switching Between Source/Destination IP Addresses and Host Object Names

You can view source and destination IP addresses or you can view the host object name of objects that match a source or destination IP address. By default, the Event Viewer shows host object names when available.

IP address to host name mapping is supported only for the source and destination of events. Also, the mapping applies to Host objects only; Event Viewer will not show an object name when the source or destination of an event matches a Network object, Group object, or Address Range object.

Please clarify the type and content of the object. E.g. is this feature for host type network/host objects only, that is, the single-value host version of the object? does it work for single-value group objects, or for network or range objects?

To switch between source/destination IP addresses and host object names, do the following:

- To see host objects names for any objects that match a source or destination IP address, select **View > Show Network Host Objects**. This option is selected by default.

**Tip**

Hover over a host object name to view the IP address associated with that object.

**Note**

An IP address to host object name cache is created when Event Viewer is launched. If you define new host objects, you must submit those changes to the database and then close and relaunch Event Viewer for those mappings to be used.

- To see IP addresses in the source and destination columns, deselect **View > Show Network Host Objects**.

## Configuring Color Rules for a View

You can use color rules to color-code events shown in the event table based on the severity of the event. Color-coding can help you quickly identify the events that you most want to know about.

You can selectively enable and disable color rules by editing them. This allows you to turn them on and off without deleting them.

**Tip**

You can configure color rules for both predefined and custom views. However, you cannot share color rules between views: all color rules are unique to a view. If you want to apply the same rules to multiple views, you must recreate the rules in each view.

To define and enable a color rule, follow these steps:

- Step 1** Open the view in which you want to define the color rule (see [Opening Views, page 69-38](#)).
- Step 2** Click the **Color Rules** tab in the View Settings pane (see [Event Monitoring Window, page 69-14](#)).
- Step 3** Do any of the following:
  - To add a new rule, click the **Add** button. In the Add Color Rule dialog box, configure the rule as follows:
    - Select **Enable** to make the rule active.
    - Select the severity level for which the rule applies from the **Severity** list.
    - Use the **Foreground** (which is the text color), **Background**, and **Font Type** (either Bold or Italics) controls to define how the severity should be presented in the table. The Preview Text area shows how your rule will look.
  - To edit a rule, select it and click the **Edit** button.
  - To delete a rule, select it and click the **Delete** button.

## Creating Custom Views

A custom view is one in which you define the filters in the view settings. Using custom views, you can configure filter rules to pin-point specific areas for monitoring and analysis. Custom views are private and cannot be shared between users.

You basically have two options for creating custom views, creating a view from scratch or from an existing view:

- To create a custom view that has no predefined column filters, do one of the following:
  - Select **File > New View** from the menu bar.
  - Click the **New** button above the view list.

Then, enter a name for the view and optionally a description of the view and click **OK**. The view is added to the My Views folder in the views list.

- To create a custom view based on an existing view, do one of the following:
  - With the desired base view open, click the down arrow on the Save button in the event table toolbar and select **Save As**, or select **File > Save As** from the menu bar.
  - Right-click the desired base view in the views list and select **Save As**.

Then, enter a name for the view and optionally a description of the view and click **OK**. The view is added to the My Views folder in the views list. The new view has the same filters as the base view.

**Note**

View names can be up to 128 characters and contain alphanumeric characters, spaces, hyphens (-), underscore characters (\_), plus signs (+), periods, and ampersands (&). The description can be up to 1024 characters.

After you create the new view, you can customize it the same way that you can an existing view:

- Define filters in the view settings. See [Creating Column-Based Filters, page 69-45](#).
- Define color rules in the view settings. See [Configuring Color Rules for a View, page 69-40](#).
- Select the columns to display in the event table. See [Columns in Event Table, page 69-18](#).
- Customize the event table appearance. See [Customizing the Event Table Appearance, page 69-39](#).

**Related Topics**

- [Views and Filters, page 69-3](#)
- [Event Table Toolbar, page 69-16](#)
- [Editing a Custom View Name or Description, page 69-41](#)
- [Deleting Custom Views, page 69-43](#)

## Editing a Custom View Name or Description

To change the name of a custom view, or the custom view's description, do one of the following:

- Select the custom view in the view list and click the **Edit** button above the list.
- Right-click the custom view in the view list and select **Edit**.

Then, make the desired changes to the custom view name or description and click **OK**.

**Note**

---

View names can be up to 128 characters and contain alphanumeric characters, spaces, hyphens (-), underscore characters (\_), plus signs (+), periods, and ampersands (&). The description can be up to 1024 characters.

---

You cannot change the name or description of a predefined view.

## Switching Between Real-Time and Historical Views

You can update the events table for any view using either real-time or historical time periods. A real-time view shows events as they are received, whereas an historical view shows a static list of events that is not updated until you click the **Start** button in the event table toolbar.

To switch between real-time and historical time periods in an open view, do the following:

- To see events in real-time, select **View > Mode > Real Time**, or click the Time Selector control in the event table toolbar and select **Real Time**. For help in locating the control on the toolbar, see [Event Table Toolbar, page 69-16](#).
- To see events in an historical period, select the desired time frame from the **View > Mode** menu or from the Time Selector control on the event table toolbar. All options other than Real Time are historical views. For more information, see [Selecting the Time Range for Events, page 69-43](#).

## Saving Views

If you edit the settings for a view, you must save it to make those changes permanent. Saving a view saves changes to filters (for custom views only), table preferences such as selected columns, column width, and sort order, the time range, and color rules. If you make filter changes to a predefined view, you must use Save As to create a new custom view.

- To save changes to a view, do one of the following in Event Viewer:
  - Select **File > Save** from the menu bar.
  - Click the **Save** button in the event table toolbar.

You are asked to confirm that you want to save your changes.

- To save your changes as a new custom view, do one of the following to open the Save View As dialog box:
  - Select **File > Save As** from the menu bar.
  - Click the down arrow on the Save button in the event table toolbar and select **Save As**.
  - Right-click the view in the views list and select **Save As**.

Then, enter a name for the view and optionally a description of the view and click **OK**. The view is added to the My Views folder in the views list.

**Note**

---

View names can be up to 128 characters and contain alphanumeric characters, spaces, hyphens (-), underscore characters (\_), plus signs (+), periods, and ampersands (&). The description can be up to 1024 characters.

---

## Deleting Custom Views

You can delete custom views, but you cannot delete predefined views. To delete a custom view, do one of the following:

- Select it in the view list and click the **Delete** (trash can) button above the list.
- Right-click it in the view list and select **Delete**.

You are asked to confirm your deletion.

## Filtering and Querying Events

There are many options for filtering the events that appear in the event table. You can reduce the list of events by selecting the appropriate time range, by filtering on elements in specific columns, or even by searching on a text string.

This section contains the following topics:

- [Selecting the Time Range for Events, page 69-43](#)
- [Using the Time Slider with Filtering, page 69-44](#)
- [Refreshing the Event Table, page 69-44](#)
- [Creating Column-Based Filters, page 69-45](#)
- [Filtering Based on a Specific Event's Values, page 69-47](#)
- [Filtering on a Text String, page 69-47](#)
- [Clearing Filters, page 69-48](#)

## Selecting the Time Range for Events

Use the Time Selector control in the event table toolbar, or the equivalent **View > Mode** command, to select the time range for displaying events. The event table lists only those events that occur within the selected time range. For help in locating the Time Selector control on the toolbar, see [Event Table Toolbar, page 69-16](#).

### Tip

---

For historical views, the time is based on server time, not the time configured on your workstation.

---

When you change the time range, the table reloads to show events in the selected range. For historical views, you can refresh the events list by clicking **Start** or by doing the other actions described in [Refreshing the Event Table, page 69-44](#).

The following are your options for the time range:

- To view events from the present time into the past, select one of the following time periods: **last 10 minutes**, **last 1 hour**, **last 12 hours**, **last 1 day**, or **last 1 week**.
- To view events from today or yesterday, select **today** or **yesterday**, as desired.
- To view events from a specific day, select **is on** and then select the date from the displayed calendar.
- To view events from a specific date and time range, select **is between** and select the first and last days and times from the displayed calendars.
- To view real-time events, select Real Time.

## Using the Time Slider with Filtering

You can use the vertical slider control in the time slider to change the start time for the events shown in the event table. This is particularly useful when you want to locate events and you know the approximate time they occurred.

For details on the operation of the time slider, see [Time Slider, page 69-25](#).

To use the time slider to aid filtering, follow these steps:

---

**Step 1** Open an historical view, or use the Time Selector in the toolbar, or the **View > Mode** command, to select an appropriate time range, such as Last 10 Minutes. For more information, see [Selecting the Time Range for Events, page 69-43](#).

**Step 2** Move the vertical slider to the approximate time of the events you want to examine. The event table is reloaded to display events on or before the time you specified with the vertical slider. This time range is shaded in the time slider, and the length of time selected is based on the length of time selected in the Time Selector (for example, 10 minutes for a Last 10 Minute view, or the same length of time selected for an “is between” view). The time range is noted in the Time Selector control, for example:

**Step 3** To locate the events, you can now do any of the following:

- Apply custom column filters. See [Creating Column-Based Filters, page 69-45](#).
- Use the quick filter to search on a text string. See [Filtering on a Text String, page 69-47](#).
- Scroll or page through the event table.
- Use the time slider paging controls to reset the time range forward or back. For more information, see [Time Slider, page 69-25](#).

---

**Note** The distance moved forward or back when paging in the time slider depends either on the mode (time range) that is set or the number of events the event table can hold. The position of the vertical slider denotes the most recent event loaded in the event table.

---

## Refreshing the Event Table

When you are using an historical mode, such as “last 10 minutes,” the latest events displayed correspond to the time you selected the time range or opened the view. Similarly, if you are in real-time mode and have clicked Stop, the event table does not include events that arrived after you stopped the event stream.

To refresh the events listed in the event table, so that they are current with your selected time range, do any of the following:

- Click **Start** in the toolbar, or select **View > Start**. The table is refreshed based on your currently selected time range. For real-time views, the event stream restarts.
- Select a different time range using the Time Selector in the toolbar or the **View > Mode** command.
- Select a different time slice using the vertical slider or the pagination controls in the time slider below the event table. For more information on using these controls, see [Time Slider, page 69-25](#).

## Creating Column-Based Filters

You can filter the event table in Event Viewer based on the contents of specific columns. Column filters are the type of filter contained in the view settings; they define the basic content of the view. Whenever you apply a column filter, the view settings for the view are updated to include the newly selected filter; you must save the view before closing it if you want the new filter to become a permanent part of the view's definition.

There are many ways in which to define a column filter:

- In the View Settings pane, click the **Add** button. You are first prompted to select the column on which to base the filter. When you click **OK**, you are prompted to create the filter.
- In the View Settings pane, select a filter and click the **Edit** button to change it.
- In the event table, click the down arrow button in the heading of a column and select any of the following from the drop-down list:
  - A specific entry. The drop-down list contains all values currently displayed in the events listed in the table.
  - (All). Select (All) to remove a filter from this column. The event table is updated to show the events that meet your other filter criteria.
  - (Custom). Select (Custom) to create a filter that might have multiple values, negative values, or be based on data not currently contained in the column in the current event table. Selecting (Custom) is essentially the same as creating a filter directly in the View Settings pane.
- In the event table, you can right-click a value and select **Filter This Value**. This action has the same effect as selecting the value from the drop-down list for the column.

You can alternatively select **Filter Not This Value** to create a filter that excludes a value,

- In the event table, you can right-click a value and select **Create Filter from Event**. You are prompted to select the specific columns to include; the column on which you right-clicked is initially selected, but you can deselect it.

The following procedure explains how to build a custom column-based filter, one in which you are not simply selecting a value from the column's drop-down list.

### Tips

- Column filters are cumulative: for an event to appear in the event table for a view, the event must meet all column filter criteria. You cannot create a set of OR'ed column filters.
- Some columns allow you to select network/host or service policy objects to define the filter criteria. Selecting policy objects can simplify your filters. However, for a policy object to be selectable in a filter, the object must be committed to the database. If you create a new object for filtering purposes, ensure that you submit your changes in Configuration Manager (and if using Workflow mode with an approver, get the changes approved) before attempting to create the filter in Event Viewer.

When using policy objects, the filtering recognizes whether a device-level override is defined for the object. For example, if you use a network/host object that contains 10.10.10.10, and Device A has an override to change the address to 10.10.10.12, events from Device A appear in the list only if the event matches 10.10.10.12. For devices that do not have overrides, the events must match 10.10.10.10. Furthermore, if Device A has an event that matches 10.10.10.10, that event is not listed because it does not match the device-level override. Thus, using policy objects can provide results that vary by device and therefore match more closely to your policy definitions.

If your organization is using ACS to control user access, you must have the appropriate View Object privileges for network/host, network/host-IPv6, and service objects to use them in filters.

- You can filter on the contents of most but not all columns. If a column does not have a down arrow, you cannot filter on it. For example, you cannot filter on Description, Event Name, Generation Time, or Receive Time.
- The filter icon (a funnel) appears in the heading of a filtered column.
- For a description of the available columns, see [Columns in Event Table, page 69-18](#).

**Step 1** Do one of the following:

- In the View Settings pane, click the **Add** button. The Add Custom Filter to a Column dialog box opens. Select the column on which to base the filter and click **OK**.
- In the View Settings pane, select a filter you want to change and click the **Edit** button.
- From the drop-down list for a column, select **(Custom)**.
- Right-click any cell in the desired column and select **Custom Filter**.

The Custom Filter dialog box opens for the selected column.

**Step 2** In the Custom Filter dialog box, select the desired values. The following illustration shows a typical example of this dialog box, for the Source column.

Following is a description of the controls you might find in the Custom Filter dialog box. Not all controls appear for every column:

- **Available and Selected Items lists**—In most cases, to select an item you highlight it in the left list, which contains the available values, and click the right arrow to move it to the list of selected values. You can select multiple values. The right list defines the filtered values.

The items listed in the available values column are determined by the values currently present in the events listed in the events table. For address and service fields, the list also includes policy objects. If there are a lot of available values, you can search for the desired value by typing into the edit box above the list; the list is filtered as you type. Click the down arrow next to the Q to change how your search string is evaluated for matches.

You can also select, or deselect, values using the following techniques:

- Type the item into the edit box above the selected values list and click the + button. This technique is useful if there is a large number of available values, or if you want to filter on a value that is not present in the current events list.

- Double-click an item in either list to move it to the other list.
- Click the double-arrow buttons to move all items, regardless of your selection.

**Note**

In a limited number of cases, the Custom Filter dialog box contains a single list. For example, the dialog boxes for the Event Type ID and Device columns contain single selectors. In these cases, make your selection using the check boxes next to the items; selecting a folder selects all items in the folder.

- **Filter on IPv6 Addresses**—For columns that contain addresses, use this option to toggle between listing IPv4 and IPv6 addresses and network/host objects in the available values column. You can filter on either IPv4 addresses or IPv6 addresses, but not both, in a single view.
- **Condition, Not**—Defines the condition applied to the selected items, typically “is in.”  
To create a negative condition, so that selected values define the events to not include in the events table, select the Not option.

**Step 3** Click **OK**.

The view settings are updated to include the new filter, and the events table is updated to show only those events that satisfy all filters.

## Filtering Based on a Specific Event's Values

You can base a new filter on information contained within an event, or a single cell within an event, by right-clicking and choosing a filter command. When you filter using these commands, a column filter is added to the view settings. You can do the following:

- To create a filter based on multiple values in the selected event, select **Create Filter from Event**, then select from the dialog box the values on which to filter. The dialog box lists only those columns that are displayed in the table; the current values are shown in parentheses. For an explanation of the columns, see [Columns in Event Table, page 69-18](#).
- To filter on only the value in the cell on which you right-click, select **Filter This Value**.
- To filter to exclude the value in the cell on which you right-click, select **Filter Not this Value**. All events that do not contain the selected value in this column, including all empty cells, are shown in the table.
- To filter on the flow of the selected event, based on source, source service, destination, and destination service, select **Filter This Flow**.

## Filtering on a Text String

Use the quick filter to search for text strings in events. As you type a search keyword, the events table automatically excludes non-matching events as you type. You can search on all columns (the default), or you can select a specific column in which to search.

The following illustration shows the quick filter, which is on the right of the event table toolbar (see [Event Table Toolbar, page 69-16](#)).

To perform a search, simply type in the search string. To change how the string is evaluated, click the down arrow next to the Q (magnifying glass) in the left of the edit box. You can limit the search scope using these controls:

- **Column name**—Select a specific column to search only within that column. The list includes all columns currently displayed in the table. The default is to search all columns.
- **Case sensitivity**—Select **Case sensitive** or **Case insensitive** to control whether capitalization is considered when selecting matches. The default is case insensitive.
- **Wild card usage**—Select **Use Wild Cards** to have the following characters evaluated as wild cards:
  - \* (asterisk)—matches 0 or more characters.
  - ? (question mark)—matches one character.
- **Match method**—Select one of the following to determine the location within a cell that the search string should reside:
  - Match from start—The string must be at the beginning of the cell.
  - Match exactly—The cell must contain all and only the search string.
  - Match anywhere—The string can appear anywhere within the cell.

To remove the search string, simply delete it from the quick filter edit box.

For example, if you want to find events that relate to ports that start with tcp/48, type **tcp/48** into the quick filter. In the following illustration, note that all but six events are filtered out of the table. In this example, the search string is found in the Source Service column for the first five events, but in the Destination Service column for the sixth event. If you know beforehand that you are interested in destination services only, you could select **Destination Service** from the quick filter drop-down list and the table would show the last event only.

| Receive Time      | Severity | Event Type ID | Device   | Source        | Source Serv... | Destination     | Destination ... | Description           |

## Clearing Filters

When you apply filters to the event table, non-matching events are not displayed. You might find that you need to see the non-matching events. You can either open a different view that applies different (or no) filters, or you can clear filters from the current view.

When clearing filters, the filter definition is removed from the view settings, but the change is not permanent until you click **Save**. Thus, you can remove filters temporarily without redefining the view settings.

You can clear filters one at a time or clear all filters:

- To clear a single filter, so any of the following:
  - Select the filter in the View Settings pane and click **Delete**.
  - Select **(All)** from the drop-down list of a filtered column.
  - Right-click in the filtered column and select **Clear This Filter**.

- To clear all filters, right click in the events table and select **Clear all filters**.

## Performing Operations on Specific Events

You can operate upon a single event in the event table in a variety of ways, which include the following:

- **Right-click**—Right-clicking a single event in the event table opens a context menu with commands that you can use on the event. For more information about what you can do from the right-click menu, see the following topics:
  - [Event Context \(Right-Click\) Menu, page 69-49](#)
  - [Examining Details of a Single Event, page 69-53](#)
  - [Copying Event Records, page 69-53](#)
  - [Saving Events to a File, page 69-53](#)
  - [Filtering Based on a Specific Event's Values, page 69-47](#)

---

**Note** You can hover your mouse over a valid IPv4 address in Event Viewer to launch the IP Intelligence tool for that IP address. The IP Intelligence tool provides various pieces of information about an IPv4 address, such as the fully qualified domain name (FQDN), geographic location information, and WHOIS information. For more information on the IP Intelligence tool, see [IP Intelligence, page 72-34](#).

---

- **Select an event**—When you click a single event in the event table it is highlighted and the Event Details pane displays details for that particular event. Hold the **Ctrl** key to select additional events, or hold the **Shift** key to select a range of events.
- **Double-click an event**—Double-clicking a single event in the event table opens the Event Details dialog box, which shows the event information in an easier-to-read format. From the Event Details dialog box, you can print the displayed details or copy some, or all, of the details to the clipboard for pasting into another program. You can use the Next and Previous buttons to scroll through the events listed in the event table. For information on the meaning of the attributes, see [Columns in Event Table, page 69-18](#).

Alternatively, you can right-click on an event and select **Show All Details** to open the Event Details dialog box.

### Event Context (Right-Click) Menu

When you right-click an event in the Event Table, a context menu appears that provides commands that you can use with the selected event. The specific list of available commands depends on the type of event and also the specific cell on which you right-click. The following table explains all of the available commands.

**Note**

---

In addition to the right-click options listed below, you can also hover your mouse over a valid IPv4 address in Event Viewer to launch the IP Intelligence tool for that IP address. The IP Intelligence tool provides various pieces of information about an IPv4 address, such as the fully qualified domain name (FQDN), geographic location information, and WHOIS information. For more information on the IP Intelligence tool, see [IP Intelligence, page 72-34](#).

---

**Table 69-9 Event Context Menu**

| <b>Command</b>                             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clear This Filter                          | Removes the filter defined for this column. The command is available only if you right-click on a cell that is in a filtered column.<br><br>The filter is removed from the view settings. You must save the view to make your change permanent.                                                                                                                                                                      |
| Clear All Filters                          | Removes all filters from the view settings. This command is available only if there is at least one column filter.<br><br>You must save the view to make your change permanent.                                                                                                                                                                                                                                      |
| Filter This Value<br>Filter Not This Value | Creates a column filter based on the value in the cell that you right click. You can create either a positive or negative filter based on the value.<br><br>The view settings are updated with the new filter and replace any existing filter for this column. You must save the view to make your change permanent.                                                                                                 |
| Create Filter from Event                   | Creates a set of column filters based on the values in the selected event. You are prompted to select the specific columns to include; the column on which you right-clicked is initially selected, but you can deselect it.<br><br>The view settings are updated with the new filters and any existing column filters for the selected columns are replaced. You must save the view to make your changes permanent. |
| Custom Filter                              | Creates a custom column filter, as described in <a href="#">Creating Column-Based Filters, page 69-45</a> .<br><br>The view settings are updated with the new filter and any existing filters for the selected columns are replaced. You must save the view to make your changes permanent.                                                                                                                          |
| Filter This Flow                           | Creates a set of column-based filters that present the events related to a specific traffic flow. Filtered columns are source and source service and destination and destination service.<br><br>The view settings are updated with the new filter and any existing filters for the selected columns are replaced. You must save the view to make your changes permanent.                                            |
| Show IPLogs                                | Opens the IP log for an IPS Alert event using an external packet analyzer tool. You must have a packet analyzer installed and associated with *.pcap file extension.                                                                                                                                                                                                                                                 |
| Show All Details                           | Opens the Event Details dialog box for the event, which shows all event information in an easier-to-read format. You can also print the details or copy them to the clipboard.<br><br>The details are the same as those shown in the Event Details pane below the event table.                                                                                                                                       |

**Table 69-9 Event Context Menu (continued)**

| Command        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tune Signature | <p>Opens the IPS Signature Quick Tune dialog box where you can enable or disable the signature associated with the selected event, and modify the Base Risk Rating of the signature that is assigned to the device or shared policy.</p> <p>To tune a signature you must create or open a ticket. For more information see <a href="#">Working with Activities/Tickets, page 4-7</a>.</p> <p>The Base Risk Rating value of the signature is calculated by multiplying the fidelity rating and the severity factor and dividing them by 100 (Fidelity Rating x Severity Factor /100). This value is read only; you cannot directly change it. To change the Base Risk Rating, you must alter the Severity and Fidelity values.</p> <ul style="list-style-type: none"> <li>• Severity: The severity level that the signature will report: High, Medium, Low, or Informational, where, <ul style="list-style-type: none"> <li>- High = 100</li> <li>- Medium = 75</li> <li>- Low = 50</li> <li>- Informational = 25</li> </ul> </li> <li>• Fidelity: The Fidelity Rating, or Signature Fidelity Rating (SFR), identifies the weight associated with how well this signature might perform in the absence of specific knowledge of the target. This rating can be any number from 0 to 100, with 100 indicating the most confidence in the signature.</li> </ul> <p>After you enable or disable the signature or modify the Base Risk Rating you must redeploy the configuration to the device, using Configuration Manager, for the change to take effect on the device. Note that such changes will affect only real time events and not the historical events. For information about deploying configuration, see <a href="#">Chapter 8, “Managing Deployment”</a>.</p> |

## IPS Signature Quick Tune Dialog Box

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Signature Quick Tune dialog box to enable or disable the signature associated with the selected event, and modify the Base Risk Rating of the signature that is assigned to the device or shared policy.

### Navigation Path

In Event Viewer, right-click a row (an event) and click **Tune Signature**. For more information, see [Event Context \(Right-Click\) Menu, page 69-49](#).

## Examining Details of a Single Event

Each event contains a lot of specific information in many separate fields. Typically, you display a subset of these fields in the event table. When you want to see the complete details of an event, you can use either of the following:

- **Event Details pane**—Select the event and open the Event Details pane below the event table. You can open the pane by clicking anywhere in the “Event Details” title row, or you can select **View > Show Event Details** from the menu. The Event Details pane organizes the information in tabs. For more information about this pane, see [Event Details Pane, page 69-26](#).
- **Event Details dialog box**—You can open this dialog box by double-clicking the event, or by right-clicking the event and selecting **Show All Details**. The information is presented as a flat list and shows the information that would be shown on the Details tab in the Event Details pane. For information on the meaning of the attributes, see [Columns in Event Table, page 69-18](#).

The Event Details dialog box includes the following controls:

- **Print button**—Click this button to print the information. You are prompted to select a printer.
- **Copy button**—Click the down arrow on this button and select **All Rows** or **Selected Rows**. The information is copied to the clipboard, and you can paste it into another application. Note that the Selected Rows command works only if you select at least one row in the table.
- **Next, Previous buttons**—Click these buttons to scroll through the events currently displayed in the event table. Next moves up and Previous moves down in the table.

## Copying Event Records

You can copy single events, multiple events, all events, or even the contents of a single cell to the clipboard. You can then paste the information into another application, such as a spreadsheet or an e-mail message.

You can do the following from the event table:

- **Copy selected events**—To copy one or more selected events, right-click in the event table and select **Copy Selected Events**. The event you right-click does not matter, the copied events are those that are selected (highlighted) in the table.

Click an event to select it. Hold **Ctrl** key to select additional events, or hold the **Shift** key to select a range of events.

- **Copy the contents of a single cell**—To copy the contents of a single cell in one event, right-click the cell and select **Copy Cell**. You cannot copy cell contents if there is more than one event selected in the table.
- **Copy all events**—To copy all the events shown in the event table, right-click anywhere in the table and select **Copy All Events**.

## Saving Events to a File

Rather than copying events to the clipboard and pasting them into another application, you can directly save events to an HTML or comma-separated values (CSV) file. HTML files are useful for viewing information, whereas you can open a CSV file in a spreadsheet application for further analysis and report generation.

When saving event data, you are prompted to select a folder and enter a file name.

You can do the following from the event table:

- **Save selected events**—To save one or more selected events, right-click in the event table and select either **Save Selected Events as HTML** or **Save Selected Events as CSV**. The event you right-click does not matter, the saved events are those that are selected (highlighted) in the table.  
Click an event to select it. Hold **Ctrl** key to select additional events, or hold the **Shift** key to select a range of events.
- **Save all events**—To save all the events shown in the event table, right-click anywhere in the table and select either **Save All Events as HTML** or **Save All Events as CSV**.

## Looking Up a Security Manager Policy from Event Viewer

In Event Viewer, if an event was generated from an IPS signature policy, or from certain actions related to explicit access rules (such as denied access), you can quickly locate the related signature or access rule from the event itself.

The main reason you would want to perform policy lookup is to adjust a policy based on the events that it is generating. For example, an access rule might be dropping traffic that you actually want to allow. Because you are looking at the event, you know there is a policy that is causing the event, so with a few clicks, you can get from that event to the policy that you need to reconfigure.

You can look up policies from the following types of events:

- Firewall events—You can look up policies for the following syslog messages:
  - 106023—Denied IP packet.
  - 106100—Permit/Denied by ACL.
  - 302013—Built TCP (started a TCP session).
  - 302015—Built UDP (started a UDP session).
- IPS alert events—All IPS events that have valid signature and sub-signature identifiers.

### Tips and Caveats

- You cannot look up firewall policies for events that contain IPv6 addresses. You can look up IPS policies for IPv6 addresses, however.
- When a policy that is based on IP address alone and not on a user name triggers an event, the device looks up the IP address in the Active Directory and if a user name is associated with that IP address, the user name is added to the syslog. Hence, even if a policy does not contain a user name, the resulting syslog might contain it. Policies cannot be created with a destination user and, as a result, this field will not be used during policy lookup.
- If an event is generated for a policy that is configured based on source/destination FQDN, the resulting syslog will not contain the FQDN because of a device defect. In such cases, policy lookup will not work.
- If an event is generated for a policy that is based on user groups, the syslog will contain the specific user name that triggered the event and not the user group. In such cases, policy lookup will not work.
- Hash codes are required for successful policy lookups from syslog 106023 and 106100 events. These hash codes are available only if you deployed the configuration using Security Manager. If policy lookup fails, try deploying the configuration (either to the device or to a file), then try the policy lookup again.
- If you had applied a filter to the device's policy table, and the rule or signature that generated an event is filtered from the current view, Security Manager cannot highlight it. Clear the filter and try again.

- If the event is caused by an implicit rule, such as the implicit **deny any** at the end of access rules, Security Manager cannot highlight the rule. It is practice to create an explicit deny any rule at the end of access lists.
- The target policy is always found in Device view, even if the device uses a shared policy. Device view is opened if necessary to highlight the policy.
- For IPS signatures, you might not be able to edit the signature if it is a default signature.
- For access rules, the selected rule is the best match for the event. It is possible that more than one rule would generate the same event if you have overlapping or redundant rules. In these cases, editing the selected rule might not completely eliminate the event, because a subsequent rule might perform the same action. Use the access rules tools to analyze and combine overlapping rules.
- For access rules, multiple rules might permit a packet during session creation, but the first rule only is highlighted.
- If your organization is using ACS to control access, you must have View Device privileges to the device, and also View privileges to the firewall or IPS policy, to perform policy lookup. If you do not have all permissions, you will get an “Unable to Find Matching Rule” error if you try to look up a matching rule.

---

**Step 1** Right-click the event in Event Viewer and select **Go To Policy**.

**Tip**

You can identify whether you can look up policies from the event by looking at the Event Name cell in the table. If there is a binoculars icon before the event name, policy lookup is available. Also, if the Go To Policy command is greyed out, you cannot look up policies for that type of event.

---

**Step 2** Security Manager finds the related access rule or IPS signature for the device and highlights it in the policy table. From here, you can edit the policy to view or change it; for detailed instructions, see [Configuring Access Rules, page 16-7](#) and [Configuring Signatures, page 39-4](#).

Your changes do not take effect until you submit and deploy the updated configurations.

---

## Looking Up Events for a Security Manager Policy

You can look up events in Event Viewer that relate to specific firewall access rules or IPS signatures. You can also look up events that relate to specific devices or site-to-site tunnels in Health and Performance Monitor.

When Event Viewer receives events, they are parsed, “sessionized,” written to an event buffer, and then written to the database. Sessionizing takes two forms: with a session-oriented protocol, such as TCP, the session encompasses the initial handshake to the connection tear-down; with a sessionless protocol, such as UDP, the session start and end times are based more on first and last packets tracked within a restricted time period—packets that fall outside of the time period are considered parts of other sessions.

Because there is a difference between newly-received and fully processed data, you can look up either real-time or historical events:

- **Real-time**—Because sessionization takes time, keeping an event in cache for up to two minutes, you can use the real-time event query to view events right after parsing, providing access to the most current data received.

- **Historical**—Historical event reports help you identify trends over longer periods of time than is possible with real-time monitoring. For historical events, the Result Format is the All Matching Events option, and the Filter By Time value is set to the previous 10 minutes.

The following topics explain event lookup in more detail:

- [Viewing Events for an Access Rule, page 69-56](#)
- [Viewing Events for an IPS Signature, page 69-57](#)
- [Viewing Events for HPM Devices and Site-to-Site VPNs, page 69-58](#)

## Viewing Events for an Access Rule

From the **Firewall > Access Rules** policy in Security Manager, you can select an access rule and view related event information in Event Viewer. You can view real-time or historical events matching the rule. You can view events for ASA (including ASA-SM) and FWSM devices.

Firewall access rules are presented in the form of an ordered list or table. When deployed, this policy becomes an access-control list (ACL), with each entry in the list known as an access-control entry (ACE). (For more detailed information, see [Understanding Access Rules, page 16-1](#).)

When deciding whether to forward or drop a packet, a device tests the packet against each access rule in the ordered listed. If you enable logging for an access rule, the results of the test are recording according to your per-rule log settings. Some devices, such as ASA, generate log entries for denied access even if you do not configure logging explicitly. For information on creating access rules, including logging options, see [Configuring Access Rules, page 16-7](#).

If logging is enabled for the rule (in the [Advanced and Edit Options Dialog Boxes, page 16-17](#)), the device sends syslog messages to Event Viewer to record the logged events. This query includes the access-rule parameters, including available keyword information. Reported events do not include connection set-up and tear-down.

To view rule-related events, use the following right-click commands:

- **Show Events > Realtime**—To view real-time query results in Event Viewer for events matching this rule. You can change the query criteria in the Event Monitoring window at any time, applying new parameters to alter the real-time results.
- **Show Events > Historical**—To view historical query results in Event Viewer for events matching this rule. You can change the query criteria in the Event Monitoring window at any time, applying new parameters to alter the historical results.

Security Manager provides the following information to Event Viewer as criteria for access-rule event queries:

- Device details—General information about the device, such as host name, domain name, management IP address, and display name.
- Source addresses—Source addresses of hosts and the network/host objects expanded to display the networks or collections of IP addresses.
- Destination addresses—Destination addresses of hosts and the network/host objects expanded to display the networks or collections of IP addresses.
- Service—Protocol and port information.
- Event Type—“Built/teardown/permitted IP connection” for permit rules and “Deny packet due to security policy” for deny rules.

**Notes:**

- You can query on only one access rule at a time.
- When NAT or PAT is configured on a security device, the source and destination addresses are mapped to pre-translation and post-translation addresses, respectively, and the translated addresses are used when Security Manager sends a query to Event Viewer. For inbound access rules, the destination address is considered the pre-translation address, and for outbound access rules, the source address is considered the post-translation address.
- Filtering with multiple services (like UDP, TCP, and ICMP) might not give accurate results. To work around this problem, you can remove some of the filters after Event Viewer is launched.
- Filtering based on ICMP sub types is not supported. For example, if an ACE has 'ICMP Echo' in service, the filter is applied only for the protocol (ICMP), but not for type column (Echo) in Event Viewer.
- Service ports with 'eq', 'neq', 'gt', and 'lt' are not supported in cross launch to Event Viewer.

## Viewing Events for an IPS Signature

**Note**

---

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

---

When an IPS device detects and reports a network intrusion by comparing incoming traffic to a configured signature, a syslog message is generated on the device. If the device is monitored by Security Manager, an incident is generated in Event Viewer after the log associated with the signature is obtained from the device. Looking up the events associated with a specific signature lets you quickly identify attacks and tune your device configuration to minimize or prevent intrusions.

To view reported network intrusion events in Event Viewer, you can select one or more entries in the Signatures policy for a device in Security Manager and navigate to the Event Viewer to view real-time and historical events.

**Related Topics**

- [Looking Up Events for a Security Manager Policy, page 69-55](#)
- [Viewing Events for an Access Rule, page 69-56](#)
- [Viewing Events for HPM Devices and Site-to-Site VPNs, page 69-58](#)

- 
- Step 1** (Device view) With an IPS device selected, select **IPS > Signatures > Signatures** to display the [Signatures Page, page 39-4](#).
- Step 2** Right-click the desired entry in the signatures table, or select multiple entries before right-clicking one of them, and choose one of the following commands from the **Show Events** menu:

- **Realtime**—To view real-time query results in Event Viewer for events matching this signature. Use this option to view raw events as they stream to Event Viewer.

You can change the query criteria in the Event Monitoring window at any time, applying new parameters to alter the real-time results.

- **Historical**—To view historical query results in Event Viewer for events matching this signature.

You can change the query criteria in the Event Monitoring window at any time, applying new parameters to alter the results.

**Tips:**

- If a signature is disabled, you are warned and asked if you want to proceed to event lookup.
- Events of type Packet Data and Context Data are not displayed in the query results because these events are not triggered by signature rules.

## Viewing Events for HPM Devices and Site-to-Site VPNs

From Health and Performance Monitor, you can quickly access events for a monitored device or for site-to-site VPNs that have had a tunnel up/down event.

To view events for a monitored device, select a device from the All Devices, Firewall Devices, IPS Devices, Priority Devices, or custom device-related view, and with the Summary tab selected in the device details area, click the **View Events** button. Event Viewer opens and the Event Monitoring window lists events filtered by the selected device and the time period specified by the slider bar.

To view related events for a site-to-site VPN that has had a tunnel up/down event, do one of the following:

- From the Site-to-Site Tunnels view, click on the Down notification hyperlink in the Status column.
- From the Alerts view, click on the hyperlink in the Description column for tunnel up/down alerts.

Event Viewer will show IPSec VPN Events for the device within a time range depending on the polling interval for that device. If it is a priority device, the time range will be 5 minutes before until 5 minutes after the first up/down notification was received. For non-priority devices, the time range will be +/- 10 minutes instead of 5 minutes.

## Examples of Event Analysis

There are many different techniques you can use to analyze and respond to events generated by your network devices. The examples in this section can help you understand some of the things you can do with the Security Manager Event Viewer.

This section contains the following topics:

- [Help Desk: User Access To a Server Is Blocked By the Firewall, page 69-59](#)

- [Monitoring and Mitigating Botnet Activity](#), page 69-61
- [Removing False Positive IPS Events from the Event Table](#), page 69-66

## Help Desk: User Access To a Server Is Blocked By the Firewall

In this example, the help desk gets a call from a user who cannot access a server.

There are many reasons that a user might not be able to access a server, such as:

- Problems at the server's end of the network, including server down, no network connection, or the server's firewall is actively preventing access by policy.
- Problems in the network cloud between the user and the server, such as routing problems.
- Problems in the user's network, which could include workstation problems, physical problems with a network connection (for example, broken wires), problems with the switch port or wireless access point, DNS lookup failures, and so forth.

The Security Manager Event Viewer cannot identify or resolve these problems. However, it can identify whether a firewall that you control is blocking access to the server. This can help you either to rule out the firewall as being the source of the problem, or if it is blocking access, to fix the problem or to inform the user that the server is blocked by policy.

This procedure assumes that you have first determined that access to the server is not being denied by policy and that the firewall should allow access to the server.

- 
- Step 1** Ask the user for the IP address of the workstation and server.
- Step 2** Open Event Viewer, for example, by selecting **Launch > Event Viewer** in Configuration Manager.
- Step 3** Double-click the **Firewall Traffic Events** view to open it. Optionally, you can use the **All Device Events** view if you also want to see if there are any IPS events related to the workstation.

---

**Tip** You can also select the **Firewall Denied Events** view to see just denial events. However, you might want to see other events related to the user's workstation.

---

- Step 4** Ask the user to retry the server access.
- Step 5** Click the **Start** button, or select **View > Start**, to refresh the event table with the latest events.
- Step 6** Type the user's IP address into the **Search within Results** box. The list of events is filtered as you type, and presents events in which the search string appears in any column. In the following illustration, the event list shows all events in the past 10 minutes for the IP address 10.52.150.50.

Figure 69-5 Restricting the Events List to One IP Address

| Receive Time   | Severity | Event ID | Event Name       | Source   | Destination  | Action  |
|----------------|----------|----------|------------------|----------|--------------|---------|
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |
| 4/21/10 1:2... | Warning  | 106023   | Denied IP packet | 10.1.1.1 | 10.52.150.50 | udp/123 |

**Tip**

You can also select the IP address from the Source column's drop-down list, and the server's IP address from the Destination column's drop-down list (or the reverse), to show only events with both the source and destination that interests you. Use the column filters if the search string does not sufficiently reduce the event list for easy analysis.

**Step 7** Look for an event that indicates that traffic from the user's workstation to the server, or from the server to the workstation, was denied. Syslog **106xxx** messages indicate denial actions.

Select the event in the table and open the Event Details pane at the bottom of the window. The tabs in this pane show the complete message information and include plain-language explanations and recommended actions.

**Step 8** If the event is message **106023** or **106100**, you can quickly locate the access rule that is denying the connection and fix it. You can identify whether you can look up policies from the event by looking at the Event Name cell in the table. If there is a binoculars icon before the event name, policy lookup is available. Also, if the Go To Policy command is greyed out, you cannot look up policies for that type of event.

**Tip**

If the traffic is denied because of the implicit **deny any** rule at the end of the access list, the Go To Policy command cannot take you to the rule. For tips about rule lookup, see [Looking Up a Security Manager Policy from Event Viewer](#), page 69-54.

- a. Right-click the event and select **Go To Policy**. You are taken to Device view with the rule selected. You are notified if a matching rule cannot be found.
- b. Modify the rule so that it allows the desired access. This might be as simple as deleting the rule, or you might have to add a new rule that specifically allows traffic to or from the destination server (place the permit rule above the deny rule). Your organization's security policy determines the allowable changes. For more information about configuring the access rules policy, see [Configuring Access Rules](#), page 16-7.
- c. Submit and deploy the updated configuration to the device. For more information on the deployment process, see [Deploying Configurations in Non-Workflow Mode](#), page 8-28 or [Deploying Configurations in Workflow Mode](#), page 8-34.

Wait for deployment to complete successfully.

**Step 9** Ask the user to try to access the server again. If access is again denied, click **Start** in Event Viewer to refresh the events list and find the latest denial event.

**Tip**

There might be more than one access rule that can deny communications with the server. The access rule policy is processed in order, top to bottom, so deleting a rule that prevents access can result in a rule that previously was not being hit suddenly becoming active. If you have a very long access rule policy, you could have several rules that you will have to remove one after the other. Alternatively, you could use the Rule Combiner tool to consolidate and simplify your access rules policy; for more information, see [Combining Rules, page 12-22](#).

**Step 10** Continue to resolve access denial events until the firewall is no longer blocking access.

**Tip**

You can also use the Packet Tracer tool to simulate traffic going through the ASA device from the workstation to the server. In Device view, right-click the device that is denying access and select **Packet Tracer**. For more information, see [Analyzing an ASA or PIX Configuration Using Packet Tracer, page 72-23](#).

After resolving all events, if the user still cannot reach the server, you know that the firewall is no longer one of the network elements that is blocking access. Consider other intervening network devices; perhaps a router includes an access rule that blocks the traffic.

## Monitoring and Mitigating Botnet Activity

After you configure Botnet Traffic Filtering as described in [Chapter 19, “Managing Firewall Botnet Traffic Filter Rules”](#), you want to monitor it and resolve any problems identified in your network. You can use Security Manager and ASDM to monitor Botnet activity, and mitigate identified problems, as explained in the following sections:

- [Understanding the Syslog Messages That Indicate Actionable Events, page 69-61](#)
- [Monitoring Botnet Using the Security Manager Event Viewer, page 69-62](#)
- [Monitoring Botnet Using the Security Manager Report Manager, page 69-64](#)
- [Monitoring Botnet Activity Using the Adaptive Security Device Manager \(ASDM\), page 69-64](#)
- [Mitigating Botnet Traffic, page 69-65](#)

### Understanding the Syslog Messages That Indicate Actionable Events

Botnet Traffic Filter events use syslog message numbers 338xxx. However, some messages are informational and require no action on your part.

When viewing syslogs for botnet events, you should be most concerned with the following message numbers. For information on dealing with messages that indicate blocked or allowed traffic, see [Mitigating Botnet Traffic, page 69-65](#). For detailed descriptions of syslog messages, see the Syslog Message document for your ASA software version at [http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html).

- **338001 to 338004**—Indicate blocked traffic that the ASA is logging, but the ASA is not stopping the traffic. These messages require immediate attention if you want to stop botnet activity that is in progress.

- **338005 to 338008**—Indicate blocked traffic that the ASA is logging and dropping. This indicates that the traffic was covered by a drop rule. Thus, your network is being protected, although you still need to disinfect the victim computer.
- **338201, 338202**—Indicate greylisted traffic that the ASA is logging but not dropping. These messages can indicate an active botnet connection that needs to be handled immediately.
- **338203, 338204**—Indicate greylisted traffic that the ASA is logging and dropping. Your network is protected from this traffic. However, if the greylisted site is legitimate, the fact that the traffic is being dropped might be a problem that requires immediate attention. You can add the greylisted address to the allow list if you determine it is legitimate and redeploy the configuration, as described in [Adding Entries to the Static Database, page 19-5](#).
- **338305 to 338307, 338310**—The ASA could not download the dynamic filter database. Ensure that you configured DNS lookup on the device, and that there is a routable network path to the Cisco Intelligence Security Operations Center. You might need to contact Cisco Technical Support.
- **338309**—The Botnet Traffic Filter license is not current, and you cannot download the dynamic database. Purchase and install the appropriate license. The Botnet Traffic Filter license is time-based, so you might have had a valid license that expired.

## Monitoring Botnet Using the Security Manager Event Viewer

You can use the Event Viewer application to monitor syslog events generated by an ASA device. The Event Viewer has a predefined view that shows just botnet events.

Botnet messages are in the informational to debug severity levels and are numbered 338xxx.

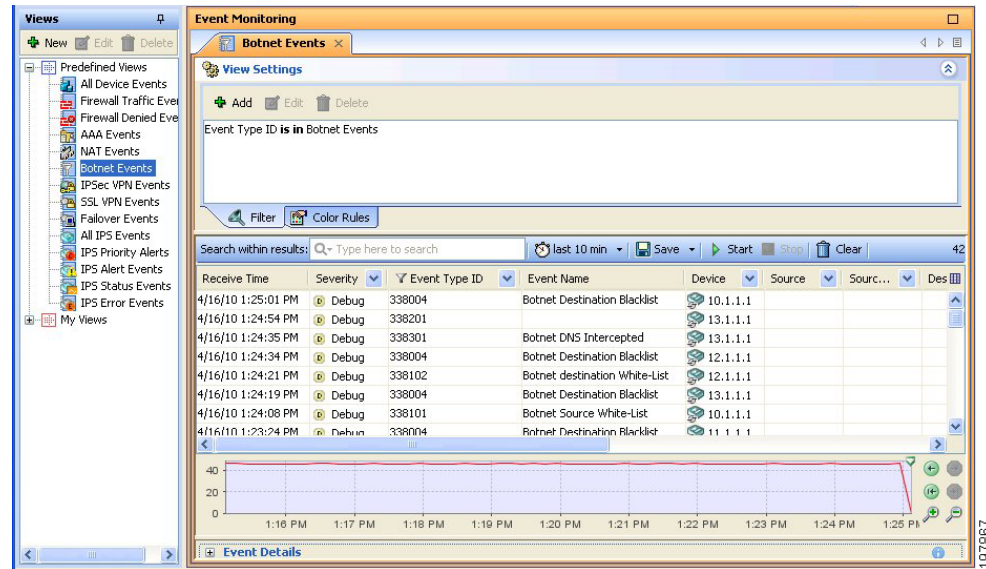

### Tip

This procedure assumes the Event Manager service is enabled. If it is not, enable it using the **Tools > Security Manager Administration > Event Management** page.

- 
- Step 1** Open Event Viewer, for example, by selecting **Launch > Event Viewer** in Configuration Manager.
- Step 2** Double-click **Botnet Events** from the list of predefined views in the left pane. You must double-click to activate the view and load it into the right pane. To verify the view has been opened, ensure that the tab name for the view in the right pane says “Botnet Events.” The following illustration shows an example of the botnet events view.

Figure 69-6 Botnet Events View in the Security Manager Event Viewer

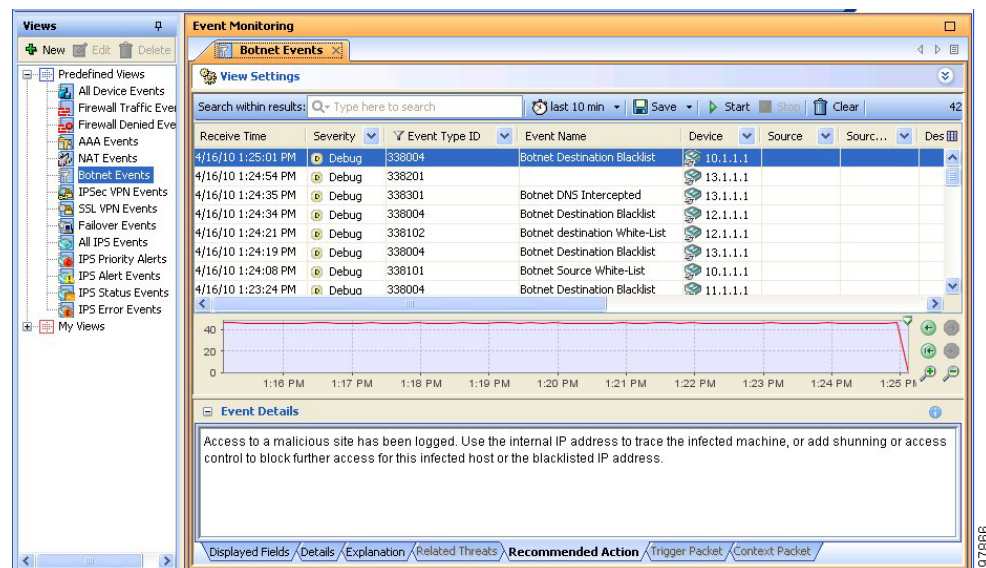

**Step 3** To see the details of a specific event, select it in the table. You can then do the following:

- Double-click the event to see the tabular information presented in a more readable format.
- Open the **Event Details** section at the bottom of the window. The details pane shows information about the event organized on tabs. The Explanation and Recommended Action tabs include plain-language information about the event and what you might want to do about it.

The following illustration shows the Event Details pane for the Botnet Destination Blacklist message 338004. In this example, the recommended action is shown. The explanation for this message is “This syslog message is generated when traffic to a IP address in the block list in the dynamic filter database appears.” For information on dealing with this type of event, see [Mitigating Botnet Traffic, page 69-65](#).

Figure 69-7 Botnet Event Details for Message 338004, Botnet Destination Blacklist

**Step 4** To narrow the list of events to those generated by a single ASA, click the drop-down arrow in the Device column and select the desired device from the list. If you want to narrow the list to multiple ASAs, select Custom from the drop-down list and select the desired devices in the dialog box that appears.

You can also narrow the list using filters for any of the other columns. Filtering works the same way for all columns: either select the desired value from the drop-down list, or select Custom to create a more complex column filter.

## Monitoring Botnet Using the Security Manager Report Manager

You can use the Report Manager application to generate reports on botnet activity. There are predefined reports that show the top infected hosts, the top malware ports, and the top malware sites. For a description of these reports, see [Understanding Firewall Summary Botnet Reports](#), page 70-15.

**Tip**

This procedure assumes the Event Manager service is enabled. If it is not, enable it using the **Tools > Security Manager Administration > Event Management** page.

**Step 1** Open Report Manager, for example, by selecting **Launch > Report Manager** in Configuration Manager.

**Step 2** Open the desired report from the **System > FW > Summary Botnet** folder. You can open the report by double-clicking it or by right-clicking and selecting **Open Report**.

**Step 3** (Optional) Customize the report to select the desired time range and devices to include in the report. For more information, see [Editing Report Settings](#), page 70-22.

If you want to save your custom settings to generate the report again in the future, click **Save As** to create a custom report. For more information, see [Creating Custom Reports](#), page 70-21.

**Step 4** Click **Generate Report** to retrieve the collected information and display the graphs and tabular data. For more information, see [Opening and Generating Reports](#), page 70-20.

If you want to generate the report on a regular basis, you can configure a schedule as described in [Configuring Report Schedules](#), page 70-34.

## Monitoring Botnet Activity Using the Adaptive Security Device Manager (ASDM)

The Adaptive Security Device Manager (ASDM) includes botnet reporting features. A read-only version of ASDM is installed with the Security Manager client as a device manager, and you can start ASDM from within Security Manager.

**Tip**

You can also install the full ASDM application separately. However, any configuration changes that you perform in ASDM are considered out-of-band changes by Security Manager and are overwritten the next time you deploy configurations from Security Manager. If you ever find a need to make configuration changes using ASDM, be sure to rediscover policies on the device in Security Manager so that Security Manager's view of the configuration is up-to-date.

**Step 1** In Device view in Configuration Manager, select the ASA device.

**Step 2** Select **Launch > Device Manager** to open an ASDM connection to the ASA. You are warned that you cannot make configuration changes. Click **Yes** to continue.

**Step 3** In ASDM, view Botnet Traffic Filter monitoring information in the following areas:

- **Home > Firewall Dashboard** includes a Botnet Traffic Filter summary.
- **Monitoring > Botnet Traffic Filter > Reports** includes charts on the top botnet sites, ports, and infected hosts.
- **Monitoring > Logging > Log Buffer** shows historical syslog messages.
- **Monitoring > Logging > Real-Time Log Viewer** shows syslog messages as they are generated.

**Tip**

You can also search the dynamic database on the **Configure > Botnet Traffic Filter > Botnet Database** page. This page also allows you to manually start a database download or to purge the dynamic database. These actions do not change the device's configuration and do not require policy rediscovery in Security Manager.

## Mitigating Botnet Traffic

Botnet traffic mitigation is a two step process:

1. Stop traffic from your network to the botnet control site.
2. Disinfect the victim computers.

The following procedure explains the process in more detail.

**Step 1** You see syslog events that indicate that packets are traveling to or from an objectionable address, typically message numbers 338001-338008 or 338201-338204. For detailed information about these messages, see [Understanding the Syslog Messages That Indicate Actionable Events, page 69-61](#).

**Tip**

Messages 338201-3382004 are for greylisted traffic. You might want to first determine if the greylisted traffic is truly objectionable before stopping the traffic.

**Step 2** Stop the botnet traffic:

- Messages 338005-338008 and 338203-338204 indicate that the ASA is already dropping the traffic for you. Traffic classification drop rules cover the addresses that are part of the block lists or greylists. See [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#).
- Messages 338001-338004 and 338201-338202 indicate that the ASA is logging the event but not dropping the traffic. The first order of business is to stop this traffic.

You have these options for stopping the botnet traffic if the ASA is not already dropping it because of a drop rule:

- (Preferred method.) Configure a drop rule for the botnet site and redeploy the configuration. See [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#).
- (Second best method.) Log into the ASA using an SSH client, enter privileged EXEC mode, and use the **shun** command to prevent traffic to or from the botnet site. You can also issue this command through ASDM in a CLI window, but you cannot do it from Security Manager. The shun command does not create a permanent rule blocking traffic.

For example, if the botnet site is 10.1.14.14, and the internal infected computer is 10.100.10.10, issue the following commands. The first command blocks all incoming traffic from the botnet command center, the second blocks traffic from the infected computer just to the botnet site.

```
shun 10.1.14.14
```

```
shun 10.100.10.10 10.1.14.14
```

- (Not recommended.) Although the shun command is preferred, you can also create a permanent rule in the interface's access control list (ACL) that denies traffic to or from the botnet site. With the device selected in Security Manager, select **Firewall > Access Rule**, and create two rules: one that denies the botnet site as the source address, with any destination address; one that denies any source address with the botnet site as the destination address. For service, select IP so that all traffic is blocked. You must deploy the configuration for the rule to take effect.

Creating an access rule is not the preferred method because it creates a permanent rule, whereas botnet sites are transient. Using the Botnet Traffic Filter to dynamically block botnet traffic is a better fit for this type of network attack compared to traditional access rules.

- Step 3** Shut down network access for the infected computer. For example, find the switch port to which the computer is attached, and shut down the port using the switch's CLI. There might also be wireless access for the computer, so completely shutting down network access might not be a simple task.
- Step 4** Inform the owner of the victim computer that it is infected and dispatch IT personnel to disinfect the computer. Tools and techniques for disinfecting a computer are outside the scope of this document.
- 

## Removing False Positive IPS Events from the Event Table

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

---

An IPS appliance or service module (IPS device) triggers an alarm when a given packet or sequence of packets matches the characteristics of known attack profiles defined in the IPS signatures. False positives (benign triggers) occur when the IPS reports certain benign activity as malicious. Because each event requires human intervention to diagnose, spending your time analyzing false-positive events can significantly drain resources.

Due to the nature of the IPS signatures that are used to detect malicious activity, it is almost impossible to completely eliminate false positives without severely degrading the effectiveness of the IPS or severely disrupting the computing infrastructure of an organization (such as hosts and networks). Customized tuning when an IPS is deployed minimizes false positives. Periodic re-tuning is required when the computing environment changes (for example, when new systems and applications are deployed). IPS devices provide a flexible tuning capability that can minimize false positives during steady-state operations.

An example of a false-positive is a network management station that periodically builds a network discovery map by running ping sweeps. A ping sweep triggers the ICMP Network Sweep with Echo signature (signature ID 2100). Thus, ICMP Network Sweep with Echo events that have the IP address of the network management station as the source address are actually expected and desired events.

You have the following options to remove false-positive IPS events from the event table in Event Viewer:

- **Filter out events from known “clean” sources.**

By filtering out the events, you do not stop their generation, but you also do not see them in the table. Because they are still available (you can remove the filter), you can see the events if some particular network behavior requires that you examine activity from the excluded host.

There are two main drawbacks to using this technique:

- The events are still generated, adding events to the event store.
- The filter excludes all events from a host. You cannot create a complex filter that excludes a host/signature ID pair.

The procedure below shows how to filter out events from sources that you identify as clean.

- **Create event action filter rules to stop the generation of the false-positive events.**

Event action filter rules are the easiest way to stop generating events, and are thus preferable to editing signatures or creating custom signatures, which is a more difficult task. If you exclude a host in an event action filter rule, the IPS device does not generate alarms or log records when the host triggers the event.

Because you can target specific signatures, rather than making a blanket-exclusion of all events from a host, you can eliminate only those events that you are certain are benign. For example, the following event filter rule removes the Produce Alert action from the ICMP Network Sweep with Echo (2100) signature for the network management station 10.100.15.75. The network management host is identified as the attacker address; the action specified in an event filter rule is actually the action that is removed from the event. Note that if you create an event action override rule to add other alert-producing actions to ICMP Network Sweep with Echo events, you must also remove the override action in this rule.

| Name             | Active | IDs  | Subs  | Attackers    | Attack Ports | Victims                 | Victim Ports | Actions       | RR    | Stop |
|------------------|--------|------|-------|--------------|--------------|-------------------------|--------------|---------------|-------|------|
| Local (1 Filter) |        |      |       |              |              |                         |              |               |       |      |
| NMS_Ping_Sweep   | Yes    | 2100 | 0-255 | 10.100.15.75 | 0-65535      | 0.0.0.0-255.255.255.255 | 0-65535      | Produce Alert | 0-100 | No   |

For more information about configuring event action filter rules, see [Configuring Event Action Filters, page 40-4](#).

The following procedure shows how to use filtering in Event Viewer to remove false positives from the events list. It uses network/host policy objects to accomplish the filtering.

**Tip**

By creating source or destination address filters using network/host objects, you can update the filters simply by changing the contents of the object. You do not need to add or remove filters from your views. Another advantage is that you can proactively create filters for addresses that do not currently appear in the events table; the source/destination column filter controls in Event Viewer list only those addresses that currently appear in listed events.

**Step 1** Create a network/host policy object that includes the IP address of the clean hosts or networks.

- a. Select **Manage > Policy Objects** to open the Policy Object Manager window (see [Policy Object Manager, page 6-4](#)).
- b. Select **Networks/Hosts** from the table of contents.
- c. Click the **Add Row (+)** button beneath the table of network/host policy objects, and select **Group** as the object type.
- d. In the Add Network/Host Group dialog box, enter a name for the object, for example, IPS\_Safe\_Hosts.
- e. Select **Enter IPv4 Address Information** and enter the IP address, for example, 10.100.15.75.

- f. Click **Add >>** to add the IP address to the Members in Group list.
- g. Click **OK** to create the object.
- h. Click **Close** to close the Policy Object Manager window.

**Step 2** Select **File > Submit** to submit your changes to the database (non-Workflow mode). Keep in mind that all of your configuration changes are submitted, not just the new policy object.

If you are using Workflow mode, you must submit your activity and have it approved, if necessary.

**Tip** Event Viewer can see only those policy objects that have been submitted to the database, so you must submit your changes before you can create a filter using the object. If you later change the object, you must also submit your changes for the filter to use the new definition of the policy object.

**Step 3** Select **Launch > Event Viewer** to open the Event Viewer application.

**Step 4** Create a custom view that filters out the network management station:

- a. Double-click the predefined view that you want to use as the basis of your custom view, for example, **All IPS Events**. Double-clicking the view in the Views list opens the view. If you already have a custom view that you want to update, open it.
- b. Click the down arrow button in the title of the Source column in the events table and select **Custom** to open the Custom Filter for Source dialog box.

**Tip:** You can also get to this dialog box through the View Settings pane by clicking the **Add** button, then selecting Source in the Add Custom Filter to a Column dialog box and clicking **OK**.

- c. In the Custom Filter for Source dialog box, select the policy object you created and click the right-arrow button to move it to the selected list. Also, select the **Not** option next to the Condition option. The following illustration shows how the dialog box should look.

- d. Click **OK**. The filter is added to the view settings and is used to remove events from the table.

- e. Select **File > Save As** to save the changes as a new custom view. You are prompted for a view name and description; enter the information and click **OK**.

The following illustration shows what the view settings would look like if you started with the All IPS Events predefined view and named your new view Filtered IPS Events.

## Managing Reports

---

Use the Report Manager application to view security and usage reports for devices and remote access IPsec and SSL VPNs.

This chapter contains the following topics:

- [Understanding Report Management, page 70-1](#)
- [Overview of Report Manager, page 70-6](#)
- [Understanding the Predefined System Reports in Report Manager, page 70-13](#)
- [Working with Reports in Report Manager, page 70-19](#)
- [Scheduling Reports, page 70-33](#)
- [Troubleshooting Report Manager, page 70-36](#)

## Understanding Report Management

Use the Report Manager application to view security and usage reports for devices and remote access IPsec and SSL VPNs. These reports can provide useful information about your network.

The Report Manager aggregates information that is collected from monitored devices by the Event Manager service. Thus, to view reports about a device, you must also be monitoring the device in Event Viewer. Some statistics, such as VPN statistics, are obtained directly from the device through regular polling at five minute intervals. Aggregated data is kept for 90 days with data aggregated at 15-minute, hourly, daily, and monthly intervals; 15-minute aggregated data is kept for up to three days, hourly data up to one week. For more information about data aggregation, see [Understanding Report Manager Data Aggregation, page 70-4](#).

You can use Report Manager to develop reports on the following:

- Adaptive Security Appliances (ASA) running ASA Software releases 8.0 and later. ASA Software 7.x releases are also supported for VPN reports.

---

**Note** VPN reports are not available for Cisco Catalyst 6500 Series ASA Services Modules (ASA-SM), which do not support any VPN configuration. Other types of reports are available for the ASA-SM.

---

- IPS devices running IPS software release 6.1 and later (but not IOS IPS devices). This includes dedicated IPS modules installed in ASAs, routers, and switches.
- Remote access IPsec and SSL VPNs hosted on a supported ASA device.

**Note**

Report Manager does not report on FWSM events even though Event Viewer works with FWSM.

The following topics explain Report Manager and its available reports in more detail, and also describe the other types of reports available in Security Manager:

- [Understanding the Types of Reports Available in Security Manager, page 70-2](#)
- [Preparing Devices for Report Manager Reporting, page 70-3](#)
- [Understanding Report Manager Data Aggregation, page 70-4](#)
- [Understanding Report Manager Access Control, page 70-5](#)
- [Understanding the Predefined System Reports in Report Manager, page 70-13](#)

## Understanding the Types of Reports Available in Security Manager

Security Manager provides a variety of reporting capabilities. The following are the types of reports available:

- **Security and Usage Reports (Report Manager application)**—You can use the Report Manager application to view aggregated information collected by the Event Manager service from monitored devices. Some information is also obtained directly from the devices. These reports can provide information on network security and remote access IPsec and SSL VPN usage.
- **Activity (Configuration Session) Change Reports**—These reports provide detailed information about the policies changed within a specific activity (in Workflow mode) or configuration session (in non-Workflow mode). For more information, see [Viewing Change Reports, page 4-16](#).
- **Out of Band Change Report**—These reports identify inconsistencies between the configuration that exists on a device and the configuration for the device maintained in Security Manager. You can use this information to proactively address these inconsistencies before deploying configurations, where the change will either be overwritten or the deployment will fail, depending on the behavior you select in the deployment job. For more information, see [Detecting and Analyzing Out of Band Changes, page 8-45](#).
- **Audit Report**—This report provides information about changes to Security Manager and the objects contained in the database. The report includes information about the runtime environment, such as logins and authentication failures, changes to objects, such as activity changes and deployments, and changes to managed devices, such as inventory additions and deletions. For more information, see [Generating the Audit Report, page 10-20](#).
- **Inventory Status**—This report provides information on policy deployment status. For more information, see [Viewing Inventory Status, page 72-12](#).
- **Policy Discovery Status reports**—When you discover policies from a device, either while adding it to the inventory or when rediscovering policies on a managed device, the information about the policy discovery is maintained so that you can view it at a later time. For more information, see [Viewing Policy Discovery Task Status, page 5-22](#).
- **Deployment Status reports**—When you deploy configurations to managed devices, information about the deployment is maintained so that you can view it at a later time. For more information, see [Viewing Deployment Status and History for Jobs and Schedules, page 8-26](#).
- **Deployment and Discovery Status reports for troubleshooting**—You can export deployment and policy discovery status reports in a form suitable for sending to Cisco Technical Support (TAC) to help troubleshoot problems. You might also find these reports useful for your own purposes. For more information, see [Generating Deployment or Discovery Status Reports, page 10-30](#).

- **Extranet VPN Configuration Summaries**—You can print, or generate a PDF file of, a summary of the configuration of an Extranet VPN. This summary can include the preshared key used for the connection. You can use this information to maintain a current record of connections between your network and the networks of partners or service providers. For more information, see [Viewing a Summary of a VPN Topology's Configuration, page 25-63](#).
- **Policy Object Usage report**—This report shows you where a policy object is used, including instances where it is referred to by a policy or another policy object. You can use this information to help determine whether a proposed change to the object will provide the desired effect in all cases where it is used. The information is also helpful if you want to delete an object, because you cannot delete an object that is actively being used by a policy or another policy object. For more information, see [Generating Object Usage Reports, page 6-15](#).
- **Policy Object Override report**—This report shows you all of the device-level overrides currently defined for a policy object, if the object is defined so that overrides are allowed. You can also create and delete overrides from this report. For more information, see [Creating or Editing Object Overrides for Multiple Devices At A Time, page 6-19](#) and [Policy Object Overrides Window, page 6-20](#).
- **Device Manager reports**—Security Manager includes read-only versions of individual device managers, such as the Adaptive Security Device Manager (ASDM), for most supported devices. You can start these device managers directly from Security Manager's Configuration Manager application and use any type of report available in those device managers. These reports are for a single device, and can augment the reports available through Report Manager. They can also provide status information for devices that are not directly supported by Event Viewer or Report Manager. For more information, see [Starting Device Managers, page 72-14](#).

## Preparing Devices for Report Manager Reporting

Before you can view reports about a device in Report Manager, you must configure the device to send events to Security Manager and configure Security Manager to monitor the device. Report Manager can provide reports only for devices you are monitoring in Event Viewer, so the device configuration for reporting is identical to the configuration for event monitoring.

- 
- Step 1** Configure the devices to send events to Security Manager. You can use Report Manager with the following types of devices:
- ASA 8.0 and later—For the detailed configuration steps, see [Configuring ASA and FWSM Devices for Event Management, page 69-28](#).
  - IPS 6.1 and later—For the detailed configuration steps, see [Configuring IPS Devices for Event Management, page 69-29](#).
- Step 2** Ensure that the devices are selected for event management as described in [Selecting Devices to Monitor, page 69-34](#).
- Step 3** Ensure that the Event Manager service is enabled as described in [Starting, Stopping, and Configuring the Event Manager Service, page 69-30](#).
-

## Understanding Report Manager Data Aggregation

Report Manager aggregates information that is collected from monitored devices by the Event Manager service. Thus, to view reports about a device, you must also be monitoring the device in Event Viewer.

Report Manager collects data using two techniques. First, the Event Manager service provides relevant events to Report Manager and then Report Manager decides if it should store those events based on the predefined reports and custom reports that are currently configured. Second, some statistics, such as VPN statistics, are obtained directly from the device through regular polling at five minute intervals.

**Table 70-1 Report Manager Data Sources**

| Reports                            | Data Sources                                                                        |
|------------------------------------|-------------------------------------------------------------------------------------|
| <b>FW Reports</b>                  |                                                                                     |
| Top Sources                        | Built Syslogs:                                                                      |
| Top Destinations                   | 302013,302015,302017,302020                                                         |
| Top Services                       | Deny syslogs:<br>106001,106006,106007,106010,106011,106014,106015,106016,106017     |
| Top Malware Sites                  | BOTNET Syslogs:                                                                     |
| Top Malware Ports                  | 338001,338002,338003,338004,338005,338006,338007,338008,338201,338202,338203,338204 |
| Top Infected Hosts                 |                                                                                     |
| <b>IPS Reports</b>                 |                                                                                     |
| All IPS Reports                    | All IPS Alerts                                                                      |
| <b>VPN Reports</b>                 |                                                                                     |
| Top Bandwidth Users (Full-Client)  | For ASA version 8.3 and earlier:<br>show vpn-sessiondb full svc                     |
| Top Duration Users (Full-Client)   | For ASA version 8.4.1 and later:                                                    |
| Top Throughput Users (Full-Client) | show vpn-sessiondb full anyconnect                                                  |
| Top Bandwidth Users (IPSec-RA)     | For ASA version 8.3 and earlier:<br>show vpn-sessiondb full remote                  |
| Top Duration Users (IPSec-RA)      | For ASA version 8.4.1 and later:                                                    |
| Top Throughput Users (IPSec-RA)    | show vpn-sessiondb full ra-ikev1-ipsec                                              |
| Top Bandwidth Users (Clientless)   | For all ASA versions:<br>show vpn-sessiondb full webvpn                             |
| Top Duration Users (Clientless)    |                                                                                     |
| Top Throughput Users (Clientless)  |                                                                                     |
| User Report                        | All above show commands.                                                            |
| VPN Device Usage Report            | All above show commands.                                                            |

Report Manager aggregates this collected information at 15-minute, hourly, daily, and monthly intervals. Fifteen-minute aggregated data is kept a day, hourly data up to five days, and the other data for 90 days.

The aggregation schedule occurs at fixed times: 15-minute aggregation occurs at 00, 15, 30, and 45 minutes past the hour; hourly aggregation occurs on the hour (00 minutes); daily aggregation occurs at the change of day (when midnight is reached, the day is aggregated); monthly aggregation occurs at the change of the month.

The aggregation cycle has implications in what you will see in reports:

- Report data does not cover the immediate past. Instead, it covers the most recently completed whole time period of the selected duration. For example, a one-day report covers yesterday, it does not include data for today. In other words, a one day report is not the previous 24 hours starting from the time the report is generated.
- When configuring reports with a custom time period, you cannot select a time period of less than 15 minutes long. A report will always contain at least 15 minutes of aggregated data. Minute entries are rounded to the nearest aggregation time (that is, 00, 15, 30, or 45). You can configure minutes only for custom reports that start and end on the current day.

Also, because hourly data is kept only up to five days, you can specify hours in a custom time period only for the past five days.

- You cannot generate a report for periods that are longer than the device has been monitored. For example, when you start the Event Manager service for the first time, you will not be able to generate a monthly report until after the month changes. This might be only a few days (for example, if you start the service on the twenty-ninth day of the month), or it might be almost a full month (for example, if you start the service on the first day of the month).

The exception to this rule is the custom time period report. Custom time period reports are generated using daily aggregation data, so you can select any custom time period.

---

**Note** Be aware that your first month of aggregated data might be significantly less than one month's worth of data. If you compare monthly reports, this might appear as a significant discrepancy when in reality you are comparing 30 days of data to 15 days (as an example).

---

You can configure the default time interval for predefined system reports and configure time intervals in individual reports. The following topics explain the time controls:

- [Configuring Default Settings for Reports, page 70-29](#)
- [Editing Report Settings, page 70-22](#)

## Understanding Report Manager Access Control

The user privileges assigned to your username control what you can do in Report Manager. If you use local users, or other types of non-ACS access control, then all users have access to Report Manager and all reports. However, the following access limits are imposed:

- You must have system administrator or network administrator privileges to configure default settings for the predefined system reports. See [Configuring Default Settings for Reports, page 70-29](#).
- You must have system administrator or network administrator privileges to do the following to another user's schedules: see them, enable or disable them, view results generated from them, or delete them. See the following topics:
  - [Viewing Report Schedules, page 70-33](#)

- [Viewing Scheduled Report Results, page 70-35](#)
- [Enabling and Disabling Report Schedules, page 70-36](#)
- [Deleting Report Schedules, page 70-36](#)
- You must have system administrator or network administrator privileges to see a list of all custom reports configured on the server and to delete another user's custom report. See [Managing Custom Reports, page 70-32](#).

If you use ACS to control access to Security Manager, you can also control user access to Report Manager. When using ACS:

- You can control access to the Report Manager application using the View Report Manager privilege. Using this privilege, you could prevent certain users from accessing Report Manager, or create roles that allow access to Report Manager without allowing access to Event Viewer.
- Users can view reports on devices only if they have at least View privileges to the device.

For information on integrating Security Manager with Cisco Secure ACS, see the [Installation Guide for Cisco Security Manager](#).

## Overview of Report Manager

Use Report Manager to create security and usage reports for ASA and IPS devices, and for remote access IPsec and SSL VPNs hosted on ASA devices. For more information about supported devices and the reports you can generate using Report Manager, see [Understanding Report Management, page 70-1](#).

To open Report Manager, do any of the following:

- Select **Start > All Programs > Cisco Security Manager Client > Report Manager** from the Windows Start menu (your exact command path might differ), or double-click the Report Manager icon on the desktop. You are prompted to log in. For more information about starting a Security Manager client application, see [Logging In to and Exiting the Security Manager Client, page 1-12](#).
- Select **Launch > Report Manager** from the Configuration Manager or Event Viewer applications. Report Manager is opened using the same user account that you used to log into the other application.

The following illustration and subsequent list explain the basics of Report Manager.

Figure 70-1 Report Manager Main Window

The following list explains the main Report Manager window and its call-outs in more detail.

- **Menu Bar (1)**—General commands for performing actions in Report Manager. For a description of the commands, see [Report Manager Menus, page 70-8](#).
- **Main Window Tabs (2)**—The main window area consists of the following tabs:
  - **Reports**—Use the Reports tab to generate reports on demand, to create custom reports, and to perform other report-oriented tasks. The illustration above, and most of the information in this topic, relates to the Reports tab. For information on the tasks you can perform from the Reports tab, see [Working with Reports in Report Manager, page 70-19](#).
  - **Scheduled Reports**—Use the Scheduled Reports tab to view and manage report schedules. For more information on the Scheduled Reports tab, see [Viewing Report Schedules, page 70-33](#). For information on the tasks you can perform from the Scheduled Reports tab, see [Scheduling Reports, page 70-33](#).
- **Report List (3)**—The left pane of the Reports tab is a list of reports. The list is organized into folders; the System Reports are predefined reports, whereas the My Reports folder contains the custom reports that you create. Double-click a report to open it, select the report and select **File > Open**, or right-click the report and select **Open Report**. For more information about using the report list, see [Understanding the Report List in Report Manager, page 70-9](#).

- **Report Pane (4, 5, 6, 7)**—The right pane of the Reports tab shows the open reports. Each open report is represented on separate tabs (you can have up to five open reports). Note that you can arrange reports horizontally or vertically in this space, or even make a report float to a separate window. For more information about how you can arrange or float reports, see [Arranging Report Windows, page 70-30](#).

You can use the Maximize control (7) above the pane to make it take over the entire workspace (hiding the report list). After maximizing the pane, the control changes to a Restore control to return the main window to a two-pane view.

You can use the right and left arrows, and the Show List icon button, to scroll through the open reports or to go directly to a report. However, clicking the tab with the desired report name is the easiest way to go to a report.

The Report Pane includes these areas for each open report:

- **Report Settings pane (5)**—The top part of the report shows the report settings, which are the criteria used to generate the report. You can open and close the settings pane by clicking on the heading, or on the expand/collapse icon button. The heading includes a toolbar that has commands that you can perform on the report. For more information about the settings pane, see [Understanding the Report Settings Pane, page 70-10](#).
- **Generated Report Pane and Report Toolbar (6)**—Below the settings pane is an additional toolbar used to generate and manipulate report data. Use these controls to generate the report using the criteria defined in the report settings, to print the report or to export it to PDF or CSV format, or to change the type of graphic displayed in the report.

The bottom part of the report pane is the actual report. This area is empty until you click the Generate Report button. The top of the report shows a graphical representation of the information, the lower page shows the tabular data. For more information, see [Understanding the Generated Report Pane and Toolbar, page 70-12](#) and [Opening and Generating Reports, page 70-20](#).

## Report Manager Menus

The following table describes the commands on the menus in Report Manager.

**Table 70-2 Report Manager Menu Reference**

| Menu | Command                           | Description                                                                                                                                      |
|------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| File | Open                              | Opens the report selected in the report list on the Reports tab. See <a href="#">Opening and Generating Reports, page 70-20</a> .                |
|      | Save                              | Saves changes made to the report settings. This command is available for custom reports only. See <a href="#">Saving Reports, page 70-31</a> .   |
|      | Save As                           | Saves the report as a new report. Use this command to create new reports from existing reports. See <a href="#">Saving Reports, page 70-31</a> . |
|      | Close Report<br>Close All Reports | Closes the active open report, or closes all open reports. See <a href="#">Closing Report Windows, page 70-32</a> .                              |
|      | Exit                              | Exits Report Manager.                                                                                                                            |

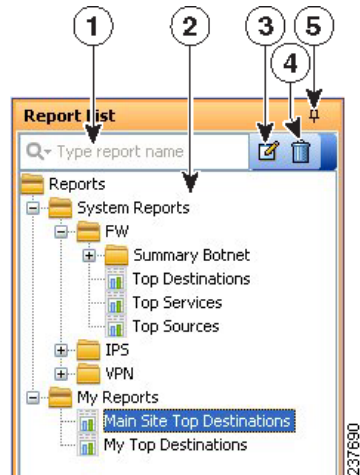

**Table 70-2 Report Manager Menu Reference (continued)**

| Menu   | Command                        | Description                                                                                                                                                                               |
|--------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Launch | Dashboard                      | Opens the indicated Security Manager application.                                                                                                                                         |
|        | Configuration Manager          |                                                                                                                                                                                           |
|        | Event Viewer                   |                                                                                                                                                                                           |
|        | Health and Performance Monitor |                                                                                                                                                                                           |
|        | Image Manager                  |                                                                                                                                                                                           |
| Tools  | Default Report Settings        | Configures the default settings for predefined system reports. See <a href="#">Configuring Default Settings for Reports, page 70-29</a> .                                                 |
|        | Custom Report List             | Displays all custom reports configured on the server, not just those that you created. You can manage reports from this window. See <a href="#">Managing Custom Reports, page 70-32</a> . |
| Help   | Help about this page           | Opens the online help to a topic relevant to the page currently displayed in the main window.                                                                                             |
|        | About Report Manager           | Displays copyright, version, and licensing information for the application.                                                                                                               |

## Understanding the Report List in Report Manager

The left pane of the Reports tab in Report Manager displays a list of available reports, as shown in the following illustration.

**Figure 70-2 Report Manager Report List**

The Report List includes the following controls (illustration call-outs cited):

- **Quick Filter search box (1)**—Use the quick filter search box to search for reports in the list. The list is filtered as you type, although folders are not opened automatically. The default is to search for the text string anywhere in the report name. However, you can click the down arrow in the Quick Filter box to select a variety of options to change how your search string is evaluated.
- **List of reports (2)**—The list is organized into folders; the System Reports are predefined reports (explained in [Understanding the Predefined System Reports in Report Manager, page 70-13](#)), whereas the My Reports folder contains the custom reports that you create. Double-click a report to open it, or select the report and select **File > Open**. For more information, see [Opening and Generating Reports, page 70-20](#).
- **Right-click shortcut menu (not shown)**—If you right-click on a report, you get a list of additional commands that you can perform, such as opening the report, creating a schedule, or saving the report as a new report.
- **Edit button (3)**—Click the Edit button to change the name of the selected custom report. You can edit custom reports only. For more information, see [Renaming Reports, page 70-31](#).
- **Delete button (4)**—Click the Delete button to delete the selected custom report. You can delete custom reports only. For more information, see [Deleting Reports, page 70-32](#).
- **Push Pin button (5)**—Click the Push Pin icon to control whether the report list pane is opened or closed. If the pin is vertical, the report list remains open unless you maximize the report pane (the right pane). If the pin is horizontal, the report list collapses to the left margin, and you must click the Report List heading in the left margin to open the list.

## Understanding the Report Settings Pane

The top part of the right side of the Reports tab, with a report open, shows the report settings. These settings define the criteria that are used to generate a report. The following illustration shows an example of the report settings pane.

Figure 70-3 Report Manager Report Settings

The Report List includes the following controls (illustration call-outs cited):

- **Report tab (3)**—Although not part of the settings per se, each report appears on its own tab. The settings are the top part of the tab. If you right-click the tab itself, you get a menu of commands that allow you to arrange report windows. For more information, see [Arranging Report Windows, page 70-30](#).
- **Heading and toolbar (2)**—The top of the settings pane includes the heading (for example, Top Sources - Settings) and a row of buttons for manipulating the settings. You can open or close the pane by clicking the heading or the up arrow button in the far right of the toolbar. The other buttons have the following functions:
  - Create Schedule button—Creates a new schedule for automatically generating reports based on these settings. For more information, see [Configuring Report Schedules, page 70-34](#).
  - Edit button—Edits the report settings. For more information, see [Editing Report Settings, page 70-22](#).
  - Save As button—Saves the report as a new report. If you edit the settings for a predefined system report, and you want to save your changes, you must use Save As to create a custom report. For more information, see [Saving Reports, page 70-31](#) and [Creating Custom Reports, page 70-21](#).
  - Save button—Saves changes to the settings. You can save changes for custom reports only. For more information, see [Saving Reports, page 70-31](#).
  - Reset button—Resets the settings to the last saved values.
  - Expand/Collapse button (double up/down arrows)—Toggles between opening and closing the report setting pane.
- **Settings display (1)**—Below the heading and toolbar is a summarization of the report settings. Information includes the type of report, the devices included in the report, the time range, a description, the schedules defined for the report, and other properties unique to the report.

To change the description, type your changes directly into the Description edit box.

## Understanding the Generated Report Pane and Toolbar

The bottom part of the right side of the Reports tab, with a report open, shows the generated report and report toolbar. This pane displays the results of clicking the Generate Report button.

The following illustration shows an example of the generated report pane and its associated report toolbar.

**Figure 70-4** Report Manager Generated Report Pane and Toolbar

The Report List includes the following controls (illustration call-outs cited):

- **Report toolbar (1)**—The top of the generated report pane is a row of controls for generating and manipulating reports. The controls have the following functions:
  - **Generate Report button**—Generates a report based on the criteria defined in the report settings (in the upper pane). For more information, see [Opening and Generating Reports, page 70-20](#).
  - **Print button**—Prints the generated report. For more information, see [Printing Reports, page 70-27](#).
  - **Export button**—Exports the report. Click the down arrow in the button and select the type of file you want to create: **As PDF** (for Adobe Acrobat) or **As CSV** (for comma-separated values). For more information, see [Exporting Reports, page 70-28](#).

- Chart Type—Determines the type of graphical chart displayed in the upper part of the report, typically pie, bar, and XY (linear) graphs are available. In some cases, you do not have a choice of chart types. For more information, see [Opening and Generating Reports, page 70-20](#).
- **Graphical view (2, 3, 5)**—The top part of the generated report shows a graphical, color-coded view of the report data, and includes a legend that explains the colors. Also included is the date and time the report was generated.

**Note** For the Top Destinations, Top Services, and Top Sources firewall reports and the Top Attackers, Top Signatures, and Top Victims IPS reports, you can click on a data point in the Pie, XY, or Bar graph to see additional details for that data point. For example, if you click on a slice in the Pie chart for the Top Signatures report, you will see report details for the top attackers and top victims for the selected signature. For more information, see [Drilling Down into Report Data, page 70-26](#).

At the bottom of the graphical view are the following controls:

- Up and Down arrows (5)—These icon buttons, to the left of the graphic, allow you to open and close the graphical part of the report.
- Window size control (3)—If you hover the mouse pointer over the vertical dashes below the graphic in the center of the window, you can click and move the pointer to change the size of the graphical portion of the report. The graphic is automatically resized as you increase or decrease the size of the area. In fact, you can hover over any part of the top of the table to access this control.
- **Tabular view (4)**—The bottom part of the report is a table that presents the data collected for the report and used to produce the graphic. The columns in the table vary according to the type of report. You can click a heading to sort the table by the column. There are three sort orders, and clicking the column heading cycles through these orders with an arrow indicating the sort order: ascending (up arrow), descending (down arrow), and no sort (empty). You can use Ctrl+click to create a second sort order on a separate column, which has an effect only if the first sort column repeats one or more entry. Numbers indicate whether the column is the first, second, third, and so on, sort criteria.

## Understanding the Predefined System Reports in Report Manager

Report Manager includes several predefined system reports that you can use to analyze your network. You can customize these reports to focus on specific sets of devices and time periods or to focus on other configurable parameters.

This section contains the following topics:

- [Understanding Firewall Traffic Reports, page 70-14](#)
- [Understanding Firewall Summary Botnet Reports, page 70-15](#)
- [Understanding VPN Top Reports, page 70-16](#)
- [Understanding General VPN Reports, page 70-16](#)
- [Understanding IPS Top Reports, page 70-17](#)
- [Understanding General IPS Reports, page 70-19](#)

## Understanding Firewall Traffic Reports

Report Manager includes predefined system reports that you can use to identify the top destinations, services, and sources for firewall ACL events. The statistics are based on the events collected by the Event Manager service (as displayed in Event Viewer).

The following reports are available in the **System Reports > FW** folder.

- **Top Destinations**—This report ranks the session destinations of all built/deny firewall events received by Security Manager. The report shows the destination IP address, the count of the number of events for each address, and the percentage of the count compared to the sum of all counts in the report. You can click on a data point in the Pie, XY, or Bar graph that represents a specific destination to see report information about the top sources and top services associated with that destination (see [Drilling Down into Report Data, page 70-26](#)).
- **Top Sources**—This report ranks the session sources of all built/deny firewall events received by Security Manager. The report shows the source IP address, the count of the number of events for each address, and the percentage of the count compared to the sum of all counts in the report. You can click on a data point in the Pie, XY, or Bar graph that represents a specific source to see report information about the top destinations and top services associated with that source (see [Drilling Down into Report Data, page 70-26](#)).
- **Top Services**—This report ranks the destination services of all built/deny firewall events received by Security Manager. TCP and UDP services include the port number. The report shows the service, the count of the number of events for each service, and the percentage of the count compared to the sum of all counts in the report. You can click on a data point in the Pie, XY, or Bar graph that represents a specific service to see report information about the top destinations and top sources associated with that service (see [Drilling Down into Report Data, page 70-26](#)).

The parameters used to define the number of addresses or services to included in the report and the reporting time period are defined in the system defaults as described in [Configuring Default Settings for Reports, page 70-29](#).

You can also edit the report settings and create custom versions of the reports. You can narrow the reports to focus on specific sets of source or destination addresses or services, or on just permit or deny actions, or limit the report to focus on a sub-set of firewall devices, as described in the following topics:

- [Editing Report Settings, page 70-22](#)
- [Creating Custom Reports, page 70-21](#)

## Understanding Firewall Summary Botnet Reports

Report Manager includes predefined system reports that you can use to analyze botnet traffic filtering. The statistics are based on the botnet events collected by the Event Manager service (as displayed in Event Viewer) for sites on the block list and gray list.

For more information about botnet, see [Chapter 19, “Managing Firewall Botnet Traffic Filter Rules”](#).

The following reports are available in the **System Reports > FW > Summary Botnet** folder.

- **Top Infected Hosts**—This report ranks the top infected hosts for traffic originating from infected hosts to blocked or gray-listed sites based on all botnet events received by Security Manager. The report shows the IP address of the infected host with the firewall interface name on which the event was detected in parentheses, the count of the number of connections logged to sites on the block list or gray list for each address, the count of the number of connections that were blocked (dropped) by botnet traffic filtering, and the percentage of the count compared to the sum of all counts in the report.
- **Top Malware Ports**—This report ranks the top destination ports for traffic originating from infected hosts to blocked or gray-listed sites based on all botnet events received by Security Manager. The report shows the destination malware port, the count of the number of connections logged to blocked or gray-listed sites for each port, the count of the number of connections that were blocked (dropped) by botnet traffic filtering, and the percentage of the count compared to the sum of all counts in the report.
- **Top Malware Sites**—This report ranks the top botnet sites (blocked or gray-listed sites) for all inbound and outbound sessions based on all botnet events received by Security Manager. The report shows the following information:
  - IP Address—The IP address that is indicated as the malicious host in botnet events, either on the block list or the grey list.
  - Malware Site—The domain name or IP address in the dynamic filter database to which the traffic was initiated.
  - List Type—Whether the site is on the block list or the grey list.
  - Connections Logged—The count of the number of connections logged or monitored for each site.
  - Connections Blocked—The count of the number of connections that were blocked (dropped) by botnet traffic filtering for each site.
  - Threat Level—The botnet threat level for the site, from very low to very high, or none.
  - Category—The category of threat the site poses as defined in the botnet database, such as botnet, Trojan, spyware, and so on.

The parameters used to define the number of hosts, ports, or sites in the report and the reporting time period are defined in the system defaults as described in [Configuring Default Settings for Reports, page 70-29](#). You can also edit the report settings and create custom versions of the reports, as described in the following topics:

- [Editing Report Settings, page 70-22](#)
- [Creating Custom Reports, page 70-21](#)

## Understanding VPN Top Reports

Report Manager includes predefined system reports that you can use to identify the top remote access VPN users based on bandwidth usage, duration of connection to your network, and data throughput. Separate reports are provided based on the type of connection made by the user.

These reports are available in the **System Reports > VPN** folder in the **AnyConnect (SSL) Remote Access VPN**, **Cisco VPN Client (IPsec) Remote Access VPN**, and **Clientless SSL VPN**.

The following reports are available in each folder. Each report is specific to the connection type indicated by the folder name and also included in parentheses in the report name.

- **Top Bandwidth Users**—This report ranks the VPN users who consumed the most bandwidth. The report shows the usernames, the bandwidth in total number of bytes sent and received, and the percentage of reported bandwidth used by each user.
- **Top Duration Users**—This report ranks the VPN users who remained connected to the network for the longest time. The report shows the usernames, the connection duration time in *days hours:minutes:seconds* format, and the percentage of the reported duration by each user. The chart shows duration in seconds.
- **Top Throughput Users**—This report ranks the VPN users who sent and received data at the highest throughput rate. The report shows the usernames, the throughput for each user in kbps, and the percentage of reported throughput by each user. The throughput is calculated as  $8.0 * (\text{bandwidth of the user in bytes}) / (\text{duration for which the user is connected in seconds} * 1000.0)$ .

The parameters used to define the number of users included in the report and the reporting time period are defined in the system defaults as described in [Configuring Default Settings for Reports, page 70-29](#). You can also edit the report settings and create custom versions of the reports, including focusing on specific users, as described in the following topics:

- [Editing Report Settings, page 70-22](#)
- [Creating Custom Reports, page 70-21](#)

## Understanding General VPN Reports

Report Manager includes predefined system reports that you can use to analyze general remote access VPN usage in your network. These reports are not specific to the connection types used in the VPN.

The following reports are available in the **System Reports > VPN** folder.

- **Connection Profile Report**—This report provides a count of user, session, and summary of the bandwidth utilization and throughput usage for each remote access connection profile.

The default report contains this information for all devices for the previous hour. You can customize the report in several different ways (see [Editing Report Settings, page 70-22](#)).

- **User Report**—This report provides a summary of the bandwidth utilization, connection duration and throughput usage for each remote access VPN user. The report shows the usernames, the bandwidth in total number of bytes sent and received, the connection duration time in *days hours:minutes:seconds* format, and the throughput for each user in kbps. The throughput is calculated as  $8.0 * (\text{bandwidth of the user in bytes}) / (\text{duration for which the user is connected in seconds} * 1000.0)$ .

Beginning with Security Manager 4.7, the User Report provides both **user-level details** and **session-level details**:

- **User-Level Details**—For a particular user, the **user-level details** represent the combined value of all that user's sessions: Username, Total no. of Sessions, Bandwidth, Duration, and Throughput.

**Note** Starting from Cisco Security Manager 4.13, the Public IP and Assigned IP details are also displayed as part of the User-Level Details in the general VPN report.

- **Session-Level Details**—Expanding the tree displays the **session-level details** for each session that a particular user has a VPN connection with; the session-level details encompass the Session ID, Login Time, Logout Time, Bandwidth, Throughput, and Duration of the Session. (Here the logout time is calculated by using the formula **Logout Time = Login Time + Duration**.)

The default report includes information for all connection technologies and all users. You can customize the report to focus on a single technology type or one or more specific users (see [Editing Report Settings, page 70-22](#)).

The "Criteria" section of the User Report has filters for Technology (All, Clientless, Full Client, and IPSec RA), Username, and User Session Duration (<= and >= in hours).

- **VPN Device Usage Report**—This report provides a summary of the usage statistics for each device that hosts remote access VPN connections. The report shows the device (using the Security Manager display name), the average number of users logged into the VPN at any given time during the reported time range, the total bandwidth of all users in the VPN in bytes (sent and received), the total connection duration time in *days hours:minutes:seconds* format, and the average throughput in kbps at any given time during this report period.

The default report includes information for all connection technologies. You can customize the report to focus on a single technology type (see [Editing Report Settings, page 70-22](#)).

The parameter used to define the reporting time period is defined in the system defaults as described in [Configuring Default Settings for Reports, page 70-29](#). You can also edit the report settings and create custom versions of the reports, as described in the following topics:

- [Editing Report Settings, page 70-22](#)
- [Creating Custom Reports, page 70-21](#)

## Understanding IPS Top Reports

**Note**

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Report Manager includes predefined system reports that you can use to analyze top attackers, victims, and signatures for IPS alerts in your network.

The following reports are available in the **System Reports > IPS** folder.

- **Top Attackers**—This report ranks the attacker (source) addresses that generated the highest numbers of recorded IPS alerts. The report shows the attacker IP address, the count of the number of alerts for each address, and the percentage of the count compared to the sum of all counts in the report. You can click on a data point in the Pie, XY, or Bar graph that represents a specific attacker to see report information about the top signatures and top victims associated with that attacker (see [Drilling Down into Report Data, page 70-26](#)).

The default report includes information for all attackers, victims, and signatures for both blocked and unblocked actions. You can customize the report to focus on subsets of attackers, victims, or signatures, or limit the analysis to blocked only or unblocked only actions (see [Editing Report Settings, page 70-22](#)).

- **Top Victims**—This report ranks the victim (destination) addresses that generated the highest numbers of recorded IPS alerts. The report shows the victim address, the count of the number of alerts for each address, and the percentage of the count compared to the sum of all counts in the report. You can click on a data point in the Pie, XY, or Bar graph that represents a specific victim to see report information about the top signatures and top attackers associated with that victim (see [Drilling Down into Report Data, page 70-26](#)).

The default report includes information for all attackers, victims, and signatures for both blocked and unblocked actions. You can customize the report to focus on subsets of attackers, victims, or signatures, or limit the analysis to blocked only or unblocked only actions (see [Editing Report Settings, page 70-22](#)).

- **Top Signatures**—This report ranks the signatures that fired the highest numbers of alerts. The report shows the signature ID number, the name of the signature, the count of the number of alerts for each signature, and the percentage of the count compared to the sum of all counts in the report. You can click on a data point in the Pie, XY, or Bar graph that represents a specific signature to see report information about the top victims and top attackers associated with that signature (see [Drilling Down into Report Data, page 70-26](#)).

The default report includes information for all attackers, victims, and signatures for both blocked and unblocked actions. You can customize the report to focus on subsets of attackers, victims, or signatures, or limit the analysis to blocked only or unblocked only actions (see [Editing Report Settings, page 70-22](#)).

- **Top Blocked/Unblocked Signatures**—This report ranks the signatures that blocked the highest numbers of attacks. The report shows the signature ID number, the name of the signature, the count of the number of alerts for each signature, and the percentage of the count compared to the sum of all counts in the report.

The default report shows blocked actions only. However, you can customize the report to show unblocked only or a combination of blocked and unblocked actions (see [Editing Report Settings, page 70-22](#)).

If you want to see blocked or unblocked lists that are limited to specific attacker or victim addresses, or to a subset of signatures, use the Top Signatures report instead of the Top Blocked/Unblocked Signatures report. Customize the report to show blocked only or unblocked only signatures.

- **IPS Target Analysis**—This report provides the top targets by signature and frequency of attack. The report shows the signatures that generated the alerts, the number of alerts, and the victim IP address, and is based on an aggregated view of the Top Signatures and Top Victims reports. The report contains up to ten signatures and five attackers. The information is plotted on a scatter plot, which is the only graphical representation available for the report.

The parameters used to define the number of addresses or signatures to included in the report and the reporting time period are defined in the system defaults as described in [Configuring Default Settings for Reports, page 70-29](#). You can also edit the report settings and create custom versions of the reports, as described in the following topics:

- [Editing Report Settings, page 70-22](#)
- [Creating Custom Reports, page 70-21](#)

## Understanding General IPS Reports

**Note**

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Report Manager includes predefined system reports that you can use to analyze general IPS activity in your network.

The following reports are available in the **System Reports > IPS** folder.

- **Inspection/Global Correlation**—This report provides a comparison of alerts generated by global correlation against alerts generated by traditional IPS inspection. The report shows the number and percentage of alerts per IPS inspection method (either Global Correlation or Inspection).
- **IPS Simulation Mode**—This report provides a comparison of alerts in inline (IPS) and promiscuous (IDS or IPS simulation) modes. The report shows the number and percentage of alerts based on mode, either Non Simulation Count (inline) or Simulation Mode Count (promiscuous). The IPS sensor cannot directly block attacks that occur in promiscuous mode.

When working with IPS events, the Report Manager component of Cisco Security Manager reports events individually; the Event Viewer component of Cisco Security Manager displays alerts. In the Event Viewer component, the IPS Summarizer groups events into a single alert, thus decreasing the number of alerts that the IPS sensor sends out.

**Tip**

Cisco IPS Manager Express (IME) and Cisco Security Manager do not summarize events in precisely the same way.

The parameter used to define the reporting time period is defined in the system defaults as described in [Configuring Default Settings for Reports, page 70-29](#). You can also edit the report settings and create custom versions of the reports, as described in the following topics:

- [Editing Report Settings, page 70-22](#)
- [Creating Custom Reports, page 70-21](#)

## Working with Reports in Report Manager

Use the Report Manager application to view security and usage reports for devices and remote access IPsec and SSL VPNs. The following topics explain the basics of creating reports. For information on working with report schedules, see [Scheduling Reports, page 70-33](#).

This section contains the following topics:

- [Opening and Generating Reports, page 70-20](#)
- [Creating Custom Reports, page 70-21](#)
- [Editing Report Settings, page 70-22](#)
- [Drilling Down into Report Data, page 70-26](#)
- [Printing Reports, page 70-27](#)
- [Exporting Reports, page 70-28](#)
- [Configuring Default Settings for Reports, page 70-29](#)

- [Arranging Report Windows, page 70-30](#)
- [Saving Reports, page 70-31](#)
- [Renaming Reports, page 70-31](#)
- [Closing Report Windows, page 70-32](#)
- [Deleting Reports, page 70-32](#)
- [Managing Custom Reports, page 70-32](#)

## Opening and Generating Reports

Reports are not static. When you open a report, it contains no data, although it does contain settings that define the data that shall be used to generate the report. Thus, to view a report, you need to open it and then generate it. This procedure explains the process.

### Related Topics

- [Overview of Report Manager, page 70-6](#)
- [Creating Custom Reports, page 70-21](#)
- [Arranging Report Windows, page 70-30](#)
- [Troubleshooting Report Manager, page 70-36](#)

---

**Step 1** In Report Manager, do one of the following to open a report:

- Double-click the name of the report in the report list (in the left pane).
- Select the report in the reports list and select **File > Open**.
- Right-click a report in the reports list and select **Open Report**.

The report opens with the report settings pane open and the report content area empty.

---

**Tip** You can have five reports at most open at one time. You can also collapse the report settings pane to provide more room for viewing the generated report by clicking on any area of the settings toolbar that is not a button that performs another function.

---

**Step 2** (Optional) Verify that the report settings contain the desired values, for example, the desired time window for the report. The settings for system reports are based on the system defaults (which you can configure as described in [Configuring Default Settings for Reports, page 70-29](#)). The settings for custom reports are those that were last saved for the report.

If you need to change the settings, click the **Edit** button in the settings toolbar and make your changes in the Edit Settings dialog box. For more information, see [Editing Report Settings, page 70-22](#).

---

**Tip** Be sure to save your changes if you want to make them permanent. If you change the settings for a system report and you want to preserve them, you must use Save As to create a new custom report; you cannot change the settings of a system report from the default settings.

---

**Step 3** Click the **Generate Report** button below the settings pane to retrieve the report data from the reporting database and to display the resulting information. The information is displayed in two formats:

- **Graphical**—A graphical representation of the data is shown in the top part of the report. You can select different types of graphics from the **Chart** menu above the report data: pie, XY (for linear graphs), and bar. If there are more than 10 items in the report (for example, you configured a Top report to show 25 values), all values after the tenth are summarized in the chart as “others.”

**Note** For the Top Destinations, Top Services, and Top Sources firewall reports and the Top Attackers, Top Signatures, and Top Victims IPS reports, you can click on a data point in the Pie, XY, or Bar graph to see additional details for that data point. For example, if you click on a slice in the Pie chart for the Top Signatures report, you will see report details for the top attackers and top victims for the selected signature. For more information, see [Drilling Down into Report Data, page 70-26](#).

Some reports, such as the IPS Target Analysis report, use scatter plots. For these reports, you do not have the option to select a different graphic type.

- **Tabular**—The table below the graphic lists the data used to generate the graphic. The table has different columns based on the type of report. Following are some typical columns; for more detailed information about the content of each report, see [Understanding the Predefined System Reports in Report Manager, page 70-13](#).
  - **Rank**—The order of the information by magnitude. For example, for a firewall top destinations report, a rank of 1 indicates that the destination is the most used in the evaluated events.
  - **(Name of reported characteristic)**—There is always a column whose name is based on the characteristic targeted by the report, for example, Source/Destination (IP addresses), Service (protocol and port), or User (usernames).
  - **Count**—The number of times the item appears in an event or related statistic.
  - **Percentage**—The ratio of the reported characteristic to the total sum of that characteristic in the report. The ratio includes only those numbers included in a report, so for example, you could get a different percentage for the same item in a top 10 versus a top 25 report.

**Step 4** (Optional) If desired, you can print the report or export it to a PDF or comma-separated values (CSV) file.

- To print the report, click the **Print** button and select your printer. For more information, see [Printing Reports, page 70-27](#).
- To export the report, click the **Export** button and select the file type, PDF or CSV. For more information, see [Exporting Reports, page 70-28](#).

**Tip** The report data is not preserved when you close the report. If you want to keep the displayed information, you must print or export the report.

## Creating Custom Reports

You can create custom reports to target specific characteristics that require regular analysis or presentation. For example, you might want to create separate Top Destination firewall reports for different groups of firewall devices so that you can separately analyze activity in separate physical sites. You can also use custom reports to analyze sources, destinations, or services that otherwise do not make it into the top reports.

**Tip**

It might take up to one hour for data to be available for a newly-created custom report. If you get the message that no records are found after creating the report, wait an hour and then ensure that the time span for the report is Last 1 Hour.

**Related Topics**

- [Opening and Generating Reports, page 70-20](#)
- [Overview of Report Manager, page 70-6](#)

- 
- Step 1** Select the report on which you want to base your custom report in the reports list. Open it by double-clicking it, by selecting it and selecting **File > Open**, or by right-clicking and selecting **Open Report**.
- Step 2** Click the **Edit** (pencil) button in the settings toolbar to open the Edit Settings dialog box.

**Note**

Do not click the Edit button above the reports list. That edit button allows you to change the name of the report only.

The Edit Settings dialog box is divided into two panes. The left pane lists the available settings pages; the right pane shows the settings for the page selected in the left pane.

- Step 3** Configure the settings so that they define the desired report parameters. For more information, see [Editing Report Settings, page 70-22](#).
- Step 4** Click the **Save As** button in the settings toolbar, or select **File > Save As**.
- Step 5** Enter the name of the report and optionally a description and click **OK**.
- Report names can be up to 64 characters and contain alphanumeric characters, spaces, hyphens (-), and the underscore character (\_). The description can be up to 1024 characters.

## Editing Report Settings

You can change the settings that define the criteria used to generate a report. For custom reports, you can save your changes.

For predefined system reports, you cannot directly save your changes. Instead, you can use Save As to create a new custom report using the updated settings. You can also change the default settings used in all predefined system reports rather than editing report settings, as described in [Configuring Default Settings for Reports, page 70-29](#).

**Related Topics**

- [Opening and Generating Reports, page 70-20](#)
- [Overview of Report Manager, page 70-6](#)
- [Creating Custom Reports, page 70-21](#)
- [Understanding Report Manager Data Aggregation, page 70-4](#)
- [Arranging Report Windows, page 70-30](#)

**Step 1** In Report Manager, open the report whose settings you want to change. To open the report, double-click it, select it and select **File > Open**, or right-click it and select **Open Report**.

The report opens with the settings pane open at the top of the report. The settings pane shows the type of report, the devices included in the report, the time range, a description, the schedules defined for the report, and other properties unique to the report.

**Step 2** (Optional) Change the Description by typing into the Description edit box in the report settings pane.

**Step 3** Click the **Edit** (pencil) button in the settings toolbar to open the Edit Settings dialog box.

**Note** Do not click the Edit button above the reports list. That edit button allows you to change the name of the report only.

The Edit Settings dialog box is divided into two panes. The left pane lists the available settings pages; the right pane shows the settings for the page selected in the left pane.

**Step 4** Edit the settings on the desired pages as follows:

- **Devices**—To change which monitored devices are included in the report. The default is **All Devices**.

If you want the report to reflect a subset of monitored devices, select **Filter Devices** and then select the desired devices or created contexts from the list. If a device is in italics, it means that the device is not currently selected for monitoring in Event Viewer; you can select these devices, and the report will include data for the device if it was monitored during the selected time period. You can select a folder to select all the devices in the folder.

The device list is pre-filtered to show devices of the appropriate type only. For example, if you are editing the settings for a firewall report, IPS devices do not appear in the list of selectable devices.

**Note** Starting from Cisco Security Manager 4.10, all the created contexts for ASA 9.5(2) and above will be listed under **Filter Devices**.

- **Time**—To change the time span used to select events and data to include in the report. The time is based on the Security Manager server time. You can select one of the following options to define the time span:
  - **Last 1 Hour**—The last full one hour on the zeros, for example, if the current time is 11:45 AM, the Last 1 Hour report shows data from 10:00 to 11:00.
  - **Last 1 Day**—The last full day, from midnight to midnight. For example, if the current day is Tuesday, the Last 1 Day report shows data from Monday.
  - **Last 1 Week**—The previous Monday through Sunday.
  - **Last 1 Month**—The previous month. For example, if the current date is September 29, the Last 1 Month report shows data from August.
  - **Custom**—Use the Start Date and End Date calendars to select the desired starting and ending times for the report. Click the down arrow, select the desired day and time, then click OK in the calendar widget. Reportable data is kept for 90 days, so you cannot select a date more than 90 days into the past. Additionally, you cannot specify a time if you select a start date more than five days into the past. If you select the current date for the start date, you can also specify minutes for both starting and ending dates, but because report data is aggregated every 15 minutes at 00, 15, 30, and 45 minutes past each hour, minute entries are rounded to the nearest of these figures. The allowed time selection is based on how data is aggregated, as explained in [Understanding Report Manager Data Aggregation, page 70-4](#).

- **Criteria**—To change the other criteria used to define the report. The attributes available on the Criteria settings page are variable. In some cases, there are no selectable criteria. Following is a list of the possible criteria:
  - Top (All “Top” reports.)—The number of items targeted by the report to include. For example, the Top 10 firewall destinations returns the 10 most frequent destinations for firewall events in the configured time range. Select 10, 20, 25, or 50.
  - Service (Firewall reports except Botnet)—The services to include in the report. To specify services, click the Edit button next to the field and select the desired service policy objects. You can select multiple objects.
  - Source IP, Destination IP (Firewall reports except Botnet)—The source and destination IP address fields are separate, but they are functionally the same. They define the IP addresses for sources or destinations to include in the report. You can enter individual addresses, such as 10.100.10.10, or address ranges, such as 10.100.10.10-10.100.10.20. Both IPv4 and IPv6 addresses are accepted. Separate multiple addresses with commas.

You can click the Edit button next to the field to open a dialog box where you can more easily create complex lists of addresses and address ranges. However, you cannot use network/host objects to define addresses.

---

**Note** Do not specify values for all of the Service, Source IP, and Destination IP criteria in a single report. You can specify the criteria on which the report is based (for example, Service for the Top Services report) plus one other criteria. If you specify all three values, the report will always contain no data.

---

- Permit/Deny (Firewall reports except Botnet)—The action reflected in the event, either permitting the matching traffic (Permit), denying the matching traffic (Deny), or either (All). The default is All.
- Signature ID (IPS top attackers, top signatures, top victims)—The signatures to include in the report. To specify signatures, click the Edit button next to the field and select the desired signatures. You can select a folder to select all signatures in the folder.

---

**Note** In the predefined system reports, you cannot specify values for all three of the Signature ID, Attacker IP, and Victim IP criteria. You can specify a value for the key attribute of the report (for example, Victim IP for the top victims report) plus one of the other values. If you want to configure values for all three criteria, you must create a custom report.

---

- Attacker IP, Victim IP (IPS top attackers, top signatures, top victims)—The attacker and victim IP address fields are separate, but they are functionally the same. They define the IP addresses for attackers (sources) or victims (destinations) to include in the report. You can enter individual addresses, such as 10.100.10.10, or address ranges, such as 10.100.10.10-10.100.10.20. Both IPv4 and IPv6 addresses are accepted. Separate multiple addresses with commas.
- You can click the Edit button next to the field to open a dialog box where you can more easily create complex lists of addresses and address ranges. However, you cannot use network/host objects to define addresses.
- Blocked (IPS top attackers, top blocked/unblocked signatures, top signatures, top victims)—Whether the event resulted in dropped traffic (Blocked), traffic that was not dropped (Unblocked), or either (All).

- Username (Connection Profile Report and User Report)—The names of the users to include in the report. The default, an empty list, includes all users. If you want the report to focus on specific users, use the Add (+), Edit (pencil), and Delete (trash can) buttons beneath the table to create the desired list of users. Beginning with Version 4.7 of Security Manager, the Username filter supports uppercase/lowercase character sensitivity, wildcard characters, and "NOT" operation support. Please refer to **Enabling Uppercase/Lowercase Character Sensitivity** and **Disabling Wildcard Support** in the paragraphs at the end of this topic.
- Technology (Connection Profile Report, User Report, and VPN Device Usage Report)—The type of remote access technology to include in the report: All, Clientless (SSL VPN), Full Client (SSL VPN), IPsec RA (IPsec remote access VPN).
- Connection Profile (Connection Profile Report)—Allows you to customize a Connection Profile Report in Report Manager by adding or editing a connection profile for a Clientless (SSL VPN), Full Client (SSL VPN), or IPsec RA (IPsec remote access VPN) topology. For more information, see [Connection Profiles Page, page 31-8](#) and [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 31-7](#). Beginning with Version 4.7 of Security Manager, the Connection Profile filter supports uppercase/lowercase character sensitivity, wildcard characters, and "NOT" operation support. Please refer to **Enabling Uppercase/Lowercase Character Sensitivity** and **Disabling Wildcard Support** in the paragraphs at the end of this topic.
- Group Policy (Connection Profile Report)—Allows you to customize a Connection Profile Report in Report Manager by specifying a single or multiple group policies in the filter to generate the report for the user who has logged with the specified group policies. For more information, see [Configuring Group Policies for Remote Access VPNs, page 31-26](#). Beginning with Version 4.7 of Security Manager, the Group Policy filter supports uppercase/lowercase character sensitivity, wildcard characters, and "NOT" operation support. Please refer to **Enabling Uppercase/Lowercase Character Sensitivity** and **Disabling Wildcard Support** in the paragraphs at the end of this topic.
- User Session Duration (Connection Profile Report and User Report)—As the title indicates, allows you to specify the duration of a user session as <= or >= a given number of hours.

**Step 5** Click **OK** in the Edit Settings dialog box to implement your changes.

You can now click the Generate Report button to retrieve the data defined by the settings and display it in the report. You can also use Save or Save As to permanently save the changes to the settings.

### Enabling Uppercase/Lowercase Character Sensitivity

Beginning with Version 4.7 of Security Manager, uppercase/lowercase character sensitivity is available for the Username filter, the Connection Profile filter, and the Group Policy filter. Uppercase/lowercase character sensitivity is disabled by default. If you want to use it, you must enable it by following these steps; note that enabling it for one of these three filters enables it for all three of them:

1. Locate the reporting.properties file. The default location is NMSROOT/MDC/reports/config. (The default value for NMSROOT is C:\Program Files (x86)\CSCOpx
2. Set the parameter reports.reportgeneration.vpnUserReport.casesensitive.enable=true
3. Restart the Report Manager service, which is CsmReportServer

### Disabling Wildcard Support

Beginning with Version 4.7 of Security Manager, wildcard support is available for the Username filter, the Connection Profile filter, and the Group Policy filter. Wildcard support is enabled by default. If you do not want to use it, you must disable it by following these steps; note that disabling it for one of these three filters disables it for all three of them:

1. Locate the reporting.properties file. The default location is NMSROOT/MDC/reports/config. (The default value for NMSROOT is C:\Program Files (x86)\CSCOpx

2. Set the parameter `reports.reportgeneration.vpnUserReport.wildcard.enable=false`
3. Restart the Report Manager service, which is `CsmReportServer`

## Drilling Down into Report Data

The Top Destinations, Top Services, and Top Sources firewall reports and the Top Attackers, Top Signatures, and Top Victims IPS reports allow you to drill down into the report data.

To drill down into one of the supported reports, click on a data point in the Pie, XY, or Bar graph for that report. For example, if you click on a slice in the Pie chart for the Top Signatures report, you will see report details for the top attackers and top victims for the selected signature.

### Note

The filter criteria you use for a report affects the data available in the associated drill-down reports. If you apply filters to the report data, only one drill-down report will be shown when drilling down into the report data.

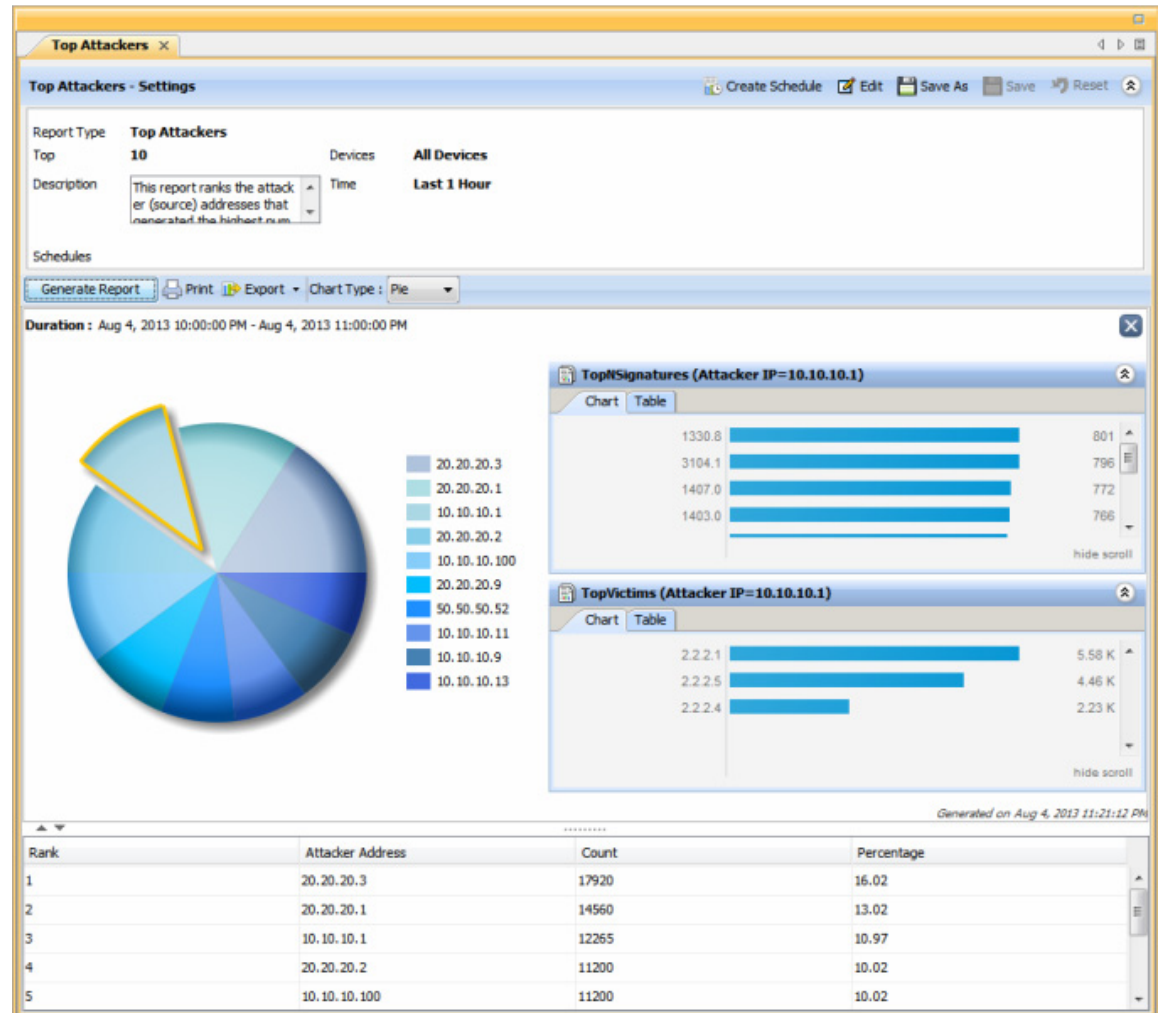

The following table shows the drill-down reports that are shown for each supported report type.

| Report Name      | Drill-down Reports Shown       |
|------------------|--------------------------------|
| <b>Firewall</b>  |                                |
| Top Sources      | Top Destinations, Top Services |
| Top Destinations | Top Sources, Top Services      |
| Top Services     | Top Sources, Top Destinations  |
| <b>IPS</b>       |                                |
| Top Signatures   | Top Attackers, Top Victims     |
| Top Attackers    | Top Signatures, Top Victims    |
| Top Victims      | Top Signatures, Top Attackers  |

For each of the drill-down reports, you can view a chart or a table of the drill-down data. If you have drilled down into a specific data point in one of the supported reports, the drill-down report graph and tabular data will be included in the printed report and in the exported report data.

The following illustration shows an example of the drill-down report data for the Top Attackers report.

Figure 70-5 Top Attackers Drill-down Reports

**Related Topics**

- [Opening and Generating Reports, page 70-20](#)
- [Overview of Report Manager, page 70-6](#)

**Printing Reports**

After you generate a report as described in [Opening and Generating Reports, page 70-20](#), you can print it.

**Note**

If you have opened drill-down reports for a specific data point in the Top Destinations, Top Services, or Top Sources firewall reports or the Top Attackers, Top Signatures, or Top Victims IPS reports, the drill-down report graph and tabular data will be included in the printed report. For more information, see [Drilling Down into Report Data, page 70-26](#).

To print the report, click the **Print** button above the report. You are prompted to select a printer.

## Exporting Reports

After you generate a report as described in [Opening and Generating Reports, page 70-20](#), you can export it to an Adobe Acrobat (PDF) or comma-separated values (CSV) file.

Exported files include the following information:

- The creation time of the report.
- The settings used to generate the report.
- (PDF only.) The graphical representation of the report data.
- The tabular report data. In PDFs, the information is represented as a table. In CSVs, the information is comma-separated, with the first row being the column headings.

### Note

If you have opened drill-down reports for a specific data point in the Top Destinations, Top Services, or Top Sources firewall reports or the Top Attackers, Top Signatures, or Top Victims IPS reports, the drill-down report graph and tabular data will be included in the export. For more information, see [Drilling Down into Report Data, page 70-26](#).

To export the report, click the down arrow in the **Export** button above the report and select either **As PDF** or **As CSV**. You are prompted to select a folder for the report. A default file name is provided, but you can change the file name.

### Troubleshooting Report Exporting Error

When we try to export, device status report we get the following error.

"Windows cannot find 'acrord32'. Make sure you typed the name correctly and then try again".

First, the above error occurs if Adobe Reader is not installed on the server. Windows cant located the acrord32.exe file as Adobe is not installed.

Second, Even if Adobe reader is installed, the above error might be thrown. This is an issue which exists in windows XP, Vista, 7, 8.1 and 10. This is caused due to failure in opening Adobe Reader. it is a known error and can happen to any application and not just Adobe reader. Microsoft hasn't provided patch for this yet.

Reported reasons why this issue can happen are:

- 1) Corrupt registry entry
- 2) Problem while installing Adobe
- 3) Deleting the default Adobe Reader

<B>Symptom:</B>

When we try to export, device status report we get the following error.

"Windows cannot find 'acrord32'. Make sure you typed the name correctly and then try again"

**<B>Conditions:</B>**

First, the above error occurs if Adobe Reader is not installed on the server. Windows can't locate the acro32.exe file as Adobe is not installed.

Second, Even if Adobe reader is installed, the above error might be thrown. This is an issue which exists in windows XP, Vista, 7, 8.1 and 10. This is caused due to failure in opening Adobe Reader. It is a known error and can happen to any application and not just Adobe reader. Microsoft hasn't provided patch for this yet.

**<B>Workaround:</B>**

- 1) If Adobe reader is not installed, install it
- 2) If Adobe reader is installed and error is still thrown, Go to the location where the file is saved and perform

Open with Adobe Reader action. Even though the error is thrown, the file will be created but it will be without a

format. So we can open it using a PDF reader.

**<B>Further Problem Description:</B>**

## Configuring Default Settings for Reports

You can control the default settings that Report Manager uses for System reports. When you change the defaults, you automatically change the settings for all System reports, but the changes do not apply to any reports you saved as custom reports (in the My Reports folder). You must have system administrator or network administrator privileges to change these settings.

While viewing a report, you can edit any system report to specify different values for these settings, either to use temporarily while viewing the report, or to save as a custom report in the My Reports folder.

**Tip**

If you change the settings in a system report, you can return the report to the default settings by clicking the **Reset** button in the Report Settings toolbar.

**Step 1** In Report Manager, select **Tools > Default Report Settings** to open the Default Report Settings dialog box.

**Step 2** Configure any of the following options:

- **Top**—The number of results listed in any of the “Top” reports, which list the most-often occurring items of the type targeted by the report. For example, if you select 20, the firewall Top Destinations report shows the 20 most often occurring traffic destinations in events reported to Security Manager. The default is 10.

If you select more than 10, all items after the tenth are summarized as “others” in charts, although the detailed information for each additional item is listed in the report table.

- **Time Range**—The time window for events included in the report:
  - Last 1 Hour—The last full one hour on the zeros, for example, if the current time is 11:45 AM, the Last 1 Hour report shows data from 10:00 to 11:00.
  - Last 1 Day—The last full day, from midnight to midnight. For example, if the current day is Tuesday, the Last 1 Day report shows data from Monday.
  - Last 1 Week—The previous Monday through Sunday.
  - Last 1 Month—The previous month. For example, if the current date is September 29, the Last 1 Month report shows data from August.

For more information on the implications of the time range setting, see [Understanding Report Manager Data Aggregation, page 70-4](#).

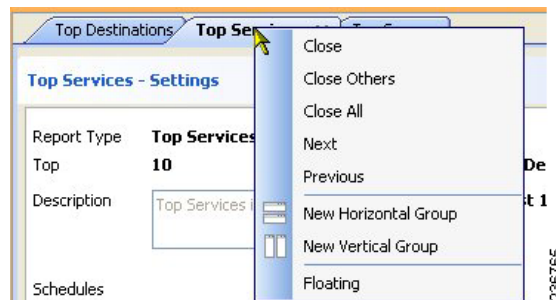

- **Default Email Address**—The email address used as the default destination for scheduled reports.

If you decide you want to return to the installation default values, click **Restore Defaults**.

**Step 3** Click **Apply** to save your changes, then click **Close** to close the dialog box.

## Arranging Report Windows

You can open up to five report windows at one time. Reports are opened as tabbed windows in the right pane of the main Report Manager window, in the most recently used area (“tabbed group”) if there is more than one area. The commands to arrange the windows appear if you right-click the tab for the report window as shown in the following illustration.

You have many options for arranging report windows based on your requirements. For example, you might want to compare two reports side-by-side, or remove a report from the main window without closing it.

You can use the following techniques to arrange the report windows to get the view that you desire:

- **Floating a report**—To remove a report from the main Report Manager window without closing it, right-click the report tab and select **Floating**. The report is moved to its own window.
 

If you have already floated a report, you can select **Floating to** and choose one of the already-floated windows. The report becomes a new tab in that window.
- **Docking a report**—To move a floating report back to the main Report Manager window, right-click the report tab and select **Docking**.
- **Arranging reports horizontally or vertically for side-to-side comparison**—To create a vertical or horizontal arrangement of reports to allow for easy comparison, without floating the reports, right-click the report tab and select **New Horizontal Group** or **New Vertical Group**. These

commands split the current tabbed group into the selected layout. You must have at least two reports open to use these commands. If you have more than two open reports, and you want all of them in separate windows, you need to use the command multiple times.

- Move reports to different tabbed groups—If you have several open reports, and you have arranged them into horizontal or vertical groups, you can move reports among the groups by right-clicking the report tab and selecting **Move to Next Tab Group** or **Move to Previous Tab Group**. The commands appear only if reports are arranged in a manner where such movement is possible:
- Change the orientation of groups—You can switch between horizontal and vertical layouts by right-clicking the report tab and selecting **Change Tab Groups Orientation**.

## Saving Reports

If you edit the settings for a report, you must save it to make those changes permanent. However, to save changes to predefined system reports, you must save the report as a custom report.

**Tip**

When you save a report, you are saving the settings that define the report. You are not saving the generated content of the report. If you want to save the generated content of the report, that is, the graphs and the report data, you must export the report rather than save it.

- To save changes to a custom report, do one of the following in Report Manager:
  - Select **File > Save** from the menu bar.
  - Click the **Save** button in the Report Settings toolbar.
- To save your changes as a new custom report, do one of the following to open the Save Report As dialog box:
  - Select **File > Save As** from the menu bar.
  - Click the **Save As** button in the Report Settings toolbar.
  - Right-click the report in the reports list and select **Save As**.

Then, enter a name for the report and optionally a description of the report and click **OK**. The report is added to the My Reports folder in the reports list.

**Note**

Report names can be up to 64 characters and contain alphanumeric characters, spaces, hyphens (-), and the underscore character (\_). The description can be up to 1024 characters.

## Renaming Reports

You can change the name of custom reports, but you cannot change the names of predefined system reports.

### Related Topics

- [Overview of Report Manager, page 70-6](#)
- [Understanding the Report List in Report Manager, page 70-9](#)

- 
- Step 1** In Report Manager, select the report whose name you want to change from the reports list. You do not need to open the report; simply select it in the list.
- Step 2** Click the **Edit** (pencil) button above the reports list to open the dialog box that allows you to change the report name.
- Step 3** Enter the new name and click **OK**.
- Report names can be up to 64 characters and contain alphanumeric characters, spaces, hyphens (-), and the underscore character (\_).
- 

## Closing Report Windows

You can close any report by clicking the X icon on the report tab. For reports that you have floated, you can simply click the X icon in the window's title bar.

**Tip**

When you close a report, none of the generated report data is preserved. If you want to preserve the generated data, you must print it or export it before you close the report window.

---

You can also use the following techniques to close the report windows without exiting Report Manager:

- Close a report—Select **File > Close Report** to close the currently-viewed report, or right-click the desired report tab and select **Close**.
- Close all reports—Select **File > Close All Reports**, or right-click any report tab and select **Close All**.
- Close all reports except one—Right-click the report tab of the report you want to keep open and select **Close Others**.

## Deleting Reports

You can delete custom reports, but you cannot delete predefined system reports.

To delete a custom report, select it in the reports list and click the **Delete** (trash can) button above the reports list. You are asked to confirm your deletion.

**Tip**

Deleting a report also deletes any schedules for that report.

---

If you need to delete another user's custom report, see [Managing Custom Reports, page 70-32](#).

## Managing Custom Reports

If you have system administrator or network administrator privileges, you can view a list of custom reports created by all Report Manager users on this Security Manager server.

To view the list of custom reports, select **Tools > Custom Report List** to open the Manage Custom Reports dialog box. The list shows the report name, the type of report, the type of device analyzed by the report, and the username of the person who created the custom report.

You can use the following controls to manage custom reports from this page:

- **Pagination controls**—If there are a lot of custom reports, use the pagination controls to move through the list. You can click the buttons to move to the first page, previous page, next page, or last page, or type the page number into the Page X of Y edit box. You can also click the down arrow in the edit box to change the edit box to work by record number rather than page number.
- **Delete button**—Click this button to delete the selected report. Any schedules (and schedule results) that use the report are also deleted.
- **Refresh button**—Click this button to update the list with the latest information.

## Scheduling Reports

You can create schedules to regularly generate reports from Report Manager.

This section contains the following topics:

- [Viewing Report Schedules, page 70-33](#)
- [Configuring Report Schedules, page 70-34](#)
- [Viewing Scheduled Report Results, page 70-35](#)
- [Enabling and Disabling Report Schedules, page 70-36](#)
- [Deleting Report Schedules, page 70-36](#)

## Viewing Report Schedules

You can view a list of report schedules that are configured in Report Manager. If you have system administrator or network administrator privileges, the list includes all schedules configured on the server, whether you configured them or another user configured them. Users with lesser privileges can see their own schedules only.

To view the list of report schedules, select the **Scheduled Reports** tab, and if necessary, the **Schedule List** sub-tab. The list shows the schedule name, description, the report that will be generated by the schedule, the frequency of report generation, the e-mail addresses to which reports are sent (if any), whether the schedule is enabled or disabled, and the username of the person who created the schedule.

You can use the following controls to manage report schedules from this page:

- **Pagination controls**—If there are a lot of schedules, use the pagination controls (below the table to the left) to move through the list. You can click the buttons to move to the first page, previous page, next page, or last page, or type the page number into the Page X of Y edit box. You can also click the down arrow in the edit box to change the edit box to work by record number rather than page number.
- **Add button**—Click this button to add a new schedule. For more information, see [Configuring Report Schedules, page 70-34](#).
- **Edit button**—Click this button to edit the selected schedule. For more information, see [Configuring Report Schedules, page 70-34](#).
- **Delete button**—Click this button to delete the selected schedule. For more information, see [Deleting Report Schedules, page 70-36](#).
- **Refresh button**—Click this button to update the list with the latest information.

- **Enable button**—Click this button to enable the selected schedule. The button is active only if the selected schedule is disabled. For more information, see [Enabling and Disabling Report Schedules, page 70-36](#).
- **Disable button**—Click this button to disable the selected schedule. The button is active only if the selected schedule is disabled. For more information, see [Enabling and Disabling Report Schedules, page 70-36](#).

## Configuring Report Schedules

You can create schedules to automatically generate reports at set times. The generated reports are e-mailed to identified recipients and are also stored and available for viewing from Report Manager. By scheduling reports, you can easily and efficiently create regular milestone views of network security and usage. This procedure explains how to set up a schedule for a report.

### Related Topics

- [Overview of Report Manager, page 70-6](#)
- [Opening and Generating Reports, page 70-20](#)
- [Viewing Report Schedules, page 70-33](#)
- [Troubleshooting Report Manager, page 70-36](#)

---

**Step 1** In Report Manager, do one of the following:

- On the Reports tab, open the report for which you are creating a new schedule by double-clicking the name of the report in the report list (in the left pane). Then, click the **Create Schedule** button in the report settings toolbar.

---

**Note** You cannot edit an existing schedule from the Reports tab.

---

- On the Reports tab, right-click the report on which you are creating a schedule and select **Create Schedule**. If the report is not already open, it is opened.
- On the Scheduled Reports tab, Schedule List sub-tab, click the **Add** button below the list of schedules to create a new schedule. To edit an existing schedule, select it in the list and click the **Edit** button.

The Add or Edit Report Schedule dialog box opens.

**Step 2** Configure the following options in the dialog box:

- **Schedule Name**—A name for the schedule, up to 64 characters.
- **Report Name**—Select the name of the report to be generated by the schedule. When you create a schedule from the report settings pane, the name is pre-selected and you cannot change it.
- **Schedule**—Select whether the report shall be generated daily, weekly (once per week), or monthly (once per month). Then, enter the day and time for generating the report:
  - Daily schedules—Select whether the schedule is for Monday through Friday (five days) or Monday through Sunday (all seven days). Enter the time of day (in 24-hour notation) to generate the report.
  - Weekly schedules—Select the day of the week and enter the time of day in 24-hour notation.

- Monthly schedules—Select whether to generate the report on the first day of the month, the last day, or custom. If you select Custom, enter the day number. Then, enter the time of day in 24-hour notation.
- **Email To**—The email addresses that should be sent the report. Separate multiple addresses with commas. If you do not want reports e-mailed, ensure that the field is empty. Note that for e-mails to be sent successfully, you must configure SMTP on the Security Manager server as described in [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27](#).  
If the report fails to generate for some reason, notification of the failure is sent to these e-mail addresses.
- **Export Report Format**—Whether to generate the report in Adobe Acrobat (PDF) or comma-separated value (CSV) format. The PDF includes graphics, the CSV does not. For more information on export formats, see [Exporting Reports, page 70-28](#).
- **Description**—A description of the schedule.
- **Status**—Whether the schedule is enabled (reports will be generated) or disabled (reports will not be generated).

**Step 3** Click **OK** to save the schedule. New schedules are added to the schedules list on the Schedules tab.

---

## Viewing Scheduled Report Results

Typically, report schedules include e-mail addresses to which generated reports are sent. You can also view reports generated from schedules in Report Manager. If you have system administrator or network administrator privileges, you can view results generated by other users' schedules.

**Tip**

Report Manager maintains a copy of the last report generated by the schedule. You cannot retrieve previously generated reports.

---

### Related Topics

- [Overview of Report Manager, page 70-6](#)
  - [Opening and Generating Reports, page 70-20](#)
  - [Viewing Report Schedules, page 70-33](#)
  - [Troubleshooting Report Manager, page 70-36](#)
- 

**Step 1** In Report Manager, select the **Scheduled Reports** tab.

**Step 2** Select the **Results** sub-tab.

All results that you are authorized to see are listed on this tab. The list shows the schedule name, the name of the report that was generated, the frequency of report generation, the date and time of the last schedule run (when the report was generated), the status of the report generation (Success or Failed), a link to the generated report (in the Last Report column), and the username of the person who created the schedule.

**Tip**

If the status of a report is Failed, click the link to see the reason for failure.

---

- Step 3** Double-click the icon link to the report in the Last Report column to open it. While viewing the report, you can save it to your workstation.
- If you cannot find the report you are looking for, click the **Refresh** button to update the list with the latest information.
- 

## Enabling and Disabling Report Schedules

You can enable or disable report schedules to change whether reports are generated based on the schedules. By disabling a schedule, you can prevent reports from being generated without deleting the schedule. If you have system administrator or network administrator privileges, you can enable or disable another user's schedule.

### Related Topics

- [Overview of Report Manager, page 70-6](#)
- [Viewing Report Schedules, page 70-33](#)

- Step 1** In Report Manager, select the **Scheduled Reports** tab, then if necessary, the **Schedule List** sub-tab. This tab lists all currently-defined schedules that you are authorized to see.
- Step 2** Select the schedule whose status you want to change and click either the **Enable** or **Disable** button.
- 

## Deleting Report Schedules

You can delete report schedules if you no longer need them. If you have system administrator or network administrator privileges, you can delete another user's schedule.

### Tip

If you do not want to generate reports from a schedule, but you want to keep the schedule definition, you can disable the schedule. Disabled schedules do not generate reports.

---

- Step 1** In Report Manager, select the Scheduled Reports tab, then if necessary, the Schedule List sub-tab. This tab lists all currently-defined schedules that you are authorized to see.
- Step 2** Select the schedule and click the **Delete** button below the list. You are asked to confirm the deletion.
- When you delete a schedule, any results of the schedule are also deleted from the server and they are removed from the Results tab.
- 

## Troubleshooting Report Manager

Following are some problems you might encounter when using the Report Manager application, and some ways to resolve the problems.

**Problem:** Report Manager does not open, you get the message “Not able to connect to server.”

**Solution:** Report Manager requires that the `csmReportServer`, `rptDbEngine`, and `rptDbMonitor` processes be started. Report Manager also relies on the Event Management service `VmsEventServer`. Ensure that all services are started and running correctly on the Security Manager server.

To view the current state of the processes, log into the Security Manager web interface using `http://SecManServer:1741`, where `SecManServer` is the DNS name of the server. From the Security Management Suite home page, click the **Server Administration** link to open CiscoWorks Common Services at the Admin page. Click **Processes** in the TOC on the left side of the window to open the list of processes that displays their current states. Select these processes and click **Start** to start them. If necessary, you might want to stop them, and then restart them. Wait for the processes to fully restart, then try again to open Report Manager.

**Problem:** When generating a report, you get the message “No records found.”

**Solution:** This message indicates that there were no event records in the event data storage location that relate to the report type and the configured settings, or that the required Report Manager aggregation cycle has not completed. Investigate the following:

- Ensure that devices of the appropriate type are selected for monitoring as described in [Selecting Devices to Monitor, page 69-34](#).
- Ensure that these devices are appropriately configured for sending events to Security Manager, and that events from the device appear in Event Viewer. Ensure that the device and Security Manager are using the same syslog port. For information on configuring the devices, see [Configuring ASA and FWSM Devices for Event Management, page 69-28](#) and [Configuring IPS Devices for Event Management, page 69-29](#). To check the syslog port that Security Manager is using, view the setting on the **Tools > Security Manager Administration > Event Management** page in Configuration Manager.
- For IPS devices, ensure that the certificate has not expired. Check the certificates table by selecting **Manage > IPS > IPS Certificates** in Configuration Manager and regenerate the certificate if necessary.
- The report settings might specify a time period in which no aggregated data exists for the report. Data is aggregated every 15 minutes, 1 hour (on the hour), and 1 day (at midnight). Try changing the time parameters of the report. See [Editing Report Settings, page 70-22](#). Consider the following:
  - To see a Last 1 Hour report, a change of hour must occur since initially starting the Event Manager service. For example, if you start the service at 10:05, hourly reports are available only after 11:00.
  - To see a Last 1 Day report, a change of day must occur since initially starting the Event Manager service. For example, if you start the service at 10:05, you must wait until after midnight to see a daily report.
  - To see a Last 1 Week report, at least one full day cycle must occur. Weekly reports are based on daily reports.
  - To see a Last 1 Month report, at least one full month must pass since starting the service.
  - To see a custom time period report, at least one daily cycle must occur.
- If you create a new custom report, it might take up to one hour for data to become available. Also, ensure that the time period is Last 1 Hour until the report is old enough to have data for other time periods.

**Problem:** You cannot get reports for a specific device.

**Solution:** Investigate the following:

- The device must have been selected for event management during the reporting time-frame as described in [Selecting Devices to Monitor, page 69-34](#). Even if a device is selected, Report Manager might not support all devices that are supported for Event Viewer. For information on the supported device types, see [Understanding Report Management, page 70-1](#).
- The report settings might exclude the device. Unless the report settings indicate that All Devices are considered in the report, check the device selection to ensure the device is included. See [Editing Report Settings, page 70-22](#).
- The report settings might specify a time period in which no data exists for the device. Try changing the time parameters of the report. See [Editing Report Settings, page 70-22](#).
- If your organization uses Cisco Secure ACS to control access to the application, you can view reports on a device only if you have at least View privileges to the device. Check whether you have the required permissions.

**Problem:** You cannot see data in certain IPS predefined reports after specifying values for each of signature, victim IP, and attacker IP.

**Solution:** The top attackers, top victims, and top signatures predefined reports include criteria for signature, victim IP address, and attacker IP address. However, you cannot configure all three criteria in a predefined report. Instead, you can configure the criteria on which the report is based (for example, victim IP address for the top victims report) plus one, and only one, of the remaining values. Note that this limitation does not apply to the other criteria, such as Blocked and Top.

**Problem:** You cannot see data in certain Firewall predefined reports after specifying values for each of service, source IP, and destination IP.

**Solution:** The top destinations, top services, and top sources predefined reports include criteria for service, source IP address, and destination IP address. However, you cannot configure all three criteria in a predefined report. Instead, you can configure the criteria on which the report is based (for example, service for the top services report) plus one, and only one, of the remaining values. Note that this limitation does not apply to the other criteria, such as Permit/Deny and Top.

**Problem:** Statistics for VPN reports are not available.

**Solution:** VPN statistics are partially obtained directly from the device rather than from events stored in the event data storage location. To obtain the statistics, Report Manager must be able to log into the device and use show commands. Ensure that the device properties for your VPN devices have the correct credentials for logging in.

**Problem:** Scheduled reports are not getting sent to recipients.

**Solution:** Ensure that the SMTP server is configured correctly and that a valid source e-mail address is configured for Security Manager. For more information, see [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27](#).

**Problem** When exporting the device status report, you get the following error.

```
"Windows cannot find 'acrord32'. Make sure you typed the name correctly and then try again".
```

**Solution** Execute the following:

- Install Adobe Reader on the server, if it is not installed already. MS-Windows will not be able to locate the acrord32.exe file if Adobe Reader is not installed.

- Though Adobe Reader is installed, the error might be thrown if you are using Windows XP, Vista, 7, 8.1 or 10. This is a known error of Microsoft Windows. Microsoft is yet to provide patch for this error. Do the following:
  - Go to the location where the exported report file is saved. Right-click and choose **Open with > Adobe Reader**. Despite the error, the file is created without the defined format. Hence, you can open it using a PDF reader.

## Health and Performance Monitoring

---

The Health and Performance Monitor (HPM) application lets you monitor key health and performance data for ASA devices, IPS devices, and VPN services by providing network-level visibility into device status and traffic information.

A variety of views are provided—All Devices, Firewall Devices, IPS Devices, VPN Summary, and so on—and you can create your own customized views. A configurable listing of device alerts is also available.

This ability to monitor key network and device metrics lets you quickly detect and resolve device malfunctions and bottlenecks in the network.

This chapter contains the following topics:

- [Health and Performance Monitor Overview, page 71-1](#)
- [HPM Access Control, page 71-3](#)
- [Preparing for Health and Performance Monitoring, page 71-4](#)
- [Launching the Health and Performance Monitor, page 71-4](#)
- [Managing Monitored Devices, page 71-5](#)
- [HPM Window, page 71-6](#)
- [Monitoring Devices, page 71-21](#)
- [Alerts and Notifications, page 71-32](#)
- [SNMP Trap Forwarding Notification, page 71-44](#)

## Health and Performance Monitor Overview

The Health and Performance Monitor is a stand-alone application that you can launch from the other stand-alone Security Manager applications (Dashboard, Configuration Manager, Event Viewer, Report Manager, and Image Manager) or from the Cisco Security Manager Client login screen accessed from the Windows Start menu.

The HPM application complements the Event Viewer and Report Manager applications, as follows:

- **Event Viewer** – Monitors your network for syslog (system log) events from ASA and FWSM devices and their security contexts, and for SDEE (Secure Device Event Exchange) events from IPS devices and virtual sensors. These events include firewall traffic information, NAT events, failover events, IPS alerts, and so on. Event Viewer collects and displays this information, organized into a variety of views. See [Chapter 69, “Viewing Events”](#) for more information.

- **Report Manager** – Collects, displays and exports network usage and security information for ASA and IPS devices, and for remote-access IPsec and SSL VPNs. These reports aggregate security data such as top sources, destinations, attackers, victims, as well as security information such as top bandwidth, duration, and throughput users. Data is also aggregated for hourly, daily, and monthly periods. See [Chapter 70, “Managing Reports”](#) for more information.
- **Health and Performance Monitor (HPM)** – Monitors and displays key health, performance and VPN data for ASA and IPS devices in your network. This information includes critical and non-critical issues, such as memory usage, interface status, dropped packets, tunnel status, and so on. You also can categorize devices for normal or priority monitoring, and set different alert rules for the priority devices.

You can add notes to displayed alerts, you can “acknowledge” them, and you can clear them. When an alert is cleared, it is removed from the Alerts display; however, the alert information is retained in a database for 30 days. See [Alerts: Acknowledging and Clearing, page 71-42](#) for more information about adding notes, and acknowledging and clearing alerts.

---

**Note** You can use the Alerts History window to access and view previously cleared alerts, as described in [Alerts: History, page 71-43](#).

---

This section contains the following topics:

- [Trend Information, page 71-2](#)
- [Monitoring Multiple Contexts, page 71-3](#)

## Trend Information

The Health and Performance Monitor periodically polls monitored devices for status and performance data. This information is used for alert generation, and to display real-time views and historical trends based on aggregated data.

Trends are displayed graphically for a specific set of metrics. Each trend for the currently selected device is represented as a graph generated for a chosen time interval. Comparing current values with the weekly averages for CPU and memory usage, for example, can provide an operational context for the selected device. Available trend intervals for monitored devices are one hour, 24 hours, and one week.

Metrics used for generating trends include:

- CPU usage
- Memory usage (only for single-context devices)
- Connections per second (firewall devices)
- Translations per second (firewall devices)
- Inspection load (IPS devices)
- Missed packets as a percentage (IPS devices)
- Number of VPN tunnels
- Number of RA VPN sessions
- Total VPN throughput
- Firewall throughput
- Total dropped packets (firewall interfaces)

For additional graphical information about the health and performance of a specific device, you can launch the related device manager by right-clicking the entry for a device, a cluster node, or the system context for a multi-context device, and then choosing **Device Manager** from the pop-up menu. See [Starting Device Managers, page 72-14](#) for more information about the device managers.

## Monitoring Multiple Contexts

The Health and Performance Monitor can monitor single- and multiple-context ASA devices. For multiple-context devices, each context is monitored and displayed as if it was a separate device.

Each context will be polled separately for all applicable metrics, with HPM polling a maximum of five contexts at a time from any given device. For devices with more than five contexts, data will be acquired from each successive batch of five contexts, with each batch being polled progressively during successive polling cycles. This means that all contexts may not be updated at the same time.

For multiple-context devices, basic device health—memory usage, device status, and so on—is monitored only on the physical device (that is, from the system context), while traffic data—number of connections, number of translations, dropped packets and so on—are monitored at context level.

For virtual contexts, CPU usage data are used only for pattern analysis, not for alert generation. Only interface-status alerts will be generated for virtual contexts.

## HPM Access Control

The privileges assigned to your user name control what you can do in Health and Performance Monitor. If you use local users, or other types of non-ACS access control, then all users have access to HPM. However, the following access limits are imposed:

- You must have system administrator privileges to enable or disable Health and Performance Monitoring in Security Manager, as described in [Health and Performance Monitor Page, page 11-36](#).
- You must have system administrator, network administrator, or approver privileges to select or deselect devices for monitoring, as described in [Managing Monitored Devices, page 71-5](#).
- You also must have system administrator, network administrator, or approver privileges to configure alerts and notifications, as described in [Alerts: Configuring, page 71-34](#).

If you use ACS to control access to Security Manager, you can also control the following:

- You can control access to the Health and Performance Monitor application using the View > Health and Performance Monitor privilege (part of Role Management in ACS). Using this privilege, you could prevent certain users from accessing HPM, or create roles that allow access to HPM without allowing access to Event Viewer or Report Manager. All default ACS roles are permitted to use the Health and Performance Monitor application.
- Use the Modify > Policies > HPM Monitoring privilege to control which users can select and deselect the devices that are monitored (see [Managing Monitored Devices, page 71-5](#)), configure alerts and notifications (see [Alerts: Configuring, page 71-34](#)), and annotate and acknowledge alerts (see [Alerts: Acknowledging and Clearing, page 71-42](#)). All default ACS roles except Help Desk and Super Admin have this permission.
- Users can view health and performance information for a device only if they have at least View privileges for the device.

- You can control access to the Health and Performance Monitoring administrative settings page (in Security Manager's Configuration Manager) where HPM is enabled or disabled, as described in [Health and Performance Monitor Page, page 11-36](#). The user must have the Modify > Policies > HPM Admin privilege to access this page (or any other administrative settings page). All default ACS roles except Help Desk can view the page, but only System Administrators can change the setting.

For information on integrating Security Manager with Cisco Secure ACS, see the [Installation Guide for Cisco Security Manager](#).

## Preparing for Health and Performance Monitoring

In order to use the Health and Performance Monitor (HPM), you must configure Security Manager, enable the HPM application, and configure device monitoring, as follows:

- Basic Threat Detection must be enabled on ASA 8.0+ devices in order to monitor metrics such as ACL Dropped Packets, Scanning Threat Dropped Packets, Inspection Dropped Packets, and Syn Attack Dropped Packets. (Basic Threat Detection is enabled by default on these ASA devices.)
- To receive alert notifications via email, you must have configured the SMTP server and administrator email ID on the **System Preferences** page of the Security Manager server. See the [Installation Guide for Cisco Security Manager](#) for more information. (Specifying email addresses for alert notifications from the Health and Performance Monitor application is described in [Alerts: Configuring, page 71-34](#).)
- Health and Performance Monitoring must be enabled in Security Manager, as described in [Health and Performance Monitor Page, page 11-36](#).
- In HPM, specify the devices to be monitored, in both Normal and Priority modes, as described in [Managing Monitored Devices, page 71-5](#).

### Note

---

To prevent read time-outs for ASAs, those devices must be configured to use only certain SSL/TLS protocol versions when acting as a server, as described in [Setting Up SSL \(HTTPS\) on PIX Firewall, ASA and FWSM Devices, page 2-3](#).

---

- Enable and configure the device threshold values and state-change rules that define when alerts and email notifications are triggered. This process is described in [Alerts: Configuring, page 71-34](#).

### Note

---

We also recommend configuring monitored devices to use a Network Time Protocol (NTP) server for synchronized timing. See [NTP Page, page 52-21](#) for more information.

---

After you have completed these steps, HPM begins polling the specified devices and displays health information and alerts.

## Launching the Health and Performance Monitor

Use the Health and Performance Monitor (HPM) to view status information and alerts collected from monitored firewall and IPS devices across your network. For more information about selecting devices for monitoring, see [Managing Monitored Devices, page 71-5](#).

To launch HPM, do any one of the following:

- Choose **All Programs > Cisco Security Manager Client > Cisco Security Manager Client** from the Windows Start menu (your command path may differ slightly), and then select **Health and Performance Monitor** as the Default View during login.
- Choose **Launch > Health and Performance Monitor** from the Configuration Manager, Event Viewer, Image Manager, or Report Manager applications.
- Click the Health and Performance Monitor button on the quick-launch toolbar in the Configuration Manager or Image Manager window.

If you are currently not logged into a Security Manager application, you are prompted to log in. (For more information about starting and logging into a Security Manager client application, see [Logging In to and Exiting the Security Manager Client, page 1-12](#)). Otherwise, the **HPM Window, page 71-6** is opened using the same user account you used to log into the other application.

**Note**

As described above, you can “cross-launch” HPM from any of the other Security Manager client applications. You can similarly cross-launch any of the other client applications from Health and Performance Monitor by choosing the desired application from the **Launch** menu, or clicking the appropriate quick-launch button.

## Managing Monitored Devices

The HPM device selector is used to add and remove devices from both the “normal” and “priority” monitoring lists. You can also use the device selector to transfer devices between the two lists.

**Note**

After enabling a device for monitoring in HPM, it can take up to 5 minutes for priority devices and 10 minutes for non-priority devices before actual values for HPM parameters can be seen in the device summary.

To use the HPM device selector:

- 
- Step 1** Choose **Device Selector** from the Tools menu to open the device selector window; the device-management screen is displayed.
- The All Devices section on the left lists all ASA and IPS devices in the Security Manager inventory that can be monitored. (For example, HPM supports monitoring of version 7.0.1 and later IPS sensors only. Earlier IPS versions are not displayed in the device selector.)
- All devices currently assigned to the Normal monitoring list and the Priority monitoring list are displayed in the two sections on the right side of the window.
- Step 2** To add a device to the Normal list, select the device in the All Devices list and then click the > button between the All Devices list and the Normal Monitored Devices list.
- The procedure for moving a device to the Priority Monitored Devices list is the same: use the > button between the All Devices list and that list.
- Step 3** To remove a device from either Monitored list, returning it to the All Devices list, select the device and then click the appropriate < button.
- Step 4** To transfer a device from one Monitored list to the other, highlight that entry and click the Up or Down button to move it to the upper or lower list respectively.
- Step 5** Click Next at the bottom of the window to display the VPN-selector screen.

All monitored devices and their individual contexts, if any, are listed; each entry includes a checkbox for remote-access (RA) and one for site-to-site (S2S) VPN selection.

---

**Note** Starting from Cisco Security Manager 4.10, all the contexts for ASA 9.5(2) and above will be listed in the **Device Selector**. From the **Device Selector**, you can now monitor the RA and site-to-site VPN for all user contexts by enabling the corresponding check box.

---

You can use the List Filter field on this page to filter the list, as described in [Using The List Filter Fields, page 71-19](#).

**Step 6** Select the types of VPN to be monitored on specific devices by checking the appropriate boxes.

**Step 7** Click **Save** to save and apply your changes, and close the device selector.

---

## HPM Window

The Health and Performance Monitor (HPM) application window is where you view status information and alerts collected from monitored firewall and IPS devices, as well as remote-access (RA) and site-to-site (S2S) VPN information, across your network.

---

**Note** See [Managing Monitored Devices, page 71-5](#) for information about specifying the devices to be monitored.

---

The following illustration presents the primary features of the HPM window.

Figure 71-1 Health and Performance Monitor Window

|   |                    |   |                                 |
|---|--------------------|---|---------------------------------|
| 1 | Monitoring button. | 4 | Quick-launch buttons.           |
| 2 | Views              | 5 | Monitoring/Alerts display area. |
| 3 | Alerts button.     |   |                                 |

The HPM window consists of three main elements:

- **Monitoring button (1)** – Click this button to view device and VPN health and performance data. See [HPM Window: Monitoring Display, page 71-25](#) for more information.
- **Views (2)** - When in the Monitoring view, the left pane of the HPM main window displays a list of available views. See [Managing Device Views, page 71-21](#) for more information.  
as shown in the following illustration.
- **Alerts button (3)** – Click this button to view a table of alerts in the window’s display area. See [HPM Window: Alerts Display, page 71-32](#) for more information.
- **Quick-launch buttons (4)** – Click any button to cross-launch the related Security Manager client application.
- **Monitoring/Alerts display area (5)** – This section of the window displays either Monitoring information for devices and VPNs, or a table of alerts generated by monitored devices. The Monitoring and Alerts buttons are used to switch back and forth between these two displays.

## Working with Table Columns

You can customize the different tables of information presented in HPM as follows:

- Sort a table such entries in a particular column are in ascending or descending order.
  - Click a column heading—anywhere but on a drop-down menu button—to sort the table such that the column entries are in ascending order (indicated by a small grey up-arrow).
  - Click the heading again to sort the entries are in descending order (indicated by a small grey down-arrow).
  - Click the heading again to return the table to its original order of display (the direction icon is removed).
- Hide and show various columns; the columns available for display depend on the particular table.
- Apply a column filter, meaning the table displays only entries that fit the specified criteria.

This section contains the following topics:

- [Showing and Hiding Table Columns, page 71-8](#)
- [Column-based Filtering, page 71-17](#)

### Showing and Hiding Table Columns

You can customize the different tables presented in HPM by hiding and showing various columns of information; the columns available for display depend on the particular table.

**Note**

---

The column headings are menus that you can use to further filter the table by hiding or showing entries according to chosen parameters, as described in [Column-based Filtering, page 71-17](#).

---

To show or hide specific columns displayed for a table:

1. Click the Columns button on the right side of the column headings to open the Choose Columns to Display dialog box.

All columns available for the current view are listed.
2. Select and deselect the columns to be shown and hidden.
3. Click **OK** to close the dialog box.

Only the selected columns are displayed for this table.

The following topics describe the individual columns available for various tables:

- [Table Columns: Device-related Views, page 71-8](#)
- [Table Columns: VPN-related Views, page 71-13](#)
- [Alert Table Columns, page 71-16](#)

#### Table Columns: Device-related Views

You can customize the tables presented in the Monitoring pane for the device-related views by hiding and showing various columns of information; the columns available for display depend on the particular view.

The order of the entries in the Choose Columns to Display dialog box reflects the ordering of the columns when displayed. (However, the ordering of the rows in the following table does not necessarily reflect ordering of the columns as displayed.) See [Showing and Hiding Table Columns, page 71-8](#) for information about opening the Choose Columns to Display dialog box.

The following table presents all available data columns for the device-related Monitoring views: Priority Devices, IPS Devices, Firewall Devices, All Devices, and all custom views based on these system views. Some of the listed columns are not available for specific views, as indicated.

**Table 71-1 Available Table Columns for Device-related Views**

| Column Name   | Available in View* | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Name   | IPS, Firewall      | <p>Name assigned to the device; that is, the Host Name as defined on the <a href="#">Device Properties: General Page, page 3-42</a> of the Device Properties window. <a href="#">Column-based Filtering, page 71-17</a> is available.</p> <p>The Name is preceded by an icon indicating device type. This icon in turn may be preceded by a device-alerts indicator: a red dot indicates one or more critical alerts (and possibly warnings), while a yellow dot indicates one or more warnings only. The area is blank for a device with no alerts.</p> <p>You can “hover” the mouse pointer over the dot to view a pop-up displaying the number of critical alerts and the number of warnings on the device.</p> <p>A gold star is added to the device icon itself to indicate Priority monitoring.</p> |
| Receive Time  | IPS, Firewall      | Poll date and time for this entry (format is: day-of-week MMM DD HH:MM:SS your-time-zone YYYY).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| IP Address    | IPS, Firewall      | IP address of this device. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Health Status | IPS, Firewall      | <p>Current overall health of the device: Critical, Warning, or Normal. <a href="#">Column-based Filtering, page 71-17</a> is available.</p> <p><b>Note</b> Overall health is defined by the most critical of any of the health metrics. For instance, if all the selected metrics on the device are normal except for one that is critical, overall device health becomes critical.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 71-1 Available Table Columns for Device-related Views (continued)**

| Column Name               | Available in View* | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Status         | IPS, Firewall      | Indicates HPM's ability to connect to/poll the device: Connected, Authentication Error, Certificate Mismatch Error, Connection error, Timeout during Read operation, or Service unavailable. <a href="#">Column-based Filtering, page 71-17</a> is available.<br><br><b>Note</b> If the device is not selected as a Normal or Priority Monitored Device in HPM (Tools > Device Selector), this status will not apply. Changes to Monitored Device selection may take several minutes to become effective and be reflected on screen.<br><br>Any information displayed for a non-"Connected" device is from the indicated Receive Time, prior to connection failure. |
| Memory (%)                | IPS, Firewall      | Memory usage as a percentage of the total available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CPU (%)                   | IPS, Firewall      | CPU usage as a percentage of the total available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Model                     | IPS, Firewall      | Device type and model number. For example, ASA 5510, or IPS 4270.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Version                   | IPS, Firewall      | Software version running on this device. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Inspection Load (%)       | IPS                | Inspection load on the device when polled, as a percentage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Missed Packet(%)          | IPS                | Dropped packets as a percentage of total packets inspected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Sensor App Status         | IPS                | Current Sensor App (Analysis Engine) status: Up or Down. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Main App Status           | IPS                | Current Main App status: Up or Down. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Collaboration App Status  | IPS                | Current Collaboration App status: Up or Down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| License Expiration Status | IPS                | Status of the sensor's license, based on red and yellow threshold values set on the sensor: Normal, Warning, or Critical. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| In Bypass Mode            | IPS                | Whether bypass mode is enabled on the sensor: Yes or No. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Event Retrieval Status    | IPS                | Status of the IPS event retrieval: Normal, Warning, or Critical. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 71-1 Available Table Columns for Device-related Views (continued)**

| Column Name               | Available in View * | Description                                                                                                                                                                                                                                                                                                                      |
|---------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global Correlation Status | IPS                 | For a sensor participating in global correlation, its update status: Normal (last update was successful), Warning (no successful update within the past day [86,400 seconds]), or Critical (no successful update within the last three days [259,200 seconds]). <a href="#">Column-based Filtering, page 71-17</a> is available. |
| Signature Update          | IPS                 | The number of the most recent signature update applied to this sensor; for example, S574. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                       |
| Firewall Mode             | Firewall            | Operating mode of this device: Routed, Transparent, or Mixed. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                   |
| Context Mode              | Firewall            | Context mode of this device: Single or Multiple. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                                |
| Connections               | Firewall            | Number of active connections when device was polled.                                                                                                                                                                                                                                                                             |
| Xlates                    | Firewall            | Address translation counter.                                                                                                                                                                                                                                                                                                     |
| Connections/second        | Firewall            | Number of connections established per second.                                                                                                                                                                                                                                                                                    |
| Translations/second       | Firewall            | Number of translations per second.                                                                                                                                                                                                                                                                                               |
| Failover Status           | Firewall            | If this device is part of a failover pair, its current state: Active or Standby. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                |
| Failover Host Role        | Firewall            | If this device is part of a failover pair, its current role: Primary or Secondary. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                              |
| Failover Peer Role        | Firewall            | If this device is part of a failover pair, current role of its peer device: Primary or Secondary. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                               |
| Failover Peer Status      | Firewall            | If this device is part of a failover pair, current status of its peer: Active or Standby Ready. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                 |
| Used Memory (MB)          | Firewall            | Amount of memory (in megabytes) in use when device was polled. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                                  |
| Free Memory (MB)          | Firewall            | Amount of memory available (in megabytes) when device was polled. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                                                                                                               |
| Max. Connections          | Firewall            | Peak number of connections. Not available for ASA clusters.                                                                                                                                                                                                                                                                      |
| Max. Xlates               | Firewall            | Peak number of address translations. Not available for ASA clusters.                                                                                                                                                                                                                                                             |

**Table 71-1 Available Table Columns for Device-related Views (continued)**

| Column Name                     | Available in View* | Description                                                                                                                                                                                                                                                                                                 |
|---------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Throughput (Kbps)               | Firewall           | Average device throughput in kilobits per second. For an ASA 9.0+ cluster, this the total throughput for all interfaces in the cluster.                                                                                                                                                                     |
| ACL Dropped Packets             | Firewall           | The number of packets dropped because they failed an access control list rule. Available only at cluster level for ASA clusters; not available for individual nodes.                                                                                                                                        |
| Scanning Threat Dropped Packets | Firewall           | If scanning threat detection is enabled, the number of packets dropped because they failed scanning threat inspection. If not enabled, "NA" is displayed. Available only at cluster level for ASA clusters; not available for individual nodes.                                                             |
| Inspection Dropped Packets      | Firewall           | If application inspection is enabled, the number of packets dropped because they failed application inspection. If not enabled, "NA" is displayed. Available only at cluster level for ASA clusters; not available for individual nodes.                                                                    |
| Syn Attack Dropped Packets      | Firewall           | Number of packets dropped because of SYN flooding. Available only at cluster level for ASA clusters; not available for individual nodes.                                                                                                                                                                    |
| Total Interface Dropped Packets | Firewall           | Total number of dropped packets on all interfaces. Available only at cluster level for ASA clusters; not available for individual nodes.<br><br><b>Note</b> You can view the number of per-interface dropped packets on the tabbed Interface panel presented in the detail section for the selected device. |
| Analysis Engine Memory (%)      | IPS                | Percentage of memory assigned to the Analysis Engine currently in use.                                                                                                                                                                                                                                      |
| Role in Cluster                 | Firewall           | The role of this member of an ASA load-balancing cluster: Cluster, Master, or Slave.<br><br>A cluster is managed by Security Manager as a single device with multiple nodes. Thus, each cluster is displayed in HPM as single entry, which you can expand in order to view a list of nodes.                 |

\* All of these columns are available in the All Devices and Priority Devices views.

## Table Columns: VPN-related Views

You can customize the tables presented in the Monitoring pane for the VPN-related views by hiding and showing various columns of information; the columns available for display depend on the particular view.

The order of the entries in the Choose Columns to Display dialog box reflects the ordering of the columns when displayed. (However, the ordering of the rows in the following table does not necessarily reflect ordering of the columns as displayed.) See [Showing and Hiding Table Columns, page 71-8](#) for information about opening the Choose Columns to Display dialog box.

The following table presents all available data columns for the VPN-related Monitoring views: Remote Access Users (RA), Site-to-Site Tunnels (S2S), VPN Summary, and all custom views based on these system views. Some of the listed columns are not available for specific views, as indicated.

When a device sends trap message, Cisco Security Manager captures the trap and posts it to the Site to Site Tunnels page in Health and Performance Monitoring application. Till Cisco Security Manager version 4.16, devices used to send the trap messages over IPv4 only. Beginning with Cisco Security Manager 4.17, the SNMP traps are captured using IPv6. Thus, Cisco Security Manager receives the trap messages; maps the IPv6 address of the device to the device details; displays an alert about the trap in Site to Site Tunnels page of the Health and Performance Monitoring application. The status is displayed in the Health and Performance Monitoring application after couple of refresh cycles.

### Note

Beginning with Security Manager version 4.9, the Health and Performance Monitoring application monitors and displays the site-to-site tunnels that have IPv6 address configured, in addition to the IPv4 based tunnels. Also the Email and Trap notifications now contain IPv6 addresses in addition to IPv4 addresses.

**Table 71-2 Available Table Columns for VPN-related Views**

| Column Name       | Available in View    | Description                                                                                                                          |
|-------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Receive Time      | RA, S2S, VPN Summary | Poll date and time for this entry (format is: day-of-week MMM DD HH:MM:SS your-time-zone YYYY).                                      |
| Firewall Name     | RA, S2S, VPN Summary | Name of this device, as provided in the Security Manager inventory. <a href="#">Column-based Filtering, page 71-17</a> is available. |
| User Name         | RA                   | User log-in name used to establish this session. <a href="#">Column-based Filtering, page 71-17</a> is available.                    |
| User Group Policy | RA                   | The name of the ASA VPN user group to which this user belongs. <a href="#">Column-based Filtering, page 71-17</a> is available.      |
| Gateway           | RA                   | IP address of the VPN gateway to which the user is connected. <a href="#">Column-based Filtering, page 71-17</a> is available.       |
| Assigned IP       | RA                   | Private IP address assigned to the remote client for this session; also known as the “inner” or “virtual” IP address.                |
| Public IP         | RA                   | Publicly routable IP address assigned to the client. <a href="#">Column-based Filtering, page 71-17</a> is available.                |

**Table 71-2 Available Table Columns for VPN-related Views (continued)**

| Column Name                | Available in View                | Description                                                                                                                                                                         |
|----------------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Initiation Time | RA                               | Time and date (HH:MM:SS day-of-week MMM DD YYYY) when connection was initiated. Time is displayed in 24-hour Coordinated Universal Time (UTC) notation.                             |
| Duration                   | RA                               | Elapsed time (HH:MM:SS) between the session initiation and the most-recent device poll.                                                                                             |
| Client Version             | RA                               | VPN client software, and version, running on the remote peer; for example, AnyConnect Windows 3.0, or Mozilla 4.0. <a href="#">Column-based Filtering, page 71-17</a> is available. |
| EndPoint OS                | RA                               | Operating system in use on remote peer; for example, Windows or Windows NT. <a href="#">Column-based Filtering, page 71-17</a> is available.                                        |
| Authentication Method      | RA                               | User password, certificate, or preshared key. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                      |
| Encryption                 | RA, S2S                          | Data encryption algorithm this session is using. <a href="#">Column-based Filtering, page 71-17</a> is available..                                                                  |
| Tunnel Type                | RA, VPN Summary (as “Type” only) | Type of tunnel or connection. These include Clientless, IPsec, and AnyConnect. <a href="#">Column-based Filtering, page 71-17</a> is available.                                     |
| Throughput (Kbps)          | RA, S2S                          | Bytes received plus bytes transmitted, in kilobits per second.                                                                                                                      |
| Session ID                 | RA                               | Identifier assigned to this session.                                                                                                                                                |
| Inactive Time              | RA                               | Amount of time this session has been inactive.                                                                                                                                      |
| IP Address                 | S2S, VPN Summary                 | IP address of this device. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                         |
| Local Endpoint             | S2S                              | IP address of local tunnel interface.                                                                                                                                               |
| Remote Endpoint            | S2S                              | IP address of remote tunnel interface.                                                                                                                                              |
| Local Subnet               | S2S                              | Address of local protected subnet.                                                                                                                                                  |
| Remote Subnet              | S2S                              | Address of remote protected subnet.                                                                                                                                                 |
| Uptime                     | S2S                              | Current duration of this tunnel.                                                                                                                                                    |
| Connection Time            | S2S                              | Time and date (HH:MM:SS day-of-week MMM DD YYYY) when connection was initiated. Time is displayed in 24-hour Coordinated Universal Time (UTC) notation.                             |

**Table 71-2 Available Table Columns for VPN-related Views (continued)**

| Column Name                 | Available in View | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status                      | S2S               | <p>Tunnel connection status; this will be Up or Down. An alert is issued when a tunnel goes down a specified number of times; see <a href="#">Alerts: Configuring, page 71-34</a> for more information.</p> <p><b>Tip</b> You can click on a Down notification hyperlink in the Status column to view the IPSec VPN Events for that device in Event Viewer. Event Viewer will show IPSec VPN Events for the device within a time range depending on the polling interval for that device. If it is a priority device, the time range will be 5 minutes before until 5 minutes after the first down notification was received. For non-priority devices, the time range will be +/- 10 minutes instead of 5 minutes.</p> |
| Health Status               | VPN Summary       | <p>Current overall health of the underlying device: Critical, Warning, or Normal. <a href="#">Column-based Filtering, page 71-17</a> is available..</p> <p><b>Note</b> Overall health is defined by the most critical of any of the health metrics. For instance, if all the selected metrics on the device are normal except for one that is critical, overall device health becomes critical.</p>                                                                                                                                                                                                                                                                                                                     |
| Connection Status           | VPN Summary       | <p>Remote connection status; this will always be Connected. (HPM cannot present information about previous connections.) <a href="#">Column-based Filtering, page 71-17</a> is available.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Monitoring Type             | VPN Summary       | <p>Types of VPN connections being monitored. <a href="#">Column-based Filtering, page 71-17</a> is available.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Active Sessions             | VPN Summary       | <p>Current active sessions (S2S, IPSec RA, client-based SSL RA, and clientless SSL RA).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Peak Sessions               | VPN Summary       | <p>Peak numbers of concurrent sessions (S2S, IPSec RA, client-based SSL RA, and clientless SSL RA).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Total Users                 | VPN Summary       | <p>Current remote user total (S2S, IPSec RA, client-based SSL RA, and clientless SSL RA).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Inactive Sessions           | VPN Summary       | <p>Number of inactive sessions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Total VPN Throughput (Kbps) | VPN Summary       | <p>Sum of all VPN traffic; that is, sum of RA and S2S throughput values, in kilobits per second. <a href="#">Column-based Filtering, page 71-17</a> is available.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 71-2 Available Table Columns for VPN-related Views (continued)**

| Column Name | Available in View    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACL Name    | Site-to-Site Tunnels | Beginning with version 4.9, Security Manager enables you to view the Access Control List (ACL) name that is associated with the selected Site-to-Site tunnel. This column name is selected by default.<br><br><b>Note</b> In the Health and Performance Alerts Display, Tunnel up/down Alert now also displays the ACL Name in the Description column. Similarly, Email and Trap notifications also display the ACL Name in the Description column. |
| Remarks     | Site-to-Site Tunnels | (Optional) This column displays the remarks corresponding to the ACL Name.<br><br><b>Note</b> Alert, Email, and Trap notifications do not contain Remarks as part of the description field.                                                                                                                                                                                                                                                         |

**Limitation:**

When Cisco Security Manager Daemon Manager service is started, the HPM application uses the latest configuration from the Configuration Archive to extract the ACL Name and Remarks associated with the Site-to-Site VPN tunnel. When the VPN tunnel is identified by HPM, it uses the extracted data to display the ACL Name and Remarks columns in the S2S view. If the VPN tunnel comes up before the data is available in HPM, the ACL Name and Remarks columns may not display the data until the next UI refresh. Similarly, the Alerts Display may not show the ACL Name in the Description column if the Alert is generated before the data is extracted by HPM. This might occur during upgrade to Security Manager version 4.9 from a previous version. If the same Alert appears in the next polling, the ACL Name is added to the Description.

**Tip:**

Sometimes you may notice discrepancy in the content of the Remarks column. Check if the latest configuration from the Configuration Archive contains the Remarks. If the Remarks are added or updated by Out-of-Band changes, you must perform rediscovery of the device.

**Alert Table Columns**

You can customize the Alerts table by hiding and showing various columns of information.

The order of the entries in the Choose Columns to Display dialog box reflects the ordering of the columns when displayed. (However, the ordering of the rows in the following table does not necessarily reflect ordering of the columns as displayed.) See [Showing and Hiding Table Columns, page 71-8](#) for information about opening the Choose Columns to Display dialog box.

**Table 71-3 Available Data Columns for the Alerts Table**

| Column Name                   | Description                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Name (always selected) | Name of this device on which this alert was triggered, as provided in the Security Manager inventory. <a href="#">Column-based Filtering, page 71-17</a> is available. |

**Table 71-3 Available Data Columns for the Alerts Table (continued)**

| Column Name | Description                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node        | The Node Name if this alert was generated by a member of an ASA load-balancing cluster <a href="#">Column-based Filtering, page 71-17</a> is available.                                     |
| Device Type | Type of device: ASA or IPS. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                                                |
| Severity    | Alert severity: Critical, Warning, or Normal. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                              |
| Status      | Current device status: Active or Acknowledged. <a href="#">Column-based Filtering, page 71-17</a> is available.                                                                             |
| Description | Description of the alert. For example, “Device Health Critical” or “Device Polling: Authentication Error.”                                                                                  |
| First Seen  | Date and time when this alert was first logged (day-of-week MMM DD, YYYY HH:MM:SS AM/PM). Time is based in your time zone. <a href="#">Column-based Filtering, page 71-17</a> is available. |
| Last Seen   | Date and time when this alert was first logged (day-of-week MMM DD, YYYY HH:MM:SS AM/PM). Time is based in your time zone. <a href="#">Column-based Filtering, page 71-17</a> is available. |
| Notes       | You can annotate an alert when you acknowledge it. Any annotations are displayed in this field. See <a href="#">Alerts: Acknowledging and Clearing, page 71-42</a> for more information.    |

## Column-based Filtering

You can filter the various tables in HPM based on the contents of specific columns. When you apply a column filter, the table is filtered to include only those entries with the specified criteria in that column.

### Note

See [Working with Table Columns, page 71-8](#) for other methods of altering table displays.

### Tips

- Column filters are cumulative: for an entry to appear in the filtered table, it must meet all column filter criteria. You cannot create a set of ORed column filters.
- You can filter on the contents of most but not all columns. If a column does not have a down arrow, you cannot filter on it. For example, you cannot filter on Receive Time in All Devices view.
- The filter icon (a funnel) appears in the heading of a filtered column.
- For a description of the available columns, see [Showing and Hiding Table Columns, page 71-8](#).

To filter a table according to a particular column parameter:

### Step 1

Click the down-arrow in the heading of a column and choose one of the following from the drop-down menu:

- **All** – Choose **All** to remove or “undo” a filter from this column. The table is updated to show all entries for this parameter. For example, if you filtered the Severity column of the Alerts table to display only Critical alerts, choosing this option will re-display all Critical and Warning alerts.

- **Custom** – Choose **Custom** to open the Custom Filter dialog box where you can create a custom filter based on the information in that column. See [Custom Filtering, page 71-18](#) for more information.
- A specific entry – The drop-down menu includes all values relevant to the column; choose one to display only that group of entries. For example, choosing **Critical** from the Severity column of the Alerts table filters the table to display only Critical alerts.

## Custom Filtering

The following procedure explains how to create a custom column-based filter, one in which you are not simply selecting a value from the column's drop-down list. Refer to [Column-based Filtering, page 71-17](#) for information about other column-based filtering options.

- Step 1** Click the down-arrow in the heading of a column and choose (**Custom**) from the drop-down menu. The Custom Filter dialog box for that column opens.
- Step 2** In the Custom Filter dialog box, select the desired values. The following illustration shows a typical example of this dialog box.

These are the controls you might find in the Custom Filter dialog box (not all controls appear for every instance):

- **Condition** – Choose the condition applied to the selected Values. Typically this is **is in**, meaning each of the Values you select must be “in” a column in order for that entry to be displayed in the filtered table.
- **Not** – Check this box to create a negative Condition. With **is in** as the chosen Condition, this would mean the selected Values cannot be in the column. In other words, the table is filtered such that entries with these Values in the column are not displayed.

- **Values** list – A few instances of the dialog box present one list of Values from which to select: simply check the desired options.

Available and selected **Values** lists – In most cases, the dialog box presents two Values lists, as shown in the previous illustration. To select a value for the custom filter, highlight it in the left list, which contains available values for the column, and click the right arrow to add it to the list of selected values on the right. You can select multiple values.

The items in the available Values list are determined by the values currently present in the selected column of the source table.

If there are a lot of available values, you can search for a specific value by typing in the List Filter field above the list. For more information, see [Using The List Filter Fields, page 71-19](#).

You can also select, or deselect, values using the following techniques:

- Type a Value name into the text field above the selected Values list and click the + button; the Value is added to the selected Values. This technique is useful if there is a large number of available Values, or if you want to filter on a value that is not present in the available Values list.
- Double-click an item in either list to move it to the other list.
- Click one of the double-arrow buttons to move all items from one list to the other, regardless of any selected values.

**Step 3** Click **OK** to close the dialog box.

The table is updated to show only those entries that satisfy all currently applied filters.

---

## Using The List Filter Fields

A List Filter field is provided above the devices and VPNs lists in the Monitoring display, above the alerts table in the Alerts display, above the device list on the VPN page of the Device Selector, and in the View Cleared Alerts window. In each case, you can use the List Filter field to quickly locate any entries in the related table that contain a specified text string.

### Note

The found text can be part of any data field associated with an entry. For example, as you type “license” into the Alerts List Filter field, the Alerts table is filtered to show only those alerts related to imminent license expiration. (Any matched entries are listed even if the relevant data column—in this example, Detail—is not displayed, which could cause confusion. See [Showing and Hiding Table Columns, page 71-8](#) for more information about hiding table columns.)

---

Figure 71-2 Health and Performance Monitor: List Filter Field

|   |                           |   |               |
|---|---------------------------|---|---------------|
| 1 | Filter-parameters button. | 2 | Clear button. |
|---|---------------------------|---|---------------|

To search for a specific text string in the devices list, the VPNs list, the Alerts table, or the View Cleared Alerts window:

- Click in the List Filter field to place the text cursor, and then begin typing.  
These are “live filter” fields. That is, as you type each character, entries that do not include your current text string are removed from the list or table. For example, suppose in an extensive list of alerts there is one with a Status of “Device Health Critical,” and that none of the other alerts include any text strings containing the letters *hea*. You want to use the List Filter field to quickly locate that one alert, so you begin to enter the word “health.” That alert is the only one displayed after you have typed the first three letters.

To clear a List Filter field:

- Click the clear button at the right side of the field.  
This button appears when you begin typing in the field. (You also can highlight the characters and press the Delete or Backspace key on your keyboard.)  
When you clear the List Filter field, all entries in the list are again displayed.

You can tune the filter results by specifying the information (columns) searched, by selecting case sensitivity or insensitivity, by allowing wildcards or regular expressions, and by specifying where in a returned string your characters must be located.

To change the List Filter criteria:

1. Click the filter-parameters button (magnifying glass) at the left side of the List Filter field to open the parameters menu.
2. Choose an option.

The menu consists of four sections:

- A list of all available information types—these entries correspond to the columns that can be displayed for that particular list or table. You can choose **All**, or alternatively you can choose individual entries.
- **Case sensitive** and **Case insensitive** – Choose one or the other. If you choose **Case sensitive**, found text must match not only the characters you enter, but also their as-typed case.
- **Use wildcards** and **Use regular expression** – Choose one or the other. The following wildcards are recognized:
  - \* (asterisk) – Match zero or more characters at that location in the string.
  - ? (question mark) – Match one character at that location in the string.

- **Match from start**, **Match exactly**, and **Match anywhere** – Choose one. **Match from start** means that the string you enter must be found at the beginning of an entry, although it can be part of a larger set of characters. **Match exactly** requires that the string you enter exactly match the entire column entry. **Match anywhere** means the string can be found anywhere within an entry, and it can be part of a larger set of characters.
3. Repeat Steps 1 and 2 to change another parameter.

## Monitoring Devices

The HPM Monitoring display presents View controls, view panels, and detailed information about the currently selected device, as described in [HPM Window: Monitoring Display, page 71-25](#).

To switch to the Monitoring screen:

- Click the **Monitoring** button below the HPM menu bar.  
(Click the **Alerts** button to return to the Alerts screen.)

### Note

---

See [Managing Monitored Devices, page 71-5](#) for information about specifying the devices to be monitored.

---

This section contains the following topics:

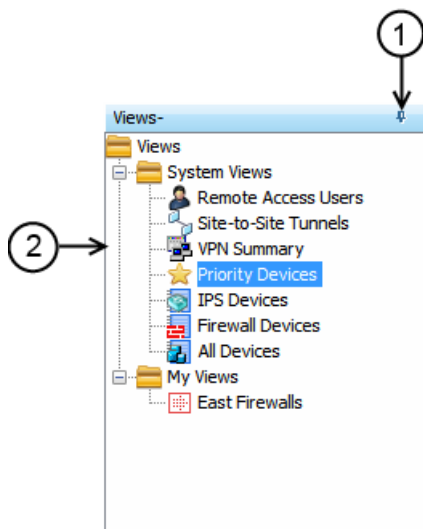

- [Managing Device Views, page 71-21](#)
- [HPM Window: Monitoring Display, page 71-25](#)

## Managing Device Views

“Views” provide the means to filter and organize the information displayed in the Monitoring pane of the HPM application. Various system views are provided—for example, All Devices, Firewall Devices, Remote Access Users Details, and so on—and you can create custom views that organize the information in other ways, such as geographic device location.

The left pane of the HPM main window displays a list of available views as shown in the following illustration.

**Figure 71-3 Health and Performance Monitor: Views Pane**

The Views pane includes the following controls:

- **(1) Push Pin button** – Click the Push Pin button to control display of the Views list. When the list is displayed as a pane of the HPM window (the pin is vertical), click the button to collapse the pane into the left edge of the window, leaving a labeled tab; the Monitoring pane is expanded to fill the HPM window.

You can “hover” your mouse pointer over the tab to “pop out” the Views list; it remains visible as long as the pointer is over the tab or in the list area (the pin is horizontal). You also can click anywhere in the title bar—except on the pin itself—to keep the list “popped out.”

Click the pin once again to re-establish the Views list as an open pane; the Monitoring pane contracts to make room for it.

- **(2) List of views** – The list is organized into folders: System Views and My Views. Click an entry in either folder to open that view in the Monitoring pane, as described in [Views: Opening and Closing, page 71-23](#). See [Views: Custom, page 71-24](#) for information about creating new views in the My Views folder.
- **Right-click shortcut menu** – You can right-click any entry in the View list to access a pop-up menu of view-related commands:
  - **Edit** – Edit the name and description of the existing custom view. See [Views: Custom, page 71-24](#).
  - **Save As** – Save the view as a new custom view. See [Views: Custom, page 71-24](#).
  - **Delete** – Delete that custom view.
  - **Set as default view** – Use this command to designate the view that is always displayed whenever you launch the HPM application.

This section contains the following topics:

- [Views: Opening and Closing, page 71-23](#)
- [Views: Tiling Horizontally or Vertically, page 71-23](#)
- [Views: Floating and Docking, page 71-24](#)
- [Views: Custom, page 71-24](#)

## Views: Opening and Closing

All available views are listed in the Views pane, on the left side of the HPM window. The Monitoring pane displays open views, with each open view presented as a separate tabbed panel. (See [HPM Window: Monitoring Display, page 71-25](#) for more information about this window.)

**Note**

You can detach views so they “float” in separate windows. For more information, see [Views: Floating and Docking, page 71-24](#).

To display a new view in the Monitoring pane:

- Click the desired entry in the Views list.

The view appears as a tabbed panel in the Monitoring pane; it is automatically selected and displayed.

To switch to another open view:

- Click the desired tab in the Monitoring pane; that view is displayed.
- Right-click any tab and choose **Next** or **Previous** to display the view to the right or left of that tabbed view.
- Click the Scroll Back and Scroll Forward buttons to the right of the tabs to display the view to the left or right of the current view.

To close a view:

- Click the close button in that tab.
- Right-click the tab and choose the **Close**.
- Right-click the tab and choose **Close Others** to close all open views except the one you right-clicked.
- Right-click any tab and choose **Close All** to close all open views.

## Views: Tiling Horizontally or Vertically

Rather than displaying a single view such that it fills the Monitoring pane, you can tile two or more of the views, either horizontally or vertically, for easy comparison.

For example, if you tile two views horizontally, one view fills the upper half of the Monitoring pane, while the other fills the lower half. Similarly, tiling two views vertically fills the left-hand half of the pane with one view, with the other view filling the right half. Further, you can tile more than two views—the pane is subdivided equally for each view.

To create two horizontal or vertical tiles:

- Right-click one of the tabs and choose **New Horizontal Group** or **New Vertical Group**.

The selected view and the other view(s) are distributed to share the Monitoring pane equally, either horizontally or vertically depending on your choice.

Note that if there are more than two views open when you choose one of these commands, the selected view is tiled, with the remaining group of tabbed views displayed as the other tile. You can then repeat this process with the remaining tabbed views, increasing the number of visible tiles, as desired.

You can also move an existing tile to another tile:

- Right-click the tab and choose **Move to Next Tab Group** or **Move to Previous Tab Group**.

The selected view is added to the next tile (below or to the right, depending on tile orientation), or to the previous tile (above or to the left). These commands are available only if the tiled views are arranged in a manner where such movement is possible.

To change the orientation of the views, switching from horizontal to vertical tiling, or vice versa:

- Right-click any tab and choose **Change Tab Groups Orientation**.

This command is available only when two or more tiled views are displayed.

## Views: Floating and Docking

You can detach tabbed views so they “float” as separate windows, and you can “dock” floating views, returning them to the Monitoring pane as tabbed views.

To detach a view as a floating window:

- Right-click that tab and choose **Floating**.

A standard window opens, displaying the selected view.

To move another tabbed view from the Monitoring pane to an already-open floating-view window:

- Right-click the tab and choose the window from the **Floating to** submenu.

The right-clicked view is added to the existing window as another tabbed panel.

To return a floating view to the Monitoring pane as a tabbed panel:

- Right-click the view’s tab in the window and choose **Docking**.

That view is returned to the Monitoring pane.

### Note

---

As a standard window, you can minimize, maximize and close a floating view, as you would any other window.

---

## Views: Custom

The Health and Performance Monitor provides seven System Views. In addition, you can create any number of custom views, each of which is based on an existing view. You also can edit and delete custom views.

The various views are presented in the Views pane of the Monitoring display, organized into two folders: System Views and My Views (the latter folder contains your custom views). The Monitoring display is described in [HPM Window: Monitoring Display, page 71-25](#).

Follow these steps to create a new custom view:

1. In the Views list, select the view on which the new view is to be based.  
This can be a System View or an existing custom view.
2. Choose **Save As** from the File menu to open the Save View As dialog box.  
You also can right-click the selected view and choose **Save As** from the pop-up menu to open the dialog box.
3. Provide a *Name* for the new view, and optionally a *Description*.
4. Specify the devices to be monitored for this view: check and clear entries in the device-selector area of the dialog box.
5. Click **Save** to close the dialog box and add the new view to the My Views folder.

Follow these steps to edit an existing custom view:

1. Under My Views, select the view.
2. Choose **Edit** from the File menu to open the Save View As dialog box.  
You also can right-click the selected view and choose **Edit** from the pop-up menu.
3. Edit the *Name* and *Description*, as necessary.
4. Check and clear entries in the device selector to change the devices monitored for this view.
5. Click **Save** to close the dialog box.

Follow these steps to delete an existing custom view:

1. Under My Views, select the view.
2. Choose **Delete** from the File menu.  
You also can right-click the selected view and choose **Delete** from the pop-up menu.
3. Confirm that you want the view deleted.  
That view is removed from the Views list.

## HPM Window: Monitoring Display

The HPM window provides two different information displays: Monitoring and Alerts. Click the Monitoring button to access the Monitoring display.

The Monitoring display consists of two primary panes: Views and Monitoring. The Views pane presents a list of available views. Click an entry in this list to open that View as a tabbed panel in the Monitoring pane.

The Monitoring pane can present multiple tabbed views, most of which display several sections. Click a tab to bring that view to the front.

### Note

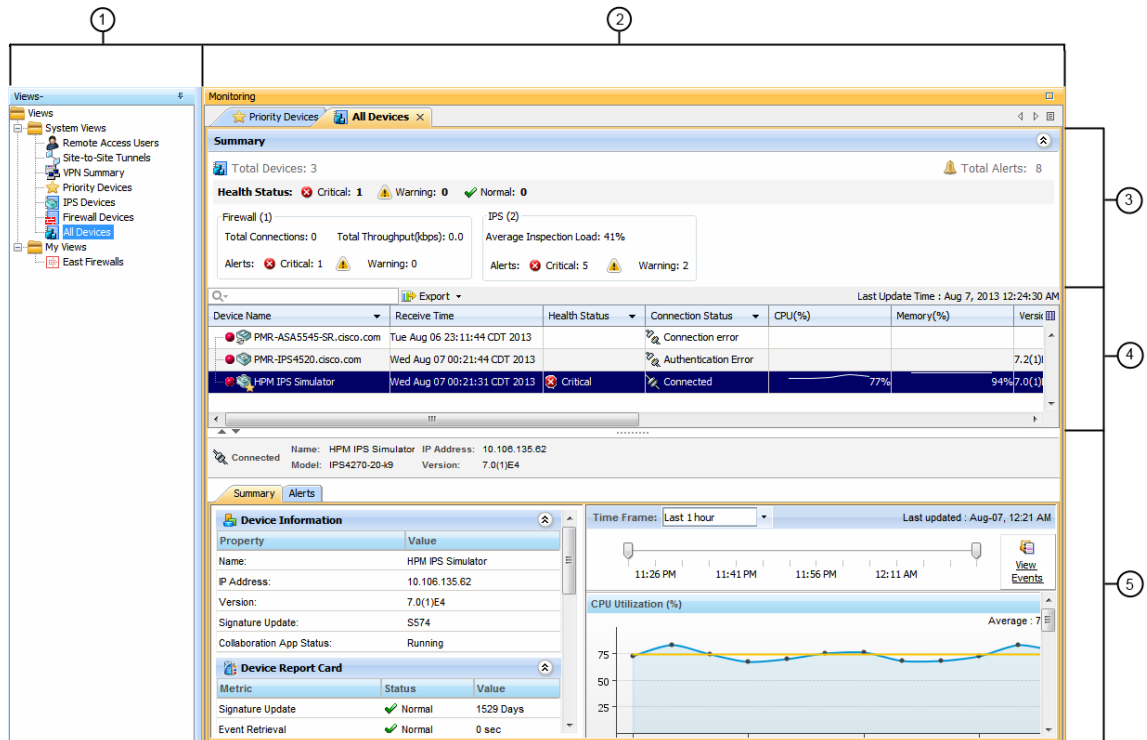

---

The Remote Access Users and the Site-to-Site Tunnels views each display only a single table of information, as described in [Monitoring Views: VPN, RA and S2S, page 71-30](#). The following descriptions focus mainly on the other available system views.

---

The following illustration presents the primary features of the Monitoring display and the panel sections.

Figure 71-4 Health and Performance Monitor: the Monitoring Display

|   |                           |   |                            |
|---|---------------------------|---|----------------------------|
| 1 | Views list.               | 4 | Status of devices or VPNs. |
| 2 | Monitoring view controls. | 5 | Selected device details.   |
| 3 | Summary of all devices.   |   |                            |

The Monitoring display consists of five main elements:

- **Views list (1)** – This pane lists all views available—click an entry in this list to open that view in the Monitoring pane. The views are organized into System Views, provided as part of the Health and Performance Monitor, and My Views, which are custom views you have created. See [Managing Device Views, page 71-21](#) for information about the Views pane, and [Views: Custom, page 71-24](#) for information about managing custom views.
- **Monitoring view controls (2)** – A labeled tab appears here for each view you open; click any tab to bring that view to the front. You also can use the Scroll Backward and Scroll Forward buttons to step backward or forward through the tabbed views. Alternately, open the Show List drop-down menu on the right and choose a label to make that the active view.
- **Summary of all devices or VPNs (3)** – Provides aggregate information for all devices or VPNs represented by this view. Expand or collapse this section by clicking the button on the right side. The device-summary section is described in greater detail in [Monitoring Views: Devices or VPNs Summary, page 71-27](#).
- **Device-status list (4)** – All devices or VPNs included in this view are listed here; see [Monitoring Views: Device or VPN Status List, page 71-27](#) for more information about this list. Use the List Filter field in this section to filter the list, as described in [Using The List Filter Fields, page 71-19](#).

- **Selected device or VPN details (5)** – This section provides detailed information about the device or VPN currently highlighted in the device list. The details section is described in greater detail in [Monitoring Views: Device or VPN Details, page 71-28](#).

This section contains the following topics:

- [Monitoring Views: Devices or VPNs Summary, page 71-27](#)
- [Monitoring Views: Device or VPN Status List, page 71-27](#)
- [Monitoring Views: Device or VPN Details, page 71-28](#)
- [Monitoring Views: VPN, RA and S2S, page 71-30](#)
- [Exporting HPM Data, page 71-31](#)

## Monitoring Views: Devices or VPNs Summary

The HPM Monitoring display presents tabbed views, each of which provides detailed information about the device or VPN currently selected, as described in [HPM Window: Monitoring Display, page 71-25](#). All device-related views (that is, all but the Remote-Access Users and Site-to-Site Tunnels views), include a Summary section, as described here.

This devices summary, or VPN Summary, which you can show and hide by clicking the button on the right side of its title bar, displays a snapshot of the aggregate Health Status and Alert Status for all the devices or VPNs relevant to the current view. For example, if you are viewing the Firewall Devices panel, the status summaries are for all monitored firewall devices only.

## Monitoring Views: Device or VPN Status List

The [HPM Window: Monitoring Display, page 71-25](#) presents detailed information about the device or VPN currently selected (in a specific device view, or the VPN Summary view, respectively). All device-related views and the VPN Summary view include a table of monitored devices or VPNs relevant to the current view.

This table displays “at-a-glance” status information for every monitored device or VPN—each is represented by an entry in this table. Note that ASA clusters are presented as expandable entries: click the + icon in front of the cluster entry to expand it and view indented entries for each cluster node.

Again, the list includes only those elements relevant to the current view. For example, the list in the Firewall Devices view does not include entries for IPS devices. The Remote-Access Users and Site-to-Site Tunnels views do not include this status display.

You can resize the table columns, you can show and hide columns, and the column headings are menus you can use to filter the table by hiding or showing devices according to chosen parameters. See [Showing and Hiding Table Columns, page 71-8](#) for more information about these options.

When you select an entry in this list, detailed information for that device is displayed in the device-details area below the table, as described in [Monitoring Views: Device or VPN Details, page 71-28](#).

Tip

With the All Devices, Firewall Devices, IPS Devices, and Priority Devices views (and any custom device-related views), you can right-click the highlighted entry and choose **Device Manager** from the pop-up menu to open the appropriate external device manager for that device—that is, ASDM for an ASA, and IDM for an IPS sensor—where you can “drill down” into the health and performance data for that device. See [Starting Device Managers, page 72-14](#) for more information about the device managers.

## Monitoring Views: Device or VPN Details

The [HPM Window: Monitoring Display, page 71-25](#) presents views and detailed information about the currently selected device or VPN. All device-related views and the VPN Summary view provide three or four tabbed panels of detailed information for the individual device or VPN currently selected in the device-status table above it. (The Remote-Access Users and Site-to-Site Tunnels views do not provide this details panel.)

The information presented for each type of view follows.

### For the All Devices, Firewall Devices, IPS Devices, Priority Devices, and custom device-related views, the tabbed panels are:

- **Summary** - The Summary tab consists of four sections that provide information about the device and the device's status:
  - **Device Information** – This section provides a read-only listing of device-specific information such as device name, IP address, device type and model number, and so on. A read-only listing of Failover information is also presented. If an ASA cluster is selected, the Failover listing is replaced with a listing of cluster-related information.
  - **Device Report Card** - This section provides a collection of metrics that indicate the current status of the device. For more information about the metrics shown here, see [Table Columns: Device-related Views, page 71-8](#).
  - **Interface Status** – This section provides a listing of all interfaces defined on the device, with current status information.
  - **Device Health Graphs** - This section provides a “snapshot” of device status using graphic displays for certain metrics such as CPU and memory usage. It also presents device-specific traffic information, for example, average number of connections and number of translations for firewall devices (over the most-recent polling period), and average inspection load and percentage of missed packets for IPS sensors (over the most-recent polling period). You can specify the time frame (Last 1 hour, Last 24 hours, or Last 7 days) to use for these graphs from the Time Frame list. You can focus in on a specific time frame by using the slider bar above the graphs. To view events for the selected device, click the **View Events** button. Event Viewer opens and the Event Monitoring window lists events filtered by the selected device and the time period specified by the slider bar.

---

**Note**

For IPS devices, certain health-metric thresholds must be configured separately on the individual devices—that is, outside of HPM. Therefore, it is possible for the health of an IPS device to be critical, for example, without any indication in HPM. See [Alerts Configuration: IPS, page 71-35](#) for additional information.

---

- **Alerts** - The Alerts tab lists all alerts for the selected device. You can show and hide various columns of information for each alert. See [Alerts and Notifications, page 71-32](#) for more information about alerts. For information about the fields available on this tab, see [HPM Window: Alerts Display, page 71-32](#).

### For the All Devices, Firewall Devices and Priority Devices the tabbed panels are:

- **Summary** - The Summary tab consists of four sections that provide information about the device and the device's status:

- **Device Information** – This section provides a read-only listing of device-specific information such as device name, IP address, device type and model number, and so on. A read-only listing of Failover information is also presented. If an ASA cluster is selected, the Failover listing is replaced with a listing of cluster-related information.
- **Device Report Card** - This section provides a collection of metrics that indicate the current status of the device. For more information about the metrics shown here, see [Table Columns: Device-related Views, page 71-8](#).
- **Interface Status** – This section provides a listing of all interfaces defined on the device, with current status information.
- **Device Health Graphs** - This section provides a “snapshot” of device status using graphic displays for certain metrics such as CPU and memory usage. It also presents device-specific traffic information, for example, average number of connections and number of translations for firewall devices (over the most-recent polling period), and average inspection load and percentage of missed packets for IPS sensors (over the most-recent polling period). You can specify the time frame (Last 1 hour, Last 24 hours, or Last 7 days) to use for these graphs from the Time Frame list. You can focus in on a specific time frame by using the slider bar above the graphs. To view events for the selected device, click the **View Events** button. Event Viewer opens and the Event Monitoring window lists events filtered by the selected device and the time period specified by the slider bar.

**Note**

For IPS devices, certain health-metric thresholds must be configured separately on the individual devices—that is, outside of HPM. Therefore, it is possible for the health of an IPS device to be critical, for example, without any indication in HPM. See [Alerts Configuration: IPS, page 71-35](#) for additional information.

- **Alerts** - The Alerts tab lists all alerts for the selected device. You can show and hide various columns of information for each alert. See [Alerts and Notifications, page 71-32](#) for more information about alerts. For information about the fields available on this tab, see [HPM Window: Alerts Display, page 71-32](#).
- **Flow-offload**- The Flow-offload tab displays basic information about the offload engine, the load percentage on offload cores and information on active offloaded flows- the number of offloaded flow created, the offloaded active flows, their rewrite rules and data.
- **Flow- offload Statistics**- The Flow-offload Statistics tab displays the counts for transmitted, received and dropped packets and statistics for the virtual NIC used.

**For the VPN Summary view, the tabbed panels are:**

- **VPN Usage** – Several graphs presenting information such as active site-to-site tunnels, active remote-access sessions, and total throughput. This includes historical trending information for active Site-to-Site tunnels, active IPSec remote-access users, active SSL VPN clientless users, and active SSL VPN with client users.
- **Cluster Resource Usage** – Displays the usage details of cluster resources—resource names, its current, peak, and usage limits. It also provides the number of denied packets and the contexts. This feature is applicable only for Cisco Firepower 9K devices.
- **Cluster Distribution Details** – Displays the cluster mode of the VPN. If it is centralized, an error message is displayed mentioning that the destination mode is not VPN distributed. If it is distributed, it displays the respective member I and member II details. This feature is applicable only for Cisco Firepower 9K devices.

- **License Information** – A read-only listing of license information by VPN type, or IPSec and SSL license and load information, depending on your selection in the table above. For the System context of a multiple-mode device, VPN Licensing and allocation are shown; for individual contexts, VPN allocation Limits and VPN licensing usage are shown.
- **Other Details** – A listing of certificate and TrustPoint details.

See [Managing Monitored Devices, page 71-5](#) for information about selecting devices for VPN monitoring.

## Monitoring Views: VPN, RA and S2S

The HPM Monitoring display presents a variety of device- and VPN-related data views, as described in [HPM Window: Monitoring Display, page 71-25](#). These include the Remote Access Users and Site-to-Site Tunnels views, which unlike the other views, are simply tables of current users and tunnels.

See [Managing Monitored Devices, page 71-5](#) for information about selecting devices for VPN monitoring.

In both of these views, you can resize the table columns, you can show and hide columns, and the column headings are menus you can use to filter the table by hiding or showing entries according to chosen parameters. See [Showing and Hiding Table Columns, page 71-8](#) for more information about these options.

The Remote Access Users view lists the remote-access users currently logged into network resources via the devices being monitored by HPM. Note that remote-access user information is updated every 20 minutes (for normal monitoring; for Priority monitoring the interval is 15 minutes), rather than the five minutes that is standard for the other views. Also, no historical or trending data is available for remote-access users.

Further, you may notice a mismatch between RA user count in the VPN Summary view and the Remote Access Users view. This is because the VPN Summary is updated at ten-minute/five-minute (normal/Priority) intervals.

**Tip**

In the Remote Access Users view, you can right-click a user entry and choose **Log Off User** from the pop-up menu to terminate that remote-access connection.

The Site-to-Site Tunnels view provides current VPN tunnel information through all monitored devices. Note that to enable tunnel Up/Down alerts for a device or context, you must configure SNMPv3 on the device, as described in [SNMP Credentials Dialog Box, page 3-49](#).

**Tip**

In the Site-to-Site Tunnels view, you can click on a Down notification hyperlink in the Status column to view the IPSec VPN Events for that device in Event Viewer. Event Viewer will show IPSec VPN Events for the device within a time range depending on the polling interval for that device. If it is a priority device, the time range will be 5 minutes before until 5 minutes after the first down notification was received. For non-priority devices, the time range will be +/- 10 minutes instead of 5 minutes.

For clusters of ASA 9.0+ devices, information is shown for the director device only, since VPN processing is not load-balanced across the nodes and is thus limited to centralized support in the cluster.

**Note**

VPN polling occurs on a fixed time interval, so it is not possible to log status changes within that time interval. For example, if a site-to-site tunnel goes down immediately after polling and comes back up just before the next poll, that status change cannot be detected.

## Exporting HPM Data

You can save a “snapshot” of the device-status information in the current View as a PDF, HTML, or CSV (comma-separated values) file.

**Note**

Beginning with Security Manager version 4.9, the exported data in PDF, HTML, or CSV format also contain the IPv6 tunnel information.

The following steps describe exporting the current View data in either a PDF, HTML, or CSV file:

### Related Topics

- [HPM Window, page 71-6](#)
- [Showing and Hiding Table Columns, page 71-8](#)

**Step 1** Click the appropriate tab to display the View you want to export (that is, Priority Devices, VPN Summary, All Devices, or another).

**Tip**

To export the data for a subset of all entries in a particular view, create a custom view that includes only the desired devices. See [Views: Custom, page 71-24](#) for information.

**Step 2** Click the down-arrow beside the Export button next to the List Filter field (above the device- or VPN-status list) and choose **As PDF**, **As HTML**, or **As CSV** from the drop-down menu.

The Export dialog box opens.

**Step 3** Select the specific information to be exported by checking the appropriate columns in the dialog box.

The following topics describe the individual columns available for various views:

- [Table Columns: Device-related Views, page 71-8](#)
- [Table Columns: VPN-related Views, page 71-13](#)

**Step 4** If you chose **As PDF** from the Export drop-down list, at the bottom of the Export dialog box you can choose the desired **Page Size** for the PDF file: A1, A2, A4, Letter, or Legal.

The pages of the PDF file will be the selected size, with the presented information formatted accordingly.

**Step 5** If you chose **As CSV** from the Export drop-down list, Security Manager exports the information in a CSV file that you can save as required. Beginning with version 4.8, Security Manager provides the Export Trend Charts checkbox that you can select to export trend information in CSV file format. You can then chose the Time Frame from available time range of last one hour, last 24 hours, and last seven days.

**Step 6** Click **Export** to close the Export dialog box.

The Save file dialog box opens.

**Step 7** Provide a name for the file, and specify where it is to be saved.

The default file name is the current system time (as a long integer); you can change this to something informative. On Windows systems, the default location is My Documents; you can specify any location.

**Step 8** Click **Save** to close the Save dialog box and export the selected data.

## Alerts and Notifications

The Health and Performance Monitor (HPM) provides trend information, alerts, and notifications regarding the performance and health of monitored devices. You can monitor the overall health of your network—including network user and device resource utilization—by quickly scanning the status of individual devices and groups of devices.

Specific device-level trend information is available for hourly, daily and weekly intervals. Alerts are displayed prominently, with easy navigation to the relevant HPM data. You also can acknowledge and annotate individual alerts.

### Note

When a node from a cluster is deleted and then the cluster is rediscovered in Security Manager, the node will be removed from monitoring in HPM if currently enabled. However, any alerts generated on the node will still be shown in HPM. You must manually clear the alerts from HPM.

These alerts are based on threshold values and state-change rules that you have configured: you specify thresholds that define Critical, Warning, and Normal levels for various metrics, and you can configure rules for certain state changes such as interface failure.

Further, there are two levels of device monitoring. Initially all devices are unmonitored. However, you can designate devices to be monitored at a “normal” level, or at a “Priority” level—you define a separate set of alert definitions for each level. Priority devices are polled and reported on more frequently (five-minute intervals versus ten for “normal” devices), and failure parameters are more stringent.

You also can enable email alert notifications. If configured, an email is sent to the specified address(es) whenever an alert is generated. You can provide multiple addresses for each category of alerts (Firewall and IPS).

### Note

An email notification is sent the first time an alert is logged, and when the severity of an alert changes from warning to critical (but not vice-versa). No notification is issued if a device returns to the Normal state.

This section contains the following topics:

- [HPM Window: Alerts Display, page 71-32](#)
- [Alerts: Configuring, page 71-34](#)
- [Alerts: Viewing, page 71-41](#)
- [Alerts: History, page 71-43](#)

## HPM Window: Alerts Display

The HPM window provides two different information displays: Monitoring and Alerts. Click the Alerts button to access the Alerts display.

 **Note**

A device-specific view of alert data is available on the Alerts tab when viewing details for a specific device (see [Monitoring Views: Device or VPN Details, page 71-28](#)). With a few exceptions, you can perform many of the same functions from the device-specific alert view as you can from the primary Alerts display.

The following illustration presents the primary features of the Alerts display.

**Related Topics**

- [Alerts: Configuring, page 71-34](#)

**Figure 71-5 Health and Performance Monitor: Alerts Display**

|   |                    |   |                             |
|---|--------------------|---|-----------------------------|
| 1 | Alerts button.     | 5 | Clear button.               |
| 2 | List Filter field. | 6 | Acknowledge button.         |
| 3 | Alerts table.      | 7 | View Cleared Alerts button. |
| 4 | Refresh button.    |   |                             |

The Alerts display consists of seven main elements:

**Note**

With the exception of the List Filter field and the View Cleared Alerts button, these same elements are available to you on the Alerts tab when viewing details for a specific device (see [Monitoring Views: Device or VPN Details, page 71-28](#)).

- **Alerts button (1)** – The HPM window displays either Monitoring information for devices and VPNs, or a table of alerts generated by monitored devices. Click the Alerts button to view the alerts table.
- **List Filter field (2)** – You can use this field to filter the alerts displayed in the table; only those alerts containing the specified text are listed. Refer to [Using The List Filter Fields, page 71-19](#) for more information.
- **Alerts table (3)** – This table lists all alerts for all currently monitored devices. The alerts displayed can be filtered using the List Filter field. You also can show and hide various columns of information for each alert. See [Alerts and Notifications, page 71-32](#) for more information.
- **Refresh button (4)** – Click this button to update all alerts ahead of the normal polling cycles.
- **Clear button (5)** – When one or more alerts are selected, you can click this button to open the Clear dialog box. Click the Clear button in the dialog box to close it and clear the highlighted alerts from the table.

**Note**

See [Alerts: Acknowledging and Clearing, page 71-42](#) for additional information about clearing and acknowledging alerts.

- **Acknowledge button (6)** – When one or more alerts are selected, you can click this button to open the Acknowledge dialog box. If desired, you can enter a note that will be applied to the selected alerts. Click the Acknowledge button to close the dialog box and mark all highlighted alerts as acknowledged.

**Tip**

You can add a note to any previously acknowledged alert. Click the Note field for that alert to open the Enter Notes dialog box. This is the only method of accessing the Enter Notes dialog box.

- **View Cleared Alerts button (7)** – Click this button to open the View Cleared Alerts window where you can access and view previously cleared alerts; you specify a set of devices and a time range. See [Alerts: History, page 71-43](#) for more information about using this window.

## Alerts: Configuring

The alerts and email notifications provided by HPM are based on threshold values and state-change rules that you configure in the Alerts Configuration dialog box.

The Alerts Configuration dialog box consists of three tabbed panels: **IPS** for IPS sensor-related alerts, **FW** for firewall-related alerts, and **VPN** for tunnel-status alerts. Each panel presents groups of options in sections—use the expand/collapse button to show or hide a particular section.

**Note**

You can enable and disable a particular alert without expanding that section; simply check or clear the box preceding the section heading—the current settings are used and retained.

There are two levels of device monitoring: normal or “standard” priority and “active” priority. Active priority devices are polled and reported on more frequently, and failure parameters are more stringent. You can designate up to 10% of all monitored devices for Priority monitoring. See [Managing Monitored Devices, page 71-5](#) for more information about device selection.

Follow these steps to configure alert reporting and notifications for both Standard and Priority devices:

- 
- Step 1** Choose Alert Configuration from the Tools menu to open the Alerts Configuration dialog box.
- Step 2** On the IPS panel, configure IPS-related alerts—if necessary, click the IPS tab to display the panel.
1. To enable email Notifications when IPS alerts are generated, enter one or more valid addresses in the Email Addresses field; separate multiple addresses with commas.
  2. Use the checkboxes in the section headings to enable and disable specific alerts. Expand a section to update those alert definitions. The IPS parameters are described in [Alerts Configuration: IPS, page 71-35](#).
-  **Note** An email notification is sent the first time an alert is logged, and when the severity of an alert changes from warning to critical (but not vice-versa). No notification is issued if a device returns to the Normal state.
- 
- Step 3** On the FW panel, configure firewall-related alerts—click the FW tab to display the panel.
1. To enable email Notifications when firewall alerts are generated, enter one or more valid addresses in the Email Addresses field; separate multiple addresses with commas.
  2. Use the checkboxes in the section headings to enable and disable specific alerts. Expand a section to update those alert definitions. The FW parameters are described in [Alerts Configuration: Firewall, page 71-37](#).
- Step 4** On the VPN panel, configure tunnel-status alerts—click the VPN tab to display the panel.
1. To enable email Notifications when tunnel-down alerts are generated, enter one or more valid addresses in the Email Addresses field; separate multiple addresses with commas.
  2. Use the checkbox in the section heading to enable and disable tunnel-status alerts. Expand the section to update those alert definitions. The VPN parameters are described in [Alerts Configuration: VPN, page 71-39](#).
-  **Note** To enable these tunnel-status alerts for a device or context, you must first configure SNMP on the device, as described in [Configuring SNMP for S2S Polling, page 71-40](#).
- 
- Step 5** Click **Save** to save your changes and close the dialog box.
- 

## Alerts Configuration: IPS

**Note** From version 4.17, Cisco Security Manager does not support IPS devices.

The alerts and status information collected from monitored IPS devices are configured on the IPS panel of the Alerts Configuration dialog box. Refer to [Alerts: Configuring, page 71-34](#) for information about opening the dialog box, accessing the IPS panel, and providing email addresses for IPS-related Notifications.

The IPS-alert configuration parameters are grouped into sections that can be expanded and collapsed. Each section includes a checkbox next to its heading; use this checkbox to enable or disable that alert. When expanded, each section provides access to the settings used to define the alert.

The IPS alert and status configuration parameters are described in the following table. Each parameter can be configured separately for Priority Devices and Standard Devices. (Specifying devices for priority and standard monitoring is described in [Managing Monitored Devices, page 71-5](#).)

**Note**

Some of the following alert settings require specific related parameters to be configured on the monitored IPS sensors themselves. For example, if **license-expiration-policy (health-monitor command)** is not enabled on a particular sensor, license-expiration messages are not generated by that sensor and therefore no occurrences are tallied for it by HPM.

**Table 71-4**      *IPS Alerts Configuration*

| Setting                  | Description                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Collaboration App Status | Errors generated by the Collaboration App application are tallied. Alerts and Notifications are generated when the number of errors tallied reaches the specified Occurrences value.                                                                                                                       |
| Sensor App Status        | Errors generated by the Sensor App application are tallied. Alerts and Notifications are generated when the number of events reaches the specified Occurrences value.                                                                                                                                      |
| Bypass Mode              | Any time bypass mode is triggered, one Occurrence is tallied for this setting. Alerts and Notifications are generated when the number of Occurrences reaches the value specified.                                                                                                                          |
| Interface Status         | The status of each enabled interface is polled periodically. Each “down” result for any given interface is tallied as one Occurrence for that interface. Alerts and Notifications are generated when the number of Occurrences reaches the value specified.                                                |
| License Expiration       | A license-expiration threshold can be configured on each IPS sensor, and whenever this threshold is crossed, a status message is issued.                                                                                                                                                                   |
| Memory Usage             | A memory-usage threshold can be configured on each IPS sensor, and whenever this threshold is exceeded, a status message is issued.<br>An Occurrence is tallied for each memory-usage message. Alerts and Notifications are generated when the number of Occurrences reaches the value specified here.     |
| Missed Packets           | A missed-packets threshold can be configured on each IPS sensor, and whenever this threshold is exceeded, a status message is issued.<br>An Occurrence is tallied for each missed-packets message. Alerts and Notifications are generated when the number of Occurrences reaches the value specified here. |

**Table 71-4** IPS Alerts Configuration (continued)

| Setting         | Description                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inspection Load | <p>A traffic inspection-load threshold can be configured on each IPS sensor, and whenever this threshold is exceeded, a status message is issued.</p> <p>An Occurrence is tallied for each load-exceeded message. Alerts and Notifications are generated when the number of Occurrences reaches the value specified.</p> |

## Alerts Configuration: Firewall

The alerts and status information collected from monitored firewall devices are configured on the **FW** panel of the Alerts Configuration dialog box. Refer to [Alerts: Configuring, page 71-34](#) for information about opening the dialog box, accessing the FW panel, expanding and collapsing sections, and providing email addresses for FW-related Notifications.

The firewall-alert configuration parameters are grouped into sections that can be expanded and collapsed. Each section includes a checkbox next to its heading; use this checkbox to enable or disable that alert. When expanded, each section provides access to the settings used to define the alert.

Some section headings also include **Consider for Device Health** checkboxes. Checking one of these boxes means that particular information is considered when determining overall health of each device.

The FW alert and status configuration parameters are described in the following table.

**Table 71-5** Firewall Alerts Configuration

| Setting              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Failover Peer Status | <p>The status of the link to the device's failover peer is polled periodically. Each failed contact attempt is tallied as one Occurrence. Alerts and notifications are generated when the number of occurrences reaches the values specified here.</p> <p>For Priority devices and for Standard devices: choose <b>Critical</b> or <b>Warning</b> to specify the type of alert generated, and then specify the number of occurrences necessary to trigger the alert.</p>                                                                                                                                                                                                                            |
| Interface Status     | <p>The status of each enabled interface is polled periodically. Each "down" result for any given interface is tallied as one Occurrence for that interface. This monitoring is per stand-alone device, and per node of an ASA cluster. Alerts and notifications are generated when the number of occurrences reaches the values specified here.</p> <p>For Priority devices and for Standard devices: choose <b>Critical</b> or <b>Warning</b> to specify the type of alert generated, and then specify the number of occurrences necessary to trigger the alert.</p> <p><b>Note</b> Check <b>Consider for Device Health</b> in the header to include these data in device-health calculations.</p> |

**Table 71-5 Firewall Alerts Configuration (continued)**

| Setting             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Master Changed      | <p>An Occurrence is tallied each time the device designated as control unit node of an ASA cluster changes. Alerts and notifications are generated when the number of occurrences reaches the values specified here.</p> <p>For Priority devices and for Standard devices: choose <b>Critical</b> or <b>Warning</b> to specify the type of alert generated, and then specify the number of occurrences necessary to trigger the alert.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Cluster Node Status | <p>An Occurrence is tallied each time the Connection Status of an ASA cluster node changes (comes up or goes down). Alerts and notifications are generated when the number of occurrences reaches the values specified here.</p> <p>For Priority devices and for Standard devices: choose <b>Critical</b> or <b>Warning</b> to specify the type of alert generated, and then specify the number of occurrences necessary to trigger the alert.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CPU Usage           | <p>An Occurrence is tallied each time CPU usage exceeds the specified Threshold percentage. This is per stand-alone device; per node of a single-context cluster; and per node for the system context only in a multi-context cluster. Alerts and notifications are generated when the number of occurrences reaches the values specified here.</p> <p><b>Note</b> Check <b>Consider for Device Health</b> in the header to include these data in device-health calculations.</p> <p>For Priority devices and for Standard devices, you can enable either or both <b>Critical</b> and <b>Warning</b> CPU Usage alerts:</p> <ol style="list-style-type: none"> <li>1. Check the appropriate box to enable the <b>Threshold</b> and <b>Occurrence</b> fields.</li> <li>2. Specify a <b>Threshold</b> percentage by clicking the up or down arrows, or by highlighting the existing value and typing a number.</li> <li>3. In the <b>Occurrence</b> field, specify the number of times the specified Threshold must be exceeded before the critical or warning alert is issued.</li> </ol> |

**Table 71-5 Firewall Alerts Configuration (continued)**

| Setting      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Memory Usage | <p>An Occurrence is tallied each time memory usage exceeds the specified Threshold percentage. This is per stand-alone device; per node of a single-context cluster; and per node for the system context only in a multi-context cluster. Alerts and notifications are generated when the number of occurrences reaches the values specified here.</p> <p><b>Note</b> Check <b>Consider for Device Health</b> in the header to include these data in device-health calculations.</p> <p>For Priority devices and for Standard devices, you can enable either or both <b>Critical</b> and <b>Warning</b> Memory Usage alerts:</p> <ol style="list-style-type: none"> <li>1. Check the appropriate box to enable the <b>Threshold</b> and <b>Occurrence</b> fields.</li> <li>2. Specify a <b>Threshold</b> percentage by clicking the up or down arrows, or by highlighting the existing value and typing a number.</li> <li>3. In the <b>Occurrence</b> field, specify the number of times the specified Threshold must be exceeded before the critical or warning alert is issued.</li> </ol> |

## Alerts Configuration: VPN

The generation of alerts for site-to-site (S2S) tunnels on monitored devices and contexts is enabled and configured on the **VPN** panel of the Alerts Configuration dialog box. Refer to [Alerts: Configuring, page 71-34](#) for information about opening the dialog box, accessing the VPN panel, and providing email addresses for VPN-related Notifications.

### Tip

When VPN alerts are enabled, HPM polls the monitored devices and contexts at normal and Priority intervals (ten and five minutes, respectively), according to your normal/Priority designations. You also can enable SNMP monitoring which updates HPM tunnel status immediately upon processing the traps. See [Configuring SNMP for S2S Polling, page 71-40](#) for more about enabling SNMP processing for HPM.

The tunnel-status configuration parameters are grouped into a section that can be expanded and collapsed. When expanded, you have access to the alert settings. The checkbox next to the heading is used to enable or disable the alert.

The VPN alert parameters are described in the following table.

**Table 71-6 VPN Alerts Configuration**

| Setting       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Status | <p>The status of each monitored S2S tunnel is updated whenever it comes up or goes down, based on periodic polling or SNMP trap processing. Each “down” result for any given tunnel is tallied as one Occurrence. An alert is generated when the number of occurrences reaches the values specified here.</p> <p>For Priority Devices and for Standard Devices, you can separately configure both Critical and Warning tunnel-down alerts: choose <b>Critical</b> or <b>Warning</b> to specify the type of alert generated, and then in the <b>Occurrence</b> field, specify the number of times a tunnel is down when polled before the critical or warning alert is issued.</p> |

### Configuring SNMP for S2S Polling

The Health and Performance Monitor (HPM) application uses SNMP to poll site-to-site (S2S) VPN tunnels for up/down status updates. The generation of alerts for site-to-site (S2S) tunnels on monitored devices and contexts is configured on the **VPN** panel of the HPM Alerts Configuration dialog box. Refer to [Alerts: Configuring, page 71-34](#) for information about opening the dialog box, accessing the VPN panel, and providing email addresses for VPN-related Notifications.

Configuring SNMP in Security Manager to provide S2S polling is outlined here. The basic steps are:

1. Enable and configure SNMP on the [SNMP Page, page 49-17](#) for the device or individual context; specifically: check Enable SNMP Servers and provide and confirm the Read Community String.
2. In the [SNMP Trap Configuration Dialog Box, page 49-19](#), check **IPSEC Start** and **IPSEC Stop** on the Other panel.
3. In the [Add/Edit SNMP Host Access Entry Dialog Box, page 49-22](#), provide Interface Name, IP Address, Community String (and Confirm it), and choose the SNMP Version (1 or 2c).

Versions 1, 2c and 3 are supported for S2S polling, but version 3 must be configured separately, as described in the next section.

4. Configure SNMP credentials for the device or individual context in the [SNMP Credentials Dialog Box, page 3-49](#).

For versions 1 and 2c, provide and confirm the RO Community String.

For version 3, Security Manager supports three modes; which to use is determined from your input:

- noauthnopriv (no authentication, no privacy) – User name is mandatory, others are optional.
- authnopriv (authentication, no privacy) – User name, Password, Auth Algorithm, and Engine ID are required.
- authpriv (authentication and privacy) – User name, Password, Auth Algorithm, Privacy Password, Privacy Algorithm, and Engine ID are required.

Again, configuration of SNMP v3 is performed separately, as described in the next section.

#### Configuring SNMP v3 for Security Manager Device

You cannot configure SNMP v3 directly in Security Manager; you must use CLI commands or set up a FlexConfig. The steps are:

1. Configure an SNMP server group.

```
snmp-server group group-name v3 [auth | noauth | priv]
```

The `auth` keyword enables packet authentication. The `noauth` keyword indicates no packet authentication or encryption is being used. The `priv` keyword enables packet encryption and authentication. There are no default values for the `auth` or `priv` keywords.

## 2. Define a new SNMP user.

```
snmp-server user username group-name{v3 [encrypted]}
[auth {md5 | sha} auth-password]
[priv [des | 3des | aes] [128 | 192 | 256] priv-password]
```

The `v3` keyword specifies that the SNMP Version 3 security model is used, and enables the use of the `encrypted`, `priv`, and `auth` keywords. The `encrypted` keyword indicates the password is in encrypted format. Encrypted passwords must be in hexadecimal format.

The `auth` keyword specifies which authentication level (`md5` or `sha`) is used.

The `priv` keyword specifies the encryption level. There are no default values for the `auth` or `priv` keywords.

For the encryption algorithm, you can specify either `des`, `3des`, or `aes`. You can also specify which version of the AES encryption algorithm to use: `128`, `192`, or `256`. The `auth-password` specifies the authentication user password. The `priv-password` specifies the encryption user password.

## 3. Specify the recipient of SNMP notifications.

```
snmp-server host interface {hostname | ip_address} [version 3 username]
```

Indicates the interface from which traps are sent. Identifies the name and IP address of the NMS or SNMP manager that can connect to the device.

### Related Topics

- [Configuring SNMP, page 49-14](#)

## Alerts: Viewing

All alerts generated for monitored devices are displayed as a table in an alternate screen of the HPM window. The Alerts table is updated automatically as devices are polled for status information. You can also click the Refresh button, above the table on the right side, to update the table.

These alerts are based on the threshold values and state-change rules you have configured. See [Alerts: Configuring, page 71-34](#) for more information.

### Note

See [Managing Monitored Devices, page 71-5](#) for information about specifying the devices to be monitored.

To switch to the Alerts screen:

- Click the **Alerts** button below the HPM menu bar.

(Click the **Monitoring** button to return to the Monitoring screen.)

### Note

You can also view alerts that apply to a specific device from the Alerts tab when viewing details for that device (see [Monitoring Views: Device or VPN Details, page 71-28](#)).

The Alerts listing is a basic table, consisting of rows and columns, with each row representing one alert from a given device. Each column provides specific information about that alert: device name, alert severity, time recorded, and so on. (See [HPM Window: Alerts Display, page 71-32](#) for more about the Alerts screen.)

**Note**

The column headings are menus that you can use to filter the table by hiding or showing alerts according to chosen parameters. For example, you might choose to display alerts for only a particular device, and then choose only critical alerts for that device. See [Working with Table Columns, page 71-8](#) for more information.

**Tip**

You can click on the hyperlink in the Description column for tunnel up/down alerts to view the IPSec VPN Events for that device in Event Viewer. Event Viewer will show IPSec VPN Events for the device within a time range depending on the polling interval for that device. If it is a priority device, the time range will be 5 minutes before until 5 minutes after the first up/down notification was received. For non-priority devices, the time range will be +/- 10 minutes instead of 5 minutes.

In addition to scrolling the Alerts table, you can view sets of specific alerts:

- Use the List Filter field above this table to filter the list. See [Using The List Filter Fields, page 71-19](#) for more information.
- Use the View Cleared Alerts window to view previously cleared alerts for a selected set of devices over a specified time range. See [Alerts: History, page 71-43](#) for more information.

You also can acknowledge alerts, clear alerts, and edit alert notes:

- You can acknowledge an alert, or clear it, as described in [Alerts: Acknowledging and Clearing, page 71-42](#).
- To add to an existing alert note, click Notes field for that entry in the table to open the Enter Notes dialog box—used to view and add notes to an alert. Available only when a single alert with an existing note is selected in the table.

## Alerts: Acknowledging and Clearing

All alerts generated for monitored devices are displayed in the Alerts table, as described in [Alerts: Viewing, page 71-41](#). You can add notes to individual alerts, and you can acknowledge or clear alerts individually or in groups.

To select an alert, click that entry in the Alerts table. You can Shift-click another alert to select the group between the two, and you can Ctrl-click various rows to select multiple non-contiguous alerts.

When an alert is selected in the table, you can:

- Click the **Acknowledge** button to open the Acknowledge Alert dialog box, used to add a note to, and then mark the selected alert(s) as acknowledged. You can acknowledge multiple alerts at one time. Enter text in the Notes field in this dialog box (this is optional), and then click **OK**. The dialog box closes and the alerts are marked as acknowledged with a timestamp displayed in the Notes column.
- Click the **Clear** button to open the Clear Alert dialog box, used to add a note to, and then remove the selected entries from the Alerts table. Enter text in the Notes field in this dialog box (this is optional), and then click **OK**. The dialog box closes and the selected alerts are removed from the Alerts table.

**Note**

Alerts can be cleared automatically by HPM if you change the relevant threshold(s). Like alerts you have cleared, these alerts can be viewed in the View Cleared Alerts window (see [Alerts: History, page 71-43](#)).

Notes and other information for cleared alerts are saved in an Alerts database for 30 days.

## Alerts: History

All alerts generated for monitored devices are displayed as a table in the HPM window. You can filter the table by any visible column parameter, as described in [Alerts: Viewing, page 71-41](#).

You also can use the View Cleared Alerts window to access and view previously cleared alerts; you specify a set of devices and a time range. (Clearing alerts is described in [Alerts: Acknowledging and Clearing, page 71-42](#).)

**Note**

Notes and other information for cleared alerts is maintained in an Alerts database for 30 days—you cannot access alerts more than 30 days old.

Follow these steps to open and use the View Cleared Alerts window:

1. In the Alerts screen, click the View Cleared Alerts button next to the List Filter field to open the View Cleared Alerts window. (See [Alerts: Viewing, page 71-41](#) for more information about accessing the Alerts screen of the HPM window.)
2. Specify the alert View Settings; these define the set of alerts you wish to view:
  - Specify the devices of interest; **All** devices are selected by default. To select a particular set of devices:
    - a. Click the **Select** button to open the Select Devices dialog box.
    - b. Select the desired device(s); deselect any devices you wish to exclude.
    - c. Click **OK** to close the Select Devices dialog box.
  - Specify the types of Alerts to display: select or deselect **Critical**, **Warning** and **Normal**.
  - Define the desired **Time Range** by choosing a From date and time, and a To date and time. All alerts with a First Seen time within this range will be displayed.

From and To each present a standard drop-down calendar used to select a month and day.

Use the time field below each calendar to specify the precise start or end time, respectively. Highlight a digit and click the up or down arrow, or simply type the desired number. You can also click the **Now** button to specify the present moment.
3. Click the **Search** button to display the defined set of alerts.

Note that the View Cleared Alerts window provides a List Filter field that you can use to filter the cleared-alerts display. Using this field is described in [Using The List Filter Fields, page 71-19](#).

Refer to [Working with Table Columns, page 71-8](#) for other methods of filtering this table.

# SNMP Trap Forwarding Notification

In 4.6 and earlier versions of Security Manager, e-mail notifications were sent to users when Health and Performance Monitor alerts were generated for ASA, IPS, and VPN.

This framework has been enhanced for Security Manager 4.7 to send SNMP trap notifications in addition to e-mail notifications. Security Manager 4.7 converts the alerts to traps and sends them to the centralized SNMP trap server. SNMP v1, v2c, and v3 are supported. A trap is generated the first time an alert is seen and again if the severity increases, resulting in a trap being generated a maximum of 2 times, as is done with e-mail notification.

SNMP trap forwarding notification has the following pre-requisites:

1. An SNMP trap receiver (server) is available. More than one server can be used for a given Security Manager installation.
2. An ASA device is available.
3. An IPS sensor running IPS 7.0.x or later is available.
4. Health and Performance Monitor is enabled.

**Tip**

To verify that Health and Performance Monitor is enabled, navigate to Configuration Manager > Tools > Security Manager Administration... > Health and Performance Monitor.

5. Normal or priority monitoring for the ASA device and the IPS sensor Device is enabled in Health and Performance Monitor.
6. The alert settings for firewall, IPS, and VPN are enabled.

**Tip**

To enable the alert settings for firewall, IPS, and VPN, navigate to Health and Performance Monitor > Tools > Alert Configuration.

## MIB Documentation

The information in this section documents which MIB Security Manager uses to send the trap notification and what OID the user has to look for to get the particular alert information.

For the SNMP trap, Security Manager uses "CISCO-DEVICE-EXCEPTION-REPORTING-MIB"

The following list contains the OID details and the information that it contains:

- iso.org.dod.internet.mgmt.mib-2.system.sysUpTime.0 (shows how long the HPM server has been up and running) – calculated using the formula, System Up time = Current Security Manager server time - HPM Service start up time.
- snmpTrapOID (1.3.6.1.4.1.9.9.224.2.0.1)
- .1.3.6.1.4.1.9.9.224.1.1.5.1.2 (lists the alert rule name like memory usage)
- .1.3.6.1.4.1.9.9.224.1.1.5.1.3 (constant value of 1, specifies IP address type)
- .1.3.6.1.4.1.9.9.224.1.1.5.1.4 (device display name – device type and if any cluster node, then its name)
- .1.3.6.1.4.1.9.9.224.1.1.5.1.5 (severity of the alert)
- .1.3.6.1.4.1.9.9.224.1.1.5.1.6 (time stamp of the alert) – Current Security Manager server time - Alert first seen time
- .1.3.6.1.4.1.9.9.224.1.1.5.1.7 (maximum 1024 char string describing the alert)

- .1.3.6.1.4.1.9.9.224.1.1.5.1.8 (Security Manager Server name)

This section contains the following topics:

- [SNMP Trap Entries Dialog Box, page 71-45](#)
- [Add/Edit/Copy SNMP Trap Entries Dialog Box, page 71-46](#)

## SNMP Trap Entries Dialog Box

Use the SNMP Trap Entries dialog box as your launching point for SNMP trap forwarding notifications.

### Navigation Path

In Health and Performance Monitor, select **SNMP Trap Configuration** from the Tools menu. The SNMP Trap Entries dialog box contains the following areas:

- The Settings table, which displays the traps that are currently configured.
- Add, Edit, and other options for working with SNMP trap entries.

### Field Reference

**Table 71-7** The Settings table and other options in the SNMP Trap Entries dialog box

| Field                           | Description                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forward Trap To table           |                                                                                                                                                                                                           |
| Status column                   | Enabled or Disabled. A maximum of 5 trap forwarding hosts can be enabled at any given time.                                                                                                               |
| IP/Host column                  | IP address or hostname of the centralized SNMP trap server. Neither the local host nor the Security Manager server is allowed to be used as the SNMP server, in order to avoid problems with performance. |
| PORT column                     | The port used by the centralized SNMP trap server                                                                                                                                                         |
| SNMP Version column             | v1, v2c, or v3. The default value is v2c.                                                                                                                                                                 |
| Username column                 | The username for authentication to the SNMP server                                                                                                                                                        |
| Authentication Algorithm column | MD5 or SHA                                                                                                                                                                                                |
| Encryption Algorithm column     | DES, 3DES, AES128, AES192, and AES256                                                                                                                                                                     |
| Add                             | Used to add a new configuration. The Add button opens the Add Trap Settings dialog box.                                                                                                                   |
| Edit                            | Used to edit an existing configuration. The edit button opens the Edit Trap Settings dialog box.                                                                                                          |
| Copy Settings                   | Used to copy all the settings in an existing configuration. The Copy Settings button opens the Copy SNMP Trap Settings dialog box.                                                                        |
| Delete                          | Used to delete an existing configuration                                                                                                                                                                  |
| Enable                          | Used to enable an existing configuration                                                                                                                                                                  |
| Disable                         | Used to disable an existing configuration                                                                                                                                                                 |

## Add/Edit/Copy SNMP Trap Entries Dialog Box

Use the Add/Edit/Copy SNMP Trap Entries dialog box to add, edit, and otherwise work with and configure SNMP traps.

### Navigation Path

In Health and Performance Monitor, select **SNMP Trap Configuration** from the Tools menu. Then select **Add**, **Edit**, or **Copy Settings**.

The Add/Edit/Copy SNMP Trap Entries dialog box contains the following areas:

- The IP/Host and Port area
- The Trap Settings area for FW Alerts, IPS Alerts, and VPN Alerts
- The Trap Settings area for SNMP Options

### Field Reference

**Table 71-8** *The Trap Settings area and other options in the Add/Edit/Copy SNMP Trap Entries dialog box*

| Field                                                 | Description                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trap Settings                                         | Used to select all or only selected alerts for FW, IPS, and VPN, described in the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Alerts Configuration: Firewall, page 71-37</a></li> <li>• <a href="#">Alerts Configuration: IPS, page 71-35</a></li> <li>• <a href="#">Alerts Configuration: VPN, page 71-39</a></li> </ul> |
| SNMP Options                                          |                                                                                                                                                                                                                                                                                                                                                      |
| RO Community String<br>(SNMP version v1 and v2c only) | The password used for authentication in SNMP version v1 or v2c.                                                                                                                                                                                                                                                                                      |
| Group Type<br>(SNMP version v3 only)                  | NOAUTH, AUTH, or PRIV.                                                                                                                                                                                                                                                                                                                               |
| Engine ID<br>(SNMP version v3 only)                   | The SNMPEngineID identifier used for authentication in v3.                                                                                                                                                                                                                                                                                           |
| User Name<br>(SNMP version v3 only)                   | The username for authentication to the SNMP server.                                                                                                                                                                                                                                                                                                  |
| Authentication Password<br>(SNMP version v3 only)     | The password for authentication to the SNMP server.                                                                                                                                                                                                                                                                                                  |
| Authentication Protocol<br>(SNMP version v3 only)     | MD5 or SHA.                                                                                                                                                                                                                                                                                                                                          |
| Encryption Password<br>(SNMP version v3 only)         | The password for MD5 or SHA encryption.                                                                                                                                                                                                                                                                                                              |
| Encryption Protocol<br>(SNMP version v3 only)         | DES, 3DES, AES128, AES192, and AES256.                                                                                                                                                                                                                                                                                                               |

**NOTE:** In order to use AES192, AES256, or 3DES, you must follow these steps:

1. Download the unlimited strength cryptography policy .jar files from [http://www.oracle.com/technetwork/>Downloads>Java SE > Java Cryptography Extension \(JCE\) Unlimited Strength Jurisdiction Policy Files for JDK/JRE 7](http://www.oracle.com/technetwork/>Downloads>JavaSE>JavaCryptographyExtension(JCE)UnlimitedStrengthJurisdictionPolicyFilesforJDK/JRE7). (Click the download button to download the files by accepting the license agreement.)
2. Replace local\_policy.jar and US\_export\_policy.jar on your Security Manager server in the folder CSCOpX\MDC\jre\lib\security.
3. Restart your Security Manager server.

# Using External Monitoring, Troubleshooting, and Diagnostic Tools

---

A high degree of network availability is a requirement for large enterprises and service providers. Network managers face various challenges in maintaining network availability, including unscheduled down time, lack of expertise, insufficient tools, complex technologies, business consolidation, and competing markets. Network monitoring, problem diagnosis, and troubleshooting are essential to meeting and overcoming these challenges.

Monitoring involves the study of network activity and device status to identify anomalous events and behaviors. Quickly diagnosing and correcting network and system faults such as outages and degradations increase service availability, and thus tools to isolate, analyze and correct problems are essential.

The main Security Manager tools for monitoring device events are the Health and Performance Monitor (see [Chapter 71, “Health and Performance Monitoring”](#)) and the Event Viewer (see [Chapter 69, “Viewing Events”](#)).

In addition to Health and Performance Monitor and Event Viewer, the following topics describe additional monitoring, troubleshooting and diagnostic tools that are available with Security Manager:

- [Dashboard Overview, page 72-1](#)
- [CSM Mobile, page 72-11](#)
- [Viewing Inventory Status, page 72-12](#)
- [Starting Device Managers, page 72-14](#)
- [Launching Cisco Prime Security Manager or FireSIGHT Management Center, page 72-20](#)
- [Analyzing an ASA or PIX Configuration Using Packet Tracer, page 72-23](#)
- [Analyzing Connectivity Issues Using the Ping, Trace Route, or NS Lookup Tools, page 72-26](#)
- [Using the Packet Capture Wizard, page 72-31](#)
- [IP Intelligence, page 72-34](#)
- [Integrating CS-MARS and Security Manager, page 72-37](#)

## Dashboard Overview

Beginning with Version 4.5, the Security Manager client has a new launch point—a configurable dashboard, for which this topic presents an overview.

The dashboard is one of the six client applications that you can select as your default client application when you start the Security Manager client. (The others are Configuration Manager, Event Viewer, Report Manager, Health and Performance Manager, and Image Manager; there is also an application designed for mobile devices called CSM Mobile.) The dashboard is a convenient way for you to accomplish tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings.

The dashboard contains the widgets shown in the following table, categorized by whether they are for use with IPS, firewalls, or both. (Not all of these widgets are shown by default). In addition to the original dashboard, you can create new, additional dashboards, which are displayed as tabs. You can customize all dashboards, both the original dashboard and any new, additional dashboards that you create. To customize a dashboard, you can drag and drop widgets from the list of available widgets into any dashboard.

**Table 72-1** *Widgets for IPS, Firewalls, and Both*

|                                           |                                                                                                                                                                                                                                                                                  |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Widgets for IPS</b>                    | <ul style="list-style-type: none"> <li>• IPS Inspection Load Trends</li> <li>• Top 10 Reports for IPS Attackers, Victims, and Signatures</li> <li>• IPS Missed Packet Trends</li> <li>• IPS License</li> <li>• IPS Update Packages</li> <li>• IPS Sensors Out of Date</li> </ul> |
| <b>Widgets for Firewalls</b>              | <ul style="list-style-type: none"> <li>• Top 10 Reports for Firewall Sources, Destinations, and Services</li> <li>• Top 10 Reports for Botnet Malware Sites, Ports, and Hosts</li> <li>• Firewall CPU Usage Trends</li> </ul>                                                    |
| <b>Widgets for Both IPS and Firewalls</b> | <ul style="list-style-type: none"> <li>• Device Health Summary</li> <li>• Memory Usage Trends</li> <li>• Deployment</li> <li>• IP Intelligence</li> </ul>                                                                                                                        |

The way in which you use the dashboard and its widgets depends upon your goals in using Security Manager. For example, you can use the following four widgets to observe device health trends:

- IPS Inspection Load Trends
- IPS Missed Packet Trends
- Memory Usage Trends
- Firewall CPU Usage Trends

Individual widgets are described in the following table. One of the key widgets is the Device Health Summary widget. One reason it is important is that it provides the same information accessible through CSM Mobile, which is designed specifically for mobile devices. For more information about CSM Mobile, see [CSM Mobile, page 72-11](#). For information on enabling or disabling CSM Mobile, see [CSM Mobile Page, page 11-9](#).

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IPS Inspection Load Trends</b> | <p>A measure of the IPS inspection load trends. The inspection load trend data will appear in this widget only when an IPS device issues an alert because of inspection load, and the data will disappear when the alert is cleared.</p> <p>Indicates how much traffic inspection capacity the sensor is using. 0 indicates that there is no traffic backup, and 100 indicates that the buffers are completely backed up. Inspection load trends are affected by the following things:</p> <ul style="list-style-type: none"> <li>• Rate of traffic that needs inspection</li> <li>• Type of traffic being inspected</li> <li>• Number of active connections being inspected</li> <li>• Rate of new connections per second</li> <li>• Rate of attacks being detected</li> <li>• Signatures active on the sensor</li> <li>• Custom signatures created on the sensor</li> </ul> <p>You can set monitoring parameters on the IPS Health Monitor page at [IPS device in Device View] Platform &gt; Device Admin &gt; Health Monitor.</p> |

|                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Top 10 Reports for IPS Attackers, Victims, and Signatures</b>       | <p>Pre-defined system reports that you can use to analyze top attackers, victims, and signatures for IPS alerts in your network.</p> <p><b>Clickable Link</b>—In the Top Attackers widget, the IP address is an active hyperlink; click it to display IP intelligence. For details on IP intelligence in Security Manager, refer to <a href="#">IP Intelligence, page 72-34</a>.</p> <p><b>Clickable Link</b>—In the Top Signatures widget, the Signature ID is an active hyperlink; click it to display signature information.</p> <p>To use these reports, use Report Manager (Launch &gt; Report Manager...).</p> <p>To cross-launch Event Viewer from one of these top ten reports, select a particular attacker, victim, or signature, and click the number of occurrences. The number of occurrences is listed for the last 24 hours by default; you can change it to the last hour if desired.</p> <p><b>Note</b> When you cross-launch Event Viewer, the event query time in Event Viewer will be shown as the last 10 minutes despite its being the last 24 hours or the last hour in the Summary Dashboard. You can change the event query time in Event Viewer from the last 10 minutes to another value by using the dropdown list.</p> |
| <b>IPS Missed Packet Trends</b>                                        | <p>A measure of the IPS missed packets trends. The missed packets trend data will appear in this widget only when there is an alert based on missed packets, and the data will disappear when the alert is cleared.</p> <p>You can set monitoring parameters on the IPS Health Monitor page at [IPS device in Device View] Platform &gt; Device Admin &gt; Health Monitor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>IPS License</b>                                                     | <p>Displays IPS devices for which the license will expire in 30 days or 60 days. (Use the dropdown list to choose 30 days or 60 days.)</p> <p>If the license will expire in 30 days or 60 days (whichever you select) this widget displays the license expiry date.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>IPS Update Packages</b>                                             | <p>Displays sensor updates and signature updates that are available on Cisco.com or on a local download server but not downloaded to the Security Manager server.</p> <p>If there are many such updates, then this widget displays only the 10 most recent updates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>IPS Sensors Out of Date</b>                                         | <p>Sensors requiring a signature update.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Top 10 Reports for Firewall Sources, Destinations, and Services</b> | <p>Pre-defined system reports that you can use to identify the top destinations, services, and sources for firewall ACL events. | <p><b>Device Health Summary</b></p> | <p>Shows current high- or medium-severity active alerts generated by HPM. Alerts can be grouped by Alert-Description, Predefined-Category, Device, or Alert Technology.</p> <p><b>Clickable Link</b>—The device name is an active hyperlink; click it to display the Device Summary dialog box in the Dashboard. This link works for any option in the <b>Group by</b> _____ dropdown list: Alert, Category, Device, or Technology.</p> <p>To configure these alerts, use HPM (Launch &gt; Health and Performance Monitor...).</p> <p><b>Note</b> After enabling a device for monitoring in HPM, it can take up to 5 minutes for priority devices and 10 minutes for non-priority devices before actual values can be seen in the Device Health Summary.</p> <p><b>Acknowledge Alert</b>—To acknowledge an alert, follow these steps:</p> <ol style="list-style-type: none"> <li>1. Use the <b>Group by</b> _____ dropdown list to choose Alert, Category, Device, or Technology.</li> <li>2. Expand the alert, category, device, or technology that you are interested in. Doing this will show you an alert, category, device, or technology for each device that you are monitoring in Security Manager.</li> <li>3. Click the <b>Details</b> icon (pictured at the end of this topic). Doing this will open the Alert dialog box.</li> <li>4. Click <b>Acknowledge Alert</b></li> </ol> <p><b>Clear Alert</b>—To clear an alert, follow these steps:</p> <ol style="list-style-type: none"> <li>1. Use the <b>Group by</b> _____ dropdown list to choose Alert, Category, Device, or Technology.</li> <li>2. Expand the alert, category, device, or technology that you are interested in. Doing this will show you an alert, category, device, or technology for each device that you are monitoring in Security Manager.</li> <li>3. Click the <b>Details</b> icon (pictured at the end of this topic). Doing this will open the Alert dialog box.</li> <li>4. Click <b>Clear Alert</b></li> </ol> <p>You can also access device health summary information from mobile devices. To do this, use the CSM Mobile application. The information available to you from CSM Mobile is the same as that available in the Device Health Summary widget in the Dashboard. For information on enabling or disabling CSM Mobile, see <a href="#">CSM Mobile Page, page 11-9</a>.</p> |

| <b>Memory Usage Trends</b> | <p>A measure of IPS health status or firewall health trends.</p> <p>For IPS devices, you can set monitoring parameters on the IPS Health Monitor page at [IPS device in Device View] Platform &gt; Device Admin &gt; Health Monitor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Deployment</b>          | <p>Shows the deployment status for all devices for the past 24 hours</p> <p>You can also monitor deployment status by using Deployment Manager (Configuration Manager &gt; Manage &gt; Deployments...)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>IP Intelligence</b>     | <p>Information about an IP address related to the following things:</p> <ul style="list-style-type: none"> <li>• IP Geolocation</li> <li>• FQDN through DNS reverse lookup</li> <li>• WHOIS information</li> </ul> <p>For IP Intelligence settings in Security Manager, navigate to Configuration Manager &gt; Tools &gt; Security Manager Administration &gt; IP Intelligence Settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>CSM Monitor</b>         | <p>Shows server information in three categories:</p> <ul style="list-style-type: none"> <li>• CSM Server Statistics. This information is self-explanatory; for example, the operating system boot time is listed.</li> <li>• CSM User Related Information. This information consists of only one item, the number of users logged in.</li> <li>• CSM DB Backup Related Information. This information tells you if the CSM Monitor widget has found a dangling backup lock file.</li> </ul> <p>Knowing if you have a dangling backup lock file is important for the following reason: When a CSM backup is performed, it fails with an error similar to this: "Backup failed.ERROR(383): C:\PROGRA~2\CSCOPx\backup.LOCK file exists."</p> <p>The solution can be described as follows: Security Manager creates a new lock file (backup.LOCK) in the backup directory before it starts a backup. If a backup is interrupted or fails, the file does not get cleaned up. You must delete the current backup.LOCK file from the Security Manager server, and then execute the backup process again.</p> <p>The CSM Monitor widget makes it faster and more convenient for you to detect a dangling backup lock file.</p> <p>For detailed information, refer to the Cisco TAC document at the following URL:<br/> <a href="http://www.cisco.com/en/US/products/ps6498/products_tech_not_e09186a0080c13cdd.shtml">http://www.cisco.com/en/US/products/ps6498/products_tech_not_e09186a0080c13cdd.shtml</a></p> |

**Note**

In some cases, Top Infected Hosts, for example, the dashboard report has a slightly different appearance than the report generated by Report Manager. This is caused by a difference in sorting, but the data is identical. Such a case will occur when more than one entry in the dashboard report has the same count.

Basic dashboard operations are listed in the following table:

**Table 72-3 Basic Dashboard Operations**

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Add a new dashboard</b>                          | File > New Dashboard                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Re-arrange Dashboard Tabs for a Default View</b> | <p>You can re-arrange the dashboard tabs so that you can set a default view. For example, you might want the IPS tab to be first (on the extreme left):</p> <ol style="list-style-type: none"> <li>1. Click a tab that you are interested in, e.g., Summary, Firewall, or IPS.</li> <li>2. While your tab of interest is still selected, right-click to see the following context menu options: Move to Left, Move to Right, Move to First, Move to Last.</li> <li>3. Click your choice.</li> <li>4. You do not need to save your changes, and your changes will be persistent--the individual dashboard tabs will be arranged in the same way the next time you launch the Dashboard.</li> </ol> |
| <b>Display a different dashboard</b>                | Click the tab for the desired dashboard, such as Summary, Firewall, or IPS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Show or hide widgets</b>                         | File > Show Widgets or File > Hide Widgets                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Add a widget</b>                                 | <p>Drag-and-Drop Method:</p> <ol style="list-style-type: none"> <li>1. File &gt; Show Widgets</li> <li>2. Drag and drop the desired widget onto the dashboard.</li> </ol> <p>Menu Method:</p> <ol style="list-style-type: none"> <li>1. File &gt; Show Widgets</li> <li>2. Select the desired widget by clicking it.</li> <li>3. Click <b>Add</b> in the Description bar.</li> <li>4. Click <b>Done</b> in the Description bar.</li> </ol> <p><b>Note</b> When using the menu method, the widget will be added to the upper left-hand corner of the Dashboard. If desired, you can rearrange all the widgets by dragging and dropping them.</p>                                                   |
| <b>Remove a widget</b>                              | Click the <b>Remove</b> icon in the title bar of the widget that you want to remove.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 72-3 Basic Dashboard Operations***Dashboard operations (continued)*

|                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Expand a widget</b>                                       | <p>If a widget is shown in the dashboard, you can expand it with the down arrow. The down arrow becomes visible when you hover the mouse pointer over the right side of the widget title bar. The tooltip for the down arrow is labeled "Expand."</p> <p><b>Note</b> A special consideration applies when you 1) collapse a widget, 2) exit the dashboard, and then 3) launch the dashboard again. In this case, you will find that the widget is still collapsed, but the down arrow (normally used to expand it) is not present; only the up arrow (normally used to collapse it) is present. To expand the widget in this case, click the up arrow, note that the down arrow re-appears, and then click the down arrow as usual.</p> |
| <b>Collapse a widget</b>                                     | <p>If a widget is shown in the dashboard, you can collapse it with the up arrow. The up arrow becomes visible when you hover the mouse pointer over the right side of the widget title bar. The tooltip for the up arrow is labeled "Expand" (not "Collapse").</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Group by _____</b><br>(Device Health Summary widget only) | <p>A dropdown list offering you the following choices:</p> <ul style="list-style-type: none"> <li>• Group by Alert</li> <li>• Group by Category</li> <li>• Group by Device</li> <li>• Group by Technology</li> </ul> <p><b>Note</b> In the Group by _____ dropdown list, you can click the display name of a device (underlined to indicate that it is a hyperlink) to see an information box on the health of that device in terms of memory and other parameters. The information box contains an address field; the address can be either Host.Domain or the IP address: if Host.Domain is configured, that information will be displayed; otherwise, the IP address will be displayed.</p>                                          |

In the Dashboard, many of the icons can be clicked to accomplish a particular action, such as "Refresh" or "Add Dashboard." Most of these "clickable" icons have a tooltip to document the action that clicking the icon will accomplish, but a few do not. Clickable icons that have no tooltip in the dashboard are documented in the following table.

**Table 72-4** Clickable Icons that have no Tooltip in the Dashboard Dashboard icons icons without tooltips in Dashboard

| Icon                                                                                | Appearance                                                           | Widget            | Description                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|  | Clipboard with a pencil making annotations on a sheet of paper. | Device Health Summary widget | <p><b>Details icon.</b></p> <p>Click this icon to open/close the job description:</p> <ul style="list-style-type: none"> <li>• Created date and time</li> <li>• Job Name</li> <li>• Description</li> <li>• State</li> <li>• User</li> <li>• Job Type</li> </ul> |

## CSM Mobile

Beginning with Version 4.5, Cisco Security Manager has an application called CSM Mobile.

CSM Mobile allows you to access device health summary information from mobile devices. The information available to you in this way is the same as that available in the Device Health Summary widget in the Dashboard: current high or medium severity active alerts generated by Health and Performance Monitor. Alerts can be grouped by Alert-Description, Predefined-Category, Device, or Alert Technology. For more details on device health summary information in the Dashboard, see [Dashboard Overview, page 72-1](#).

The principal users of CSM Mobile are expected to be those who use an Apple iPad, an Apple iPhone, the Google Chrome browser, or the Apple Safari browser.

CSM Mobile must be enabled for you to use it. For information on enabling or disabling CSM Mobile, see [CSM Mobile Page, page 11-9](#).

### Note

If the CSM Mobile feature is not enabled, you will be redirected to the default Security Manager login page (which is provided by the CiscoWorks Common Services framework software); you will not receive an error message.

The home page for CSM Mobile has the following alert categories:

- Device Not Reachable
- Interface Down
- Overall Device Health Alerts
- High Memory Utilization
- Firewall—High CPU Utilization
- IPS—High Inspection Load
- IPS—High Missed Packets
- IPS—Bypass Mode
- Other Alerts

Navigation and other tasks in CSM Mobile are accomplished by using a few simple screens and icons:

- **Login**—A screen reading "Cisco Security Manager Mobile—Version 4.5.0" with fields for username and password and a button for login.
- **Logout**—On the CSM Mobile home page, a white X icon on a blue background. This icon is located in the upper left-hand corner.
- **Refresh**—On the CSM Mobile home page, a white circular arrow icon on a blue background. This icon is located in the upper right-hand corner.
- **Alert Detail**—For each type of alert on the CSM Mobile Home page, an grey arrow icon to the right of the alert count.
- **CSM Mobile Back Button**—On each alert detail page, a white angle arrow on a blue pentagon-shaped background [available only on alert detail pages]. The CSM Mobile back button is functionally equivalent to your browser's back button.

**Note**

The CSM Mobile display does not refresh itself automatically; you must manually click the refresh button to obtain up-to-date alert data.

## Viewing Inventory Status

You can view a summary of device properties for all devices that you are authorized to view. The summary includes device contact information and all device configurations, indicating which settings are local and which are using a shared policy, and indicating any policy object overrides in effect. You can also view the status of configuration deployment to the device.

The report is in table format, allowing you to organize information by filtering, sorting, reordering and removing columns. You can also export the table contents to a comma-separated values (CSV) file on the Security Manager server.

- 
- Step 1** In Device view, select **Tools > Inventory Status** to open the [Inventory Status Window, page 72-13](#).
- Step 2** Select the device whose detailed status you want to view in the upper table. The detailed information is shown in the tabs in the lower pane. The information is organized into folders; click the +/- icons to open and close folders, or double-click the folder name. The following tabs are available:
- **Inventory**—Lists summary information about the selected device's device properties, deployment methods, device group membership, and the parent device for modules.
  - **Policy**—Lists the current status of the policies that can be configured for the selected device, whether the policy is unassigned (not defined), a local policy, or a shared policy.
  - **Policy Object Overrides**—Lists policy objects that have overrides defined for the selected device.
  - **Status**—Lists status messages from Security Manager deployment jobs for the selected device, organized by event type.
- An **event** is a notification that a managed device or component has experienced an abnormal condition. Multiple events can occur simultaneously on a single monitored device or service module.
- Security Manager displays only the most-recent event of each type. To view historical status information, use the Deployment Manager.
- Step 3** Click **Close** to close the Inventory Status window.
-

## Inventory Status Window

Use the Inventory Status window to view device properties and status for the devices that you are allowed to view. This window summarizes device information so that you do not have to open the device properties for each individual device.

In addition to device property information, you can view summary information about how the policies on each device are configured (whether local, shared, or not configured) and the policy objects that have overrides for each device. You can also view the status of configuration deployment to the device.

The Inventory Status window contains two panes. Use the upper pane to view a complete listing of all devices, to sort the devices by attribute, or to filter out certain ones. Use the lower pane to view the device property details of the device selected in the upper pane.

### Navigation Path

Select **Tools > Inventory Status**.

| Export button                                                  | Click this button to export the inventory as a comma-separated values (CSV) file. You are prompted to specify a file name and to select a folder on the Security Manager server. You can use the export file for reference or analysis. |
| Display Name                                                   | The name of the device as it is displayed in Security Manager.                                                                                                                                                                          |
| Deployment                                                     | The status of the configuration deployment for the device.                                                                                                                                                                              |
| OS Type                                                        | The family of the operating system running on the device, for example, IOS, IPS, ASA, FWSM, or PIX.                                                                                                                                     |
| Running OS Version                                             | The version of the operating system running on the device.                                                                                                                                                                              |
| Target OS Version                                              | The target OS version for which you want to apply the configuration. Configurations are based on the commands supported by this version.                                                                                                |
| Host Name.Domain Name                                          | The DNS host and domain names for the device.                                                                                                                                                                                           |
| IP Address                                                     | The management IP address of the device.                                                                                                                                                                                                |
| Device Type                                                    | The type of device.                                                                                                                                                                                                                     |

### Details for the Selected Device (Lower Pane)

The detailed information is shown in the tabs in the lower pane. The information is organized into folders; click the +/- icons to open and close folders, or double-click the folder name.

**Table 72-5** *Inventory Status Window (continued)*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inventory               | Lists summary information about the selected device's device properties, deployment methods, device group membership, and the parent device for modules.                                                                                                                                                                                                                                |
| Policy                  | Lists the current status of the policies that can be configured for the selected device, whether the policy is unassigned (not defined), a local policy, or a shared policy.                                                                                                                                                                                                            |
| Policy Object Overrides | Lists policy objects that have overrides defined for the selected device. For more information on policy object overrides, see <a href="#">Policy Object Override Pages, page 3-53</a> .                                                                                                                                                                                                |
| Status                  | Lists any deployment status messages for the selected device.<br><br>Events are organized by event type. Event details include timestamp, description, and recommended action. The time stamp indicates the time of the last change in status for the device, not the time of the latest polling of the device.<br><br>Also shown is the highest severity level of the status messages. |
| Navigation buttons      | Click the navigation buttons to move through the inventory list. From left to right, buttons mean go to the first device in the list, go to the previous device, go to the next device, and go to the last device. The center field indicates which device is currently selected based on the row number (for example 5/10 means the fifth of 10 devices in the list).                  |

## Starting Device Managers

You can start a device manager to view a device's configuration and status from within Security Manager. You can start device managers for ASA, ASA-SM, PIX, FWSM, IPS, and IOS devices.

Each device manager includes several monitoring and diagnostic features that provide information regarding the services running on the device and a snapshot of the overall health of the system. You can use these device managers to view the existing device configuration and to monitor current status, but you cannot use it to apply configuration changes to the device.

**Note**

You cannot start device managers for IPS virtual sensors.

**Note**

In Cisco Security Manager 4.16, due to upgrade of JRE 1.7 build 161, support to some of old applets are dropped. Hence, beginning from Cisco Security Manager 4.16 you cannot launch PIX 6.3, IDS/IPS versions 5.x to 7.x, and FWSM 2.x directly.

**Note**

In Cisco Security Manager 4.19, as ASDM was upgraded to Java 1.8, you cannot start device managers for ASA 9.12.1 devices. However, the Security Manager supports cross-launch of ASDM for ASA 9.10.1 and earlier versions.

To start a device manager, select the device in Device view, right-click and select **Device Manager**. You can also start the device manager by selecting **Launch > Device Manager**. (These commands are disabled when you select an ASA CX device, and the **Prime Security Manager** commands are enabled. Cisco Prime Security Manager is used to configure and manage ASA CX devices. See [Launching Cisco Prime Security Manager or FireSIGHT Management Center, page 72-20](#) for more information.)

When you start a device manager from Security Manager, the device manager executable is downloaded to your client system; the device manager does not need to be installed on the network device. The first time you start a device manager, it takes time to download the software to your workstation (you are shown a progress bar). (If you run into problems, review the tips in [Troubleshooting Device Managers, page 72-16](#).)

Security Manager selects the most appropriate device manager version based on the operating system running on the network device. Subsequent communications with the selected device are completely transparent. Connections are made through the Security Manager server; that is, the Security Manager server acts as a proxy server. By starting a device manager from Security Manager, you eliminate the need to open an HTTPS connection between your client system and the device you want to monitor.

**Tip**

When you start a device manager session, Security Manager opens a version of the manager that is appropriate for the operating system software version running on the device. However, Security Manager might not open the most recently-available version of the device manager if new device manager versions have been released after the release of the Security Manager version you are using. When you start the device manager, check its version (for example, select **Help > About** in the device manager window); if there is a more recent device manager available with features that you require, you must install and use that device manager outside of Security Manager to use those new features.

Keep in mind that if you use an external device manager running on the device to modify device configurations directly, these changes are considered out-of-band by Security Manager, and might be subsequently overwritten when you next deploy configurations from Security Manager. For more information about out-of-band changes, and what you can do to identify and recreate them, see the following topics:

- [Understanding How Out-of-Band Changes are Handled, page 8-12](#)
- [Detecting and Analyzing Out of Band Changes, page 8-45](#)

Security Manager starts only one instance of a device manager per device, and closes the device manager when you exit Security Manager, or when the idle-session timeout period is exceeded. You can have more than one device manager window open at one time (connected to different devices).

The following table outlines the device managers you can launch from Security Manager.

**Table 72-6** *Device Managers Available in Security Manager*

| Device Manager | Description                                                                                                                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDM            | The IPS Device Manager (IDM) lets you monitor IPS sensors and modules that are part of the Security Manager inventory.<br>See the <a href="#">IDM documentation</a> for more information about using this device manager.                                           |
| PDM            | The PIX Device Manager (PDM) lets you monitor PIX 6.x devices and early FWSMs, specifically FWSM releases 1.1, 2.2 and 2.3 in single- or multiple-context modes.<br>See the <a href="#">PDM documentation</a> for more information about using this device manager. |

**Table 72-6** Device Managers Available in Security Manager (continued)

| Device Manager | Description                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASDM           | The Adaptive Security Device Manager (ASDM) lets you monitor ASA, ASA-SM, PIX 7.x+, and FWSM 3.x+ devices.<br><br>See the <a href="#">ASDM documentation</a> for more information about using this device manager.                                                                                                                                     |
| SDM            | The Security Device Manager (SDM) lets you monitor Cisco IOS-based resources. SDM requires no previous experience with Cisco devices or the Cisco command-line interface (CLI). Cisco SDM supports a wide range of Cisco IOS software releases.<br><br>See the <a href="#">SDM documentation</a> for more information about using this device manager. |

The following topics explain more about troubleshooting and using device managers:

- [Troubleshooting Device Managers, page 72-16](#)
- [Access Rule Look-up from Device Managers, page 72-17](#)
- [Navigating to an Access Rule from ASDM, page 72-18](#)
- [Navigating to an Access Rule from SDM, page 72-19](#)

## Troubleshooting Device Managers

If you can successfully deploy configurations to a device, Security Manager should be able to open a device manager session with the device (as described in [Starting Device Managers, page 72-14](#)).

### Note

From 4.19, Cisco Security Manager does not support cross-launch of Cisco Adaptive Security Device Manager 7.12.1 for ASA 9.12.1 devices. However, the Security Manager supports cross-launch of ASDM for ASA 9.10.1 and earlier versions. Hence, beginning with version 4.19, you must install ASDM separately for ASA 9.12.1 devices in Cisco Security Manager client machine.

However, if you have problems making a connection or using one that is open, consider the following troubleshooting tips, which are divided into basic tips and tips for using multiple device managers.

### Basic Device Manager Troubleshooting Tips

- Generally, the credentials configured for the device in the Security Manager inventory are used to start the device manager. However, some versions of SDM require that you enter a user name and password when the device manager is started. If you get an error that says device credentials are missing, or they are not valid, update the Device Properties Credentials page with a username and password that can log into the device. In Device view, right-click the device and select **Device Properties**. For more information, see [Viewing or Changing Device Properties, page 3-41](#) and [Device Credentials Page, page 3-46](#).
- All users associated with any of the CiscoWorks Common Services roles have permission to start device managers from Security Manager, with the exception of the Help Desk role or any of the predefined Cisco Secure ACS roles. Ensure you have appropriate permissions.

- SSL/HTTPS must be enabled on the target device to provide secure communications between Security Manager and the device. An error message is displayed if SSL is not enabled on the device. See [Understanding Device Communication Requirements, page 2-1](#) for more information.
- You might need to modify Cisco Security Agent, or other anti-virus and network firewall software, on the Security Manager system and on your workstation to allow the device manager service (**xdm-launcher.exe**) to be started.
- Ensure that Security Manager is correctly configured for contacting and communicating with the target device. Specifically verify device properties such as identity, operating system and credentials. Select the desired device, right-click and choose **Device Properties**. Verify the settings on the General and Credentials pages. You can test whether Security Manager can connect to the device by selecting the Credentials tab and clicking **Test Connectivity** (see [Testing Device Connectivity, page 9-1](#)).
- Device managers can be started for FWSMs and ASAs running in transparent mode (Layer 2 firewall) or routed mode (Layer 3 firewall), and supporting a single security context or multiple security contexts. For FWSM and ASA devices running multiple security contexts, you must define a unique management IP address for each security context.
- If you get a message saying that the platform is not supported for device manager launch, but you believe the platform should be supported based on information in this guide, consider the relative newness of the operating system version running on the device and the age of the Security Manager software version you are using. If you are using very recent operating systems, but a relatively older version of Security Manager, you might need to upgrade Security Manager (or apply a service pack), contact Cisco Technical Support, or simply install the latest device manager on the network device and use it outside of Security Manager. Before using a device manager outside of Security Manager, review the information on out-of-band changes in [Starting Device Managers, page 72-14](#).

#### Multiple Device Manager Sessions Troubleshooting Tips

- Starting multiple device managers might affect the performance of both the Security Manager server and your client. On the client, memory requirements and performance impact are proportional to the number of device managers launched. On the server, a large number of requests to start device managers or retrieve current information from the device can have an adverse impact on performance.
- The maximum number of persistent HTTPS connections that can be established with any one device from all clients depends on the device type and model. An error message is displayed if you attempt to exceed this limit.

For example, a single PIX 6.x allows multiple clients to each have one browser session open, supporting up to 16 concurrent PDM sessions. An FWSM (1.1, 2.2, or 2.3) allows up to 32 PDM sessions for the entire module, with a maximum of five concurrent HTTPS connections per context.

Refer to the appropriate device documentation for information about specific limits.

## Access Rule Look-up from Device Managers

A set of access rules is associated with each device interface. These rules are presented in the form of an ordered list or table. This list is often referred to as an access-control list (ACL), with each rule in the list known as an access-control entry (ACE). When deciding whether to forward or drop a packet, the device tests the packet against each access rule in the order listed. When a rule is matched, the device performs the specified action, either permitting the packet into the device for further processing, or denying entry. If the packet does not match any rule, the packet is denied.

Activity on your firewall or router can be monitored through syslog messages. If logging is enabled on the device, whenever an access rule that is configured to generate syslog messages is matched—for example, a connection was attempted from a denied IP address—a log entry is generated.

**Note**

For the device to generate log entries, logging must be enabled on the device (on the [Logging Setup Page](#) for ASA/PIX devices and the Logging policies for IOS devices, described in [Logging on Cisco IOS Routers, page 65-1](#)), and the individual access rules must be configured to generate log messages when they are matched (in the [Advanced and Edit Options Dialog Boxes, page 16-17](#)).

You can monitor syslog messages in device managers launched from Security Manager. For certain device managers, you can also look up the access rule in Security Manager that generated a particular message from the monitoring window. The access rule that triggered the syslog entry is highlighted in Security Manager on a first-match basis, even if there are multiple matches.

This access rule look-up is available through SDM for all managed routers running IOS, and through ASDM for managed PIX and ASA devices (including ASA-SM) running version 8.0(3) and above, and FWSM devices running version 3.1 and above.

The following topics describe how to look up access rules in Security Manager from a device manager:

- [Navigating to an Access Rule from ASDM, page 72-18](#)
- [Navigating to an Access Rule from SDM, page 72-19](#)

## Navigating to an Access Rule from ASDM

**Note**

From 4.19, Cisco Security Manager does not support cross-launch of Cisco Adaptive Security Device Manager 7.12.1 for ASA 9.12.1 devices. However, the Security Manager supports cross-launch of ASDM for ASA 9.10.1 and earlier versions. Hence, beginning with version 4.19, you must install ASDM separately for ASA 9.12.1 devices in Cisco Security Manager client machine.

In an ASDM device manager launched from Security Manager, you can monitor system log messages in the Real-time Log Viewer window and the Log Buffer window. You can select a syslog message displayed in either window and navigate to the access-control rule in Security Manager that triggered the message, where you can update the rule as necessary.

The Real-time Log Viewer is a separate window that lets you view syslog messages as they are logged. The separate Log Buffer window lets you view messages present in the syslog buffer.

You can look up access rules associated with the following syslog message IDs:

- 106023 – Generated when an IP packet is denied by the access rule. This message appears even when logging is not enabled for the rule.
- 106100 – If logging is enabled for a matched access rule (in the [Advanced and Edit Options Dialog Boxes, page 16-17](#)), this message provides information about the traffic flow, depending on the parameters set. This message provides more information than message 106023, which logs only denied packets.

This procedure describes how to look up an access rule in Security Manager from ASDM's Real-time Log Viewer or Log Buffer windows.

**Related Topics**

- [Access Rule Look-up from Device Managers, page 72-17](#)

- [Navigating to an Access Rule from SDM, page 72-19](#)

- 
- Step 1** Select a PIX, ASA, ASA-SM, or FWSM in the Security Manager device inventory.
- Step 2** Select **Launch > Device Manager** to start ASDM. For more information about starting device managers, see [Starting Device Managers, page 72-14](#).

---

**Note** In Cisco Security Manager 4.19, this procedure is not applicable for ASDM 7.12.1 managing ASA 9.12.1 devices. However, the Security Manager supports cross-launch of ASDM for ASA 9.10.1 and earlier versions. Hence, beginning with version 4.19, you must install ASDM separately for ASA 9.12.1 devices in Cisco Security Manager client machine.

---

- Step 3** In the ASDM window, click the **Monitoring** button to display the Monitoring panel; click **Logging** in the left pane to access the log-viewing options.
- Step 4** Select either **Real-time Log Viewer** or **Log Buffer**.
- Step 5** Click the **View** button to open the selected log-viewing window.

---

**Note** The View button is not displayed if logging is not enabled on the device.

---

Each syslog message listed in the window includes the following information: message ID number, date and time the message was generated, the logging level, and the network or host addresses from which the packet was sent and received.

- Step 6** To view the access rule that triggered a specific syslog message, select the message and click the **Show Rule** button in the ASDM toolbar (or right-click the message and choose **Go to Rule in CSM** from the pop-up menu).

The Security Manager client window is activated and the Access Rules page appears with the rule highlighted in the rules table. If the syslog entry was triggered by an access rule not referenced in the current Security Manager activity, an error message appears.

---

## Navigating to an Access Rule from SDM

In an SDM device manager launched from Security Manager, you can view a log of events categorized by security level under the Syslog tab of the Logging window. You can select a syslog message and navigate to the access-control rule in Security Manager that triggered the message, where you can update the rule as necessary.

The Monitor > Logging option in SDM offers four log tabs; Syslog is the only one of these offering the Security Manager access-rule look-up option. The router contains a log of events categorized by severity level. The Syslog tab displays the router log, even if log messages are being forwarded to a syslog server.

On Cisco IOS devices, syslog messages are generated for access rules configured with the **log** or **log-input** keywords. The **log** keyword produces a message when a packet matches the rule. The **log-input** keyword produces a message that includes ingress interface and source MAC address, in addition to the packet's source and destination IP addresses and ports. When identical packets are matched, the message is updated at five-minute intervals with the number of packets permitted or denied in the previous five minutes.

This procedure describes how to look up an access rule in Security Manager from the Syslog tab of SDM's Logging panel.

- [Navigating to an Access Rule from ASDM, page 72-18](#)

- 
- Step 1** Select an IOS router in the Security Manager device inventory.
- Step 2** Select **Launch > Device Manager** to start SDM. For more information about starting device managers, see [Starting Device Managers, page 72-14](#).
- Step 3** In the SDM window, click the **Monitoring** button to display the Monitoring panel; click **Logging** in the left pane to access the log-viewing options.
- The Logging pane appears with Syslog tab displayed.
- Step 4** To view the access rule that triggered a specific syslog message, select the message and click the **Go to Rule in CSM** button above the table of log messages.
- The Security Manager client window is activated and the Access Rules page appears with the rule highlighted in the rules table. If the syslog entry was triggered by an access rule not referenced in the current Security Manager activity, an error message appears.
- 

## Launching Cisco Prime Security Manager or FireSIGHT Management Center

The ASA CX is an Adaptive Security Appliance module that provides advanced ConteXt-aware security, extending the ASA platform to provide in-depth “who-what-where-when-how” application visibility and control. The ASA FirePOWER module supplies next-generation firewall services, including Next-Generation IPS (NGIPS), Application Visibility and Control (AVC), URL filtering, and Advanced Malware Protection (AMP).

The ASA CX devices are managed by the Cisco Prime Security Manager (PRSM) application and the ASA FirePOWER modules are managed by the FireSIGHT Management Center application—they cannot be directly managed by Cisco Security Manager. However, Security Manager has been enhanced to allow you to discover the presence of these modules on ASA devices; to “cross launch” PRSM and FireSIGHT Management Center from the Configuration Manager application; and to share Policy Object data between Security Manager and PRSM.

**Note**

PRSM and FireSIGHT Management Center are browser-based applications; that is, they are launched and operate within a browser window. Therefore, when you cross-launch PRSM or FireSIGHT Management Center from the Configuration Manager client, the host system’s default browser is opened and the management application initiated. However, some browsers have not been certified with PRSM or FireSIGHT Management Center and you may need to change the default browser on the Security Manager client’s host system prior to cross-launching. See “Browser Requirements” in the PRSM or FireSIGHT Management Center installation guide for more information.

---

**Before You Begin**

In order to cross-launch PRSM or FireSIGHT Management Center, Security Manager must be aware of the presence of the modules. This is accomplished through discovery of either new ASA devices, or of modules which have been added to existing ASAs. This process is outlined in [Detecting ASA CX and FirePOWER Modules, page 72-21](#).

Also, you can enable and configure “single sign-on” (SSO) to allow Security Manager users direct access to PRSM or FireSIGHT Management Center without logging into the applications separately. To allow this, the appropriate user credentials must be defined in both applications. (Note that SSO is not necessary to cross-launch PRSM or FireSIGHT Management Center.) See Security Manager’s [Single Sign-on Configuration Page, page 11-68](#), and “Configuring Single Sign-On for Cisco Security Manager” in the *User Guide for ASA CX and Cisco Prime Security Manager (Cisco ASA CX Context-Aware Security End-User Guides)* for more information.

#### Related Topics

- [Single Sign-on Configuration Page, page 11-68](#)
- [Detecting ASA CX and FirePOWER Modules, page 72-21](#)
- [Sharing Device Inventory and Policy Objects with PRSM, page 72-23](#)

To monitor and manage your ASA CX devices or FirePOWER Modules, cross-launch PRSM or FireSIGHT Management Center:

- 
- Step 1** Select a previously discovered ASA CX device or ASA with FirePOWER module in Configuration Manager’s Device view—in either the device-selector tree, or the table of devices in the content area. Again, discovering ASA CX devices or FirePOWER modules in Security Manager is described in [Detecting ASA CX and FirePOWER Modules, page 72-21](#).
- Step 2** Right-click the selected device and choose **Prime Security Manager** or **FireSIGHT Management Center** from the pop-up menu. Alternatively, you can choose **Prime Security Manager** or **FireSIGHT Management Center** from the Configuration Manager’s **Launch** menu. (These commands are available only when you have selected an ASA CX or an ASA with a FirePOWER module.)
- The browser-based PRSM or FireSIGHT Management Center window appears, displaying the device screen for the selected device.

**Note** The URL used by Security Manager to launch PRSM incorporates the management IP address of the CX module (obtained during device detection), and includes the string `/admin/mgmt?rtp`. During cross-launch, this type of request is redirected to the appropriate PRSM central server, if one exists. Otherwise, the “on-box” version of PRSM is launched. (To directly launch the on-box version of PRSM yourself, you must type `https://<management_IP_address>`, where `<management_IP_address>` is the management address of the desired CX module, into your browser’s address field.)

Information about using PRSM can be found on the [Cisco ASA CX Context-Aware Security End-User Guides](#) page of cisco.com and information about using FireSIGHT Management Center can be found on the [Cisco FireSIGHT Management Center](#) page of cisco.com.

## Detecting ASA CX and FirePOWER Modules

Prior to being able to share Policy Object data between Security Manager and PRSM, and to cross-launch PRSM or FireSIGHT Management Center from Configuration Manager, you must ensure that Security Manager is aware of the module.

Detection of a CX or FirePOWER module is automatic when you discover a new ASA device by selecting the relevant options in the New Device wizard, as described in [Adding Devices to the Device Inventory, page 3-7](#).

When you add a CX or FirePOWER module to an ASA device already in the inventory, you can detect the new module without affecting the existing policies on the host ASA, as follows:

1. Select one or more ASA devices in Configuration Manager's device-selector tree.  
You can detect more than one module at once—any selected devices that are not ASAs, or that are ASAs which do not include a CX or FirePOWER module, are ignored.
2. Right-click any selected device and choose **Detect ASA-CX/FirePOWER Module** from the pop-up menu.

The Create Discovery Task dialog box or Bulk Rediscovery dialog box appears, with the *Detect ASA-CX/FirePOWER Module* option selected—none of the other discovery options are available.

See [Create Discovery Task and Bulk Rediscovery Dialog Boxes, page 5-18](#) for more information about using this dialog box.

3. Click **OK** on the Create Discovery Task dialog box or click **Finish** on the Bulk Rediscovery dialog box to close the dialog box and begin module detection.

You may be warned that discovery will replace existing policies; you can safely click Yes to close the warning and proceed.

The Discovery Status dialog box opens automatically displaying discovery progress; see [Viewing Policy Discovery Task Status, page 5-22](#) for more information about this process.

When a CX or FirePOWER module is detected on an ASA, the management IP address of the module itself is fetched and the ASA-CX/FirePOWER Module section of the Device Properties window is updated; see [Device Properties: General Page, page 3-42](#). The management IP address is used to cross-launch PRSM or FireSIGHT Management Center. (Cisco Prime Security Manager, or PRSM, is the application used to configure and manage ASA CX devices and FireSIGHT Management Center is the application used to configure and manage ASA FirePOWER modules, as described in [Launching Cisco Prime Security Manager or FireSIGHT Management Center, page 72-20](#).)

#### Note

The URL used by Security Manager to launch PRSM incorporates the management IP address of the CX module (obtained during device detection), and includes the string `/admin/mgmt?rtip`. During cross-launch, this type of request is redirected to the appropriate PRSM central server, if one exists. Otherwise, the “on-box” version of PRSM is launched. (To directly launch the on-box version of PRSM yourself, you must type `https://<management_IP_address>`, where `<management_IP_address>` is the management address of the desired CX module, into your browser's address field.)

Upon completion of the detection process, all ASAs with CX modules installed are indicated in the various Security Manager displays by presentation or inclusion of the PRSM icon: . For example, here is the ASA CX icon used in the Device selector: .

#### Caution

You also can detect the presence of a CX or FirePOWER module on an existing ASA by choosing **Discover Policies on Device(s)** from the selected-device right-click menu, or by choosing **Discover Policies on Device** from the Policy menu. Depending on the number of devices selected and which command you choose, the Create Discovery Task dialog box, or the Bulk Rediscovery Task dialog box, opens and all discovery-rediscovery options are available. This means you can potentially overwrite any

shared policies already established on the selected device(s). Be sure to deselect all options except **Detect ASA-CX/FirePOWER Module**, unless you are sure you want to rediscover existing policies. See [Discovering Policies on Devices Already in Security Manager, page 5-15](#) for more information.

## Sharing Device Inventory and Policy Objects with PRSM

You can export the current device inventory, and the current set of policy objects, as defined in Security Manager for import into Cisco Prime Security Manager (PRSM).

### Exporting the Device Inventory

To share the Security Manager device inventory with PRSM, export the inventory as a comma-separated values (CSV) file, as described in [Exporting the Device Inventory, page 10-6](#). Be sure to specify “Cisco Security Manager” as the format type for the export file.

### Exporting Networks/Hosts and Services Policy Objects

To export Security Manager policy objects—specifically Networks/Hosts objects, or Services objects; PRSM does not support Port List objects—for import into PRSM, you must execute a Perl script on the Security Manager server host to create a CSV file.

The Perl script is included in the Security Manager server installation, and its use is described in detail in [Importing and Exporting Policy Objects, page 6-23](#). The basic procedure is as follows:

1. Log into the computer running the Security Manager server, open a Cmd window, navigate to the Perl-script location, and then execute the Perl-script command at the command prompt.

```
Here is an example of the command as used to export Networks/Hosts objects: perl
PolicyObjectImportExport.pl -u user -p password -o export -t network -f
C:\CSM_Net_objects.csv -e true
```

2. Copy the CSV file to the PRSM client system.

This file can be edited, if necessary.

3. Launch PRSM and import the CSV file. For information about this process, see the section “Importing Objects” in the “Managing Policy Objects” chapter of the PRSM user guide.

## Analyzing an ASA or PIX Configuration Using Packet Tracer

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Packet tracer is a policy debugging tool for ASA and PIX security appliances running version 7.2.1+ that are operating in router mode.

The packet tracer inspects the active policies currently running on the appliance. Without having to generate real traffic, you can analyze how traffic between two addresses traverses the security appliance, whether it is dropped or allowed. If the result is unexpected, you can determine where the issue exists and update the corresponding policy in Security Manager to resolve it.

Packet tracer presents a step-by-step analysis of how a simulated packet is processed by the security appliance's active configuration. It traces the packet's flow through the active firewall modules, such as route lookup, access lists, NAT translations, and VPN. The set of active modules changes based on the type of packet configured and the active configuration. For example, if no VPN policies are configured, the VPN module is not evaluated.

You can inspect the simulated packet's traversal rather than having to generate network traffic, enable syslog messages, and manually review resulting syslog messages. Packet tracer details the actions enforced by the active configuration on the packet. If a configuration command causes the packet to be dropped, the reason is provided, such as "Drop-reason: (telnet-not-permitted) Telnet not permitted on least secure interface."

You can trace the life span of a simulated packet through the security appliance to see whether the packet is behaving as expected. Packet tracer uses include the following:

- Debug all packet drops in a production network.
- Verify the configuration is working as intended.
- Show all rules applicable to a packet including the CLI that defines the rule.
- Show a time line of packet changes in a data path.
- Trace packets in the data path.
- If the packet is blocked or permitted by some explicit access rule, you can use a short-cut to go to the policy so that you can edit the rule.

#### Tips:

- Packet Tracer is also available in the ASDM application and the ASA command line, and the Security Manager version is equivalent to the ASDM version. For an example of using Packet Tracer from ASDM and the CLI to analyze a configuration, see [PIX/ASA 7.2\(1\) and later: Intra-Interface Communications](#).
- Before you can use packet tracer on a device, you must submit your policy changes at least once after adding the device to the inventory.
- Packet tracer analyzes only the active configuration running on a device. Therefore, you cannot use packet tracer to test proposed configurations before they are deployed and running on the device. Do not use packet tracer on a device with pending configuration changes—deploy the changes first and then use packet tracer to ensure the packet tracer results are valid.

To use Packet Tracer:

- 
- Step 1** (Device view) Right-click on the ASA or PIX 7.2.1+ device and select **Packet Tracer** on the shortcut menu to open the Packet Tracer window.
- Step 2** Select the interface you want to test from the **Interfaces** list. The list contains all interfaces defined on the device.
- Step 3** Model the packet that you want to trace by configuring the following fields:
- **Packet Type**—Select whether you are tracing a TCP, UDP, ICMP, IP, or ESP packet.

---

**Note** Beginning with 4.16, Cisco Security Manager supports tracing of a ESP packet from ASA 9.9.1 devices.

---

- **Source, Destination IP Address**—Select from the following address types and enter the host addresses for both ends of the communication (from source to destination):

- IP Address of the host. This can be IPv4 or IPv6 addresses. Packet tracer with IPv6 is not supported for devices running ASA software version lower than 8.4(2).
- User (source only). For example, DOMAIN\Administrator. The IP address mapped to the user is used for the trace. You must enable identity-aware firewall by configuring identity options to use this type of address.
- FQDN, or fully-qualified domain name, of the host. For example, host.example.com. You must configure DNS to use this type of address.
- Security Name (ASA 9.x+ only).
- Security Tag (ASA 9.x+ only).
- **Source, Destination Port (TCP and UDP only)**—Enter, or select, the port numbers that represent the traffic type. The selection list uses names that equate to the standard port numbers for the named application. For example, selecting **http** and entering **80** is the same.
- **Type, Code, ID (ICMP only)**—When modeling an ICMP packet, you must enter values in all of these fields:
  - **Type**—Select the ICMP packet type or enter the equivalent number. The list includes all main ICMP types. For a complete list of types and related codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for “ICMP Type Numbers.”
  - **Code**—Enter **0** unless you are modeling a packet type that has non-zero codes. These are destination unreachable (type 3, codes 0-12), redirect (type 5, codes 0-3), time exceeded (type 11, codes 0-1), and parameter problem (type 12, codes 0-2). See RFC 1700 for code explanations, and note that additional codes might have been introduced in other RFCs.
  - **ID**—You must enter a value for ID even though the field is used for a limited number of message types only. The ID is used for ICMP types that include request and reply versions, such as echo and echo request, to help match replies to requests. The value should be between 1-255.
- **Protocol (IP only)**—Enter the number that identifies the next level protocol. For a complete list of protocol codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for the “Protocol Numbers” heading. As of the writing of this topic, numbers 1-54 and 61-100 represent values assigned to actual protocols from the accepted range of 0-255.
- **VLAN ID (1- 4096)**—Enter the VLAN ID for the flow. The VLAN ID determines, which VLAN the packet belongs to. Cisco Security Manager validates the ID range to be between 1 and 4096.

**Note**

Beginning with Version 4.13, Cisco Security Manager Packet tracer supports the transparent FW devices. Vlan ID is the new parameters introduced in Version 4.13 to support the packet tracer on devices 9.7.1 onwards.

- **Destination MAC**—Enter the destination MAC address for the flow. Cisco Security Manager validates the MAC address for its format.
- **Enter the SPI (ESP only)**—Enter the security parameter index. It is the arbitrary value used (together with the destination IP address) to identify the security association of the receiving party. Enter a numeric value between 0 and 4294967295.

**Step 4** From the **Tracing Packet** drop-down list, select the relevant option:

- **bypass-checks**—bypasses all security checks for the simulated packet
- **decrypted**—treats simulated packet as IPsec/SSL VPN decrypted
- **persist**—enables long term tracing and follow tracing in cluster
- **transmit**—allows simulated packet to be transmitted from device

**Step 5** If you want to see the progress of the trace while it is happening, select **Show animation**. Otherwise, the window is not updated with the results until the trace is completed.

**Step 6** Click **Start** to trace the packet.

The policies are examined, and the bottom of the window shows the results in two forms: graphical and detailed information. The graphical view summarizes the phases evaluated in the packet's path. Checkmarks indicate the packet passed the phase, a red X indicates the packet was dropped at that point.

The detailed information organizes the results in folders that correspond to the phases, with an Action column that indicates the results of the phase (checkmark for passed, red X for dropped). To open a folder, click its heading. Detailed information can include the specific configuration commands evaluated and the data derived from **show** commands. The final folder, named Result, summarizes the results of the trace.

**Tips:**

- If the packet is allowed or denied by an explicit access rule, then you can jump to that rule. Select the Access-List folder to open it, then click the **Show access rule** link at the top of the section. You are taken to the Access Rule policy with the rule highlighted; you can edit the rule as desired. If a packet is dropped due to an implicit drop rule, the Show access rule link is not available because the rule does not exist in the policy table.
- If the device is shut down or not reachable due to a network failure during the analysis, an error message stating "Device Connectivity is Failed" appears.
- If you start a new trace, the information shown is cleared automatically. However, you can clear it yourself by clicking **Clear**.

## Analyzing Connectivity Issues Using the Ping, Trace Route, or NS Lookup Tools

You can use the Ping or Trace Route tools to investigate and troubleshoot your network configuration and connectivity. You typically run these commands in the device, from within Security Manager by specifying specific launch points and parameters. This causes Security Manager to generate the corresponding command. NS Lookup, on the other hand, is typically run from the Security Manager client.

**Note**

Beginning with Version 4.13, Cisco Security Manager trace routes supports IPv6 address. From ASA version 9.7.1, traceroute for IPv6 address is supported.

**Table 72-7 Profiles of the Ping, Trace Route, and NS Lookup Troubleshooting Commands**

| Tool               | Profile                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ping</b>        | Use Ping to test whether a particular host is reachable across an IP network and to measure the round-trip time for packets sent from the local host to a destination computer. This can include measuring the local host's own interfaces using ICMP messages.<br><br>See <a href="#">Analyzing Configuration Using Ping, page 72-27</a> for details on using this tool. |
| <b>Trace Route</b> | Use trace route to show the route taken by packets across an IP network. The system returns the number of hops taken and the addresses of each device traversed.<br><br>See <a href="#">Analyzing Configuration Using TraceRoute, page 72-29</a> for details on using this tool.                                                                                          |
| <b>NS Lookup</b>   | Use NS lookup (namespace lookup) to issue an NS lookup command from a device so you can test the contents of the DNS server that the queried device uses.<br><br>See <a href="#">Analyzing Configuration Using NS Lookup, page 72-30</a> for details on using this tool.                                                                                                  |

**Applicability**

The Ping tool is applicable on the following devices: ASA (7.0 – 8.3), PIX [6.3(1-5) to 8.0(2-4)], FWSM [2.2(1) – 4.1(1)], all IOS. It is not applicable to IPS.

The Trace Route tool is applicable on the following devices: ASA [7.2(1) and onward], PIX [6.3(1-5) to 8.0(2-4)], and all IOS. It is not applicable to FWSM nor IPS.

The NS Lookup tool is not supported in any of the devices managed by Cisco Security Manager; rather, you run it from the Cisco Security Manager client using the Windows API.

## Analyzing Configuration Using Ping

The ping tool, by default uses the ICMP echo request and echo reply messages to test reachability to a remote system. You can also choose to employ TCP to ping. In its simplest form, ping simply confirms that an IP packet is capable of getting to and getting back from a destination IP address. A ping is sent to an IP address and it returns a reply. This process enables network devices to discover, identify, and test each other. From within Security Manager, you can designate both the network device from which to issue the ping command, and the target of the echo request. This tool generally returns two pieces of information: whether the source can reach the destination (and, by inference, vice versa), and the round-trip time (RTT, typically in milliseconds).

You can use the Ping diagnostic tool in a variety of ways, including:

- **Pinging to a security appliance**—Ping an interface on another security appliance to verify that it is up and responding.
- **Loopback testing of two interfaces**—Initiate a ping from one interface to another on the same security appliance, as an external loopback test to verify basic “up” status and operation of each interface.

- **Pinging through a security appliance**—Ping packets originating from the Ping tool may pass through an intermediate security appliance on their way to a device. The echo packets also pass through two of its interfaces as they return. You can use this to perform a basic test of the interfaces, operation, and response time of the intermediate unit.
- **Pinging to test intermediate communications**—Initiate a ping from a security appliance interface to a network device that is known to be functioning correctly and returning echo requests. If you receive the echo, you confirm physical connectivity and the correct operation of any intermediate devices.

**Tip**

From within the Event Manager, you can right-click on an event to open the Ping Tool and ping the associated device.

**Step 1** In Device view, select **Tools > Ping, TraceRoute and NS Lookup . . .**

The Ping, TraceRoute and NS Lookup dialog box appears.

**Step 2** From the device selector, select the device from which to issue the **Ping** command.

The selected device is listed in the top right of the dialog box.

**Note**

To employ TCP for the ping, select TCP for the Packet Type. (The default packet type is ICMP)

**Step 3** In Hostname/IPv4address, enter the IP address of the host network/host policy object to be pinged.

Alternatively, click **Select** to choose a host network/host object that defines the host network/host policy object to be pinged.

**Step 4** Enter a timeout value. [Optional]

**Step 5** Click **Ping**.

The results are displayed in the lower window area.

Example Ping output:

```
Sending 5, 100-byte ICMP Echos to out-pc, timeout is 2 seconds:
```

```
!!!!!
```

```
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

Example Ping unsuccessful output:

```
Sending 5, 100-byte ICMP Echos to 10.132.80.101, timeout is 2 seconds:
```

```
?????
```

```
Success rate is 0 percent (0/5)
```

You can click **Clear Output** to remove the previous response from the Ping output area.

For additional details on the **ping** command, see [Troubleshooting TCP/IP](#) on Cisco.com.

## Analyzing Configuration Using TraceRoute

The Traceroute tool helps you to determine the route that packets will take to their destination. The tool prints the result of each probe sent. Every line of output corresponds to a TTL value in increasing order.

Traceroute can return useful information about TCP/IP connectivity across your network. The following table shows some of the codes that can be returned by the Traceroute utility, along with their possible cause.

**Table 72-8** Traceroute Output Symbols

| Output Symbol | Description                                                                              |
|---------------|------------------------------------------------------------------------------------------|
| *             | No response was received for the probe within the timeout period.                        |
| nn msec       | For each node, the round-trip time (in milliseconds) for the specified number of probes. |
| !N.           | ICMP network unreachable.                                                                |
| !H            | ICMP host unreachable.                                                                   |
| !P            | ICMP unreachable.                                                                        |
| !A            | ICMP administratively prohibited.                                                        |
| ?             | Unknown ICMP error.                                                                      |

**Step 1** In Device view, select **Tools > Ping, TraceRoute and NS Lookup . . .**

The Ping, TraceRoute and NS Lookup dialog box appears.

**Tip** From within the Event Manager, you can right-click on an event to open the TraceRoute page and trace the route of the associated device.

**Step 2** Select the **Trace Route** tab.

The Trace Route page appears.

**Step 3** From the device selector, select the host from which the route is traced.

**Step 4** Enter the **IP Address/Hostname** to specify the address or name of the host to which the route is traced. Alternatively, click **Select** to choose a host network/host object that defines the IP address.

**Note** Beginning with Version 4.13, Cisco Security Manager trace routes supports IPv6 address. Till Version 4.12, the Syslog server was configured with Devices having IPv4 address. From Device version 9.7.1, traceroute for IPv6 address is supported. The Syslog server can be configured with IPv6 syslog address with devices having IPv6 addresses.

**Step 5** Specify values, as required, for the following:

**Table 72-9** Traceroute Fields

| Field                     | Description                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Timeout</b> [optional] | The amount of time, in seconds, to wait for a response before the connection times out. The default is three seconds. |

**Table 72-9 Traceroute Fields (continued)**

| Field                    | Description                                                                |
|--------------------------|----------------------------------------------------------------------------|
| Port[optional]           | The destination port used by the UDP probe messages. The default is 33434. |
| Probes per hop[optional] | The number of probes to be sent at each TTL level. The default is three.   |
| TTL Min[optional]        | The minimum TTL value for the first probes. (Default is 1.)                |
| TTL Max[optional]        | The maximum TTL value for the first probes.(Default is 30.)                |

**Step 6** If desired, select **Specify Source Interface or IP Address**, and then do one of the following:

- Select a source **Interface** from the drop-down list

**Note** If an IPv6 address is specified in the **IP Address/ Hostname** field, the source **Interface** field is not applicable.

- Enter an **IP Address**

**Step 7** If desired, select **Reverse Resolve** to reverse between displaying the address or hostname.

**Step 8** If desired, select **ICMP** to use that protocol rather than IP.

**Step 9** Click **Trace**.

The traceroute terminates when the packet reaches the destination or when the TTL Max value is reached. The hops taken and the device address corresponding to each hop are displayed.

## Analyzing Configuration Using NS Lookup

You use the NS Lookup tool to look up a remote host address when you have the hostname, or to look up the hostname when you have the address.

Unlike the Ping and Traceroute tools, NS Lookup is done on the Security Manager client.

**Step 1** In Device view, select **Tools > Ping, TraceRoute and NS Lookup . . .**

The Ping, TraceRoute and NS Lookup dialog box appears.

**Step 2** Select the **NS Lookup** tab.

**Step 3** Enter an address or hostname in IPv4Address/Hostname.

Alternatively, click **Select** to choose a host network/host object that defines the IP address.

**Step 4** Optionally, to employ a particular DNS server in the lookup, enter the server's name or address in DNS Server.

**Step 5** Click **Lookup**.

The system displays the particular address/hostname pair, as well as the DNS server used in the lookup.

# Using the Packet Capture Wizard

You can use the Packet Capture Wizard to configure, run, view, and save captures for troubleshooting errors. The captures can be run using preconfigured access lists or using match criteria of packet parameters such as source and destination addresses/ports on one or more interfaces. The wizard runs one capture on each of the ingress and egress interfaces. You can save the captures on the Cisco Security Manager client computer to examine them using a packet analyzer.

The Packet Capture Wizard also supports packet captures on ASA clusters. If you run the Packet Capture Wizard on the director unit of an ASA cluster, you are given the option of capturing data for just the selected device or all devices in the cluster. After running the capture for a cluster, you can view summary information for the cluster and also view or download capture buffers for specific devices in the cluster.

**Note**

If the director has changed, it should be updated in Security Manager before running the Packet Capture Wizard. If not, capture for cluster members will contain errors. You can update the director for a cluster using the **Retrieve From Device** button on the **Device Properties > Cluster Information** page. For more information, see [Cluster Information Page, page 3-51](#).

The captures can be run using pre-configured access-lists or using match criteria of packet parameters such as source, destination address/port on one or more interfaces.

Please note the following:

- You can only use the Packet Capture Wizard on firewall devices (PIX, ASA, or FWSM).
- Packet capture based on packet match criteria is only supported on devices running ASA version 7.2(3) or later. For other devices, packet capture can only be performed based on access-lists.

To use the Packet Capture Wizard:

- 
- Step 1** Launch the Packet Capture Wizard using one of the following methods:
- Select **Tools > Packet Capture Wizard**.
  - (Device view) Right-click on an ASA, PIX, or FWSM device and select **Packet Capture** on the shortcut menu. Proceed to [Step 3](#).
  - (Event Viewer) Right-click on an event from an ASA, PIX, or FWSM device and select **Packet Capture** on the shortcut menu. Proceed to [Step 3](#).
- Step 2** If you launched the Packet Capture Wizard from the Tools menu, select the device on which you want to capture packets. The Security Devices list contains only devices on which packet capture can be run.
- Step 3** If you selected a device that is the director unit of an ASA cluster, specify whether to run the capture for the selected device only or for the entire cluster, and then click **Next**.
- Step 4** Select the ingress interface from the drop-down list.

**Note**

You cannot select the same interface as ingress and egress in the same wizard.

**Step 5** Select the **Capture control packets on cluster interface** check box to capture the cluster control plane packets sent by the interface.

**Note** This optional field is introduced in Cisco Security Manager 4.19 for ASA 9.12.1 and later devices, to capture only cluster control plane packets. This information is useful to troubleshoot issues on cluster especially in multi-context mode.

**Step 6** In the Packet Match Criteria area, do one of the following:

- To specify the access list to use for matching packets, select the **Access-List** radio button, and then choose the access list from the drop-down list.
- To specify packet parameters, select the **Packet Parameters** radio button and complete the following fields:
  - Specify the source and destination in the Source Host / Network and Destination Host / Network fields, respectively. You can use any of the following to specify the source or destination:
    - Source Host/ Network object. Enter the name of the object or click **Select** to select it from a list. You can also create new network/host objects from the selection list.

**Note** Starting from Cisco Security Manager 4.18, the packet parameters are supported with All-Address (any), All-IPv4-Address(any4), and All-IPv6-Address(any6).

- Host IP address, for example, 10.10.10.100.
- Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.
- Choose the protocol type to capture from the drop-down list. Available protocol types to capture are ah, eigrp, esp, gre, icmp, icmp6, igmp, igrp, ip, ipinip, nos, ospf, pcp, pim, snp, tcp, or udp.

If the protocol is ICMP, select the ICMP type from the drop-down list. Available types include ALL, alternate-address, conversion-error, echo, echo-reply, information-reply, information-request, mask-reply, mask-request, mobile-redirect, parameter-problem, redirect, router-advertisement, router-solicitation, source-quench, time-exceeded, timestamp-reply, timestamp-request, traceroute, or unreachable.

If the protocol is TCP or UDP, specify the source and destination port services. Available options include the following:

- To include all services, choose All Services.
- To indicate specific services, choose an appropriate operator from the drop-down list (=, !=, >, <, or range) and then select one of the following: aol, bgp, chargen, cifs, citrix-ica, ctiqbe, daytime, discard, domain, echo, exec, finger, ftp, ftp-data, gopher, h323, hostname, http, https, ident, imap4, irc, kerberos, klogin, kshell, ldap, ldaps, login, lotusnotes, lpd, netbios-ssn, nfs, nntp, pcanewhere-data, pim-auto-rp, pop2, pop3, pptp, rsh, rtsp, sip, smtp, sqlnet, ssh, sunrpc, tacacs, talk, telnet, uucp, whois, or www. The >, <, and range operators function based on the port number assigned to the selected service.

When using the range operator, a second drop-down list is enabled. Use the two drop-down lists to select the starting and ending services in the range you want to specify. The service with the lower corresponding port number should be selected in the first drop-down list, and the service with higher corresponding port number should be selected in the second drop-down list.

**Step 7** Click **Next** to proceed to the Select egress interface step.

**Step 8** Select the egress interface from the drop-down list.

---

**Note** You cannot select the same interface as ingress and egress in the same wizard.

---

**Step 9** Select the **Capture control packets on cluster interface** check box to capture the cluster control plane packets sent by the interface.

---

**Note** This optional field is introduced in Cisco Security Manager 4.19 for ASA 9.12.1 and later devices, to capture only cluster control plane packets. This information is useful to troubleshoot issues on cluster especially in multi-context mode.

---

**Step 10** In the Packet Match Criteria area, do one of the following:

---

**Note** The Packet Match Criteria option (Access-list or Packet Parameters) you selected for the ingress interface will also be used for the egress interface. Also, if you used packet parameters for matching on the ingress interface, the protocol definition you used will also be used for the egress interface.

---

- If you are using an access list to match packets, choose the access list from the drop-down list.
- If you are using packet parameters to match packets, the parameters used for ingress are also used for egress.

**Step 11** Click **Next** to proceed to the Set buffer parameters step.

**Step 12** Specify the buffer parameters by configuring the following fields:

In the Buffer Parameters area, you specify the buffer size and packet size. The buffer size is the maximum amount of memory that the capture can use to store packets. The packet size is the longest packet that the capture can hold. We recommend that you use the longest packet size to capture as much information as possible.

- **Read capture buffer every 10 seconds**—Select this option to automatically retrieve captured data every 10 seconds. You must use the circular buffer when selecting this option.
- **Use a circular buffer**—Select this option to continue capturing packets after the buffer is full. When you choose this setting, if all the buffer storage is used, the capture starts overwriting the oldest packets.
- **Buffer Size**—Enter the number of bytes (between 1534 and 33554432) that the capture can use to store packets.
- **Maximum Packet Size**—Enter the number of bytes (between 14 and 1522) that the capture can use to store a single packet. Use the largest value, 1522, to capture as much information as possible.

**Step 13** Click **Next** to proceed to the Summary step, which shows the traffic selectors and buffer parameters that you have entered.

**Step 14** Click **Next** to proceed to the Run, View & Save step.

**Step 15** From the Run, View & Save step, you can do the following:

- Click **Start Capture** to begin capturing packets.
- Click **Stop Capture** to stop capturing packets.
- To fetch the next set of captured packets, do one of the following:

- For individual devices, click **Display Capture Packets** to fetch the next set of captured packets from the device and update the buffer status bar. This button is only enabled if the Read capture buffer every 10 seconds option was not selected during the Set buffer parameters step.
- For clusters, click **Get Cluster Capture Summary** to fetch the next set of captured packets from the devices in the cluster and update the buffer status bar. This button is only enabled if the Read capture buffer every 10 seconds option was not selected during the Set buffer parameters step.
- When running a capture for an ASA cluster, the following options are available for working with the capture buffers of the devices in the cluster:
  - To view the captured packets from a device in the cluster, select the device in the Device Name list under Get Capture Buffer, and then click **Get Capture Buffer**.  
The capture information for the selected device is displayed. Refer to the other options in this list for the actions you can perform on this data.
  - To remove the capture content for a specific device or all devices in the cluster and allow room in the buffer to capture more packets, select the device or **--All--** in the Device Name field under Clear Capture Buffer, and then click **Clear Capture Buffer**.

---

**Note** We recommend saving captures prior to clearing the device buffers. If you do not save captures prior to clearing the device buffers, captured data will be lost.

---

- Click the **Launch Network Sniffer** button above the Ingress Capture window or the Egress Capture window to view the corresponding ingress or egress capture using an external packet analyzer tool. You must have a packet analyzer installed and associated with \*.pcap file extension.
- Click **View Data in Larger Window** to view the packet capture data side-by-side in a larger window.
- Click **Save captures** to display the Save Capture dialog box. Choose the format in which you want to include the captures: ASCII or PCAP. You have the option of saving either the ingress capture or the egress capture.
- Click **Clear Device Buffer** to remove the current content and allow room in the buffer to capture more packets.

---

**Note** We recommend saving captures prior to clearing the device buffers. If you do not save captures prior to clearing the device buffers, captured data will be lost.

---

- Click **Refresh Capture Buffers** to fetch the next set of captured packets for a device in a cluster and update the buffer status bar.

**Step 16** Click **Finish** to exit the wizard.

---

## IP Intelligence

Network security devices managed by Cisco Security Manager generate large amounts of security logs and security events containing the IP address information of the attacker or victim machines or both.

Useful details about an IP address, collectively referred to as IP intelligence, can be discovered by using tools such as ping, trace route, and NS lookup. Often, however, it is desirable to augment these somewhat rudimentary tools with more advanced tools.

Beginning with Version 4.5, Security Manager provides advanced tools that furnish critical details about an IP address in real time or in generated reports. These critical details are provided by Security Manager in the following categories:

- Reverse DNS (FQDN) Lookup Service
- GeoIP Lookup Service
- Whois Lookup Service

**Note**

IP intelligence for IPv6 addresses is not supported.

These IP intelligence categories are described in the following table:

**Table 72-10 IP Intelligence Categories**

| IP Lookup Provider                | Information Source                     | Real Time or Manual/Limitations                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reverse DNS (FQDN) Lookup Service | DNS servers                            | Real time<br><b>Note</b> External DNS configuration is an additional option that you can configure, but you will need to evaluate your individual situation.                                                                                                                                                                                             |
| GeoIP Lookup Service              | External third-party commercial vendor | Real time, till Cisco Security Manager version 4.18.<br>GeoIP Lookup Service upgraded their database to GeoIP2; Cisco Security Manager is yet to upgrade. Hence, the auto update of GeoIP for the previous versions of Cisco Security Manager and the default GeoIP package in Cisco Security Manager 4.19 will only have the database of December 2018. |

**Table 72-10 IP Intelligence Categories (continued)**

|                      |                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Whois Lookup Service | Provided by free whois server, a third-party web server. | <p>Real time</p> <p>Limitations:</p> <ul style="list-style-type: none"> <li>Whois is a query and response protocol that is widely used for querying databases that store the registered users or assignees of an Internet resource, such as a domain name, an IP address block, or an autonomous system. There are five regional internet registry (RIR) organizations that manage the allocation and registration of IP addresses.</li> <li>ARIN (American Registry for Internet Numbers), RIPE (Réseaux IP Européens Network Coordination Centre), and APNIC (Asia-Pacific Network Information Centre) are the 3 RIR's that Security Manager will use to query directly; they also provide the referred URL. For RIPE and APNIC, if there is any parsing error, only the direct URL link will be shown.</li> <li>Clicking on the provided URL will display the details for the given IP address in web browsers. If an IP address belongs to LACNIC ( Latin America and Caribbean Network Information Centre) or AfriNIC (African Network Information Centre) , the web browser will display the homepage of the respective RIR.</li> <li>In some cases (such as dns query getting blocked by windows firewall or invalid proxy has configured in the cco settings page) , Whois may not work even though it is enabled. In such scenario as a "Fail-safe" method it will provide only the referred url.</li> </ul> |
|----------------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Before you begin looking up IP intelligence, you must enable the necessary services at **Configuration Manager > Tools > Security Manager Administration... > IP Intelligence Settings**. Refer to [IP Intelligence Settings Page, page 11-41](#).

IP intelligence lookup can be done by using any of the following methods:

- Use the IP Intelligence dialog box: Navigate to **Configuration Manager > Tools > IP Intelligence...** and then enter a valid IPv4 address in the search field of the IP Intelligence dialog box that pops up. (You must press **Enter** after typing the IP address.)
- Use "Quick Launch" by mousing over (hovering over) a valid IPv4 address in the Security Manager interface. You can do this in Event Viewer, for example; in general, you can do this in all GUI tables in which an IP address is part of the data displayed. If more than one IP address is displayed in one cell of a GUI table, only the first IP address is displayed.

---

**Note** You may experience a second or two of latency with Quick Launch before you see the "IP Intelligence" option in the GUI.

---

---

**Note** You can enable or disable Quick Launch by selecting or clearing the "Enable Quick Launch" check box in the IP Intelligence dialog box at **Configuration Manager > Tools > IP Intelligence...**

---

- Use the IP Intelligence widget in the Dashboard (**Launch > Dashboard...**). This method is equivalent to using the IP Intelligence dialog box described above.
- Use Report Manager (**Launch > Report Manager...**) to see IP intelligence in any of the following reports:
  - **FW/Summary Botnet**—Top Infected Hosts
  - **FW/Summary Botnet**—Top Malware Sites
  - **FW**—Top Destinations
  - **FW**—Top Sources
  - **IPS**—Target Analysis
  - **IPS**—Top Attackers
  - **IPS**—Top Victims

---

**Note** There are several points to note about these reports: 1) They will not contain Whois information. 2) If you have disabled all the providers at **Configuration Manager > Tools > Security Manager Administration... > IP Intelligence Settings**, then none of the IP intelligence-related columns will be displayed in the report. 3) If you enable *all* the services, only the reverse dns (FQDN) and GeoIP details will be displayed in the report. 4) If you enable only *one* service, then that service only will be displayed in the report.

---

---

**Note** The generated report in both PDF and CSV formats will contain the IP intelligence details.

---

---

**Note** All these reports require the necessary services to be enabled. Refer to [IP Intelligence Settings Page, page 11-41](#).

## Integrating CS-MARS and Security Manager

While Cisco Security Manager lets you centrally manage security policies and device settings in your network, the Cisco Security Monitoring, Analysis and Response System (CS-MARS) is a separate application that monitors devices and collects event information, including syslog messages and NetFlow traffic records, with much more extensive network monitoring capabilities than Security Manager. CS-MARS aggregates and presents massive amounts of network and security data in an easy-to-use format. Based on information derived from CS-MARS reports, you can edit device policies in Security Manager to counter security threats.

Specifically, if you use Security Manager to configure firewall access rules and IPS signatures, you can configure CS-MARS to collect information related to those policies and make it available to Security Manager users. By registering the CS-MARS servers with Security Manager, users can navigate directly from a specific access rule or IPS signature to a CS-MARS report window, pre-populated with query criteria for that rule or signature.

Similarly, CS-MARS users can view the Security Manager policies related to specific CS-MARS events. This bi-directional mapping of specific events to the policies that triggered them, combined with the ability to immediately modify the policies, can dramatically reduce the time spent configuring and troubleshooting large or complex networks.

To enable this cross-communication, you must register your CS-MARS servers with Security Manager, and register your Security Manager server with the CS-MARS servers. You must also register the specific devices with each application. Then, when working with firewall access rules or IPS signatures for a device, a Security Manager user can quickly view real-time and historical event information related to that rule or signature.

The following sections explain how to enable and use CS-MARS and Security Manager cross-communication:

- [Checklist for Integrating CS-MARS with Security Manager, page 72-38](#)
- [Looking Up CS-MARS Events for a Security Manager Policy, page 72-43](#)
- [Looking Up a Security Manager Policy from a CS-MARS Event, page 72-47](#)

## Checklist for Integrating CS-MARS with Security Manager

To enable the cross-communication between CS-MARS and Security Manager (as described in [Integrating CS-MARS and Security Manager, page 72-37](#)), you must identify the applications to each other and ensure that devices managed by both applications are configured appropriately. The following table describes the integration steps.

If you have problems with cross-communications, see [Troubleshooting Tips for CS-MARS Querying, page 72-42](#).

**Table 72-11 Integrating CS-MARS and Security Manager**

| Task                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Configuring the Security Manager Server to Respond to CS-MARS Policy Queries**

CS-MARS must be allowed access to the Security Manager server so that it can perform policy lookup queries and obtain policy information.

- If you are using Common Services AAA authentication on the server (for example, Cisco Secure ACS), you must update the administrative access settings to ensure that CS-MARS has the necessary client access to the Security Manager server.

- Define a user account in Security Manager that CS-MARS can use to perform queries. A separate account is recommended to provide a specific audit trail on the Security Manager server. This account must be assigned one of the following Common Services roles:
  - Approver
  - Network Operator
  - Network Administrator
  - System Administrator

Users with the Help Desk security level can only view the policy look-up table in CS-MARS; that is, they cannot cross-launch Security Manager to modify policies.

**Note**

When you register a Security Manager server with CS-MARS, if you choose to prompt for Security Manager credentials for policy table look-up, a separate CS-MARS account in Common Services for authentication purposes might not be necessary.

For more information on adding users and associating roles with them in Common Services, see the *User Guide for CiscoWorks Common Services*.

- [Registering CS-MARS Servers in Security Manager, page 72-40](#)
- [Discovering or Changing the CS-MARS Controllers for a Device, page 72-41](#)

## Registering CS-MARS Servers in Security Manager

As described in [Checklist for Integrating CS-MARS with Security Manager, page 72-38](#), you must register your CS-MARS controllers with Security Manager to enable cross-communication between the applications if you intend to use the applications together.

Then, when a user looks up events for a device, Security Manager identifies the CS-MARS controller that is collecting events for that device. If more than one CS-MARS controller is collecting events for a device, the user can select which to use. You can also specify the correct CS-MARS controller to use in the Device Properties window for each device. (See [Discovering or Changing the CS-MARS Controllers for a Device, page 72-41](#) for more information.)

**Note**

For information about the CS-MARS versions explicitly supported by Security Manager, see the [Release Notes for Cisco Security Manager](#) for this version of the product. If you do try to use a version that is not explicitly supported, you cannot use CS-MARS versions earlier than 4.3.4 or 5.3.4.

- 
- Step 1** Choose **Tools > Security Manager Administration** and select **CS-MARS** in the table of contents to display the [CS-MARS Page, page 11-7](#).
  - Step 2** Click the **Add** button to add a CS-MARS server. The New CS-MARS Device dialog box opens (see [New or Edit CS-MARS Device Dialog Box, page 11-8](#) for detailed information).
  - Step 3** In the New CS-MARS Device dialog box, enter the IP address or fully qualified DNS host name of the server, and a user name and password for logging into the server. If you add a local controller, the user name you enter can be either a local account or a global account. Choose the type of account from the User Type list.

**Tip**

If you are using CS-MARS Global Controllers, add them instead of individual Local Controllers. By adding Global Controllers, Security Manager can identify the correct Local Controller for a device, without you having to add each Local Controller. When you add a Global Controller, do not add the individual Local Controllers monitored by the Global Controller.

Click **Retrieve From Device** to get the server's authentication certificate. Click **Accept** when the certificate is presented to you.

Click **OK** when finished. The New CS-MARS Device dialog box closes and the server is added to the CS-MARS device list.

**Step 4** From the **When Launching CS-MARS** list, choose whether you want users to be prompted to log in to the CS-MARS server when they request event status, or whether Security Manager should automatically log in to CS-MARS using the credentials provided when the user logged in to Security Manager.

If you elect to use Security Manager credentials, the necessary user accounts must be configured in CS-MARS. Refer to the CS-MARS documentation for more information.

**Step 5** Click **Save** on the CS-MARS page to save your changes.

## Discovering or Changing the CS-MARS Controllers for a Device

If you use the Cisco Security Monitoring, Analysis and Response System (CS-MARS) controllers to monitor devices, you can register them in Security Manager and then view syslogs and events that are related to firewall access or IPS signature rules for individual devices.

Security Manager can automatically discover the CS-MARS controllers that monitor a device when you try to view events related to a rule. If more than one controller monitors a device, you are prompted to select which controller to use.

You can also proactively select the CS-MARS controller for a device in its Device Properties window. Similarly, if you ever need to change the CS-MARS controller assigned to a device, you can change the selection in its Device Properties window. This procedure explains how to discover or change the CS-MARS controller for a device from its Device Properties window.

### Before You Begin

The CS-MARS controller that monitors the device must already be registered with Security Manager on the CS-MARS administration page (**Tools > Security Manager Administration > CS-MARS**). For more information, see [Registering CS-MARS Servers in Security Manager, page 72-40](#).

**Step 1** In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.
- Right-click a device and choose **Device Properties**.
- Select a device and choose **Tools > Device Properties**.

**Step 2** Click **General** in the table of contents to open the General properties page (see [Device Properties: General Page, page 3-42](#)).

- Step 3** In the CS-MARS Monitoring group, click **Discover CS-MARS**. Security Manager determines which registered controller is monitoring the device, if any. If there are more than one, you are prompted to select which CS-MARS controller to use.
- 

## Troubleshooting Tips for CS-MARS Querying

Use the following troubleshooting tips to help you identify and resolve problems you might encounter when using CS-MARS and Security Manager together:

- HTTPS is required for communication between the Security Manager server and CS-MARS.
- Interface names are not case-sensitive in Security Manager, but they are in CS-MARS. For example, “outside” and “Outside” are considered exclusive by a CS-MARS appliance, while they are equivalent in Security Manager. Further, syslog messages use lower case for all interface names. As a result, when you perform a query for a Security Manager policy from an event generated in CS-MARS, the interface name logged in the syslog event might not match the interface name in that policy in Security Manager. To avoid this problem, use lower case for all interface names, and in the definition of interface roles, in CS-MARS.
- To query for CS-MARS events from Security Manager policies, the Security Manager client must be on the same side of a network address translation (NAT) boundary as the CS-MARS appliance and the Security Manager server.

Similarly, when the CS-MARS client is not on the same side of a NAT boundary as the CS-MARS appliance and the Security Manager server, you can look up Security Manager policies, but in read-only mode. However, you cannot start the Security Manager client from the read-only policy look-up table. The Security Manager client must be on the same side of the NAT boundary as the CS-MARS appliance and the Security Manager server if you want to start the client from CS-MARS to modify a matching policy.

- For FWSM, PIX and ASA devices on which multiple independent security contexts exist, to query for CS-MARS events, you must define a unique management IP address in Security Manager for each security context. Also, the host name and reporting IP address for each virtual context must be configured before adding it to CS-MARS. Otherwise, event look-up from policies on these contexts fails.
- For all IPS device and service policies, a default signature policy is assigned to the device when you do not discover IPS policies, or when you remove the configured policies from the device. If you try to perform event look-up from the default signature, a “Policy not found” error message is displayed. However, if you edit the default signature and save it, you can then navigate to events in CS-MARS.
- If object grouping or rule optimization is enabled for an access rule defined in Security Manager and the associated access-list commands on the device do not match the optimized rules, no events are displayed in CS-MARS.
- If logging is not enabled for an access rule, a warning message is displayed, and you can only look up traffic-flow events for those rules.
- When supported by the device, Security Manager uses access-control entry (ACE) hashcodes as additional keywords when querying CS-MARS for syslog messages generated by an ACE, and large access-control lists (ACLs) might contain thousands of such hashcodes. If the number of keywords, or the sum of the number of sources, destinations, and protocols for an ACE or a signature exceeds the query limit of 150, an error message is displayed. The error message indicates the probable cause and recommended action.
- Problems with the synchronization between rules and reported events can occur in the following situations:

- The device has been added to Security Manager, but the configuration or changes to it have not been saved to the database. This is especially true for access rules that have been changed but not deployed since the device was added to CS-MARS.
- Access rules exist on the device for which there are no corresponding rules in Security Manager, and vice versa. Be sure all devices are added to Security Manager, and that access rules are configured on them using Security Manager.
- Traffic in the “wrong” direction triggering events for which there is no defined rule. For example, outbound traffic on a higher-security-level interface on which only inbound-traffic rules have been defined.
- If you perform a policy lookup from CS-MARS and the Security Manager client is active, the query is performed on all policies within the open activity or configuration session plus what is saved in the database (the committed configurations). If the Security Manager client is not active, only committed policies are considered.

## Looking Up CS-MARS Events for a Security Manager Policy

After you integrate CS-MARS and Security Manager, you can look up events in CS-MARS that relate to specific firewall access rules or IPS signatures.

When CS-MARS receives events, they are parsed, “sessionized,” written to an event buffer, and then written to the database. Sessionizing takes two forms: with a session-oriented protocol, such as TCP, the session encompasses the initial handshake to the connection tear-down; with a sessionless protocol, such as UDP, the session start and end times are based more on first and last packets tracked within a restricted time period—packets that fall outside of the time period are considered parts of other sessions.

Because there is a difference between newly-received and fully processed data, you can look up either real-time or historical events:

- **Real-time**—Because sessionization takes time, keeping an event in cache for up to two minutes, you can use the real-time event query to view events right after parsing, providing access to the most current data received.

When you query for real-time events, the query is run automatically, based on the policy values obtained from Security Manager, and the results are displayed in the CS-MARS Query Results window. This real-time event viewer lets you monitor CS-MARS traffic in near real-time, as raw events streaming to CS-MARS, before they are sessionized, with a maximum delay of five seconds. You also can elect to view the sessionized event stream by clicking Edit in the Query Results window and then choosing “Sessionized events” from the Realtime drop-down menu. Note that more delay is possible when there are many events in a session.

- **Historical**—Historical event reports help you identify trends over longer periods of time than is possible with real-time monitoring. When you query for historical events, the CS-MARS Query Criteria: Result window opens. You can either run the query immediately, or save the criteria as a “report” to run at a later time. For historical events, the Result Format is the All Matching Events option, and the Filter By Time value is set to the previous 10 minutes.

The following topics explain event lookup in more detail:

- [Viewing CS-MARS Events for an Access Rule, page 72-44](#)
- [Viewing CS-MARS Events for an IPS Signature, page 72-46](#)

## Viewing CS-MARS Events for an Access Rule

From the **Firewall > Access Rules** policy in Security Manager, you can select an access rule and view related event information in CS-MARS. You can view real-time or historical events matching the rule, the traffic flow, the source address, or the destination address. You can view events for any device that supports access rules, including ASA, PIX, FWSM, routers, and switches.

Firewall access rules are presented in the form of an ordered list or table. When deployed, this policy becomes an access-control list (ACL), with each entry in the list known as an access-control entry (ACE). (For more detailed information, see [Understanding Access Rules, page 16-1](#).)

When deciding whether to forward or drop a packet, a device tests the packet against each access rule in the ordered list. If you enable logging for an access rule, the results of the test are recorded according to your per-rule log settings. Some devices, such as ASA, generate log entries for denied access even if you do not configure logging explicitly. For information on creating access rules, including logging options, see [Configuring Access Rules, page 16-7](#).

You can query CS-MARS for real-time or historical events related to an access rule for the following types of traffic. To use the commands, right-click the rule and select them from the context menu.

- **Flow**—A traffic flow is defined by the rule's source and destination IP addresses, protocol, and ports. The reported flow events include connection set-up and tear-down. Logging need not be enabled for the access rule to record this information.

To view flow-related events, use the following right-click commands:

- **Show MARS Events > Realtime > Matching this Flow**—To view real-time query results in CS-MARS for events matching this traffic flow. You can change the query criteria in the CS-MARS window at any time, applying new parameters to alter the real-time results.
- **Show MARS Events > Historical > Matching this Flow**—Opens the historical query criteria page in CS-MARS with fields populated based on the selected rule's traffic flow. Edit the rule parameters and query criteria as desired, and click **Apply** to continue. Next, in the Query window, you can submit the query or save it for later submission and re-use.
- **Rule**—If logging is enabled for the rule (in the [Advanced and Edit Options Dialog Boxes, page 16-17](#)), the device sends syslog messages to CS-MARS to record the logged events (assuming CS-MARS monitors the device). This query includes the access-rule parameters, including available keyword information. Reported events do not include connection set-up and tear-down.

To view rule-related events, use the following right-click commands:

- **Show MARS Events > Realtime > Matching this Rule**—To view real-time query results in CS-MARS for events matching this rule (flow parameters plus keywords); results begin scrolling within five seconds. You can change the query criteria in the CS-MARS window at any time, applying new parameters to alter the real-time results.
- **Show MARS Events > Historical > Matching this Rule**—Opens the historical query criteria page in CS-MARS with fields populated based on the access rule (flow parameters plus keywords). Edit the rule parameters and query criteria as desired, and click **Apply** to continue. Next, in the Query window, you can submit the query, or save it for later submission and re-use.
- **Source or Destination**—If you right-click the Source or Destination cell in an access rule entry, you also can choose to view real-time or historical events matching the rule's source or destination IP address.

To view events for a source or destination address, right-click the address in the Source or Destination cell and choose one of the following commands (the specific command differs depending on the cell you select):

- **Show MARS Events > Realtime > Matching this Source/Destination**—To view real-time query results in CS-MARS for events with a matching source or destination address. You can change the query criteria in the CS-MARS window at any time, applying new parameters to alter the real-time results.
- **Show MARS Events > Historical > Matching this Source/Destination**—Opens the historical query criteria page in CS-MARS with fields populated based on the access rule's source or destination address. Edit the rule parameters and query criteria as desired, and click **Apply** to continue. Next, in the Query window, you can submit the query, or save it for later submission and re-use.

Security Manager provides the following information to CS-MARS as criteria for a traffic-flow or access-rule event queries:

- Device details—General information about the device, such as host name, domain name, management IP address, and display name.
- Source addresses—Source addresses of hosts and the network/host objects expanded to display the networks or collections of IP addresses.
- Destination addresses—Destination addresses of hosts and the network/host objects expanded to display the networks or collections of IP addresses.
- Service—Protocol and port information.
- Event Type—"Built/teardown/permitted IP connection" for permit rules and "Deny packet due to security policy" for deny rules.
- Keyword (rule events only, not provided for traffic-flow queries)—ACL name and ACE hashcode, if available, connected by the logical operator OR.

On Version 7.0 or later PIX and ASA devices, each access rule is assigned an MD5 hashcode, which is included in the syslogs generated by that rule. Large ACLs can include thousands of access rules. Used as query keywords, these hashcodes can help produce more-accurate event matches. If a device does not support hashcodes, a warning is displayed that query results might be inaccurate because of keyword ambiguity; you can proceed with the query, and then edit the query keyword list and resubmit.

#### Tips:

- You can query on only one access rule at a time.
- When NAT or PAT is configured on a security device, the source and destination addresses are mapped to pre-translation and post-translation addresses, respectively, and the translated addresses are used when Security Manager sends a query to CS-MARS. For inbound access rules, the destination address is considered the pre-translation address, and for outbound access rules, the source address is considered the post-translation address.
- If the device is monitored by multiple CS-MARS controllers, you are prompted to select the CS-MARS instance to be used.
- Depending on how credentials verification is set up on your system, you might be prompted to log into CS-MARS. For more information, see [Registering CS-MARS Servers in Security Manager](#), page 72-40.

## Viewing CS-MARS Events for an IPS Signature

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

When an IPS or IOS IPS device detects and reports a network intrusion by comparing incoming traffic to a configured signature, a syslog message is generated on the device. If the device is monitored by CS-MARS, an incident is generated in CS-MARS after the log associated with the signature is obtained from the device. Looking up the events associated with a specific signature lets you quickly identify attacks and tune your device configuration to minimize or prevent intrusions.

To view reported network intrusion events in CS-MARS, you can select one or more entries in the Signatures policy for a device in Security Manager and navigate to the CS-MARS Query page to view real-time and historical events.

When you look up real-time events for a signature, the query is run automatically and the results displayed in CS-MARS. However, when you look up historical events for a signature, the values sent by Security Manager to CS-MARS are used to populate the query fields. You can modify the query fields as desired, and then run the query, or save it for later use.

Security Manager provides the following signature information to CS-MARS as query criteria:

- **Device details**—General information about the device, such as host name, domain name, management IP address, and display name.
- **Keyword**—Signature ID, subsignature ID, and virtual sensor name, if applicable.  
For virtual sensors, the name of the sensor is included as a keyword criterion along with other device information and signature parameters.

### Related Topics

- [Looking Up CS-MARS Events for a Security Manager Policy, page 72-43](#)
- [Viewing CS-MARS Events for an Access Rule, page 72-44](#)

- 
- Step 1** (Device view) With an IPS or IOS IPS device selected, select **IPS > Signatures > Signatures** to display the [Signatures Page, page 39-4](#).
- Step 2** Right-click the desired entry in the signatures table, or select multiple entries before right-clicking one of them, and choose one of the following commands from the **Show MARS Events** menu:
- **Realtime**—To view real-time query results in CS-MARS for events matching this signature; results begin scrolling within five seconds. Use this option to view raw events as they stream to CS-MARS.  
You can change the query criteria in the CS-MARS Query Results window at any time, applying new parameters to alter the real-time results.
  - **Historical**—Opens the historical query criteria page in CS-MARS with fields populated based on the signature parameters. Edit the parameters and query criteria as desired, and click **Apply** to continue. Next, in the Query window, you can submit the query or save it for later submission and re-use. You can edit the query and save it as a report if you want to run it again later.

### Tips:

- If a signature is disabled, you are warned and asked if you want to proceed to event lookup.
  - If the device is monitored by multiple CS-MARS controllers, you are prompted to select the CS-MARS instance to be used.
  - Depending on how credentials verification is set up on your system, you might be prompted to log into CS-MARS. For more information, see [Registering CS-MARS Servers in Security Manager](#), page 72-40.
  - All custom signatures are categorized as “Unknown Device Event Type” events in CS-MARS.
  - A default signature is assigned to an IPS device if you elect not to discover IPS policies when adding the device to the Security Manager inventory, or when you remove configured IPS policies from the device. If you try to look up events from the default signature, a “Policy not found” error message is displayed. However, if you edit the default signature and save it, you can then query for related events in CS-MARS.
  - Events of type Packet Data and Context Data are not displayed in the query results because these events are not triggered by signature rules.
- 

## Looking Up a Security Manager Policy from a CS-MARS Event

The *User Guide for Cisco Security MARS Local and Global Controllers* contains detailed information about how to look up policies based on events shown in CS-MARS. The information includes extensive troubleshooting information to help resolve any problems you might have, plus a checklist of what you must configure in CS-MARS to enable the interaction.

The main reason you would want to perform policy lookup is to adjust a policy based on the events that it is generating. For example, an access rule might be dropping traffic that you actually want to allow. Because you are looking at the event, you know there is a policy that is causing the event, so with a few clicks, you can get from that event to the policy you need to reconfigure.

The general process for looking up a policy based on a device-generated event is as follows. Note that the Security Manager client must be installed on your system to perform policy lookup.

### Related Topics

- [Viewing CS-MARS Events for an Access Rule](#), page 72-44
  - [Viewing CS-MARS Events for an IPS Signature](#), page 72-46
- 

- Step 1** Find the event in CS-MARS in the Query Results or Incident Details pages.
- For more information on the syslog and NetFlow events you can use for querying access rules, see the following topics:
- [System Log Messages Supported for Policy Look-up](#), page 72-48
  - [NetFlow Event Reporting in CS-MARS](#), page 72-49
- Step 2** Click the Security Manager icon in the Reporting Device cell for the event. You might be prompted to log into Security Manager, based on how you configured CS-MARS.
- If more than one device in Security Manager matches the event characteristics, you are prompted to select a device.
- Step 3** Detailed information is obtained from Security Manager and presented based on whether the event is for an access rule or IPS signature:

- **Access rule**—The access rules are displayed in CS-MARS in a read-only window with the rule that matches the event highlighted.

If you decide to edit a rule, click the rule number, and you are taken to the rule in the Access Rule policy in the Security Manager client. You can then make your edits, save them, and then deploy configurations. Remember that your changes are not made to the device until you deploy them.

For more information on configuring access rules, see [Configuring Access Rules, page 16-7](#).

- **IPS Signature**—Signature details are displayed in CS-MARS in a read-only window.

To edit the signature, click **Edit Signature**, and you are taken to the signature in the Signatures policy, where you can make your changes. For more information, see [Editing Signature Parameters \(Tuning Signatures\), page 39-23](#).

If you decide you want to instead remove specific actions from an event, or remove the event entirely, and prevent further processing by the sensor, click **Add Filter**. This opens the Add Event Filter dialog box in Security Manager, where you can configure an event filter. For more information, see [Filter Item Dialog Box, page 40-9](#).

As with access rules, your changes do not take effect until you deploy the new configuration.

## System Log Messages Supported for Policy Look-up

When you configure access rules on security appliances and IOS devices, you can configure logging options in the [Advanced and Edit Options Dialog Boxes, page 16-17](#) that generate system log (syslog) messages. On devices with multiple contexts, each security context includes its own logging configuration and generates its own messages. If Security Manager is configured to interoperate with CS-MARS, these messages are reported to CS-MARS and you can query for the reported information on a per-rule basis.

For additional information about each of these message IDs, see the System Message Guide of the relevant product documentation.

### Security-appliance messages

Security-appliance syslog messages begin with a percent sign (%) and are structured as follows:

```
%{ASA | PIX | FWSM}-Level-Message_number: Message_text
```

For example:

```
%ASA-2-302013: Built outbound TCP connection 42210
for outside:9.1.154.12/23 (9.1.154.12/23) to inside:2.168.154.12/4402
(192.168.154.12/4402)
```

Note that additional information, such as date and timestamp, precedes these messages. The specific additional information depends on the type of device.

A unique six-digit number identifies each message (302013 in the preceding example). The following security-appliance syslog message IDs are supported for Security Manager-to-CS-MARS queries. If you change the logging level of a security appliance, be sure these messages are generated at the new level.

| Message ID | Message                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 106023     | An IP packet was denied by the access rule. This message is recorded even if logging is not enabled for the rule; this is the Default Logging option. |

|        |                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 106100 | An IP packet was permitted or denied by the access rule. Additional information is provided, based on the logging level defined for the rule in the <a href="#">Advanced and Edit Options Dialog Boxes, page 16-17</a> . |
| 302013 | A TCP connection between two hosts was created.                                                                                                                                                                          |
| 302014 | A TCP connection between two hosts was torn down.                                                                                                                                                                        |
| 302015 | A UDP connection between two hosts was created.                                                                                                                                                                          |
| 302016 | A UDP connection between two hosts was torn down.                                                                                                                                                                        |
| 302020 | A ICMP connection between two hosts was created.                                                                                                                                                                         |
| 302021 | A ICMP connection between two hosts was torn down.                                                                                                                                                                       |

### Router messages

On Cisco IOS routers, syslog messages are also generated for access rules. The first packet that triggers the access list causes an immediate logging message, and subsequent packets are collected over five-minute intervals before they are displayed or logged. Each logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior five-minute interval.

The following IOS syslog message IDs are supported for Security Manager-to-CS-MARS queries.

|                      |                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------|
| %SEC-6-IPACCESSLOGP  | A packet matching the log criteria for the given access list was detected: TCP and UDP.              |
| %SEC-6-IPACCESSLOGS  | A packet matching the log criteria for the given access list was detected: IP address.               |
| %SEC-6-IPACCESSLOGDP | A packet matching the log criteria for the given access list was detected: ICMP.                     |
| %SEC-6-IPACCESSLOGNP | A packet matching the log criteria for the given access list was detected: all other IPv4 protocols. |

#### Note

If an excessive number of syslog messages are being generated and reported to CS-MARS, use the [Advanced and Edit Options Dialog Boxes, page 16-17](#) to change the logging level for those access rules that are producing the largest number of messages. You can also look at changing the logging policies on the device to limit the types of messages generated.

## NetFlow Event Reporting in CS-MARS

Event reporting in CS-MARS can include NetFlow events from an ASA 8.1+ device.

NetFlow Security Event Logging uses NetFlow version 9 fields and templates to efficiently deliver security telemetry in high-performance environments. NetFlow Security Event Logging scales better than syslog messaging, while offering the same level of detail and granularity in logged events. The ASA NetFlow implementation exports only significant events in the life of a flow, rather than exporting data about flows at regular intervals. The following flow events are exported:

- Flow creation
- Flow tear-down
- Flows denied by an access rule

The ASA also exports syslog messages that contain the same information. If you enable NetFlow on a device, you can consider disabling the equivalent syslog messages. Disabling equivalent syslog messages can help avoid the potential performance degradation caused by generating and processing both NetFlow records and syslog messages representing the same event. The following table lists syslog messages with an equivalent NetFlow event; the NetFlow Event IDs and Extended Event IDs are included. For information on how to disable NetFlow equivalent syslog messages, see [Server Setup Page, page 54-21](#).

| Syslog ID                            | Syslog Description                                                                          | NetFlow Event ID                                                                           | Extended Event ID                                                                                        |
|--------------------------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| 302013<br>302015<br>302017<br>302020 | TCP, UDP, GRE, and ICMP connection creation.                                                | 1 = Flow Created.                                                                          | 0 = Ignore.                                                                                              |
| 302014<br>302016<br>302018<br>302021 | TCP, UDP, GRE, and ICMP connection tear-down.                                               | 2 = Flow Deleted.                                                                          | 0 = Ignore, or<br>> 2000 = ASP drop reasons.                                                             |
| 710003                               | An attempt to connect to the device's interface was denied.                                 | 3 = Flow Denied.                                                                           | 1003 = To-the-box flow denied due to configuration.                                                      |
| 106015                               | A TCP flow was denied because the first packet was not a SYN packet.                        | 3 = Flow Denied.                                                                           | 1004 = Flow denied because first packet was not a TCP SYN packet.                                        |
| 313001                               | An ICMP packet to the device was denied.                                                    | 3 = Flow Denied.                                                                           | 1003 = To-the-box flow denied due to configuration.                                                      |
| 313008                               | An ICMP v6 packet to the device was denied.                                                 | 3 = Flow Denied.                                                                           | 1003 = To-the-box flow denied due to configuration.                                                      |
| 106023                               | A flow was denied by an access list attached to an interface with the access group command. | 3 = Flow Denied.                                                                           | 1001 – Flow denied by Ingress ACL.<br>1002 – Flow denied by Egress ACL.                                  |
| 106100                               | An access rule was hit.                                                                     | 1 = Flow Created (if ACL permitted the flow).<br>3 = Flow Denied (if ACL denied the flow). | 0 – If Flow permitted by ACL.<br>1001 – Flow denied by Ingress ACL.<br>1002 – Flow denied by Egress ACL. |

For the Flow Denied NetFlow event, an Extended Event ID indicates the reason for denial, as shown in the following table.

| Extended Event ID | Event       | Description                            |
|-------------------|-------------|----------------------------------------|
| 1001              | FLOW DENIED | The flow was denied by an Ingress ACL. |
| 1002              | FLOW DENIED | The flow was denied by an Egress ACL.  |

| Extended Event ID | Event        | Description                                                                                                                                                                                                                                |
|-------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1003              | FLOW DENIED  | The security appliance denied an attempt to connect to the interface service. For example, this message appears (with the service SNMP) when the security appliance receives an SNMP request from an unauthorized SNMP management station. |
| 1004              | FLOW DENIED  | The flow was denied because the first packet was not a TCP SYN packet.                                                                                                                                                                     |
| > 2000            | FLOW DELETED | Values above 2000 represent various reasons for a flow being terminated.                                                                                                                                                                   |

## **PART 8**

### **Image Management**

## Using Image Manager

---

Image Manager is a tool to simplify the distribution and management of images on internal and edge firewall devices in your network. It enables you to:

- Download and maintain a repository of different types and versions of images
- Evaluate images
- Analyze impact of upgrading images to the devices in the network
- Prepare for and plan an upgrade
- Reliably upgrade devices, with sufficient fallback and recovery mechanisms built in to ensure minimal network downtime

This chapter contains the following topics:

- [Getting Started with Image Manager, page 73-1](#)
- [Working with Images, page 73-9](#)
- [Working with Bundles, page 73-13](#)
- [Working with Devices, page 73-16](#)
- [About Image Updates on Devices Using Image Manager, page 73-20](#)
- [Working with Jobs, page 73-32](#)
- [Troubleshooting Image Management, page 73-37](#)

## Getting Started with Image Manager

Image Manager contains sections that are used for managing your images, working with the devices that you will need to update, and performing image installations on those devices.

For more information on these areas of Image Manager, see the following topics:

- [Working with Images, page 73-9](#)
- [Working with Bundles, page 73-13](#)
- [Working with Devices, page 73-16](#)
- [Working with Jobs, page 73-32](#)

Before working with Image Manager, you should review the sections that follow:

- the platforms that are supported by this feature,
- the configuration settings you can change to control how the feature works, and

- the steps that are necessary to ensure your devices are configured to work with Image Manager.

This section contains the following topics:

- [Image Manager Supported Platforms and Versions](#), page 73-2
- [Device Configurations supported by Image Manager](#), page 73-4
- [Image Manager Supported Image Types](#), page 73-5
- [Administrative Settings for Image Manager](#), page 73-6
- [Bootstrapping Devices for Image Manager](#), page 73-8

## Image Manager Supported Platforms and Versions

### Caution

From version 4.18, Cisco Security Manager does not support SFR from ASA 9.10(1) onwards for ASA 5512, ASA 5506, ASA 5506H and ASA 5506W models. Therefore, if you upgrade to 9.10(1) through Image Manager, the exiting SFR configuration will be lost.

Image Manager is available only for ASA devices. The following devices support Image Manager:

- All legacy ASA models—ASA 5505/10/20/40/50/80
- ASA 5585
- ASA 5515/25/35/45/55
- ASA-SM module for Catalyst 6K
- 5516-X
- Adaptive Security Virtual Appliance (ASA v)

Beginning with Cisco Security Manager 4.20, Image Manager supports the following Firepower devices, that operate in Appliance Mode, running on ASA 9.13(1) and higher devices:

- Cisco Firepower 1140 Security Appliance
- Cisco Firepower 1150 Security Appliance
- Cisco Firepower 1010 Security Appliance
- Cisco Firepower 2140 Security Appliance
- Cisco Firepower 2120 Security Appliance
- Cisco Firepower 1120 Security Appliance
- Cisco Firepower 2110 Security Appliance
- Cisco Firepower 2130 Security Appliance

The following devices are not supported and are filtered out in the devices tab of the Image Manager unified view:

- PIX firewall
- FWSM blade
- ASA device managed by AUS
- Devices unmanaged in Security Manager
- Other device types—IPS and Routers

Image Manager supports image upgrade for ASA device version from 7.x onwards. The target image version that can be used to upgrade is not restricted. Image upgrade to the highest ASA version supported in Security Manager 4.4, that is ASA version 9.0(1) and 9.1(1), has been tested.

Prior to version 4.9, the Image Manager application listed all the images of the supported device type. You could select and download any image that you required. Beginning with version 4.9, the Image Manager application lists only the specific versions of images.

The latest images of ASDM, †Remote Access Plugin and Host scan are listed in Image Manager. For AnyConnect version 3.x and 4.x, the latest images are listed.

For ASA devices, the following images are listed:

| ASA Device Model                  | ASA Images listed in Image Manager                                                                                                                                               |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5512-x,5515-x,5525-x,5545-x,5585x | 9.4.1<br>9.3.3<br>9.3.2<br>9.3.1.SMP<br>9.2.3.SMP<br>9.2.2.4.SMP<br>9.2.1.SMP.ED<br>9.1.4.SMP.ED<br>9.1.5.SMP.ED<br>9.1.6.SMP.ED<br>9.1.2.SMP.ED<br>9.0.4.SMP.ED<br>8.4.6.SMP.ED |
| 5580-x                            | 9.1.6.SMP<br>9.1.5.SMP.ED<br>9.1.4.SMP.ED<br>9.1.2.SMP.ED<br>9.0.4.SMP.ED<br>8.4.6.SMP.ED                                                                                        |
| 5555-x                            | 9.4.1<br>9.3.3<br>9.3.2<br>9.3.1.SMP<br>9.2.3.SMP<br>9.2.2.4.SMP<br>9.2.1.SMP.ED<br>9.1.2.SMP.ED<br>9.0.4.SMP.ED                                                                 |

|                                            |                                                                   |
|--------------------------------------------|-------------------------------------------------------------------|
| 5505,5510,5520,5540,5550                   | 9.1.6<br>9.1.5.ED<br>9.1.4.ED<br>9.1.2.ED<br>9.0.4.ED<br>8.4.6.ED |
| 5506-X                                     | 9.4.1, 9.3.3, 9.3.2                                               |
| 5506H-X                                    | 9.4.1                                                             |
| 5506W-X                                    | 9.4.1                                                             |
| 5516-X                                     | 9.4.1                                                             |
| Adaptive Security Virtual Appliance (ASAv) | 9.3.1, 9.3.2, 9.4.1                                               |

**Warning**

**Image downgrade is not restricted, but is done at your own risk. Image Manager does not validate downgrade cases.**

## Device Configurations supported by Image Manager

In addition to supporting image updates on standalone ASA devices, Image Manager manages the filesystem and supports seamless image update for ASA devices specially configured for high availability and scalability. Following configurations are supported:

- **Multiple context mode**—ASA in multiple context mode where a single ASA can be partitioned into multiple virtual devices/firewalls. Refer to [http://www.cisco.com/en/US/docs/security/asa/asa91/configuration/general/ha\\_contexts.html](http://www.cisco.com/en/US/docs/security/asa/asa91/configuration/general/ha_contexts.html). Each of these virtual firewalls are represented in Security Manager as independent devices. When Image Manager updates the image on the physical unit hosting these virtual devices, it updates device properties of all virtual devices with the new image information.
- **Failover configuration**—Two identical ASA devices configured to failover for high availability. They can be configured to be in Active/Active or Active/Standby failover. Refer to [http://www.cisco.com/en/US/docs/security/asa/asa91/configuration/general/ha\\_overview.html](http://www.cisco.com/en/US/docs/security/asa/asa91/configuration/general/ha_overview.html). Image update on an Active/Active failover pair is not supported in Image Manager. In order to use Image Manager to update the images on an Active/Active failover pair, the Active/Active failover pair has to temporarily be converted to Active/Standby by making all the failover groups active on one unit, and the corresponding failover groups standby on the other unit. After upgrade, you can convert the failover pair back to Active/Active.
- **Cluster configuration**—Multiple ASAs (up to 8 ASAs) can be grouped together as a single logical unit called a **cluster** for achieving increased throughput and redundancy. The purpose of clustering devices is to simplify manageability and to increase processing speed. By using clusters you are able to scale to a multitude of simultaneous connections that work together to load balance the connections. Clustering feature has been introduced starting from ASA version 9.0(1). For more information see [http://www.cisco.com/en/US/docs/security/asa/asa91/configuration/general/ha\\_cluster.html](http://www.cisco.com/en/US/docs/security/asa/asa91/configuration/general/ha_cluster.html).

**Note**

Clustering is only supported on ASA 5580 and ASA 5585.

Starting from release 4.4, Security Manager supports Clustering. In Configuration manager and Image Manager, all the devices/members in a cluster or a failover pair are managed as a single device. That is, when you change the configuration on a control unit, the change is automatically made to all the devices in the cluster. Similarly, Image Manager updates image on each of the physical unit that is part of failover or cluster in a single operation.

## Image Management for Multi-Context ASA

Beginning with version 4.12, the Image Manager Device Tree view displays all the user contexts (Admin and User contexts) of the multi-context firewall devices running the ASA software version 9.6(2) or later.

You can select a User context and view the storage-url information of the selected context on the Storage tab.

On the Compatible Images tab, you can view only the AnyConnect images for the selected User Context. However, all image types are displayed for the System Contexts.

## Image Manager Supported Image Types

Image Manager supports the following types of images:

- ASA System software
- ASDM image
- VPN images [includes Cisco Secure Desktop (CSD), AnyConnect, and Hostscan]
- SSLVPN Plug-in images (For example: RDP, SSH, ICA, and others)

Image Manager completely manages the ASA system software and the ASDM images on the ASA devices, i.e., it performs loading of the image, activating the image by modifying configuration, and even reloading the device if required to complete the image upgrade process.

For the User Context devices Security Manager supports only AnyConnect images for copying and installation.

Image Manager does not support the ASA-CX images. This includes both the system images, for example `asacx-sys-9.1.1-1.pkg`, and also the boot images, for example `asacx-5500x-boot-9.1.1-1.img`. Using Image Manager, you cannot add any CX images to the Image Manager repository and cannot push any CX images to the device .

### Handling of SSL VPN Images

Image Manager only reliably copies SSL VPN images to the ASA device. No configuration or activation commands are added for SSL VPN images by Image Manager. The configuration of the images must still be done using Configuration Manager.

The following files are not managed in Image Manager and have to be configured and deployed from Configuration Manager as in earlier versions of Security Manager:

- CSD Configuration XML
- AnyConnect Client Profile files
- DAP Configuration XML
- Full Customization XML files

After the SSL VPN images have been copied to the device using Image Manager, the remote access VPN policies must be configured in Configuration Manager to make use of these images. The Remote Access VPN policies that must be configured are located at the following paths in Configuration Manager:

- **CSD Package**—Remote Access VPN > Dynamic Access > Cisco Secure Desktop group box
- **HostScan Package**—Remote Access VPN > Dynamic Access > Cisco Secure Desktop group box
- **Anyconnect Image**—Remote Access VPN > SSL VPN > Other Settings > Client Settings tab
- **Plug-ins**—Remote Access VPN > SSL VPN > Other Settings > Plug-in tab

The SSL VPN binary files must be present on the device flash before you reference them in VPN policy. If not, Security Manager will present an activity validation warning informing the user of the preference to use Image Manager to push these files reliably to the device before deploying the configuration. If the user ignores the activation warning and goes ahead, Configuration Manager defaults to the old behavior and pushes the images or files as was done in the earlier versions of Security Manager before deploying the configuration referring to these files. But the user cannot leverage the following advantages of using Image Manager for copying these files:

1. Capability to use external disks like disk1 to copy the files. Configuration Manager only copies the files to disk0 and does not recognize or support external disks.
2. Image Manager preempts errors during the image copy by validating that there is enough free space on the disk to copy the selected images and does not allow creation of a job unless there is sufficient space to copy the images. User can make space by using the Image Manager to delete unwanted images.

**Note**

Image Manager does not validate the compatibility of the SSL VPN files that are pushed to the ASA. But Configuration Manager will complain when incompatible files are referenced in the Remote Access VPN policies.

## Administrative Settings for Image Manager

Image Manager introduces new administrative settings. These administrative settings must be configured as part of Configuration Manager.

### Configuring Cisco.com Certificates

Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to [Certificate Trust Management, page 10-18](#).

To configure administrative settings for Image Manager, do the following:

---

**Step 1** Go to **Configuration Manager > Tools > Security Manager Administration**.

The Cisco Security Manager - Administration page appears.

**Step 2** Configure workflow settings:

---

**Tip** Refer to the Configuration Manager documentation for workflow control setting information.

- a. Select **Workflow**.

- b. To require that Install Jobs be approved explicitly by an assigned approver before they are installed on devices, select **Require Deployment & Install Image Approval**. If you select this option, make sure you configure appropriate email notification settings. For more information, see the [Workflow Page, page 11-75](#).

**Note** To allow the submitter to approve deployment jobs, select **Submitter can Approve Deployment Job**.

- c. Click **Save**.

**Step 3** Configure debug settings:

- a. Select **Debug Options** and from the drop-down list for Image Manager Debug Level, select the debug level you want.

**Tip** The levels include: Severe, Error, Warning, Info and Debug. The default log level is Error.

**Note** The log files are stored as follows:

- The server logs are located at: *%NMSROOT%\MDC\log\operation\vmssharedsvcs.log* and *%NMSROOT%\MDC\tomcat\logs\stdout.log*
- The client logs are located at: *<Client Install Dir>\logs\\*.log*

- b. Click **Save**.

**Step 4** Configure Cisco.com credentials:

- a. Select **Image Manager**.

The Image Manager page appears.

- b. If you have credentials to connect to Cisco.com configured already at Tools > Security Manager Administration > IPS Updates > Update Server and wish to reuse the same for Image Manager, then check the **Use IPS Updates Settings** check box. This is also the default behavior.

**Note** Only Cisco.com is supported, not Local Server.

- c. On the Image Manager page, deselect the **Use IPS Updates Settings** check box if you want to specify a set of credentials for Image Manager explicitly.

The fields on the Image Manager page become operable.

- d. Complete the following fields:

- Username
- Password
- Confirmation

- e. Optionally, complete the Proxy Server Settings to configure a proxy, if required.

1. Select the **Enable Proxy** check box.

2. Complete the following fields to define the proxy:

- IP or Hostname

- Port
- Username
- Password
- Confirmation (of Password)

- f. Click **Test Connection** test connectivity to Cisco.com with the configured settings.
- g. Click **Save**.

**Step 5** Configure Purge Interval for Image Install Jobs

- a. Select Image Manager.
- b. Enter a purge value to specify how many days should pass between purges, in the Purge Jobs Older Than field.

**Note** Pressing the Purge Now button immediately purges the Image Installation jobs satisfying the Purge Interval criteria.

**Step 6** Configure Image Backup Settings

- a. Select Image Manager.
- b. To include the repository as part of the standard backup, select **Include Repository**.

**Caution**

Ensure that you have sufficient hard disk space on the Security Manager server as the image files consume a lot of space.

**Note** You can click the Reset button to reset the values to the last saved values before the current change.

- c. Click **Save**.

**Step 7** Click **Close** to close the Administration window.

## Bootstrapping Devices for Image Manager

The bootstrapping in Image Manager is essentially the same as that which you perform in Configuration Manager for ASA devices.

To bootstrap a device for Image Management, do the following:

**Step 1** Configure HTTPS on the device(s) to manage ASA in Security Manager.

- a. Ensure that the HTTP server is enabled.
- b. Add the Security Manager server IP address as an allowed host for HTTP management on the device.

**Step 2** Ensure that the configuration register setting is set to boot with the image list in the running configuration.

- a. Register value: 0x1,0x3,0x5, 0x7, 0x9

---

**Note** Register value: 0x1 is the recommended setting.

---

- b. Do not set to boot to **rommon** mode. (Otherwise device will not be rebooted and the image upgrade will be aborted.)

**Step 3** In Security Manager, go to Tools > Security Manager Administration > Device Communication > SSL Certificate Parameters. In the SSL Certificate Parameters area, set PIX/ASA/FWSM Device Authentication Certificates to Do not use certificate authentication.

**Step 4** Ensure that there is sufficient space in the flash memory of the device(s) to hold the images you intend to load.

---

**Tip** If necessary, you can delete other images you do not intend to use from the device(s).

---

**Step 5** We recommend that you unmanage the Boot-Image/Configuration policy for ASA, as follows:

- a. In Security Manager, navigate to Tools > Administration > Policy Management.
- b. Uncheck the Boot Image/Configuration policy selection.

---

**Note** Image Manager configures boot image and ASDM image as part of the image installation job. So, if the Boot Image/Configuration policy is not unmanaged, then any configuration deployment after the image installation will remove these boot commands added by Image Manager. To prevent this, the Boot Image/Configuration policy should be unmanaged in Security Manager. This can be done from Security Manager administration settings -> Device Exception Settings -> Firewall Policies node.

---

**Step 6** We recommend that the device not be set as a priority monitored device in HPM.

**Step 7** Ensure that all configuration changes on the device are submitted and deployed.

---

## Working with Images

Image Manager provides access to images on Cisco.com as well as images on your network. When an image shows a location of Repository, it means that image has already been downloaded (either from Cisco.com or from a local file system). Conversely, an image that shows location as Cisco.com has not been downloaded into the repository. Navigating to the Repository Images in the Images section of the selector enables you to examine a list of all the images. You can also filter, sort, and search the images available. Filtering, in particular, is a good way to navigate within Image Manager. Beginning with all images, you can use the headings in the main repository view to locate images by a variety of attributes including name, version, and type.

Image Manager does not manage ASA-CX images. Any CX images available on Cisco.com will not be shown in Image Manager for download. You also cannot add any CX images from the file-system.

---

**Note** Only images that are downloaded to the Image Repository can be used for image upgrade jobs.

---

**Note**

Beginning with Security Manager release 4.4, when Security Manager contacts Cisco.com to update images or to check on the availability of image updates, an additional certificate validation is performed. The update or download fails if you have not accepted the most recent certificate. You must retrieve, view, and accept the most recent certificate before you can proceed with other operations. For more information on the certificates, see [Managing Device Communication Settings and Certificates](#), page 9-4.

This section contains the following topics:

- [View All Images](#), page 73-10
- [Download Images to the Repository](#), page 73-11

## View All Images

When you first open Image Manager, or when you select All Images from the selector, the system displays a complete list of images. This list includes both those images in the repository as well as those on Cisco.com (which have not yet been downloaded). Some of the VPN image files are bundled with the Security Manager installation and are shown in the repository from the first time onwards. Image Manager will display a warning about credentials not being configured when the Image Manager client is launched for the first time, or until the credentials are configured under Security Manager administration settings for Image Manager.

**Note**

In earlier releases of Security manager, only the prepackaged SSL-VPN images already existing in the Image Manager repository could be seen. If you do not have a repository connection, beginning with Security Manager release 4.4, on a freshly installed Security Manager, Image Manager shows not only the prepackaged SSL-VPN images in the repository, but also lists supported ASA images available on Cisco.com. The prepackaged files are available at: `CSMRoot>\MDC\athena\ccometadata`. Thus, even if you do not have initial connectivity to Cisco.com, you can view the latest images that are available at the time of release of the Security Manager. You have to have Cisco.com connectivity and should configure credentials to Cisco.com to either check for the latest updates on Cisco.com or to download the images from Cisco.com, or both. This prepackaged information about image availability enables users not having Cisco.com connectivity to still view the latest images available on Cisco.com (at least the ones published on Cisco.com by the Security Manager release). This also lets you view compatible images for a particular device type/platform.

This view can be re-ordered by any of the listed image attributes. For example, you can list the images by size. The attributes that you can sort on include:

- Download State - This is the first column and is shown as icons. The icons are actionable, and you can double-click the icon in this column to start the download of an image from Cisco.com, or to abort an ongoing image download, or to delete an image from the repository. Note that the icons change during each of these actions. (A green arrow indicates an image on Cisco.com, a red cross indicates an image that has already been downloaded, and another icon indicates that a download is in progress.)
- Image (name)
- Type
- Version
- Location

- Size
- Description
- Comments (you can add and edit comments for an image).

To view all images, do the following:

- 
- Step 1** Check for new images available on Cisco.com
- Configure the credentials for reaching Cisco.com by navigating to Tools > Security Manager Administration > Image Manager.
  - In the upper right corner, click the double arrow **Check for Updates** icon.
  - Ensure that the CCO account has permissions to download crypto images. Otherwise, navigate to the link and accept the agreement, and then retry the operation.
- The system displays “*Updating*” while it checks for updates. When finished, it reads: *Last updated at: <timestamp>*, and you can view the new images available in the All Images view.
- Step 2** If you have not already accepted the most recently issued Cisco.com certification, the system notifies you that you must retrieve, view, and accept the latest certificate before any communication with Cisco.com by Image Manager can occur.
- Step 3** Click **All Images** in the selector.
- The system displays the image list.
- Step 4** To re-order the list, click on any of the column headings.
- The list of images is reordered according to the selected attribute.
- Step 5** To filter the list, use the Image Manager’s search window to enter a key string. For example, you could enter the digits of a version number.

---

**Note** Also, you can use the filter settings in some of the column headings to filter the list shown.

---

## Download Images to the Repository

You can download images to the repository either from Cisco.com or from a local file system.

**Note**

---

Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to [Certificate Trust Management, page 10-18](#). You must have accepted the latest certificate from the image download site on Cisco.com to proceed. The certificate of the site from which the image is to be downloaded may be different from the site that is contacted for "Check for updates" to obtain the latest meta-data information about images. Thus, even if you have accepted the certificate from the "Image Meta-data Locator" URL, the image download may fail with an error to accept the certificate of the image download URL. You must retrieve and accept the certificate from the download URL given in the error message to proceed with the image download.

---

**Note**

Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading images from cisco.com.

**Tip**

Images can also be downloaded from the Compatible Images tab. For details see [Manage Images on a Device, page 73-17](#).

To add an image file to your Security Manager repository, do the following:

**Step 1**

To download images from Cisco.com, do the following:

- a. From the All Images view double-click the **Start Download** icon in the first column.

**Tip**

Ensure that the credentials to Cisco.com are configured and you have authorization to download the images.

**Note**

Image Manager displays an error message if the image to be downloaded already exists in the repository. The system skips the download when the file name and checksum are identical.

The Downloads window appears showing the progress of the download.

**Tip**

The progress icons may change as the download progresses. A green check icon with the word Deployed indicates success. A red X icon indicates failure. In case of failures, you can view the cause of the failure for that image in the Downloads window. You can double click the message to view the complete details of the error.

- b. When completed, select Repository Images and view the image in the listing.

**Tip**

You can also select multiple images and download them all at once by right-clicking them and using the context-sensitive menu.

**Tip**

By sorting the list on Update Time, you can easily view the most recent image.

**Step 2**

To download images from a local file system, do the following:

- a. From the toolbar in the Repository Images view, click the **Download image from file system** icon (found on the far left).

The Download from File System dialog box appears.

- b. Use the Browse feature to select the Import location and to select the image to be imported.
- c. Click **OK**.
- d. Click **OK** in the Download image from file system dialog box.

- e. Observe the progress of the download.

**Note** If the image to be downloaded already exists in the repository, the system displays an error.

- f. When completed, select a device group in Security Manager and view the image in the listing.

**Tip** By sorting the list on Update Time, you can easily view the most recent image.

- g. Alternatively, you can download an image file using the drag-and-drop method. For example, you can drag one or more files from your desktop and simply drop it on the Image Manager application.

## Working with Bundles

Bundles are groups of compatible images that you define. You can use bundles to simplify repetitive operations, by grouping images that are pre-validated to work together as a logical group. For example, you might define bundles that reflect ASA and ASDM pairs to ensure that you deploy both types in a single operation. The following types of images can be part of a bundle:

- ASA system software
- ASDM image
- VPN images (including csd, AnyConnect, Hostscan)
- Plug-ins (including rdp, ssh, ica, owa, and others)

Multiple system software images cannot be included in the same bundle.

**Caution**

The Image Manager does not stop you from adding incompatible images as part of a bundle. You must determine this compatibility. The ASA and ASDM Compatibility matrix is located at: <http://www.cisco.com/en/US/docs/security/asa/compatibility/asamatrix.html#wp42231>.

**Tip**

Throughout Image Manager there are operations where you can choose to apply an image, multiple images, or a (predefined) bundle of images.

This section contains the following topics:

- [Creating Bundles, page 73-14](#)
- [View Images by Bundle, page 73-14](#)
- [Renaming Bundles, page 73-15](#)
- [Deleting Bundles, page 73-15](#)
- [Deleting Images from Bundles, page 73-15](#)

## Creating Bundles

You can define bundles of images to simplify your Image Manager. Bundles are particularly useful when you have a group of images upon which you regularly operate.

To create a bundle, do the following:

- 
- Step 1** From the Bundles heading in the selector, click the **Add Bundle** (plus sign) icon.
- Step 2** In the Create Bundle dialog box that opens, enter the name for the new bundle.
- Step 3** Click **OK**.
- The bundle is listed under the Bundles heading in the selector.
- Step 4** From the Images section of the selector, select an image to be bundled. Then click on the Release Notes tab. Finally, examine the compatibility table in the applicable release notes to ensure there are no conflicts with the other images to be bundled.

### Caution

The Image Manager does not stop you from adding incompatible images as part of a bundle. It is the responsibility of the user to determine this compatibility. The ASA and ASDM Compatibility matrix is located at: <http://www.cisco.com/en/US/docs/security/asa/compatibility/asamatrix.html#wp42231>.

- Step 5** With compatibility determined, drag and drop each image onto the bundle.

### Note

Multiple system software images cannot be included in the same bundle.

### Tip

You can select a range of images to drag and drop by selecting the first image in the range and then, with the Shift key pressed, selecting the last image in the range. You can select multiple images by clicking those images while keeping the Ctrl key pressed. You can also select a range of images and then add additional images to your selection by using the Ctrl key method. To move multiple images to a bundle, drag using the right mouse button.

## View Images by Bundle

You can view the images that have been added to a bundle.

To view the images in a bundle, do one of the following:

- 
- Step 1** To view the images contained within all bundles:
- a. Under the Bundles heading in the selector, click the top-level Bundles folder.
 

All the bundles are listed, together with the images contained within each.
  - b. You can expand or collapse any of the bundles to make viewing easier. To expand all bundles or collapse all bundles, use the Expand All and Collapse All buttons at the top of the main window.
- Step 2** To view the images for a specific bundle:
- a. Under the Bundles heading in the selector, select a bundle.

The list of images for the selected bundle is displayed in the main window.

- Step 3** To view a particular bundle:
- a. In the Bundles section of the selector, click **Search** (the magnifier icon).
  - b. Enter the bundle name in the search field under the Bundles banner.

The list of bundles displays only the specified bundle.

---

## Renaming Bundles

Bundles can easily be renamed to provide better organization or to more accurately reflect the contents of the bundle.

To rename a bundle, do the following:

- 
- Step 1** From the Bundles heading in the selector, select a bundle.
- Step 2** Right-click the bundle name and, from the drop-down list, select **Rename Bundle**.  
The Rename Bundle dialog box appears.
- Step 3** Type the new bundle name.
- Step 4** Click **OK**.

The new bundle name appears in the selector under Bundles.

---

## Deleting Bundles

Bundles that are no longer needed can be deleted.

To delete a bundle, do the following:

- 
- Step 1** Select the bundle.
- Step 2** From the Bundles heading in the selector, click **Delete** (the red X icon). Alternatively, right click on the selected bundle and select **Delete Bundle**.
- 

## Deleting Images from Bundles

If you wish to change the contents of a bundle, you can delete any of the images that are defined as part of a bundle.

To delete images from bundle, do the following:

- 
- Step 1** Select the bundle.
- Step 2** Right-click on the image(s) to be removed.

**Step 3** Select **Delete Image from Bundle**. Alternatively, click the Delete button at the top of the table.

---

## Working with Devices

The following topics explain how to work with devices in Image Manager.

### Note

---

For a cluster, only the control unit supports the download of files from storage.

---

This section contains the following topics:

- [Viewing Device Inventory, page 73-16](#)
- [Manage Images on a Device, page 73-17](#)
- [View Device Memory, page 73-19](#)
- [Configuring the Image Install Location, page 73-19](#)

## Viewing Device Inventory

You can use the Device Summary page to quickly view the devices on your network and their attributes.

Within the selector panel on the left is an area called Devices. From that area you can display all devices by selecting All (or you could select a location or group of devices you have defined). After you have chosen the scope of device selection, the corresponding devices are displayed in the upper panel of the Device Summary page. The upper window of the Device Summary page displays the following attributes, as applicable, for each device:

- Device Display name
- Mode (for example, Standalone, Active-Active, Active-Standby, Cluster)
- System SW Version
- ASDM Version
- AnyConnect Version
- Secure Desktop Version
- Hostscan Version

The Device Summary table includes a Mode column. This column specifies such modes as Cluster, Standalone, Active-Active, and Active-Standby.

For configurations in which multiple physical devices are grouped together, as in failover and cluster configuration, each physical unit/ member has its own file system. And these file systems can be different. The details of the file systems of each physical device/ member are viewable within Image Manager.

Details of individual cluster members, including storage and image status, are shown in the Security Manager user interface. During discovery of image management inventory data, details are discovered regarding each cluster member's storage and running image details.

When a Failover or Cluster device is selected in the Device Summary page, the individual physical members in the group are displayed in the middle Device View table. The Device View table for Cluster device displays the following information about the cluster members:

- **Name**—Device or cluster member name.
- **ID**—Cluster Member ID.
- **Status**—Role of the member in the cluster. For example, Cluster Master or Cluster Slave.
- **Serial Number**—Serial number of the cluster device.
- **Running OS Version**—Version of OS on the particular member.
- **CCL IP**—Cluster Link IP address.
- **CCL MAC**—Cluster Link MAC address.
- **Site ID**—Site ID of the Cluster device.

The Device View table for a *Failover device* has columns that include Name, Status (for example Standby or Active), Serial Number, RAM size, and Running OS Version. The Failover Device table lists these elements by Primary and Secondary devices for the failover pair nodes.

When you select a particular device in the device summary page, then the lower window displays the following tabbed pages for the details of that device.

- **Summary**—Display Name, Device Type, IP Address, Hostname, Domain Name, Serial Number, Running OS Version, Target OS Version, RAM, Failover Mode, Image Install Location
- **Compatible Images**—Images compatible to the device—Image, Type, Version, Location, Size, Description, Comment.
- **History**—Chronological view of Image Installation Jobs and Configuration Deployment Jobs that have been executed on the device—Job Name, Changed By, State, Last Action, Tickets

When you select a particular member of a failover or cluster device in the middle Device View, the lower window displays the following tabbed details for that physical device.

- **Summary**—Running OS Version, Target OS Version, RAM
- **Storage**—The number and capacity of flash memory units. Name, Size, Path, Type, Disk Usage
- **Running Images**—The images presently operating. Name, Type, Version, Path, Size

## Manage Images on a Device

You can use the Image Management tool to review, download, and remove the images on the ASA device(s) you select.

To review, download, or remove ASA images on a device, do the following:

---

**Step 1** Select a device group from the Devices area of the selector panel.

The main window displays the Device Summary. The Device summary lists the devices and the associated system software versions.

**Tip** Alternatively, you can select the search function (magnifier icon) from the Devices banner and then enter the device name in the search field that appears.

---

**Step 2** From the upper pane of the Device Summary page, select a device.

---

**Note** If a particular device is part of a cluster, you can navigate through the cluster to view device details.

---

The lower pane displays details of the selected device.

**Step 3** Select the Storage tab in the lower pane and then check the amount of free space listed under Disk Usage.

---

**Note** If a particular device is part of a cluster, you can navigate through the cluster to view device storage details.

---

---

**Tip** The device may have more than one storage area, for example, disk1. Be sure to scroll down to see secondary (flash) storage capacity.

---

**Step 4** Note the available disk space on the device.

**Step 5** To remove one or more images from the device to free up space, select one or more images in the Storage Tab and click **Delete** at the top of the Storage Tab.

---

**Tip** Alternatively, you can select one or more images, right-click and click Delete.

---

---

**Tip** If you delete an image that is currently active and is being referenced, Image Manager displays a warning message.

---

**Step 6** To download an image from the device, select the image and click **Download** at the top of the Storage tab. Select the location on the local file system to which to download the image and click **OK**.

---

**Note** For a cluster device, download of images is only supported on the Control Unit. Similarly, for a failover device, download of images is only supported on the active device in the pair.

---

A dialog appears showing the progress of the download from the device. After the download is completed, the downloaded image is shown in Explorer.

**Step 7** Select the Compatible Images tab in the lower pane.

The system displays images that are compatible to the device.

**Step 8** To install the compatible image(s) onto the device do the following:

- a. Select the image to be added to the device.
- b. Double-click the download icon.  
The image is downloaded to the repository.
- c. Select the image and then select **Install** from the context menu.

The Install wizard appears and the system installs the image. Please see [Install Compatible Images on Devices, page 73-31](#) for details.

---

## View Device Memory

You can use Image Manager to determine the memory capacity and application of a device in your network.

### Note

Only physical devices can display memory capacity, clusters do not.

To view the details of the memory on a device, do the following:

- Step 1** From the Devices area of the selector panel, choose the device to examine. Details of the selected device appear in upper window of the Device Summary page.
- Step 2** In the upper panel, examine the RAM listing.

### Caution

Image Manager warns you if there is insufficient RAM on a device to load the new image. However, the system does not stop you from performing such an image upgrade. (This is in contrast with Configuration deployment, where the deployment job stops if there is insufficient RAM.)

## Configuring the Image Install Location

ASA devices have a default flash (disk0) where all the images reside. By default, Image Manager copies images to disk0 of the ASA device. When the ASA device is configured with an external disk (that is, disk1), Image Manager allows you to choose between the two disks, disk0 or disk1, when loading images on the ASA device.

### Note

The capability to load images on an external disk is very useful for storing large images such as those for AnyConnect and CSD, as disk0 can run out of space quickly with even a few of these larger images.

For configuring Image Manager to use the external disk, do the following:

- Step 1** Select the device from the Devices area of the selector.
- Step 2** View the Summary information on the right pane. The available disks on the device are listed in the Image Install Location drop-down list. For a device with external disk, disk0 and disk1 would be listed.
- Step 3** Select the external disk, disk1, from the Image Install Location drop-down list and click **Apply**. For a user context device, you can select shared or private label to apply the default Install location. All future image installation jobs for the device will load the images to disk1.

### Tip

The configuration of the external disk can be verified by performing an image install operation. After the job is complete, view the contents of disk1 in the Storage tab of the device in Image Manager. It should list the newly installed images.

**Note** For cluster and failover devices, and multi-context devices, if all the physical member devices do not have the disk that is selected as the Image Install location, then there will be a validation error when you try to copy or install images. You need to select the Image Install location to be a disk that is present on every member device to proceed with copying or installing images.

## About Image Updates on Devices Using Image Manager

### How does Image Manager update images on an ASA device?

Image Manager follows the standard documented procedure to upgrade the stand-alone ASA devices with several built-in checks to ensure reliable image upgrade. Please refer to: [http://www.cisco.com/en/US/products/ps6120/products\\_configuration\\_example09186a008067e9f9.shtml#maintask2](http://www.cisco.com/en/US/products/ps6120/products_configuration_example09186a008067e9f9.shtml#maintask2) for the procedure for image upgrade.

**Note**

You must have accepted the latest Cisco.com certificate to enable Image Manager to interface with cisco.com. You must accept the certificate from both the "Image Meta-data locator" site and the download site of the images to start downloading images successfully (see [Image Manager Page, page 11-41](#)).

Image Manager uses the HTTPS protocol to copy images to the ASA device, performs configuration changes to activate the new image (ensuring fallback to the older image in case of any error), and finally reloads the device if required, with the new image.

### How does Image Manager update images on an ASA configured for failover?

Updating the images in an Active/Standby failover pair is accomplished by creating an image upgrade job on the active device of the pair, and then running the image upgrade job.

Image update on an Active/Active failover pair is not supported in Image Manager. The Active/Active failover pair has to be converted to Active/Standby by making all the failover groups active on one unit, and the corresponding failover groups standby on the other unit. Only then can Image Manager update the image on the pair of devices.

To upgrade devices in an Active/Active failover pair:

1. Manually convert the pair to active/standby by forcing all the failover groups on one device to be **active** and on the other device to be **standby**.

**Note**

Do not discover the devices in Security Manager.

**Note**

For additional details on how to convert an active/active failover pair to active/standby, see [http://www.cisco.com/en/US/products/ps6120/products\\_configuration\\_example09186a0080b20f35.shtml#Actact](http://www.cisco.com/en/US/products/ps6120/products_configuration_example09186a0080b20f35.shtml#Actact).

2. Create an image upgrade job on the active device of the pair, and run the image upgrade job.
3. After the upgrade has occurred, manually convert the pair back to active/active configuration, as existed before the upgrade, by making the required failover groups active on one unit and the remaining failover groups to be active on the other physical unit.

4. Rediscover in Security Manager only the device inventory for the unit that was converted to standby. Image Manager follows the upgrade procedure as detailed at: [http://www.cisco.com/en/US/products/ps6120/products\\_configuration\\_example09186a0080b20f35.shtml](http://www.cisco.com/en/US/products/ps6120/products_configuration_example09186a0080b20f35.shtml). The image is copied to both the units and then configuration change is done to activate the image that is synced to both units. First the standby is reloaded via the active unit and after ensuring that the standby has been upgraded successfully to the new version, the current active is reloaded. After both the units are upgraded to the new version, the failover pair or cluster upgrade is marked successful.

**Note**

During the current active reload and until the standby ASA takes over, the traffic going through the failover pair will be impacted.

There are restrictions for image upgrade in failover ASA pair. We recommend that, while performing image upgrades on a failover ASA pair or cluster using Image Manager, you ensure the following restrictions are satisfied:

- The two units in a failover configuration should have the same major (first number) and minor (second number) software version.
- **Maintenance Release:** You can upgrade from any maintenance release to any other maintenance release within a minor release. For example, you can upgrade from 7.0(1) to 7.0(4) without first installing the maintenance releases in between.
- **Minor Release:** You can upgrade from a minor release to the next minor release. **You cannot skip a minor release.** For example, you can upgrade from 7.0 to 7.1. Upgrading from 7.0 directly to 7.2 is not supported for zero-downtime upgrades; you must first upgrade to 7.1
- **Major Release:** You can upgrade from the last minor release of the previous version to the next major release. For example, you can upgrade from 7.9 to 8.0, assuming that 7.9 is the last minor version in the 7.x release.

**How does Image Manager update images on an ASA cluster?**

Image updates follow the procedure previously established for hitless upgrades that ensures that all members of a cluster are upgraded to a new version in a single user operation without affecting traffic flow. During an image upgrade:

- The data units of a cluster are first loaded with the new image from the control unit. Images are copied to all members of a cluster while being connected only to the control unit. Such propagation through a cluster does not require switchovers of each device to control unit status and, thereby, minimizes traffic disruption.
- Configuration is changed on the control unit to add the boot command to load with the new image. The configuration, once changed on the control unit, automatically gets synced on all the data units.
- All the data units reboot with the new image sequentially via the control unit.
- All the data units come online and rejoin the cluster.
- The control unit is then made into a data unit (with the next data unit taking over the control unit's role).
- Via the new control unit, the old control unit is reloaded with the new image.

This procedure for image update followed by Image Manager ensures minimal switchovers and minimal disruption of traffic.

### Device State Changes During and After Image Update

Image upgrade is a critical operation and hence there is a need to depict visually, and inform users of, all image update operations. Thus, three new device states have been introduced:

- **Upgrade In Progress**—The device is put into this state whenever an image install job starts on the device. This state is automatically reset by the system after the image update operation is completed on the device.
- **Maintenance**—The device is put into Maintenance state when the image install job fails on the device and the device becomes unreachable after the image install operation. You need to manually reset this state to normal/operational state after taking necessary steps to bring back the device online by manually correcting issues due to upgrade or by rolling back the image.
- **Configuration Required**—For certain cases of image upgrade (like from ASA 8.2 to ASA 8.3), there are significant changes in the device configuration as part of the image upgrade which renders the policy configuration model in Security Manager incompatible with the device configuration. In such cases, even if the image upgrade operation may be successful, you must perform some operations, like rediscovery of device, to ensure that after upgrade, Security Manager's configuration policy model and the device configuration are in tandem. Thus, after an image upgrade, if some additional configuration is required to be made in Configuration Manager to make the device operational, the device is put into *Configuration Required* state. Even in the case where VPN images are deployed using Image Manager, the device is put into *Configuration Required* state since this requires the user to configure these images in the VPN policies using Configuration Manager. The *Configuration Required* state indicates that there are changes to be done in Configuration Manager to make the device functional in Security Manager after the image update operation. You can make the suggested changes and, after you are satisfied with your configuration changes, you can manually bring the device back to *Operational* state.

---

**Note** Refer to the [Troubleshooting Image Management, page 73-37](#) for more scenarios that can put the device in the Configuration Required mode.

---

Whenever the device state is changed to any of these three states, the state is indicated in the device selector with an explicit icon. This change in device state can be seen in both Configuration Manager and Image Manager. The normal state of the device when there is no image update operation on the device is the *Operational* state.

**Tip**

---

To manually reset the device state to normal or *Operational* status, select the device(s) in the device selector in Configuration Manager or Image Manager, right click, and select Make Device Operational.

---

This section contains the following topics:

- [Validating a Proposed Image Update on a Device, page 73-23](#)
- [Using the Image Installation Wizard to Install Images on Devices, page 73-26](#)
- [Install Bundled Images on Devices, page 73-30](#)
- [Install Compatible Images on Devices, page 73-31](#)
- [Install Images on Selected Devices, page 73-32](#)

## Validating a Proposed Image Update on a Device

You can validate the image update job on one or more devices prior to actually performing it. The following list details the various validations that are performed:

- Insufficient disk space on the ASA device to accommodate the selected images.

An error is displayed in this case. You must navigate to the Storage tab for that device and delete one or more images to make space. Then retry the upgrade validation operation.

---

**Note** The disk space on each of the members in the Cluster and both active and standby units in a Failover are evaluated for sufficient space to accommodate the selected images. When a single member or device does not have sufficient space, an error is displayed and you cannot proceed to creating a job on the device. You must navigate to the Storage tab for that particular member and make space by deleting one or more unwanted images.

---

- Insufficient RAM on the device to run the new image as recommended in: [Release Notes for the Cisco ASA 5500 Series, 8.4\(x\)](#).

---

**Note** Image Manager will warn you if there is insufficient RAM on the device to load the new image. However, this will not stop you from performing an image upgrade. This is in contrast with Configuration deployment, wherein the deployment job stops if there is insufficient RAM.

---

- If the flash device (disk0 or disk1) that is selected for Image Install Location is not present on any of the devices/members in cluster/failover setup, then an error is displayed and the job is aborted.
- Configuration changes that have been submitted but not yet deployed to the device. These changes need to be deployed before starting the image update job. Otherwise, the configuration changes may become incompatible with the upgraded image version on the device.
- Warn if the selected image(s) is (are) incompatible with the device type, for example, if non-SMP images are selected for ASA 5585 device types.

---

**Note** This warning only occurs when you are using the drag-and-drop method. For other flows, the incompatible images/devices are filtered out in step 2 of the Image Install Wizard.

---

---

**Note** This validation was skipped in Cisco Security Manager 4.3 if Check for updates is not performed due to the unavailability of meta-data information about images on Cisco.com compatible with MDF IDs. In Cisco Security Manager 4.4, the meta-data information are prepackaged with Cisco Security Manager install and hence even if Check for updates is not performed, Image manager will validate the compatibility of images for device types and warn the user when an incompatible image-device combination is chosen.

---

- Warn if the device is being updated to a version that is unsupported on Security Manager.
- Warn if the new image version is the same as or lower than the version running on the device.
- An image upgrade to ASA Version 8.3 from any lower version would require the device to be re-discovered in Security Manager. There were major changes in the NAT configuration introduced in ASA version 8.3 that are incompatible with previous ASA versions. Likewise, there were major

changes to the NAT policy model in Security Manager for Version 8.3. Hence, when a device is upgraded to ASA 8.3, that device is put into the Configuration Required state to indicate to the Configuration user that some changes are required in Configuration Manager to make the device operational. After rediscovering the device in Security Manager, the user can right-click the device in the device tree and select Make Device Operational to bring it back to normal state.

- An image upgrade from ASA Version 8.3.x to 8.4.2 or later versions also requires rediscovery of the device in Security Manager because of incompatible changes in PAT configuration in ASA Version 8.4.2. In this case also, the device state is changed to the Configuration Required state after the image upgrade.
- An image upgrade from ASA Version 8.x to 9.0.1 or later requires rediscovery of the device in Security Manager because of incompatible changes in Unified access rules, inspection, and NAT rules.
- An image upgrade from ASA Version 7.x to 8.x introduces major changes in the SSLVPN configuration both on the device and in Security Manager. Because of these incompatible changes, the device must be deleted from Security Manager after the image upgrade and then added again. The device is put into the Configuration Required state to notify the user to act upon these warnings.
- Any VPN image, such as an AnyConnect, CSD, or Hostscan image, being loaded using Image Manager warns the user if the existing VPN image was part of a shared policy being assigned to the current device or other devices. A warning is issued to also copy the new image to all the devices to which the shared policy is assigned so that the shared policy can be updated for all the devices seamlessly without the loss of policy sharing.
- Warn when the standby unit in a failover pair is not reachable. This is an error that will cause the job to be aborted.
- Warning for upgrade of Active/Standby failover pair. The version being upgraded should comply with the recommendations listed at: [ASA/PIX: How to Use the CLI to Upgrade the Software Image on a Failover Pair](#).

---

**Note** The same warnings are also applicable for an ASA in cluster configuration.

---

- Warning for upgrade of Active/Active failover pair that the image update job will be aborted unless the pair is converted to Active/Standby (that is, if all the failover groups are active on one physical unit).

**Note**

---

Additional validations are required for a "device" that is a designated control unit of the cluster. In addition to a check that is similar to that for Active/Standby Failover, there is also a check that the cluster image is compatible with supported platforms. A cluster cannot be downgraded to a version less than 9.x.

---

To validate an image installation, do the following:

- 
- Step 1** From the File menu, select **Validate**.  
The Validate Image Assignments window opens.
- Step 2** Click **Add Assignment**.  
The Image Assignment window opens.
- Step 3** In the Image Assignment window, from the drop-down list, select either:
- Select Images and Assign to Devices

- Select Devices and Assign to Images

---

**Tip** The same result is obtained by assigning images to devices or by assigning devices to images.

---

**Step 4** Select one or more items (images or devices) by moving them to the window on the right.

---

**Tip** You can use pre-defined bundles rather than images by clicking **Bundles** and selecting the bundle.

---

**Step 5** Click **Next** and assign the other item (images or devices).

The Confirm Assignments window appears.

**Step 6** Examine and confirm the assignments that you have specified.

---

**Tip** You can continue to add or remove assignments, as required.

---

**Step 7** Click **Finish**.

The Validate Assignments window appears.

**Step 8** Click **Start Validation**.

The validation status of the assignment is shown in the Validation column. It shows either Warning or Successful or Error.

**Step 9** Click on the display of Warning or Successful or Error.

A lower pane window opens.

**Step 10** According to the validation status, do one of the following:

- **Error**—Examine the potential reasons for the error and correct as necessary.
- **Warning**—Examine the potential reasons for the warning and correct as necessary.
- **Successful**—No action required.

---

**Tip** Be sure to display and examine all the errors or warnings by using the window slider bar on the right.

---

**Step 11** After addressing the warnings or errors shown, you can proceed to create the job using the Image Install wizard.

**Step 12** Optionally, you can right-click on an assignment element in the Validate Image Assignments window and modify or delete it before proceeding.

**Step 13** You can also right-click on an assignment and select **Copy Table**. This copies the assignment details and the validation status and notes. You can then paste the contents to Notepad or another program as a CSV file to be used as reference.

---

## Using the Image Installation Wizard to Install Images on Devices

You can use this feature to create a job to assign and install images on devices. An assignment is simply an association of an image and a device that defines an installation job.

**Note**

If you have the workflow function enabled, you must perform the additional steps described for obtaining authorization before you can accomplish installation.

**Note**

You can choose to operate upon any arbitrary set of devices.

To create a job to install images on devices, do the following:

**Step 1** Go to Files > Open Image Installation Wizard.

The Image Installation Wizard dialog box appears.

**Tip**

The Image Installation Wizard can be invoked in several ways. In addition to invoking the Wizard from the menu, as described here, you can invoke it when you do any one of the following things: (1) install images by the drag-and-drop method; (2) right-click on a device or bundle; or (3) select a device, navigate to the Compatible Image tab, select one or more images from the table, right-click, and select the **Install** option.

**Step 2** On the lower left, click **Add Assignment**.

The Image Assignments dialog box appears.

**Step 3** From the drop-down list on the top, select whether you want to assign images to devices, or devices to images.

**Step 4** Move items (devices or images) from the list on the left to the selected items list on the right. Then click **Next**. You can also select bundles, instead of images, by clicking the Bundles tab.

**Tip**

When pairing images and devices to define assignments, you can proceed with images and then devices, or devices and then images. The order of this selection does not matter.

**Step 5** Review the assignment definition in the Confirm Assignments dialog box and click **Finish**.

**Tip**

At this point you can choose to add additional assignment pairs, as desired, by clicking **Add Assignment**.

**Step 6** When you are finished defining assignments, click **Start Validation**. Wait until the system displays Validation Complete.

**Step 7** Examine the status in the Validation column on the Assignments tab of the Wizard dialog box. It shows either Warning or Successful or Error.

**Step 8** Determine what steps are necessary according to the status:

- **Error**—Examine the potential reasons for the error and correct as necessary.
- **Warning**—Examine the potential reasons for the warning and correct as necessary.

- **Successful**—No action required.

**Step 9** Right-click on the assignment for more options:

- **Move Up/Move Down**—Select these options for a multi-device job when you want to change the order in which the devices will get updated. This feature can be used to order or sequence the devices when the Install Images to Devices job option is set to Sequential.
- **Delete/Delete All**—You choose these options to remove one or all devices from the image upgrade job.
- **Copy Table**—Use this to copy the warning messages to some text editor or spreadsheet program for reference.
- **Test File copy**—Use this option to check whether files can be copied between Security Manager Image repository and ASA device flash using https protocol.

---

**Tip** Be sure to display and examine all the errors or warnings by using the windows slider bar on the right.

---

**Step 10** If you want the installation job scheduled for a particular time, select the **Schedule** tab and specify the date and time.

**Step 11** To set properties of the installation job, select the **Properties** tab.

- Edit the **Name**, if desired. (The default is Image install Job—<timestamp>)
- Edit the **Description**, if desired.
- Select a **Ticket ID**, if desired.

---

**Tip** Starting from release 4.4, Ticket ID field in Image Manager has been decoupled from Config Manager. It is now just a ‘tag’ and can be any arbitrary string. Ticket ID field is an editable combo box with auto completion that shows tickets created earlier both in Image Manager and Configuration Manager. Also, there is no dependency on Ticketing mode in Configuration Manager for Ticket ID field. Ticket ID is an optional field and can be left blank. Global search in Configuration Manager also supports tickets used in Image Manager and lists the Image Installation jobs with which the ticket is associated.

---

- Set the **On Error** option. (Default is Stop Installation, alternative is Continue Operation.)
- Set the **Backup Current Image** option. (Default is Yes, alternative is No.)

---

**Tip** This is only applicable for system software images

---

- Set the **Install images to devices in** option. (Default is parallel, alternative is Sequential.)
- Select one of three operations:
  - Install image and reboot device
  - Install image but do not reboot device
  - Only copy image onto devices
 – Select the **Non-Intrusive: Does not trigger failover** check box to copy the image without switching the failover devices.
- If you are using Workflow, you can optionally configure the following approval options:

**Tip**

---

These are located in the top frame in Job properties for the job.

---

- **Action**—
- Approve
- Reject
- Deploy
- Submit

If you reject a job, the status is set to Rejected, after which you discard the job. When you discard a job the status is shown as Discarded and all the job's action buttons are disabled.

If you approve a job, the status is set to Approved. Then, you must click Deploy to start the image upgrade job.

- i. Beginning with version 4.12, Security Manager provides an option to select the Storage URL for ASA multi-context devices running the software version 9.6(2) or later. You can select either Shared or Private Storage URL for the selected user context. By default, Shared is selected.

**Tip**

---

You can check running commentary by selecting the Details tab, and clicking **Show Progress**.

---

After you deploy a job, the job status is shown as either Deployed or Failed. The History tab in the bottom pane (for the selected job) only is activated in WF mode and displays one of two job action flows:

- Creating/ Edit-In-use/ Submitted/ Rejected/ Discarded
- Creating/Edit-In-use/ Submitted/ Approved/ Deploying/ Deployed (or Failed)
- **Submit the job**—This is checked by default
- **Approver email**—The email address list of approvers
- **Submitter email**—The email address of the person submitting the job

- j. You can change job properties by clicking **Edit**.

- k. Refer to [Viewing Install Jobs, page 73-34](#) for additional job viewing options.

**Step 12** Click **Install**.

The Jobs page appears and the install job is shown with its status as Deploying.

**Note**

---

If a schedule was selected for the job, the job state is shown as Scheduled. The job will start deploying at the scheduled time and, at that time, the job state changes to Deploying.

---

**Note**

---

If workflow is enabled for Image Install Jobs, then the job state is changed to either Submitted or Edit-in-Use. In this mode, the job can be deployed only after it has been approved. Please refer to [Image Installation Job Approval Workflow, page 73-36](#) for details on the job states in the workflow mode.

---

**Tip** You can halt the job by clicking **Abort**. Please see [Aborting an Image Installation Job, page 73-35](#) for important information about aborting an installation job.

You can discard a job before the scheduled run time by clicking **Discard**.

- Step 13** When the job starts deploying, notice the change in the state of the devices to *Update in progress* state in the device tree in Configuration Manager and Image Manager. A green progress icon appears beside the device in the device tree.
- Step 14** View the details of the job and its progress while it is in deploying state. Please see [Viewing Install Jobs, page 73-34](#) for details.
- Step 15** Wait for the job to complete.
- The job state is changed to *Deployed* if all the devices are successfully updated. The job state is changed to *Failed* if one or more devices failed in the job.
- Step 16** Notice the change in state of the device(s) in the device tree after the job is complete.
- If the image update is successful and there are no further configuration changes required in Configuration Manager, the device will be moved back to *Operational* state. If there are configuration changes required on the device after the update, then device is moved to *Configuration Required* state. Clicking on the device in the device tree brings up a balloon tip with details of the state and actions to be taken to move the device state back to *Operational*.
- If the image update fails on the device and the device is rendered unreachable during the image update operation, the device is put to *Maintenance* state.
- Step 17** Verifying the image update:
- a. Click on the device in the device tree in Image Manager.
  - b. Go to the Summary tab to view the updated Running OS version.
  - c. Go to the Running Images tab to view the new running images after the image update.
  - d. Select the device in Configuration Manager.
  - e. Right-click the device and select **Device Properties**.
  - f. Notice the new image version updated in Running OS Version field.
  - g. Go to **Configuration Manager > Manage > Configuration Archive**.
  - h. From the device CLI, enter *sh ver*  
The updated OS version should be displayed.
  - i. Select the device in the left device tree.
  - j. View the Configuration Archive versions in the right pane and notice the latest entry with the Archival Source as *Image Manager*.
  - k. Select the archived entry and click **View**.
  - l. Compare this entry with the previous archived version to view the configuration changes made by Image Manager during image update. You can view the boot commands being prepended for the new ASA system software image and/or ASDM image command being added for the new ASDM image.
  - m. Email notification will be sent to configured recipients with the status of the Image Upgrade job if email notification is configured in Image Manager administration settings.

- Step 18** If the device is set to *Configuration Required* or *Maintenance* state after the image update operation, follow the steps below to complete the post-image update requirements to make the device functional from Configuration Manager:
- a. Click on the device in the device tree in Configuration Manager or Image Manager.  
A balloon tip appears showing the device information.
  - b. View the contents of the balloon tip. Review the reason for the device being set to the *Configuration Required* or *Maintenance* state. Review also the recommended actions to be taken.
  - c. Perform the recommended actions.
  - d. Right-click the device in the device tree and select **Make Device(s) Operational**.  
The device is moved to *Operational* state and the icon beside the device in the device tree is removed.

**Note**

Before initiating an install job for Cisco Firepower 1000 and 2000 series devices operating in Appliance Mode, you must ensure to select the No option for the Backup Current Image field in the Properties panel.

## Install Bundled Images on Devices

You can use the Image Manager tool to assign and install compatible images that are grouped as bundles. Bundles simplify repetitive operations and can ensure consistent actions are taken on a group of devices. To selectively install an image bundle on a device or device group, do the following:

- Step 1** Drag and drop the bundle onto a device or device group.  
The Install images on devices dialog box appears with device and images in the bundle pre-assigned. If the bundle is dropped onto a device group, all the devices in the group are automatically selected and assigned to the images in the bundle.
- Step 2** Investigate any assignment validation errors or warnings listed in the Install images on devices dialog box.

**Tip**

You can choose to schedule the job and also modify the default properties for the job. Please see [Using the Image Installation Wizard to Install Images on Devices, page 73-26](#) for details on scheduling a job and configuring job properties.

- Step 3** When your warnings are corrected (or you determine them to be insignificant), click **Install**.

**Note**

Alternatively, you can right-click a bundle and select **Install** to launch the Image Installation wizard with the bundle pre-selected. You can then choose the devices and click **Install** to install the bundle on the selected devices.

## Install Compatible Images on Devices

You can use Image Manager to install compatible images on devices.

To selectively install one or more compatible images on a device or device group, do the following:

- 
- Step 1** Select a device in the Devices area of the selector and navigate to the Compatible Images tab.
- Step 2** Select one or more Repository images in the Compatible Images tab.
- Step 3** Right-click a selected image and click **Install**.
- The Image Installation wizard appears with the selected images pre-assigned or moved to the right pane in the Select Image page.
- Step 4** Click **Next**.
- The Select Devices page of the wizard is displayed.
- Step 5** Select the devices to which you want to install, and then click **Next**.
- The Confirm Assignments page of the wizard is displayed.
- Step 6** Confirm the devices and images assignments, and then click **Finish**.
- The Install images on selected devices dialog box appears with the devices and image(s) assigned.
- Step 7** Click **Start Validation** in the upper-right corner of the Assignments tab. Investigate any assignment validation errors or warnings listed in the Install images on devices dialog box.

Beginning with version 4.9, Security Manager provides an enhanced validation procedure for installing images on devices:

- If you have downloaded the images from CCO using the Image Manager, before installing the images to the device, the serial number of the device is verified for the service contract. If the device has a valid service contract, the image will proceed with the installation or upgrade process. If the device does not have a valid service contract, the image will not proceed with the installation or upgrade process.
- If you have copied the images from the local file system to Image Manager, the service contract validation will not be performed for the device and you can proceed to install the image on the device.

**Tip**

You can choose to schedule the job and also modify the default properties for the job. Please see [Using the Image Installation Wizard to Install Images on Devices, page 73-26](#) for details on scheduling a job and configuring job properties.

- Step 8** When your warnings are corrected (or you determine them to be insignificant), click **Install**.

The image installation job is created. Please see [Using the Image Installation Wizard to Install Images on Devices, page 73-26](#) for the remaining steps to monitor the job progress and verify the image update.

**Note**

Alternatively, to install one or more images on a device or device group, you can drag multiple images from the Repository view and drop them onto a device or device group. Then, click **Install** to install the selected image(s) on the selected device(s).

## Install Images on Selected Devices

You can use Image Manager to upgrade the images on a set of devices that you select.

To install images on a selected set of devices, do the following:

---

**Step 1** Select a device group in the Devices area of the selector.

**Step 2** View the listing of devices in the group in the right pane.

**Step 3** Select one or more devices from the list.

---

**Tip** Use the Shift and Control keys to select multiple devices.

---

**Step 4** Right-click a selected device and click **Install**.

The Image Installation wizard appears with the selected devices pre-assigned or moved to the right pane in the Select Devices page.

**Step 5** Click **Next**.

The Select Images page of the wizard is displayed.

**Step 6** Select the images you want to install, and then click **Next**.

---

**Tip** You can also select a bundle in the Bundles tab.

---

The Confirm Assignments page of the wizard is displayed.

**Step 7** Confirm the devices and images assignments, and then click **Finish**.

The Install Images on selected devices dialog box appears with the devices and image(s) assigned.

**Step 8** Click **Start Validation** in the upper-right corner of the Assignments tab. Investigate any assignment validation errors or warnings listed in the Install images on devices dialog box.

---

**Tip** You can choose to schedule the job and also modify the default properties for the job. Please see [Using the Image Installation Wizard to Install Images on Devices, page 73-26](#) for details on scheduling a job and configuring job properties.

---

**Step 9** When your warnings are corrected (or you determine them to be insignificant), click **Install**.

The image installation job is created. Please see [Using the Image Installation Wizard to Install Images on Devices, page 73-26](#) for the remaining steps to monitor the job progress and verify the image update.

---

## Working with Jobs

This section details the set of functions that assists in the performance of the image installation jobs. An image installation job may be immediately run, or it may be scheduled to run at a specified time and date. As Image Manager jobs tend to be time-consuming, the job management functions enable you to perform these operations in the background. Image Manager incorporates an optional ticketing system that enables you to easily locate a job or jobs by means of a unique Ticket ID.

You should understand that the details of a particular job are defined and validated before being run. This section contains the following topics:

- [Viewing Image Installation Job Summary, page 73-33](#)
- [Viewing Install Jobs, page 73-34](#)
- [Aborting an Image Installation Job, page 73-35](#)
- [Retry a Failed Image Install Job, page 73-35](#)
- [Roll Back a Deployed Job, page 73-35](#)
- [Image Installation Job Approval Workflow, page 73-36](#)

## Viewing Image Installation Job Summary

You can use the Image Manager tool to monitor image installation and deployment jobs. You can view the history and status of jobs that Image Manager has performed, as well as the summary, details, or history of any particular job.

**Note**

Comprehensive details of job state changes are available in Configuration Manager (see [Job States in Non-Workflow Mode, page 8-4](#) or [Job States in Workflow Mode, page 8-6](#)). For an Audit Report navigate to Configuration Manager > Manage > Audit Report.

To view a summary of image installation jobs, do the following:

**Step 1** In the selector, under Jobs, click **Install Jobs**.

The main window displays the Jobs list in the upper pane.

**Step 2** Examine the details of the Jobs list, which may include:

- **Name**—The name of the job. By default the name includes a time stamp.
- **Last Action**—Date of the last action.
- **Status**—Whether the job has deployed, failed, or is underway.
- **Changed By**—Who started the job.
- **Description**—Job description.
- **Schedule**—Job schedule.
- **Ticket ID(s)**—Tickets are just tags attached to Image Manager job to track changes. These tickets may be tickets created in Configuration Manager, but are not mandated to be so.

**Step 3** Optionally, you can find and select a single job about which more information is then displayed in the lower pane. This includes:

- Summary
- Details
- History

**Tip**

While viewing the lower pane Details tab, you can select a device and then view a log of the job in the lower right pane.

---

**Note** These are dockable windows. You can customize the default view.

---

## Viewing Install Jobs

You can view the details associated with a particular Image Management job.

To view the details associated with a job, do the following:

---

**Step 1** In the selector, under Jobs, click **Install Jobs**.

---

**Tip** The Status column in the Jobs selector indicates whether a job is Submitted, Approved, Deployed, In Progress, or Failed.

---

The main window displays the Jobs list in the upper pane.

**Step 2** Select a job to examine.

---

**Tip** To find a particular job, you can sort the Jobs list by any of the column headings, including Name, Last Action (chronology), Status (e.g., Deployed, Failed), Description, and so forth. You can also find a particular job by using the search window to enter a filtering string.

---

---

**Note** The location of the jobs folder is CSM-ROOT\files\vms\jobs directory.

---

**Step 3** Examine job summary information by clicking **Summary** in the lower pane.

The lower pane displays job summary information including Image Management Job Name, Devices to be Deployed, Devices Deployed Successfully, and Devices Deployed with Errors.

**Step 4** Examine job summary details by clicking **Details** in the lower pane.

Details of the Devices, New Image, Old Image, and the device status are displayed.

**Step 5** Examine the Commentary on the devices in the job by clicking on the vertical **Commentary** tab on the far right. This shows the progress of the image install operation on the device.

**Step 6** Examine the Transcript of the devices in the job by clicking on the vertical **Transcript** tab on the far right. This shows the chronology of the commands executed on the device and their responses.

**Step 7** Examine job history details by clicking **History** in the lower pane. This shows the history of the transition in the job state.

---

**Note** This information is visible only in the workflow mode.

---

## Aborting an Image Installation Job

You can abort an image installation job by clicking **Abort** from the Jobs page. This option is effective only for multi-device jobs:

**Note**

If the job involves a single device, then Abort will have no effect after the job begins and the job will always run to completion.

- If the Sequential option is selected, then all the devices on which the job has not yet started will be aborted.
- If Parallel is selected, then all the devices till that batch will undergo image upgrade. All devices from the next batch onwards will be aborted.

## Retry a Failed Image Install Job

If your attempts to deploy an image to one or more devices fails, you can retry the job. However, you should retry the entire job and not attempt to simply continue from a failed step.

To retry a failed job, do the following:

- 
- Step 1** To determine that an installation job has failed, go to the Jobs section in the selector and click **Install Jobs**.
- The Jobs page appears.
- Step 2** Determine the status of the job in question by examining the Status column.
- 
-  **Tip** A green check icon with the word Deployed indicates success. A red X icon indicates failure.
- 
- Step 3** Investigate possible reasons for job failure.
- Step 4** Select the failed image install job from the job list and click **Retry** from the toolbar atop the upper pane.
- The Install Images on Devices window appears. You can observe the validation warnings as you would in a normal install job.
- Step 5** As required, you can change the images, devices, schedule, or job properties to be used.
- Step 6** From within the Install Images on Devices window click **Install**.
- Step 7** Determine that the retried attempt is successful by observing the newly created job.
- 

## Roll Back a Deployed Job

You can roll back the changes from a deployed image installation job.

To roll back a Deployed job, do the following:

- 
- Step 1** From the job list, select the image install job to be rolled back and click **Rollback** from the toolbar atop the upper pane.

The Install Images on Devices window appears. You can observe the validation warnings as you would in a normal install job.

- Step 2** As required, you can change the images, devices, schedule, or job properties to be used in the rollback.
  - Step 3** From within the Install Images on Devices window click **Install**.
  - Step 4** Determine that the rollback attempt is successful by monitoring the newly created job.
- 

## Image Installation Job Approval Workflow

Image update is a critical operation that has the potential to cause downtime for devices and your network. Hence, change control and management for image install operations is crucial. Change management for image installation jobs is done using the Deployment Workflow framework of Configuration Manager. This ensures that all image installation jobs need to be approved before getting executed or deployed.

To use workflow with image installation jobs, do the following:

- 
- Step 1** Enable workflow for image installation jobs:
    - a. In Configuration Manager, select **Tools > Security Manager Administration > Workflow**.
    - b. If workflow is not already enabled, select **Enable Workflow**.
    - c. Select **Require Deployment & Install Image Approval**.
    - d. Configure the email address of the person responsible for approving the image installation job in the Job/Schedule Approver field. For more information, see [Workflow Page, page 11-75](#).
    - e. Click **Save** and then **Close**.
    - f. Launch Image Manager and navigate to **Install Jobs**. Notice the new buttons available in the Menu bar for job state transitions in workflow mode: Submit, Approve, Reject, and Deploy.
  - Step 2** To create and execute an image installation job with workflow enabled:
    - a. Use any of the previously documented procedures to create an image installation job. See [About Image Updates on Devices Using Image Manager, page 73-20](#).

---

**Note** There is an additional option in the Properties tab to Submit the Job. Check this option to automatically submit the job for approval after creation of the job.

---

- b. Once the image installation job is created, note the state of the job in the Image Install Jobs View.
- c. Select the job and click **Submit** to submit the job for approval if automatic submit option was not selected while creating the job.
 

The job Approver (user with Approver role/privileges) receives an email notification to approve the job.
- d. The Approver can log in to Security Manager, launch Image Manager, and navigate to the job.
- e. The Approver clicks **Approve** to approve the job after reviewing the details of the upgrade, that is, image being upgraded to, job properties, schedule, and so on.
 

Job state is changed to *Approved*. The creator of the job receives an email that the job has been approved. Now the job can be deployed.

- f. If the Approver is not convinced after reviewing the job details, he can choose to reject the job by clicking **Reject**.

The job state is moved to *Rejected*. The creator of the job receives an email that job has been rejected. A rejected job will not be deployed.

**Note** A rejected job will not be deployed. It can be edited and resubmitted for approval or it has to be discarded.

- g. Once the job is approved, the job can be deployed by clicking **Deploy**.  
The job state is changed to *Deploying* and image install job execution is started.
- h. If the job is rejected or any other changes are required to be made for a job, the job can be edited by clicking **Edit**.  
The Image Assignments page of the wizard showing all the devices and images is displayed. The user can modify the Job Properties, schedule and even delete some device-to-image assignments and submit the job for approval again by clicking **Submit**.
- i. If a job has not started executing, then the user can dismiss the job by clicking **Discard**.  
The job is moved to *Discarded* state. A discarded job does not execute and cannot be edited or moved to any other state.
- j. If the changed job is acceptable to the approver, he can approve the job this time and the job can be deployed as mentioned above.
- k. Once the deploying job completes execution it will be moved to *Deployed* state if the image installation is successful or it will be moved to *Failed* state if the image installation operation fails.

## Troubleshooting Image Management

This section addresses steps you can take to troubleshoot Image Management in response to particular symptoms.

Image installation job might show as failed due to the configured reboot time.

For cluster and failover devices, the reboot time between the standby device and primary device is, by default, set to 15 minutes. If the devices have large configurations, the Image installation job might show as failed due to the configured reboot time. The device will be updated with the image after the configurations are complete. However, due to inconsistencies in reboot time, Security Manager will show the job as failed.

To modify the reboot time, do the following.

- Go to `%NMSROOT%\MDC\tomcat\vms\athena\WEB-INF\classes`.
- Open the `swimng.properties` file.
- In the following code, modify the `reloadTime` property:

```
##MAX_RELOAD_WAIT_TIME for the primary or cluster device
```

```
#default time will be 15 mins (15*60*1000)
```

```
reloadTime = 900000
```

- Manually restart the Cisco Security Manager Daemon Manager service.

**No data for devices in Image Manager, after Security Manager upgrade.** Any one of the following operations that first contacts the device will collect the image inventory for the device:

- Rediscover the device choosing to discover only Device Inventory
- Perform a live deployment to device
- Perform an Image Install operation to the device

#### **Image Download from Cisco.com Fails**

- Go to Configuration Manager > Tools > Security Manager Administration.
- Select Image Manager.
- Click **Test Connection** to ensure the server is reachable.
- Check *%NMSROOT%/MDC/athena/config/\*\*\*\*-CCOMetaData.xml* for error in downloading metadata information for particular MDF IDs.

#### **Update or Image Download fails due to certificate mismatch, unavailability, expiration, or other cause.**

- Employ the recommended actions cited by the error message. Use the failed download URL from the error message to retrieve the certificate.
- View the stored certificate at *%NMSROOT%/MDC/certificates/\*.ser* (Serialized object--file contents are unintelligible and cannot be viewed in any editor.)

#### **Image Download from Cisco.com Fails with Message: "User not authorized to download file"**

- Go to Configuration Manager > Tools > Security Manager Administration.
- Select Image Manager.
- Click **Test Connection** to ensure the server is reachable.
- Register your acceptance of the Cisco Encryption Software Usage Handling and Distribution Policy.

**Tip**

---

The policy is found at: <http://tools.cisco.com/legal/k9/controller/do/k9Check.x?eind=Y>.

---

#### **Image Download from Cisco.com is Slow**

- Ensure proxy is configured
- Trace route from Security Manager to Cisco.com

#### **Check for Updates Fails**

Go to the Security Manager administrative settings page and test connectivity to Cisco.com. Check *%NMSROOT%/MDC/athena/config/\*\*\*\*-CCOMetaData.xml* for an error in downloading metadata information for particular MDF IDs.

Message: "User not authorized to download file." Go to the Security Manager administrative settings page and test connectivity to Cisco.com. Accept the crypto agreement at <http://tools.cisco.com/legal/k9/controller/do/k9Check.x?eind=Y>

#### **Image Download from External File System or Network Fileshare Fails**

- Check that you have proper permissions/credentials for the external file system or fileshare.
- Open the fileshare on the client, drag the image and drop it on Image Manager.

**Image Install Wizard does not Show Compatible Images**

- Image Manager uses the information on Cisco.com to determine the compatibility of the images for the MDF IDs. Please download the latest images available on cisco.com by performing 'Check for Updates'. If the image is available on Cisco.com and listed as compatible for the platform, you should now be able to view these images for the device in the Image Install Wizard and also in the Compatible Images tab for the device.
- Even the Compatible Images tab for the device may not show some images that are actually compatible to the device.
- If you still don't see the images in the Install Wizard, either because you do not have Cisco.com connectivity or images are not updated on Cisco.com for that platform, you can use the drag and drop procedure to install the images on the device. You would be warned that the image is not compatible, but you can still go ahead and install the image by dragging the image and dropping it on to the device and creating a job.

**Image Copy Failure –"HTTP 413 Error"**

- Right-click **Device** in Image Manager > Test File Copy To Device
- Check Error Message in vmssharedsvcs.log
- If you encounter an HTTP 413 error, split the job to contain a smaller number of images in one job

**Image Copy Failure –"Not enough space on disk"**

- Check Device > Storage View for files on device and free space in the Image Install Location.
- If Device > Storage View shows files, then delete files from Storage to make space and retry.
- If Device > Storage View does not show files, either because it is a greenfield device or it is a Security Manager upgrade setup, rediscover only the device inventory on the device and then delete files from Storage view to make space.

**Image Install Job failure –Error: "Invalid flash device"**

- Check if flash exists on the device:
  - Right-click on device in IM > Test File Copy to Device
  - Connect to device, and check whether it is a multiple-context device that is being managed as a single context device in Security Manager
  - Rediscover the device selecting to discover **System Context**. Then, retry the image install job.

**Image Upgrade Job on Active/Standby pair fails**

- Error: *"This host is not the 'active' device in the failover pair"* - Ensure that the failover pair is managed in Security Manager via the IP address of the active device in the failover pair and not the IP address of the standby device.
- Error: *"Secondary device is not in standby-ready state"* - Ensure that the devices in the failover pair are up and the standby device is in standby-ready state. Job will abort if standby device is in failed state

**Image Install Job failure –Error: "SWIM1114: Device could not be reached after upgrade"**

- Manually check if device is reachable. Solution: After image upgrade, device has to be re-added in Security Manager or change the Admin option to "Do not check certificate authentication"
- Check whether Tools > Admin > Device Communication > SSL Certificate Parameters > PIX/ASA/FWSM Device Authentication Certificates is set to "Retrieve while adding devices."

- After image upgrade, ensure the device has been re-added in Security Manager. Otherwise, change the Admin option to "Do not check certificate authentication."

**Note**

---

You must have accepted the latest Cisco.com certificate to enable Image Manager to interface with cisco.com. You must accept the certificate from both the "Image Meta-data locator" site and the download site of the images to start downloading images successfully (see [Image Manager Page, page 11-41](#)).

---

**No data for devices in Image Manager after Security Manager upgrade**

- Rediscover the device choosing to discover only Device Inventory
- Perform a live deployment to device
- Perform an image install operation to the device

**Trying to retry or rollback a job fails**

- Check if any of the devices in the job are deleted from Security Manager
- Check if none of the images to be retried or rolled back to are unavailable in Security Manager. Add the images to the Security Manager repository and retry the operation
