| TFTP Server for Rollback                                                                            | The fully-qualified DNS hostname or IP address of the server to use for TFTP file transfers. TFTP is used during rollback for IOS devices when the configuration cannot be updated using the <b>configure replace</b> command, which does not force a system reload. Enter <b>localhost</b> to use the Security Manager server.<br><br>By default, a TFTP server is enabled on the Security Manager server. If you specify a remote TFTP server, you must configure that server appropriately to provide TFTP services. |
| TFTP Root Directory                                                                                 | The root directory for configuration file transfers if you are using the Security Manager server as the TFTP server. Click <b>Browse</b> to select a directory on the Security Manager server.<br><br>If you specify a server other than the Security Manager server as the TFTP host, Security Manager always uses the root directory of that TFTP server. You cannot specify a non-root directory for remote TFTP servers.                                                                                            |
| Save button                                                                                         | Saves and applies changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Reset button                                                                                        | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Restore Defaults button                                                                             | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## CS-MARS Page

Use the CS-MARS page to register the Cisco Security Monitoring, Analysis and Response System servers that are monitoring your devices with Security Manager. By registering your CS-MARS servers, you can view messages and events captured in CS-MARS based on a device's firewall access rules or IPS signature rules configured in Security Manager. You must register a CS-MARS server before users can see events collected from it.

### Tip

If you are using CS-MARS global controllers, add them instead of the individual local controllers. By adding global controllers, Security Manager can identify the correct local controller for a device automatically, without you having to add each of the local controllers. This simplifies your CS-MARS configuration in Security Manager.

**Navigation Path**

Select **Tools > Security Manager Administration** and select **CS-MARS** from the table of contents.

## New or Edit CS-MARS Device Dialog Box

Use the New or Edit CS-MARS Device dialog box to register a CS-MARS server with Security Manager. Users can obtain messages or event status for a device's firewall or IPS policies from the CS-MARS server that is monitoring the device. For more information, see [Registering CS-MARS Servers in Security Manager, page 72-40](#).

**Navigation Path**

From the [CS-MARS Page, page 11-7](#), click the Add button to add a new server, or select a server and click the Edit button.

**Field Reference****Table 11-7 Add or Edit CS-MARS Device Dialog Box**

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CS-MARS Hostname/IP                                   | The IP address or fully-qualified DNS host name of the CS-MARS server.<br><br><b>Tip</b> If you add a CS-MARS global controller, do not add any of the local controllers that the global controller monitors. Security Manager will automatically determine the local controller that is monitoring a specific device. Adding global controllers simplifies your CS-MARS configuration.                                                                                                            |
| Username<br>Password<br>User Type                     | The username and password for logging into the server to validate that the CS-MARS server is running the appropriate software version and to obtain other basic information. Security Manager also uses this account to determine which CS-MARS server is monitoring a particular device.<br><br>For CS-MARS local controllers, you can enter either a global or local user account. For global controllers, you must enter a global account. Identify the type of account in the User Type field. |
| Certificate Thumbprint<br>Retrieve From Device button | The CS-MARS server certificate, a hexadecimal string that is unique to the device. Click <b>Retrieve From Device</b> to have Security Manager retrieve the certificate from the CS-MARS server.<br><br>If the certificate is retrieved successfully, it is displayed. After verifying the certificate, click <b>Accept</b> to save it on the Security Manager server. You must have a correct certificate to use the CS-MARS server from Security Manager.                                         |

## CSM Mobile Page

Use the CSM Mobile page of the Security Manager Administration window to enable or disable the CSM Mobile feature in Cisco Security Manager. If the CSM Mobile feature is enabled, users can access device health and summary information from mobile devices by navigating to the following link, where <SecManServer> is the DNS name or IP address of the Security Manager server:

<https://<SecManServer>/mobile/>

or

<https://<SecManServer>/mobile>

For more information about the types of information provided, see [Dashboard Overview, page 72-1](#).

For more information about CSM Mobile, see [CSM Mobile, page 72-11](#).

**Navigation Path**

Click **Tools > Security Manager Administration** and select **CSM Mobile** from the table of contents.

**Field Reference****Table 11-8 CSM Mobile Page**

| Element                   | Description                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable CSM Mobile Feature | Lets you enable or disable the CSM Mobile feature. If you disable this feature, you cannot access device health summary information from mobile devices. |
| Save button               | Saves and applies changes.<br>If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.      |
| Reset button              | Resets changes to the last saved values.                                                                                                                 |

## Customize Desktop Page

Use the Customize Desktop page to control whether Security Manager applications close automatically after being idle for a specified time, to reset whether you are prompted to verify your actions in certain circumstances, and to control whether certain file operations can be performed on the Security Manager client.

**Navigation Path**

Select **Tools > Security Manager Administration** and select **Customize Desktop** from the table of contents.

| Element                               | Description                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reset 'Do Not Ask' on Warnings button | Click this button to reestablish 'Are you sure...?' pop-up warnings. When you perform some actions, you are warned about the consequences and you are given the option to not be warned again. If you selected Do Not Ask Me Again for any of these warnings, clicking this button reenables the warning. |

Table 11-9 Customize Desktop Page (continued)

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Idle Timeout<br>Idle Timeout (minutes) | <p>Whether to have the Security Manager client applications close automatically if you do not use them for the specified period of time. The timeout applies across all applications; working in one application resets the timer in all applications.</p> <p>If you select this option, enter the number of minutes that must elapse before closing the client in the Idle Timeout field. The default is to close the client after 120 minutes of inactivity.</p>                                                                                                                                                                                                                                                                                                           |
| Enable Client side file browser               | <p>Whether to allow file operations on the Security Manager client. If you select this option, you will be able to choose between client and server file systems when performing the following file operations:</p> <ul style="list-style-type: none"> <li>• Installing Security Manager license files</li> <li>• Installing IPS license files</li> <li>• Importing/exporting device inventory files</li> <li>• Importing/exporting shared policies</li> <li>• Creating the following file objects: <ul style="list-style-type: none"> <li>– Cisco Secure Desktop Package</li> <li>– Plug-In—For browser plug-in files.</li> <li>– AnyConnect Profile</li> <li>– AnyConnect Image</li> <li>– Hostscan Image</li> </ul> </li> </ul> <p>This option is enabled by default.</p> |
| <b>Global Search</b>                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Global Search                          | <p>Whether to enable or disable the Global Search feature. This feature is enabled by default.</p> <p><b>Tip</b> You can disable Global Search before performing bulk discovery or rediscovery of devices to improve performance. You can reenable Global Search and then recreate the index after discovery is complete or when users are least likely to be using the system.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| Recreate Index                                | Click this button to regenerate the search index. The global search feature is not available while the index is being recreated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Save button                                   | Saves and applies changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reset button                                  | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Restore Defaults button                       | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Debug Options Page

Use the Debug Options page to configure the severity level of messages to include in debugging logs and to determine what other debugging information is collected.

You should change debugging levels only if the Cisco Technical Assistance Center (TAC) asks you to change them. This makes it possible for you to include more detailed information in the CSMDiagnostics.zip file.

After you change the message level for the appropriate subcomponent, redo the actions that are resulting in system problems. After the problems occur, create the CSMDiagnostics.zip file (or the CSMDiagnostics\_light.zip file) by selecting **Tools > Security Manager Diagnostics... > General Diagnostics...** (or **Tools > Security Manager Diagnostics... > Light Diagnostics...**). You can then reset the debug options to the default levels so that the Security Manager server does not become bogged down collecting extra debug information. For more information about generating the CSMDiagnostics.zip file, see [Creating Diagnostics Files for the Cisco Technical Assistance Center, page 10-28](#).

By default, logs contain messages of the Error severity or worse. The severity levels in order of severity are:

- Severe—Problems that make the system unusable.
- Error—Problems from which Security Manager cannot recover.
- Warning—Unexpected conditions from which Security Manager can recover.
- Info—Informational messages.
- Debug—Internal status information.

### Navigation Path

Select **Tools > Security Manager Administration**, then select **Debug Options** from the table of contents.

### Field Reference

| Element                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Capture Discovery/Deployment Debugging Snapshots to File | <p>Whether Security Manager generates data files about configuration generation, deployment, and discovery as these functions are performed. The temporary data files are stored in the MDC\temp directory in the Security Manager installation folder on the server, and you can use these files for debugging purposes.</p> <p>Enable this setting if you encounter problems with deployment or discovery.</p> <p><b>Note</b> Selecting this check box slows down Security Manager response time. Enable this option only in limited circumstances.</p> <p>If you need to send these files to Cisco TAC for debugging, encrypt the files, because they can contain sensitive data such as passwords.</p> <p><b>Note</b> Do not delete any snapshot files under MDC\temp directory in the Security Manager installation folder while discovery (or) deployment is in progress. You can delete them when Security Manager is idle. In addition, ensure you are not deleting any of the default files.</p> |
| Deployment Debug Level                                   | The message severity level for deployment-related actions such as device communication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Event Manager Debug Level                                | The message severity level for the Event Manager subsystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 11-10** *Debug Options Page (continued)*

| Element                                    | Description                                                                     |
|--------------------------------------------|---------------------------------------------------------------------------------|
| Health and Performance Monitor Debug Level | The message severity level for the Health and Performance Monitor subsystem.    |
| Image Manager Debug Level                  | The message severity level for the Image Manager subsystem.                     |
| Firewall Services Debug Level              | The message severity level for firewall-related policies.                       |
| IOS Platform Debug Level                   | The message severity level for Cisco IOS Software platform policies.            |
| PIX Platform Debug Level                   | The message severity level for PIX, ASA, and FWSM platform policies.            |
| Report Manager Debug Level                 | The message severity level for the Report Manager subsystem.                    |
| VPN Services Debug Level                   | The message severity level for VPN services policies.                           |
| API Debug Level                            | The message severity level for the Application Programming Interface subsystem. |
| Save button                                | Saves your changes.                                                             |
| Reset button                               | Restores all fields to their previous values.                                   |
| Restore Defaults button                    | Resets values to Security Manager defaults.                                     |

## Deployment Page

Use the Deployment page to define the default methods by which Security Manager deploys configurations to devices. You can override some of these settings when you create deployment jobs.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Deployment** from the table of contents.

| Default Deployment Method Directory | <p>The method to use as the default method for deploying configurations to devices:</p> <ul style="list-style-type: none"> <li>• <b>Device</b>—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see <a href="#">Deploying Directly to a Device, page 8-9</a>.</li> <li>• <b>File</b>—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. Even if you select file as the default, the setting does not apply to IPS devices; you can use device deployment only for IPS devices. For more information, see <a href="#">Deploying to a File, page 8-11</a>.</li> </ul> <p>You can override this method when you create deployment jobs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| When Out of Band Changes Detected   | <p>How Security Manager should respond when it detects that changes were made directly on the device CLI since a configuration was last deployed to the device. Out of band change detection works correctly only when deploying to device, not to file, and applies only when the deployment method is configured to obtain the reference configuration from the device (see below for a description of the Reference Configuration setting).</p> <p>This setting specifies the default action, which you can override when you create deployment jobs. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Overwrite changes and show warning</b> (default)—If changes were made to the device manually, Security Manager continues with the deployment, overwrites the changes, and displays a warning notifying you of this action.</li> <li>• <b>Cancel deployment</b>—If changes were made to the device manually, Security Manager cancels the deployment and displays a warning notifying you of this action.</li> <li>• <b>Do not check for changes</b>—Security Manager does not check for changes and deploys the changes to the device, overwriting any local modifications.</li> </ul> <p>For a more complete discussion of out-of-band change handling, see <a href="#">Understanding How Out-of-Band Changes are Handled, page 8-12</a>.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p> <b>Note</b> For devices in which failover is not configured, if you select the <b>Cancel Deployment</b> option when Out of Band changes are detected, the bootstrap configuration may cause deployments to fail. For deployments to be successful, you must configure failover before discovering the device in Security Manager.</p> </div> |

Table 11-11 Deployment Page (continued)

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deploy to File Reference Configuration                 | <p>The configuration that Security Manager uses to compare new policies against the previous configuration for the device, if you are deploying the configuration to a file on the Security Manager server.</p> <ul style="list-style-type: none"> <li>• Archive (default)—The most recently archived configuration.</li> <li>• Device—The current running device configuration, which is obtained from the device.</li> </ul> <p>After comparing the configurations, Security Manager generates the correct CLI for deployment.</p>          |
| Deploy to Device Reference Configuration               | <p>The configuration that Security Manager uses to compare new policies against the previous configuration for the device, if you are deploying the configuration directly to the device (or to a transport server).</p> <ul style="list-style-type: none"> <li>• Archive—The most recently archived configuration.</li> <li>• Device (default)—The current running device configuration, which is obtained from the device.</li> </ul> <p>After comparing the configurations, Security Manager generates the correct CLI for deployment.</p> |
| Allow Download on Error                                | Whether deployments to devices should continue even if there are minor device configuration errors.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Save Changes Permanently on Device                     | Whether to save the running configuration to the startup configuration (using the <b>write memory</b> command) after deploying a configuration to a device. This applies to PIX, FWSM, ASA, or Cisco IOS devices. If you deselect this check box, the startup configuration is not changed, which means your configuration changes will be lost if the device reloads for any reason.                                                                                                                                                         |
| Preselect Devices with Undeployed Changes              | Whether the list of changed devices you see when you create a deployment job has all changed devices preselected. If you deselect this option, users must manually select the devices to include in the deployment job.                                                                                                                                                                                                                                                                                                                       |
| Enable Auto Refresh in Deployment Main Panel           | Whether the deployment job and schedule status information should be automatically refreshed in the Deployment Manager window. If you deselect this option, you must click the Refresh button to refresh the information manually.                                                                                                                                                                                                                                                                                                            |
| Remove Unreferenced SSL VPN Files on Device (ASA Only) | Whether to have Security Manager delete files related to the SSL VPN configuration from the device if the files are no longer referred to by the device's SSL VPN configuration. If you deselect this option, unused files remain on the device after deployment.                                                                                                                                                                                                                                                                             |

| <b>ACL Parameters</b>                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Optimize the Deployment of Access Rules For (IPv4 and IPv6 access rules.) | <p>How firewall rules are deployed. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Speed (default)</b>—Increases deployment speed by sending only the delta (difference) between the new and old ACLs. This is the recommended option. By making use of ACL line numbers, this approach selectively adds, updates, or deletes ACEs at specific positions and avoids resending the entire ACL. Because the ACL being edited is still in use, there is a small chance that some traffic might be handled incorrectly between the time an ACE is removed and the time that it is added to a new position. The ACL line number feature is supported by most Cisco IOS, PIX and ASA versions, and became available in FWSM from FWSM 3.1(1).</li> <li>• <b>Traffic</b>—This approach switches ACLs seamlessly and avoids traffic interruption. However, deployment takes longer and uses more device memory before the temporary ACLs are deleted. First, a temporary copy is made of the ACL that is intended for deployment. This temporary ACL binds to the target interface. Then the old ACL is recreated with its original name but with the content of the new ACL. It also binds to the target interface. At this point, the temporary ACL is deleted.</li> </ul> <p><b>Note</b> For FWSM devices, this option affects processing only if you also select the Let FWSM Decide When to Compile Access Lists option.</p> |
| Firewall Access-List Names (IPv4 and IPv6 access rules.)                  | <p>How ACL names are deployed to devices if the access rule does not have a name in Security Manager.</p> <ul style="list-style-type: none"> <li>• <b>Reuse existing names</b>—Reuse the ACL name that is configured in the reference configuration (which is usually from the device).</li> <li>• <b>Reset to CS-Manager generated names</b>—Reset the name to a Security Manager auto-generated ACL name.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable ACL Sharing for Firewall Rules<br>(IPv4 and IPv6 access rules.)    | <p>Whether Security Manager should share a single access control list (ACL) for an access rule policy with more than one interface. If you do not select this option, Security Manager creates unique ACLs for every interface to which you apply an IPv4 or IPv6 access rule policy. The sharing of ACLs is done only for ACLs created by access rule policies.</p> <p>If you select this option, Security Manager evaluates the access rules policy for each interface and deploys the minimum number required to implement your policy while preserving your ACL naming requirements. For example, if you use an interface role to assign the same rules to four interfaces, you specify <b>Reset to CS-Manager generated names</b> for the Firewall Access-List Names property, and you do not specify ACL names for the interfaces in the access control settings policy, only a single ACL is deployed, and each interface uses that ACL.</p> <p>If you select this option, keep the following in mind:</p> <ul style="list-style-type: none"> <li>• An interface might use an ACL that is named for a different interface.</li> <li>• If you specify a name for the ACL in the access control settings policy, an ACL by that name is created even if it is otherwise identical to one used by another interface. Names specified in this policy have precedence over any other settings.</li> <li>• If you select <b>Reuse existing names</b> for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device.</li> <li>• Hit count statistics are based on ACL, not on interface, so a shared ACL provides statistics that are combined from all interfaces that share the ACL.</li> <li>• Sharing ACLs is primarily beneficial for memory-constrained devices such as the FWSM.</li> </ul> |
| Let FWSM Decide When to Compile Access Lists<br>(IPv4 access rules only.) | <p>Whether to have the Firewall Services Module (FWSM) automatically determine when to compile access lists. Selecting this option might increase deployment speed but traffic might be disrupted and the system might become incapable of reporting ACL compilation error messages. If you select this option, you can use the Optimize the Deployment of Access Rules For Traffic setting to mitigate potential traffic disruptions.</p> <p>When deselected, Security Manager controls ACL compilation to avoid traffic interruption and to minimize peak memory usage on the device.</p> <p> <b>Caution</b> You should not select this option unless you are experiencing deployment problems and you are an advanced user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Remove Unreferenced Access-lists on Device<br>(IPv4 and IPv6 access rules.)                                   | Whether to delete any access lists that are not being used by other CLI commands managed by Security Manager from devices during deployment.<br><br><b>Note</b> After enabling this option, Security Manager will remove access lists during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an access list, Security Manager will still attempt to delete that object during deployment. This also applies to access lists that are used in FlexConfigs but are not used in any other policies managed by Security Manager.                                                                                                                                                                                                  |
| Generate ACL Remarks During Deployment<br>(IPv4 and IPv6 access rules.)                                       | Whether to display ACL warning messages and remarks during deployment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Preserve Sections for Access Rules                                                                            | Whether to deploy the section name under which access rules are organized. This option ensures that if a device is discovered or rediscovered, the section names will not be lost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Generate CSM Rule Number                                                                                      | Whether to deploy the rule number used in the Cisco Security Manager user interface. This option helps in correlating an access rule in a device configuration to its position in rule table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Object Group Parameters</b>                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Remove Unreferenced Object Groups from Device<br>(PIX, ASA, FWSM, IOS 12.4(20)T+)<br>(IPv4 and IPv6 objects.) | Whether Security Manager should remove object groups that are not being used by other CLI commands managed by Security Manager from devices during deployment. Object groups include network/host, service, and identity user groups.<br><br><b>Note</b> After enabling this option, Security Manager will remove objects during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an object, Security Manager will still attempt to delete that object during deployment. In such cases, deployment will fail with a transcript error indicating that it was unable to delete the object.<br><br><b>Tip</b> Network/host objects that include object NAT configurations on ASA 8.3+ devices are never considered unreferenced. |

## Device Communication Page

Use the Device Communication page to define default settings for communicating with devices. These settings mainly affect device inventory and policy discovery and configuration deployment. You can override the transport settings for individual devices in the device properties for the device.

If you change the transport protocol settings, ensure that your devices are appropriately configured to accept those types of connections.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents.

| Device Connection Timeout                       | The number of seconds that Security Manager has to establish a connection with a device before timing out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Retry Count                                     | The number of times that Security Manager should try to establish a connection to a device before concluding that the connection cannot be completed. The default value is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Socket Read Timeout                             | For SSH and Telnet sessions, the maximum number of seconds Security Manager can wait for incoming data before concluding that the connection is lost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transport Protocol (IPS)                        | The default transport protocol for IPS sensors and routers that include the IPS feature. The default is HTTPS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Transport Protocol (IOS Routers 12.3 and above) | The default transport protocol for routers that run Cisco IOS software release 12.3 and above. The default is HTTPS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Transport Protocol (Catalyst Switch/7600)       | The default transport protocol for Catalyst 6500/7600 devices and all other Catalyst switches, regardless of the Cisco IOS software version running on the devices. The default is SSH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Transport Protocol (IOS Routers 12.2, 12.1)     | The default transport protocol for routers that run Cisco IOS software releases 12.1 and 12.2. The default is Telnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Connect to Device Using                         | <p>The type of credentials Security Manager should use when accessing devices. For more information, see <a href="#">Understanding Device Credentials, page 3-4</a>.</p> <ul style="list-style-type: none"> <li>• <b>Security Manager User Login Credentials</b>—Security Manager contacts the device using the credentials that you entered while logging in to Security Manager. The same set of credentials are used for all devices regardless of the credentials configured for each device on the Device Credentials page.</li> <li>• <b>Security Manager Device Credentials</b>—Security Manager contacts the device using the credentials specified in the Device Properties Credentials page. This is the default.</li> </ul> <p> <b>Caution</b> You must use Security Manager Device Credentials, not Security Manager User Login Credentials, if a connection to an IPS sensor is involved. When Security Manager contacts an IPS sensor, it must use device credentials whether or not someone is logged in to Security Manager.</p> |
| <b>SSL Certificate Parameters</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Device Authentication Certificates (IPS)<br>Device Authentication Certificates (Router)<br>PIX/ ASA/ FWSM Device Authentication Certificates<br>Add Certificate button | <p>How to handle device authentication certificates for SSL (HTTPS) communications. You can configure different behaviors for different types of devices, but the settings have the same meaning:</p> <ul style="list-style-type: none"> <li>• <b>Retrieve while adding devices</b>—Security Manager automatically obtains certificates from the devices while you add devices from the network or from an export file.</li> <li>• <b>Manually add certificates</b>—Security Manager does not automatically accept certificates from the device. Click <b>Add Certificate</b> to open the Add Certificate dialog box (see <a href="#">Add Certificate Dialog Box, page 11-24</a>) where you can manually add the thumbprint before you try to add the device from the network or from an export file. You can also add certificates for devices that you create manually from the Device Properties Credentials page to be successful. For more information, see <a href="#">Manually Adding SSL Certificates for Devices that Use HTTPS Communications, page 9-5</a>.</li> <li>• <b>Do not use certificate authentication</b>—Security Manager ignores device authentication certificates. This option leaves your system vulnerable to third-party interference with device validation. We recommend that you do not use this option.</li> </ul> |
| Accept Device SSL Certificate after Rollback                                                                                                                           | <p>For devices that use SSL, whether to obtain the certificate installed on an IPS device, firewall device, FWSM, ASA, or Cisco IOS router from the device when you roll back the configuration on the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| HTTPS Port Number                                                                                                                                                      | <p>The default port number that the device uses for secure communication with Security Manager (as well as other management applications that use these protocols). This value overrides the HTTPS port number that you configure in the HTTP policy for a device.</p> <p><b>Note</b> If you configure the local HTTP policy to be a shared policy and assign the HTTP policy to multiple devices, the HTTPS port number setting in the shared policy overrides the port number configured in the Device Properties Credentials page for all devices to which the policy is assigned.</p> <p>In addition to providing access to the device through the Cisco web browser user interface, the HTTPS port number is used by device management applications (such as the Cisco Router and Security Device Manager (SDM)) and monitoring tools to communicate with the device.</p> <p><b>Note</b> The security appliance can support both SSL VPN connections and HTTPS connections for device manager administrative sessions simultaneously on the same interface. Both HTTPS and SSL VPN use port 443 by default. Therefore, to enable both HTTPS and SSL VPN on the same interface, you must specify a different port number for either HTTPS or WebVPN. An alternative is to configure SSL VPN and HTTPS on different interfaces.</p>             |

**Table 11-12** Device Communication Page (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overwrite SSH Keys      | Whether Security Manager can overwrite the SSH key for a device when it changes on the device. For SSH connections, a correct key is required for successful communication.<br><br>Deselect this check box with caution, and only if you require a greater level of security. Security Manager does not communicate with the device if keys are changed on the device. |
| Save button             | Saves and applies changes.                                                                                                                                                                                                                                                                                                                                             |
| Reset button            | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                               |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                            |

## Add Certificate Dialog Box

Use the Add Certificate dialog box to add device certificates manually for devices that use the SSL transport protocol (firewall devices, FWSMs, ASAs, IPS devices, and Cisco IOS devices). Adding the device certificates manually gives you the highest level of security because then an intruder is prevented from introducing a fraudulent certificate thumbprint. Device certificates are stored in the database to be used for device authentication.

For more information about manually adding SSL certificates, see [Manually Adding SSL Certificates for Devices that Use HTTPS Communications](#), page 9-5.

### Navigation Path

Select **Tools > Security Manager Administration**, select **Device Communication** from the table of content, and click **Add Certificate**.

### Field Reference

**Table 11-13** Add Certificate Dialog Box

| Element                 | Description                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------|
| Host Name or IP Address | The hostname or IP address of the device for which you are adding the certificate.                |
| Certificate Thumbprint  | The certificate thumbprint, which is a string of hexadecimal digits that is unique to the device. |

## Device Groups Page

Use the Device Groups page to manage the device groups and group types defined in the device inventory.

### Navigation Path

Select **Tools > Security Manager Administration**, then select **Device Groups** from the table of contents.

Table 11-15 Discovery Page

| Element                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prepend Device Name when Generating Security Context Names | <p>Whether the name of the device that contains the security context should be added to the front of the security context's name. For example, if a security context is named admin, and it is contained in the device with the display name 10.100.15.16, the name that will appear in the Device selector is 10.100.15.16_admin.</p> <p>If you do not prepend the device name, the security context name appears in the inventory by itself. Because Security Manager does not place security contexts in a folder related to the parent device, the only way to easily see contexts that are related to a device is to prepend the device name.</p> <p>If you do not prepend device names, Security Manager adds a numbered suffix to distinguish identically named devices. For example, if the admin context exists in more than one firewall, you will see admin_01, admin_02, and so on, in the Device selector.</p>                                                                                                                                                                                            |
| Purge Discovery Tasks Older Than                           | The number of days to save discovery and device-import tasks. Tasks older than the number of days you enter are deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Reuse Policy Objects for Inline Values                     | <p>Whether to substitute any named policy objects, such as network/host or identity user group objects already defined in Security Manager, for inline values in the CLI. For more information on policy objects, see <a href="#">Chapter 6, "Managing Policy Objects"</a>.</p> <p><b>Tip</b> Although this option generally applies to network/host objects, it does not apply to FQDN network/host objects because you cannot specify a fully-qualified domain name (FQDN) as an inline value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Allow Device Override for Discovered Policy Objects        | <p>For the types of objects for which overrides are possible, whether to allow users to override the parent object values at the device level for policy objects that are discovered. For example, if you select this option, if you run policy discovery on a device that has an ACL with the same name as an ACL policy object in Security Manager, the name of the discovered policy object is reused, but a device-level override is created for the object. If you deselect this option, a new policy object is created with a number appended to the name.</p> <p><b>Tip</b> For objects that have subtypes, such as network/host and service, overrides are limited to within a type. For example, an override can be created for a network/host group when discovering a same-named network/host group, but no override would be created when discovering a same-named network/host address range. Instead, the newly-discovered object will have a number appended to the name.</p> <p>For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, page 6-18.</p> |

Table 11-15 Discovery Page (continued)

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| On Error, Rollback Discovery for Entire Device | Whether Security Manager should roll back all discovered policies if even one error is encountered for a single policy during policy discovery. When deselected, Security Manager keeps the policies successfully discovered and discards only those policies with errors. For more information on policy discovery, see <a href="#">Discovering Policies</a> , page 5-12.                                                                                                                                                                                                                                                                         |
| Auto-Expand Object Groups with Prefixes        | Expands object groups, such as network or identity user group, with the listed prefixes during the device import process. Separate the prefixes with a comma. This expansion causes the elements of the object group to display as separate items in the discovered policies. For more information, see <a href="#">Expanding Object Groups During Discovery</a> , page 12-35.<br><br><b>Tip</b> This option does not apply to policy objects created from the <b>object network</b> or <b>object service</b> commands from ASA 8.3+ devices. These commands create host, FQDN, network, or address range network/host objects or service objects. |
| Save button                                    | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Reset button                                   | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Restore Defaults button                        | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Event Management Page

Use the Event Management page to enable event management, which allows you to view ASA, FWSM, and IPS events using the Event Viewer. You can also configure settings required for event collection.

The Event Manager service is also required by the Report Manager application, which allows you to view reports that aggregate information collected by the service.

### Tip

If you get a message that Event Viewer is unavailable when you select Launch > Event Viewer, but the **Enable Event Management** option is selected on this page, try restarting the Event Manager Service. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening Event Viewer again.

### Navigation Path

Click **Tools > Security Manager Administration** and select **Event Management** from the table of contents.

Table 11-16 Event Management Page

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Event Management Options</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Event Management         | <p>Whether to enable the Event Manager service, which allows Security Manager to collect event information. If you disable this feature, you cannot use the Event Viewer or Report Manager applications.</p> <p><b>Tip</b> If you change this setting and click <b>Save</b>, you are prompted to confirm that you want to start or stop the Event Manager Service. If you click <b>Yes</b>, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.</p>                                                                                                                    |
| Event Data Store Location       | <p>The directory to use for collecting event information. This is known as the primary event store. Click <b>Browse</b> to select a directory on the Security Manager server.</p> <p>If the directory does not yet exist, create it in Windows Explorer. You cannot create the directory from within Security Manager.</p> <p><b>Tip</b> If you change the location after you have started using the Event Manager service, you cannot query old events.</p>                                                                                                                                                                                                                                                 |
| Event Data Store Disk Size      | <p>The amount of disk space you want to allocate for storing event data, in gigabytes (GB). Events are incrementally deleted (rotated out) from the extended store when it becomes 90% full. Before changing this setting, consider the following:</p> <ul style="list-style-type: none"> <li>• If you reduce the size below the amount of disk space already used by event data, the oldest events are deleted until your new size limit is reached.</li> <li>• You can see a visual representation of the amount of space currently used for event data. Open the Event Viewer (<b>Launch &gt; Event Viewer</b>), then from Event Viewer, select <b>Views &gt; Show Event Store Disk Usage</b>.</li> </ul> |
| Event Syslog Capture Port       | <p>The port on which you want to enable syslog event capture. The default is 514.</p> <p>You must ensure that the Security Manager server, and intervening firewalls, allow incoming traffic on this port for Security Manager to collect the events. Managed devices must be configured to send syslog information to this port on the Security Manager server.</p> <p><b>Tip</b> If you change this port, you must also change the Syslog Servers policies for all ASA and FWSM devices and security contexts that send events to Security Manager. For more information, see <a href="#">Syslog Servers Page, page 54-27</a>.</p>                                                                         |
| Event Data Pagination Size      | <p>The maximum number of events per page each query response can contain. The default is 20000, but you can select a different size from the list of supported values.</p> <p><b>Note</b> In Security Manager 4.10, the maximum number of events per page has been increased to 100000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Extended Store Management Options</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Auto Copy Events to Extended Store       | <p>Whether you want to define an extended storage location for event storage. Events are copied from the regular event storage location to the extended location so that they remain available for use. When you query for historical events in Event Viewer, events in the extended storage location are automatically retrieved if they are needed.</p> <p><b>Tip</b> You are prompted to verify that you want to start the extended service and to make changes to the extended storage location.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Extended Data Store Location             | <p>The location of the extended data store for events. This location can be on directly-attached storage that appears as a drive on the server and that uses DAS protocols. For example, SAN storage attached through fiber channel. CIFS storage is not supported. Click <b>Browse</b> to select the desired drive and directory.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• When you select an extended storage location and save your changes, Security Manager checks that it can be accessed and that it has write permissions. The primary storage location is used as a reference, and any data that exists in the primary storage location that does not exist in the extended storage location is copied to the extended storage location. Any data that already exists in the extended storage location is not evaluated and is left untouched, although it can be deleted later to make room for new data.</li> <li>• If you change the extended data store location, you cannot query events that exist only in the previous extended data store location (that is, you cannot query events that have already be removed from the primary location). If you want to preserve these events, copy the data from the old location to the new location.</li> </ul> |
| Extended Data Store Disk Size            | <p>The amount of space you want to allocate to the extended event storage location, in gigabytes (GB). Events are incrementally deleted (rotated out) from the extended store when it becomes 90% full. The size must be equal to or larger than the primary event data storage location.</p> <p>You can see a visual representation of the amount of space currently used for event data. Open the Event Viewer (<b>Launch &gt; Event Viewer</b>), then from Event Viewer, select <b>Views &gt; Show Event Store Disk Usage</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Syslog Relay Capture Port       | <p>Specifies the UDP port on which the Syslog Relay Service listens for syslogs. The default is 514.</p> <p>If the Syslog Relay Service is enabled, devices must send syslogs to the Syslog Relay Capture Port so that they can be forwarded to the local collector and remote collectors. If the Syslog Relay Service is turned off, devices should send syslogs to the Event Syslog Capture Port.</p> <p><b>Note</b> The Syslog Relay Capture Port and the Event Syslog Capture Port cannot be the same. When enabling the Syslog Relay Service, if devices are currently configured to send syslogs to the Event Syslog Capture Port, you should instead use that port number for the Syslog Relay Capture Port and then change the Event Syslog Capture Port to something else.</p> <p>You must ensure that the Security Manager server, and intervening firewalls, allow incoming traffic on this port for Security Manager to collect the events. Managed devices must be configured to send syslog information to this port on the Security Manager server.</p> <p><b>Tip</b> If you change this port, you must also change the Syslog Servers policies for all ASA and FWSM devices and security contexts that send events to Security Manager. For more information, see <a href="#">Syslog Servers Page, page 54-27</a>.</p> |
| Relay to Local Event Collector  | Enables or disables syslog relay for the local event collector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Relay to Remote Collector 1     | Enables or disables syslog relay for Remote Collector 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Collector 1 IP address          | Specifies the IP address to which syslogs should be sent for Remote Collector 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Collector 1 Syslog Capture Port | Specifies the UDP port on which Remote Collector 1 is listening for relayed syslogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Relay to Remote Collector 2     | Enables or disables syslog relay for Remote Collector 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Collector 2 IP address          | Specifies the IP address to which syslogs should be sent for Remote Collector 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Collector 2 Syslog Capture Port | Specifies the UDP port on which Remote Collector 2 is listening for relayed syslogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Device Filter           | <p>You can filter the devices for which syslogs should be relayed for a specific collector. Using this feature, you can configure syslogs for one set of devices to go to one collector and syslogs for a different set of devices to go to another collector:</p> <ol style="list-style-type: none"> <li>1. Select the tab (Local Collector, Remote Collector 1, or Remote Collector 2) for which you want to filter devices.</li> <li>2. To specify the devices for which you want relay syslogs for this collector, select <b>Permit Relay</b>. If instead you want to specify the devices for which you want to disable syslog relay for this collector, clear the <b>Permit Relay</b> check box. If the Permit Relay check box is <b>not</b> selected, then syslogs for the devices you add to the filter will not be relayed; however, syslogs for all other devices will be relayed.</li> </ol> <p><b>Note</b> For each enabled collector, syslog relays from all devices are enabled by default.</p> <p><b>Note</b> When adding a cluster to the filter list, the IP addresses for the cluster management pool will be included as part of filter configuration.</p> <ol style="list-style-type: none"> <li>3. Select the devices or device groups from the Available Devices list that you want to add to the filter and click &gt;&gt; to move them to the Selected Devices list. For more information on selecting devices, see <a href="#">Using Selectors, page 1-45</a>.</li> <li>4. To add a device that is not managed in Security Manager, enter the IP address of the device in the Add Special Device field and then click the bottom &gt;&gt; to move the device to the Selected Devices list.</li> </ol> |
| Restart                 | Restarts the Syslog Relay Service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CPU Throttle Settings   | Opens the CPU Throttling Policy dialog box in which you can control the CPU load used by the syslog relay service. For more information, see <a href="#">CPU Throttling Policy Dialog Box, page 11-33</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| View Statistics         | Opens the Syslog Relay Statistics dialog box in which you can see the average CPU and memory usage of the syslog relay service process as well as traffic rates for the different collectors. For more information, see <a href="#">Syslog Relay Statistics Dialog Box, page 11-35</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Save button             | <p>Saves and applies changes.</p> <p>Most changes related to the Event Viewer settings require that the Event Manager service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.</p> <p>Changes to Syslog Relay Service settings require that the Syslog Relay Service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Reset button            | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Troubleshooting Syslog Relay Servers

If the Syslog Relay Service is enabled, devices must send syslogs to the Syslog Relay Capture Port so that they can be forwarded to the local collector and remote collectors. If the Syslog Relay Service is turned off, devices should send syslogs to the Event Syslog Capture Port.

Syslog Relay Servers act as an intermediate connection between device events and Security Manager Event Manager application. It receives device event packets and forwards them to the Local Collectors and Remote Collectors.

### Device Management via IP

To manage devices in Security Manager via IP (using IPv4 or IPv6), the Device Management interface must have the appropriate IP information.

For example, see the following sample configuration.

```
!
interface Management1/1
management-only
nameif management
security-level 100
ip address 10.197.87.95 255.255.255.0
ipv6 address 2016::b2aa:77ff:fe7c:a068/64
ipv6 enable
```

In this configuration, the Device Management IP address has both IPv4 and IPv6 management addresses. So you can manage a device via IPv4 or IPv6.

#### Problem:

If a device is managed via IPv6 Management Address in Security Manager, the communication between Security Manager and the device would occur only via IPv6 address and not IPv4 address.

However, Event Syslog server still sends the Event Syslog packets only to IPv4 address, therefore in this scenario Security Manager cannot map the equivalent device for the received IPv4 Event Syslog packets.

When you add a filter device in Local Collector or Remote Collector for Syslog Relay Services in **Tools > Security Manager Administration > Event Management - Syslog Relay Service**, Security Manager tries to extract the device Management IPv4 address instead of the IPv6 management address.

However, there is no IPv4 Management Interface configured in the device. Therefore, Security Manager displays the following error:

```
Device selection - Ipv4 address not found for device(s)
```

#### Solution:

Go to **Device View > Policies > Interfaces**, to configure the device Management Interface with IPv4 address.

## CPU Throttling Policy Dialog Box

Use the CPU Throttling Policy dialog box to specify settings for controlling the CPU load used by the syslog relay service.

After CPU throttling is enabled, if the syslog relay service's average CPU usage over the time period selected in the Average Max CPU Usage Time field is greater than the Maximum CPU Usage threshold, then CPU throttling will take place for the collectors specified in the Stop Forwarding To field for the time specified in the Stop Forwarding For field.

**Note**

You can use the Syslog Relay Statistics dialog box to see the number of syslog packets dropped per collector due to the throttle policy (see [Syslog Relay Statistics Dialog Box, page 11-35](#)).

**Navigation Path**

Click **Tools > Security Manager Administration**, select **Event Management** from the table of contents, and then click **CPU Throttle Settings**.

**Field Reference**

**Table 11-17 CPU Throttling Policy Dialog Box**

| Element                              | Description                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable CPU Throttling                | Whether to enable throttling for the syslog relay service. CPU throttling for the syslog relay service is disabled by default.                                                                                                                                                                                                            |
| Maximum CPU Usage                    | Specify the maximum CPU usage for the syslog relay service as a percentage of total CPU capacity. This is threshold at which CPU throttling will be initiated.                                                                                                                                                                            |
| Average Max CPU Usage Time (Minutes) | Specifies the time in minutes for which CPU usage by the syslog relay service is calculated. Options are 1 minute, 5 minutes, and 15 minutes. This average is compared to the Maximum CPU Usage value to determine whether throttling should take place.                                                                                  |
| Stop Forwarding To                   | Specify the collectors for which you want to stop forwarding syslogs when throttling is engaged.                                                                                                                                                                                                                                          |
| Stop Forwarding For                  | Specify how long, in minutes, throttling should be enabled when the threshold is hit. After the specified interval of time has elapsed, if the CPU usage is still above the Maximum CPU Usage threshold, throttling will remain in effect.                                                                                                |
| Enable Email Notifications           | Whether to send email notifications when the syslog relay service enters or exits throttle mode. Email notifications are disabled by default.<br><br>For the e-mails to be sent, you must configure an SMTP server as described in <a href="#">Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27</a> . |
| Notification Email IDs               | Enter one or more valid addresses in the Notification Email IDs field; separate multiple addresses with commas.                                                                                                                                                                                                                           |

**Table 11-17 CPU Throttling Policy Dialog Box (continued)**

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send Email | <p>Specify how often to send notification emails:</p> <ul style="list-style-type: none"> <li>• <b>Every time</b>—Select this option to have a notification sent every time the syslog relay service enters or exits throttle mode. If the CPU usage is still above the Maximum CPU Usage threshold after the Stop Forwarding For timer has elapsed, throttling will remain in effect and an additional notification will be sent.</li> <li>• <b>Every</b>—Select this option to have at most one notification sent when the syslog relay service enters or exits throttle mode during a specific period of time. If you select this option, specify the time period by entering the number of minutes or hours and then selecting the corresponding option (Min/Hour) from the drop-down list.</li> </ul> |

## Syslog Relay Statistics Dialog Box

Use the Syslog Relay Statistics dialog box to view the average CPU and memory usage of the syslog relay service process as well as traffic rates for the different collectors.

### Navigation Path

Click **Tools > Security Manager Administration**, select **Event Management** from the table of contents, and then click **View Statistics**.

### Field Reference

**Table 11-18 Syslog Relay Statistics Dialog Box**

| Element                                              | Description                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Log Relay Service</b>                             |                                                                                                                                                                                                                                                                                                                   |
| Memory Usage Average (last 1 min.)                   | Shows the amount of memory used by the syslog relay service on average over the last minute.                                                                                                                                                                                                                      |
| CPU Usage Average (last 1 min.)                      | <p>Shows the percentage of CPU capacity used by the syslog relay service on average over the last minute.</p> <p><b>Tip</b> If the average CPU usage is too high, you might consider enabling CPU throttling for the syslog relay service (see <a href="#">CPU Throttling Policy Dialog Box, page 11-33</a>).</p> |
| Total syslog packets received                        | Shows the total number of syslog packets that have been received by the syslog relay service since the service was started.                                                                                                                                                                                       |
| Average syslog received per second since start       | Shows the average number of syslog packets that have been received by the syslog relay service per second since the service was started.                                                                                                                                                                          |
| Average syslog received per second for last 1 minute | Shows the average number of syslog packets that have been received by the syslog relay service per second over the last minute.                                                                                                                                                                                   |
| Average syslog received per second for last 5 minute | Shows the average number of syslog packets that have been received by the syslog relay service per second over the last five minutes.                                                                                                                                                                             |

Table 11-18 Syslog Relay Statistics Dialog Box (continued)

| Element                                                      | Description                                                                                                                                                                                |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Average syslog received per second for last 15 minute        | Shows the average number of syslog packets that have been received by the syslog relay service per second over the last fifteen minutes.                                                   |
| Period (in mins.) for which throttle policy is active        | Shows how long, in minutes, the CPU throttle policy for the syslog relay service has been active. For more information, see <a href="#">CPU Throttling Policy Dialog Box, page 11-33</a> . |
| <b>Local Collector/Remote Collector 1/Remote Collector 2</b> |                                                                                                                                                                                            |
| Total syslog packets sent successfully                       | Shows the total number of syslog packets that have been sent by the syslog relay service since the service was started.                                                                    |
| Total syslog packets dropped (filter policy)                 | Shows the total number of syslog packets that have been dropped by the syslog relay service in accordance with the defined filter policy since the service was started.                    |
| Total syslog packets dropped (throttle policy)               | Shows the total number of syslog packets that have been dropped by the syslog relay service in accordance with the throttle policy since the service was started.                          |
| Total syslog packets failed during transmit                  | Shows the total number of syslog packets that were not able to be forwarded by the syslog relay service since the service was started.                                                     |
| Average syslog sent per second since start                   | Shows the average number of syslog packets that have been sent by the syslog relay service per second since the service was started.                                                       |
| Average syslog sent per second for last 1 minute             | Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last minute.                                                                |
| Average syslog sent per second for last 5 minute             | Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last five minutes.                                                          |
| Average syslog sent per second for last 15 minute            | Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last fifteen minutes.                                                       |
| Refresh                                                      | Refreshes the statistics displayed on the Syslog Relay Statistics dialog box.                                                                                                              |

## Health and Performance Monitor Page

Use the Health and Performance Monitor page of the Security Manager Administration window to enable network-wide health and performance monitoring. The Health and Performance Monitor (HPM) is a stand-alone application that lets you monitor key health and performance data for ASA devices, IPS devices, and VPN services by providing network-level visibility into device status and traffic information.

### Tip

If you get a message that the application is unavailable when you attempt to launch the Health and Performance Monitor, but the **Enable Health and Performance Monitor** option is selected on this page, try restarting Health and Performance Monitoring. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening the HPM application again.

**Navigation Path**

Click **Tools > Security Manager Administration** and select **Health and Performance Monitor** from the table of contents.

**Field Reference****Table 11-19 Health and Performance Monitor Page**

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Health and Performance Monitor | <p>Lets you enable or disable the Health and Performance Monitoring service, which allows Security Manager to collect event information. If you disable this feature, you cannot use the HPM application.</p> <p><b>Tip</b> If you change this setting and click <b>Save</b>, you are prompted to confirm that you want to start or stop the Health and Performance Monitoring service. If you click <b>Yes</b>, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.</p> |

**OOB Notification Settings**

**Note** To receive email notifications make sure that an SMTP server has been configured on the Security Manager Server. For more information, see, [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27](#)

Cisco Security Manager considers an out-of-band (OOB) change to be any change made to a device manually or outside of Security Manager control, for example, by logging into the (monitored) device directly and entering configuration commands through the CLI. For devices monitored by the HPM application, Cisco Security Manager monitors the OOB changes, detected by the HPM periodically. If any out-of-band changes are detected, HPM generates an alert displayed on the **Device Status View** page and sends an email, to the configured recipients.

**Note** If a Cisco Security Manager restart occurs during the update time, after an OOB change is detected and an email notification has already been sent, the same email maybe sent again after Cisco Security Manager starts up.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable OOB Email Notification | <p>Lets you enable or disable email notifications for Out of Band changes.</p> <p><b>Note</b> When the email notification is disabled, only an alert is displayed on the <b>Device Status View</b> page.</p> <p><b>Note</b> When HPM detects the OOB change and syncs with the Configuration Manager, a separate email alert notification is sent for each device being monitored. To prevent duplication, emails sent for each OOB change are tracked and stored in a file, once in 5 minutes.</p> <p><b>Tip</b> The default tracking time is set as 5 minutes in the Cisco Security Manager properties file. You can update this as needed.</p> |
| Recipient E-mail(s)           | Specify the recipients who must be notified of the OOB change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 11-19** Health and Performance Monitor Page (continued)

| Element      | Description                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Save button  | Saves and applies changes.<br><br>Most changes require that the Health and Performance Monitoring service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator. |
| Reset button | Resets changes to the last saved values.                                                                                                                                                                                                                       |

## Report Manager Page

Use the Report Manager page of the Security Manager Administration window to enable or disable the Report Manager feature in Cisco Security Manager. Report Manager is a stand-alone application that lets you view security and usage reports for devices and remote access IPsec and SSL VPNs.

### Navigation Path

Click **Tools > Security Manager Administration** and select **Report Manager** from the table of contents.

### Field Reference

**Table 11-20** Health and Performance Monitoring Page

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Identity Settings Page

Use the Identity Settings page to configure the Active Directory (AD) server group to use for a NetBIOS domain for use with identity-aware firewall policies on ASA devices. These settings enable you to use the Find feature when selecting users or user groups for identity-aware policies or identity user group policy objects.

**Tip**

You can also add entries by configuring the Identity Options policy on an ASA. When you save the policy, you are asked if you want to update the identity settings administrative page. Keep in mind that you can have a single domain-to-AD server match on the settings page, whereas you can configure different ASAs to use different server groups for a domain. Username lookup always selects the AD servers defined in the identity settings administrative page, regardless of what server group is configured for the individual ASA that you are configuring.

**Navigation Path**

Select **Tools > Security Manager Administration** and select **Identity Settings** from the table of contents.

|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Domain                  | <p>The NetBIOS domain to use when you do not type in a domain when specifying a user or group name in a firewall policy or an identity user group policy object.</p> <p>The default is LOCAL, which means the name is defined on the ASA itself, either as a local user or as a VPN user who was authenticated by a means other than an LDAP server group associated with a domain name.</p> <p>Other than LOCAL, only domains configured in the Domain-AD Server Group Mapping table appear in this list.</p> <p><b>Tip</b> This setting is not related to the default domain configured on the ASA using the user-identity default-domain command. This setting is a convenience setting to allow you to type in usernames without always having to include the domain name. Select the domain for which you will most often type user names.</p>                                                                                                                                                                                                                   |
| Route query via                 | <p>When you use the Find feature while selecting users or user groups, Security Manager must query the AD server. Select whether the query comes from the Security Manager client (the workstation on which you are running the client) or the server.</p> <p>By default, LDAP queries come from the client.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| For user strings without domain | <p>If you select something other than LOCAL for the default domain, how to handle username or user group names that you type in without a domain name:</p> <ul style="list-style-type: none"> <li>• <b>Auto determine user/user-group from AD</b>—Check the AD server associated with the default domain to determine whether the name is for a user or user group, and add the appropriate string: Default-Domain\user or Default-Domain\\user-group. If the name cannot be found, you must manually type in the domain name and the one or two \ characters to indicate whether the name is for a user or a group.</li> <li>• <b>Change it to Default-Domain/user</b>—Assume that typed in names are user names, not user group names, and add the default domain: Default-Domain\user.</li> </ul> <p><b>Tip</b> When typing, if you precede the name with \ or \\, the default domain is automatically added. Thus, if you select the Change it to Default-Domain/user option, you can still enter group names without typing the domain by first entering \\.</p> |
| Save button                     | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reset button                    | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Restore Defaults button         | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Image Manager Page

Use the Image Manager page to control the administrative settings for Image Manager within Security Manager.

## Navigation Path

Select **Tools > Security Manager Administration** and select **Image Manager** from the table of contents.

## Field Reference

**Table 11-22** *Image Manager Page*

| Element                 | Description                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit CCO Settings       | Use the Edit CCO Settings link to quickly navigate to the CCO Settings page. For information on the CCO Settings page, see <a href="#">CCO Settings Page, page 11-4</a> .                         |
| Purge Jobs Older Than   | Enter the length of time in days to hold Image Manager jobs before purging them. The default is 365 days. Select <b>Purge Now</b> to immediately clear previous Image Manager job specifications. |
| Include Repository      | If checked, the image repository is part of Security Manager backup. The default is to exclude images.                                                                                            |
| Save button             | Saves your changes.                                                                                                                                                                               |
| Reset button            | Resets changes to the last saved values.                                                                                                                                                          |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                       |

# IP Intelligence Settings Page

Use the IP Intelligence Settings page to control the administrative settings for the IP Intelligence features within Security Manager.

## Navigation Path

Select **Tools > Security Manager Administration** and select **IP Intelligence Settings** from the table of contents.

## Field Reference

**Table 11-23** *IP Intelligence Settings Page*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit CCO Settings | Credentials for connecting to Cisco.com are required for automatic updates of the GeoIP database. You can use the <b>Edit CCO Settings</b> link to quickly navigate to the CCO Settings page where these credentials are configured. You can also configure settings for a proxy server on the CCO Settings page. For information on the CCO Settings page, see <a href="#">CCO Settings Page, page 11-4</a> . |

| <p>MaxMind GeoLite City update packages are updated monthly on Cisco.com. Use the GeoIP Maxmind Database Update Settings to download an update package automatically from Cisco.com and to configure scheduled updates.</p> <p><b>Note</b> Credentials for connecting to Cisco.com are required for automatic updates of the geographic location database. You can use the <b>Edit CCO Settings</b> link to quickly navigate to the CCO Settings page where these credentials are configured. For information on the CCO Settings page, see <a href="#">CCO Settings Page, page 11-4</a>.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Run immediate database update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Click <b>Update Now</b> to update the geographic location database in Security Manager using the latest update package from Cisco.com.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable scheduled update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Whether to enable or disable automatic updates of the geographic location database on a regular schedule. After enabling scheduled updates, click <b>Edit Settings</b> to specify the schedule for when the update should take place.</p> <p>Using the Weekly option, you can specify the days of the week on which the automatic update should take place. Using the Monthly option, you can specify the day of the month on which the automatic update should take place. For either option, you can specify the time of day that the update should take place.</p> <p><b>Tip</b> The geographic location database is updated by MaxMind on the first Tuesday of every month. New update packages are typically available on Cisco.com approximately one week after they are issued by MaxMind. We recommend configuring your update schedule to occur monthly on day 15 or later. However, you can schedule the updates to take place more frequently if you want to ensure that the updated database is made available in Security Manager as close to the time it is available on Cisco.com as possible.</p> <p><b>Note</b> Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com.</p> |
| Default Blocking Ranges                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Lists the IP address ranges that are excluded from GeoIP lookup by default:</p> <p>0.0.0.0, 255.255.255.255, 127.0.0.1, 10.0.0.0-10.255.255.255, 169.254.0.0-169.254.255.255, 172.16.0.0-172.31.255.255, 192.168.0.0-192.168.255.255, 224.0.0.0-239.255.255.255</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Eventing Notification Settings Page

Use the Eventing Notification Settings page to receive email notifications for IPS events and critical ASA events. You can configure the time interval at which you want to receive the email notifications.

The events are sent in the form of .CSV files in a .zip file format. By default, email notification is disabled. When you enable email notification, only the notification for IPS events is enabled. To receive email notification for critical events you must enable the additional settings for critical events.

**Note**

For notifications to be sent successfully by Security Manager, you must configure an SMTP server, as described in [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27](#).

**Tip**

You can also use the Security Manager Event Viewer application or the Dashboard to view and monitor all events.

**Navigation Path**

Select **Tools > Security Manager Administration** and select **Eventing Notification Settings** from the table of contents.

**Field Reference****Table 11-24** Eventing Notification Settings Page

| Element                                 | Description                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Eventing Email Notification      | Select to enable notification of IPS events through email.                                                                                                                                                                                                                                    |
| Notification Interval (15 - 60 minutes) | Enter the interval at which you want Security Manager to send email notifications for IPS events or critical events.<br><b>Note</b> If Security Manager receives more than 50000 events during the configured time interval, only the first 50000 events are selected and sent through email. |
| <b>Notification Settings (IPS)</b>      |                                                                                                                                                                                                                                                                                               |
| Email IDs (for IPS Events)              | Enter one or more email addresses (comma separated).                                                                                                                                                                                                                                          |
| Select Severity of Events               | The severity level that the IPS signature reports: High, Medium, Low, or Informational. By default, High and Medium severity are selected.                                                                                                                                                    |
| Notification Content                    | Whether to send summarized or detailed notifications through email. If you select Detailed Notifications, select the fields that you want information for, in the email notification. Some fields are selected by default.                                                                    |

**Table 11-24** *Eventing Notification Settings Page (continued)*

| Element           | Description                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fields</b>     |                                                                                                                                                                                                                                                     |
| Event ID          | A unique sequential number for each event, assigned internally.                                                                                                                                                                                     |
| Severity          | The Firewall or IPS severity values.                                                                                                                                                                                                                |
| Device            | The source of the event; usually the device ID.<br>A device identified as Not Available has been deleted from the Security Manager inventory.                                                                                                       |
| Application Name  | The name of the application originating the event.                                                                                                                                                                                                  |
| Receive Time      | The time the event was received by Security Manager.                                                                                                                                                                                                |
| Event Time        | The time the event was generated by the device.                                                                                                                                                                                                     |
| Sensor Local Time | The local time of the sensor where the event originated.                                                                                                                                                                                            |
| Sig ID            | The Sig ID value is used by the alert originator to identify the activity. It identifies the pre-defined signature defined for this activity.                                                                                                       |
| Sub Sig. ID       | Identifies the unique numerical value assigned to the sub signature. The Sub Sig. Id identifies a more granular version of a broad signature.                                                                                                       |
| Sig. Name         | The name assigned to the signature.                                                                                                                                                                                                                 |
| Sig. Details      | The details of the reported signature that was triggered and resulted in the generation of the alert.                                                                                                                                               |
| Sig. Version      | The version of the signature definition used to generate an alert.                                                                                                                                                                                  |
| Attacker IP       | The IP address of the host that sent the offending packet.                                                                                                                                                                                          |
| Attacker Port     | The port used by the attacker host. This is the port from which the offending packet originated.                                                                                                                                                    |
| Attacker Locality | Identifies whether the attacker address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.                                                                                            |
| Victim IP         | The IP address of the host being attacked.                                                                                                                                                                                                          |
| Victim Port       | The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent.                                                                                                               |
| Victim OS         | The OS of the host being attacked.                                                                                                                                                                                                                  |
| Victim Locality   | Identifies whether the target address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.                                                                                              |
| Summary Count     | Specifies that this is a summary alert, representing one or more alerts with common characteristics. The numeric value indicates the number of times the signature fired since the last summary alert with a matching initialAlert attribute value. |
| Initial Alert     | This field applies to a summary alert, representing one or more alerts with common characteristics. The value of InitialAlert provides the event ID of the last nonsummary evIdsAlert with the same characteristic (sigid/ subsigid).               |
| Summary Type      | Defines the common characteristics of all alerts in a summary alert.                                                                                                                                                                                |

**Table 11-24** *Eventing Notification Settings Page (continued)*

| Element                                             | Description                                                                                                                                                                                         |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Final                                            | Applies to a summary alert, representing one or more alerts with common characteristics. It indicates whether this is the last event alert containing the same value in the initialAlert attribute. |
| Interface                                           | Name of the IPS interface.                                                                                                                                                                          |
| VLAN                                                | The VLAN number associated with packets involved in the activity that triggered the alert.                                                                                                          |
| Virtual Sensor                                      | The name of the virtual sensor associated with the event.                                                                                                                                           |
| Action Taken                                        | The action performed on the flow. For example: Terminated or denied.                                                                                                                                |
| Alert Details                                       | The details regarding the alerts.                                                                                                                                                                   |
| Risk Rating                                         | A value that represents the calculated risk associated with the event.                                                                                                                              |
| Threat Rating                                       | The threat rating of the event, if any.                                                                                                                                                             |
| Reputation                                          | The attacker's reputation score in the range -10.0 to +10.0. A lower (more negative) score indicates a greater likelihood that the host is malicious.                                               |
| Reputation Details                                  | Deny Attacker: Whether a deny-attacker action occurred (or would have occurred) because an internal override was exceeded due to the calculated risk rating: true or false.                         |
| Protocol                                            | The Level-3 or Level-4 protocol.                                                                                                                                                                    |
| <b>Notification Settings (Critical Events only)</b> |                                                                                                                                                                                                     |
| Enable                                              | Whether to send email notification for critical events. If you select this option, also enter one or more email addresses (comma separated).                                                        |
| Email IDs                                           |                                                                                                                                                                                                     |
| Save button                                         | Saves your changes.                                                                                                                                                                                 |
| Reset button                                        | Resets changes to the previously applied values.                                                                                                                                                    |
| Restore Defaults button                             | Resets values to Security Manager defaults.                                                                                                                                                         |

## IPS Updates Page

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS Updates page to perform administrative tasks associated with keeping your sensors up to date with regard to signatures, minor version updates, and service packs. You can use the IPS Updates page to:

- Monitor update status.
- Check the availability of updates and download them.
- Configure an IPS update server.
- Configure automatic update settings.

**Note**

Beginning with Security Manager version 4.9, only the latest sensor and signature packages for IPS will be available for download from CCO. The older packages will not be available for download from CCO.

**Tips**

- To apply IPS updates manually, select **Tools > Apply IPS Update**. For more information, see [Manually Applying IPS Updates, page 44-7](#).
- If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to [Certificate Trust Management, page 10-18](#).

**Navigation Path**

Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents.

| Update Status group | Displays the following items. Click <b>Refresh</b> to update the information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Refresh button      | <ul style="list-style-type: none"> <li>• Latest Available—The most recent signature and sensor update available on Cisco.com or the local HTTP server when you last checked for updates.</li> <li>• Latest Downloaded—The most recent signature and sensor update downloaded to Security Manager.</li> <li>• Latest Applied—The most recent signature and sensor update applied to any device in Security Manager.</li> <li>• Latest Deployed—The most recent signature and sensor update deployed to any device in Security Manager.</li> <li>• Last Check On—The time that the last check of Cisco.com was performed.</li> <li>• Last Download On—The time that the last update was downloaded to Security Manager.</li> <li>• Last Deployed On—The time that the last update was deployed to any of the devices.</li> </ul> |

Table 11-25 IPS Updates Page (continued)

| Element                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Check for Updates button<br>Download Latest Updates button | <p>These buttons check for updates, or download signature and sensor updates that have not already been downloaded to the Security Manager server, from the IPS Update server. You must configure an IPS Update server before checking for updates or downloading them (click <b>Edit Settings</b> in the Update Server group).</p> <p>When you click one of these buttons, a dialog box opens to display the results of the operation. Security Manager logs into the IPS Update server, checks for updates, and downloads them if you clicked the Download button. If a Cisco.com download fails, ensure that the account you are using has applied for eligibility to download strong encryption software. For details, see the description of User Name in <a href="#">Edit Update Server Settings Dialog Box, page 11-52</a>.</p> <p><b>Tip</b> If you configure a server, and then try to check for updates, and you are told you did not configure a server, click <b>Save</b> at the bottom of the page and try again.</p> <p><b>Note</b> Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com.</p> |
| Update Server group                                        | <p>Displays the settings used to access Cisco.com or the local server that contains the IPS update packages. The fields indicate whether the update server is Cisco.com or a locally-configured HTTP server, the name of the local server if you are using one, the user account for logging into the server, and the name of the proxy server, if any. To configure or change the IPS Update server, click <b>Edit Settings</b> to open the Edit Update Server Settings dialog box (see <a href="#">Edit Update Server Settings Dialog Box, page 11-52</a>).</p> <p>For more information, see <a href="#">Configuring the IPS Update Server, page 44-4</a></p> <p>Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to <a href="#">Certificate Trust Management, page 10-18</a>.</p>                                                                                                                                                                                                                                                                                |
| Signature Filter Settings group                            | <p>Enables you to download IPS signature updates selectively. Click <b>Edit Settings</b> to open the Edit Signature Download Filter Settings dialog box (see <a href="#">Edit Signature Download Filter Settings Dialog Box, page 11-55</a>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Auto Update Settings group                                 | <p>Contains the settings specific to automatic updates. For more information, see <a href="#">Automating IPS Updates, page 44-6</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 11-25 IPS Updates Page (continued)

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Update Mode                               | <p>Establishes whether, and to what extent, automatic updates are performed. Contains the following options:</p> <ul style="list-style-type: none"> <li>• Download, Apply, and Deploy Updates</li> <li>• Disable Auto Update</li> <li>• Check for Updates</li> <li>• Download Updates</li> <li>• Download and Apply Updates</li> </ul> <p>By default, auto update is disabled. The other options are a combination of one or more of the following options:</p> <ul style="list-style-type: none"> <li>• Check for Updates—Security Manager contacts the IPS Update server to check if an update is available and sends e-mail if e-mail notification is configured. No files are downloaded.</li> <li>• Download Updates—Security Manager downloads the latest updates from the IPS Update server, and sends e-mail notification if e-mail notification is configured.</li> <li>• Apply Updates—Security Manager modifies the configuration of the devices selected in the Apply Update To list based on the downloaded update packages. You have to separately deploy these updates unless you also select Deploy Updates.</li> <li>• Deploy Updates—Security Manager starts a deployment job to send the applicable update packages to the devices selected in the Apply Update To list. The device must have the required license for a signature update to be successful.</li> </ul> |
| Update Schedule<br>Edit Update Schedule button | <p>The schedule for the actions selected in the Auto Update Mode field. To change the schedule, click <b>Edit Update Schedule</b> and define the schedule in the Edit IPS Updates Schedule dialog box. You can specify that Security Manager perform the updates based on hourly, daily, weekly, or monthly schedules, or specify a one-time event. When entering the start time, use the 24-hour clock and the <i>hh:mm</i> format.</p> <p><b>Note</b> If you schedule an update to occur in less than 10 minutes from your Security Manager server time, the "Next Update" field will show tomorrow's date and the job will run accordingly. This is a safety feature designed to guarantee the first occurrence to run.</p> <p><b>Tip</b> Cisco recommends scheduling automatic downloads during off hours so that they do not conflict with other user operations, such as device discovery.</p> <p><b>Tip</b> Cisco recommends using an account other than the admin account for routine user operations.</p>                                                                                                                                                                                                                                                                                                                                                                        |

A notification is sent when an update:</p> <ul style="list-style-type: none"> <li>• Is available for download.</li> <li>• Has been downloaded.</li> <li>• Has been downloaded and applied.</li> <li>• Has been downloaded, applied, and deployed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Apply Update To<br>Type<br>Edit Row button<br>Devices to be Auto Updated | <p>The selector includes the IPS devices that have local signature policies and the shared signature policies that are defined in Security Manager. The columns in the selector indicate whether a local device policy or a shared policy is selected for these types of updates:</p> <ul style="list-style-type: none"> <li>• Signature—For auto updating the signature update level.</li> <li>• Minor—For minor updates and service packs.</li> <li>• S.P.—For service pack updates.</li> </ul> <p>For shared policies, a partial grey checked box indicates that some, but not all, of the devices that use the policy are selected. If you change the devices assigned to the shared policy between automatic update events, the shared policy is grayed out, and only the old assignments are shown on this page. After the update runs, the assignment list will be synchronized with the shared policy device assignments. To update the device list proactively prior to the next auto update run, select the policy and edit it (to select auto update settings), and the device assignment list will be corrected.</p> <p><b>Note</b> Also for shared policies: You can select only the shared policy assigned to the default virtual sensor (vs0). If you attempt to select the shared policy for a different virtual sensor, your changes will not be applied, and you will not receive an error message.</p> <p>Use the Type field to toggle between viewing local and shared policies. Changing the view does not change your auto update selections.</p> <p>To select a local or shared policy for auto update, select it in the selector and click the <b>Edit Row</b> button below the selector. This opens the Edit Auto Update Settings dialog box, where you can select the types of updates for the policy. When you select any type of auto update for a policy, the affected devices are listed in the <b>Devices to be Auto Updated</b> list to the right of the selector.</p> |
| Save button                                                              | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Reset button                                                             | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Restore Defaults button                                                  | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Edit Update Server Settings Dialog Box

Use the Edit Update Server Settings dialog box to configure the server to use for obtaining IPS updates. If necessary, you can configure a proxy server for communicating with the update server.

Also, use the Edit Update Server Settings dialog box for certificate trust management. (Security Manager downloads IPS packages from Cisco.com over HTTPS, which uses certificates for establishing trust.) The certificate trust management feature on the Image Manager page is new in Security Manager 4.4. It will help you with improved handling of Cisco.com certificates for IPS package downloads:

- You can use it to view a certificate and use discretion in accepting it.
- After you accept a certificate, it is stored on your Security Manager server.
- You can see all your certificates in a summary table on the Image Manager page, and you can use that table to view or remove certificates.

Tip

Please be sure to refer to "Retrieve Certificate" in the table below.

### Navigation Path

Select **Tools > Security Manager Administration > IPS Updates** and click **Edit Settings** in the Update Server group.

### Field Reference

**Table 11-26** Edit Update Server Settings Dialog Box

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Update From                                   | <p>Whether to get IPS updates from Cisco.com or from a local HTTP/HTTPS server. Your selection changes the fields on the dialog box.</p> <p>If you select local, you must configure an HTTP or HTTPS server to use as the IPS update server.</p> <p> <b>Caution</b> The default value for "Update From:" is "Local Server." You must choose "Cisco.com" to see certificate settings. Improper or incomplete certificate setting will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.</p> |
| IP Address/ Host Name<br>(Local server only.) | The hostname or IP address of the local IPS update web server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Web Server Port<br>(Local server only.)       | The port number that your local server listens to for connection requests. The default is 80.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 11-26 Edit Update Server Settings Dialog Box (continued)**

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name                                    | The username to log into the IPS update server. If you are configuring a local server that does not require a user login, leave this field blank.<br><br>If you are specifying a Cisco.com username, the user account on Cisco.com must be eligible for downloading strong encryption software. If you are not certain that the account has the required permissions, use the account to log into Cisco.com and try to download an IPS update file ( <a href="http://www.cisco.com/cgi-bin/tablebuild.pl/ips5-system">http://www.cisco.com/cgi-bin/tablebuild.pl/ips5-system</a> ). If the account does not have the appropriate permissions, you are prompted to read and accept the required conditions. If you meet the eligibility requirements, you can accept them. Otherwise, talk to your Cisco sales representative for help.                                                                                                                                                                                                                                                                           |
| Password<br>Confirm                          | The password for the specified username, entered in both fields. If you are configuring a local server that does not require a password, leave these fields blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Path to Update Files<br>(Local server only.) | The path to the IPS update files location on your local server. For example, if update files can be accessed at <a href="http://local-server-ip:port/update_files_path/">http://local-server-ip:port/update_files_path/</a> , then enter <code>update_files_path</code> in this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Connect Using HTTPS<br>(Local server only.)  | Whether to use SSL when connecting to the local IPS Update server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Certificate Thumbprint                       | Displays the certificate thumbprint after it is calculated from the certificate on the local server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Retrieve From Server                         | Used to connect to the local server specified in this dialog box, retrieve the certificate from the local server given, and calculate the certificate thumbprint, which is displayed in the Certificate Thumbprint field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Contact URL                                  | <ul style="list-style-type: none"> <li>When selected, "Image Meta-data Locator" is used. This is the URL on Cisco.com that is used to obtain meta-data information about images. Meta-data information consists of the images applicable to a particular product, name, size, checksum, and URL to download for each image.</li> <li>When selected, "Other" is used. You can enter any valid HTTPS URL. This URL is intended primarily for the HTTPS URL to download the image as obtained from the meta-data information about the image. This URL may be different from the URL of the image meta-data locator described in the previous paragraph; the certificate may be different, as well.</li> </ul> <p> <b>Caution</b> If you choose "Other," you need to explicitly add "https://dl.cisco.com" [without the quotation marks]: Enter it in the text field adjacent to the "Other" button. Failure to do this will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.</p> |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retrieve Certificate      | Used to connect to and retrieve the certificate from the selected "Contact URL". After retrieving the certificate it opens the Certificate Verification dialog, which along with a brief summary of the certificate, i.e., who the certificate is issued to, by whom, and the validity period of the certificate, gives you the following choices: <ul style="list-style-type: none"> <li>• <b>View Certificate</b>—Opens the Certificate Viewer, where you can see all the details of the certificate: Certificate Authority, version, serial number, thumbprint, and other details. It shows the complete certificate chain information all the way up to the root issuing certificate Authority.</li> <li>• <b>Accept</b>—Accepts the certificate and adds it to the Cisco Security Manager.</li> <li>• <b>Reject</b>—Rejects the certificate and no action is taken.</li> <li>• <b>Cancel</b>—Closes the Certificate Verification dialog with no action taken.</li> </ul> |
| Certificate               | A table that displays, for each certificate in your Security Manager installation, Subject, Issued By, and Accepted By.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| View                      | Opens the Certificate Viewer for a certificate selected in the Certificate table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Remove                    | Removes a certificate selected in the Certificate table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Proxy Server Group</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Proxy Server       | Whether a proxy server is needed to connect to Cisco.com or to your local server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IP Address/ Host Name     | The hostname or IP address of the proxy server.<br>You can configure the proxy server to use basic, digest, NT LAN Manager (NTLM) V1, or NTLM V2 authentication. NTLM V2 is the most secure scheme.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Port                      | The port number that the proxy server listens to for connection requests. The default is 80.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| User Name                 | The username to log into the proxy server. If the proxy server does not require a user login, leave this field blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Password<br>Confirm       | The password for the specified username, entered in both fields. If the proxy server does not require a password, leave these fields blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Edit Auto Update Settings Dialog Box

Use the Edit Auto Update Settings dialog box to configure the automatic update options for the device or policy selected in the Apply Update To table on the IPS Updates page. For information on configuring automatic updates, see [Automating IPS Updates, page 44-6](#).

**Navigation Path**

Select a device or policy on in the Apply Update To table on the IPS Updates page (see [IPS Updates Page, page 11-47](#)) and click the Edit Row button.

**Field Reference****Table 11-27 Edit Auto Update Settings Dialog Box**

| Element                                               | Description                                                                                                                                                                                                      |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Update<br>(IPS sensors and shared policies only) | The type of sensor updates to apply to the selected devices or shared policies. You can apply both minor updates and service packs, service packs only, or select None to apply no sensor updates automatically. |
| Auto Update Signature Update Level                    | Whether to select the device or policy for automatic signature updates.                                                                                                                                          |

## Edit Signature Download Filter Settings Dialog Box

The Edit Signature Download Filter Settings dialog box enables you to download IPS signature updates selectively. It applies both to the manual download and to the automated download.

**Note**

Filtering does not apply to IPS sensor packages or to IPS engine packages; it applies to IPS signature packages only. All the available sensor packages on Cisco.com or on the local server will be downloaded as part of a signature download.

The benefits of selective download are reduced download time, reduced disk storage space, and faster troubleshooting because you can download only what you need.

There are four types of signature download available to you with the Edit Signature Download Filter Settings dialog box:

- No filter
- Download all signatures for engine versions starting with [choose E4, E3, E2, or E1]
- Download all signature versions starting with [enter a signature version such as 1000]
- Download a single signature version number [enter a signature number such as 1000]

The default signature configuration is to download all signatures for engine versions starting with E4.

**Tip**

This default value is the same for a new installation of Security Manager 4.3 and for upgrades from previous versions.

**Navigation Path**

Select **Tools > Security Manager Administration** and then select **IPS Updates** from the table of contents; then click **Edit Settings** in the Signature Filter Settings group.

| Element                                                                | Description                                                                                 |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Filter Type: No filter                                                 | All available signatures for all available engines are downloaded.                          |
| Filter Type: Download all signatures for engine versions starting with | All available signatures for the engine that you select (E4, E3, E2, or E1) are downloaded. |
| Filter Type: Download all signature versions starting with             | All available signatures starting with the ID that you enter are downloaded.                |
| Filter Type: Download single signature version number                  | The single signature having the ID that you enter is downloaded.                            |

## ISE Settings Page

Use the ISE Settings page to configure communication between Cisco Security Manager and the Cisco Identity Services Engine (ISE) for use with TrustSec firewall policies.

### Note

Security Manager supports communications with only one ISE appliance/server for fetching and resolving security group names and tags.

To be PCI compliant, in Cisco Security Manager 4.15 and 4.16, TLS 1.0 and TLS 1.1 were disabled respectively. Hence from 4.16, Cisco Security Manager was using only TLS 1.2 version.

However, the ISE 1.3 server and its lower versions does not support TLS 1.2. This impacts the legacy ISE settings with Cisco Security Manager from release 4.15. This incompatibility prevents integration of ISE server with Cisco Security Manager.

If you are required to use ISE server (versions 1.3 and lower) in the Cisco Security Manager 4.15, 4.16, or 4.17 versions, to integrate ISE 1.3 and lower versions with Cisco Security Manager successfully, refer *Cisco Security Manager User Guide for release 4.17*.

### Navigation Path

Select **Tools > Security Manager Administration** and select **ISE Settings** from the table of contents.

| Element                          | Description                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Enable ISE feature               | Whether to enable communication with the ISE.                                                                             |
| Username                         | The username Security Manager should use to log on to the ISE.                                                            |
| Password                         | The password for the username.                                                                                            |
| ISE Server (IP Address/Hostname) | The DNS hostname or IP address of the ISE.                                                                                |
| ISE Version                      | Beginning with version 4.18, Cisco Security Manager supports integration of only ISE version 2.3.                         |
| Test Connectivity                | Click Test Connectivity to ensure that Security Manager can communicate with the ISE given the settings you have entered. |
| Save button                      | Saves your changes.                                                                                                       |
| Reset button                     | Resets changes to the previously applied values.                                                                          |
| Restore Defaults button          | Resets values to Security Manager defaults.                                                                               |

## Licensing Page

Use the Licensing page to manage licenses for the Security Manager application and for IPS devices. For more information, see [Managing IPS Licenses, page 44-1](#).

**Navigation Path**

Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Field Reference****Table 11-30 Licensing Page**

| Element | Description                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CSM tab | The license settings for the Security Manager application. For a description of the fields on this tab, see <a href="#">CSM Tab, Licensing Page, page 11-57</a> .        |
| IPS tab | The license settings for IPS devices managed by Security Manager. For a description of the fields on this tab, see <a href="#">IPS Tab, Licensing Page, page 11-58</a> . |

## CSM Tab, Licensing Page

Use the CSM tab on the Licensing page to view the list of installed Security Manager licenses and to install new licenses. For more information, see [Installing Security Manager License Files, page 10-16](#).

**Navigation Path**

Select **Tools > Security Manager Administration**, select **Licensing** from the table of contents, and click CSM.

**Field Reference****Table 11-31** CSM Tab, Licensing Page

| Element                  | Description                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| License Information      | Displays information about the license registered with the product: the edition, license type, expiration date, the number of licensed devices, the number of devices in use, and the percentage of the device count used.                                                            |
| Install License          | The list of installed licenses with their installation dates.                                                                                                                                                                                                                         |
| Install a License button | Click this button to install a license file. The dialog box that is opened includes links to Cisco.com, where you can obtain licenses if you have not already obtained them. You must copy license files to a local drive on the Security Manager server before you can install them. |

## IPS Tab, Licensing Page

**Note**

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS tab on the Licensing page to view the list of installed IPS device licenses, to install new or updated licenses, or to redeploy licenses. The license list shows current licenses, unlicensed devices, devices with expired licenses, and devices with invalid licenses. You can also use the settings on this page to send a report of all those IPS devices whose license would expire within a specified number of days.

**Navigation Path**

Select **Tools > Security Manager Administration**, select **Licensing** from the table of contents, and click **IPS**.

Table 11-32 IPS Tab, Licensing Page

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPS License Table                 | <p>Displays all the IPS devices in the device inventory and their license status as of the last time you refreshed the information. Click the <b>Refresh</b> button to obtain the latest information from the devices.</p> <p>Information includes the serial number for the device, which is used to register for licenses, the license status, and the expiration date of the license. The list shows not only current licenses, but also unlicensed devices, devices with expired licenses, and devices with invalid licenses.</p> <p><b>Tip</b> The list does not include Cisco IOS IPS devices. You cannot use Security Manager to manage licenses for routers running IPS.</p>                                                                                                                                                                                       |
| Update Selected via CCO button    | <p>Click this button to update the license file for the selected devices by connecting to Cisco.com and retrieving a new license. When you click this button, a dialog box opens listing devices that can be updated from Cisco.com, which might not be all the devices you selected. Click <b>OK</b> to perform the update. For successful updates, the updated file is automatically applied to the device.</p> <p>To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.</p> <p><b>Tip</b> The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.</p> |
| Redeploy Selected Licenses button | <p>Click this button to redeploy licenses to the selected devices. Redeploying licenses might be necessary when you have obtained an updated license file and it was not applied to the device successfully during an automatic update.</p> <p>When you click this button, a dialog box opens listing devices whose licenses you are redeploying. Click <b>OK</b> to perform the update. For successful updates, the updated file is automatically applied to the device.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| Update from License File button   | <p>Click this button to update licenses by selecting a license file from the Security Manager server. When you click this button, a dialog box opens where you can specify the license files. Click <b>Browse</b> to select the files, which must be on a local drive on the Security Manager server. When you click <b>OK</b>, the updated files are automatically applied to the devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Export As button                  | <p>Select one or more IPS devices from the list and then click the <b>Export As</b> button to export their licenses to a Portable Document Format (PDF) or comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name. If you do not select any device from the list, the licenses of all available devices are exported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 11-32 IPS Tab, Licensing Page (continued)

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh License button                                          | Click this button to refresh the data in the IPS license table for the selected devices. The updated information is retrieved from the device. If you do not select any devices, all devices are refreshed; this can take a long time depending on the number of devices listed.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Download and apply licenses<br>Days before the expiration date. | Whether to automatically download IPS licenses from Cisco.com and apply them to the devices. To successfully configure automatic updates, you must have a Cisco.com support contract that includes the serial numbers of your IPS devices.<br><br>If you select this option, also specify the number of days before the license expiration date for downloading and applying licenses. Security Manager evaluates only those devices that do not have licenses, have expired licenses, or have valid licenses within this number of days of expiration. Licenses are applied only if they are valid and either have an expiration date farther out than the current one, or that have different license information. |
| Discover devices daily at                                       | If you select automatic license updates, the time of day when Security Manager should contact devices for current licenses status and evaluate whether there are devices that have licenses that will expire within the specified number of days. Cisco.com is contacted only if one or more device meets the expiration requirements.                                                                                                                                                                                                                                                                                                                                                                               |
| Email License Update Results<br>Email Notification              | Whether to send email notifications of expiration alerts and license update job results. If you select this option, also enter one or more email addresses (comma separated).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Email License Expiration Status<br>Email Notification           | Whether to send a PDF report of those IPS devices whose license would expire within a specified number of days. If you select this option: <ul style="list-style-type: none"> <li>• Enter the number of days (not more than 100) before the device license expiry date, by which you want Security Manager to send the PDF report.</li> <li>• Select the time and day for Security Manager to check the license expiry.</li> <li>• Enter one or more email addresses (comma separated) to which you want the License Expiration Status PDF report to be sent.</li> </ul>                                                                                                                                             |
| Save button                                                     | Saves your changes to the automatic license update and e-mail notification settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Verifying IPS Devices for License Update or Redeployment

### Note

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

When you select a device on the **Licensing > IPS** tab (see [IPS Tab, Licensing Page, page 11-58](#)) and try to update the license from Cisco.com (CCO) or redeploy the license, you are first shown a list of devices that will be updated. The name of the dialog box is based on the action you are taking:

- **Updating Licenses via CCO dialog box**—Review the IPS devices you selected to update from Cisco.com. The device list displays the IPS devices for which you can update the license from Cisco.com, which might not be all of the devices you selected.

To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.

**Tip**

The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.

- **Redeploying Licenses dialog box**—Review the IPS devices you selected for redeploying licenses. Before you can redeploy a license to a device, you must have already deployed the license. Security Manager uses the file already associated with the IPS device to redeploy the license.

When you click **OK**, the License Update Status Details dialog box opens so that you can view the status of the license redeployment task. See [License Update Status Details Dialog Box, page 11-62](#).

#### Navigation Path

To open these dialog boxes, select one or more device on the **Tools > Security Manager Administration > Licensing > IPS** tab and click **Update Selected via CCO** or **Redeploy Selected Licenses**.

## Selecting IPS License Files

**Note**

From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

If you select one or more devices on the **Tools > Security Manager Administration > Licensing > IPS** tab and click **Update from License File**, you are prompted to select the license file you want to use with the Updating Licenses from File dialog box.

You can store the license file on a local drive on the Security Manager server, and, beginning with Version 4.5 of Security Manager, you can store it on a local drive on a client.

Click **Browse** to select the license file. You can select multiple license files using Ctrl+click or a range of files using Shift+click.

**Note**

If you installed the Security Manager client on a different machine than the one on which Security Manager server is installed, you can choose to select the license file from either the client machine or the server machine. If both the client and the server are installed on the same machine, Security Manager allows you to select the license file only from the server.

When you have selected the license files you want to use, click **OK** to apply them to the IPS devices.

**Note**

If you want to store the license file on a client machine, you must select "Enable Client side file browser" on the Customize Desktop page at **Tools > Security Manager Administration > Customize Desktop**.

## License Update Status Details Dialog Box

Use the License Update Status Details dialog box to view the status of an IPS license update task. This dialog box opens whenever you start an update task from the IPS tab of the Licensing page. For more information, see [IPS Tab, Licensing Page, page 11-58](#).

### Field Reference

**Table 11-33 License Update Status Details Dialog Box**

| Element                      | Description                                                                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Progress bar                 | Indicates what percentage of the license update task on the current device has been completed.                                                                                                                                                                 |
| Status                       | The current state of the update task.                                                                                                                                                                                                                          |
| Devices to be updated        | The total number of devices being updated during this task.                                                                                                                                                                                                    |
| Devices updated successfully | The number of devices updated without errors.                                                                                                                                                                                                                  |
| Devices updated with errors  | The number of devices that generated errors during the update.                                                                                                                                                                                                 |
| Device list                  | The devices that are being updated, including the device name, the status of the update, and summary information about the update. Select a device to see the messages generated during the update for that device in the message list below the summary list. |
| Messages list                | The messages generated during the license update for the selected device. Select a message to see detailed information in the fields to the right of the list.                                                                                                 |
| Description                  | Additional information about the message selected in the message list.                                                                                                                                                                                         |
| Action                       | The steps you should take to resolve the described problem.                                                                                                                                                                                                    |
| Abort button                 | Aborts the license update task.                                                                                                                                                                                                                                |

## Logs Page

Use the Logs page to configure the default settings for the audit and operations logs. The audit log keeps a record of all state changes that occur in Security Manager.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Logs** from the table of contents.

| Keep Audit Log in DB For (days)                         | The maximum number of days of Audit Log entries that has to be stored in the database before deleting it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Keep Audit Log in DB For Last (entries)                 | The maximum number of audit log entries to be stored in the database. If an entry becomes older than the number of days specified in the Keep Audit Log For field, it is deleted even if the log has fewer than the maximum number of entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Purge Now                                               | <p>To delete the old entries from the database, click <b>Purge Now</b>. Based on the values entered in the Keep audit log in DB for Last (days) and Keep audit log in DB for Last (entries) fields, the audit log entries that is maximum gets deleted.</p> <p>For example, if the value for <b>Keep audit log in DB for Last (days)</b> is 5 and <b>Keep audit log in DB for Last (entries)</b> is 5000, and last 5 days log entries is more than 5000, then Cisco Security Manager keeps the last 5000 entries and deletes the older entries even if they belong to the last 5 days.</p> <p><b>Note</b> The Purge Now button only removes audit report entries from the database. It does not remove the *.csv files from the &lt;install_dir&gt;\CSCOPx\MDC\log\audit folder. These *.csv files can be deleted directly.</p> |
| Keep Audit Log File For (days)                          | Number of days an audit log file should be retained in the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Purge Now                                               | <p>Click this button to immediately delete the specified older audit log files.</p> <p><b>Note</b> The Purge Now button deletes the CSDL Audit log files from &lt;install_dir&gt;\MDC\log\CSDL Audit Log folder along with Audit log files from &lt;install_dir&gt;\MDC\log\audit folder.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Keep Operation Log Files For (days)                     | The number of days that Security Manager keeps operation logs before deleting them. These logs are used for debugging purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Purge Now button                                        | Click this button to immediately delete the specified older operation log files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Scheduled Purging</b>                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Scheduled Purging for Audit Log Database Entries | Click this check box to scheduled the purging of older log entries. The schedule options are enabled on clicking this check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Keep Audit Log in DB For (days)                         | The maximum number of days of Audit Log entries that has to be stored in the database before deleting it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Keep Audit Log in DB For Last (entries)                 | The maximum number of audit log entries to be stored in the database. If an entry becomes older than the number of days specified in the Keep Audit Log For field, it is deleted even if the log has fewer than the maximum number of entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Enable Scheduled Purging for Audit Log Files     | Click this check box to schedule purging of audit logs from the system.                                                                                                                                                                         |
| Keep Audit Log File For (days)                   | Number of days an audit log file should be retained in the system.                                                                                                                                                                              |
| Enable Scheduled Purging for Operation Log Files | Click this check box to schedule purging of operation logs from the system.                                                                                                                                                                     |
| Keep Operation Log Files For (days)              | The number of days that Security Manager keeps operation logs before deleting them. These logs are used for debugging purposes.                                                                                                                 |
| Log Level                                        | The level of information, according to severity, that you would like collected in the operation logs. Each level collects different amounts of data. For example, the Info level yields the most data, and the Severe level collects the least. |
| Save button                                      | Saves your changes.                                                                                                                                                                                                                             |
| Reset button                                     | Resets changes to the previously applied values.                                                                                                                                                                                                |
| Restore Defaults button                          | Resets values to Security Manager defaults.                                                                                                                                                                                                     |

## Policy Management Page

Use the Policy Management page to select the types of router and firewall policies you will manage in Security Manager. These selections apply to routers and firewall devices, but do not apply to IPS devices. By default, all policies are selected for management.

Unmanaged policies are removed from both Device view and Policy view. Any unmanaged policies, local or shared, are removed from the Security Manager database. The only exception is interface policies, which continue to appear in Security Manager but are marked as read-only policies. For firewall devices, interface and failover settings are considered a unit and are managed or unmanaged together.

For detailed information on managing and unmanaging policy types, including what you should do before and after changing these settings, see [Customizing Policy Management for Routers and Firewall Devices, page 5-11](#).

### Caution

If you use AUS or CNS to deploy configurations to ASA or PIX devices, be aware that the device downloads a full configuration from AUS or CNS. Thus, reducing the policies managed by Security Manager actually removes the configurations from the device. If you intend to deselect some ASA/PIX policies for management to use other applications along with Security Manager to configure devices, do not use AUS or CNS.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Policy Management** from the table of contents.

| Element                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policies to Manage                                            | <p>The policy types are organized in folders, with router and firewall (which includes all ASA, PIX, and FWSM devices) handled separately, and then by category (NAT, Interfaces, and Platform). Select or deselect policy types as desired and click <b>Save</b>. Deselecting the check box for a group of policies deselects all policies in that group. By default, all policies are selected.</p> <p><b>Note</b> Beginning with version 4.18, Cisco Security Manager provides support for ASA 9.10(1) devices that are configured on the Umbrella server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Display a warning on all shared policies and imported objects | <p>Whether to add a message to all shared policies and to objects that were imported using the <b>File &gt; Import</b> command. If you select this option, messages appear on the following:</p> <ul style="list-style-type: none"> <li>All shared policies, whether they were imported or locally created.</li> <li>Policy objects that were created by importing devices or shared policies using the <b>File &gt; Import</b> command, but not imported policy objects created by the PolicyObjectImportExport.pl command (described in <a href="#">Importing and Exporting Policy Objects</a>, page 6-23.</li> </ul> <p>If you regularly import shared policies, the imported policies and objects replace any same-named policies and objects, so any changes made locally are removed. This message can notify users that policies might be imported and help users identify policy objects that they might not want to edit.</p> <p><b>Tip</b> When importing policies or devices, you are prompted to select a setting for this option. Thus, users who import policies or devices can change this setting without accessing this page provided they have the required authorization. The change is effective only after the importer submits (and if necessary, approves) the changes. For more information, see <a href="#">Importing Policies or Devices</a>, page 10-13.</p> |
| Save button                                                   | <p>Saves your changes.</p> <p>If you are unmanaging a policy, you are shown a list of devices that have the policy assigned to them. Security Manager must be able to obtain the required locks to unassign the policy from all devices, or you must manually unassign the policies (or remove the locks) before unmanaging the policy.</p> <p>If you are managing a previously unmanaged policy, be sure to rediscover all affected devices to bring the existing configurations into Security Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Reset button                                                  | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Restore Defaults button                                       | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# Policy Objects Page

Use the Policy Objects page to define system defaults related to policy object creation.

## Navigation Path

Select **Tools > Security Manager Administration** and select **Policy Objects** from the table of contents.

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| When Redundant Objects Detected  | <p>The action you want Security Manager to take when you try to create a policy object that has the same definition as an existing object:</p> <ul style="list-style-type: none"> <li>• Ignore—You can freely create objects with identical definitions. Any conflicts are ignored by Security Manager.</li> <li>• Warn—Security Manager displays a warning if you attempt to create an object that is identical to an existing object. You may proceed to create the object, if you wish.</li> <li>• Enforce—Security Manager prevents you from creating an object that is identical to an existing object. An error message is displayed.</li> </ul>  |
| Default Source Ports             | <p>The port range value that is used as the default source port range for service objects. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• Use all ports—Includes all ports from 1 to 65535.</li> <li>• Use secure ports—Includes all ports from 1024 to 65535.</li> </ul> <p>If you change the default source ports, you must manually redeploy any previously deployed devices that might be affected. These changes might not be reflected in any open activities until you refresh the data.</p> <p>For more information on port list objects, see <a href="#">Configuring Port List Objects, page 6-102</a>.</p> |
| Enable AutoComplete Dropdown Box | <p>Whether to have Security Manager list matching service and port list names as you type them when you create a service. You can then easily select from names you have already defined. If you deselect AutoComplete, you have to remember the complete service and port list names and type them in yourself.</p>                                                                                                                                                                                                                                                                                                                                    |
| Save button                      | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Reset button                     | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Restore Defaults button          | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# Process Monitoring Settings Page

Use the Process Monitoring Settings page to enable process monitoring. Here, you can enable or disable monitoring for specific processes and configure notification settings such as monitoring interval and email addresses. This will send an email notification to specified recipients, when a process stops.

## Before You Begin

Configure SMTP Server and sender mail in the CS web console, to get email alerts.

## Navigation Path

Select **Tools > Security Manager Administration** and select **Process Monitoring Settings** from the table of contents.

## Field Reference

**Table 11-37** Process Monitoring Settings Page

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Process Monitoring           | <p>When selected, Security Manager will allow you to specify the processes that you want to monitor. You must proceed to configure other process monitoring settings.</p> <p>By default, the Process Monitoring feature is disabled on the Cisco Security Manager Server.</p> <p><b>Note</b> Enabling or disabling the process monitor modifies the Windows registry and may generate a system alert.</p>                                                                                                       |
| Monitoring Interval (in minutes)    | <p>Specify the interval, at which, the process will be monitored. Valid values are between 1-60 minutes. The default monitoring interval is 5 minutes.</p> <p><b>Note</b> If the monitoring interval is changed, the monitoring task in progress stops and the new monitoring task starts with the updated interval.</p>                                                                                                                                                                                        |
| Notification Recipient(s) E-mail(s) | <p>Enter email IDs for the notification recipients. You can enter multiple email IDs, separated by a comma. These are the recipients that will be notified, when a process being monitored, stops.</p>                                                                                                                                                                                                                                                                                                          |
| Maximum Mail Alerts                 | <p>Enter the maximum number of emails that will be sent to the recipients during the course of Security Manager runtime. The default value here, is 10.</p>                                                                                                                                                                                                                                                                                                                                                     |
| Process List                        | <p>Select one or more processes that you want to monitor. Whenever any of these selected processes stop, a notification email will be sent to the specified recipients.</p> <p><b>Note</b> When Event Management, Health and Performance Monitor and Report Manager are disabled from <b>Tools &gt; Security Manager Administration</b>, email notifications will not be sent, even if, the VmsEventServer, CsmHPMServer and CsmReportServer processes are enabled in the process monitoring settings page.</p> |
| Save button                         | <p>Saves your changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 11-37** Process Monitoring Settings Page (continued)

| Element                 | Description                                      |
|-------------------------|--------------------------------------------------|
| Reset button            | Resets changes to the previously applied values. |
| Restore Defaults button | Resets values to Security Manager defaults.      |

## Single Sign-on Configuration Page

Use the Single Sign-on Configuration page of the Security Manager Administration window to enable and configure a “single sign-on” (SSO) shared key to use for cross-launching Cisco Prime Security Manager or FireSIGHT Management Center.

### Note

Single sign-on allows users to cross-launch Prime Security Manager or FireSIGHT Management Center from Security Manager without logging into Prime Security Manager or FireSIGHT Management Center separately. However, SSO is not required to cross-launch Prime Security Manager or FireSIGHT Management Center.

### Tip

Cisco Prime Security Manager is used to manage ASA CX modules. FireSIGHT Management Center is used to manager ASA FirePOWER modules.

- [Launching Cisco Prime Security Manager or FireSIGHT Management Center, page 72-20](#)
- [Sharing Device Inventory and Policy Objects with PRSM, page 72-23](#)

### Navigation Path

1. Click **Tools > Security Manager Administration** and select **Single Sign-on Configuration** from the table of contents.
2. Select **Enable for Prime Security Manager** [checkbox] or **Enable for FireSIGHT Management Center** [checkbox].

### Field Reference

**Table 11-38** Single Sign-on Configuration Page

| Element                                | Description                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Enable for Prime Security Manager      | [checkbox] Lets you enable or disable the SSO feature for Prime Security Manager. When disabled, the shared key is retained.      |
| Enable for FireSIGHT Management Center | [checkbox] Lets you enable or disable the SSO feature for FireSIGHT Management Center. When disabled, the shared key is retained. |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shared Key for Single Sign-on | <p>Use the features in this section to generate and view an encryption key for cross-launching Prime Security Manager or FireSIGHT Management Center.</p> <p>Click the <b>Generate</b> button to randomly generate a 128-bit AES key, which is then displayed as a 32 hexadecimal string in the SSO Shared Key field.</p> <p><b>Note</b> This key must be provided when configuring single sign-on cross-launching in Prime Security Manager or FireSIGHT Management Center. Also, each allowed Security Manager user must be configured in the Prime Security Manager database or the FireSIGHT Management Center user database with the same username as that in the Security Manager user database (the password can be different).</p> <p><b>Tip</b> Refer to “Configuring Single Sign-On for Cisco Security Manager” in the <i>User Guide for ASA CX and Cisco Prime Security Manager (Cisco ASA CX Context-Aware Security End-User Guides)</i> for information about configuring SSO in PRSM.</p> |

## Rule Expiration Page

Use the Rule Expiration page to define the default values for policy rule expiration. When you create policies for some types of policy rules (such as access rules), you can set an expiration date for the rule, and Security Manager can notify you by e-mail of the approaching expiration date.

You must configure an SMTP server to enable e-mail notifications. For more information, see [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-27](#).

### Navigation Path

Select **Tools > Security Manager Administration** and select **Rule Expiration** from the table of contents.

**Table 11-39** *Rule Expiration Page*

| Element                  | Description                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notify Email             | The default e-mail address that should receive notifications of rule expiration. Users can override this address when configuring individual rules.                     |
| Notify Before Expiration | The default number of days before a rule expires that Security Manager should send the e-mail message. Users can override this value when configuring individual rules. |
| Sender                   | The e-mail address that Security Manager will use for sending e-mail notifications.                                                                                     |

**Table 11-39** Rule Expiration Page (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Email Format            | The format of the e-mail message: <ul style="list-style-type: none"> <li>Text—The e-mail is sent in HTML and plain text formats.</li> <li>XML—The e-mail is sent using an XML markup. This option might be appropriate if you decide to write a program to automatically process and respond to notifications.</li> </ul> |
| Save button             | Saves your changes.                                                                                                                                                                                                                                                                                                       |
| Reset button            | Restores all fields to their previous values.                                                                                                                                                                                                                                                                             |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                               |

## Server Security Page

Use the Server Security page to open specific pages in the CiscoWorks Common Services application, where you can configure various security features on the Security Manager server. CiscoWorks Common Services controls the basic functions of the Security Manager server, including user access control and system security.

When you log in to Security Manager, your username and password are compared with the account information stored in the CiscoWorks or Cisco Secure Access Control Server (ACS) database, depending on which system you established at installation as your AAA provider. After the authentication of your credentials, you have access according to the role you have been assigned.

For more information on Security Manager roles and privileges, including descriptions of how Common Services roles translate to user functions in Security Manager, see the [Installation Guide for Cisco Security Manager](#).

### Navigation Path

Select **Tools > Security Manager Administration** and select **Server Security** from the table of contents.

### Field Reference

**Table 11-40** Server Security Page

| Element                  | Description                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA Setup button         | Opens Common Services and displays the AAA Mode Setup page. From this page, you can set AAA as your fallback sign-on method. For more information about AAA, click <b>Help</b> from the AAA Mode Setup page.                                                                                                                                          |
| Certificate Setup button | Opens Common Services and displays the Self-Signed Certificate Setup page. CiscoWorks enables you to create self-signed security certificates, which you can use to enable SSL connections between your client browser and management server. For more information about self-signed certificates, click <b>Help</b> from the Certificate Setup page. |

Table 11-40 Server Security Page (continued)

| Element                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Single Sign On button                                         | Opens Common Services and displays the Single Sign-On Setup page. With Single Sign On (SSO), you can use your browser session to transparently navigate to multiple CiscoWorks servers without having to authenticate to each of them. Communication between multiple CiscoWorks servers is enabled by a trust mode addressed by certificates and shared secrets. For more information about setting up SSO, click <b>Help</b> from the Single Sign-On page. |
| Local User Setup                                              | Opens Common Services and displays the Local User Setup page, from which you can add and delete users, edit user settings, and assign roles or permissions. For more information, click <b>Help</b> from the Local User Setup page and see the <i>Installation Guide for Cisco Security Manager</i> .                                                                                                                                                        |
| System Identity Setup                                         | Opens Common Services and displays the System Identity Setup page. Communication between multiple CiscoWorks servers is enabled by a trust mode addressed by certificates and shared secrets. System Identity setup helps you to create a trust user on servers that are part of a multi-server setup. For more information about system identity setup, click <b>Help</b> from the System Identity Setup page.                                              |
| <b>Native RBAC Parameters</b>                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Allow logon for user ids not available in Local User Database | For Security Manager installations integrated with an external authentication server like Active Directory, TACACS+, or RADIUS, specifies whether users can log in even when their user name is not defined in the Security Manager user list. When enabled, users are allowed to log in using the default role specified in Role Management Setup. If a default role is not configured, the user is not allowed to log in.                                  |

## Take Over User Session Page

Use the Take Over User Session page to take over another user's configuration session. A user with administrative privileges can take over the work of another user in non-Workflow mode. Taking over a session is useful when a user is working on devices and policies, causing the devices and policies to be locked, and another user needs access to the same devices and policies. However, when you take over another user's session, your current session is discarded, so make sure that you submit your changes before taking over a session.

The table shows all current configuration sessions, listing the user name and the state of the session, whether the user is currently logged in or logged out. Select the configuration session you want to take over and click **Take over session**. The session is transferred to you in its current state, including any saved changes the user made during the session.

If the selected user is logged in at the time you take over the session, the user receives a warning message, loses any unsaved changes in progress, and then is logged out.

For more information, see [Taking Over Another User's Work](#), page 10-23.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Take Over User Session** from the table of contents.

# Ticket Management Page

Use the Ticket Management page to enable Ticket Management, to configure a ticketing system URL for integration with an external change management system, and to configure purge settings for ticket information.

When Ticket Management is enabled, every Image Management installation job must have an assigned ticket or it will not be performed.

## Navigation Path

Select **Tools > Security Manager Administration** and select **Ticket Management** from the table of contents.

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Ticketing                     | Whether to enable Ticket Management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| System Generated Default Ticket Name | By default, this check box is checked. Clear the check box, if you do not want the ticket name to be appended with the system generated default name. The ticket name field in the activity creation dialog is left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Ticketing System URL</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Ticketing System URL                 | <p>The URL to use for launching an external change management system. When this field is configured, the Ticket ID is a hyperlink that will launch the URL specified. The URL must be formatted as a template that accepts the Ticket ID as part of the URL. The template format uses {0} in place of the actual Ticket ID.</p> <p>For example, if the URL to launch an external ticket management system for a ticket with the ticket ID of <i>TKT12345</i> is <code>http://ticketsystem/displayticket?ticketid=TKT12345</code>, then the template URL you would use would be <b><code>http://ticketsystem/displayticket?ticketid={0}</code></b>.</p> <p>When you create a ticket, the Ticket ID you specify will be used in the hyperlink in place of the {0}.</p> |
| Generate                             | <p>Click to display the Generate Template URL dialog box that can be used to create a Ticketing System URL.</p> <p>Using the example above, you would enter <b>TKT12345</b> in the Ticket ID field and <b><code>http://ticketsystem/displayticket?ticketid=TKT12345</code></b> in the Ticket URL field. When you click <b>OK</b>, the appropriate template URL is created and entered into the Ticketing System URL field.</p>                                                                                                                                                                                                                                                                                                                                       |

## Token Management Page

Use the Token Management page to identify the Token Management System (TMS) server to use for deploying configurations to Cisco IOS routers that use TMS as the communication protocol. Security Manager uses the settings on this page to contact the TMS server.

Security Manager uses FTP to deploy the delta configuration file to the TMS server, from which the configuration file can be downloaded and encrypted onto an eToken.

To use TMS with Cisco IOS routers, you must specify TMS as the transport protocol. You can do this for all routers on the Device Communication page (see [Device Communication Page, page 11-21](#)), or for a specific router in its device properties (see [Device Properties: General Page, page 3-42](#)). You must also configure the TMS server as an FTP server, otherwise deployment will fail.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Token Management** from the table of contents.

| Username                                     | The username Security Manager should use to log on to the TMS server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Password<br>Confirm Password                 | The password for the username. Enter the password in both fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Directory in the TMS Server for Config Files | The directory on the TMS server where deployed configuration files will be downloaded. The root FTP directory (“.”) is the default FTP location on the TMS server.                                                                                                                                                                                                                                                                                                                                                                                         |
| Public Key File Location                     | The location of the public and private key files on the Security Manager server, as copied from the TMS server. Security Manager uses the public key to encrypt data sent to the TMS server. Then the server uses its private key to decrypt the data. Security Manager comes with a default public key that matches the default private key on the server.<br><br><b>Note</b> If needed, you can generate a new pair of public and private keys using the TMS server. If you do this, you need to copy the new public key to the Security Manager server. |
| Save button                                  | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Reset button                                 | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Restore Defaults button                      | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## VPN Policy Defaults Page

Use the VPN Policy Defaults page to view or assign the default VPN policies that Security Manager uses for each IPsec technology. Before you can select a policy as a default, you must create the policy as a shared policy, submit it to the database and have it approved. You cannot create policies from this page. For detailed information on how to configure these defaults, see [Understanding and Configuring VPN Default Policies, page 25-12](#).

For each tab that relates to a VPN topology, the drop-down lists for each policy type list the existing shared policies that you can select. You can select a policy and click the **View Content** button to see the definition of that policy. In some cases, you are allowed to make changes, but you cannot save them.

Security Manager uses VPN policy defaults to simplify VPN configuration while ensuring that policy consistency is maintained. Security Manager provides factory default policies for mandatory policies, which provide values for settings that must be configured on the devices in your VPN topology for the VPN to work. Mandatory policies differ depending on the assigned IPsec technology. Factory default policies with their default configurations enable you to deploy to your devices immediately after creating the VPN topology. Default settings are not provided for optional policies. You might want to create shared policies to provide different default settings instead of using the factory default settings.

### Navigation Path

Select **Tools > Security Manager Administration** and select **VPN Policy Defaults** from the table of contents.

| Remote Access VPN     | Lists the policy types for which you can configure default policies for IPsec remote access VPNs.                           |
| S2S Endpoints tab     | The interface roles that define the default endpoints for internal and external interfaces in site-to-site VPNs.            |

## Workflow Page

Use the Workflow page to select the workflow mode that Security Manager enforces and to define the default settings for activity and deployment job notifications and logging.

Before changing the workflow mode, read the following topics to understand how the modes differ and the effects of changing the modes:

- [Working in Workflow Mode](#), page 1-21
- [Working in Non-Workflow Mode](#), page 1-22
- [Comparing Workflow Modes](#), page 1-22
- [Changing Workflow Modes](#), page 1-28

### Navigation Path

Click **Tools > Security Manager Administration** and select **Workflow** from the table of contents.

**Field Reference****Table 11-44** Workflow Page

| Element                                          | Description                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Workflow Control</b>                          |                                                                                                                                                                                                                                                                                             |
| Enable Workflow                                  | Whether to enable Workflow mode. When Workflow mode is enabled, you can select whether or not to have an approver for activities and deployment jobs.                                                                                                                                       |
| Require Activity Approval                        | Whether to require that activities be approved explicitly by an assigned approver. For more information about the differences between working with and without an approver, see <a href="#">Activity Approval, page 4-3</a> .                                                               |
| Submitter can Approve Activity                   | Activities can be approved by submitter.                                                                                                                                                                                                                                                    |
| Require Deployment & Install Image Approval      | Whether to require that deployment jobs and install image jobs be approved explicitly by an assigned approver. For more information about the differences between working with and without an approver, see <a href="#">Understanding Deployment, page 8-1</a> .                            |
| Submitter can Approve Deployment Jobs            | Deployment jobs can be approved by submitter.                                                                                                                                                                                                                                               |
| System Generated Default Activity Name           | By default, this check box is checked. Clear the check box, if you do not want the activity name to be appended with the system generated default name. The activity name field in the activity creation dialog is left blank.                                                              |
| <b>Email Notifications</b>                       |                                                                                                                                                                                                                                                                                             |
| Sender                                           | The e-mail address that Security Manager will use for sending e-mail notifications.                                                                                                                                                                                                         |
| Activity Approver                                | The default e-mail address for the person responsible for approving activities. Users can override this address when submitting an activity for approval. For more information, see <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver), page 4-20</a> . |
| Job/Schedule Approver                            | The default e-mail address of the person responsible for approving deployment jobs or schedules. Users can override this address when submitting a job or schedule for approval. For more information, see <a href="#">Submitting Deployment Jobs, page 8-38</a> .                          |
| Require Deployment Status Notification           | Whether to have e-mail notifications sent whenever the status of a deployment job changes. If you select this option, enter the e-mail addresses that should receive notification in the Job Completion Notification field. Separate multiple addresses with commas.                        |
| Include Job Deployer Job Completion Notification | You can also select Include Job Deployer to include the e-mail address of the person who deployed the job on the notification e-mail message.                                                                                                                                               |

| <b>Workflow History</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Keep Activity for         | The number of days that activity information should be kept in the Activity table. The default is 30. You can specify from 1 to 180 days.<br>Click <b>Purge Now</b> to delete all activities older than the number of days specified.<br><b>Note</b> If ticketing is enabled in non-Workflow mode, purge settings are controlled via the settings for Tickets (see <a href="#">Ticket Management Page, page 11-72</a> ). |
| Keep Job for              | The number of days that deployment job information should be kept in the Deployment Job table. The default is 30. You can specify from 1 to 180 days.<br>Click <b>Purge Now</b> to delete all jobs older than the number of days specified.                                                                                                                                                                              |
| Keep job per schedule for | The number of days that deployment job information should be kept in the Deployment Job table for each job schedule. This setting applies only to jobs that were initiated by a schedule. The default is 30. You can specify from 1 to 180 days.<br>Click <b>Purge Now</b> to delete all jobs older than the number of days specified.                                                                                   |
| Save button               | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Reset button              | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                         |
| Restore Defaults button   | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                              |

## Wall Settings Page

The Security Manager Wall Settings page is where you can enable or disable the Wall feature.

The "Wall" feature is also called the "ShoutBox" feature. You can use it to send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page.

### Note

Only admin users have permission to enable or disable the Wall feature, but all users have permission to send messages.

You would want to use the Wall feature, for example, to interact with other users while making some changes in your Security Manager installation, perhaps about the changes being made or certain immediate actions to be performed on the changes. The message being sent is broadcast to all users who are logged in. The Wall feature allows users to enter basic profile information that can be viewed by others when logged in. A significant use of the Wall feature is that it can be used to view a list of all users who are currently logged in. (A user is removed from the Wall window after idle timeout or logging out through the Security Manager client.)

You cannot use the Wall feature to send \*.pdf, \*.xls, or other file attachments.

**Navigation Path**

Click **Tools > Security Manager Administration** and select **Wall Settings** from the table of contents.

**Field Reference****Table 11-45 Wall Settings Page**

| Element                                 | Description                                    |
|-----------------------------------------|------------------------------------------------|
| Enable users to send messages to others | Whether to enable or disable the Wall feature. |
| Save button                             | Saves and applies changes.                     |
| Reset button                            | Resets changes to the last saved values.       |
| Restore Defaults button                 | Resets values to Security Manager defaults.    |

When the Wall feature is enabled, you can open the Wall window by clicking **Tools > Wall...** or by clicking the Wall icon in Configuration Manager.

You can also open the Wall window by clicking the Wall icon in Health and Performance Monitor or Image Manager. You cannot open the Wall window in Event Viewer or Report Manager.

Detailed Wall feature help is available on the Wall window by clicking the help icon.

The Wall window contains the following elements:

- Left-hand pane, which shows the users who are logged in on the same Security Manager server and an expand/collapse button.
- Right-hand pane, which occupies most of the page and contains the text of the messages that users have sent. The right-hand pane also has a button to enable or disable wall alerts and the help icon, which you can click to see detailed help.

**Summary of the Wall Window**

|                 |                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message Display | <p>Messages are displayed in the right-hand pane of the Wall window. The latest messages are always displayed at the top. Selective copy of text is allowed from the messages.</p> <p>You are allowed to type a maximum of 280 characters in the message panel, and after completing this number of characters you are alerted by a beep sound.</p> |
| Message Log     | <p>You can see a log of previous messages. The message log keeps 100 messages. The messages become visible to you when you launch the Wall window.</p>                                                                                                                                                                                              |

## **PART 2**

### **Firewall Services and NAT**

## Introduction to Firewall Services

---

The Firewall policy folder (in either Device or Policy view) includes firewall-related policies that you can deploy to the Adaptive Security Appliance (ASA), PIX Firewall (PIX), Catalyst Firewall Services Module (FWSM), and security routers running Cisco IOS Software. These policies allow you to control network access through a device.

This chapter contains the following topics:

- [Overview of Firewall Services, page 12-1](#)
- [Managing Your Rules Tables, page 12-7](#)

### Overview of Firewall Services

The Firewall policy folder (in either Device or Policy view) includes firewall-related policies that you can deploy to the Adaptive Security Appliance (ASA), PIX Firewall (PIX), Catalyst Firewall Services Module (FWSM), and security routers running Cisco IOS Software, including Aggregation Services Routers (ASR) and Integrated Services Routers (ISR).

These policies are focused on controlling access through the device, rather than access to the device (that is, logging into the device so that you can change its configuration or use **show** commands). Following is a general overview of the available firewall policies with pointers to topics that provide more detailed information:

- AAA rules—These are AAA firewall or authentication proxy rules that can require a user to authenticate (with a username and password) and optionally be authorized before the device allows the user to make network connections through it. You can also create accounting rules to collect billing, security, or resource allocation information. For more information, see [Understanding AAA Rules, page 15-1](#).
- Access rules—These are traditional interface-based extended access control rules. They permit or deny a packet based on source address, destination address, source interface, and service, and you can apply them in both the in and out directions. For more information, see [Understanding Access Rules, page 16-1](#).
- Inspection rules—These are traditional Context-Based Access Control (CBAC) inspection rules that filter out bad TCP/UDP packets based on application-layer protocol session information and that enable return traffic for the selected services. For more information, see [Understanding Inspection Rules, page 17-2](#).
- Web filter rules—These are a type of inspection rule that filters web traffic based on the requested URL, allowing you to prevent connections to undesirable web sites. For more information, see [Understanding Web Filter Rules, page 18-1](#).

- Zone-based firewall rules—These rules replace access rules, inspection rules, and web filter rules on IOS devices if you want to configure your rules based on zones instead of interfaces. A zone is a defined group of interfaces that perform the same security role (such as Inside or Outside). By using zone rules, you can create more compact device configurations than you can by using the other types of rules. For more information, see [Understanding the Zone-based Firewall Rules, page 21-3](#).
- Botnet Traffic Filter Rules—These rules help you to spot botnet traffic when it is sent to known bad addresses. Botnets install malware on unsuspecting computers and use those computers as proxies to perform malicious actions. For more information, see [Chapter 19, “Managing Firewall Botnet Traffic Filter Rules”](#).
- Transparent rules—These are Ethertype access control rules that apply to non-IP layer-2 traffic on transparent or bridged interfaces. For more information, see [Configuring Transparent Firewall Rules, page 23-1](#).

Most firewall rules policies are configured in rules tables. These tables allow in-line editing for most cells, rule organization using sections, and the ability to change the order of rules. If you create shared rules policies, you can apply them to a number of devices, even to devices running different operating systems, and Security Manager automatically creates the appropriate device commands to configure the policies based on the characteristics of each individual device, filtering out settings that do not apply to a device. For more information on using rule tables, see [Managing Your Rules Tables, page 12-7](#).

Another powerful feature used by most firewall rules policies is the idea of inheritance. When you create shared policies, one of your options is to have a device inherit the policy rather than be assigned the policy. This allows you to have a set of shared rules that apply to all devices, while having unique rules that apply to only those devices that require them. For more information about inheritance, see the following topics:

- [Understanding Rule Inheritance, page 5-4](#)
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-37](#).

The following topics provide additional overview information about firewall services policies:

- [Understanding the Processing Order of Firewall Rules, page 12-2](#)
- [Understanding How NAT Affects Firewall Rules, page 12-3](#)
- [ACL Names Preserved by Security Manager, page 12-4](#)

## Understanding the Processing Order of Firewall Rules

When you configure firewall rules policies, you should keep in mind the logical order in which the rules are processed. For example, if you plan to drop all traffic of a certain type in an access rule, there is no reason to create rules in other firewall policies that apply to that type of traffic, because they will never be triggered. Conversely, if you want to apply certain types of inspection or web filtering on traffic, you must ensure that your access rules first allow that traffic to enter the device.

Following is the general logical processing order of firewall rules:

- AAA rules—If you require authentication, with or without authorization, the user must successfully pass the test or the traffic is dropped.
- Access rules (In direction)—The traffic must then get through your access rules. If you used AAA rules, you might have allowed temporary per-user access rules to be configured for the user’s session. These per-user rules are configured in your AAA server, not in Security Manager.

On ASA 8.3+ devices, global access rules are then processed after any interface-specific access rules. For more information, see [Understanding Global Access Rules, page 16-3](#).

- One of the following:
  - Inspection rules (In direction), web filter rules (In direction), botnet rules, service policy rules (IPS, QoS, Connection)—All of these are applied to the traffic. For devices that do not allow you to configure the direction, all rules are considered to be in the In direction.
  - Zone-based firewall rules—If you configured zone-based rules for an IOS device, these rules replace inspection and web filter rules (botnet rules do not apply to IOS devices).
- Routing protocols are then applied to the traffic. The traffic is dropped if it cannot be routed. (Routing policies are in the Platform folders for the various device types and are not considered firewall policies.)
- ScanSafe Web Security policies, Inspection rules (Out direction), web filter rules (Out direction)—For IOS devices only, if you created ScanSafe policies, or inspection or web filter rules in the Out direction, they are now applied.
- Access rules (Out direction)—Finally, the traffic must pass through any Out direction access rules.

Transparent rules do not fit into this picture. Because transparent rules apply to non-IP layer-2 traffic only, if a transparent rule applies to a packet, no other firewall rule applies to it; and conversely, if other rules apply, the transparent rule never applies.

## Understanding How NAT Affects Firewall Rules

Devices that support firewall rules also allow you to configure network address translation (NAT). NAT substitutes the real address in a packet with a mapped address that is routable on the destination network.

If you configure NAT to occur on an interface, the firewall rules that are also configured on that interface should assess traffic based on the translated address rather than on the original (pre-NAT) address, with the exception of ASA 8.3+ devices.

Devices running ASA software release 8.3 and later use the original, or real, IP address when evaluating traffic with the exception of IPSec VPN traffic policies. Thus, when you configure firewall rules, ACL policy objects, or the IOS, QoS, and connection rules platform service policy, ensure that you use the original addresses.

For more information about NAT, see the following topics:

- ASA, PIX, FWSM devices—[Understanding Network Address Translation, page 24-2](#).
- IOS devices—[NAT Policies on Cisco IOS Routers, page 24-5](#).

## ACL Names Preserved by Security Manager

Security Manager tries to preserve user-defined access control list (ACL) names as they appear in device configurations. Security Manager can preserve the ACL names configured on a device in the following circumstances:

- If the ACL name is specified in Security Manager.

For access rules policies, you can specify ACL names in **Firewall > Settings > Access Control** or **Firewall > Settings > IPv6 Access Control**. You can specify a given name for a single interface and direction, but the name is used for any other interfaces and directions that use the same ACL. Keep in mind that you cannot use the same name as an ACL policy object that you assign to other policies on the device, and you cannot use the same name for IPv4 and IPv6 ACLs.

### Note

---

Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.

---

- If a policy uses an ACL policy object, the name of the policy object is used for the ACL name. ACL policy objects created during discovery use the name of the ACL defined on the device whenever possible. Behavior depends on an administrative setting:
  - If you select **Allow Device Override for Policy Objects** in **Tools > Security Manager Administration > Discovery**, if a policy object with the same name exists in Security Manager, but it has different content, the name is reused and a device-level override is created.
  - If you do not select that option, a new policy object is created with the same name but with a number appended to it, for example, ACLobject\_1. This is the default behavior.
- If you select **Reuse Existing Names** for the **Firewall Access List Names** setting in **Tools > Security Manager Administration > Deployment**, names defined on the device are reused for firewall rules that generate ACLs.
- If the ACL is unshared, even if you change the content of the ACL in Security Manager.
- If the ACL is shared, but the policies that share the ACL are defined identically in Security Manager. If you change the content of the ACL, one ACL retains the name and the others are assigned generated names.

### Note

---

On ASA devices and on PIX devices not running version 6.3(x), Security Manager does not reuse the ACL name if it is used by a NAT policy static rule and contains an object-group. The ACL is deployed with the contents of the object-group defined as the source. This is because the device requires that all ACEs in the ACL have the same source.

---

### Tips

- If you use an ACL policy object that uses a name also used by an ACL already defined on the device, and the existing ACL is for a command that Security Manager does not support, you will get a deployment error asking you to choose a different name. If this happens, rename the policy object.

- ACLs named <number>\_<number> are not valid on IOS devices. Security Manager strips off the suffix prior to deployment. This also means that you cannot assign an IOS device more than one ACL object with the same numbered prefix. However, named ACLs that have a numbered suffix are allowed, for example, ACLname\_1.
- Numbered ACLs must use the correct number ranges for IOS devices. Standard ACLs must be in the range 1-99 or 1300-1999. Extended ACLs must be in the range 100-199 or 2000-2699.
- ACL names for IOS devices cannot begin with an underscore (\_).
- Policies that do not preserve user-defined names include SSL VPN policies, transparent firewall rules, and AAA rules (for IOS devices).

The following topics provide additional information about ACL naming:

- [ACL Naming Conventions, page 12-5](#)
- [Resolving User Defined ACL Policy Naming Conflicts, page 12-6](#)
- [Resolving ACL Name Conflicts Between Policies, page 12-7](#)

## ACL Naming Conventions

When the name for the ACL is generated by Security Manager, the name is derived from the type of rule or platform being defined and certain configuration settings that make it unique. All newly created ACLs are given a name based on the naming conventions shown in the following table.

### Tip

During deployment, sometimes a suffix *.n* (where *n* is an integer) might get added to an ACL name if the existing ACL cannot be edited in place. For example, if an ACL named `acl_mdc_outside_10` already exists on the device, a new ACL with the name `acl_mdc_outside_10.1` is created if you do not remove the old ACL before you deploy the new ACL.

**Table 12-1** ACL Naming Conventions

| Policy Type      | Naming Convention                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Resolving User Defined ACL Policy Naming Conflicts

Cisco Security Manager generates ACL names that begin with “CSM\_”. You should not use the same naming pattern while defining a ACL in the device. If you declare ACL names with the “CSM\_” prefix on device, during discovering the device configuration in Cisco Security Manager, those ACL names are replaced with Security Manager generated names and respective configuration delta would be applied to a device on the next deployment.

For example, Cisco Security Manager has CSM\_FW\_ACL\_InterfaceName as the ACL naming pattern for inbound firewall interface. Here, if you use the CSM pattern for ACL name declaration in device like, CSM\_xyz, Security Manager renames it as “CSM\_FW\_ACL\_InterfaceName”.

**Note**

This rule is valid for firewall access list (Table 12-1) and delta would be generated and applied to a device even when the *Reuse existing names* setting is configured in Tools > Security Manager Administration > Deployment.

## Resolving ACL Name Conflicts Between Policies

If an ACL is shared, but the policies that share the ACL are not defined identically in Security Manager, one policy uses the original name of the ACL and the other policies use a new name generated by Security Manager. The order of preference for determining which policy uses the original name is as follows:

- Access list ACLs
- AAA ACLs
- Static ACLs
- NAT0 ACLs
- NAT ACLs

For example, if an access ACL and a NAT0 ACL try to reuse the same ACL, the access ACL uses the original name as configured on the device and the NAT0 ACL is renamed by Security Manager.

## Managing Your Rules Tables

The following sections explain some of the basics of using rules tables, which appear in many of the firewall rules, NAT, and select other policies:

- [Using Rules Tables, page 12-8](#)
- [Adding and Removing Rules, page 12-9](#)
- [Editing Rules, page 12-10](#)
- [Finding and Replacing Items in Rules Tables, page 12-16](#)
- [Moving Rules and the Importance of Rule Order, page 12-19](#)
- [Enabling and Disabling Rules, page 12-20](#)
- [Using Sections to Organize Rules Tables, page 12-20](#)
- [Combining Rules, page 12-22](#)
- [Generating Policy Query Reports, page 12-28](#)
- [Optimizing Network Object Groups When Deploying Firewall Rules, page 12-35](#)
- [Expanding Object Groups During Discovery, page 12-35](#)

## Using Rules Tables

Rules tables in Security Manager display sets of rules (for example, access rules) that make up a policy. These types of tables are used in only a select group of policies, but many of the firewall services rules policies use them. Rules tables are used when the order of the rules within the policy matter.

Figure 12-1 details the features in rules tables.

**Figure 12-1 Rules Table Example**

The screenshot displays the Cisco Security Manager interface for a rules table. At the top, a banner shows the device name 'PMR-ASA912.cisco.com', the policy 'Access Rules (Unified)', and the assigned device '1 Device'. Below the banner is a filter bar with a dropdown menu set to 'Permit' and a search field containing 'is'. The main area is a table with columns for 'No.', 'Permit', 'Sources' (Network, Security Group, User), 'Destinations' (Network, Security Group, Service), and 'Service'. The table is organized into sections: 'GlobalAccessPolicy - Mandatory (1 Rule)', 'GroupA\_AccessPolicy - Mandatory (4 Rules)', 'DHCP Access (2-4) Permit access to DHCP', 'GroupA\_AccessPolicy - Default (Empty)', and 'GlobalAccessPolicy - Default (1 Rule)'. A footer contains buttons for 'Enable conflict detection', 'Generate Report', 'Refresh Hit Count', 'Query', and 'Save'. A status message at the bottom indicates 'ASA 8.3 onwards the device uses Real IP(pre-natted IP) in firewall rules.Use Real IP addresses.'

Following is an explanation of the numbered call-outs of the rules table features:

- **Device and policy identification banner (1)**—The banner provides information about policy sharing and inheritance and includes the ability to perform some actions. For detailed information, see [Using the Policy Banner, page 5-38](#).
- **Table filter (2)**—You can filter the rules displayed to help you find rules in a large table. For more information, see [Filtering Tables, page 1-48](#).
- **Table column headings (3)**—You can sort by column and move, show, and hide columns. For more information, see [Table Columns and Column Heading Features, page 1-49](#).
- **Rules, Workarea (4)**—The body of the table shows the rules that are included in the policy.
- **User-defined sections (5)**—You can group rules into sections for your convenience. For more information, see [Using Sections to Organize Rules Tables, page 12-20](#).

- **Table buttons (6)**—Use the buttons below the table to do the following:
  - Enable automatic conflict detection (Access Rules only). For more information, see [Using Automatic Conflict Detection, page 16-28](#).  
If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool.  
When you first open the Access Rules page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.
  - Update the hit count information displayed in the table. For more information, see [Viewing Hit Count Details, page 16-36](#) and [Hit Count Selection Summary Dialog Box, page 16-20](#).
  - Run a policy query, which can help you evaluate your rules and identify ineffective rules. See [Generating Policy Query Reports, page 12-28](#)
  - Find and replace items within rules (button with the binoculars icon)—For more information, see [Finding and Replacing Items in Rules Tables, page 12-16](#).
  - Move and rearrange rules (up and down arrows)—For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).
  - Add rules to the table (+ icon)—For more information, see [Adding and Removing Rules, page 12-9](#).
  - Edit the selected rule (pencil icon)—For more information, see [Editing Rules, page 12-10](#).
  - Delete the selected rule (trash can icon)—For more information, see [Adding and Removing Rules, page 12-9](#).
- **Conflict Navigation Bar (7)**—Use the Conflict navigation bar to navigate to conflicting rules in the rules table. For more information, see [Using Automatic Conflict Detection, page 16-28](#).

## Adding and Removing Rules

When you work with policies that use rules tables, like many of the firewall rules policies, you can add rules to the policy using several methods:

- **Add Row** button (+ icon)—Clicking the Add Row button beneath the table is the standard method to add a new rule. Clicking this button opens the dialog box for adding rules that is specific to that type of policy. If you select a row or section heading, the new rule is added after the selected row. Otherwise, it is added at the end of the appropriate scope (typically, the local scope).
- Right-click a row and select **Add Row**—This is equivalent to selecting a row and clicking the Add Row button.
- Copy and paste—If you want to create a new rule that is similar to an existing rule, you can select the rule, right-click and select **Copy**, then select the row after which you want to place the rule, right-click and select **Paste**. This creates a duplicate rule, which you can select and edit (see [Editing Rules, page 12-10](#)).
- Cut and paste—Cut and paste is similar to copy and paste, except you are deleting the existing rule when you select the **Cut** command. Instead of cut and paste, consider moving the rule (see [Moving Rules and the Importance of Rule Order, page 12-19](#)).

When you no longer need a rule, you can remove it by selecting the rule and clicking the **Delete Row** button (trash can icon).

**Tip**

Rather than deleting a rule, consider first disabling the rule. By disabling a rule, you remove it from the device (when you redeploy the configuration) without removing it from Security Manager. Then, if you discover that you really needed that rule after all, you can simply enable it and redeploy the configuration. If you delete the rule, you would have to recreate it (there is no undo function). Thus, you might want to develop a policy of deleting rules only after they have been disabled for a certain amount of time. For more information, see [Enabling and Disabling Rules, page 12-20](#).

**Related Topics**

- [Using Rules Tables, page 12-8](#)
- [Using Sections to Organize Rules Tables, page 12-20](#)

## Editing Rules

To edit an existing rule in any of the rules policies that use rules tables, select the rule and click the **Edit Row** button, or right-click and select **Edit Row**. This allows you to edit all aspects of the selected rule.

**Tip**

You cannot edit any aspect of an inherited rule from a local device rule policy. Edit inherited rules in Policy view.

For most rule tables, you can also edit specific attributes, or table cells, instead of editing the entire rule, using commands in the right-click menu.

The ability to edit a cell is limited by whether it makes sense to edit the content. For example, Inspection Rules have many limitations based on how the rule is configured:

- If you applied the rule to All Interfaces, you cannot edit source or destination addresses, the interface, or the direction of the rule.
- If you selected Default Inspection Traffic for the traffic match criteria (without selecting the option to limit inspection between source and destination), or Custom Destination Ports, you cannot edit source or destination addresses.
- If you selected Destination Address and Port (IOS), you cannot edit source addresses.

The following cell-level commands are available, although the ability to edit multiple rows is not supported in all policies that use rule tables:

- **Add <Attribute Type>**—When you select multiple rows and right-click a Source, User, Destination, Services, or Interface cell, you can select the Add command to append entries to the data currently in the selected cells. The Add command's full name includes the name of the attribute, for example, Add Source.
- **Edit <Attribute Type>**—Most attributes allow you to edit the content. Editing replaces the content of the cell. You can edit a single cell, or select multiple rows and edit the contents of the same type of cell in all rows at once. The Edit command's full name includes the name of the attribute, for example, Edit Interfaces.
- **Edit <Entry>**—In some cases, when you edit Source, User, Destination, Services, or Interfaces, you can select an entry in the cell and edit just that entry. For example, if the Sources cell contains three network/host objects and an IP address, you can select any of them and edit the entry. The edit command includes the name of the entry, for example, Edit HostObject.

- **Remove <Entry>**—In some cases, when you edit Source, User, Destination, Services, or Interfaces, you can select an entry in the cell and remove the entry. You cannot remove the last entry in the cell, because the rule would become invalid. The remove command includes the name of the entry, for example, Remove IP.
- **Create <Object Type> Object from Cell Contents**—In the Sources, User, Destinations, and Services cells, you can select the Create command to create a policy object of the appropriate type. You can also select an entry in the cell and create a policy object from just the selected item. The create command includes the policy object type you can create, and the name of the item that is the source for the object, either cell contents for everything in the cell, or the name of an entry if you selected one. When creating network/host objects, you are always creating network/host group objects.
- **Show <Attribute Type> Contents; Show <Entry> Contents**—The show commands let you view the actual data defined in the cell. The results depend on the view you are in:
  - **Device View, Map View, or Import Rules**—You are shown the actual IP addresses, fully-qualified domain names (FQDNs), services, or interfaces to which the rule will apply for the specific device. For example, if the rule uses network/host objects, you will see the specific IP addresses or FQDNs defined by the objects. If the rule uses interface objects, you will see the specific interfaces defined on the device that the object identifies, if any.

The IP addresses for network/host objects are sorted in ascending order on the IP address, and then descending order on the subnet mask.

Service objects are sorted on protocol, source port, and destination port.

Interface objects are listed in alphabetical order. If the interface is selected because it matches a pattern in an interface object, the pattern is listed first, and the matching interface is shown in parentheses. For example, “\* (Ethernet1)” indicates that the Ethernet1 interface on the device is selected because it matches the \* pattern (which matches all interfaces).
  - **Policy View**—You are shown the patterns defined in the policy objects and entries defined for the policy. Entries are sorted alphabetically, with numbers and special characters coming first.

## Adding or Editing Address Cells in Rules Tables

Use the Add or Edit Sources or Destinations dialog boxes, or Address dialog boxes for NAT tables, to edit the source or destination entry in a rules table that includes sources or destinations. For detailed information on editing firewall rules cells, see [Editing Rules, page 12-10](#).

You can enter any combination of the following address types to define the source or destination of the traffic. The type of policy determines whether an IPv4 or IPv6 address is required; you cannot mix address types. You can enter more than one value by separating the items with commas. For more information, see [Specifying IP Addresses During Policy Definition, page 6-87](#).

- **Network/host object.** Enter the name of the object or click **Select** to select it from a list. You can also create new objects from the selection list.

**Note** The only way to specify a fully-qualified domain name (FQDN) is to use an FQDN network/host object or a group object that includes an FQDN object. You cannot directly type in an FQDN. Not all policy types allow FQDN; you are prevented from specifying an object that contains an FQDN object if the policy does not allow it.

- Host IP address, for example, 10.10.10.100 (IPv4) or 2001:DB8::200C:417A (IPv6).
- IPv4 network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.
- IPv6 network address and prefix length in the format 2001:DB8::/32.
- A range of IP addresses, for example, 10.10.10.100-10.10.10.200 (IPv4) or 2001:DB8::1-2001:DB8::100 (IPv6).
- (IPv4 only.) An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see [Contiguous and Discontiguous Network Masks for IPv4 Addresses, page 6-81](#)).
- Interface roles object. Enter the name of the object or click **Select** to select it from a list (you must select Interface Role as the object type). When you use an interface role, the rule behaves as if you supplied the IPv4 or IPv6 address of the selected interface. This is useful for interfaces that get their address through DHCP, because you do not know what IP address will be assigned to the device. For more information, see [Understanding Interface Role Objects, page 6-73](#).

If you select an interface role as a source, the dialog box displays tabs to differentiate between hosts or networks and interface roles.

### Navigation Path

Do any of the following in a rules policy that includes sources, destinations, or other address cells:

- Right-click an address cell in a rules table and select **Edit Sources** or **Edit Destinations** or a similar command. The data replaces the content of the selected cells.
- Select an entry in an address cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a Sources or Destination cell, and select **Add Sources** or **Add Destinations**. The data is appended to the data already in the cell.

## Adding or Editing User Cells in Rules Tables

### Tip

The user cell applies to ASA 8.4(2+) only. Anything configured in the cell is ignored for other device types or OS versions.

Use the Add or Edit Users dialog boxes to edit the user entry in a rules table that includes user identity groups. For detailed information on editing firewall rules cells, see [Editing Rules, page 12-10](#).

You can enter any combination of the following to identify traffic based on Active Directory (AD) user or user group names. If you configure identity user groups, they apply to source traffic only. For traffic to match the rule, both the source addresses and identity user groups must match. That is, the rule applies to traffic sent from users on the specific networks or hosts defined in the source field when directed at the destination. For more information, see [Configuring Identity-Based Firewall Rules, page 13-21](#).

To make the rule apply to a user without regard for the source address, specify **any** in the source cell.

You can enter more than one value by separating the items with commas. Following are the supported formats:

- Identity user group objects.
- Individual users: NETBIOS\_DOMAIN\user
- User groups (note the double \): NETBIOS\_DOMAIN\user\_group

Click **Select** to select objects, users, or user groups from a list or to create new objects. For more information, see [Selecting Identity Users in Policies, page 13-21](#) and [Creating Identity User Group Objects, page 13-19](#).

#### Navigation Path

Do any of the following in a rules policy that includes user cells:

- Right-click a user cell in a rules table and select **Edit Users**. The data replaces the content of the selected cells.
- Select an entry in a user cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a user cell, and select **Add Users**. The data is appended to the data already in the cell.

## Adding or Editing Services Cells in Rules Tables

Use the Edit Services dialog box to edit the services that define the type of traffic to act on. You can enter more than one value by separating the items with commas.

You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab. You can also click **Select** to select the service from a list, or to create a new service.

For complete information on how to specify services, see [Understanding and Specifying Services and Service and Port List Objects, page 6-100](#).

For detailed information on editing firewall rules cells, see [Editing Rules, page 12-10](#).

#### Navigation Path

Do any of the following in a rules policy that includes services:

- Right-click a Services cell in a rules table and select **Edit Services**. The data replaces the content of the selected cells.
- Select an entry in a Services cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a Services cell, and select **Add Services**. The data is appended to the data already in the cell.

#### Tip

For inspection rules, services appear in the Traffic Match column and only for rules where the traffic matches source, destination, and port.

## Adding or Editing Interfaces or Zones Cells in Rules Tables

Use the Add or Edit Interfaces (or Zones) dialog box to edit the interfaces or zones for which the rule is defined. For detailed information on editing firewall rules cells, see [Editing Rules, page 12-10](#).

- When editing interfaces, you can enter any combination of specific interface names or interface roles. You can enter more than one value by separating the items with commas. Enter the names or click **Select** to select the interfaces and roles from a list, or to create new roles. An interface must already be defined to appear on the list.

When you deploy the policy to the device, interface roles are replaced by actual interface names, and only to interfaces that are actually configured on the device. To see which interfaces will actually be selected by a rule, right-click the Interfaces cell and select **Show Interfaces**.

- When editing zones, you can select only one interface role, and you cannot select individual interfaces. The interface roles are used to create zones for zone based firewall rules. To see the interfaces that will belong to the zone, right-click the Zones cell and select **Show Zone Contents**.

For more information about interface roles and selecting interfaces, see the following topics:

- [Understanding Interface Role Objects, page 6-73](#)
- [Specifying Interfaces During Policy Definition, page 6-76](#)

#### Navigation Path

Do any of the following in a rules policy that includes interfaces or zones:

- Right-click an Interfaces or Zones cell in a rules table and select **Edit Interfaces**, **Edit Zones**, or similar command. The data replaces the content of the selected cells.
- Select an entry in an Interfaces cell and select **Edit <Entry>**. The data replaces the selected entry. You cannot edit an entry in a zone.
- Select multiple rules, right-click an Interfaces cell, and select **Add Interfaces**. The data is appended to the data already in the cell. You cannot add entries to a zone.

## Editing Category Cells in Rules Tables

Use the Edit Category dialog box to change the category assigned to a rule. Categories help you organize and identify rules and objects. See [Using Category Objects, page 6-13](#). For detailed information on editing firewall rules cells, see [Editing Rules, page 12-10](#).

#### Navigation Path

Right-click a Category cell in a rules policy that includes categories and select **Edit Category**.

## Editing Description Cells in Rules Tables

Use the Edit Description dialog box to edit the description of the rule. The description helps you identify the purpose of a rule and can be up to 1024 characters. For detailed information on editing rules cells, see [Editing Rules, page 12-10](#).

#### Navigation Path

Right-click a Description cell in a rules policy that includes descriptions and select **Edit Description**.

## Showing the Contents of Cells in Rules Tables

Use the Show Contents dialog boxes to display the actual, translated data defined in a source, user, destination, services, interfaces, zones, or other cell in a rules table that includes addresses, identity user groups, interfaces, services, or policy objects that define those things. The title of the dialog box

indicates which cell or entry you are examining. Use this information to determine to which addresses, services, or interfaces the rule will actually apply when deployed to the device. For detailed information about editing or viewing cell contents, see [Editing Rules, page 12-10](#).

What you see in the dialog box depends on the view you are in:

- **Device View, Map View**—You are shown the actual IP addresses, users, services, or interfaces to which the rule will apply for the specific device. For example, if the rule uses network/host objects, you will see the specific IP addresses or fully-qualified domain names (FQDN) defined by the objects. If the rule uses interface objects, you will see the specific interfaces defined on the device that the object identifies, if any.
  - The IP addresses for network/host objects are sorted in ascending order on the IP address, and then descending order on the subnet mask.
  - Service objects are sorted on protocol, source port, and destination port.
  - Interface objects are listed in alphabetical order. If the interface is selected because it matches a pattern in an interface object, the pattern is listed first, and the matching interface is shown in parentheses. For example, “\* (Ethernet1)” indicates that the Ethernet1 interface on the device is selected because it matches the \* pattern (which matches all interfaces).
- **Policy View**—You are shown the patterns defined in the policy objects and entries defined for the policy. Entries are sorted alphabetically, with numbers and special characters coming first.

### Filtering Contents

A List Filter field is provided above the results in the Show Contents dialog box. You can use the List Filter field to quickly locate any entries that contain a specified text string.

**Figure 12-2** List Filter Field

|          |                           |          |               |

| <b>1</b> | Filter-parameters button. | <b>2</b> | Clear button. |
|----------|---------------------------|----------|---------------|

To search for a specific text string in the Show Contents list:

- Click in the List Filter field to place the text cursor, and then begin typing.  
These are “live filter” fields. That is, as you type each character, entries that do not include your current text string are removed from the list or table.

To clear a List Filter field:

- Click the clear button at the right side of the field.  
This button appears when you begin typing in the field. (You also can highlight the characters and press the Delete or Backspace key on your keyboard.)  
When you clear the List Filter field, all entries in the list are again displayed.

You can tune the filter results by selecting case sensitivity or insensitivity, by allowing wildcards or regular expressions, and by specifying where in a returned string your characters must be located.

To change the List Filter criteria:

1. Click the filter-parameters button (magnifying glass) at the left side of the List Filter field to open the parameters menu.
2. Choose an option.

The menu consists of three sections:

- **Case sensitive** and **Case insensitive** – Choose one or the other. If you choose **Case sensitive**, found text must match not only the characters you enter, but also their as-typed case.
  - **Use wildcards** and **Use regular expression** – Choose one or the other. The following wildcards are recognized:
    - \* (asterisk) – Match zero or more characters at that location in the string.
    - + (plus sign)– Match one or more characters at that location in the string.
    - ? (question mark) – Match one character at that location in the string.
    - **Match from start**, **Match exactly**, and **Match anywhere** – Choose one. **Match from start** means that the string you enter must be found at the beginning of an entry, although it can be part of a larger set of characters. **Match exactly** requires that the string you enter exactly match the entire column entry. **Match anywhere** means the string can be found anywhere within an entry, and it can be part of a larger set of characters.
3. Repeat Steps 1 and 2 to change another parameter.

### Navigation Path

Do any of the following in a rules policy that includes sources, user, destinations, services, interfaces, zones, or other fields that specify networks, identity user groups, interfaces, or services. You can also show contents when using tools that work with rules, such as importing rules.

- Right-click one of those cells and select **Show <Attribute Type> Contents**, where the attribute type is the name of the cell. The data includes all entries defined in the cell.
- Right-click an entry in one of those cells and select **Show <Entry> Contents**, where the name of the selected entry is included in the command name. The data displayed is only for the selected entry.

Tip

---

For inspection rules, services appear in the Traffic Match column and only for rules where the traffic matches source, destination, and port.

---

## Finding and Replacing Items in Rules Tables

In policies that use rules tables, you can search for items in some cells and selectively replace them. The cells that you can search depend on the policy. You can use wildcard characters to find items based on pattern matching, for example, so that you can replace several related networks with a new network/host policy object defined for them.

To use find and replace, click the **Find and Replace** (binoculars icon) button at the bottom of any policy that uses rules tables to open the [Find and Replace Dialog Box](#), page 12-17. In the Firewall folder, this includes AAA rules, access rules, IPv6 access rules, inspection rules, zone based firewall rules, and web filter rules (for ASA/PIX/FWSM devices only). For ASA/PIX/FWSM devices, it also includes the NAT translation rules policy (but not for every combination of context and operational mode) and the IOS, QoS, and connection rules platform service policy.

When searching for items, you select the type of item, the columns you want to search, and enter the string that you want to find and optionally, the string you want to use to replace it. You can find and replace the following types of items:

- Network—A network/host object name, or the IP address of a host or network.
- User—An Active Directory (AD) username (NetBIOS\_DOMAIN\user), user group name (NetBIOS\_DOMAIN\user\_group), or identity user group object name.
- Service—A service object name or protocol and port, for example TCP/80. The search is syntactic, not semantic, that is, if you are searching for TCP/80 and a rule uses HTTP, the search results will not find it.
- Interface Role—An interface name or interface role object name.

**Note** In access rules, you can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name “Global,” you are actually creating an interface-specific access rule that uses a policy object named Global.

- Text—A text string in a Description field.

The following are some examples of what you might do with find and replace:

- If you create a new network/host object named network10.100 for all networks in the 10.100.0.0/16 range, you can search and replace all subordinate network specifications. For example, you can search for ^10.100\* to find all addresses like 10.100.10.0/24. Select the **Find Whole Words Only** and **Allow Wildcard** options, and enter network10.100 as the replacement string. Because you selected Find Whole Words Only, the string that is replaced is the entire 10.100.10.0/24 string, not just the 10.100 portion.
- If you want to find all rules that use IP addresses (instead of network/host objects), you can search for \*.\*.\*.\* to find all host or network IP addresses. You can then selectively edit the cell while the Find and Replace dialog box is open.
- If you want to replace all interface role objects that include “side” in the name (such as inside and outside) with the interface role object named External, search for \*side with the **Find Whole Words Only** and **Allow Wildcard** options selected, and enter External in the Replace field.

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Case            | For text searches, whether you want to match the capitalization you used in the Find field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Find Whole Words Only | <p>Whether the search should find and select only whole words, which are strings delimited by spaces or punctuation. For example, a whole word search for SanJose will find SanJose but not SanJose1.</p> <p>If you use this option with the Allow Wildcard option, you can search for partial strings but if you replace the located string, you replace the whole word and not the partial string. For example, you can search for ^10.100* to find all addresses like 10.100.10.0/24, and replace with them with the network10.100 policy object. By selecting Whole Words, the network/host object replaces the entire address, not just the portion you searched for.</p> <p>For text searches, this option and the Allow Wildcards option are mutually exclusive.</p> |
| Allow Wildcards       | <p>Whether the search or replacement strings use wildcard characters. If you do not select this option, all characters are treated literally.</p> <p>You can use the Java regular expression syntax to create your expression with the following exceptions:</p> <ul style="list-style-type: none"> <li>• Period (.)—The period is a literal period and it is implicitly escaped.</li> <li>• Question mark (?)—The question mark indicates a single character.</li> <li>• Asterisk (*)—The asterisk matches one or more characters. It does not match zero characters.</li> <li>• Plus sign (+)—The plus sign means the same as the asterisk; it matches one or more characters.</li> </ul>                                                                                 |
| Find Next button      | Click this button to find the next occurrence of the search string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Replace button        | Click this button to replace the found string with the replacement string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Replace All button    | Click this button to automatically find the search string and replace it throughout the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Moving Rules and the Importance of Rule Order

Rules policies that use rules tables are ordered lists. That is, the top to bottom order of the rules matters and has an effect on the policy.

When the device analyzes a packet against a rules policy, the device searches the rules in order from top to bottom. The first rule that matches the packet is the rule that is applied to the packet, and all subsequent rules are ignored. Thus, if you place a general rule pertaining to IP traffic before a more specific rule pertaining to HTML traffic for a given source or destination, the more specific rule might never be applied.

For access control rules, you can use the automatic conflict detection tool to help identify when rule order will prevent a rule from ever being applied to traffic (for more information, see [Using Automatic Conflict Detection, page 16-28](#)). For other rules policies, carefully inspect the table to spot problems with rule order.

When you find that you need to rearrange the order of a rule, select the rule that needs to be moved and click the **Up Row** (up arrow) or **Down Row** (down arrow) buttons as appropriate. If these buttons do not appear beneath the rules table, rule order does not matter and you cannot rearrange them.

If you use sections to organize your rules, you can move rules only within the section. When you move rules that are outside the sections, you can move them above or below the section. For more information about working with sections, see [Using Sections to Organize Rules Tables, page 12-20](#).

**Tip**

Special rules apply to moving access rules when you mix interface-specific and global rules in a policy. For more information, see [Understanding Global Access Rules, page 16-3](#).

## Enabling and Disabling Rules

You can enable and disable individual rules in a policy that uses rules tables, such as most firewall services rules policies. Your change takes effect when you redeploy the configuration to the device.

If a rule is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled rules are removed from the device.

Disabled rules are kept in the rules policy in Security Manager as a convenience so that you can easily enable needed rules without recreating them. Thus, it is often wise to disable a rule that you believe you no longer need instead of immediately deleting it.

To change whether a rule is enabled or disabled, select the rule, right-click and select **Enable** or **Disable**, as appropriate.

## Using Sections to Organize Rules Tables

You can organize policies that use rules tables into sections. There are two types of sections:

- Scopes, which define inheritance relationships between a policy and an inherited policy. These sections are automatically created when you inherit policies. For more information, see [Understanding Rule Inheritance, page 5-4](#).
- User-defined sections, which are convenient groupings that help you organize rules so that you can evaluate and edit the policy more easily. These types of sections are most useful for policies that contain a large number of rules.

All rules within a section must be sequential; you cannot group rules randomly. If you want to identify non-contiguous rules as being related, you can assign the same category to the rules.

User-defined sections are set off visually from the other rules in the table by an indented section heading. The heading contains, left to right, a +/- icon for opening and closing the section, a band of color identifying the category you assigned the section (if any), the section name, the first and last rule number contained in the section (for example, 4-8), and the description, if any, you gave the section.

**Note**

You might need to resize the rule number column to see the numbering of rules in sections.

Whether you create user-defined sections is completely up to you. If you decide creating these types of sections is worthwhile, the following information explains how to create and use them:

- To create a new section, right-click a row that you want to place the section and select **Include in New Section**. (You can also use Shift+click to select a block of rules.) You are prompted for a name, description, and category for the section (the name is the only required element).
- To move existing rules into a section, select one or more contiguous rules, right-click and select **Include in Section <name of section>**. This command appears only if the selected rows are next to an existing section. If the rows you want to add to a section are not currently next to the section, you can do one of two things: move the rules until they are next to the section; cut the rules and paste them into the section.
- You cannot move a section. Instead, you need to move the rules that are outside of the section around it. When you move a rule that is next to, but not within, a section, the rule jumps over the section.
- You cannot move a rule outside of or through a section. A section defines the borders within which you can move rules. If you want to move rules out of a section and back into the Local scope section, select one or more contiguous rules, right-click and select **Remove from Section <name of section>**. The rules must be at the beginning or end of the section to use this command. If they are not, you can either move the rules until they are, or use cut and paste to move them out of the section.
- To add a new rule to a section, select the rule after which you want to create the rule before clicking the Add Row button. To place it at the beginning of the section, select the section heading.

If you want to create a rule after, but outside of, a section, you can either create it as the last rule in the section and then remove it from the section, or create it just above the section and click the down arrow button.

- You can change the name, description, or category of a section by right-clicking the section heading and selecting **Edit Section**.
- When you delete a section, all rules contained in the section are retained and moved back into the Local scope section. No rules are deleted. To delete a section, right-click the section heading and select **Delete Section**.
- If you use the Combine Rules tool, the resulting combined rules respect your sections. Rules that are in a section can be combined only with other rules in that section.

## Add and Edit Rule Section Dialog Boxes

Use the Add and Edit Rule Section dialog boxes to add or edit a user-defined section heading in a rules table. For detailed information about how to use sections to organize a rules table, see [Using Sections to Organize Rules Tables, page 12-20](#).

### Navigation Path

Do one of the following:

- Select one or more rules in a rules table, right-click and select **Include in New Section**.
- Right-click a section heading and select **Edit Section**.

### Field Reference

**Table 12-3 Add and Edit Rule Section Dialog Boxes**

| Element     | Description                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the section.                                                                                                                                   |
| Description | A description for the section, up to 1024 characters.                                                                                                      |
| Category    | The category assigned to the section. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> . |

## Combining Rules

Access rules and AAA rules policies can grow over time to include a large number of rules. The size of these policies can make it difficult to manage them. To alleviate this problem, you can use the rule combiner tool to reduce the number of rules in a policy without changing how the policy handles traffic.

### Tip

Combining rules can dramatically compress the number of access rules required to implement a particular security policy. For example, a policy that required 3,300 access rules might only require 40 rules after hosts and services are efficiently grouped. However, you cannot use the rule combiner with IPv6 access rules or with rules that specify users or user groups, either directly or with identity user group objects. You can use the tool with rules that use FQDN network/host objects.

You might have several rules that allow a specific range of services to various trusted hosts (as sources) to various public servers (as destinations). If you have 10 rules applying to this situation, it is possible that those 10 rules can be combined into a single rule. You could then create new policy objects for the collection of services (for example, AllowedServices), hosts (for example, TrustedHosts), and servers (for example, PublicServers). To create the new objects during rule combination, you can right-click the newly-combined cells and select **Create Network (or Service) Object from Cell Contents**.

For example, you might have two rules for interface FastEthernet0:

- Permit TCP for source 10.100.10.1 to destination 10.100.12.1

- Permit TCP for source 10.100.10.1 to destination 10.100.13.1

These can be combined into a single rule: permit TCP for source 10.100.10.1 to destination 10.100.12.1, 10.100.13.1.

Multidimensional sorting is used to combine rules. For example, for access rules:

1. Rules are sorted by their sources, so rules with the same source are placed together.
2. Same-source rules are sorted by destination, so rules with the same source and destination are placed together.
3. Same-source and same-destination rules are combined into a single rule, and the services are concatenated.
4. Adjacent rules are checked to see if they have the same source and service. If so, they are combined into a single rule, and the destinations are concatenated.
5. Adjacent rules are checked to see if they have the same destination and service. If so, they are combined into a single rule, and the sources are concatenated.

Sorting is repeated based on destination and service in place of source.

**Tip**

Rules from different sections are never combined. Any sections you create to organize rules limit the scope of the possible combinations. Also, interface-specific and global access rules are never combined. For more information about global rules, see [Understanding Global Access Rules, page 16-3](#).

**Related Topics**

- [Chapter 15, “Managing Firewall AAA Rules”](#)
- [Chapter 16, “Managing Firewall Access Rules”](#)

- 
- Step 1** Select the policy whose rules you want to combine from the **Firewall** folder. You can combine rules for the following types of policy:
- AAA rules
  - Access rules
- Step 2** If you want the tool to limit possible combinations to a specific group of rules, select them. You can select rules using Shift+click and Ctrl+click, select all rules in a section by selecting the section heading, or all rules within a scope by selecting the scope heading (for example, Local). To not limit the tool, do not select anything in the table. Keep the following in mind:
- In Device view, you can save combinations only for local rules. The tool will allow you to run it on shared and inherited rules, but you cannot save the results. If you do not select any rules, the default is to consider all local scope rules.
  - To combine rules in shared policies, you must run the tool in Policy view. If you do not select any rules, the default is to consider all mandatory rules.
- You are warned if you try to run the tool when you cannot save the results.
- Step 3** Right-click anywhere in the rules table and choose **Combine Rules** to open the [Combine Rules Selection Summary Dialog Box, page 12-24](#). If you have selected specific rules for which to limit combining, make sure you right-click on one of the selected rules or the rules will be deselected.
- Step 4** Select the columns you want the rule to consider combining. If you do not select certain columns, the combined rules must have the identical settings in those columns to be combined.
- You can also elect to consider combining the rules you selected or all rules within the policy.

**Tip** If a column type is not listed, then combined rules must have the identical content in those cells except for the Description cell. Rules that have different content for the cells are not combined.

**Step 5** Click **OK** to generate the combination and display the results in the Rule Combiner Results Dialog Box. Analyze the results and evaluate whether you want to save the combinations. You must save all or none, you cannot pick and choose which combinations to save.

For more information on evaluating the results, see [Interpreting Rule Combiner Results, page 12-25](#). For an example, see [Example Rule Combiner Results, page 12-27](#).

**Step 6** Click **OK** to replace the original rules in the rules tables with the combined rules.

## Combine Rules Selection Summary Dialog Box

Use the Combine Rules Selection Summary dialog box to define the parameters used for combining rules in firewall rules policies. When you click **OK**, the combination results are displayed in the Rule Combiner Results Dialog Box, where you can choose to save or discard the results as explained in [Interpreting Rule Combiner Results, page 12-25](#).

### Navigation Path

You can combine rules from the [AAA Rules Page, page 15-10](#) and the [Access Rules Page, page 16-10](#). Click **Tools** located at the bottom of the tables and select **Combine Rules**.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Choose which columns to combine | <p>The columns in the rules table that can be combined. Any columns that you do not select must have the identical content for two rules to be combined (even those not listed as combinable, except for the Description column). The columns you can combine are:</p> <ul style="list-style-type: none"> <li>• Source</li> <li>• User</li> <li>• Destination</li> <li>• Service</li> <li>• Interface</li> <li>• Security Sources</li> <li>• Security Destinations</li> <li>• For AAA rules, these additional columns: <ul style="list-style-type: none"> <li>– Action</li> <li>– Auth Proxy</li> </ul> </li> </ul> |

## Interpreting Rule Combiner Results

Use the Rule Combiner Results dialog box to evaluate the results of a rule combination (see [Combining Rules, page 12-22](#)). The dialog box includes a summary of the results, and shows the new rules that will be created if you click **OK**.

Changed rule cells are outlined in red. Select a combined rule in the upper table to see the rules in the lower table that were combined to create the rule.

You can refine some elements of the results in this window:

- You can right-click on the Source, Destination, and Service cells with multiple elements and select **Create Network (or Service) Object from Cell Contents** to create a new policy object that contains the contents of the combined cell. The new object replaces the contents of the cell.

You can also automatically create network object groups in the deployed configuration to replace the comma-separated values in a rule table cell. The network objects are created during deployment, and they do not affect the content of your rules policy. To enable this option, select **Tools > Security Manager Administration > Deployment** to open the [Deployment Page, page 11-13](#) and select **Create Object Groups for Multiple Sources, Destinations, or Services in a Rule**.

- You can right-click on Description and select **Edit Description** to change the description. The descriptions of combined rules are a concatenation of the descriptions of the old rules separated by new lines.

For an example, see [Example Rule Combiner Results, page 12-27](#).

### Tips

- The combined results are not applied to the policy until you click **OK**. If you do not like the results of the combination, click **Cancel** and consider selecting smaller groups of rules to limit the scope of the Combine Rules tool.

If you click **OK** but then decide you do not want to accept the changes, you have two options. First, make sure you do not click **Save** on the policy page, select a different policy, and click **No** when prompted to save your changes to the policy. If you already clicked **Save**, you can still back out the changes by discarding your activity or configuration session (for example, **File > Discard** in non-Workflow mode), but this also discards any other changes you have made to other policies. Once you submit your changes or your activity is approved, you cannot undo your changes.

- You are allowed to run the Combine Rules tool even if you are combining rules for a policy that you are not allowed to save. For example, you cannot save combined rules for a shared or inherited policy in Device view. You are warned before running the tool if you will not be allowed to save the results.
- Rules from different sections are never combined. Any sections you create to organize rules limit the scope of the possible combinations. Also, interface-specific and global access rules are never combined. For more information about global rules, see [Understanding Global Access Rules, page 16-3](#).

### Navigation Path

You can combine rules from the [AAA Rules Page](#) and the [Access Rules Page](#). Click **Tools** located at the bottom of the tables and select **Combine Rules**, fill in the [Combine Rules Selection Summary Dialog Box](#) and click **OK**.

**Table 12-5 Combined Rules Results Summary**

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Result Summary                     | Provides a summary of the results of the combination and indicates the number of original rules, the number of rules remaining after the combination, and the number of changed and unchanged rules, if any combinations could be made.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Resulting Rules table              | <p>The rules that will replace the rules currently in the policy. If you click <b>OK</b>, these rules become part of your policy. The columns are the same as those in the associated policy (see <a href="#">AAA Rules Page, page 15-10</a> or <a href="#">Access Rules Page, page 16-10</a>), with the addition of the Rule State column.</p> <p>The Rule State column shows the status of the rule:</p> <ul style="list-style-type: none"> <li>• <b>Modified, Combined</b>—The new rule is the result of combining one or more rules or modifying an existing rule. A red box around a cell indicates cells that have combined contents.</li> <li>• <b>Unchanged</b>—The rule remains unchanged, as it could not be combined with any other rule.</li> <li>• <b>Not Selected</b>—You did not select the rule for possible combination.</li> </ul> <p>If there are a large number of rules, you can use the buttons beneath the table to scroll through the rules that have changes. Unchanged and unselected rules are skipped.</p> |
| Original rules table (lower table) | The table in the lower half of the dialog box shows the original rules that were combined to create the rule you select in the upper table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 12-5 Combined Rules Results Summary (continued)**

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Detail Report button | Click this button to create an HTML report of the results. The report summarizes the results and also provides the details about the resulting rules and the rules that were combined to create the new rule.<br><br>For combined rules that have a lot of entries in cells, this report makes it easier to read the results. You can also print or save the report for later use. |

### Example Rule Combiner Results

When you run the Combine Rules tool as described in [Combining Rules, page 12-22](#), the results of the combination are displayed in the Rule Combiner Results Dialog Box (see [Interpreting Rule Combiner Results, page 12-25](#)).

Figure 12-3 shows an example of a rule combination.

The new rules are shown in the upper table. Any new rules are indicated as modified or combined rules, and the changed cells are outlined in red. When you select a new rule in the upper table, the lower table shows the old rules that were combined to create the new rule. In this example, the two old rules had the same destination, service, and interface, and the two distinct sources were concatenated to form the new rule.

The top of the report summarizes the results. In this example, 5700 rules were reduced to 96 rules.

**Figure 12-3 Example of Rule Combiner Results**

|          |                     |          |                |
|----------|---------------------|----------|----------------|
| <b>1</b> | Combined cell       | <b>3</b> | Original rules |
| <b>2</b> | Newly combined rule |          |                |

## Converting IPv4 Rules to Unified Rules

Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.

A utility to convert separate IPv4 and IPv6 firewall rules to “unified” rules is provided with Security Manager 4.4 for use when you upgrade an ASA from an earlier version to 9.0 or later.

**Navigation Path**

To access the firewall-rule unification utility:

- (Policy view) Select the firewall IPv4 rule type from the Policy Type selector and then right-click the desired policy in the Policies pane; choose **Convert to <rule-type> Rules (Unified)**.

**Related Topics**

- [AAA Rules Page, page 15-10](#)
- [Access Rules Page, page 16-10](#)
- [Inspection Rules Page, page 17-8](#)

---

**Step 1** Open the utility as described above; in the Convert Policy dialog box, provide a name for the new unified policy and click OK.

Following processing, the new unified rules policy is displayed. You can now assign this policy to ASA 9.0+ devices.

---

## Generating Policy Query Reports

For most of the firewall rules policies, you can generate policy query reports that can help you evaluate your rules. With policy query reports, you can determine what rules already exist for a particular source, user, destination, interface, service, or zone before creating new rules to apply to those items.

To a limited degree, you can also determine if there are some blocking rules that prevent a rule from being used, or redundant rules that you can delete. If you are evaluating access rules, however, it is better to use the more powerful rule analysis tool to determine these problems.

When you create a policy query, you describe the traffic that interests you, much the same way you describe traffic when creating a rule. Creating a query is essentially the same as creating a rule, but you might want to describe the rule more broadly to capture a wider set of traffic so you can see a set of related rules rather than a single rule or a limited number of rules. The query you create depends on the information you are trying to discover.

The possible extent of a query depends on the view you are in:

- Device or Map view—The query is limited to the selected device. However, you can query across all supported rule types. This allows you to compare different types of rules that apply to the same traffic.
- Policy view—The query is limited to the selected policy. You see only rules that are defined in that policy, and you cannot query other types of policies. If you want to query a shared policy while examining other policies, select a device that is assigned to the shared policy, and query the policy from the device in Device view.

#### Related Topics

- [AAA Rules Page, page 15-10](#)
- [Access Rules Page, page 16-10](#)
- [Inspection Rules Page, page 17-8](#)
- [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#)
- [Zone-based Firewall Rules Page, page 21-58](#)

- 
- Step 1** Select the policy that you want to query from the **Firewall** folder. You can query any of the following types of policy:
- AAA Rules
  - Access Rules
  - Inspection Rules
  - Web Filter Rules (PIX/ASA/FWSM)
  - Zone Based Rules
- Step 2** Click the **Query** button located below the table to open the Querying Device or Policy dialog box.
- Step 3** Enter the parameters that define the rules you want to query. When setting up your query, you must select at least one rule type; enabled, disabled or both; permitted, denied, or both; and mandatory, default, or both. For detailed information about the query parameters, see [Querying Device or Policy Dialog Box, page 12-29](#).
- In Policy view, you cannot change the type of rule you are querying. In Device view, you can query any combination of rule types.
- Step 4** Click **OK** to view the rules that match the criteria in the Policy Query Results dialog box. For information on reading the report, see [Interpreting Policy Query Results, page 12-32](#).
- For an example of a policy query report, see [Example Policy Query Result, page 12-34](#).
- 

## Querying Device or Policy Dialog Box

Use the Querying Device or Querying Policy dialog box to set up the parameters for a query. The query results show the rules that match your parameters. The title of the dialog box indicates what you are querying:

- In Device or Map view, you are querying rules defined for the selected device.
- In Policy view, you are querying rules within the selected policy only.

You can query rules from these types of policies: AAA rules, access rules, inspection rules, web filter rules for ASA/PIX/FWSM, and zone based firewall rules.

When setting up your query, you must select at least one rule type; enabled, disabled or both; permitted, denied, or both; and mandatory, default, or both.

**Note**

For inspection rules, if you enter Global as the interface value, the match status results will be shown as a partial match even if the match is complete.

Results are displayed in the Policy Query Results dialog box (see [Interpreting Policy Query Results, page 12-32](#)).

**Navigation Path**

To generate Policy Query reports, do one of the following:

- (Device view) Select a device, then select one of the supported firewall rules policies from the Firewall folder, and then click the **Query** button located below the table.
- (Policy view) Select any of the supported firewall rules policies from the Firewall folder, then select a specific policy from the Shared Policy selector, and then click the **Query** button located below the table.
- (Map view) Right-click a device and select a supported firewall rules policy from the Edit Firewall Policies menu. Click the **Query** button.

**Table 12-6** Querying Device or Policy Dialog Box

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Types                     | The type of rules you want to query. When querying in Policy view, you cannot change the selection. When querying in Device view, you can select any of the following types of rules; the scope of the query is limited to the selected device: <ul style="list-style-type: none"> <li>• AAA Rules</li> <li>• Access Rules</li> <li>• Inspection Rules</li> <li>• Web Filter Rules</li> <li>• Zone Based Rules</li> </ul> |
| Enabled and/or Disabled Rules  | Whether you want to query enabled or disabled rules, or both.                                                                                                                                                                                                                                                                                                                                                             |
| Mandatory and/or Default Rules | Whether you want to query rules that are in the mandatory or default sections, or both.                                                                                                                                                                                                                                                                                                                                   |
| Match                          | Whether you want to query rules that permit or deny traffic, or both.                                                                                                                                                                                                                                                                                                                                                     |

Table 12-6 Querying Device or Policy Dialog Box (continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources<br>Destinations | <p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> If you leave a field blank, the query matches any address for that field.</p> <p>You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a>.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontinuous Network Masks for IPv4 Addresses, page 6-81</a>).</li> </ul> <p><b>Tip</b> You can create an object with a list of the IP addresses to facilitate future policy query requests.</p> |
| User                    | <p>(ASA 8.4(2+) only.) The Active Directory (AD) usernames, user groups, or identity user group objects for the rule, if any. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> If you leave a field blank, the query matches only those rules that have nothing in the User field.</p> <p>You can enter any combination of the following values.</p> <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>• Identity user group object names.</li> </ul> <p>Click <b>Select</b> to select objects, users, or user groups from a list or to create new objects.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Identity Users in Policies, page 13-21</a></li> <li>• <a href="#">Configuring Identity-Based Firewall Rules, page 13-21</a></li> <li>• <a href="#">Creating Identity User Group Objects, page 13-19</a></li> </ul>                                                                                                                                                                                                                                 |

**Table 12-6** Querying Device or Policy Dialog Box (continued)

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Services                                            | <p>The services that define the type of traffic that is acted on. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> If you leave the field blank, the query matches any service.</p> <p>You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a>, page 6-100.</p> <p><b>Tip</b> You can create an object with a list of the services to facilitate future policy query requests.</p> |
| Interfaces                                          | <p>The interfaces for which the rule is defined. You can enter any combination of interface or interface role names, separated by commas. Enter the name or click <b>Select</b> to select the interface or interface role.</p> <p><b>Note</b> If you leave the field blank, the query matches any interface or interface role.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Query for Global Rules                              | Whether the query should also consider global rules when querying access rules or inspection rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| From Zone<br>To Zone                                | For zone based firewall rules, the zones defined for the rule. Enter the zone names (which are interface roles), or click <b>Select</b> to select them from a list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Actions                                             | For zone based firewall rules, the actions defined for the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check if Matching Rules Are Shadowed by Rules Above | Whether to have the policy query results include rule conflict detection information. Selecting this option might have an impact on performance and cost results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Interpreting Policy Query Results

Use the Policy Query Results dialog box to view the results of a policy query that you defined on the Query Device or Policy dialog box. The results report opens after you define your query parameters on the [Querying Device or Policy Dialog Box](#), page 12-29 and click **OK**. For the procedure, see [Generating Policy Query Reports](#), page 12-28. To see an example report, see [Example Policy Query Result](#), page 12-34.

### Tip

In the query results table, you can double-click a row, or right-click and select **Go to Rule**, to select the rule in the rules policy page, where you can edit the rule. If the appropriate rules policy is not already selected in the policy selector, you might have to do this twice to actually select the rule.

To read the report, consider the following report sections:

- **Query Parameters**—The top portion of the report specifies the parameters you entered for the query. If you want to change them, click **Edit Query** to open the [Querying Device or Policy Dialog Box](#), page 12-29, where you can make your changes and regenerate the report.

- **Results Table**—This table lists all rules that match your query. If you queried more than one type of rule, select the rule type you want to examine in the **Display** field. The columns in the table are the same as those for that type of rule, except for the following:

- Match Status—Indicates how the rule matches your query:

**Complete Match**—The rule matches all query parameters.

**Partial Match**—All of the search criteria overlap or are a superset of the matched rule. For example, if you have a rule defined with a source address of 10.100.20.0/24, a destination address of 10.200.100.0/24 and a service of IP, and your query is to search for a source of 10.100.20.0/24, the match status is shown as a partial match because the query results represent only a portion of the rule's definition.

**No Effect**—Rules are blocked by other matching rules, or a conflict exists that has no effect. For example, you might have two matching rules, A and B. If rule A's source address, destination address, and services are equivalent to, or contain, those of rule B, rule B is blocked by rule A. Thus, rule B will have no effect on traffic.

In another example, you might have a global mandatory rule that permits a service, but a rule at the device (local) level denies the service. Because rules are recognized on a first-match basis, after discovering a match at the mandatory global scope, no other rules are checked. The local rule has no effect; the service is permitted, not denied. You should edit your policies to ensure you get the desired results.

- Scope—Identifies whether a rule is shared or local, mandatory or default.

- **Details Table**—The details table shows the detailed query match information for the rule selected in the results table. The folders on the left represent the attributes for which you can see detailed information. Select a folder to view the details.

The details show the query value, which is the parameter you defined, and the item in the rule that matches the parameter. The matching relationship is one of the following:

- Identical—The parameter is identical to the value in the rule.
- Contains—The parameter is a superset that contains the value in the rule. For example, the query parameter might have been a network/host object, and the rule used an IP address that was part of the object definition.
- Is contained by—The parameter is a subset nested within the value of the rule.
- Overlaps—The query parameter shows results that overlap between more than one policy object used in the rule. For example, the service query parameter was tcp/70-90 and the results show a service defined as tcp/80-100.

## Example Policy Query Result

Figure 12-4 shows an example of a policy query report on access rules. The criteria does not limit source, destination, service, and interface parameters, but limits the query to enabled rules. Both shared and local rules are included.

The Query Parameters section shows the query criteria for the report. In this example, the first row in the results table is selected, and the detailed information for that rule is shown in the details table in the bottom half of the window. In this example, the source folder is selected in the details table, and the result shows that the rule value, **any**, is an identical match to the query parameter **\***, which is equivalent to any source address.

For detailed information on reading the report, see [Interpreting Policy Query Results](#), page 12-32.

**Figure 12-4 Policy Query Results**

The screenshot displays the 'Policy Query Results' window, divided into three main sections: Query Parameters, Results Table, and Details Table.

**Query Parameters:** Shows the search criteria. Query Scope is 'Device odin', Rule Types are 'Access Rules', and Actions are 'Deny, Permit'. The 'Display' dropdown is set to 'Access Rule Results'.

**Results Table:** A table with columns: Match Status, Scope, Rule, Permit, Source, Destination, Service, Interface, and Dir. The first row is selected (highlighted in yellow).

| Match Status              | Scope              | Rule | Permit | Source     | Destination | Service | Interface               | Dir. |
|---------------------------|--------------------|------|--------|------------|-------------|---------|-------------------------|------|
| Partial Match             | Shared - Mandatory | 1    | ⊘      | any        | any         | IP      | All-Interfaces          | in   |
| Partial Match (No Effect) | Local - Default    | 1    | ✓      | 5.5.5.0/24 | 3.3.3.0/24  | ICM...  | intf5<br>intf6<br>intf7 | in   |
| Partial Match (No Effect) | Local - Default    | 2    | ✓      | 10.10.1... | 6.6.6.0     | ICM...  | intf5<br>intf6<br>intf7 | in   |
| Partial Match (No Effect) | Local - Default    | 3    | ⊘      | 4.5.4.0/24 | nestedAny   | ICM...  | intf5                   | in   |

**Details Table:** Shows the relationship between the query value and the rule value for the selected row.

| Query Value    | Relationship | Rule Value |
|----------------|--------------|------------|
| * (Any Source) | identical    | any        |

The 'Sources' folder is selected in the left-hand tree view of the Details section. A 'Close' button is located at the bottom right.

## Optimizing Network Object Groups When Deploying Firewall Rules

When you deploy firewall rules policies to an ASA, PIX, FWSM, or IOS 12.4(20)T+ device, you can configure Security Manager to evaluate and optimize the network/host policy objects that you use in the rules when it creates the associated network object groups on the device. Optimization merges adjacent networks and removes redundant network entries. This reduces the runtime access list data structures and the size of the configuration, which can be beneficial to some FWSM and PIX devices that are memory-constrained.

For example, consider a network/host object named **test** that contains the following entries and that is used in an access rule:

```
192.168.1.0/24
192.168.1.23
10.1.1.0
10.1.1.1
10.1.1.2/31
```

If you enable optimization, when you deploy the policy, the resulting object group configuration is generated. Note that the description indicates the group was optimized:

```
object-group network test
description (Optimized by CS-Manager)
network-object 10.1.1.0 255.255.255.252
network-object 192.168.1.0 255.255.255.0
```

If you do not enable optimization, the group configuration would be as follows:

```
object-group network test
network-object 192.168.1.0 255.255.255.0
network-object 192.168.1.23 255.255.255.255
network-object 10.1.1.0 255.255.255.255
network-object 10.1.1.1 255.255.255.255
network-object 10.1.1.2 255.255.255.254
```

This optimization does not change the definition of the network/host object, nor does it create a new network/host policy object. If you rediscover policies on the device, the existing unchanged policy object is used.

**Note**

If a network/host object contains another network/host object, the objects are not combined. Instead, each network/host object is optimized separately. Also, Security Manager cannot optimize network/host objects that use discontinuous subnet masks.

To configure optimization, select the **Optimize Network Object-Groups During Deployment** option on the [Deployment Page, page 11-13](#) (select **Tools > Security Manager Administration** and select **Deployment** from the table of contents). The default is to not optimize network object groups during deployment.

## Expanding Object Groups During Discovery

When you discover policies from a device that uses object groups, you can elect to have those object groups expanded into the items they contain rather than create policy objects from the group.

For example, if an object group named CSM\_INLINE\_55 contains the hosts 10.100.10.15, 10.100.10.18, and 10.100.10.25, importing an access control list by expanding the objects will create a rule that includes all three addresses in the source (or destination, as appropriate) cell rather than a network/host policy object named CSM\_INLINE\_55.

To configure expansion, you must have a naming scheme for your object groups that allows you to identify the prefix of groups that you want to expand. The default is to expand any object group that starts with the prefix CSM\_INLINE. Configure these prefixes in the **Auto-Expand Object Groups with These Prefixes** field on the [Discovery Page, page 11-25](#) by selecting **Tools > Security Manager Administration** and selecting **Discovery** from the table of contents.

## Managing Identity-Aware Firewall Policies

---

Identity-aware firewall policies allow you to control traffic based on user identity or a host's fully-qualified domain name. For example, you can selectively allow a specific type of traffic for one user group while disallowing it for another user group, instead of allowing or disallowing all of that traffic. With fully-qualified domain names, you could disallow HTTP access to a specific server while allowing HTTP traffic to all other servers.

Identity awareness is integrated into several existing firewall rules; there is no unique identity-aware firewall policy. This chapter explains identity-aware firewall policies and how to implement them in the various policies that support identity awareness.

This chapter contains the following topics:

- [Overview of Identity-Aware Firewall Policies, page 13-1](#)
- [Configuring Identity-Aware Firewall Policies, page 13-7](#)
- [Monitoring Identity Firewall Policies, page 13-27](#)

### Overview of Identity-Aware Firewall Policies

In traditional firewall policies, decisions are made based on source and destination IP addresses, ports, and services. The Identity Firewall in the ASA provides more granular control based on either or both of the following:

- **User identity**—You can configure access rules and security policies based on user names and user group names rather than through source IP addresses alone. The ASA applies the security policies based on an association of IP addresses to Windows Active Directory login information and reports events based on the mapped user names instead of network IP addresses.

The Identity Firewall integrates with Microsoft Active Directory in conjunction with an external Active Directory (AD) agent that provides the actual identity mapping. The ASA uses Windows Active Directory as the source to retrieve the current user identity information for specific IP addresses and allows transparent authentication for Active Directory users. For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com at [http://www.cisco.com/en/US/products/ps6120/prod\\_installation\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html).

- **FQDN network objects**—You can use a host's fully-qualified domain name (FQDN) in a rule instead of its IP address. Thus, if the host's address changes (for example, because it acquires the address through DHCP), the rule will still apply.

Identity-based firewall services enhance the existing access control and security policy mechanisms by allowing users or groups to be specified as sources, and FQDNs in place of source or destination IP addresses. Identity-based security policies can be interleaved without restriction between traditional IP address based rules.

The key benefits of the Identity Firewall include:

- Decoupling network topology from security policies. The rules will apply to a user regardless of where the user connects in the network.
- Simplifying the creation of security policies.
- Providing the ability to easily identify user activities on network resources.
- Simplify user activity monitoring.

This section contains the following topics:

- [User Identity Acquisition, page 13-2](#)
- [Requirements for Identity-Aware Firewall Policies, page 13-3](#)
- [Configuring the Firewall to Provide Identity-Aware Services, page 13-7](#)

## User Identity Acquisition

When you specify Active Directory user names or user group names in a firewall policy, the ASA eventually needs to map the name to an IP address to process packets. The ASA uses two primary sources for this information:

- User group membership—If you specify a user group in a rule, the ASA contacts the configured Active Directory (AD) server to obtain group membership.
- User-to-IP address mappings—For users who log into the network domain on your standard (non-VPN) network, the AD agent, in communication with the AD server, obtains the login information and creates a user-to-IP address mapping table. This information is supplied to the ASA.

You must install and configure the required AD servers and agents before you can configure user-based identity firewall policies. For an explanation of the various deployment scenarios, see the ASA configuration guide for ASDM or CLI at

[http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html).

User names are acquired for the following types of traffic, and include the AD domain unless noted otherwise:

- Standard traffic.
- Remote access VPN, including IPsec IKEv1 and IKEv2, AnyConnect clients, and L2TP VPN. If you use LDAP authentication for the VPN, and use the same server group for a domain for the VPN and identity firewall, the users are associated with the domain used for authentication. For all other authorization mechanisms, users acquired through VPN are considered to be in the LOCAL domain. The ASA reports these users to the AD agent, which distributes them to other ASAs or clients registered with the AD agent.

**Note**

User names are not acquired for clientless SSL VPN.

- IPv4 cut-through proxy. User names are not acquired for IPv6 cut-through proxy. If the user includes the domain name during authentication, the user is associated with the domain name. Otherwise, the domain is the default domain as configured in the Identity Options policy. See [Configuring Cut-Through Proxy](#), page 13-23.

## Requirements for Identity-Aware Firewall Policies

Identity-aware firewall policies are not supported by all types of device and operating systems. The following table explains the requirements and some limits for implementing these types of policies in your network.

**Table 13-1** Requirements for Identity-Aware Firewall Policies

| Requirement           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall device       | <p>ASA running ASA Software version 8.4(2) or later, but not including the ASA-SM running 8.5(1). Single or multiple context configurations.</p> <p><b>Tip</b> The ASA must have on-board encryption acceleration. To determine if the device has the required ability, log into the device console and use the <b>show version</b> command. The output should include “Encryption hardware device.”</p> <p>You can register up to 100 ASAs with a single Active Directory agent.</p>                                                                                                                                                                                                                                                                      |
| Active Directory (AD) | <p>You must use Active Directory to define users and user groups. The ASA obtains user group information directly from the AD server, which runs the LDAP protocol. You cannot use other types of LDAP servers.</p> <p>For detailed information on the types of AD servers supported, and their configuration requirements, see <i>Installation and Setup Guide for the Active Directory Agent</i> on Cisco.com at <a href="http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html">http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html</a>.</p> <p><b>Tip</b> You can have multiple AD servers, but they must have unique IP addresses among all domains. No other type of LDAP server is supported.</p> |

**Table 13-1 Requirements for Identity-Aware Firewall Policies (continued)**

| Requirement    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AD agent       | <p>You must configure off-box AD agents to act as an intermediary between the ASA and the AD servers. The AD agent maintains an active mapping of users to IP address.</p> <p>By default, except for the 5505, the ASA obtains this list when it boots or reloads, and the AD agent sends new mappings as they are collected. The 5505 queries the AD agent on an as-needed basis in response to traffic matching rules that include identity criteria. We recommend that you use this default behavior, although you can change it using the Identity Options policy.</p> <p>The AD agent uses the RADIUS protocol.</p> <p>For information on setting up and configuring the AD agent, see <i>Installation and Setup Guide for the Active Directory Agent</i> on Cisco.com at <a href="http://www.cisco.com/en/US/products/ps6120/prod_installation_guide_s_list.html">http://www.cisco.com/en/US/products/ps6120/prod_installation_guide_s_list.html</a>.</p>                                                                                                                  |
| Client systems | <p>Users who pass traffic through the device must use one of the following client platforms:</p> <ul style="list-style-type: none"> <li>• Windows XP SP3.</li> <li>• Windows Vista.</li> <li>• Windows 7.</li> <li>• Other systems that use Active Directory in a manner consistent with the explicitly supported platforms.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IPv6           | <p>IPv6 is supported with the following exceptions:</p> <ul style="list-style-type: none"> <li>• NetBIOS over IPv6 is not supported.</li> <li>• Multiple IPv6 addresses on user workstations is not supported. Windows 64-bit systems can use temporary IPv6 addresses when initiating some communications. If a user registers with the AD agent using one IPv6 address, then initiates communication with another address, an identity-aware firewall rule for the user would not be applied and instead a rule that matches the second IPv6 address would be applied.</li> </ul> <p>There are two options for disabling the use of these temporary addresses:</p> <ul style="list-style-type: none"> <li>– Disable IPv6 routing advertisements on all interfaces on all networking devices in the network.</li> <li>– On each Windows machine, open a command window, enter the following commands, and reboot the workstation:           <pre>netsh interface ipv6 set privacy state=disable netsh interface ipv6 set global randomizeidentifiers=disabled</pre> </li> </ul> |

**Table 13-1** Requirements for Identity-Aware Firewall Policies (continued)

| Requirement                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NetBIOS logout probing<br>(Optional.) | <p>If you enable NetBIOS logout probing, the ASA can use NetBIOS to determine if an inactive user is logged off so the user can be removed from the database. The probe uses UDP-encapsulated NetBIOS traffic. Thus, you must ensure that access rules allow the following traffic on the networks between the ASA, AD agent, and user workstations:</p> <ul style="list-style-type: none"> <li>• Query packets: any UDP source port to UDP port 137 (UDP/137).</li> <li>• Query responses: UDP/137 source to any UDP port.</li> </ul> <p>In addition, you must configure workstations to provide user name information in NetBIOS reply packets. For Windows workstations, you need to enable the messenger service and configure WINS. If the messenger service is not turned on, the response from the workstation is the same whether the user is logged on or off.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• The NetBIOS logout probe is never used with VPN or cut-through proxy users.</li> <li>• The ASA has an inactive user timeout that is also used to remove users from the database. The timer applies to all user types. Thus, implementing NetBIOS probing is not required to remove inactive users from the database.</li> </ul> |

**Table 13-1 Requirements for Identity-Aware Firewall Policies (continued)**

| Requirement                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS configuration<br>(Required for fully-qualified domain name usage.) | <p>If you use fully-qualified domain name (FQDN) network/host objects in firewall rules, you must configure the domain name system (DNS) settings as described in <a href="#">DNS Page, page 52-14</a>. These settings identify the DNS servers used for looking up the names to determine the associated IP address. All processing is ultimately based on the IP address.</p> <p>When configuring DNS for FQDN usage, consider the following points:</p> <ul style="list-style-type: none"> <li>• DNS replies can be spoofed, which can open a security hole in your network. Specify only trusted DNS servers, ideally only those inside your network.</li> <li>• Some hosts can have constantly changing multiple IP addresses, so the ASA might not always have all valid IP addresses at any one time.</li> <li>• Host names with short time to live values will require frequent DNS lookups; this can impact the performance of the ASA.</li> <li>• Multiple host names can resolve to the same IP address. Ultimately, the firewall rules are applied based on IP address. Thus, if two names map to the same address, and your rules specify different services for those names, the service that is actually provided will be those specified on the first matched rule.</li> </ul> <p>Looked at another way, this means that you do not need to specify every version of an FQDN host name in your rules. When you know that several names always point to the same host, you can configure rules for the most commonly-used name and they will apply to all synonyms of that name.</p> |
| Maximum limits                                                         | <p>There are limits to the number of users, user groups, and IP addresses per user. If these limits are exceeded, identity-aware processing will not occur for the additional traffic:</p> <ul style="list-style-type: none"> <li>• IP address limits—A user can be associated with at most 8 IP addresses across all domains.</li> <li>• User group limits—Policies can be applied to up to 256 user groups. Users can be in multiple user groups.</li> <li>• User limits—Policies can be applied to up to the following number of users. This number is the total aggregate across all contexts defined on the device.               <ul style="list-style-type: none"> <li>– ASA 5505—1024 users.</li> <li>– Other ASA 5500 series—64,000 users.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring the Firewall to Provide Identity-Aware Services

To provide identity-aware firewall services to your network, you need to configure several policies to enable the firewall to process user-based or fully-qualified domain name (FQDN)-based rules. The ASA depends on other servers in your network to provide the user, user group, and FQDN name resolution services required to implement your identity-aware policies.

The required configuration depends on which aspects of identity awareness that you will use:

- User, user group resolution—To use identity user group objects in your firewall rules, you must configure several objects and policies to identify the Active Directory servers that will supply user and user group information.
- FQDN resolution—To use FQDN network/host objects in your firewall rules, you must configure DNS servers to resolve FQDNs to IP addresses.

This procedure explains the overall process for implementing identity-aware policies.

### Before You Begin

Your network must meet the requirements explained in [Requirements for Identity-Aware Firewall Policies, page 13-3](#). The following procedure assumes that you are already using Active Directory (AD), that you have installed and configured the AD agents, and that these services are working correctly.

- 
- Step 1** Enable AD user and user group resolution.
- a. Create the policy objects needed to identify the AD servers and agents and configure the NetBIOS domain for the server groups. For detailed information, see [Identifying Active Directory Servers and Agents, page 13-8](#).
  - b. If you want non-default settings, change the identity options. Use these options to enable the NetBIOS logout probe and to configure various timers and error handling. For detailed information, see [Configuring Identity Options, page 13-15](#).
  - c. If you want to create user groups defined on the ASA (in addition to AD-defined user groups), create the required identity user group policy objects. See [Creating Identity User Group Objects, page 13-19](#).
- Step 2** Enable FQDN network/host object resolution.
- a. Configure DNS servers in the DefaultDNS group. DNS is required to resolve FQDNs to IP addresses. For information on configuring DNS, see [DNS Page, page 52-14](#).
  - b. Create FQDN network/host objects as described in [Creating Networks/Hosts Objects, page 6-82](#).
- Step 3** Configure firewall rules to use FQDN objects, usernames, user group names, or identity user group objects. See [Configuring Identity-Based Firewall Rules, page 13-21](#).
- Step 4** Monitor the identity firewall system. See [Monitoring Identity Firewall Policies, page 13-27](#).
- 

## Configuring Identity-Aware Firewall Policies

Identity awareness is integrated into several existing firewall rules; there is no unique identity-aware firewall policy. The topics in this section explain the various procedures for integrating identity awareness into firewall policies.

This section contains the following topics:

- [Enabling Identity-Aware Firewall Services, page 13-8](#)
- [Creating Identity User Group Objects, page 13-19](#)
- [Selecting Identity Users in Policies, page 13-21](#)
- [Configuring Identity-Based Firewall Rules, page 13-21](#)
- [Configuring Cut-Through Proxy, page 13-23](#)
- [Collecting User Statistics, page 13-25](#)
- [Filtering VPN Traffic with Identity-Based Rules, page 13-26](#)

## Enabling Identity-Aware Firewall Services

Use the Identity Options policy to enable identity-aware firewall services. To configure the policy, do one of the following:

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one.

The policy includes the following tabs:

- **AD Setup**—Configure the Active Directory servers that define the users and user groups for the network, and the AD agent used to collect the information and provide it to the ASA. See [Identifying Active Directory Servers and Agents, page 13-8](#).
- **Advanced**—Enable or disable user identity services and configure options for error handling, the NetBIOS logout probe, idle timeout, and AD agent communication settings. See [Configuring Identity Options, page 13-15](#).

## Identifying Active Directory Servers and Agents

Use the AD Setup tab of the Identity Options policy to identify the Active Directory servers and agents to use for user identity information. You must configure at least one AD server and one AD agent to enable identity-aware firewall policies that include user specifications (such as identity user group objects).

### Note

---

ASA Software 8.4(2+) is required for identity-aware firewall.

---

### Before You Begin

The configuration uses AAA server group policy objects, and the server group objects incorporate AAA server objects. You can create these objects through the Policy Object Manager (by selecting Manage > Policy Objects), or you can create them while completing this procedure (by using the configuration wizard or by clicking the Add Object + button in the object selector dialog box).

The objects need to meet these requirements:

- **AD servers**—Must use the LDAP protocol. If you select Microsoft as the LDAP server type, you can also specify the LDAP Group Base DN to identify the base directory for user group searches, to reduce search time. If you select Auto Detect, you cannot configure the group base DN, even though

Microsoft AD servers are the only type of LDAP server that you can use in the identity firewall configuration. You must also abide by the following limitations for communications between Security Manager and Active Directory:

- Do not select the Enable LDAP over SSL option.
- Do not select the SASL Kerberos Authentication option. Only simple and SASL MD5 authentication mechanisms are supported. The simple mechanism, in which usernames and passwords are transmitted in clear text, is used if you do not select one of the SASL options.
- AD agents—Must use the RADIUS protocol. In the AAA server group object, select the **AD Agent Mode** option.

You should install the AD agents and configure them prior to configuring this policy. You can configure at most two AD agents in the server group: the second agent is used only if the first agent ceases to respond to queries. Any agents defined after the first two are ignored.

Obtain the AD agent software from <http://www.cisco.com/go/asa>. For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com.

- [Configuring Identity Options, page 13-15](#)

- 
- Step 1** Do one of the following:
- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector. Select the **AD Setup** tab.
  - (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one. Select the **AD Setup** tab.
- Step 2** If you want to be guided through the AD setup, click the **Configure Identity** button to start the Identity configuration wizard. The wizard walks you through the process of configuring the AD servers for a domain, and the AD agents, and can create the required AAA server and AAA server group objects for you.
- The wizard goes through the following steps:
- AD Server Settings—To configure the AD servers for a domain. See [Identity Configuration Wizard Active Directory Settings, page 13-11](#).
  - AD Agent Settings—To configure the AD agents for the ASA. See [Identity Configuration Wizard Active Directory Agent, page 13-13](#).
  - Preview—To show you which objects will be created. See [Identity Configuration Wizard Preview, page 13-15](#).

**Tip**

You can use the wizard multiple times to configure different NetBIOS domains. However, the wizard always prompts for AD agent information. Because you can configure a single group for AD agents, not a separate group per domain, the selection overwrites any AD agent configuration that you have already made. So be sure to select the same AAA server group for the AD agents each time you run the wizard.

- Step 3** If not using the wizard, configure the AD servers. The AD servers are used for obtaining user membership information for any AD user groups that you use in identity-aware firewall policies.
- The table lists the AD servers for the network. You need to add an entry for each NetBIOS domain name. Each row defines the AAA server group used to identify the AD LDAP servers for the domain, and whether identity-aware firewall rules for the domain are active or inactive if the AD server group is unavailable.
- You can do the following:
- To add an entry, click the **Add Row (+)** button and fill in the Add AD Domain Server dialog box. See [Domain AD Server Dialog Box, page 13-10](#).
  - To edit an entry, select it and click the **Edit Row (pencil)** button.
  - To delete an entry, select it and click the **Delete Row (trash can)** button.
- Step 4** If not using the wizard, configure the AD agents. The AD agents obtain user login/logoff and IP address mappings from the AD servers. The ASA then obtains the information from the AD agent.
- In **Active Directory Agent Group**, enter the name of the AAA server group object that defines the list of AD agents, or click **Select** to select it from a list or to create a new group object.
- Step 5** In **Default Domain**, select the domain to configure as the default domain on the device. You must add the domain to the AD server table before you can select it as the default domain.
- The default is LOCAL, which applies to user groups defined on the device or to VPN users who authenticate using a method other than an AD server configured for identity services. This setting is also used if you configure cut-through proxy (see [Configuring Cut-Through Proxy, page 13-23](#)).
- Step 6** Click **Save** to save your changes.
- You are asked if the identity settings page in the administrative settings should be updated with the domain-to-AD server mappings. The identity settings determine which servers are used when you use the Find feature when specifying users or user groups in a firewall policy or an identity user group object. The identity administrative settings do not affect the configuration of the ASA.

## Domain AD Server Dialog Box

Use the Add or Edit Domain AD Server dialog box to define the Active Directory server group for a NetBIOS domain. If you configure firewall rules for a user group in the NetBIOS domain, the user membership is determined by querying the AD servers defined for the domain.

### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the Add or Edit buttons for the domain table. See [Identifying Active Directory Servers and Agents, page 13-8](#).

- From the Identity Settings Security Manager Administration page, click the Add or Edit buttons for the settings table. These settings determine which servers are used when using Find to locate a user or user group name when configuring firewall rules or identity user group objects. See [Identity Settings Page, page 11-38](#).

**Table 13-2 Domain AD Server Dialog Box**

| Element                                                              | Description                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain                                                               | The NetBIOS domain for this AD server group. The domain name can be up to 32 characters, typically in all uppercase. For example, if the user specification is DOMAIN\user1, DOMAIN is the NetBIOS domain name.                                                                                                                                                                |
| AD Server Group                                                      | The name of the AAA server group policy object that identifies the AD servers for this domain. The object must use the LDAP protocol.<br><br>Click <b>Select</b> to select the object or to create a new one.                                                                                                                                                                  |
| Disable Rules When Server Is Down<br>(Identity Options policy only.) | Whether to disable all identity-aware firewall rules for this domain if the domain controller is down. If you select this option, all users for a domain are marked as disabled until the server becomes available.                                                                                                                                                            |
| Update Administrative Settings<br>(Identity Options policy only.)    | Whether to add the domain and server mapping to the Security Manager Administration Identity Settings page. This administrative page determines which AD servers are queried when you try to find users or user groups when adding them to firewall policies or to identity user group objects. For more information, see <a href="#">Identity Settings Page, page 11-38</a> . |

### Identity Configuration Wizard Active Directory Settings

Use the Active Directory Settings page of the Identity Configuration wizard to identify the Active Directory (AD) servers for a NetBIOS domain. These settings are required to enable user-identity-aware firewall policies for users in the domain.

#### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button. See [Identifying Active Directory Servers and Agents, page 13-8](#).
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NetBIOS Domain                                         | The NetBIOS domain for this AD server group. The domain name can be up to 32 characters, typically in all uppercase. For example, if the user specification is DOMAIN\user1, DOMAIN is the NetBIOS domain name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Select Existing AD Server Group                        | Select this option if the AAA server group policy object that identifies the required AD servers already exists. The object must use the LDAP protocol.<br><br>Click <b>Select</b> next to the Group Name field to select the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Create New AD Server Group                             | Select this option if the AAA server group policy object does not already exist, or you want the wizard to create a new object.<br><br>Configure the remaining options to identify the group and the servers that it contains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Create AD Server Group Properties</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Group Name<br>(When creating the group in the wizard.) | The name of the AAA server group object that you want to create. The name can be up to 16 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AD Server Name/IP                                      | One of the following: <ul style="list-style-type: none"> <li>The name of an existing AAA server object that defines the AD server. Click <b>Select</b> to select the object from a list.<br/><br/>If you select an object, you cannot configure the remaining properties.</li> <li>The IP address of the AD server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Username                                               | The name of the user or the directory object in the LDAP hierarchy used for authenticated binding (maximum of 128 characters). Authenticated binding is required by some LDAP servers (including the Microsoft Active Directory server) before other LDAP operations can be performed. This field describes the authentication characteristics of the device. These characteristics should correspond to those of a user with administrator privileges.<br><br>This string is case-sensitive. Spaces are not permitted in the string, but other special characters are allowed.<br><br>Typically, this is a username such as DOMAIN\Administrator. However, you can use the more traditional format too, for example, cn=Administrator,OU=Employees,DN=example,DN=com. |
| Password<br>Confirm                                    | The case-sensitive, alphanumeric password for accessing the LDAP server (maximum of 64 characters). Spaces are not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 13-3 Identity Configuration Wizard Active Directory Settings (continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface             | <p>The interface whose IP address should be used for all outgoing packets (known as the source interface). Enter the name of an interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name.</li> <li>• If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces.</li> <li>• Only one source interface can be defined for the AAA servers in a AAA server group, so if you specify more than one server, ensure that they all use the same interface.</li> </ul> |
| Add Another AD Server | <p>Click this button only if you want to create an additional server.</p> <p>When you click the button, the information in the server fields is saved and the fields are cleared so that you can add information about the next server. You can add up to 16 servers in single-context mode and 4 servers in multiple-context mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Identity Configuration Wizard Active Directory Agent

Use the Active Directory Agent Settings page of the Identity Configuration wizard to identify the Active Directory (AD) agents for a NetBIOS domain. These settings are required to enable user-identity-aware firewall policies for users in the domain.

#### Tip

You can configure a single AD agent group for an ASA; you do not configure a different group for each NetBIOS domain. Thus, if you already configured the correct AD agent group in the Identity Options policy, select the same group on this wizard page. Your selection here will replace the group defined in the policy.

#### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button and proceed to this page. See [Identifying Active Directory Servers and Agents, page 13-8](#).
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

Table 13-4 Identity Configuration Wizard Active Directory Agent Settings

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Existing AD Agent Group                         | <p>Select this option if the AAA server group policy object that identifies the required AD agents already exists. The object must use the RADIUS protocol, and should have the option <b>AD Agent Mode</b> selected.</p> <p>Click <b>Select</b> next to the Group Name field to select the object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Create New AD Agent Group                              | <p>Select this option if the AAA server group policy object does not already exist, or you want the wizard to create a new object.</p> <p>Configure the remaining options to identify the group and the servers that it contains.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Create AD Agent Group Properties</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Group Name<br>(When creating the group in the wizard.) | The name of the AAA server group object that you want to create. The name can be up to 16 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| AD Agent Name/IP                                       | <p>One of the following:</p> <ul style="list-style-type: none"> <li>The name of an existing AAA server object that defines the AD agent. Click <b>Select</b> to select the object from a list.</li> </ul> <p>If you select an object, you cannot configure the remaining properties.</p> <ul style="list-style-type: none"> <li>The IP address of the AD agent.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Secret Key<br>Confirm                                  | <p>The shared secret that is used to encrypt data between the network device (client) and AAA server. The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted.</p> <p>The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field.</p> <p>If you do not define a key, all traffic between the AAA server and its AAA clients is sent unencrypted.</p>                                                                                                                                                                                                                                                                                                                                  |
| Interface                                              | <p>The interface whose IP address should be used for all outgoing packets (known as the source interface). Enter the name of an interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name.</li> <li>If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces.</li> <li>Only one source interface can be defined for the AAA servers in a AAA server group, so if you specify more than one server, ensure that they all use the same interface.</li> </ul> |

**Table 13-4 Identity Configuration Wizard Active Directory Agent Settings (continued)**

| Element                | Description                                                                                                                                                                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Add Secondary AD Agent | <p>Click this button only if you want to create an additional agent. The agent is used in case the first agent becomes unavailable.</p> <p>When you click the button, the information in the agent fields is saved and added to the preview pane, and the fields are cleared so that you can add information about the secondary agent.</p> |

## Identity Configuration Wizard Preview

Use the Preview page of the Identity Configuration wizard to verify the information you entered into the wizard.

The preview summarizes the objects that will be created or used for the Active Directory configuration for the NetBIOS domain.

- AD server group shows the name of the AAA server group object for the AD servers used in the domain. The table shows the AAA server objects that define each of the AD servers.
- AD Agent shows the name of the AAA server group object for the AD agents. The primary and secondary agent shows the AAA server object that defines the agents.

For objects that the wizard will create, names are automatically generated for the AAA server objects, either adding **ldap\_** or **radius\_** as a prefix to the server IP address.

To make changes, click **Back**. Otherwise, click **Finish** to save the settings.

### Tip

After you complete the wizard, you can edit the properties of the newly-created objects to configure settings that the wizard left as default settings.

### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button and proceed to this page. See [Identifying Active Directory Servers and Agents, page 13-8](#).
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

## Configuring Identity Options

Use the Advanced tab of the Identity Options policy to enable or disable user identity services and configure options for error handling, the NetBIOS logout probe, idle timeout, and AD agent communication settings. The options on this tab have default values, so you need to change them only if you want to fine-tune the settings for your network.

### Navigation Path

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector. Select the **Advanced** tab.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one. Select the **Advanced** tab.

**Field Reference****Table 13-5 Identity Options Advanced Tab**

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable User Identity                                   | <p>Whether to enable the device to obtain user identity information from the AD agent and AD servers, if they are configured on the <b>AD Setup</b> tab. The default is enabled.</p> <p>If you change this option and deploy, the change has the following effect based on the new setting:</p> <ul style="list-style-type: none"> <li>• Disabled—The entire IP address to user mapping database is flushed and all users without activated user-specific rules are released. The AD agent and servers are no longer queried for updates, and all activated user-identity-based rules will have no effect on traffic.</li> <li>• Enabled—Activated users are recreated gradually through communications with the AD agent. VPN users might need to reauthenticate. Queries to the AD agent and AD server recommence.</li> </ul> |
| <b>Error Conditions</b>                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Disable Rules When Active Directory Agent Is Down      | Whether to disable all rules that include user identity if the connection to the AD agent is unavailable. If you select this option, all user-to-IP address mappings are marked disabled and all rules that include user specifications are not applied to traffic. By default the option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Remove User IP When NetBIOS Probe Fails                | Whether to remove the User's IP address mapping from the database if the NetBIOS probe for the user fails for any reason, whether the probe is somehow blocked in the network or the probe fails because the user is not in operation. The user must log into the workstation again. This option has effect only if you enable the NetBIOS logout probe on this page. By default the option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Remove User IP When User's MAC Address is Inconsistent | <p>Whether to check the Media Access Control (MAC) address in each request from a user-mapped IP address to the MAC address in the previous packet.</p> <p>If you select this option, and the MAC address changes between packets, the user-to-IP address mapping is removed from the database, subsequent packets are dropped, and the user must reauthenticate to Active Directory. The AD agent is notified if the user-to-IP mapping is removed due to MAC mismatch. By default this option is enabled.</p> <p>MAC checking occurs only on packets from IP addresses on networks that are directly attached to the ASA. VPN users are not checked.</p>                                                                                                                                                                      |
| Track User Not Found                                   | Whether to enable user-not-found tracking. By default, the option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>NetBIOS Logout Probe</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable (NetBIOS Logout Probe) | <p>Whether to enable the NetBIOS logout probe.</p> <p>You can use the probe to proactively determine if a user has logged out of the network, allowing the device to remove the user-to-IP address mapping more quickly than if idle timeout is the only mechanism used for this purpose. By default the probe is disabled, and users are removed only if they are idle for longer than the Idle Timeout value.</p> <p>Users are probed only if they are in the active state and they are used in at least one activated rule. VPN and cut-through proxy users are not probed. The AD agent is notified if the user-to-IP mapping is removed by the NetBIOS logout probe.</p> <p>In addition to configuring the following options, see <a href="#">Requirements for Identity-Aware Firewall Policies, page 13-3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Probe Timer                   | <p>The frequency of sending NetBIOS probes to activated users, regardless of whether the user is idle. The default is 15 minutes, the range is 1 to 65535 minutes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Retry Interval                | <p>The frequency of retrying the probe if a response is not received from an IP address, and the number of times the probe should be retried. The default is 3 seconds and 3 retries. The range is 1 to 65535 seconds, for retry count, 1 to 256.</p> <p>If there is no response from the final retry, the user-to-IP address mapping is removed if you selected the <b>Remove User IP When NetBIOS Probe Fails</b> option; otherwise, the address is probed during the next interval.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| User Name                     | <p>When a NetBIOS response is received, how to handle the response based on the usernames returned:</p> <ul style="list-style-type: none"> <li>• <b>Match Any</b> (the default)—Any username in the response can match the username in the database for the IP address. If there are multiple names in the response (that is, more than one user is logged into the workstation), if any user in the response matches a user in the database, the probe is considered successful and the mapping is retained.</li> <li>• <b>User Not Needed</b>—The usernames in the NetBIOS response are ignored; the query response is sufficient to maintain the user-to-IP address mapping. This option is useful if the messenger service is not turned on in the workstation, in which case the NetBIOS response will not contain usernames. The option is also useful when multiple users log into a workstation.</li> <li>• <b>Exact Match</b>—There must be one username in the NetBIOS response, and it must exactly match the username in the user-to-IP address mapping database. If there is more than one user, or if the username does not match, the mapping is removed from the database and the IP address is marked as inactive.</li> </ul> |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Users</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Idle Timeout                  | <p>The amount of time, in minutes, to allow the user to be idle before removing the user-to-IP address mapping in the database. Once removed, the user must log in again to update the mapping (for example, by using Ctrl+Alt+Delete to lock the workstation, then log in again). The default is 60 minutes, the range is 1 to 65535 minutes.</p> <p>You can deselect the option to disable idle timeout checking, in which case user-to-IP mappings are not removed due to idleness.</p> <p>VPN and cut-through proxy users are not subject to this timer. The AD agent is not notified if the user-to-IP address mapping is removed due to idle timeout.</p>                                                                                                        |
| <b>Active Directory Agent</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Hello Timer                   | <p>The frequency of sending Hello packets to the AD agent. The ASA uses Hello packets to obtain ASA replication status and domain status. If the ASA does not receive a response after the final retry, the AD agent is considered down, and the ASA switches to the backup AD agent, if you configure one.</p> <p>By default, Hello packets are sent every 30 seconds, and up to 5 retries are attempted if no response is received. The range is 10 to 65535 seconds and 1 to 65535 retries.</p>                                                                                                                                                                                                                                                                     |
| Poll Groups Timer             | <p>How often the Active Directory server should be queried to obtain user membership lists for user groups that you have specified in firewall rules. The ASA queries the server for membership in a group only if you have used the group; it does not query every group defined in the AD server. The default is 8 hours, the range is 1 to 65535 hours.</p> <p><b>Tip</b> If group membership changes, the changes are not reflected in rule processing until this timer expires and the ASA polls the AD server for updated information. Thus, you should configure the timer based on the frequency of changes to group membership in your network, balancing the need to update group membership in the ASA with the desire to reduce the amount of polling.</p> |

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retrieve User Information | <p>How the ASA should retrieve user-to-IP address mappings from the AD agent.</p> <ul style="list-style-type: none"> <li>• <b>Full Download</b> (default for ASA non-5505 devices)—On boot, the ASA obtains the full user-to-IP address mapping database from the AD agent, and then gets incremental updates as users log into and out of the network.</li> </ul> <p>Use this option on the 5505 only if there are fewer than 1024 users in the network, because the 5505 is limited to 1024 user-to-IP mappings. For the 5505, the default On Demand setting is appropriate if only a few users will pass traffic through the device.</p> <ul style="list-style-type: none"> <li>• <b>On Demand</b> (default for ASA 5505 devices)—The ASA queries the AD agent for user-to-IP mappings only when a new packet requires a connection and no mapping exists. This option uses less memory, but there can be a delay in getting the mapping, and the packets are initially evaluated based on traditional source and destination IP address and service information, which might result in the wrong action. The potential delay can be increased if a large number of users log in at the same time, either due to corporate culture or to a malicious attack.</li> </ul> |

## Creating Identity User Group Objects

You can create identity user group objects to identify individual users, user groups, or a combination of users and groups. These users and groups must be defined in Active Directory (AD), you cannot define other types of users.

### Tip

Identity user groups are defined on the ASA. You do not need to create these groups to duplicate groups that are already defined in AD. You can directly specify AD groups in firewall rules. Identity user group objects are needed only to define collections of users and user groups that do not otherwise exist in AD.

There are two pre-defined identity user groups. These groups are used when configuring cut-through proxy, as described in [Configuring Cut-Through Proxy, page 13-23](#).

- **all-auth-users**—To match any IP address that has been associated with an authenticated user.
- **all-unauth-users**—To match only IP addresses that have **not** been associated with authenticated users.

### Tips

- Use of these objects is supported on ASA 8.4(2+) only.
- You must configure the Identity Options policy on the ASA to enable the use of these objects.
- You can create identity user group objects when defining policies or objects that use this object type. For more information, see [Selecting Identity Users in Policies, page 13-21](#).

- [Requirements for Identity-Aware Firewall Policies, page 13-3](#)
- [Identity Settings Page, page 11-38](#)
- [Creating Policy Objects, page 6-9](#)

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)).
- Step 2** Select **Identity User Group** from the Object Type selector.
- Step 3** Right-click in the work area, then select **New Object** to open the Identity User Group dialog box.
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Add and remove items in the **Members in Group** list to identify the users and user groups defined in the object.

To populate the list, do any combination of the following:

- In **Available Identity User Group**, select an existing object and click the **Add >>** button between the lists.
- In **Search User/User Group**, select a user or user group from the Active Directory server configured for the domain in the Identity Settings administration options. You must configure the settings before you can select users or user groups, so that Security Manager knows which AD server to use.

To find a user or user group, select the NetBIOS domain, indicate whether you are searching for a user or user group, and enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the name (first, middle initial, last), user ID, CN, or for groups, user group name.

To add the user or group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated identity user or user group**, type in a valid name, then click the **Add >>** button between the lists. Separate multiple names with commas; they are added as separate lines in the members list.

You can enter names in the following formats:

- Individual users: NETBIOS\_DOMAIN\user
- User groups (note the double \): NETBIOS\_DOMAIN\user\_group

If you do not include the domain name, one is added for you based on the options selected in the Security Manager Administration Identity Settings page. If you precede the name with \ or \\, the default domain defined on the Identity Settings page is automatically added.

- To remove an item from the object, select it in the Members list and click the **<< Remove** button between the lists.

- Step 6** (Optional) Under **Category**, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-13](#).
- Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).
- Step 8** Click **OK** to save the object.
-

## Selecting Identity Users in Policies

In any policy or policy object that allows the specification of identity users, whether directly or through the selection of an identity user group object, you can click the Select button next to the User field to help you enter the information.

In the Identity User Group Selector dialog box, you can define the content of the User field by populating the **Members in Group** list. To populate the list, do any combination of the following:

- In **Available Identity User Group**, select an existing object and click the **Add >>** button between the lists. If the desired object does not exist, you can click the **Add (+)** button below the list to create a new object. You can also select an object and click the **Edit (pencil)** button to modify it or to examine its contents.

There are two pre-defined identity user groups. These groups are used when configuring cut-through proxy, as described in [Configuring Cut-Through Proxy, page 13-23](#).

- all-auth-users—To match any IP address that has been associated with an authenticated user.
- all-unauth-users—To match only IP addresses that have **not** been associated with authenticated users.

- In **Search User/User Group**, select a user or user group from the Active Directory server configured for the domain in the Identity Settings administrative options. You must configure the settings before you can select users or user groups, so that Security Manager knows which AD server to use.

To find a user or user group, select the NetBIOS domain, indicate whether you are searching for a user or user group, and enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the name (first, middle initial, last), user ID, CN, or for groups, user group name.

To add the user or group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated identity user or user group**, type in a valid name, then click the **Add >>** button between the lists. Separate multiple names with commas; they are added as separate lines in the members list.

You can enter names in the following formats:

- Individual users: NETBIOS\_DOMAIN\user
- User groups (note the double \): NETBIOS\_DOMAIN\user\_group

If you do not include the domain name, one is added for you based on the options selected in the Security Manager Administration Identity Settings page as explained in [Identity Settings Page, page 11-38](#). If you precede the name with \ or \\, the default domain defined on the Identity Settings page is automatically added.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

## Configuring Identity-Based Firewall Rules

Identity awareness is integrated into the access control entries, or rules, in the ACLs used to provide firewall services. Because the feature is integrated into the ACL, the techniques for adding identity-based rules to a firewall policy are the same for all types of firewall policy. This topic provides general guidance on how to incorporate identity-based rules into your existing policies, and directs you to more specific information on configuring each type of policy that allows identity-based rules.

### Guidelines For Adding Identity-Based Rules

Following are some general guidelines and recommendations for adding identity-based rules:

- FQDN (fully-qualified domain name) network/host objects are allowed in both Source and Destination fields. For information on configuring these objects, see [Creating Networks/Hosts Objects, page 6-82](#).
- User, user group, and identity user group objects, which specify Active Directory (AD) user or user group names, are defined in a separate field: User. If you configure a rule with one or more user names, user group names, or identity user group objects, the specifications modify the Source address configuration only. They never apply to the addresses specified in the Destination field. For information on configuring these identity user group objects, see [Creating Identity User Group Objects, page 13-19](#).

You must always configure a source address in a rule, even if you want the rule to primarily operate based on the specified users or user groups. The source and user specifications conjoin to control the scope of the rule. Based on the value of the Source field, the rules operate as follows:

- **Source = any**—Use “any” as the source if you want the rule to apply based solely on the user specifications. These rules will match the user specification regardless of the workstation IP address from which the user sends traffic.
- **Source = anything else**—If you specify anything other than “any” as the source address, the rule applies only if the user sends traffic from an IP address that matches the source address specification. Use this technique if you want to provide variable services based on the source network.

For example, you might have an internal trusted network from which you would allow access to a sensitive destination for users in a particular user group, although you would deny access even to those users if they were outside of the trusted network. In this case, you would create a permit rule that specified the trusted network as the source, the trusted user group as the user, and the sensitive server as the destination. You could also create a specific deny rule with just the source and destination specified, or allow the default deny any rule to capture the non-matching traffic.

- Evaluate whether there are classes of traffic that will never be sensitive to user identity. For example, you might allow DNS traffic for all users. Place these types of rules above identity-based rules so that matching traffic can be quickly allowed before the device needs to evaluate identity-based rules.
- When troubleshooting rules, keep in mind that ultimately rules are applied based on IP address. FQDN rule matching is based on DNS lookups, and the IP address of a host can change between a successful lookup and the next time the lookup is refreshed. For users, IP address mappings are obtained from the AD agent configured in the network or by authentications conducted by the ASA itself.
- FQDN and user specifications are completely independent. You can use one without the other.

### Firewall Policies That Allow Identity-Based Rules

Identity-based rules are allowed on ASA 8.4.2+ only. The following policies allow you to configure identity-based rules:

- AAA Rules—Select **Firewall > AAA Rules** and see [Configuring AAA Rules for ASA, PIX, and FWSM Devices, page 15-4](#).

#### Tip

You can use AAA rules to configure cut-through proxy, which allows users whose IP address mappings have become invalid, resulting in denied network access, to authenticate directly to the ASA to resolve the mapping problem. See [Configuring Cut-Through Proxy, page 13-23](#).

- Access Rules—Select **Firewall > Access Rules** and see [Configuring Access Rules, page 16-7](#).
- Inspection Rules—Select **Firewall > Inspection Rules** and see [Configuring Inspection Rules, page 17-5](#).
- Policies that use extended ACL policy objects—Several firewall policies use extended ACL policy objects to define traffic matching criteria instead of incorporating a rule table directly in the policy. You can configure extended ACL policy objects to include FQDN objects or user specifications (see [Creating Extended Access Control List Objects, page 6-54](#)). You can then use these identity-based extended ACL objects in the following policies:
  - Botnet Traffic Filter Rules—Select **Firewall > Botnet Traffic Filter Rules** and see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#). You can use identity-based ACLs as traffic classification for Enable and Drop rules.
  - IPS, QoS, and Connection Rules (service policy rules)—Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** and see [Service Policy Rules Page, page 58-5](#).

Traffic match criteria in this policy is based on extended ACL policy objects that are incorporated into traffic flow policy objects. You must select one of the options for specifying an ACL in the traffic flow object to incorporate identity-based traffic classification. You can use identity-based ACLs for all service types. For more information, see [Configuring Traffic Flow Objects, page 58-18](#).

One of the services available in this policy, User Statistics, is specifically designed to collect accounting information for identity-based firewall users. See [Collecting User Statistics, page 13-25](#).
  - VPN filter in remote access group policies—The VPN filter ACL is applied to VPN traffic. You can configure a VPN filter on the Connection Settings page in an ASA Group Policy object, which you use in a remote access connection policy. See [ASA Group Policies Connection Settings, page 34-33](#) and [Filtering VPN Traffic with Identity-Based Rules, page 13-26](#).

#### Policies That Do Not Allow Identity-Based Rules or Objects

There are several types of policy where you can specify network/host objects or extended ACL objects, but where the policy does not allow FQDN network/host objects or ACLs that use those objects or identity user group objects. Following are some examples where you cannot use these types of objects:

- Routing policies, including route maps.
- Network address translation (NAT).
- WCCP (web cache control protocol).
- Crypto maps in VPN configurations.
- Dynamic access policies in remote access VPN configurations.

## Configuring Cut-Through Proxy

When you use identity-aware firewall policies, user-to-IP address mappings are obtained from various facilities, primarily from the AD agent in the network. Although mappings are updated regularly, there can occur instances where a firewall rule blocks a legitimate user because the user-to-IP address mapping is not synchronized.

You can configure cut-through proxy to account for this possibility. With cut-through proxy, if a user is blocked, the user can sign on directly to the ASA, and the ASA will update the user-to-IP mapping to correctly reflect the current IP address for the user. The new mapping is forwarded to all contexts that contain the interface where the HTTP/HTTPS packets are received and authenticated.

You use AAA rules to configure cut-through proxy. You have two configuration choices, based on whether there is one or more NetBIOS domains in the network:

- **Single domain**—Configure a regular AAA rule for authentication and specify the LDAP server group that identifies the Active Directory servers for the domain. Use “any” for the source, and the IP address of the ASA for the destination. For service, you can include HTTP and HTTPS. Then, when the user needs to authenticate to the server, the user enters one of the standard authentication URLs, where *interface\_ip* is the IP address of the interface and *port* is optionally the port number, if you specify a non-default port for the protocol in the interactive authentication table:  
**http://interface\_ip[:port]/netaccess/connstatus.html** or  
**https://interface\_ip[:port]/netaccess/connstatus.html.**

**Tip**

The user-to-IP mapping is put under the same domain as configured for the selected AD server group. If you use another means for authentication, the mapping is placed under the LOCAL domain.

- **Multiple domains**—Configure two authentication rules that use the User-Identity option instead of a specific AAA server group. The following procedure explains this setup. Note that this setup also works for single domain networks. Users authenticate to the ASA using the same URLs mentioned above.

When you use the User-Identity option, authentication is handled as follows:

- If the user includes the domain in the login credentials, in the format DOMAIN\username, the ASA uses the domain to determine which AD server to use for authentication based on the domain mappings in the Identity Options policy. If no AAA server is mapped to the domain, the authentication attempt is rejected.
- If the login credentials do not include an identifiable domain name (typically, if the \ character is not included in the username string), the ASA uses the AD server assigned to the default domain selected in the Identity Options policy. If no AAA server is mapped to the default domain, the authentication attempt will be rejected.

**Tip**

Cut-through proxy works for IPv4 addresses only; IPv6 is not supported.

#### Related Topics

- [Requirements for Identity-Aware Firewall Policies, page 13-3](#)
- [Configuring the Firewall to Provide Identity-Aware Services, page 13-7](#)
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices, page 15-4](#)
- [Understanding How Users Authenticate, page 15-2](#)

- 
- Step 1** Configure the Identity Options policy to specify all of the NetBIOS domains and their AD server groups, and the AD agent group, for the network, as described in [Identifying Active Directory Servers and Agents, page 13-8](#).
- Step 2** Do one of the following to open the [AAA Rules Page, page 15-10](#):
- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
  - (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 3** Create the following rules using the **Add Row** button. For detailed information about the fields in the Add AAA Rules dialog box, see [Add and Edit AAA Rule Dialog Boxes, page 15-13](#).

**Tip**

You can use more specific source, destination, or service specifications than the ones shown here.

- **Rule 1: Do not force users who have already authenticated to authenticate again.**
  - Select the **Authentication Action** and **User-Identity** options.
  - Action = Deny. For AAA authentication rules, “deny” means the user is not prompted for authentication, it does not mean the user’s traffic is dropped.
  - Sources = any.
  - Users = all-auth-users.  
For users, **all-auth-users** means any user who has already authenticated to Active Directory, for which there is an IP mapping.
  - Destination = any.
  - Services = IP.
  - AAA Server Group = (no selection).
  - Interface = (your choice, typically inside interfaces).
- **Rule 2: Authenticate users who have not been authenticated yet.**
  - Select the **Authentication Action** and **User-Identity** options.
  - Action = Permit. This action requires matching users to authenticate.
  - User = all-unauth-users.  
In this case, **all-unauth-users** means any user who has not already authenticated to Active Directory.
  - All other options are identical to the first rule.

## Collecting User Statistics

You can collect user statistics accounting information for identity-based firewall policies. These statistics are kept for users to which a firewall policy is applied based on username or user group membership.

### Related Topics

- [Requirements for Identity-Aware Firewall Policies, page 13-3](#)
- [Configuring the Firewall to Provide Identity-Aware Services, page 13-7](#)
- [Service Policy Rules Page, page 58-5](#)
- [Configuring Traffic Flow Objects, page 58-18](#)

**Step 1** Do one of the following:

- (Device view) Select an ASA device, then select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to add the rule, then click the **Add Row (+)** button below the table to start the Insert Service Policy Rule wizard.
- Step 3** In step 1 of the wizard, select whether the rule will be Global or it will apply to specific interfaces or interface roles. Select Global if you want to collect statistics for users regardless of which interface their traffic passes through.
- Click **Next**.
- Step 4** In step 2, select the traffic class that defines the traffic for which you are collecting statistics. Select Use class-default if you want to collect statistics on all traffic. Otherwise, select Traffic Class and select the traffic flow object that defines the traffic matching attributes.
- Click **Next**.
- Step 5** In step 3, select the **User Statistics** tab.
- Select **Enable user statistics accounting**.
  - Select the type of information you want to collect:
    - **Account for sent drop count**
    - **Account for sent packet, sent drop and received packet count**
- Step 6** Click **Finish** to save your rule.
- 

## Filtering VPN Traffic with Identity-Based Rules

When you support remote access VPNs on an ASA, you configure user-sensitive access. You can also use identity-based rules to filter the traffic after validating the remote user access.

Before creating identity-based rules for VPN, understand the rules for VPN user names, to ensure that the rules use the correct domain name:

- If you use an Active Directory LDAP server group for authorization, and you configured that domain/server group in the Identity Options policy, the username is associated with the NetBIOS domain.
- For all other authorization mechanisms, the domain name for VPN users is LOCAL.

With this in mind, there are two methods you can use to filter the traffic on the VPN with identity-based ACL rules:

- Apply a VPN filter in the ASA Group Policy object. The filter applies to all users in the group. You can configure a VPN filter on the Connection Settings page in an ASA Group Policy object, which you use in a remote access connection policy. See [ASA Group Policies Connection Settings, page 34-33](#).
- By default, VPN traffic bypasses interface access rules. You can change this behavior so that all VPN traffic must also pass through the interface access rules. If you take this approach, you must ensure that the interface rules are sensitive to your VPN traffic. To force VPN traffic to go through interface access rules, deselect the **Enable IPsec over Sysopt** option on the ISAKMP/IPsec tab of the RA VPN Global Settings policy. See [Configuring VPN Global ISAKMP/IPsec Settings, page 26-33](#).

# Monitoring Identity Firewall Policies

You can use Event Viewer to monitor identity-aware firewall policies the same way you would monitor other types of policies and events. The following are some tips to help you effectively monitor identity policies. For general information on using Event Viewer, see [Chapter 69, “Viewing Events”](#).

- There is a group of syslog messages that relate specifically to identity firewall: 746001-746019. You can find descriptions of these messages in the Syslog Message document for your ASA software version at [http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html).

The following messages are of particular concern:

- **746004 and 746011**—These syslogs indicate that you have exceeded the supported number of references to user groups or users. You should consider changing your policies. For more information on these restrictions, see [Requirements for Identity-Aware Firewall Policies, page 13-3](#).
- **746003**—There was a failure in downloading user group or user mappings to IP address. The message explains the reason for the failure.
- **746005**—The AD agent could not be reached. Ensure that the agent is functioning correctly and that there is a network path between the ASA and the agent.
- **746010**—An update to the imported user or user group failed for the stated reason.
- **746016**—DNS lookup for the fully-qualified domain name (FQDN) failed for the stated reason.
- Several existing syslog messages now include username or FQDN information. Event Viewer has two columns to display the information: Destination User Identity / FQDN and Source User Identity. Updated messages include:
  - 302005, 302006, 302013, 302014, 302016-302018, 302020, 302021.
  - 305005, 305006, 305009-305013.
  - 304001-304002 include identity information, but they are not parsed.
- You can filter on all identity-related syslog messages by creating a filter on Event Type and selecting the Identity Firewall Events folder.
- When you use the Go to Policy command on an event, as described in [Looking Up a Security Manager Policy from Event Viewer, page 69-54](#), identity information is included in the lookup criteria. Note that identity information is not included in 106100, so policy lookup on that message cannot be sensitive to user identity.

## Managing TrustSec Firewall Policies

Cisco TrustSec provides an access-control solution that builds upon an existing identity-aware infrastructure to ensure data confidentiality between network devices and integrate security access services on one platform. In the Cisco TrustSec solution, enforcement devices utilize a combination of user attributes and end-point attributes to make role-based and identity-based access control decisions.

Cisco ASA, ISR, and ASR devices integrate with Cisco TrustSec to provide security group based policy enforcement. Access policies within the Cisco TrustSec domain are topology-independent, based on the roles of source and destination devices rather than on network IP addresses.

### Note

Cisco TrustSec Support for IOS feature is supported on the Cisco Integrated Services Router Generation 2 (ISR G2) only.

Security group awareness is integrated into several existing firewall rules; there is no unique TrustSec firewall policy. This chapter explains TrustSec firewall policies and how to implement them in the various policies that support security group awareness.

This chapter contains the following topics:

- [Overview of TrustSec Firewall Policies, page 14-1](#)
- [Configuring TrustSec Firewall Policies, page 14-7](#)
- [Monitoring TrustSec Firewall Policies, page 14-17](#)

## Overview of TrustSec Firewall Policies

Traditionally, security features such as firewalls performed access control based on predefined IP addresses, subnets and protocols. However, with enterprises transitioning to borderless networks, both the technology used to connect people and organizations and the security requirements for protecting data and networks have evolved significantly. End points are becoming increasingly nomadic and users often utilize a variety of end points (for example, laptop versus desktop, smart phone, or tablet), which means that a combination of user attributes plus end-point attributes provide the key characteristics, in addition to existing 6-tuple based rules, that enforcement devices, such as switches and routers with firewall features or dedicated firewalls, can reliably use for making access control decisions.

As a result, the availability and propagation of end point attributes or client identity attributes have become increasingly important requirements to enable security solutions across the customers' networks, at the access, distribution, and core layers of the network and in the data center to name but a few examples.

Cisco TrustSec provides an access-control solution that builds upon an existing identity-aware infrastructure to ensure data confidentiality between network devices and integrate security access services on one platform. In the Cisco TrustSec solution, enforcement devices utilize a combination of user attributes and end-point attributes to make role-based and identity-based access control decisions.

Implementing Cisco TrustSec into your environment has the following advantages:

- Provides a growing mobile and complex workforce with appropriate and more secure access from any device
- Lowers security risks by providing comprehensive visibility of who and what is connecting to the wired or wireless network
- Offers exceptional control over activity of network users accessing physical or cloud-based IT resources
- Reduces total cost of ownership through centralized, highly secure access policy management and scalable enforcement mechanisms

For information about Cisco TrustSec, see <http://www.cisco.com/go/trustsec>.

This section contains the following topics:

- [Understanding SGT and SXP Support in Cisco TrustSec, page 14-2](#)
- [Roles in the Cisco TrustSec Solution, page 14-3](#)
- [Security Group Policy Enforcement, page 14-3](#)
- [About Speaker and Listener Roles, page 14-6](#)
- [Prerequisites for Integrating an ASA with Cisco TrustSec, page 14-6](#)

## Understanding SGT and SXP Support in Cisco TrustSec

In the Cisco TrustSec solution, security group access transforms a topology-aware network into a role-based network, thus enabling end-to-end policies enforced on the basis of role-based access-control (RBAC). Device and user credentials acquired during authentication are used to classify packets by security groups. Every packet entering the Cisco TrustSec cloud is tagged with a security group tag (SGT). The tagging helps trusted intermediaries identify the source identity of the packet and enforce security policies along the data path.

An SGT can indicate a privilege level across the domain when the SGT is used to define a security group ACL. An SGT is assigned to a device through IEEE 802.1X authentication, web authentication, or MAC authentication bypass (MAB), which occurs with a RADIUS vendor-specific attribute. An SGT can be assigned statically to a particular IP address or to a switch interface. An SGT is passed along dynamically to a switch or access point after successful authentication.

The Security-group eXchange Protocol (SXP) is a protocol developed for Cisco TrustSec to propagate the IP-to-SGT mapping database across network devices that do not have SGT-capable hardware support to hardware that supports SGTs and security group ACLs. SXP, a control plane protocol, passes IP-SGT mappings from authentication points (such as legacy access layer switches) to upstream devices in the network.

The SXP connections are point-to-point and use TCP as the underlying transport protocol. SXP uses the well known TCP port number 64999 to initiate a connection. Additionally, an SXP connection is uniquely identified by the source and destination IP addresses.

## Roles in the Cisco TrustSec Solution

To provide identity and policy-based access enforcement, the Cisco TrustSec solution includes the functionality:

- **Access Requestor (AR):** Access requestors are end-point devices that request access to protected resources in the network. They are primary subjects of the architecture and their access privilege depends on their Identity credentials.

Access requestors include end-point devices such as PCs, laptops, mobile phones, printers, cameras, and MACsec-capable IP phones.

- **Policy Decision Point (PDP):** A policy decision point is responsible for making access control decisions. The PDP provides features such as 802.1x, MAB, and Web authentication. The PDP supports authorization and enforcement through VLAN, DACL, and security group access (SGACL/SXP/SGT).

In the Cisco TrustSec solution, the Cisco Identity Services Engine (ISE) acts as the PDP. The Cisco ISE provides identity and access control policy functionality.

- **Policy Information Point (PIP):** A policy information point is a source that provides external information (for example, reputation, location, and LDAP attributes) to policy decision points.

Policy information points include devices such as Session Directory, Sensors IPS, and Communication Manager.

- **Policy Administration Point (PAP):** A policy administration point defines and inserts policies into authorization system. The PAP acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco Trustsec tag to server resource mapping.

In the Cisco TrustSec solution, the Cisco Secure Access Control System (a policy server with integrated 802.1x and SGT support) acts as the PAP.

- **Policy Enforcement Point (PEP):** A policy enforcement point is the entity that carries out the decisions (policy rules and actions) made by the PDP for each AR. PEP devices learn identity information through the primary communication path that exists across networks. PEP devices learn the identity attributes of each AR from many sources, such as end-point agents, authorization servers, peer-enforcement devices, and network flows. In turn, PEP devices use SXP to propagate IP-SGT mappings to mutually-trusted peer devices across the network.

Policy enforcement points include network devices such as Catalyst switches, routers, firewalls (specifically the ASA), servers, VPN devices, and SAN devices.

## Security Group Policy Enforcement

Security policy enforcement is based on security group name. Compared to traditional IP-based policies configured on firewalls, identity-based policies are configured based on user and device identities. For example, mktg-contractor is allowed to access mktg-servers; mktg-corp-users are allowed to access mktg-server and corp-servers.

The benefits of this type of deployment include:

- User group and Resource is defined and enforced using a single object (SGT) - simplified policy management.
- User identity and resource identity are retained throughout the Cisco Trustsec capable switch infrastructure.

**Figure 14-1 Security Group Name Based Policy Enforcement Deployment**

Implementing Cisco TrustSec allows you to configure security policies that support server segmentation and includes the following features:

- A pool of servers can be assigned an SGT for simplified policy management.
- The SGT information is retained within the infrastructure of Cisco TrustSec capable switches.
- The ASA, ISR, and ASR can leverage the IP-SGT mapping for policy enforcement across the Cisco TrustSec domain.
- Deployment simplification is possible because 802.1x authorization for servers is mandatory.

#### How the ASA Enforces Security Group Based Policies

**Note**

User-based security policies and security-group based policies can coexist on the ASA. Any combination of network, user-based, and security-group based attributes can be configured in a security policy.

To configure the ASA to function with Cisco TrustSec, you must import a Protected Access Credential (PAC) file from the ISE.

Importing the PAC file to the ASA establishes a secure communication channel with the ISE. After the channel is established, the ASA initiates a PAC secure RADIUS transaction with the ISE and downloads Cisco TrustSec environment data (that is, the security group table). The security group table maps SGTs to security group names. Security group names are created on the ISE and provide user-friendly names for security groups.

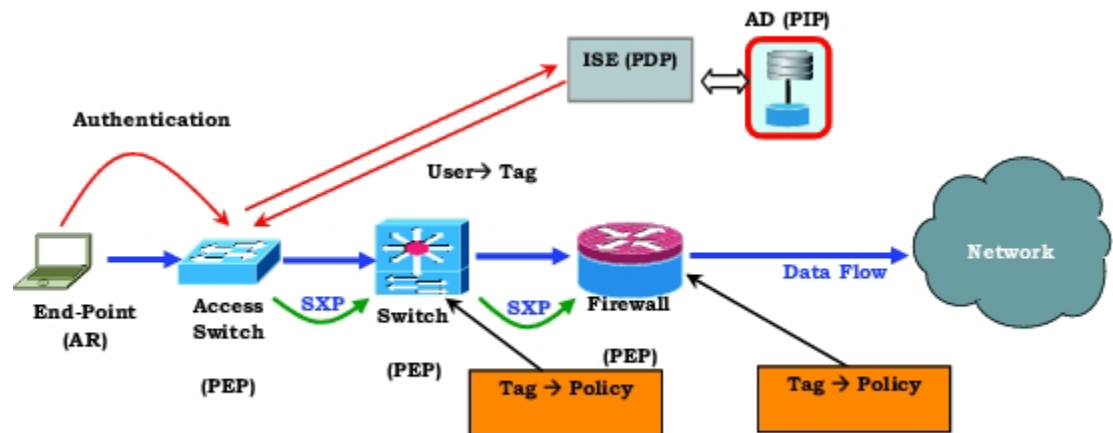

**Note**

For more information about the Cisco Identity Services Engine, see <http://www.cisco.com/en/US/products/ps11640/index.html>.

The first time that the ASA downloads the security group table, it walks through all entries in the table and resolves all the security group names included in security policies that have been configured on it; then the ASA activates those security policies locally. If the ASA cannot resolve a security group name, it generates a syslog message for the unknown security group name.

The following figure shows how a security policy is enforced in Cisco TrustSec.

**Figure 14-2 Security Policy Enforcement**

1. An end-point device connects to an access layer device directly or via remote access and authenticates with Cisco TrustSec.
2. The access layer device authenticates the end-point device with the ISE by using authentication methods such as 802.1X or web authentication. The end-point device passes role and group membership to classify the device into the appropriate security group.
3. The access layer device uses SXP to propagate the IP-SGT mapping to the upstream devices.
4. The ASA receives the packet and looks up the SGTs for the source and destination IP addresses using the IP-SGT mapping passed by SXP.

If the mapping is new, the ASA records it in its local IP-SGT Manager database. The IP-SGT Manager database, which runs in the control plan, tracks IP-SGT mappings for each IPv4 or IPv6 address. The database records the source from which the mapping was learned. The peer IP address of the SXP connection is used as the source of the mapping. Multiple sources can exist for each IP-SGT mapping.

If the ASA is configured as a Speaker, the ASA transmits all IP-SGT mappings to its SXP peers. See [About Speaker and Listener Roles, page 14-6](#).

5. If a security policy is configured on the ASA with that SGT or security group name, the ASA enforces the policy. (You can create security policies on the ASA that include SGTs or security group names. To enforce policies based on security group names, the ASA needs the security group table to map security group names to SGTs.)

If the ASA cannot find a security group name in the security group table and it is included in a security policy, the ASA considers the security group name unknown and generates a syslog message. After the ASA refreshes the security group table from the ISE and learns the security group name, the ASA generates a syslog message indicating that the security group name is known.

## About Speaker and Listener Roles

The Security-group eXchange Protocol (SXP) is used to send and receive IP-SGT mappings to and from other network devices. Employing SXP allows security devices and firewalls to learn identity information from access switches without the need for hardware upgrades or changes. SXP can also be used to pass IP-SGT mappings from upstream devices (such as datacenter devices) back to the downstream devices.

When configuring an SXP connection to an SXP peer, you must designate the device as a Speaker or a Listener for that connection so that it can exchange identity information:

- **Speaker mode**—configures the device so that it can forward all active IP-SGT mappings to upstream devices for policy enforcement.
- **Listener mode**—configures the device so that it can receive IP-SGT mappings from downstream devices (SGT-capable switches) and use that information in creating policy definitions.

If one end of an SXP connection is configured as Speaker, then the other end must be configured as a Listener, and vice versa. If both devices on each end of an SXP connection are configured with the same role (either both as Speakers or both as Listeners), the SXP connection will fail and the device will generate a system log message.

Configuring the device to be both a Speaker and a Listener for an SXP connection can cause SXP looping, meaning that SXP data can be received by an SXP peer that originally transmitted it.

As part of configuring SXP, you configure an SXP reconcile timer. After an SXP peer terminates its SXP connection, the device starts a hold down timer. Only SXP peers designated as Listener devices can terminate a connection. If an SXP peer connects while the hold down timer is running, the device starts the reconcile timer; then, the device updates the IP-SGT mapping database to learn the latest mappings.

## Prerequisites for Integrating an ASA with Cisco TrustSec

Before configuring the ASA to integrate with Cisco TrustSec, you must perform the following prerequisites:

- Register the ASA with the ISE.
- Create a security group for the ASA on the ISE.
- Generate the PAC file on the ISE to import into the ASA.

### Registering the ASA with the ISE

The ASA must be configured as a recognized Cisco TrustSec network device in the ISE before the ASA can successfully import a PAC file.

1. Log into the ISE.
2. Choose **Administration > Network Devices > Network Devices**.
3. Click **Add**.
4. Enter the IP address of the ASA.
5. When the ISE is being used for user authentication in the Cisco TrustSec solution, enter a shared secret in the Authentication Settings area.

When you configure the AAA sever on the ASA, provide the shared secret you create here on the ISE. The AAA server on the ASA uses this shared secret to communicate with the ISE.

6. Specify a device name, device ID, password, and a download interval for the ASA. See the ISE documentation for the details to perform these tasks.

### Creating a Security Group on the ISE

When configuring the ASA to communicate with the ISE, you specify a AAA server. When configuring the AAA server on the ASA, you must specify a server group.

The security group must be configured to use the RADIUS protocol.

1. Log into the ISE.
2. Choose **Policy > Policy Elements > Results > Security Group Access > Security Group**.
3. Add a security group for the ASA. (Security groups are global and not ASA specific.)

The ISE creates an entry under Security Groups with a tag.

4. Under the Security Group Access section, configure a device ID credentials and password for the ASA.

### Generating the PAC

Before generating the PAC file, you must have registered the ASA with the ISE.

1. Log into the ISE.
2. Choose **Administration > Network Resources > Network Devices**.
3. From the list of devices, select the ASA device.
4. Under the Security Group Access (SGA), click **Generate PAC**.
5. To encrypt the PAC file, enter a password.

The password (or encryption key) you enter to encrypt the PAC file is independent of the password that was configured on the ISE as part of the device credentials.

The ISE generates the PAC file. The ASA can import the PAC from flash or from a remote server via TFTP, FTP, HTTP, HTTPS, or SMB. (The PAC does not have to reside on the ASA flash before you can import it.)

## Configuring TrustSec Firewall Policies

Security group awareness is integrated into several existing firewall rules; there is no unique TrustSec firewall policy. Additionally, supporting tools have been updated to work on TrustSec firewall policies. For example, you can search for rules that include a specific Security Group using the Find and Replace tool.

The topics in this section explain the various procedures for integrating security group awareness into firewall policies.

This section contains the following topics:

- [Configuring Cisco TrustSec Services, page 14-8](#)
- [Creating Security Group Objects, page 14-14](#)
- [Selecting Security Groups in Policies, page 14-16](#)
- [Configuring TrustSec-Based Firewall Rules, page 14-17](#)

## Configuring Cisco TrustSec Services

This procedure explains how to enable and configure Cisco TrustSec in Cisco Security Manager and on the required security devices.

### Before You Begin

Before configuring an ASA to integrate with Cisco TrustSec, you must meet the prerequisites explained in [Prerequisites for Integrating an ASA with Cisco TrustSec, page 14-6](#).

To configure Cisco TrustSec, perform the following tasks:

- 
- Step 1** Configure communication between Cisco Security Manager and the Cisco Identity Services Engine (ISE). See [ISE Settings Page, page 11-56](#).
-  **Note** Security Manager supports communications with only one ISE appliance/server for fetching and resolving security group names and tags.
- 
- Step 2** Enable and set the default values for the Security Exchange Protocol (SXP). See [Configuring Security Exchange Protocol \(SXP\) Settings, page 14-8](#).
- Step 3** Add SXP connection peers for the Cisco TrustSec architecture. See [Defining SXP Connection Peers, page 14-12](#).
- Step 4** (ASA 9.3.1+ devices only) Configure Security Group Tagging options. See [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\), page 46-44](#).
- Step 5** (ASA 9.3.1+ devices only) Configure Security Group Tagging for VPN sessions. See [ASA Group Policies SSL VPN Full Client Settings, page 34-19](#).
- Step 6** Configure the Security Policy. See [Configuring TrustSec-Based Firewall Rules, page 14-17](#).
- Step 7** Monitor the TrustSec firewall system. See [Monitoring TrustSec Firewall Policies, page 14-17](#).
- 

## Configuring Security Exchange Protocol (SXP) Settings

Use the SXP Settings page to enable the Security Exchange Protocol (SXP) on your security device and to configure SXP settings for the device.

### Note

All settings are available on the SXP Settings page whether you access that page from Policy view or from Device view for a specific device type. If you configure a setting that is not supported on a particular device, you will receive a validation warning and the unsupported CLI will not be generated for the device.

---

### Navigation Path

- (Device view) Select the security device, then select **TrustSec > SXP Settings** from the Policy selector.
- (Policy view) Select **TrustSec > SXP Settings** from the Policy selector. Select an existing policy or create a new one.

| Enable SGT Exchange Protocol (SXP) | Whether to enable the Security Exchange Protocol on the device. The default is disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Retry Timer                        | <p>The default time interval between attempts to set up new SXP connections between SXP peers. Enter the retry timer value as a number of seconds in the range of 0 to 64000 seconds. If you specify 0 seconds, the timer never expires and the device will not attempt to connect to SXP peers. By default, the timer value is 120 seconds.</p> <p>The device will continue to attempt to connect to new SXP peers until a successful connection is made. The retry timer is triggered as long as there is one SXP connection on the device that is not up.</p> <p>When the retry timer expires, the device goes through the connection database and if the database contains any connections that are off or in a "pending on" state, the device restarts the retry timer.</p>                                                                                                                                                         |
| Reconcile Timer                    | <p>The reconcile timer value as a number of seconds in the range of 0 to 64000 seconds. By default, the timer value is 120 seconds.</p> <p>After an SXP peer terminates its SXP connection, the security device starts a hold down timer. If an SXP peer reconnects while the hold down timer is running, the device starts the reconcile timer; then, the device updates the SXP mapping database to learn the latest mappings.</p> <p>When the reconcile timer expires, the device scans the SXP mapping database to identify stale mapping entries (entries that were learned in a previous connection session). The device marks these connections as obsolete. When the reconcile timer expires, the device removes the obsolete entries from the SXP mapping database.</p> <p><b>Note</b> Setting the reconciliation period to 0 seconds disables the timer and causes all entries from the previous connection to be removed.</p> |
| Network Map                        | The Network Map argument specifies the maximum number of subnet IP hosts from 0 to 65,535 that can be bound to SGTs and exported to the SXP listener. The default is 0 (no expansions performed).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 14-1 SXP Settings Page (continued)**

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Group Name<br>(not applicable for IOS-XE)                | <p>Enter or select the name of the security group created on the ISE for the device.</p> <p><b>Note</b> If you choose to select a server group, you are also give the option to add a AAA Server group.</p> <p>The server group name you specify here must match the name of the security group created on the ISE for the device. If these two group names do not match, the device will not be able to communicate with the ISE. Contact your ISE administrator if you do not have this information.</p>                                  |
| <b>CTS Server Settings (IOS/IOS-XE Only)</b>                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Log Binding Changes                                             | Whether to enable logging for IP-to-SGT binding changes causing SXP syslogs (sev 5 syslog) to be generated whenever a change to IP-to-SGT binding occurs (add, delete, change). These changes are learned and propagated on the SXP connection. This logging function is disabled by default.                                                                                                                                                                                                                                               |
| Enable Cache<br>Cache NV Storage<br>(not applicable for IOS-XE) | <p>Whether to enable caching of TrustSec authorization and environment data information to DRAM and NVRAM.</p> <p>To have DRAM cache updates written to non-volatile storage and to enable the DRAM cache to be initially populated from non-volatile storage when the device boots, select the desired file system from the Cache NV Storage list. ### Add/Edit SGT Role Dialog Box

Use the Add/Edit SGT Role dialog box to manually map Security Group Tag (SGT) numbers to individual IP addresses or host objects.

#### Navigation Path

- (Device view) Select an ASA, ISR, or ASR, then select **TrustSec > SXP Settings** from the Policy selector.
  - To add an entry, click the **Add Row (+)** button beneath the SGT Rolebased Map table.
  - To edit an entry, select it and click the **Edit Row (pencil)** button beneath the SGT Rolebased Map table.
- (Policy view) Select **TrustSec > SXP Settings** from the Policy selector. Select an existing policy or create a new one.
  - To add an entry, click the **Add Row (+)** button beneath the SGT Rolebased Map table.
  - To edit an entry, select it and click the **Edit Row (pencil)** button beneath the SGT Rolebased Map table.

| CTS SGT Number | The Security Group Tag (SGT) number to assign to the specified host/IP address. Valid security tag numbers are 2-65519 for ASA 9.3(1)+ and 0-65533 for ISR and ASR.                                                                                    |

## Defining SXP Connection Peers

The Security-group eXchange Protocol (SXP) is a protocol developed for Cisco TrustSec to propagate the IP-to-SGT mapping database across network devices that do not have SGT-capable hardware support to hardware that supports SGTs and security group ACLs. SXP, a control plane protocol, passes IP-SGT mappings from authentication points (such as legacy access layer switches) to upstream devices in the network. SXP connections between peers are point-to-point and use TCP as the underlying transport protocol.

### Related Topics

- [Prerequisites for Integrating an ASA with Cisco TrustSec, page 14-6](#)
- [About Speaker and Listener Roles, page 14-6](#)
- [Configuring Security Exchange Protocol \(SXP\) Settings, page 14-8](#)

- 
- Step 1** Do one of the following:
- (Device view) Select an ASA, ISR, or ASR, then select **TrustSec > SXP Connection Peers** from the Policy selector.
  - (Policy view) Select **TrustSec > SXP Connection Peers** from the Policy selector. Select an existing policy or create a new one.
- Step 2** In **Default Source**, enter the default local IP address for SXP connections. You can enter an IP address or the name of a network/host object, or click Select to select the object from a list or to create a new one. The IP address can be an IPv4 or IPv6 address.

**Note** The device determines the local IP address for an SXP connection as the outgoing interface IP address that is reachable by the peer IP address. If the configured local address is different from the outgoing interface IP address, the device cannot connect to the SXP peer and generates a system log message.

- Step 3** In **Default Password** and **Confirm**, enter the default password for TCP MD5 authentication with SXP peers. By default, SXP connections do not have a password set.
- You can specify the password as an encrypted string up to 162 characters or an ASCII key string up to 80 characters.

**Step 4** Configure the SXP Peers:

You can do the following:

- To add an entry, click the **Add Row (+)** button and fill in the Add Connection Peer dialog box. See [Add/Edit Connection Peer Dialog Box, page 14-13](#).
- To edit an entry, select it and click the **Edit Row (pencil)** button.
- To delete an entry, select it and click the **Delete Row (trash can)** button.

**Step 5** Click **Save** to save your changes.**Add/Edit Connection Peer Dialog Box**

Use the Add/Edit Connection Peer dialog box to define the settings for an SXP Connection.

**Note**

All settings are available on the Add/Edit Connection Peer dialog box whether you access that dialog box from Policy view or from Device view for a specific device type. If you configure a setting that is not supported on a particular device, you will receive a validation warning and the unsupported CLI will not be generated for the device.

**Navigation Path**

- (Device view) Select an ASA, ISR, or ASR, then select **TrustSec > SXP Connection Peers** from the Policy selector.
  - To add an entry, click the **Add Row (+)** button.
  - To edit an entry, select it and click the **Edit Row (pencil)** button.
- (Policy view) Select **TrustSec > SXP Connection Peers** from the Policy selector. Select an existing policy or create a new one.
  - To add an entry, click the **Add Row (+)** button.
  - To edit an entry, select it and click the **Edit Row (pencil)** button.

| Role                                               | <p>Whether the device functions as a Speaker or Listener for the SXP connection:</p> <ul style="list-style-type: none"> <li>listener—The device can receive IP-SGT mappings from downstream devices.</li> <li>speaker—The device can forward IP-SGT mappings to upstream devices.</li> </ul> <p>See <a href="#">About Speaker and Listener Roles, page 14-6</a>.</p>                                                                                                                                                                |
| Hold Time Min<br>Only applicable on IOS and IOS-XE | The minimum length of the hold-time period in seconds for the speaker or listener device.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hold Time Max<br>Only applicable on IOS and IOS-XE | The maximum length of the hold-time period in seconds for the speaker or listener device. A hold-time maximum-period value is required only when you use the following option combinations: peer speaker and local listener. In other instances, only a hold-time minimum-period value is required.                                                                                                                                                                                                                                 |

## Creating Security Group Objects

You can create security group object groups for use in features that support Cisco TrustSec by including the group in an extended ACL, which in turn can be used in an access rule, for example.

When integrated with Cisco TrustSec, the security device downloads security group information from the Cisco Identity Services Engine (ISE). The ISE acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco TrustSec tag to server resource mapping. You provision and manage security group access lists centrally on the ISE.

However, the device might have localized network resources that are not defined globally that require local security groups with localized security policies. Local security groups can contain nested security groups that are downloaded from the ISE. The security device consolidates local and central security groups.

To create local security groups on the device, you create a local security object group. A local security object group can contain one or more nested security object groups or Security IDs or security group names. Users can also create a new Security ID or security group name that does not exist on the device.

You can use the security object groups you create to control access to network resources. You can use the security object group as part of an access group or service policy.

### Tips

- Use of these objects is supported on ASA 9.0(1)+, IOS 15.2(2)T+, and IOS-XE 3.5.x(15.2(1)S)+ only.
- Although IOS does not support security group object groups, Security Manager allows the use of security group object groups for ISR devices and will automatically expand the object groups to their tag numbers during deployment.
- You must configure the TrustSec policy on the device to enable the use of these objects.
- You can create security group objects when defining policies or objects that use this object type. For more information, see [Selecting Security Groups in Policies, page 14-16](#).

### Related Topics

- [Selecting Security Groups in Policies, page 14-16](#)
- [Creating Policy Objects, page 6-9](#)

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)).
- Step 2** Select **Security Group** from the Object Type selector.
- Step 3** Right-click in the work area, then select **New Object** to open the Add Security Group dialog box.
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Add and remove items in the **Members in Group** list to identify the users and user groups defined in the object.

To populate the list, do any combination of the following:

- In **Available Security Group**, select an existing object and click the **Add >>** button between the lists.
- In **Search name/tag**, select a security group from the ISE server configured in the ISE Settings administrative options. You must configure the settings before you can select a name or tag (see [ISE Settings Page, page 11-56](#)).

To find a security group, enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the security group name.

To add the security group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated (Name or Tag)**, first select the type of entry you are making, Name or Tag. Type in a valid security group name or tag number, then click the **Add >>** button between the lists. Separate multiple names or tags with commas; they are added as separate lines in the members list. When adding multiple names or tags, avoid adding spaces before or after the comma.

Valid security tag numbers are 0-65533 for ASA 9.3+, 1-65533 for ASA versions less than 9.3, 0-65533 for ISR, and 1-65535 for ASR.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

**Note** Although IOS and IOS-XE only support security group tags, Security Manager allows the use of security group names for ISR and ASR devices, either directly or as part of a security group object group, and will automatically convert security group names to their tag number during deployment. However, if the ISE is not reachable, Security Manager will not be able to resolve the security group names. In such situations, Security Manager will not generate the rule for the configuration and an appropriate warning/error message will be displayed.

- Step 6** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-13](#).
- Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).
- Step 8** Click **OK** to save the object.

## Selecting Security Groups in Policies

In any policy or policy object that allows the specification of security groups, whether directly or through the selection of a TrustSec security group object, you can click the Select button next to the Security Groups field to help you enter the information.

In the Security Group Selector dialog box, you can define the content of the Security Groups field by populating the **Members in Group** list. To populate the list, do any combination of the following:

- In **Available Security Group**, select an existing object and click the **Add >>** button between the lists. If the desired object does not exist, you can click the **Add (+)** button below the list to create a new object. You can also select an object and click the **Edit (pencil)** button to modify it or to examine its contents.
- In **Search name/tag**, select a security group from the ISE server configured in the ISE Settings administrative options. You must configure the settings before you can select a name or tag (see [ISE Settings Page, page 11-56](#)).

To find a security group, enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the security group name.

To add the security group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated (Name or Tag)**, first select the type of entry you are making, Name or Tag. Type in a valid security group name or tag number, then click the **Add >>** button between the lists. Separate multiple names or tags with commas; they are added as separate lines in the members list. When adding multiple names or tags, avoid adding spaces before or after the comma.

Valid security tag numbers are 0-65533 for ASA 9.3+, 1-65533 for ASA versions less than 9.3, 0-65533 for ISR, and 1-65535 for ASR.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

## Configuring TrustSec-Based Firewall Rules

Security group awareness is integrated into the access control entries, or rules, in the ACLs used to provide firewall services. Because the feature is integrated into the ACL, the techniques for adding security group awareness to a firewall policy are the same for all types of firewall policy. This topic provides general guidance on how to incorporate security group awareness into your existing policies, and directs you to more specific information on configuring each type of policy that supports security groups.

### Firewall Policies That Support Security Groups

For ASA 9.0.1+ only, you can configure security groups for the following policy types:

- AAA Rules—Select **Firewall > AAA Rules** and see [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#), page 15-4.
- Access Rules—Select **Firewall > Access Rules** and see [Configuring Access Rules](#), page 16-7.
- Inspection Rules—Select **Firewall > Inspection Rules** and see [Configuring Inspection Rules](#), page 17-5.
- Policies that use extended ACL policy objects—Several firewall policies use extended ACL policy objects to define traffic matching criteria instead of incorporating a rule table directly in the policy. You can configure extended ACL policy objects to include security group specifications (see [Creating Extended Access Control List Objects](#), page 6-54). You can then use these extended ACL objects in the following policies:
  - Botnet Traffic Filter Rules—Select **Firewall > Botnet Traffic Filter Rules** and see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter](#), page 19-6. You can use security groups as part of the traffic classification for Enable and Drop rules.
  - IPS, QoS, and Connection Rules (service policy rules)—Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** and see [Service Policy Rules Page](#), page 58-5.

Traffic match criteria in this policy is based on extended ACL policy objects that are incorporated into traffic flow policy objects. You must select one of the options for specifying an ACL in the traffic flow object to incorporate security group traffic classification. For more information, see [Configuring Traffic Flow Objects](#), page 58-18.

For devices running IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+, you can configure security groups for Zone-based Firewall Rules (**Firewall > Zone Based Firewall Rules**). For more information, see [Adding Zone-Based Firewall Rules](#), page 21-13.

## Monitoring TrustSec Firewall Policies

You can use Event Viewer to monitor TrustSec firewall policies the same way you would monitor other types of policies and events. The following are some tips to help you effectively monitor identity policies. For general information on using Event Viewer, see [Chapter 69, “Viewing Events”](#).

- There are groups of syslog messages that relate specifically to Cisco TrustSec: 766001-766020, 766201-766205, 766251-766254, and 766301-766313. You can find descriptions of these messages in the Syslog Message document for your ASA software version at [http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html).
- Event Viewer has the following columns to display TrustSec information: TrustSec Security Group Name, TrustSec Security Group Tag, SXP Connection Source IP, SXP Connection Failure Reason, SXP Peer IP, SXP Peer Connection Failure Reason.

- You can filter on all identity-related syslog messages by creating a filter on Event Type and selecting the All Firewall Events > Trustsec Events folder.

## Managing Firewall AAA Rules

---

You can use Authentication, Authorization, and Accounting (AAA) rules to control access to network resources based on user privileges rather than by IP addresses. If you configure authentication rules, users must enter a username and password whenever they attempt to access a network behind the protected device. Once authenticated, you can further require that the user account be checked to ensure the user is authorized for network access. Finally, you can use accounting rules to track access for billing, security, or resource allocation purposes.

AAA rule configuration is complex and requires that you configure more than just the AAA rules policy. The following topics explain AAA rules in greater detail and include procedures that explain not only the AAA rules policy configuration but also what you must configure in related policies:

- [Understanding AAA Rules, page 15-1](#)
- [Understanding How Users Authenticate, page 15-2](#)
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices, page 15-4](#)
- [Configuring AAA Rules for IOS Devices, page 15-7](#)
- [AAA Rules Page, page 15-10](#)
- [AAA Firewall Settings Policies, page 15-20](#)

The following topics can help you with general rule table usage:

- [Adding and Removing Rules, page 12-9](#)
- [Editing Rules, page 12-10](#)
- [Enabling and Disabling Rules, page 12-20](#)
- [Moving Rules and the Importance of Rule Order, page 12-19](#)

## Understanding AAA Rules

You can use Authentication, Authorization, and Accounting (AAA) rules to control access to network resources based on user privileges rather than by IP addresses. AAA rules provide a different type of control compared to traditional access rules; where access rules allow you to control which IP addresses and services are allowed, AAA rules allow you to configure ACLs for each user to define the authorization available on a user basis, regardless of the IP address from which the user connects. (These per-user ACLs are configured in the AAA server, not in the AAA rule defined on the device.)

AAA rules policies differ from other device platform AAA policies in that AAA rules apply to traffic that is passing through the device, not to traffic directed specifically at the device. By using AAA rules, you can control entry into, or out of, a network. This might be useful if you have a network segment that

is high security, where you want to carefully control access. AAA rules are also useful for circumstances where you need to maintain per-user accounting records for billing, security, or resource allocation purposes.

The AAA rules policy actually configures three separate types of rule, and the configuration of these rules differs significantly between IOS devices on the one hand and ASA, PIX, and FWSM devices on the other hand. For IOS devices, these policies define what is called authentication proxy admission control. When creating shared AAA rules, create separate rules for these types of devices. Following are the types of rules you can configure with AAA rules:

- **Authentication rules**—Authentication rules control basic user access. If you configure an authentication rule, users must log in if their connection request goes through the device on which the rule is defined. You can force users to log in for HTTP, HTTPS, FTP, or Telnet connections. For ASA, PIX, and FWSM devices, you can control other types of services, but users must first authenticate using one of the supported protocols before other types of traffic are allowed.

The device recognizes these traffic types only on the default ports: FTP (21), Telnet (23), HTTP (80), HTTPS (443). If you map these types of traffic to other ports, the user will not be prompted, and access will fail.

- **Authorization rules**—You can define an additional level of control over and above authentication. Authentication simply requires that users identify themselves. After authentication is successful, an authorization rule can query the AAA server to determine if the user has sufficient privileges to complete the attempted connection. If authorization fails, the connection is dropped.
  - For ASA, PIX, and FWSM devices, you define authorization rules directly in the AAA rules policy; if you require authorization for traffic that does not also require authentication, the unauthenticated traffic is always dropped. If you use RADIUS servers for authentication, authorization is automatically performed and authorization rules are not necessary. If you configure authorization rules, you must use a TACACS+ server.
  - For IOS devices, to configure authorization, you must configure an authorization server group in the **Firewall > Settings > AAA** policy; authorization is done for any traffic that is subject to authentication. You can use TACACS+ or RADIUS servers.
- **Accounting**—You can define accounting rules even if you do not configure authentication or authorization. If you do configure authentication, accounting records are created for each user, so that you can identify the specific user who made the connection. Without user authentication, accounting records are based on IP address. You can use TACACS+ or RADIUS servers for accounting.
  - For ASA, PIX, and FWSM devices, you define accounting rules directly in the AAA rules policy. You can perform accounting for any TCP or UDP protocol.
  - For IOS devices, to configure accounting, you must configure an accounting server group in the **Firewall > Settings > AAA** policy; accounting is done for any traffic that is subject to authentication.

## Understanding How Users Authenticate

When you create AAA rules to require that users authenticate when trying to make connections through a device, users will be prompted to supply credentials: a username and password. These credentials must be defined in a AAA server or in the local database configured on the device.

Users are prompted only for HTTP, HTTPS, FTP, and Telnet connections (if you configure those protocols to require authentication). For ASA, PIX, and FWSM devices, you can also require authentication for other protocols; however, users are not prompted for them, and so they must first attempt one of the four supported protocols and successfully authenticate before completing connections of any other protocol that requires authentication.

**Tip**

For ASA, PIX, and FWSM devices, if you do not want to allow HTTP, HTTPS, Telnet, or FTP through the security appliance but want to authenticate other types of traffic, you can require that the user authenticate with the security appliance directly using HTTP or HTTPS by configuring the interface to use interactive authentication (using the **Firewall > Settings > AAA Firewall** policy). The user would then authenticate with the appliance before trying other connections, using one of the following URLs, where *interface\_ip* is the IP address of the interface and *port* is optionally the port number, if you specify a non-default port for the protocol in the interactive authentication table:

**http://interface\_ip[:port]/netaccess/connstatus.html** or  
**https://interface\_ip[:port]/netaccess/connstatus.html.**

When attempting a connection through the device, the user is prompted based on the protocol:

- **HTTP**—The device prompts the user with a web page to provide username and password. The user is prompted repeatedly until successfully authorized. After the user authenticates correctly, the device redirects the user to the original destination. If the destination server also has its own authentication, the user enters another username and password.

For ASA, PIX, and FWSM devices, the security appliance uses basic HTTP authentication by default, and provides an authentication prompt. You can improve the user experience by configuring the interface for interactive authentication and specifying redirect for HTTP traffic. This redirects the user to a web page hosted on the appliance for authentication. To configure an interface to use interactive authentication, add the interface to the Interactive Authentication table on the **Firewall > Settings > AAA Firewall** policy (see [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#)). Ensure that you select the HTTP and Redirect options when adding the interface.

You might want to continue to use basic HTTP authentication if: you do not want the security appliance to open listening ports; if you use NAT on a router and you do not want to create a translation rule for the web page served by the security appliance; basic HTTP authentication might work better with your network. For example non-browser applications, like when a URL is embedded in email, might be more compatible with basic authentication.

However, when using basic HTTP authentication, if the user is going to an HTTP server that requires authentication, the same username and password used to authenticate with the appliance is sent to the HTTP server. Thus, login to the HTTP server fails unless the same username and password are used by the ASA and HTTP server. To avoid this problem, you must configure a virtual HTTP server on the ASA. You can configure a virtual HTTP server using the **Firewall > Settings > AAA Firewall** policy (see [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#)).

**Tip**

In HTTP authentication, the username and password are transmitted in clear text. You can prevent this by selecting the **Use Secure HTTP Authentication** option on the **Firewall > Settings > AAA Firewall** policy. This option ensures that credentials are encrypted.

- **HTTPS**—The user experience for HTTPS is the same as for HTTP; the user is prompted until successfully authorized, and then redirected to the original destination.

For ASA, PIX, and FWSM devices, the security appliance uses a custom login screen. Like with HTTP, you can configure the interface to use interactive authentication, in which case HTTPS connections use the same authentication page as HTTP connections. You must configure the interface separately for HTTPS redirection; use the **Firewall > Settings > AAA Firewall** policy.

For IOS devices, HTTPS connections are authenticated only if you enable SSL on the device and your AAA rules require HTTP authentication proxy. This configuration is explained in [Configuring AAA Rules for IOS Devices, page 15-7](#).

- **FTP**—The device prompts once for authentication. If authentication fails, the user must retry the connection.

When prompted, the user can enter the username required for device authentication followed by an at sign (@) and then the FTP username (name1@name2). For the password, the user would then enter the device authentication password followed by an at sign (@) and then the FTP password (password1@password2). For example, enter the following text.

```
name> asa1@partreq
password> letmein@he110
```

For IOS devices, this method of entering both the device and FTP credentials is required. For ASA, PIX, and FWSM devices, this feature is useful when you have cascaded firewalls that require multiple logins. You can separate several names and passwords by multiple at signs (@).

- **Telnet**—The device prompts several times for authentication. After a number of failed attempts, the user must retry the connection. After authentication, the Telnet server prompts for its username/password. You can configure a virtual Telnet server using the **Firewall > Settings > AAA Firewall** policy (see [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#)).

## Configuring AAA Rules for ASA, PIX, and FWSM Devices

### Note

---

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

---

When you configure AAA rules for an ASA, PIX, or FWSM device, you are configuring policies that define who is allowed to make HTTP, HTTPS, FTP, and Telnet connections through (not to) the device. To fully configure network access authentication, you need to configure several policies, not just the AAA rules policy.

The following procedure covers all policies you would need to configure to supply full authentication, authorization, and accounting support for network access authentication. You do not need to configure options for features you do not need.

### Related Topics

- [Understanding AAA Rules, page 15-1](#)
- [Understanding How Users Authenticate, page 15-2](#)
- [Creating a New Shared Policy, page 5-54](#)
- [Modifying Policy Assignments in Policy View, page 5-54](#)

- [Understanding Interface Role Objects, page 6-73](#)
- [Understanding and Specifying Services and Service and Port List Objects, page 6-100](#)

- [Understanding AAA Server and Server Group Objects, page 6-27](#)
- [Understanding Interface Role Objects, page 6-73](#)

- 
- Step 1** Do one of the following to open the [AAA Rules Page, page 15-10](#):
- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
  - (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit AAA Rule Dialog Boxes, page 15-13](#).

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-10](#).

---

- Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit AAA Rule Dialog Boxes, page 15-13](#).
- Authentication (with or without User-Identity), Authorization, or Accounting Action—Select the options applicable for this rule. Authentication prompts the user for a username and password when attempting HTTP, HTTPS, FTP, or Telnet access. Authorization is an additional level, where after the user authenticates, the AAA server is checked to ensure that the user is authorized for that type of access. Accounting generates usage records in the AAA server and can be used for billing, security, or resource allocation purposes. You can generate accounting information for any TCP or UDP traffic.  
  
When you select Authentication, you can also select User-Identity (ASA 8.4(2+) only). This option indicates that the ASA should use the Active Directory servers configured in the identity-firewall domain mappings to authenticate users (see [Identifying Active Directory Servers and Agents, page 13-8](#)). If the user enters a domain name, the AD server associated with the domain is queried. Otherwise, the AD server associated with the default domain is queried. When you select User-Identity, and you do not select Authorization or Accounting, do not specify a AAA server group.
  - Permit or Deny—Whether you are subjecting the identified traffic to AAA control (permit) or you are exempting it from AAA control (deny). Any denied traffic is not prompted for authentication and is allowed to pass unauthenticated, although your access rules might drop the traffic.
  - Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
  - Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies, page 14-16](#), [Configuring TrustSec-Based Firewall Rules, page 14-17](#) and [Creating Security Group Objects, page 14-14](#) for more information about security groups.
  - Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules, page 13-21](#) and [Creating Identity User Group Objects, page 13-19](#).

- **Services**—You can specify any type of service for authentication and authorization rules; however, the user is prompted to authenticate only for HTTP, HTTPS, FTP, and Telnet connections. Thus, if you specify something other than these services, the user must first attempt one of these connections and successfully authenticate (and be authorized, if you include that action) before any other types of connections are allowed. For accounting rules, you can specify any TCP or UDP service (or simply TCP and UDP themselves), if you want to account for all types of traffic.
- **AAA Server Group**—The AAA server group policy object to be used for authentication, authorization, or accounting. If the rule applies more than one of these actions, the server group must support all selected actions. For example, only TACACS+ servers can provide services for authorization rules (although using RADIUS for authentication rules automatically includes RADIUS authorization), and only TACACS+ and RADIUS servers can provide accounting services. If you want to use different server groups for particular actions, define separate rules for each type of action that requires different groups.
- **Interfaces**—The interface or interface role for which you are configuring the rule.

Click **OK** when you are finished defining your rule.

**Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).

**Step 5** Select **Firewall > Settings > AAA Firewall** (in Device or Policy view) to open the [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#). Configure the AAA firewall settings:

- If you configured rules for HTTP authentication, you should select **Use Secure HTTP Authentication**. This ensures that the username and password entered for HTTP authentication are encrypted. If you do not select this option, the credentials are sent in clear text, which is insecure.

**Tip** If you select this option, ensure that you do not configure 0 for the user authentication timeout (**timeout uauth 0**, configured in the **Platform > Security > Timeouts** policy), or users might be repeatedly prompted for authentication, making the feature disruptive to your network.

- If you configured authentication for HTTP or HTTPS traffic on an interface, you should consider adding the interface to the Interactive Authentication table. When you enable an interface for interactive authentication, users get an improved authorization web page, one that is the same for both HTTP and HTTPS.

Click **Add Row** to add the interface to the table. Select whether the interface should listen for HTTP or HTTPS traffic (add the interface twice to listen for both protocols), and the port to listen on if not the default port for the protocol (80 and 443, respectively). Select **Redirect network users for authentication request** so that network access traffic gets the improved authentication prompt; if you do not select the option, only users trying to log into the device get the prompt.

**Note** You might want to continue to use basic HTTP authentication if: you do not want the security appliance to open listening ports; if you use NAT on a router and you do not want to create a translation rule for the web page served by the security appliance; basic HTTP authentication might work better with your network. For example non-browser applications, like when a URL is embedded in email, might be more compatible with basic authentication.

- For FWSM devices, you can also disable the authentication challenge for protocols you have otherwise configured to require authentication. You can also add interfaces to the Clear Connections table to ensure that active connections for users whose authentication has timed out are cleared and do not hang.
- If you want to exempt some devices from your AAA rules based on their media access control (MAC) address, click the **MAC Exempt List** tab to open the [AAA Firewall Page, MAC-Exempt List Tab, page 15-26](#). Enter a name for the exemption list, and then click the **Add Row** button and fill in the [Firewall AAA MAC Exempt Setting Dialog Box, page 15-27](#) to add the MAC address to the table with a permit rule. You might want to do this for secure, trusted devices.

The order of entries matters, so ensure that any specific entries that are covered by broader entries come before the broad entries in the table. The device processes the list in order and the first match is applied to the host. For more detailed information about how the entries on the MAC exempt list are processed, see [AAA Firewall Page, MAC-Exempt List Tab, page 15-26](#).

- Step 6** If you are configuring authentication rules using a RADIUS server, and you include per-user ACL configurations in the user profiles, enable per-user downloadable ACLs on the interface. (RADIUS authentication automatically includes authorization checking.) For information on configuring per-user ACLs, see the information on configuring RADIUS authorization in the *Cisco ASA 5500 Series Configuration Guide Using the CLI* at [http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/access\\_fwaaa.html](http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/access_fwaaa.html).
- a. Select **Firewall > Settings > Access Control** (in Device or Policy view) to open the [Access Control Settings Page, page 16-24](#).
  - b. Click the Add Row button beneath the interface table and fill in the [Firewall ACL Setting Dialog Box, page 16-26](#) with at least these options:
    - Enter the interface or interface role on which you are performing authorization.
    - Select **Per User Downloadable ACLs**.
  - c. Click **OK** to save your changes.
- 

## Configuring AAA Rules for IOS Devices

When you configure AAA rules for an IOS device, you are configuring authentication proxy (AuthProxy) admission control policies. These policies define who is allowed to make HTTP, HTTPS, FTP, and Telnet connections through (not to) the device. To fully configure authentication proxy, you must configure several policies, not just the AAA rules policy.

The following procedure covers all policies you would need to configure to supply full authentication, authorization, and accounting support for authorization proxy. You do not need to configure options for features you do not need.

### Related Topics

- [Understanding AAA Rules, page 15-1](#)
- [Understanding How Users Authenticate, page 15-2](#)
- [Creating a New Shared Policy, page 5-54](#)
- [Modifying Policy Assignments in Policy View, page 5-54](#)
- [Understanding Networks/Hosts Objects, page 6-80](#)

- [Understanding Interface Role Objects, page 6-73](#)
- [Understanding and Specifying Services and Service and Port List Objects, page 6-100](#)
- [Understanding AAA Server and Server Group Objects, page 6-27](#)
- [Understanding Interface Role Objects, page 6-73](#)

---

**Step 1** Do one of the following to open the [AAA Rules Page, page 15-10](#):

- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit AAA Rule Dialog Boxes, page 15-13](#).

---

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-10](#).

---

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit AAA Rule Dialog Boxes, page 15-13](#).

- **Authentication Action**—Select this option. Authentication rules are the only type of rule you can configure in the AAA rules policy for IOS devices.
- **Permit or Deny**—Whether you are subjecting the identified traffic to AAA control (permit) or you are exempting it from AAA control (deny). Any denied traffic is not prompted for authentication and is allowed to pass unauthenticated, although your access rules might drop the traffic.
- **Source and Destination addresses**—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- **Source and Destination Security Groups (ASA 9.0+ only)**—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies, page 14-16](#), [Configuring TrustSec-Based Firewall Rules, page 14-17](#) and [Creating Security Group Objects, page 14-14](#) for more information about security groups.
- **Source Users (ASA 8.4.2+ only)**—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules, page 13-21](#) and [Creating Identity User Group Objects, page 13-19](#).
- **Services**—You can specify any type of service for authentication and authorization rules; however, the user is prompted to authenticate only for HTTP, HTTPS, FTP, and Telnet connections. Thus, if you specify something other than these services, the user must first attempt one of these connections and successfully authenticate (and be authorized, if you include that action) before any other types of connections are allowed. For accounting rules, you can specify any TCP or UDP service (or simply TCP and UDP themselves), if you want to account for all types of traffic.
- **Interfaces**—The interface or interface role for which you are configuring the rule.

- Service triggering the authentication proxy—Select the checkboxes for the type of traffic you want to trigger user authentication: HTTP, FTP, or Telnet. You can select any combination. If you want to trigger the proxy for HTTPS support, select HTTP and perform the HTTPS configuration that is explained in a subsequent step in this procedure.

Click **OK** when you are finished defining your rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).
- Step 5** Select **Firewall > Settings > AuthProxy** (in Device or Policy view) to open the [AAA Page, page 15-28](#). Configure the authentication proxy settings:
- **Authorization server groups**—If you want all of your authentication rules to also perform user authorization, specify the list of AAA server group policy objects that identify the TACACS+ or RADIUS servers that control authorization. You can also specify LOCAL to use the user database defined on the device. If you do not specify a server group, authorization is not performed.

**Tip**

You must configure per-user ACLs in your AAA server to define the privileges you want to apply to each user. When configuring authorization, specify **auth-proxy** as the service (e.g. service = auth-proxy), with a privilege level of 15. For more information on configuring the AAA server, including information on configuring authentication proxy in general, see the “Configuring the Authentication Proxy” section in the *Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4T* at

[http://www.cisco.com/en/US/docs/ios/sec\\_user\\_services/configuration/guide/sec\\_cfg\\_authen\\_prxy\\_ps6441\\_TSD\\_Products\\_Configuration\\_Guide\\_Chapter.html](http://www.cisco.com/en/US/docs/ios/sec_user_services/configuration/guide/sec_cfg_authen_prxy_ps6441_TSD_Products_Configuration_Guide_Chapter.html).

- **Accounting server groups**—If you want to perform accounting for all of your authentication rules, specify the list of AAA server group policy objects that identify the TACACS+ or RADIUS servers that perform accounting. If you do not specify a server group, no accounting is performed. When performing accounting, also configure the following options as appropriate:
    - If you specify more than one server group, consider selecting **Use Broadcast for Accounting**. This option sends accounting records to the primary server in each server group.
    - The **Accounting Notice** option defines when the server is notified. The default is to notify the server at the start and stop of a connection, but you can select to only send stop notices (or none at all).
  - You can also customize authentication banners for each service, and on the Timeout tab, you can change the default idle and absolute session timeouts globally or for each interface.
- Step 6** Select **Platform > Device Admin > AAA** (in policy view, this is in the Router Platform folder) to open the [AAA Policy Page, page 63-6](#). Configure these options on the Authentication tab:
- Select **Enable Device Login Authentication**.
  - Enter the list of server groups that will control authentication in priority order. Typically, you will use at least some of the same LDAP, RADIUS, or TACACS+ server groups used in the AuthProxy policy. However, this policy also defines device login control, so you might want to include some other server groups. For more information, see [AAA Page—Authentication Tab, page 63-6](#).
- Step 7** If you are using the authentication proxy with HTTP connections, and you also want to use the proxy with HTTPS connections, select **Platform > Device Admin > Device Access > HTTP** (in policy view, this is in the Router Platform folder) to open the [HTTP Policy Page, page 63-31](#). Configure these options:
- Select **Enable HTTP** and **Enable SSL** if they are not already selected.

- On the AAA tab, ensure that the configuration for login access to the device is appropriate. If you are using AAA to control access through the device, you might want to use it for access to the device.

## AAA Rules Page

Use the AAA Rules page to configure AAA rules for device interfaces. AAA rules configure network access control (called authentication proxy on IOS devices), which forces the user to authenticate when attempting network connections that traverse the device. Authenticated traffic can also be required to undergo authorization (where after the user enters a valid user name and password, the AAA server is checked to verify that the user is authorized for network access). You can also configure accounting rules, even for unauthenticated traffic, to provide information you can use for billing, security, and resource allocation purposes.

### Note

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 AAA rules were “unified,” meaning one set of AAA rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4, page 1-10](#) for additional information.) In Policy view, IPv4 and unified versions of the AAA policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to all versions of the AAA rule table, except where noted.

If you assign an IPv4 AAA-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified AAA-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

AAA rule configuration is complex and differs significantly based on the operating system. Carefully read the following topics before configuring AAA rules:

- [Understanding AAA Rules, page 15-1](#)
- [Understanding How Users Authenticate, page 15-2](#)
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices, page 15-4](#)
- [Configuring AAA Rules for IOS Devices, page 15-7](#)

### Tip

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

### Navigation Path

To access the AAA Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > AAA Rules** from the Policy selector.
- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > AAA Rules**.

| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding the Automatic Conflict Detection User Interface, page 16-30</a> .                                                      |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                                                                                    |
| Permit                            | Whether the defined traffic will be subject to the rule (Permit) or exempted from the rule (Deny): <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                                |
| Sources                           | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                  |
| Destinations                      | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                |
| Service                           | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-100</a> .                                              |
| Interface                         | The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects, page 6-73</a> . |

Table 15-1 AAA Rules Page (continued)

| Element                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                                                   | <p>The type of AAA control defined by this rule:</p> <ul style="list-style-type: none"> <li>• <b>Authenticate</b>—Users making connections through the device must authenticate with their username and password. Protocols requiring authentication are defined by the Service field (for ASA/PIX/FWSM devices) or the AuthProxy methods (for IOS devices).</li> <li>• <b>Authorize</b>—Authenticated users are also checked with the AAA server to ensure that they are authorized to make the connection (ASA/PIX/FWSM only).</li> <li>• <b>Account</b>—Accounting records for the identified traffic are sent to the AAA server (ASA/PIX/FWSM only).</li> </ul> <p>You can right-click the Action cell in an existing AAA rule and choose Edit Action to change your selections. See <a href="#">Edit AAA Option Dialog Box, page 15-19</a> for more information.</p> |
| AAA Method (IOS)<br>(not presented for ASA 9.0+ devices) | The authentication method for this rule: Web Authorization Proxy (Auth-Proxy), HTTP Basic, or Windows NT LAN Manager (NTLM)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| AuthProxy                                                | <p>The protocols that require authentication using the authentication proxy method. This applies only to IOS devices.</p> <p>You can right-click the AuthProxy cell in an existing AAA rule and choose Edit AuthProxy to change your selections. See <a href="#">AuthProxy Dialog Box, page 15-19</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Server Group                                             | <p>The AAA server group that provides the authentication, authorization, or accounting support defined in the rule. This group is used for ASA/PIX/FWSM devices only. For information on configuring AAA servers for IOS devices for use with these rules, see <a href="#">Configuring AAA Rules for IOS Devices, page 15-7</a>.</p> <p>You can right-click the Server Group cell in an existing AAA rule and choose Edit Server Group to change your selections. See <a href="#">Edit Server Group Dialog Box, page 15-19</a> for more information.</p>                                                                                                                                                                                                                                                                                                                  |
| Category                                                 | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description                                              | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Last Ticket(s)                                           | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-72</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page elements below the rules table                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Query                                                    | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports, page 12-28</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 15-1 AAA Rules Page (continued)**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables, page 12-16</a> .                                                                                                                                           |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order, page 12-19</a> .                                                                                                                                      |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit AAA Rule Dialog Boxes, page 15-13</a> . If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules, page 12-9</a> . |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules, page 12-10</a> .                                                                                                                                                                          |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                  |

**Right-click Menu**

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command “Edit Server Group” is included when you right-click a Server Group cell. See [Editing Rules, page 12-10](#) for more information.
- The Combine Rules option is also included in the right-click menu. See [Combining Rules, page 12-22](#) for more information.

## Add and Edit AAA Rule Dialog Boxes

Use the Add and Edit AAA Rules dialog boxes to add and edit AAA rules. AAA rule configuration is more complex than just filling in this dialog box, and differs significantly based on the operating system. Carefully read the following topics before configuring AAA rules:

- [Understanding AAA Rules, page 15-1](#)
- [Understanding How Users Authenticate, page 15-2](#)
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices, page 15-4](#)
- [Configuring AAA Rules for IOS Devices, page 15-7](#)

**Navigation Path**

From the [AAA Rules Page, page 15-10](#), click the **Add Row** button or select a row and click the **Edit Row** button.

**Related Topics**

- [Adding and Removing Rules, page 12-9](#)
- [Editing Rules, page 12-10](#)

**Field Reference****Table 15-2 Add and Edit AAA Rules Dialog Boxes**

| Element              | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule          | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules, page 12-20</a> .                                                                   |
| Action (Permit/Deny) | Whether the defined traffic will be subject to the rule (Permit) or exempted from the rule (Deny).<br><br>For example, if you create an authentication deny rule for the 10.100.10.0/24 network to any destination using the HTTP service, users on this network are not prompted to authenticate with the device when making HTTP requests. |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects, page 6-80</a>, <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a> and <a href="#">Understanding Interface Role Objects, page 6-73</a> for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies, page 14-16</a>, <a href="#">Configuring TrustSec-Based Firewall Rules, page 14-17</a> and <a href="#">Creating Security Group Objects, page 14-14</a> for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>– Individual user names: NetBIOS_DOMAIN\username</li> <li>– User groups (note the double \):<br/>NetBIOS_DOMAIN\user_group</li> <li>– Identity user group object names.</li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>– <a href="#">Selecting Identity Users in Policies, page 13-21</a></li> <li>– <a href="#">Configuring Identity-Based Firewall Rules, page 13-21</a></li> <li>– <a href="#">Creating Identity User Group Objects, page 13-19</a></li> </ul> </li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

**Table 15-2 Add and Edit AAA Rules Dialog Boxes (continued)**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destinations | Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Services     | <p>The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).</p> <p>Enter more than one value by separating the items with commas.</p> <p>It is important that you select the service type carefully based on the device type:</p> <ul style="list-style-type: none"> <li>For IOS devices, only the protocols you select with the authorization proxy check boxes at the bottom of the dialog box are used for AAA control, so you can use IP as the protocol.</li> <li>For ASA, PIX, and FWSM devices, although you can force authentication for any type of traffic, the security appliance prompts only for HTTP/HTTPS, FTP, and Telnet traffic. If you specify a service other than one of these, users are prevented from making any connection through the appliance until they try one of these services and successfully authenticate.</li> </ul> <p>If the rule is only for accounting, you can specify any TCP or UDP protocols for which you want to create records.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a>, page 6-100.</p> <p><b>Note</b> Due to an issue in PIX 6.3 and FWSM devices, if you specify a service with a source port, no traffic is authenticated. Therefore, source ports are ignored when the CLI is generated from your rule for these device types.</p> |
| Interface    | <p>The interface or interface role object that identifies the interface from which to authenticate, authorize, or account users. Enter the name of the interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role object.</p> <p>For authentication rules on ASA and PIX devices, you can modify how this interface authenticates HTTP/HTTPS traffic by using the <b>Firewall &gt; Settings &gt; AAA Firewall</b> policy. Configuring the interface as an HTTP/HTTPS listening port can improve the authentication experience for users. For more information, see <a href="#">Understanding How Users Authenticate</a>, page 15-2 and <a href="#">AAA Firewall Settings Page, Advanced Setting Tab</a>, page 15-20.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description  | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 15-2 Add and Edit AAA Rules Dialog Boxes (continued)**

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                        | <p>The Authentication Action, Authorization Action, and Accounting Action check boxes define the types of rules that will be generated on the device. Each type generates a separate set of commands, but if you select more than one option, your other selections in this dialog box are limited to those supported by all selected actions.</p> <p>You can right-click the Action cell in an existing AAA rule and choose Edit Action to change your selections. See <a href="#">Edit AAA Option Dialog Box, page 15-19</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authentication Action<br>User-Identity | <ul style="list-style-type: none"> <li>• Authentication—Users must supply a user name and password to make a connection through the device. For ASA, PIX, and FWSM devices, what you enter in the Services field determines which protocols require authentication, although the device will prompt only for HTTP, HTTPS, FTP, and Telnet connections. For IOS devices, the protocols that require authentication are based on the authorization proxy check boxes you select at the bottom of the dialog box.               <ul style="list-style-type: none"> <li>– User-Identity (ASA 8.4(2+) only.)—For ASA devices, when you select Authentication Action, you also have the option to select User-Identity. This option indicates that the device should use the identity-firewall domain mappings defined in the Identity Options policy to authenticate users instead of the AAA Server Group setting in the AAA rule. If the user enters a domain name, the AD server associated with the domain is queried. Otherwise, the AD server associated with the default domain is queried. See <a href="#">Identifying Active Directory Servers and Agents, page 13-8</a>.</li> </ul> </li> </ul> |
| Authorization Action<br>(PIX/ASA/FWSM) | <p>Authorization—After successful authentication, the AAA server is also checked to determine if the user is authorized to make the requested connection. If you specify a RADIUS server for authentication rules, authorization happens without you having to configure authorization rules. If you are using a TACACS+ server, you must create separate authorization rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Accounting Action<br>(PIX/ASA/FWSM)    | <p>Accounting—Accounting records will be sent to the TACACS+ or RADIUS server for the TCP and UDP protocols specified in the Services field. If you also configure authentication, these records are per-user; otherwise, they are based on IP address. For IOS devices, accounting is configured in the <b>Firewall &gt; Settings &gt; ScanSafe Web Security</b> policy, not in AAA rules, and applies only to the protocols you select for authentication proxy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 15-2 Add and Edit AAA Rules Dialog Boxes (continued)**

| Element                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA Server Group (PIX, ASA, FWSM)                    | <p>The AAA server group policy object that defines the AAA server that should provide authentication, authorization, or accounting for the traffic defined in the rule. Enter the name of the policy object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>You must select a type of server that can perform all actions defined in the rule. For example, the local database (defined on the device) cannot provide authorization services. If you use a RADIUS server for authentication, it automatically provides authorization services, but you cannot define an authorization rule that uses a RADIUS server.</p> <p>You can use a mix of server groups for different actions for the same source/destination pair by creating separate rules for the desired combination of authentication, authorization, and accounting actions. For more information on AAA server group objects, see <a href="#">Understanding AAA Server and Server Group Objects, page 6-27</a>.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you select Authenticate Action and User-Identity, but not the Authorization or Accounting actions, any server you specify here is ignored. Do not select a server to avoid validation warnings.</li> <li>• AAA server groups for IOS devices are defined in other policies. For a complete explanation of the configuration, see <a href="#">Configuring AAA Rules for IOS Devices, page 15-7</a>.</li> <li>• You can right-click the Server Group cell in an existing AAA rule and choose Edit Server Group to change your selections. See <a href="#">Edit Server Group Dialog Box, page 15-19</a> for more information.</li> </ul> |
| Category                                             | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Method (IOS)<br>(not presented for ASA 9.0+ devices) | <p>Choose Auth-Proxy, HTTP-basic, or NTLM.</p> <p>If you choose Auth-Proxy, the following options are available:</p> <ul style="list-style-type: none"> <li>• HTTP</li> <li>• FTP</li> <li>• Telnet</li> </ul> <p>Specify the protocols for which you want to enforce authentication using the authentication proxy. If you select HTTP, you can also configure HTTPS authentication proxy by enabling SSL on the device. See <a href="#">AuthProxy Dialog Box, page 15-19</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Edit AAA Option Dialog Box

Use the Edit AAA Option dialog box to select whether the rule performs authentication (with or without user identity), authorization, or accounting. Authorization and accounting rules work only on ASA, PIX, and FWSM devices. For a complete explanation of these options, see the related explanations in the following topics:

- [Add and Edit AAA Rule Dialog Boxes, page 15-13](#)
- [Understanding AAA Rules, page 15-1](#)

### Navigation Path

Right-click the Action cell in a AAA rule (on the [AAA Rules Page, page 15-10](#)) and select **Edit AAA**.

## AuthProxy Dialog Box

Use the AuthProxy dialog box to edit the authorization proxy settings in a AAA rule. For IOS devices, select the protocols (HTTP, FTP, or Telnet) for which you want to enforce authentication using the authentication proxy. If you select HTTP, you can also configure HTTPS authentication proxy by enabling SSL on the device. For specific information, see [Configuring AAA Rules for IOS Devices, page 15-7](#).

### Navigation Path

Right-click the AuthProxy cell in a AAA rule (on the [AAA Rules Page, page 15-10](#)) and select **Edit AuthProxy**.

## Edit Server Group Dialog Box

Use the Edit Server Group dialog box to edit the AAA server group used in a AAA rule, which defines the AAA server that should provide authentication, authorization, or accounting for the traffic defined in the rule. Enter the name of the policy object or click **Select** to select it from a list or to create a new object. For more information on AAA server group objects, see [Understanding AAA Server and Server Group Objects, page 6-27](#).

You must select a type of server that can perform all actions defined in the rule. For example, the local database (defined on the device) cannot provide authorization services. If you use a RADIUS server for authentication, it automatically provides authorization services, but you cannot define an authorization rule that uses a RADIUS server. Unlike the [Add and Edit AAA Rule Dialog Boxes, page 15-13](#), this dialog box does not validate your selection.

### Note

This setting applies only to ASA, PIX, and FWSM devices. AAA server groups for IOS devices are defined in other policies. For a complete explanation of the configuration, see [Configuring AAA Rules for IOS Devices, page 15-7](#).

### Navigation Path

Right-click the Server Group cell in a AAA rule (on the [AAA Rules Page, page 15-10](#)) and select **Edit Server Group**.

# AAA Firewall Settings Policies

The AAA firewall settings policy configurations influence the behavior of your AAA rules.

This section contains the following topics:

- [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#)
- [AAA Firewall Page, MAC-Exempt List Tab, page 15-26](#)
- [AAA Page, page 15-28](#)

## AAA Firewall Settings Page, Advanced Setting Tab

Use the AAA Firewall settings policy to configure optional settings to refine how your AAA rules policy behaves. This topic describes the settings available on the Advanced Setting tab; for information on the MAC Exempt List tab, see [AAA Firewall Page, MAC-Exempt List Tab, page 15-26](#).

### Navigation Path

To access the AAA Firewall settings page, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, select **Firewall > Settings > AAA Firewall**; select the **Advanced Setting** tab if necessary.
- (Policy view) Select **Firewall > Settings > AAA Firewall** from the Policy Type selector. Create a new policy or select an existing one, then select the **Advanced Setting** tab if necessary.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Settings > AAA Firewall**, then select the **Advanced Setting** tab if necessary.

| Element                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use Secure HTTP Authentication                                | <p>Whether to require users making HTTP requests that traverse the security appliance to first authenticate with the security appliance using SSL (HTTPS). The user is prompted for username and password.</p> <p>Secure HTTP authentication offers a secure method for user authentication to the security appliance prior to allowing HTTP-based web requests to traverse the security appliance. This is also called HTTP cut-through proxy authentication.</p> <p>If you select this option, ensure that your access rules do not block HTTPS traffic (port 443), and that any PAT configuration also includes port 443. Also, be aware that a maximum of 16 concurrent authentications are allowed, and that if you configure 0 for the user authentication timeout (<b>timeout uauth 0</b>, configured in the <b>Platform &gt; Security &gt; Timeouts</b> policy) users might be repeatedly prompted for authentication, making the feature disruptive to your network.</p> <p><b>Tip</b> If you do not select this option, HTTP authentication sends the username and password in clear text.</p> |
| Enable Proxy Limit<br>Maximum Concurrent Proxy Limit per User | <p>Whether to allow proxy connections. If you enable proxies, you must set a limit on the number of proxy connections allowed for each user, from 1 to 128. The device default is 16, but you must specify a number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Virtual HTTP | <p>Whether to configure a virtual HTTP server. This feature redirects all HTTP connections that require AAA authentication to the virtual HTTP server on the ASA. The ASA prompts for the AAA server username and password. After the AAA server authenticates the user, the ASA redirects the HTTP connection back to the original server, but it does not include the AAA server username and password. Because the username and password are not included in the HTTP packet, the HTTP server prompts the user separately for the HTTP server username and password. For more information, see <a href="#">Understanding How Users Authenticate, page 15-2</a>.</p> <p>For inbound users (from lower security to higher security), you must also include the virtual HTTP address as a destination interface in the access rule applied to the source interface. Moreover, you must add a static NAT rule for the virtual HTTP IP address, even if NAT is not required. An identity NAT rule is typically used (where you translate the address to itself).</p> <p>For outbound users, there is an explicit permit for traffic, but if you apply an access rule to an inside interface, be sure to allow access to the virtual HTTP address. A static NAT rule is not required.</p> <p>To configure a virtual HTTP server:</p> <ol style="list-style-type: none"> <li>1. Select the Enable Virtual HTTP check box.</li> <li>2. Enter the IP address or select a Networks/Hosts object representing the virtual HTTP server. Make sure this address is an unused address that is routed to the ASA. For example, if you perform NAT for inside addresses accessing an outside server, and you want to provide outside access to the virtual HTTP server, you can use one of the global NAT addresses for the virtual HTTP server address.</li> <li>3. (Optional) If you are using text-based browsers, where redirection does not happen automatically, select the Warning check box. This enables an alert to notify users when the HTTP connection is being redirected.</li> </ol> |

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable FTP Authentication Challenge<br>Disable HTTP Authentication Challenge<br>Disable HTTPS Authentication Challenge<br>Disable Telnet Authentication Challenge<br>(All options FWSM 3.x+ only.) | Whether to disable authentication challenges for the indicated protocols. By default, the FWSM prompts the user for a username and password when a AAA rule enforces authentication for traffic in a new session and the protocol of the traffic is FTP, Telnet, HTTP, or HTTPS.<br><br>In some cases, you might want to disable the authentication challenge for one or more of these protocols. If you disable challenge authentication for a particular protocol, traffic using that protocol is allowed only if the traffic belongs to a session previously authenticated. This authentication can be accomplished by traffic using a protocol whose authentication challenge remains enabled. For example, if you disable challenge authentication for FTP, the FWSM denies a new session using FTP if the traffic is included in an authentication AAA rule. If the user establishes the session with a protocol whose authentication challenge is enabled (such as HTTP), FTP traffic is allowed. |
| Clear Connections When Uauth Timer Expires table<br>(FWSM 3.2+ only.)                                                                                                                               | Use this table to identify the interfaces and source addresses where you want to force any active connections to close immediately after the user authentication times out or when you clear the authentication session with the <b>clear uauth</b> command. (User authentication timeouts are defined in the <b>Platform &gt; Security &gt; Timeouts</b> policy.) For any interface/source address pairs not listed in this table, active connections are not terminated even though the user authentication session expired. <ul style="list-style-type: none"> <li>To add any interface and source address pair, click the <b>Add Row</b> button and fill in the <a href="#">Clear Connection Configuration Dialog Box</a>, page 15-25.</li> <li>To edit a setting, select it and click the <b>Edit Row</b> button.</li> <li>To delete a setting, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                        |

## Interactive Authentication Configuration Dialog Box

Use the Interactive Authentication Configuration dialog box to configure an interface to listen for HTTP or HTTPS traffic to authenticate network users. The authentication web page used by a listening port provides an improved user experience compared to the default authentication pages used for these protocols. The authentication pages are used for connections directly to the device and if you select the redirection option, also for through traffic if your AAA rules policy requires HTTP/HTTPS network access authentication. For more information, see [Understanding How Users Authenticate](#), page 15-2.

### Navigation Path

Go to the [AAA Firewall Settings Page, Advanced Setting Tab](#), page 15-20 and click the **Add Row** button beneath the Interactive Authentication table, or select an item in the table and click the **Edit Row** button.

**Field Reference****Table 15-4** *Interactive Authentication Configuration Dialog Box*

| Element                                           | Description                                                                                                                                                                                                                                                           |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol                                          | The protocol that you want to listen for, either HTTP or HTTPS. If you want to listen for both protocols on an interface, add the interface to the table twice.                                                                                                       |
| Interface                                         | The interface or interface role on which to enable listeners. Enter the name of the interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.                                                                   |
| Port                                              | The port number that the security appliance listens on for this protocol if other than the default, which is 80 (HTTP) and 443 (HTTPS).                                                                                                                               |
| Redirect network users for authentication request | Whether to redirect users who are making requests through the device to the authentication web page served by the security appliance. If you do not select this option, only traffic directed to the interface is prompted with the improved authentication web page. |

**Clear Connection Configuration Dialog Box**

Use the Clear Connection Configuration dialog box to identify the source addresses whose active connections to close immediately after the user authentication times out or when you clear the authentication session with the **clear uauth** command. You must specify the interfaces on which those sessions should be cleared. These settings are used only for FWSM 3.2+ devices.

User authentication timeouts are defined in the **Platform > Security > Timeouts** policy.

**Navigation Path**

Go to the [AAA Firewall Settings Page, Advanced Setting Tab, page 15-20](#) and click the **Add Row** button beneath the Clear Connections When Uauth Timer Expires table, or select an item in the table and click the **Edit Row** button.

**Field Reference****Table 15-5** *Clear Connection Configuration Dialog Box*

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                 | The interfaces or interface roles for which you are configuring settings. Enter the name or click <b>Select</b> to select the interface or interface role or to create a new role. Separate multiple entries with commas.                                                                                                                                                                               |
| Source IP Address/Netmask | The host or network addresses for which you want to clear connections immediately when the user authentication timer expires. The list can include host IP addresses, network addresses, address ranges, or network/host objects Separate multiple addresses with commas. For more information on entering addresses, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a> . |

## AAA Firewall Page, MAC-Exempt List Tab

Use the MAC Exempt List tab of the AAA Firewall settings policy to identify hosts that should be exempt from authentication and authorization for ASA, PIX, and FWSM 3.x+ devices. For example, if the security appliance authenticates TCP traffic originating on a particular network but you want to allow unauthenticated TCP connections from a specific server, create a rule permitting traffic from the MAC address of the server.

You can use masks to create rules for groups of MAC addresses. For example, if you want to exempt all Cisco IP phones whose MAC addresses start with 0003.e3, create a permit rule for 0003.e300.0000 with the mask ffff.ff00.0000. (An f in a mask exactly matches the corresponding number in the address, whereas a 0 matches anything.)

Deny rules are necessary only if you are permitting a group of MAC addresses but there are some addresses within the permitted group that you want to require to use authentication and authorization. Deny rules do not prohibit traffic; they simply require the host to go through normal authentication and authorization. For example, if you want to allow all hosts with MAC addresses that start with 00a0.c95d, but you want to force 00a0.c95d.0282 to use authentication and authorization, enter these rules in order:

1. Deny 00a0.c95d.0282 ffff.ffff.ffff
2. Permit 00a0.c95d.0000 ffff.ffff.0000

When you deploy the policy to the device, these entries are configured using the **mac-list** and **aaa mac-exempt** commands.

**Tip**

The MAC exempt list is processed on a first match basis. Thus, the order of entries matters. If you want to permit a group of MAC addresses, but deny a subset of them, the deny rule must come before the permit rule. However, Security Manager does not allow you to order MAC exempt rules: they are implemented in the order shown. If you sort the table, your policy changes. If your entries do not depend on each other, this does not matter. Otherwise, ensure that you enter rows in the proper order.

### Navigation Path

To access the MAC Exempt List tab, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Settings > AAA Firewall**. Select the **MAC-Exempt List** tab.
- (Policy view) Select **Firewall > Settings > AAA Firewall** from the Policy Type selector. Create a new policy or select an existing one, then select the **MAC-Exempt List** tab.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Settings > AAA Firewall**, then select the **MAC-Exempt List** tab.

For example, ffff.ffff.0000 matches all addresses that have the same first 8 digits.</li> </ul> |

## AAA Page

Use the AAA firewall settings policy to identify the servers and banners to use for the authentication proxy and to configure non-default timeout values. The authentication proxy for IOS devices is a service that forces users to log in and authenticate when trying to make HTTP, Telnet, or FTP connections through an IOS device. The settings you configure here work in conjunction with your AAA rules; only if a AAA rule requires user authentication for one of these services does your AuthProxy settings come into play.

Ensure that your configuration of this policy is consistent with your **Firewall > AAA Rules** policy. Additionally, you must use the **Platform > Device Admin > AAA** policy to define the AAA server groups to use for authenticating user access; this policy defines only the authorization and accounting server groups. If you also want to use authorization proxy for HTTPS access, you must enable SSL and configure AAA in the **Platform > Device Admin > Device Access > HTTP** policy in addition to enabling HTTP authorization proxy in your AAA rules policy.

### Tip

You must configure per-user ACLs in your AAA server to define the privileges you want to apply to each user. When configuring authorization, specify **AAA** as the service (e.g. service = AAA), with a privilege level of 15. For more information on configuring the AAA server, including information on configuring authentication proxy in general, see the “Configuring the Authentication Proxy” section in the *Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4T* at [http://www.cisco.com/en/US/docs/ios/sec\\_user\\_services/configuration/guide/sec\\_cfg\\_authen\\_prxy\\_ps\\_6441\\_TSD\\_Products\\_Configuration\\_Guide\\_Chapter.html](http://www.cisco.com/en/US/docs/ios/sec_user_services/configuration/guide/sec_cfg_authen_prxy_ps_6441_TSD_Products_Configuration_Guide_Chapter.html).

### Navigation Path

To access the AAA page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > AAA** from the Policy selector.
- (Policy view) Select **Firewall > Settings > AAA** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > AAA**.

| Element            | Description                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Virtual IP Address | You use the Virtual IP Address only in communications between the IOS HTTP authentication and clients. For the system to operate correctly, the virtual IP address must be set (it cannot be 0.0.0.0), and no other device on the network can have the same address. Configure with an unassigned and unused gateway IP address, such as 1.1.1.1. |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use HTTP banner from File URL | Whether you want to use your own web page to authenticate HTTP connections. Enter the URL for your HTTP banner.<br><br>If you configure both HTTP banner text and a URL, the URL banner take precedence; however, the banner text is also configured on the device.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Advanced Tab</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Global Inactivity Time        | The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is 60 minutes.<br><br>Ensure that this timeout value is greater than or equal to the idle timeout values configured in the <b>Firewall &gt; Settings &gt; Inspection</b> policy; otherwise, timed-out user sessions might continue to be monitored and eventually hang.                           |
| Global Absolute Time          | The length of time, in minutes, that an authentication proxy user session can remain active. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 0 to 35,791. The default is 0, which means that there is no global absolute timeout; user sessions are maintained as long as they are active.                                                                                                                                                                                                                                 |
| Interface Timeout Table       | This table contains the interfaces for which you want to configure timeout values that differ from the global timeout values. If you want to use the global values for all interfaces, you do not need to configure anything in this table. <ul style="list-style-type: none"> <li>To add an interface with customized timeout values, click the <b>Add Row</b> button and fill in the <a href="#">Firewall AAA IOS Timeout Value Setting, page 15-30</a>.</li> <li>To edit a setting, select it and click the <b>Edit Row</b> button.</li> <li>To delete a setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

## Firewall AAA IOS Timeout Value Setting

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Firewall AAA IOS Timeout Value Setting dialog box to configure idle and absolute timeout values for specific interfaces. These values override the global timeout values configured on the **Firewall > Settings > ScanSafe Web Security** policy Server Timeout tab.

### Navigation Path

From the Advanced tab of the [AAA Page, page 15-28](#), click the **Add Row** button beneath the table of interfaces, or select a row and click the **Edit Row** button.

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces                        | The interfaces or interface roles for which you are configuring timeout values. Enter the names of the interfaces or roles, or click <b>Select</b> to select them from a list or to create new interface roles. Separate multiple entries with commas.                                                                                                                                                                 |
| <b>Auth Proxy Tab</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Inactivity/Cache Time             | The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session on the interface. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is the global inactivity timeout value (whose default is 60 minutes). |
| Absolute Time                     | The length of time, in minutes, that an authentication proxy user session can remain active on the interface. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 1 to 35,791. The default is 0, which means that there is no absolute timeout; user sessions are maintained as long as they are active.            |
| Authentication Proxy Method (IOS) | The protocols to which these timeout values should apply. You can select any combination of HTTP, FTP, or Telnet.                                                                                                                                                                                                                                                                                                      |

Table 15-9 Firewall AAA IOS Timeout Value Setting Dialog Box (continued)

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HTTP/NTLM Tab</b>                  | The HTTP and the NTLM areas contain the same following fields and selections:<br><br>Set the <b>Inactivity/Cache Time</b> and the <b>Absolute Time</b> for HTTP/NTLM and then, if desired, select Enable Passive Authentication. Finally, select the <b>Identity Policy</b> that you want to apply.                                                                                                                                                                |
| <b>Method Order Tab</b>               | Select the checkbox of each method you want to employ and then use the up and down arrows to arrange the methods in the order you desire.                                                                                                                                                                                                                                                                                                                          |
| <b>AAA Settings Tab</b>               | Select the <b>AAA Settings</b> tab to specify the Authentication, Authorization, and Account settings as detailed below.                                                                                                                                                                                                                                                                                                                                           |
| <b>Authenticate Using</b>             | In the Authenticate Using section you can select the server group(s) to use for authentication. Choices are: <ul style="list-style-type: none"> <li>• <b>None</b>—No authentication</li> <li>• <b>Default</b>—Use the default authentication server group(s).</li> <li>• <b>Custom</b>—Enable the selection of user specified authentication server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul>                                |
| <b>Authorize Exec Operation Using</b> | In the Authorize Exec Operation Using section you can select the server group(s) to use for authorization of executive operations. Choices are: <ul style="list-style-type: none"> <li>• <b>None</b>—No authorization</li> <li>• <b>Default</b>—Use the default authorization server group(s)</li> <li>• <b>Custom</b>—Enable the selection of user specified authorization server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul> |
| <b>Perform Exec Operation Using</b>   | In the Authorize Exec Operation Using section you can select the server group(s) to use for performing executive operations. Choices are: <ul style="list-style-type: none"> <li>• <b>None</b>—No authorization</li> <li>• <b>Default</b>—Use the default server group(s)</li> <li>• <b>Custom</b>—Enable the selection of user specified server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul>                                   |
| <b>Accounting Notice</b>              | Use Accounting Notice to specify accounting operations. <ul style="list-style-type: none"> <li>• <b>None</b>—No accounting notices</li> <li>• <b>Start-stop</b>—Accounting notices at the beginning and end of operations</li> <li>• <b>Stop-only</b>—Accounting notices at the end of operations.</li> </ul>                                                                                                                                                      |
| <b>Accounting Server Groups</b>       | Specify what accounting server groups to use. Either enter or select the Accounting Server group.<br><br><b>Note</b> If you choose to select an accounting server group, you are also give the option to add an Accounting Server group.                                                                                                                                                                                                                           |
| <b>Use Broadcast for Accounting</b>   | Select this checkbox to broadcast accounting notices.                                                                                                                                                                                                                                                                                                                                                                                                              |

## Managing Firewall Access Rules

Access rules define the rules that traffic must meet to pass through an interface. When you define rules for incoming traffic, they are applied to the traffic before any other policies are applied (with the exception of less common AAA rules). In that sense, they are your first line of defense.

**Tip**

For some types of devices, you can configure IPv6 access rules in addition to IPv4 access rules. For information on supported device types, see [IPv6 Support in Security Manager, page 1-8](#).

## Understanding Access Rules

Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them.

When you deploy access rules to devices, they become one or more entries (ACEs) to access control lists (ACLs) that are attached to interfaces. Typically, these rules are the first security policy applied to packets; they are your first line of defense. You use access rules to filter out undesired traffic based on service (protocol and port numbers) and source and destination addresses, either permitting the traffic or denying (dropping) it. Each packet that arrives at an interface is examined to determine whether to forward or drop the packet based on criteria you specify. If you define access rules in the out direction, packets are also analyzed before they are allowed to leave an interface.

**Tip**

For ASA 8.3+ devices, you can augment interface-specific access rules with global access rules. For more information, see [Understanding Global Access Rules, page 16-3](#).

When you permit traffic in an access rule, subsequent policies might end up dropping it. For example, inspection rules, web filter rules, and zone-based firewall rules are applied after a packet makes it through the interface's access rules. These subsequent rules might then drop the traffic based on a deeper analysis of the traffic; for example, the packet header might not meet your inspection requirements, or the URL for a web request might be for an undesired web site.

Thus, you should carefully consider the other types of firewall rules you intend to create when you define access rules. Do not create a blanket denial in an access rule for traffic that you really want to inspect. On the other hand, if you know that you will never allow a service from or to a specific host or network, use an access rule to deny the traffic.

Keep in mind that access rules are ordered. That is, when the device compares a packet against the rules, it searches from top to bottom and applies the policy for the first rule that matches it, and ignores all subsequent rules (even if a later rule is a better match). Thus, you should place specific rules above more general rules to ensure those rules are not ignored. To help you identify cases where IPv4 rules will never be matched, and to identify redundant rules, you can use the automatic conflict detection and policy query tools. For more information, see [Using Automatic Conflict Detection, page 16-28](#) and [Generating Policy Query Reports, page 12-28](#).

The following are additional ways in which you can evaluate your access rules:

- Combine rules—You can use a tool to evaluate your IPv4 rules and combine them into a smaller number of rules that perform the same functions. This can leave you with a smaller, easier to manage list of rules. For more information, see [Combining Rules, page 12-22](#).
- Generate hit counts—You can use a tool to view the hit count statistics maintained by the device for IPv4 and IPv6 ACLs. This can tell you how often a rule has permitted or denied traffic. For more information, see [Viewing Hit Count Details, page 16-37](#).
- View events collected by CS-MARS—You can analyze real time or historical events related to an IPv4 rule using the Cisco Security Monitoring, Analysis and Response System application if you configured it to monitor the device and you configure the rule to generate syslog messages. For more information, see [Viewing CS-MARS Events for an Access Rule, page 72-44](#).

## Understanding Global Access Rules

Traditionally, access rules (ACLs), which control which traffic can flow through a device, are applied to device interfaces. However, with ASA devices running software release 8.3+, you have the option to create global access rules for IPv4 and IPv6.

Global access rules are defined as a special ACL that is processed for every interface on the device for traffic entering the interface. Thus, although the ACL is configured once on the device, it acts like a secondary interface-specific ACL defined for the In direction. (Global rules are always for the In direction, never the Out direction.)

When traffic enters an interface on an ASA 8.3+ device, when applying ACLs, the device first applies any interface-specific access rules to the traffic. It then applies global rules. (Overall processing is explained in [Understanding the Processing Order of Firewall Rules, page 12-2](#).)

Global rules are best used for rules that you want to apply to all traffic that enters a device regardless of which interface it enters. For example, there might be a specific host or subnet that you always want to deny or permit. You can create these as global rules, so they are configured once on the device instead of configured again for each interface (although functionally the same as an interface-specific rule configured for the All-Interfaces role, All-Interfaces rules are repeated for each interface rather than being configured once on the device).

### Tip

If you want to configure the same set of global rules for more than one device, create a shared policy and inherit it in the IPv4 or IPv6 access rules policy for each device. Ensure that all global rules are in the Default section of the shared policy. If you put any global rules in the Mandatory section, you will not be able to inherit it on devices that have local interface-specific access rules defined. For more information on shared and inherited policies, see [Local Policies vs. Shared Policies, page 5-3](#) and [Understanding Rule Inheritance, page 5-4](#).

When you configure access rules for an ASA 8.3+ device in Security Manager, interface-specific and global rules are configured in the same policy. However, because the device always processes interface-specific rules first, Security Manager prevents you from intermixing these different types of rules. Therefore, if you configure both interface-specific and global rules on a device, keep the following in mind:

- Global rules always come last in the access rules policy. All interface-specific rules come before global rules.
- You cannot move rules in a way that violates the required order. For example, you cannot move an interface-specific rule below a global rule, or a global rule above an interface-specific rule.
- You cannot create rules in a location that violates the required order. For example, if you select an interface-specific rule, and another interface-specific rule follows it in the table, you cannot create a global rule. If you try to create the wrong kind of rule, when you save the rule, Security Manager

will ask you if the rule can be created at the nearest valid location. You must accept the suggestion or the rule will not be added to the table. You can always move the rule after creating it if the suggested location is not ideal (but without violating the rules on order).

- You cannot inherit a policy if the rules in the inherited policy will violate the required order. For example, if you create global rules in the device policy, and try to inherit a shared policy that contains interface-specific rules in the Default section, Security Manager will prevent you from inheriting the policy.
- After assigning or inheriting a shared policy, you cannot edit the policy in a way that will violate rule order on any device that uses the policy.
- If you assign or inherit a policy that contains global rules on a device that does not support them, all global rules are ignored and not configured on the device. For example, if you permit all traffic from host 10.100.10.10 in a global rule in a shared policy, and assign that policy to an IOS device, the rule permitting 10.100.10.10 access is not configured on the IOS device, and traffic from that host is handled either by another interface-specific policy, or the default deny all policy. As a good practice, you should not assign shared policies that contain global rules to devices that do not support them, to ensure that you do not mistakenly believe the policy defined in a global rule is being configured on the unsupported device.

There are also some changes in how certain tools work with global rules:

- Find/Replace—You can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name “Global,” you are actually creating an interface-specific access rule that uses a policy object named Global.
- Rule Combiner—Interface-specific and global rules are never combined.

## Understanding Device Specific Access Rule Behavior

If you do not create an access rule policy, the following is the default behavior based on the type of device, and what happens when you create an access rule:

- IOS devices—Permit all traffic through an interface.

When you create an access rule permitting source A to destination B without configuring TCP/UDP inspection on the inspection rule table, or configuring the **established** advanced option on the rule, the device permits any packet from A to B. However, for any returning packet from B to A, the packet is not allowed, unless there is a corresponding access rule permitting that packet. If you configure TCP/UDP inspection on the traffic the inspection rule table, a rule permitting B to A is not needed in the access rule, as any returning packet from B to A automatically passes the device.

- ASA and PIX devices—Permit traffic from a higher-security interface to a lower-security interface. Otherwise, all traffic is denied.

If an access rule allows TCP/UDP traffic in one direction, the appliance automatically allows return traffic (you do not need to configure a corresponding rule for the return traffic), except for ICMP traffic, which does require a return rule (where you permit the reverse source and destination), or you must create an inspection rule for ICMP.

- FWSM devices—Deny all traffic entering an interface, permit all traffic leaving an interface.

You must configure access rules to allow any traffic to enter the device.

If you create any rules for an interface for any type of device, the device adds an implicit **deny any** rule at the end of the policy. It is a good practice for you to add this rule yourself so that you remember it is there. Adding the rule also allows you to get hit count information for the rule. For more information, see [Viewing Hit Count Details, page 16-37](#).

Tip

---

When you create the access rule policy, ensure that you include a rule that will permit access to the device from the Security Manager server, or you will not be able to manage the device using the product.

## Understanding Access Rule Address Requirements and How Rules Are Deployed

One of the complexities of creating access control lists using the operating system commands on the command line interface (CLI) is the fact that different operating systems have different IP address formats for source and destination addresses.

For example, Cisco IOS Software requires that you enter addresses using wildcard masks instead of subnet masks. To create a rule for the 10.100.10.0/24 network (subnet mask 255.255.255.0), you are required to enter the address as 10.100.10.0 0.0.0.255. The 0 and 1 have the reverse meaning in a wildcard mask that they have in a subnet mask. In ASA, PIX, and FWSM software, however, you use subnet masks, so you enter 10.100.10.0 255.255.255.0.

Security Manager simplifies addressing requirements for access rules: you always use the subnet mask. You are not even allowed to enter a wildcard mask. When you deploy the access rules to a device, Security Manager considers the operating system of the device and converts subnet masks to wildcard masks automatically when needed.

This makes it possible for you to create shared rules based on logical policies and to apply those rules to all of your devices. For example, there might be a set of access rules that you want all devices to use, in which case you can create the shared policy and assign it as the inherited policy for all devices. You do not have to worry about defining rules using the “right” syntax for the device type. You can use the same network/host objects that you use in other types of policies to identify targeted hosts and networks.

The specific CLI commands generated in deployed configurations are also based on the type of device. For IOS devices, the **ip access-list** command is used. For ASA, PIX, FWSM devices, the **access-list** or **ipv6 access-list** command is used and the **access-group** command binds it to the interface. With ASA, PIX, FWSM, and IOS 12.4(20)T+ devices, if you use network/host objects to identify the source or destination addresses for a rule, the **object-group** command is used to create object groups for those network/host objects. Object groups are also created for service objects.

**Tips**

- Because you can use network/host objects to identify a source or destination, and you can configure deployment optimization for rules, there is not always a one-to-one relationship between an access rule and ACEs in the CLI definition of an ACL.
- All access lists created from firewall rules are extended access lists (rather than standard). Security Manager applies a system-generated name to the ACL unless you specify a name for the ACL on the [Access Control Settings Page, page 16-24](#). The name applies to the ACL that includes all of the rules related to the interface and direction for which the name is defined.
- There are several deployment options that control how object groups are deployed. This topic describes the default behavior. On the [Deployment Page, page 11-13](#) (select **Tools > Security Manager Administration > Deployment**), you can deselect the option to create object groups from network/host objects. You can also optimize object groups during deployment (see [Optimizing Network Object Groups When Deploying Firewall Rules, page 12-35](#)), create new object groups from rules with multiple services or source and destination addresses, or remove unused object groups.
- The deployment options also include settings that control the names of ACLs generated from access rules and how many ACLs are created. By default, Security Manager creates a unique ACL for each interface, even if this means that several duplicate ACLs are created.

If you select **Enable ACL Sharing for Firewall Rules**, Security Manager can create a single ACL and apply it to multiple interfaces, thus avoiding the creation of unnecessary duplicate ACLs.

However, ACL sharing occurs only if it can be done while preserving your ACL naming requirements:

- If you specify an ACL name for an interface and direction, that name is always used, even if it means a duplicate ACL must be created. For more information, see [Configuring Settings for Access Control, page 16-23](#).
- If you select **Reuse existing names** for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device.

**Tip:** To maximize ACL sharing, ensure that you select **Reset to CS-Manager Generated Names** for the Firewall Access-List Names property, select **Speed** for the Optimize the Deployment of Access Rules For property, and that you do not configure ACL names in the access control settings policy.

For more detailed information about the **Enable ACL Sharing for Firewall Rules** property, see [Deployment Page, page 11-13](#).

- IPv4 and IPv6 ACLs cannot have the same name.

# Configuring Access Rules

Access rules policies define the rules for allowing traffic to pass through an interface. If you do not configure an access rules policy, the device behavior differs based on device type as explained in [Understanding Device Specific Access Rule Behavior, page 16-4](#).

**Note**

Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were “unified,” meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4, page 1-10](#) for additional information.) However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the access-rule policy types are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to all versions of the access rule table, except where noted.

If you assign an IPv4 access-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified access-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

Before you configure access rules, consider the other types of firewall rules you will configure. Access rules are processed before all other types of rules except AAA rules. See the following topics for more information about things you should consider:

- [Understanding Access Rules, page 16-1](#)
- [Understanding Global Access Rules, page 16-3](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)

**Before You Begin**

You might have a set of access rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device’s access rules policy. For more information, see [Creating a New Shared Policy, page 5-54](#) and [Inheriting or Uninheriting Rules, page 5-47](#).

**Related Topics**

- [Using Sections to Organize Rules Tables, page 12-20](#)
- [Copying Policies Between Devices, page 5-33](#)
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-37](#)
- [Understanding Networks/Hosts Objects, page 6-80](#)
- [Understanding Interface Role Objects, page 6-73](#)
- [Understanding and Specifying Services and Service and Port List Objects, page 6-100](#)

**Step 1**

Do one of the following to open the [Access Rules Page, page 16-10](#):

- (Device view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.

- (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit Access Rule Dialog Boxes, page 16-14](#).

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-10](#). Special rules apply if you mix interface-specific and global rules in a policy; for more information, see [Understanding Global Access Rules, page 16-3](#).

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide while configuring your rule. For specific information on configuring the fields, see [Add and Edit Access Rule Dialog Boxes, page 16-14](#).

- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies, page 14-16](#), [Configuring TrustSec-Based Firewall Rules, page 14-17](#) and [Creating Security Group Objects, page 14-14](#) for more information about security groups.
- Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules, page 13-21](#) and [Creating Identity User Group Objects, page 13-19](#).
- Services—Use the IP service to apply to any traffic (for example, if you want to deny all traffic from a specific source). Otherwise, select the more specific service, which is a protocol and port combination, that you are targeting.
- Interfaces or Global—The interface or interface role for which you are configuring the rule, or Global to create global access rules on ASA 8.3+ devices (see [Understanding Global Access Rules, page 16-3](#)).
- Advanced settings—Click **Advanced** to open the Advanced dialog box for configuring additional settings. You can configure the following options; for detailed information, see [Advanced and Edit Options Dialog Boxes, page 16-17](#).
  - Logging options. If you are using Security Manager or CS-MARS to monitor the device, ensure that you enable logging.
  - The direction of traffic to which this rule should apply (in or out). The default is in. You cannot change this setting for global rules.
  - The time range for the rule, which allows you to configure rules that work only for specific periods of time, such as during working hours. For more information, see [Configuring Time Range Objects, page 6-71](#).
  - IOS device options for fragmentation and allowing the return of traffic for established outbound sessions.

- Rule expiration dates and notification settings. For more information, see [Configuring Expiration Dates for Access Rules, page 16-22](#).

**Step 4** Click **OK** when you are finished defining your rule.

**Note** You can enable conflict detection (see [Enable Conflict Detection](#)) to see if the new rule conflicts or overlaps with other rules. For more information, see [Using Automatic Conflict Detection, page 16-28](#).

**Note** While adding or editing a rule, any two rules might become identical (example shown as 1 and 2 in [Figure 16-1](#)) except for differences in time range and/or logging values (defined in [Advanced and Edit Options Dialog Boxes](#))—

- Cisco Security Manager deploys only the rule that is at the bottom (2 in [Figure 16-1](#)).
- Only rule (2) is used to identify configuration changes in preview configuration (see [Previewing Configurations, page 8-44](#)).
- If rule (2) has been deployed on the device, the preview configuration will not detect any changes.

**Figure 16-1 Identical Rules**

| No. | Permit | Sources       | Destinations | Service | Interface | Dir. | Options                           | Category | Description | Expiration Date |
|-----|--------|---------------|--------------|---------|-----------|------|-----------------------------------|----------|-------------|-----------------|
| 1   | ✓      | ExamplePC1    | ExamplePC2   | IP      | inside    | in   | Critical/300<br>TimeRange_Example | None     |             |                 |
| 2   | ✓      | All-Addresses | Example_Net1 | IP      | inside    | in   |                                   | None     |             |                 |
| 3   | ✓      | All-Addresses | Example_Net2 | IP      | inside    | in   |                                   | None     |             |                 |
| 4   | ✓      | ExamplePC1    | ExamplePC2   | IP      | inside    | in   |                                   | None     |             |                 |
| 5   | ✓      | All-Addresses | Example_Net3 | IP      | inside    | in   |                                   | None     |             |                 |

**Step 5** If you are required to find the bottom rule (example, (2) in [Figure 16-1](#)), that prevents Cisco Security Manager from deployment of a top rule (1 in [Figure 16-1](#)), do the following:

- [Enable Conflict Detection](#) for the device.
- [Generate Report](#) for the conflicts found.
- In the report, under the Rule No column, find the bottom rule (2), determine the rule number it conflicts with [rule (1)] and delete rule (1), if required.

**Step 6** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#). There are special restrictions for moving rules when you mix interface-specific and global rules; see [Understanding Global Access Rules, page 16-3](#).

**Step 7** If you already have a large number of rules, consider analyzing and combining them before deploying the new rules. You can use the conflict detection tool to analyze your rules (see [Using Automatic Conflict Detection, page 16-28](#)). If analysis shows that you have a lot of redundant rules, right-click anywhere in

the rules table and choose **Combine Rules** to combine them. You can either allow Security Manager to evaluate all rules for combination, or just the rules you select before starting the rule combination tool. For more information, see [Combining Rules, page 12-22](#).

## Access Rules Page

Use the Access Rules page to configure access control rules for device interfaces. Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them. Access rules are processed before other types of firewall rules.

### Note

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access rules were “unified,” meaning one set of access rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4, page 1-10](#) for additional information.) In Policy view, IPv4 and unified versions of the access policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to apply to all versions of the access rule table, except where noted.

Read the following topics before you configure access rules:

- [Understanding Access Rules, page 16-1](#)
- [Understanding Global Access Rules, page 16-3](#)
- [Understanding Device Specific Access Rule Behavior, page 16-4](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)
- [Configuring Access Rules, page 16-7](#)

### Tip

Disabled rules are grayed out. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

### Navigation Path

To open the Access Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.
- (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Access Rules** (or **Edit Firewall Policies > IPv6 Access Rules**).

### Field Reference

#### Note

For details on the fields and user interface elements available as part of the automatic conflict detection feature, see [Understanding the Automatic Conflict Detection User Interface](#), page 16-30.

**Table 16-1** Access Rules Page

| Element                           | Description                                                                                                                                                                                                                                                                                    |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand all rows/Collapse all rows | Use these buttons to expand or collapse all sections in the rules table.<br><b>Note</b> The buttons are located in the upper-right corner of the Filter area above the access rules table.                                                                                                     |
| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding the Automatic Conflict Detection User Interface</a> , page 16-30.         |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                                       |
| Permit                            | Whether a rule permits or denies traffic based on the conditions set: <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                |
| Sources                           | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                     |
| Destinations                      | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                   |
| Service                           | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , page 6-100. |

**Table 16-1** Access Rules Page (continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hit Count       | <p>Number of times this rule has been “hit”; that is, number of times it has permitted or denied traffic; it is actually the sum of the hit counts for all access control entries (ACEs) created by the rule. This information is useful in debugging the deployed policies.</p> <p>Use the Refresh Hit Count button at the bottom of this page to update the hit information; opens the <a href="#">Hit Count Selection Summary Dialog Box</a>, page 16-20.</p> <p><b>Note</b> The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.</p> <p>You can right-click this cell and choose Show Hit Count Details to open the Hit Count Details pane at the bottom of the Configuration Manager window. See <a href="#">Viewing Hit Count Details</a>, page 16-37 for more information.</p> |
| Last Hit Time   | Timestamp for the most-recent hit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interface       | <p>The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding Interface Role Objects</a>, page 6-73.</p> <p>For ASA 8.3+ devices, global rules are indicated with the name <b>Global</b> and a special icon to distinguish them from rules that use interface or interface role names (for an explanation of the icons, see <a href="#">Specifying Interfaces During Policy Definition</a>, page 6-76).</p>                                                                                                                                                                                        |
| Dir.            | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Options         | Any additional options configured for the rule. These include logging, time range, and some additional IOS rule options. See <a href="#">Advanced and Edit Options Dialog Boxes</a> , page 16-17.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Category        | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-13.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description     | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expiration Date | The date on which the rule expires. Expired rules show <b>Expired</b> in bold text. Expired rules are not automatically deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Last Ticket(s)  | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , page 11-72).                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Page elements below the rules table

**Table 16-1 Access Rules Page (continued)**

| Element                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable conflict detection<br>Generate Report<br>(neither option presented on the IPv6 Access Control page) | <p>Enable or disable automatic conflict detection. This feature is enabled by default and the setting is managed per user. Disabling conflict detection for one access rules table will also disable the feature for other access rules tables.</p> <p>You can disable conflict detection while creating your rule table or making large modifications and then re-enable it when you are ready to verify your changes. See <a href="#">Using Automatic Conflict Detection</a>, page 16-28.</p> <p><b>Note</b> For details on the fields and user interface elements available as part of the automatic conflict detection feature, see <a href="#">Understanding the Automatic Conflict Detection User Interface</a>, page 16-30.</p> <p>If conflict detection is enabled, you can click the <b>Generate Report</b> button to create an HTML report of any rule conflicts detected. This report can be printed or exported to another application.</p> |
| Refresh Hit Count<br>(not presented on the IPv6 Access Control page)                                       | <p>Click this button to update the hit information displayed in the table; opens the <a href="#">Hit Count Selection Summary Dialog Box</a>, page 16-20.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Query<br>(not presented on the IPv6 Access Control page)                                                   | <p>Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports</a>, page 12-28</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Find and Replace button<br>(binoculars icon)                                                               | <p>Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a>, page 12-16.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Up Row and Down Row buttons (arrow icons)                                                                  | <p>Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a>, page 12-19.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Add Row button                                                                                             | <p>Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit Access Rule Dialog Boxes</a>, page 16-14. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a>, page 12-9.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Edit Row button                                                                                            | <p>Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a>, page 12-10.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Delete Row button                                                                                          | <p>Click this button to delete the selected rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Right-click Menu**

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command “Show Hit Count Details” is included when you right-click a Hit Count cell. See [Editing Rules](#), page 12-10 for more information.

- You can also navigate from a rule to events associated with that rule in either Event Viewer or CS MARS. For more information, see [Viewing Events for an Access Rule, page 69-56](#) and [Viewing CS-MARS Events for an Access Rule, page 72-44](#).
- The Import Rules and Combine Rules options are also included in the right-click menu. See [Importing Rules, page 16-41](#) and [Combining Rules, page 12-22](#) for more information about these options.

## Add and Edit Access Rule Dialog Boxes

Use the Add and Edit Access Rule dialog boxes to add and edit security-device access rules.

### Note

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to apply to all versions of the page, except where noted.

Read the following topics before you configure access rules:

- [Understanding Access Rules, page 16-1](#)
- [Understanding Global Access Rules, page 16-3](#)
- [Understanding Device Specific Access Rule Behavior, page 16-4](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)
- [Configuring Access Rules, page 16-7](#)

### Navigation Path

On the [Access Rules Page, page 16-10](#), click the **Add Row** button or select a row and click the **Edit Row** button.

### Note

Prior to Cisco Security Manager 4.13, the **Add Access Rule** dialog was populated with default values. Starting from 4.13, the user can customize the appearance of default values by updating the **cs.m.properties** file. For more information, see [Customizing defaults in the Add Access Rule dialog, page 16-49](#)

| <b>Element</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                               |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule    | Check this box to enable this rule, which means the rule becomes active when you deploy the configuration to the device. Deselect to disable the rule while keeping the rule definition. Disabled rules are shown overlaid with hash marks in the rule table. See <a href="#">Enabling and Disabling Rules, page 12-20</a> for more information. |
| Action         | Whether the rule permits or denies traffic based on the conditions you define.                                                                                                                                                                                                                                                                   |

Table 16-2 Add and Edit Access Rule Dialog Boxes (continued)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects, page 6-80</a>, <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a> and <a href="#">Understanding Interface Role Objects, page 6-73</a> for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies, page 14-16</a>, <a href="#">Configuring TrustSec-Based Firewall Rules, page 14-17</a> and <a href="#">Creating Security Group Objects, page 14-14</a> for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>– Individual user names: NetBIOS_DOMAIN\username</li> <li>– User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>– Identity user group object names.</li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>– <a href="#">Selecting Identity Users in Policies, page 13-21</a></li> <li>– <a href="#">Configuring Identity-Based Firewall Rules, page 13-21</a></li> <li>– <a href="#">Creating Identity User Group Objects, page 13-19</a></li> </ul> </li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

**Table 16-2 Add and Edit Access Rule Dialog Boxes (continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destinations                    | Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Services                        | <p>The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).</p> <p>Enter more than one value by separating the items with commas.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a>, page 6-100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Interfaces<br>Global (ASA 8.3+) | <p>Specify whether you are creating an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see <a href="#">Understanding Global Access Rules</a>, page 16-3).</p> <p>If you select <b>Interfaces</b>, enter or Select the name of the interface or the interface role to which the rule is assigned, or click <b>Select</b> to select the interface or role from a list. An interface must already be defined to appear on the list.</p> <p>For bridge groups in routed mode, you can create access rules for both the Bridge Virtual Interface (BVI) and each bridge group member interface.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects</a>, page 6-73. Global rules are created as a special global ACL that is not attached to specific interfaces, but are processed for all interfaces in the In direction after interface-specific rules.</p> |
| Description                     | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Category                        | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-13.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Advanced button                 | Click this button to configure other settings for the rule, including logging configuration, traffic direction, time ranges, and rule expiration dates. For more information, see <a href="#">Advanced and Edit Options Dialog Boxes</a> , page 16-17.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Advanced and Edit Options Dialog Boxes

Use the Advanced dialog box to configure additional settings for an access rule. These settings are displayed in three different cells of the access-rule table: direction, options, and rule expiration. You can then edit those settings directly by right-clicking the appropriate cell.

**Note**

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to all versions of the page, except where noted.

**Navigation Path**

To access the Advanced dialog box:

- In the [Add and Edit Access Rule Dialog Boxes, page 16-14](#), click the **Advanced** button.

To access one of the Edit options dialog boxes:

- Right-click the Options or Expiration Date cell in an access rule (on the [Access Rules Page, page 16-10](#)) and choose the related Edit command. To change the rule direction, right-click the Dir. cell and choose the opposite direction (in or out).

If you select multiple rows, your changes replace those options for all selected rules.

The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock.</p> <p>Enter the name or Select the object. If the object that you want is not listed, click the Create button to create it.</p> <p><b>Note</b> Time range is not supported on FWSM 2.x or PIX 6.3 devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options (IOS)<br>(IPv4 only; not presented on the IPv6 Access Control page) | <p>Additional options for IOS devices:</p> <ul style="list-style-type: none"> <li>• none—Do not apply.</li> <li>• Fragment—Allow fragmentation, which provides additional management of packet fragmentation and improves compatibility with NFS.</li> </ul> <p>By default, a maximum of 24 fragments is accepted to reconstruct a full IP packet. However, based on your network security policy, you might want to consider configuring the device to prevent fragmented packets from traversing the firewall.</p> <ul style="list-style-type: none"> <li>• Established—Allow outbound TCP connections return access through the device. This option works with two connections: an original connection outbound from a network protected by the device, and a return connection inbound between the same two devices on an external host.</li> </ul>                                                                                                                                            |
| Rule Expiration                                                             | <p>Lets you configure an expiration date for the rule. Click the calendar icon to select a date. For more information, see <a href="#">Configuring Expiration Dates for Access Rules, page 16-22</a>.</p> <p>If you configure an expiration date, you can also configure the number of days before the rule expires to send out a notification of the pending expiration, and e-mail addresses to which to send the notifications. These fields are initially filled with the information configured on the Rule Expiration administrative settings page (select <b>Tools &gt; Security Manager Administration &gt; Rule Expiration</b>).</p> <p>You can change these options for an existing rule in the table on the <a href="#">Access Rules Page, page 16-10</a> by right-clicking the Expiration Date cell and choosing Edit Rule Expiration.</p> <p><b>Note</b> Expired rules are not automatically deleted. You must delete them yourself and redeploy the configuration to the device.</p> |

## Hit Count Selection Summary Dialog Box

Use the Hit Count Selection Summary dialog box to select the rules for which you want to refresh hit count information. Your options are limited by the rules you selected before clicking the Refresh Hit Count button. When you click OK in this dialog box, updated hit count information is obtained from the device, which can take some time, so you are given the option to abort the operation.

**Note**

The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.

**Tip**

You can view detailed hit count information for a rule by right-clicking the Hit Count cell for that rule on the [Access Rules Page, page 16-10](#). Detailed hit count information is displayed in the Hit Count Details window, as described in [Viewing Hit Count Details, page 16-37](#).

**Navigation Path**

(Device view only) On the [Access Rules Page, page 16-10](#), select one access rule in the table for which you want detailed hit count information, then right-click the Hit Count column and choose Show Hit Count Details.

| Fetch Data From | <p>Select one of the following options and then click <b>Refresh Hit Count</b>:</p> <ul style="list-style-type: none"> <li>• <b>Device</b>—Security Manager fetches the Hit Count information from the device and displays the same on the Access Rules policy page. Beginning from version 4.9, Security Manager stores the Hit Count information in its database for ASA and ASASM devices.</li> <li>• <b>History</b>—Security Manager fetches the latest Hit Count information for the particular ACEs from its database (the Hit Count history) and displays the same on the Access Rules policy page.</li> </ul> <p><b>NOTE:</b></p> <p>If there is an open activity the Hit Count data will not be persisted in the Security Manager database. This feature is supported in IPv4 Access Rules starting from ASASM/ASA version 8.3 and Unified Access Rules starting from ASASM/ASA version 9.0.</p> <p>If the Fetch Data From Device is based on Rules Selected option, the Hit Count persistence support will not be enabled. The support of Hit Count persistence will be enabled only if you choose the All Rules option within Fetch Data from Device.</p> <p>While fetching data From history, if the value of Hit Count is zero, Security Manager checks whether the rule was hit earlier based on the Hit Count History of the rule and displays its corresponding values. If Security Manager is not able to find the values of previous Hit from History, it displays the value of Hit Count as zero.</p> |

## Configuring Expiration Dates for Access Rules

A frequent use of access rules is to provide temporary access to a network. For example, you might configure an access rule to allow a partner access for the duration of a specific project. Ideally, you want to remove the access rule at the completion of the project. However, as access rule lists grow, it is hard to manage them and to remember which rules were meant to be temporary.

To help you deal with this problem, you can configure expiration dates for access rules. By configuring an expiration date, you can project when you believe the rule will no longer be needed.

Expiration dates are not hard and fast dates; Security Manager does not delete rules that reach their expiration date. Instead, when an expiration date is reached, Security Manager displays “Expired” in bold letters in the Expiration Date column for the rule. You can filter the access rules page based on the expiration date field, for example, filtering for “expiration date has passed” to see all expired rules.

If the rule is no longer needed, you can delete it (right-click and select **Delete Row**), or disable it (right-click and select **Disable**), and then redeploy the configuration to the device. You might want to initially disable the rule, which leaves the rule in the table (overlain with hash marks), in case you discover the rule really was still needed after all, saving you the time of recreating the rule. You then just need to re-enable the rule (right-click and select **Enable**) and redeploy the configuration.

When you configure an expiration date, you can also configure notification settings, specifying an e-mail address that should be notified when an expiration date is approaching. You can specify how many days before the expiration date to send the notification e-mail message to allow you time to evaluate the rule.

The notification settings are initially filled with the values configured in the administration settings (select **Tools > Security Manager Administration > Rule Expiration**); you can enter different settings for a given rule.

To configure rule expiration:

- When creating a new rule, or editing an entire rule, click the **Advanced** button in the [Add and Edit Access Rule Dialog Boxes](#), page 16-14 to get to the rule expiration settings.
- For existing rules, you can add or edit expiration settings without editing the entire rule. Right-click the **Expiration Date** cell for the rule and select **Edit Rule Expiration**. You can select multiple rows to configure the same rule expiration settings. For more information, see [Advanced and Edit Options Dialog Boxes](#), page 16-17.

## Configuring Settings for Access Control

You can configure various settings that apply to security-device access control lists. These settings work in conjunction with your access rules policy. The main setting of interest is that you can configure your own ACL names for each interface/traffic direction combination, or for the global ACL on ASA 8.3+ devices. For PIX, ASA, and FWSM devices, you can also control the maximum number of concurrent flows and the related syslog interval.

You can also configure an interface to allow per-user downloadable ACLs for PIX, ASA, and FWSM devices. This allows you to configure user-based ACLs in your AAA server to override the ACLs defined on a device.

#### Note

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access control were unified. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. The following descriptions apply to all versions of the page, except where noted.

- Step 1** Do one of the following to open the [Access Control Settings Page](#), page 16-24:
- (Device view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
  - (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Configure the global settings in the top part of the page. For PIX, ASA, and FWSM devices, you can define the maximum number of concurrent deny flows and the related syslog interval. For ASA 8.3+ devices, you can enable object group search to optimize ACL performance when converting from Checkpoint, but this setting is not recommended unless you have a memory-constrained device. (Not available on the IPv6 Access Control page.)

For specific information about these settings, and the platforms that support ACL compilation, see [Access Control Settings Page, page 16-24](#).

- Step 3** For each interface on which you want to configure an ACL name, or enable per-user ACLs, add the interface to the interfaces table by clicking the **Add Row** button beneath the table and filling in the [Firewall ACL Setting Dialog Box, page 16-26](#). Keep the following in mind:
- If you configure an ACL name, the name is applied to the specific interface and direction. Security Manager creates system-generated names for any interface/direction combinations that you do not specifically name.
  - You can also specify the name of the global ACL for ASA 8.3+ devices.

You can edit existing entries in the list by selecting them and clicking **Edit Row**, or delete them by clicking **Delete Row**.

## Access Control Settings Page

Use the Access Control Settings page to configure settings to use in conjunction with your access rules policy. You can control some performance and logging features, and configure ACL names for individual interfaces.

### Note

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access control were “unified,” meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. (See [Policy Object Changes in Security Manager 4.4, page 1-10](#) for additional information.) The following descriptions apply to apply to all versions of the page, except where noted.

Thus, many of these settings apply only to specific device types or software versions. If you configure an option and apply the policy to unsupported device types, the option is ignored for those unsupported devices.

### Navigation Path

To open the Access Control Page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
- (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Create a new policy or select an existing policy.
- (Map view) Right-click a device and select **Edit Firewall Settings > Access Control** (or **Edit Firewall Settings > IPv6 Access Control**).

**Table 16-5** Access Control Settings Page

| Element                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Maximum number of concurrent flows (PIX, ASA, FWSM)</p> <p>(not presented on the IPv6 Access Control page)</p>     | <p>The maximum number of concurrent deny flows that the device is allowed to create. Syslog message 106101 is generated when the device reaches the number. The range you should use depends on the amount of flash memory available in the device:</p> <ul style="list-style-type: none"> <li>• More than 64 MB—Values are 1-4096. The default is 4096.</li> <li>• More than 16 MB—Values are 1-1024. The default is 1024.</li> <li>• Less than or equal to 16 MB—Values are 1-256. The default is 256.</li> </ul>                                                                                                                                                                                                      |
| <p>Syslog interval (PIX, ASA, FWSM)</p> <p>(not presented on the IPv6 Access Control page)</p>                        | <p>The interval of time for generating syslog message 106101, which alerts you that the security appliance has reached a deny flow maximum. When the deny flow maximum is reached, another 106101 message is generated if the specified number of seconds has passed since the last 106101 message. Values are 1-3600 milliseconds. The default is 300.</p>                                                                                                                                                                                                                                                                                                                                                              |
| <p>Enable Access List Compilation (Global)</p> <p>(IPv4 only; also not presented on the IPv6 Access Control page)</p> | <p>Whether to compile access lists, which speeds up the processing of large rules tables. Compilation optimizes your policy rules and performance for all ACLs, but is supported on a limited number of older platforms:</p> <ul style="list-style-type: none"> <li>• Routers (global configuration only): 7120, 7140, 7200, 7304, and 7500.</li> <li>• PIX 6.3 firewalls, in global mode or per interface.</li> </ul> <p>An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000.</p> <p>To compile access lists, the device must have a minimum of 2.1 MB of memory. Access list compilation is also known as Turbo ACL.</p> |
| <p>Enable Object Group Search (ASA 8.3+)</p> <p>(not presented on the IPv6 Access Control page)</p>                   | <p>Whether to enable object group search on ASA 8.3+ devices, which optimizes ACL performance without expanding object groups. Object group search is mainly for use when migrating from Checkpoint to ASA, which can result in a large increase in the number of access rules, when you have a memory-constrained device (that is, you find during operations that memory runs low).</p> <p>If you enable object group search, you cannot use the Hit Count tool to analyze your rules. In most cases, you should not enable this feature. Instead, use the rule combination tool to simplify your access rules, and consider using global rules for rules you want to enforce on all interfaces.</p>                   |

| Enable Threshold Object Group Search<br>(IPv4 only; also not presented on the IPv6 Access Control page) | Check this box to enable the threshold limit on object group search. By default the threshold is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Access Control settings table                                                                           | <p>The table lists the interfaces for which you want to configure special processing. The interface name can be a specific interface or an interface role (which can apply settings to more than one interface at a time), or Global for global ACL settings on ASA 8.3+ devices.</p> <p>The main use of this table is to configure names for ACLs if you do not want Security Manager to configure system-generated names. The name applies to the ACL generated for an interface in a specific direction.</p> <p>You can also configure interface-level settings for per user downloadable ACLs, object group search, and ACL compilation.</p> <ul style="list-style-type: none"> <li>To add an Access Control interface setting, click the Add Row button and fill in the <a href="#">Firewall ACL Setting Dialog Box, page 16-26</a>.</li> <li>To edit an Access Control interface setting, select it and click the Edit Row button.</li> <li>To delete an Access Control interface setting, select it and click the Delete Row button.</li> </ul> |

## Firewall ACL Setting Dialog Box

Use the Firewall ACL Setting dialog box to configure settings for specific interfaces, interface roles, or global rules for use with security-device access rules policies.

### Navigation Path

Go to the [Access Control Settings Page, page 16-24](#) and click the **Add Row** button below the interface table, or select a row in the table and click the **Edit Row** button.

|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface<br>Global (ASA 8.3+)                                                                        | <p>Specify whether you are configuring settings for specific interfaces (or interface roles), or for global rules on ASA 8.3+ devices.</p> <p>If you select <b>Interface</b>, specify the name of the interface or interface role for which you are configuring settings. Enter the name or click <b>Select</b> to select it from a list or to create a new object.</p> <p>If you select Global, your only option is to specify the name of the global ACL.</p>                                                                                                                                                                                                                                                                       |
| Traffic Direction                                                                                     | <p>The direction of the traffic through the interface, In or Out. The settings you configure apply only to this direction, if direction matters.</p> <p>For global ACLs on ASA 8.3+ devices, the direction is always in.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| User Defined ACL Name<br>(checkbox not presented on the IPv6 Access Control page)<br>ACL Name         | <p>Whether you want to supply the name for the ACL. If you select this option, enter the name you want to use, which is applied to the ACL generated for the interface and direction combination. The name must be unique on the device.</p> <p>If you are configuring the name for the global ACL on ASA 8.3+ devices, the option is automatically selected; simply enter the desired name.</p> <p><b>Note</b> Make sure that the firewall rules ACL name is unique and is not the same name as the ACL object defined in the Policy Object Manager. For more information see <a href="#">Creating Access Control List Objects, page 6-53</a>.</p> <p>If you do not configure a name, Security Manager generates a name for you.</p> |
| Enable Per User Downloadable ACLs (PIX, ASA, FWSM)<br>(not presented on the IPv6 Access Control page) | <p>Whether to enable the download of per-user ACLs to override the ACLs on the interface. User ACLs are configured in a AAA server; they are not configured in Security Manager. If there are no per-user ACLs, the access rules configured for the interface are applied to the traffic.</p> <p>The option is configured on the device for the specified interface only when the Traffic Direction is in.</p>                                                                                                                                                                                                                                                                                                                        |
| Enable Object Group Search (PIX 6.x)<br>(not presented on the IPv6 Access Control page)               | <p>Whether to enable object group search on a PIX 6.x interface, which reduces the memory requirement on the device to hold large ACLs. However, object group search impacts performance by making ACL processing slower for each packet.</p> <p>Object group search is recommended when you have very large object groups.</p> <p><b>Tip</b> If you are trying to configure object group search on ASA 8.3+ devices, the setting is on the <a href="#">Access Control Settings Page, page 16-24</a>.</p>                                                                                                                                                                                                                             |

**Table 16-6** Firewall ACL Setting Dialog Box (continued)

| Element                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Access List Compilation (PIX 6.x)<br>(not presented on the IPv6 Access Control page) | Whether to compile access lists on this interface for PIX 6.x devices. This setting overrides the equivalent global setting that you configure on the Access Control Settings page.<br><br>ACL compilation speeds the processing of large rules tables and optimizes your policy rules and performance for the interface. An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000.<br><br>To compile access lists, the device must have a minimum of 2.1 MB of memory. |

## Using Automatic Conflict Detection

Security Manager provides an Automatic Conflict Detection feature for access rules. You can use Automatic Conflict Detection to evaluate the logic of your access rules. When enabled, Automatic Conflict Detection identifies rules that overlap or conflict with other rules in the access rule policy. Use this information to identify rules that need to be deleted, moved, or edited.

This section contains the following topics:

- [Understanding Automatic Conflict Detection, page 16-28](#)
- [Understanding the Automatic Conflict Detection User Interface, page 16-30](#)
- [Resolving Conflicts, page 16-35](#)

## Understanding Automatic Conflict Detection

Security Manager provides an automatic conflict detection feature to help identify unnecessary redundant or duplicate rules. Certain conflicting rules might have no effect on a device after they are deployed; however, they create unnecessary clusters in the rules table. By detecting these rules, you can clean up the rule set to develop an easier to use and more efficient access rules policy.

Other conflicting rules, can create unwanted results to your network. By detecting these conflicting rules, you can identify rules that need to be deleted, moved, or edited to implement your security needs as intended.

### Note

The conflict detection feature will report on the first conflict between two rules. If there are additional rules in the table that also conflict with a rule, they will not be reported until the first conflict is resolved.

Conflicts detected by Security Manager are categorized in the following way:

- **Redundant Object**—An element in a field of a rule is a subset of one or more elements in the same field of the rule. In the following example, the source cell has two network objects: *net-group2* and *net-group1*. Since *net-group2* is a sub-set of *net-group1*, it is a redundant object and can safely be removed:

```
object-group network net-group1
network-object 10.2.0.0 255.255.0.0
```

```
object-group network net-group2
```

```
network-object 10.2.1.1 255.255.255.255
```

- **Redundant Rule**—Two rules apply the same action to the same type of traffic, and removing the base rule would not change the ultimate result. For example, if a rule permitting FTP traffic for a particular network were followed by a rule allowing IP traffic for that same network, and there were no rules in between denying access, then the first rule is redundant and can be deleted.

The following is a simple example of redundant rules:

```
access-list acl permit ip 2.1.1.1 255.255.255.255 any
access-list acl permit ip 2.1.1.0 255.255.255.0 any
```

- **Partially Redundant Rule**—A portion of a compound rule is redundant to a rule or a portion of a compound rule that follows it.
- **Shadowed Rule**—This is the reverse of a redundant rule. In this case, one rule will match the same traffic as another rule such that the second rule will never be applied to any traffic because it comes later in the access list. If the action for both rules are the same, you can delete the shadowed rule. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy. For example, the base rule might deny IP traffic, and the shadowed rule might permit FTP traffic, for a given source or destination.

The following is a simple example of shadowed rules:

```
access-list acl permit ip 1.0.0.0 255.0.0.0 any
access-list acl permit ip 1.1.0.0 255.255.0.0 any
```

---

**Note** Duplicate rules are reported as shadowed rules by the automatic conflict detection feature.

---

- **Partially Shadowed Rule**—A portion of a compound rule is shadowed by a rule before it. If the action for both rules are the same, you can delete the portion of the rule that is shadowed. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy.

### Scope of Automatic Conflict Detection

When detecting conflicts, Security Manager evaluates the following pieces of information in your access rules:

- source
- destination
- services
- users
- interfaces

**Note**

---

Conflict detection is only available for access rules in the Access Rules policy for a device or shared policy. Conflict detection is not available for access rules that are part of other policies, such as AAA or inspection rules.

---

**Note**

If a rule contains an FQDN network/host object, the FQDN object is ignored, but the rule is otherwise included in the analysis.

**Note**

Disabled rules are not evaluated during conflict detection.

**Note**

Conflict detection does not consider time ranges when evaluating access rules. Make sure that such rules truly conflict before removing any rules flagged during conflict detection.

## Understanding the Automatic Conflict Detection User Interface

The Automatic Conflict Detection feature is tightly coupled with the access rules table to make identifying conflicts and then resolving those conflicts faster and easier. When conflict detection is enabled, additional user interface elements are available for navigating between the conflicts and for resolving those conflicts.

**Note**

For information on the standard elements of the Access Rules page, see [Access Rules Page, page 16-10](#).

Figure 16-2 Automatic Conflict Detection

|   |                             |   |                            |
|---|-----------------------------|---|----------------------------|
| 1 | Conflict Indicator icons    | 2 | Enable Conflict Detection  |
| 3 | Generate Report button      | 4 | Annotation Display Options |
| 5 | Conflict navigation bar     | 6 | Conflict Details area      |
| 7 | Conflict Navigation buttons |   |                            |

**Conflict Indicator Icons**

The Conflict Indicator icons are used to identify conflicts and to provide a quick visual representation of the type of conflict. The following table details the available icons:

**Note**

For an explanation of the types of conflicts, see [Understanding Automatic Conflict Detection](#), page 16-28.

|  |                          |
|--|--------------------------|
|  | Redundant Object         |
|  | Redundant Rule           |
|  | Partially Redundant Rule |
|  | Shadowed Rule            |
|  | Partially Shadowed Rule  |

**Note** If an access rule has multiple conflicts or if it has a user note attached to it, the conflict indicator icon for that rule will have a small plus sign (+) on it.

You can perform the following actions using the Conflict Indicator icon:

- Hover the mouse pointer over the **Conflict Indicator** icon to view a description of the conflict including any user notes attached to the conflict.
- Click the **Conflict Indicator** icon, or right-click the icon and select **Show Conflict Detail**, to open the Conflict Details pane for the selected conflict.
- Right-click the **Conflict Indicator** icon for a redundant object and select **Remove Redundant Object** to remove the redundant object from a rule.
- Right-click the **Conflict Indicator** icon and select **Add User Note** to open the Add User Note dialog box for the selected conflict. You can use the Add User Note dialog box to enter a note about the conflict that can later be included in the Rule Analysis Detail Report.

**Note**

User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

**Enable Conflict Detection**

The Enable Conflict Detection option controls whether automatic conflict detection is enabled. Conflict detection is enabled by default but can be disabled by deselecting this option. The setting is managed per user and enabling or disabling conflict detection for one access rules table, will also enable or disable the feature for other access rules tables.

**Caution**

Conflict detection uses a significant memory size on the CSM client. The memory usage varies based on the number of rules in the policy or the device that is used. Enable the conflict detection functionality on the client UI, only if required. Also, ensure that the CSM client LAX file is configured with adequate memory, based on the system RAM size. By default, it is 2 GB. For example, try configuring the LAX file with 4 GB if the machine's RAM size is 8 GB and with 8 GB if the machine's RAM is 16 GB. It is, however, strongly recommended to configure the client LAX file matching the requirements of the environment.

Use the following parameters based on number of rules and devices requirements:

```
LAX.NL.JAVA.OPTION.JAVA.HEAP.SIZE.MAX

2420m
```

```
lax.nl.java.option.java.heap.size.max=2420m
```

### Generate Report

If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool. The Rule Analysis Detail Report shows details of all the conflicts in your rules table and includes any user notes that were entered for the conflicts. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table.

#### Note

User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

When you first open the Access Rules page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.

### Annotation Display Options button

Click the **Annotation Display Options** button to open the Annotation Display Options dialog box, which is used for selecting the types of conflicts that should be reported. For an explanation of the types of conflicts, see [Understanding Automatic Conflict Detection, page 16-28](#).

Disabling a certain type of conflict does not remove those rules from the access rules table; it only turns off the rule conflict notification for those types of conflicts. To hide or show only conflicting rules of a certain type, you can use the table filter feature. For example, if you only wanted to see redundant and partially redundant rule conflicts, you could set up the following advanced filter:

You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

**Note**

The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

**Conflict Navigation Bar**

Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

**Tip**

Hovering over a conflict locator provides a quick summary of the conflict.

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Black locators**—Shadowed and partially shadowed rules

**Conflict Details Area**

The Conflict Details pane shows details for the selected conflict. The pane can be docked and undocked as needed. If the Conflict Details pane is docked while the Policy Object Manager pane is also docked, you can navigate between the two features using the tabs at the bottom of the window.

The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

You can use the links provided to navigate to the conflicting rules. You can also click the link under Action to have Security Manager perform the suggested action automatically.

**Conflict Navigation Buttons**

The Previous Conflict and Next Conflict buttons at the top of the Conflict Details pane allow you to step through the conflicts that need to be resolved without leaving the Conflict Details pane.

- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)
- [Configuring Access Rules, page 16-7](#)

## Resolving Conflicts

The following procedure explains how to use the Automatic Conflict Detection feature to resolve conflicts in your access rules.

**Tip**

You can use the Combine Rules tool to have Security Manager evaluate your rules and find ways to combine them into more efficient rules. For more information, see [Combining Rules, page 12-22](#).

### Related Topics

- [Understanding Automatic Conflict Detection, page 16-28](#)
- [Understanding the Automatic Conflict Detection User Interface, page 16-30](#)
- [Understanding Access Rules, page 16-1](#)
- [Understanding Device Specific Access Rule Behavior, page 16-4](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)
- [Configuring Access Rules, page 16-7](#)

**Step 1** Do one of the following:

- (Device view) Select **Firewall > Access Rules** from the Policy selector.
- (Policy view) Select **Firewall > Access Rules** from the Policy Type selector and select an existing policy.

This opens the [Access Rules Page, page 16-10](#). If conflict detection is enabled, the access rules will be analyzed for conflicts after the table has been loaded. If conflict detection is not enabled, select **Enable conflict detection** to begin the conflict analysis.

The analysis progress is shown below the rules table. With the exception of the conflict detection features, you can perform functions on the rules table while the rules are being analyzed. After analysis has completed, the conflict detection features are enabled.

**Step 2** Make sure that the rules you are interested in analyzing are being shown in the rules table. This includes expanding sections and making sure that if you are using filters that they are set correctly. Any rules that are being filtered or are in a section that is collapsed will not be included in the conflict detection analysis.

**Tip**

You can use the Expand all rows/Collapse all rows buttons located in the upper-right corner of the Filter area above the access rules table, to quickly expand or collapse all sections in the rules table.

**Step 3** Click the **Annotation Display Options** button, which is located above the Conflict navigation bar to the right of the vertical scroll bar, to open the Annotation Display Options dialog box. Verify that the types of conflicts you want detected are all enabled, and then click **OK**.

**Tip**

You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

---

**Note** The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

---

**Step 4** If you would like to print or save a copy of the conflicts that are found in the rule table, click **Generate Report**.

The Rule Analysis Detail Report is opened in your browser. The Rule Analysis Detail Report shows details of all the conflicts in your rules table. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table. You can save the report or print it as needed.

**Step 5** Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

---

**Tip** Hovering over a conflict locator provides a quick summary of the conflict.

---

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Grey locators**—Shadowed and partially shadowed rules

**Step 6** Click on the **Conflict Indicator** icon for the selected conflict to open the Conflict Details pane. For more information on the Conflict Indicator icons, see [Understanding the Automatic Conflict Detection User Interface, page 16-30](#).

The Conflict Details pane shows details for the selected conflict. The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

**Step 7** Use the links provided to navigate to the rules and resolve the conflict as needed or click the link under Action to have Security Manager perform the suggested action automatically.

---

**Note** If you do not want to resolve the conflict at this time, you can enter a note about the conflict by right-clicking the **Conflict Indicator** icon to the left of the conflict in the access rule table and then selecting **Add User Note**. User notes are included in the Rule Analysis Detail Report, but are not saved when leaving the access rules page or after editing a rule that has a user note.

---

**Step 8** Use the Conflict navigation bar or the **Previous Conflict** and **Next Conflict** buttons at the top of the Conflict Details pane to access additional conflicts that need to be resolved.

**Step 9** If there are any remaining conflicts that you do not want to resolve at this time, you can click **Generate Report** to print or save a copy of the remaining conflicts, if desired.

---

# Viewing Hit Count Details

Use Hit Count Details window to view information about the number of times an access rule was applied to traffic. These rules are the ones that become interface ACLs on the device. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the detailed hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

**Tip**

You can click the Refresh Hit Count button at the bottom of the page to update hit count information before viewing the details for a rule. See [Hit Count Selection Summary Dialog Box, page 16-20](#) for more information.

Consider the following points when analyzing the hit count details:

- You get best results if you deploy policies to the device before viewing hit counts. If you discover a device and then generate a hit count report before deployment, the results might be incomplete or hard to interpret. For example, an access rule might not have any hit count information.
- Hit count statistics are based on ACL, not on interface. If you select **Enable ACL Sharing for Firewall Rules** on the Security Manager Administration Deployment page (see [Deployment Page, page 11-13](#)), any shared ACL provides statistics that are combined from all interfaces that share the ACL.
- If you enable network object group optimization, as described in [Optimizing Network Object Groups When Deploying Firewall Rules, page 12-35](#), you might not get good hit count information.
- If you enable ACL optimization, as described in [Optimizing Access Rules Automatically During Deployment, page 16-47](#), the hit count results might have problems matching ACEs from the device to access rules. Thus, when you select an access rule, you might not get any hit count results for it.
- FQDN network/host objects are ignored. You cannot obtain hit count information on these objects.
- Hit count and last hit time information is cleared when a device is restarted.
- The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.

**Before You Begin**

Hit count reports are subject to the following limitations:

- Hit count reports are device-specific. You can generate the report for one device at a time from Device view only. Ensure that you deploy policies to the device before generating the reports.
- If you enable object group search on an ASA 8.3+ device, you cannot use the Hit Count tool. Object group search is configured on the [Access Control Settings Page, page 16-24](#).
- Although you can select rules that include FQDN network/host objects, the objects are ignored in the hit count results.

**Navigation Path**

(Device view only) From the [Access Rules Page, page 16-10](#), right-click the Hit Count cell for a rule in the table and choose **Show Hit Count Details**.

The Hit Count Details window opens as a pane at the bottom of the access rules table. Click the expand button on the right side of its title bar to view the hit count details in a separate window.

| Choose         | You can choose how to view the hit count information: <b>Expanded Table</b> or <b>Raw ACE</b> (both are explained below).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Expanded Table | <p>This view lists hit count information for the access control list entry (ACE) for the rule selected in the Access Rules table (on the <a href="#">Access Rules Page, page 16-10</a>) when you opened this window. The list contains more than one ACE if the access rule generated more than one ACE when you deployed the policy to the device.</p> <p>Most of the columns in this table match those of the Access Rules table; many contain the specific data configured in the ACE in place of any network/host, service, or interface role objects contained in the rule, with the exception of IOS 12.4(20)T+ devices, which show data only at the object level. Also, the name of the ACL that contains the ACE is listed.</p> <p>The Delta column the difference in hit count for the ACE since the last refresh. The Hit Count column shows the hits for the specific ACE rather than the overall rule.</p> <p>See <a href="#">Sample Hit Count Details Window, page 16-39</a> for an example of this table.</p> <p><b>Tip</b> You can sort on multiple columns at the same time by pressing and holding the <b>Ctrl</b> key while you click the column headings. You can sort on all columns except Interface, Direction, and ACL Name.</p> |
| Raw ACE        | <p>This view shows the actual CLI for the access control entry, along with the Hit Count and Last Hit Time. Use this information if you are more comfortable evaluating device commands.</p> <p>See <a href="#">Sample Hit Count Details Window, page 16-39</a> for an example of this table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Note</b>    | Beginning with version 4.9, Security Manager enables to view the Hit Count history in the Expanded Table and Raw ACE options. Click the <b>Show History</b> link to view the Hit Count history in a new window. This new Hit Count History Details window displays the Hit Count and the Last Hit Time information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Sample Hit Count Details Window

You can generate hit count reports to determine how often each rule in your access rule policy is matched to traffic. If an access rule is deployed as multiple access control entries (ACEs), for example, when you use interface roles to define rules and the roles apply to more than one interface, you can see the separate hit count information for each ACE deployed. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

The following figures show an example of a hit count report and how to use the information.

- [Figure 16-3](#) shows the default view. The upper table lists the rules as they exist in your access rules policy, either all rules or just the ones you selected before generating the report. When you select a rule, the ACEs created on the device for that rule are listed in the expanded table in the lower half of the window. When you initially open the report, the expanded table shows the ACEs for all policies listed in the upper table.

Hit counts in the expanded table are for each ACE, whereas the count in the rules table is the sum of the hit counts for all ACEs created by the rule. Note that the expanded table for ASA/PIX/FWSM devices, and IOS devices lower than 12.4(20)T, shows hit counts for each element within any policy objects used in the rule, whereas for IOS 12.4(20)T+ devices, the information is only provided at the object group level.

- [Figure 16-4](#) shows the same ACEs in CLI format. These are the ACEs as they exist in the device configuration.

For more information about how to read and interpret hit count reports, see [Viewing Hit Count Details, page 16-37](#).

# Importing Rules

Typically, when you add a device to Security Manager, you discover policies from the device. This action populates your access rules policy with the access control entries (ACEs) from all active ACLs on the device.

If you find there are other ACLs that have ACEs you want included in your policy, you can define them directly in Security Manager.

Another alternative, however, is to import them by copying and pasting the CLI entries from a device running-configuration, or by typing in the desired commands. Using the Import Rules wizard, you can quickly create ACEs and associated policy objects from ACLs that you know already work. You might also want to use this method if you are more comfortable using CLI commands to define your rules.

The following steps describe using the Import Rules wizard to add CLI-based rules and preview the results.

- 
- Step 1** (Device view only) Select **Firewall > Access Rules** to open the [Access Rules Page, page 16-10](#).
- Step 2** Select the row after which you want to add the rules. The row must be within the Local scope. If you do not select a row, the rules are added at the end of the Local scope.
- Step 3** Right-click anywhere in the rules table and choose **Import Rules** to start the wizard.  
The first page—Enter Parameters—of the three-page wizard appears.
- Step 4** On the [Import Rules Wizard—Enter Parameters Page, page 16-42](#):
- Enter the desired CLI information in the *running-configuration* format appropriate for the selected device. For examples of importable CLI-based rules, see [Examples of Imported Rules, page 16-45](#).
  - Specify whether you are creating an interface-specific rule (and enter the interface or interface role to which you want the rules to apply), or for ASA 8.3+ devices, a global rule (see [Understanding Global Access Rules, page 16-3](#)).
  - Specify the traffic direction with respect to the interface (the direction is always In for global rules).
- Beside access control rules, you should also include the CLI information for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.
- Time range objects (the **time-range** command with its subcommands), which can create time range policy objects.
  - Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T+ devices (the **object-group** command with its subcommands), which can create network/host policy objects.
- For ASA 8.3+ devices, you can also include the **object network** and **object service** commands. However, any object NAT configuration is not imported.
- Step 5** Click **Next** to process the rules and open the [Import Rules Wizard—Status Page, page 16-43](#).  
You are notified if your CLI input contains errors when you click the Next button. For some detailed tips about what commands you can enter, see [Import Rules Wizard—Enter Parameters Page, page 16-42](#).  
The CLI is evaluated and if importable, you are told the types of objects that were created from the CLI.
- Step 6** Click **Next** to view the rules and objects on the [Import Rules Wizard—Preview Page, page 16-44](#), or click **Finish** to import the rules without previewing them.  
The information on the Preview page is read-only. If the rules are acceptable, click **Finish**.

If you want to make changes, you can click the **Back** button to return to the Enter Parameters page of the wizard, or you can click Finish and edit the rules on the Access Rules page.

---

## Import Rules Wizard—Enter Parameters Page

Use the Import Rules wizard to import a set of access control entries from an ACL in device running-configuration format to your access rules policy. The command syntax you can enter is controlled by the type of device to which you are importing rules.

Beside access control rules, you should also include the CLI for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands).
- Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T devices (the **object-group** command with its subcommands).

For ASA 8.3+ devices, you can also include **object network** and **object service** commands. However, any object NAT configuration is not imported.

### Navigation Path

(Device view only) Right-click anywhere in the rules table on the [Access Rules Page, page 16-10](#) and choose **Import Rules**.

|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI                            | <p>The OS commands that define the rules and related objects that you want to import. These rules must be in running-configuration format, so they are best copied and pasted from a configuration (use Ctrl+V to paste into the field). You can also type in the commands; you will be prompted if they cannot be interpreted.</p> <p>You can import only one ACL at a time.</p> <p>To see some examples of the CLI you can import, see <a href="#">Examples of Imported Rules, page 16-45</a>.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you refer to an object but do not include the CLI, the rule might be created but it will not use the object.</li> <li>• For PIX, FWSM, ASA, and IOS 12.4(20)T+, you can include object group and name commands.</li> <li>• If you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the configuration, it is removed from the device.</li> <li>• You can import extended ACLs for all device types, and standard ACLs for IOS devices. However, standard ACLs are converted to extended ACLs.</li> </ul> |
| Interface<br>Global (ASA 8.3+) | <p>Select whether you are importing an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see <a href="#">Understanding Global Access Rules, page 16-3</a>).</p> <p>If you select <b>Interfaces</b>, enter the name of the interface or the interface role for which you are defining this rule, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. You can enter any combination of interface or interface role names, separated by commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Traffic Direction              | The direction of the traffic with respect to the interface, in or out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category                       | The category assigned to the rules. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Import Rules Wizard—Status Page

Use the Status page of the Import Rules wizard to view information about the results of the import process.

| Rules Imported         | The number of rules that will be imported.                                                                                                                                                                                                                                                                                                                                                                         |
| Policy Objects Created | The number of policy objects that will be created.                                                                                                                                                                                                                                                                                                                                                                 |
| Messages               | The warning, error, and informational messages, as indicated by the severity icon. Typical informational messages describe the policy objects created during the operation or the existing policy objects that were reused.<br><br>When you select an item, the Description box to the right describes the message in detail. The Action box to the right provides information on how you can correct the problem. |
| Abort button           | Click this button to stop the import operation.                                                                                                                                                                                                                                                                                                                                                                    |

## Import Rules Wizard—Preview Page

Use the Preview page of the Import Rules wizard to view the rules and objects that will be imported if you click Finish.

This preview is read-only; you cannot edit the rules or objects. If the rules or objects are not exactly what you want, you can click Finish to add the rules and objects, and then edit them from the access rules page. For example, you cannot import rule expiration dates, because those dates have meaning only in Security Manager.

The tabs on this dialog box appear only if the data you are importing includes items to be displayed on the tab.

**Tip**

If your CLI refers to an object that does not exist, such as a time range, the object is not included in the rule. You can either go back and add the CLI for the object, or you can click Finish, create the object yourself, and edit the rule.

## Examples of Imported Rules

The following are some examples of CLI that you can import and the rules and policy objects that are created from them. For information on how to import rules, see [Importing Rules, page 16-41](#).

### Example 1: Restrict a network from accessing FTP servers (ASA devices)

The following access list uses object groups and restricts the 10.200.10.0/24 network from accessing some FTP servers. All other traffic is allowed.

```
object-group network ftp_servers
network-object host 172.16.56.195
network-object 192.168.1.0 255.255.255.224
access-list ACL_IN extended deny tcp 10.200.10.0 255.255.255.0 object-group ftp_servers
access-list ACL_IN extended permit ip any any
```

This example creates a network/host object named ftp\_servers and two access rules.

| No. | Permit                                                                              | Source                                                                                  | Destination                                                                                     | Service                                                                                 | Interface | Dir. | Category |
|-----|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|-----------|------|----------|
| 1   |  | 10.200.10.0/24                                                                          |  ftp_servers |  TCP | Ethernet0 | in   | None     |
| 2   |  |  any |  any         |  IP  | Ethernet0 | in   | None     |

**Example 2: Restrict web access during working hours (ASA devices)**

The following example denies HTTP requests between the hours of 8 AM and 6 PM, which are typical work hours.

```
time-range no-http
 periodic weekdays 8:00 to 18:00
access-list 101 deny tcp any any eq www time-range no-http
```

This example creates a time range object named no-http and one access rule.

| No. | Permit | Source | Destination | Service | Interface | Dir. | Options | Category |
|-----|--------|--------|-------------|---------|-----------|------|---------|----------|
| 1   |        | any    | any         | HTTP    | Ethernet0 | in   | no-http | None     |

**Example 3: Filtering on TCP and ICMP using port numbers (IOS devices)**

In the following example, the first line of the extended access list named goodports permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 172.28.1.2. The last line permits incoming ICMP messages for error feedback.

```
ip access-list extended goodports
 permit tcp any 172.28.0.0 0.0.255.255 gt 1023
 permit tcp any host 172.28.1.2 eq 25
 permit icmp any 172.28.0.0 255.255.255.255
```

This example creates three access rules. Notice that the wildcard masks used in the IOS ACL syntax are converted to regular subnet masks. Security Manager automatically converts between standard network/host subnet mask designations and the wildcard masks required in IOS ACLs. Because ASA/PIX/FWSM requires the use of subnet masks in ACL commands, this makes it possible for you to create rules that can apply to all devices; Security Manager takes care of converting your rules to the correct syntax.

| No. | Per... | Source | Destination   | Service     | Interface | Dir. | Category |
|-----|--------|--------|---------------|-------------|-----------|------|----------|
| 1   |        | any    | 172.28.0.0/16 | tcp/gt 1023 | Ethernet0 | in   | None     |
| 2   |        | any    | 172.28.1.2    | SMTP        | Ethernet0 | in   | None     |
| 3   |        | any    | any           | ICMP        | Ethernet0 | in   | None     |

**Example 4: Standard ACLs restricting hosts (IOS devices)**

In the following example, the workstation belonging to Jones is allowed access to Ethernet interface 0 and the workstation belonging to Smith is not allowed access:

```
ip access-list standard workstations
 remark Permit only Jones workstation through
 permit 172.16.2.88
 remark Do not allow Smith workstation through
 deny 172.16.3.13
```

This example creates two rules, converting the standard rules to extended rules (to any destination). The remarks are saved in the description field.

| No. | Permit | Source      | Destination | Service | Interface | Dir. | Description       |
|-----|--------|-------------|-------------|---------|-----------|------|-------------------|
| 1   |        | 172.16.2.88 | any         | IP      | Ethernet0 | in   | Permit only Jo... |
| 2   |        | 172.16.3.13 | any         | IP      | Ethernet0 | in   | Do not allow S... |

For more examples of ACLs in command language format, see the following:

- IOS  
Devices—[http://www.cisco.com/en/US/docs/ios/sec\\_data\\_plane/configuration/guide/sec\\_create\\_IP\\_apply.html#wp1027258](http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_create_IP_apply.html#wp1027258).
- ASA  
Devices—[http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl\\_extended.html](http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl_extended.html).

## Optimizing Access Rules Automatically During Deployment

You can configure the system to optimize the access control lists (ACLs) that are created from your access rules policies when they are deployed to specific devices or to all devices. This optimization affects only the deployed policies, it does not make any changes to your access rules policy.

Optimization removes redundancies and conflicts and can combine multiple entries (ACEs) into single entries. Although the order of entries might change, the semantics of your policies are preserved; the optimized ACL accepts or denies the same set of packets as did its unoptimized form. Following are the basic cases where changes are made:

- Ineffective ACE—Where one entry is a subset of, or equal to, another entry, the ineffective ACE is removed. Consider the following example:

```
access-list acl_mdc_inside_access deny ip host 10.2.1.1 any
access-list acl_mdc_inside_access deny ip 10.2.1.0 255.255.255.0 any
```

The first ACE is actually a subset of the second ACE. ACL optimization will deploy only the second entry.

- Superset ACE—Where one entry is a superset of another and the order of the rules does not matter, the redundant rule is removed. Consider the following example:

```
access-list acl_mdc_inside_access permit tcp any any range 110 120
access-list acl_mdc_inside_access deny tcp any any range 115
```

The second ACE will never be hit. ACL optimization will remove the second ACE and deploy only the first one.

- Adjacent ACEs—Where two entries are similar enough that a single entry can do the same job. There can be no intervening rules that change which packets will hit each rule. Consider the following example:

```
access-list myacl permit ip 1.1.1.0 255.255.255.128 any
access-list myacl permit ip 1.1.1.128 255.255.255.128 any
```

The two ACEs are merged into one: `access-list myacl permit ip 1.1.1.0 255.255.255.0 any`.

By configuring ACL deployment optimization, you can create smaller ACLs that are more efficient, which can improve performance on devices with limited, non-expandable memory, such as the FWSM, which can be shared among multiple virtual contexts.

However, there are down sides to configuring ACL deployment optimization:

- Because optimization changes what would normally be deployed for your access rules, it is hard to correlate those rules to the actual deployed ACEs. This can make the results of the hit count tool unusable, and make it very difficult to correlate events in the Cisco Security Monitoring, Analysis and Response System application. If it is important to you that you can monitor your access rules using these tools, do not enable optimization. For more information, see [Viewing Hit Count Details, page 16-37](#) and [Viewing CS-MARS Events for an Access Rule, page 72-44](#).
- Optimization does not address inherent problems in your access rules policy. It is typically better to address redundancies and conflicts proactively by using the automatic conflict detection tool (see [Using Automatic Conflict Detection, page 16-28](#)). You can also use the combine rules tool to optimize your rules in the access rules policy before you deploy them (see [Combining Rules, page 12-22](#)).

If you decide to configure ACL deployment optimization, consider enabling it only for those devices that are memory constrained.

- 
- Step 1** Log into Windows on the Security Manager server.
- Step 2** Use a text editor such as NotePad to open the **C:\Program Files\CSCOpX\MDC\athena\config\csm.properties** file. Locate the optimization section and read the instructions.
- To turn on full optimization for all devices, enter the following:  
**OPTIMIZE.\*=full**
  - To turn on full optimization for a specific device, replace the asterisk with the Security Manager display name for the device. For example, if the display name is `west_coast.cisco.com`, enter the following:  
**OPTIMIZE.west\_coast.cisco.com=full**
  - To turn on optimization but preserve the object groups used in the ACE, replace the full keyword with `preserve_og`. For example:  
**OPTIMIZE.west\_coast.cisco.com=preserve\_og**
  - If you do not want to allow the merger of adjacent entries, enter the following:  
**AclOptimization.doMerge=false**
- Step 3** Save the file. The settings take effect immediately and will be applied to all subsequent deployment jobs. You can generate optimization reports for deployment jobs by selecting **Capture Discovery/Deployment Debugging Snapshots to File**, which is located in **Tools > Security Manager Administration > Debug Options**.
- The deployment results will show optimization results summarized as an informational message that includes the original number of ACEs before optimization and the number of ACEs after optimization. The results are saved to a file on the server in the `C:\Program Files\CSCOpX\MDC\temp` folder. A job ID is used as part of the file name.
-

## Customizing defaults in the Add Access Rule dialog

Prior to Cisco Security Manager 4.13, the **Add Access Rule** dialog was populated with default values. Starting from 4.13, the user can customize the appearance of default values by updating the **csm.properties** file.

To customize defaults in the Add Access Rule dialog, perform the following steps:

- 
- Step 1** Close and exit the Cisco Security Manager interface.
- Step 2** Use a text editor such as NotePad to open the **C:\Program Files\CSCOpX\MDC\athena\config\csml.properties** file.
- Step 3** Locate the CustDesk.Rule property at the bottom of the csm.properties file and set the values as true or false, based on your requirements:
- CustDesk.Rule.Add.Op.Load.Intf.Default.Values - Set this value as true to load the interface information by default in the Add Access rule dialog.
  - CustDesk.Rule.Add.Op.Load.Other.Default.Values - Set this value as true to load the other values by default in the Add Access rule dialog.

- Step 4** Save the file.

---

**Note** The settings do not take effect immediately. Restart the Cisco Security Manger services for the customized default values to take effect.

---

- Step 5** Launch the Cisco Security Manager interface again.
-

## Managing Firewall Inspection Rules

---

Inspection rules configure protocol inspection on a device. Inspection opens temporary holes in your access rules to allow return traffic for connections initiated within your trusted network. When traffic is inspected, the device also implements additional controls to eliminate mal-formed packets based on the inspected protocols.

### Note

---

From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

---

The device commands generated for inspection rules vary based on device type. For devices running ASA, PIX 7.0+, and FWSM 3.x+, `access-list`, `policy-map`, and `class-map` commands are used. For older FWSM and PIX 6.3 devices, `fixup` commands are used. For IOS devices, `ip-inspect` commands are used.

The following topics will help you work with inspection rules:

# Understanding Inspection Rules

Inspection rules configure Context-Based Access Control (CBAC) inspection commands. CBAC inspects traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

CBAC creates temporary openings in access lists at firewall interfaces. These openings are created when inspected traffic exits your internal network through the firewall. The openings allow returning traffic (that would normally be blocked) and additional data channels to enter your internal network back through the firewall. The traffic is allowed back through the firewall only if it is part of the same session as the original traffic that triggered inspection when exiting through the firewall.

Inspection rules are applied after your access rules, so any traffic that you deny in the access rule is not inspected. The traffic must be allowed by the access rules at both the input and output interfaces to be inspected. Whereas access rules allow you to control connections at layer 3 (network, IP) or 4 (transport, TCP or UDP protocol), you can use inspection rules to control traffic using application-layer protocol session information.

For all protocols, when you inspect the protocol, the device provides the following functions:

- Automatically opens a return path for the traffic (reversing the source and destination addresses), so that you do not need to create an access rule to allow the return traffic. Each connection is considered a session, and the device maintains session state information and allows return traffic only for valid sessions. Protocols that use TCP contain explicit session information, whereas for UDP applications, the device models the equivalent of a session based on the source and destination addresses and the closeness in time of a sequence of UDP packets.

These temporary access lists are created dynamically and are removed at the end of a session.

- Tracks sequence numbers in all TCP packets and drops those packets with sequence numbers that are not within expected ranges.
- Uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. When a session is dropped, or reset, the device informs both the source and destination of the session to reset the connection, freeing up resources and helping to mitigate potential Denial of Service (DoS) attacks.

The following topics provide more information about inspection:

- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)

- [Configuring Protocols and Maps for Inspection, page 17-22](#)
- [Configuring Inspection Rules, page 17-5](#)
- [Configuring Settings for Inspection Rules for IOS Devices, page 17-112](#)

## Choosing the Interfaces for Inspection Rules

Configure inspection on devices that protect internal networks. Use it with TCP, UDP, or more specific protocols. Inspect these applications if you want the application's traffic to be permitted through the device only when the traffic session is initiated from a particular side of the device (usually from the protected internal network).

**Tip**

For IOS devices, you need to configure inspection explicitly, and you can identify the direction of traffic to be inspected. For ASA, PIX, and FWSM devices, you cannot identify the direction, and you need to configure inspection only if you do not want the inspection defaults. In the remaining discussion, statements concerning direction apply only to IOS devices. For ASA, PIX, and FWSM, simply configure inspection on the identified interface.

In many cases, you will configure inspection in one direction only at a single interface, which causes traffic to be permitted back into the internal network only if the traffic is part of a permissible (valid, existing) session. This is a typical configuration for protecting your internal networks from traffic that originates on the Internet.

You can also configure inspection in two directions at one or more interfaces. Configure inspection in two directions when the networks on both sides of the firewall should be protected, such as with extranet or intranet configurations, and to protect against DoS attacks. For example, if the device is situated between two partner companies' networks, you might want to restrict traffic in one direction for certain applications, and restrict traffic in the opposite direction for other applications. If you are protecting a web server in the DMZ zone, you might want to configure deep inspection on HTTP traffic to identify and reset connections that have undesirable characteristics.

You might want to configure your inspection rules on the outbound interfaces of your network, those that connect to the Internet or another uncontrolled network, while allowing unfiltered connections within the trusted network. Thus, your devices use resources for inspection only on sessions that travel over unsecured and therefore potentially dangerous networks.

## Selecting Which Protocols To Inspect

You can generically inspect TCP and UDP, which covers all applications that use these protocols. However, you can also inspect more specific protocols. In some cases, inspecting a specific protocol provides better service than generic TCP/UDP inspection. TCP and UDP inspection do not recognize application-specific commands, and therefore might not permit all return packets for an application, particularly if the return packets have a different port number than the previous exiting packet.

For example:

- Some protocols allow you to configure deep inspection. Deep inspection allows you to configure more specific rules for a traffic stream. For example, you can drop HTTP connections where the content type of the request and response do not match. For information on deep inspection and your configuration options, see [Configuring Protocols and Maps for Inspection, page 17-22](#).
- Protocols that negotiate return channels, such as FTP, should be specifically inspected. If you use simple generic TCP inspection of FTP traffic, the negotiated channels are not opened, and the connection will fail. If you want to allow FTP, ensure that you create a specific inspection rule for it.

Multimedia protocols also negotiate return channels and should be specifically inspected. These include H.323, RTSP (Real Time Streaming Protocol), and other application-specific protocols. Some applications also use a generic TCP channel, so you might also need to configure generic TCP inspection. Any generic TCP inspection rule should appear below a more specific inspection rule in the table (that is, any rule that specifies TCP or UDP should appear at the end of the inspection rule table).

## Understanding Access Rule Requirements for Inspection Rules

Access rules are applied before inspection rules. Therefore, you must ensure that your access rules do not prohibit traffic that you want inspected. Use the following guidelines:

- Permit inspected traffic to leave the network through the firewall.  
All access rules that evaluate traffic leaving the protected network should permit traffic that will be inspected. For example, if Telnet will be inspected, then Telnet traffic should be permitted on all access rules that apply to traffic leaving the network.
- Deny inspected return traffic entering the network through the firewall.  
For temporary openings to be created in an access list, the access list should deny inspected return traffic because the inspection engine will open up temporary holes in the access lists for this traffic. (You want traffic to be normally blocked when it enters your network.)
- Permit or deny traffic that cannot be inspected, or that you do not want to inspect, as required by your network.  
For example, if you do not want to inspect ICMP traffic, but you want to allow some ICMP traffic, configure your access rules to allow the traffic in both directions. Consider permitting at least these ICMP message types: echo reply (for ping commands), time-exceeded (for trace route), packet-too-big (for path MTU discovery), traceroute (for trace route), and unreachable (to notify that a host cannot be found).
- Add an access rule entry denying any network traffic from a source address matching an address on the protected network.  
This is known as anti-spoofing protection because it prevents traffic from an unprotected network from assuming the identity of a device on the protected network.
- Add an entry denying broadcast messages with a source address of 255.255.255.255.  
This entry helps to prevent broadcast attacks.

## Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Inspecting packets at the application layer, and maintaining TCP and UDP session information, provides a device with the ability to detect and prevent certain types of network attacks such as SYN-flooding. A SYN-flood attack occurs when a network attacker floods a server with a barrage of requests for connection and does not complete the connection. The resulting volume of half-open connections can overwhelm the server, causing it to deny service to valid requests. Network attacks that deny access to a network device are called denial-of-service (DoS) attacks.

Inspection helps to protect against DoS attacks in other ways. Inspection looks at packet sequence numbers in TCP connections to see if they are within expected ranges and drops any suspicious packets. You can also configure inspection to drop half-open connections, which require firewall processing and memory resources to maintain. Additionally, inspection can detect unusually high rates of new connections and issue alert messages.

For IOS devices, you can configure several inspection setting parameters to fine-tune your defenses against SYN flooding and half-open connections. Configure the **Firewall > Settings > Inspection** policy. For details about each setting, see [Configuring Settings for Inspection Rules for IOS Devices, page 17-112](#).

Inspection can also help by protecting against certain DoS attacks involving fragmented IP packets. Even though the firewall prevents an attacker from making actual connections to a given host, the attacker can disrupt services provided by that host. This is done by sending many non-initial IP fragments or by sending complete fragmented packets through a router with an ACL that filters the first fragment of a fragmented packet. These fragments can tie up resources on the target host as it tries to reassemble the incomplete packets. To fine-tune fragment inspection, configure an inspection rule for the **fragment** protocol and configure the maximum number of fragments you want to allow and a timeout value.

## Configuring Inspection Rules

Inspection rules policies identify the traffic that will be inspected through an interface. Inspection tracks permitted sessions and opens temporary holes in your access rules to allow return traffic.

Inspection rules are processed after access rules, so any traffic dropped by an access rule is not inspected. You can also use deny rules to selectively exclude certain types of traffic from inspection. For example, you might create a deny inspection rule to prevent a specific class of DNS traffic from being inspected, while all other DNS traffic is inspected. The basic procedure is:

- Add a new deny rule before the default inspection rule for the specific protocol. For the Match Traffic By option, select Source and Destination Address and Port. Next, define the specific type of traffic by providing Source and Destination Network IP addresses, and selecting the desired Service type (for example, DNS-TCP). Finally, in the third screen of the inspection-rule wizard, select the appropriate protocol (for example, DNS).
- Now edit the default inspection rule (below your new deny rule in the table). Again select Source and Destination Address and Port for the Match Traffic By option. Be sure this is a Permit rule, provide an all-addresses option as the source and destination addresses, and enter IP as the Service type. In the third screen, keep the selected protocol; configure or remove the related map, as necessary.

See [Inspection Rules Page, page 17-8](#) and [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#) for additional information about this process.

See the following topics for more information about things you should consider when creating inspection rules:

- [Understanding Inspection Rules, page 17-2](#)
- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices, page 17-5](#)
- [Configuring Protocols and Maps for Inspection, page 17-22](#)
- [Understanding Map Objects, page 6-78](#)

### Before You Begin

You might have a set of inspection rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device's inspection rules policy. For more information, see [Creating a New Shared Policy, page 5-54](#) and [Inheriting or Uninheriting Rules, page 5-47](#).

- 
- Step 1** Do one of the following to open the [Inspection Rules Page, page 17-8](#):
- (Device view) Select **Firewall > Inspection Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Select an existing policy or create a new one.

- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#).

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-10](#).

---

- Step 3** Select whether to apply the rule to all interfaces on the device or to only the interfaces you specify. If you elect to specify interfaces, enter the interface name or interface role, or click **Select** to select it from a list. For IOS devices, you also can select whether the rule applies in the Out direction (traffic leaving the interface). Use the In direction for all other device types.
- Step 4** Select the criteria you want to use for matching traffic. This determines what gets inspected based on this rule.

- **Default Protocol Ports**—Select this option if the protocol you are inspecting uses the default ports on your network.

If you want to constrain the inspection based on the source or destination address, also select **Limit inspection between source and destination IP addresses** (available only for ASA, PIX 7.x+, and FWSM 3.x+ devices). When you click **Next**, you are prompted for the source and destination addresses. You can specify **any** for source or destination if you are interested only in configuring the other value.

- **Custom Destination Ports**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic. When you click **Next**, you are prompted for the port or port range.
- **Destination Address and Port (IOS devices only)**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10. When you click **Next**, you are prompted for the destination address and the port information.
- **Source and Destination Address and Port (PIX 7.x+, ASA, FWSM 3.x+)**—Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic. When you click **Next**, you are prompted for the source and destination addresses and the service port information.

---

**Note** For FWSM 2.x and PIX 6.3(x), you can select either Default Inspection Traffic or Custom Destination Ports only.

---

**Step 5** Click **Next**. If you selected anything other than Default Protocol Ports, fill in the required addressing and port information explained above and click **Next**. See [Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-13](#).

**Step 6** On the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select the protocol you want to inspect from the list. Ensure that the Device Type field indicates that inspection is supported for that protocol on the devices to which you are assigning the rule. (If you assign a rule to an unsupported device type, the rule is ignored but you will get a validation warning).

If the protocol you select allows additional configuration, the **Configure** button becomes active. Click it to view and select your options. For more information, see [Configuring Protocols and Maps for Inspection, page 17-22](#).

For IOS devices only:

- If you selected **Custom Destination Ports** or **Destination Address and Port** as the traffic match, you can select **custom protocol** as the protocol name and click **Configure** to assign a name to the configuration.
- You can configure additional alert, audit, and timeout settings that override those set in the inspection settings policy. You can also specify whether to inspect router generated traffic for a limited number of protocols. For more information about inspection settings, see [Configuring Settings for Inspection Rules for IOS Devices, page 17-112](#).

**Step 7** Click **Finish** to save the rule.

**Step 8** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).

---

**Note**

---

From ASA 9.9.1, for cluster mode devices which are enabled with Security Gateway feature, the following list of centralized inspections are disabled:

- DCERPC
- NetBIOS
- PPTP
- RADIUS
- RSH
- SUNRPC
- TFTP
- XDMCP

During preview config, if inspection rules are configured for the unsupported devices, a validation error is displayed.

---

**Note**

---

When there is rollback of device, the default dns policy-map configuration is automatically added to the device. Thus, after Cisco Security Manager processes the device rollback, on re-discovery of the device, the default dns-policy-map configuration is discovered in Cisco Security Manager.

---

## Inspection Rules Page

Use the Inspection Rules page to configure inspection rules for device interfaces. Inspection examines traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

**Note**

---

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 inspection rules were “unified,” meaning one set of inspection rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4, page 1-10](#) for additional information.) In Policy view, IPv4 and unified versions of the inspection policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to all versions of the inspection rule table, except where noted.

If you assign an IPv4 inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

---

Inspection rules are processed after your access rules. Thus, any traffic denied by an access rule is never inspected.

Read the following topics before you configure inspection rules:

- [Understanding Inspection Rules, page 17-2](#)
- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices, page 17-5](#)
- [Configuring Inspection Rules, page 17-5](#)

**Tip**

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

**Navigation Path**

To access the Inspection Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Inspection Rules** from the Policy selector.
- (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Inspection Rules**.

**Field Reference**

**Table 17-1** *Inspection Rules Page*

| Element                           | Description                                                                                                                                                                                                                                                                            |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand all rows/Collapse all rows | Use these buttons to expand or collapse all sections in the rules table.<br><b>Note</b> The buttons are located in the upper-right corner of the Filter area above the inspection rules table.                                                                                         |
| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding the Automatic Conflict Detection User Interface, page 16-30</a> . |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                               |

Table 17-1 Inspection Rules Page (continued)

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit             | <p>Whether a rule identifies traffic that should be inspected based on the conditions set:</p> <ul style="list-style-type: none"> <li>• Permit—Identifies traffic that will be inspected. Shown as a green check mark.</li> <li>• Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked. Shown as a red circle with slash.</li> </ul>                                                                                                                                                                |
| Sources            | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                                                                                                                                                                                                                     |
| Destinations       | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Traffic Match      | <p>The type of matching used in the rule:</p> <ul style="list-style-type: none"> <li>• <b>default-inspection</b>—The rule inspects traffic based on the default port.</li> <li>• TCP,UDP/port number—The rule inspects traffic based on a custom port number.</li> <li>• Service—The rule inspects traffic based on a service specification or service object. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a>, page 6-100.</li> </ul> |
| Interface          | The interfaces or interface roles to which the rule is assigned. <b>Global</b> indicates that the rule is assigned to all interfaces. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects</a> , page 6-73.                                                                                                                                               |
| Dir.               | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                           |
| Inspected Protocol | The protocol to be inspected and possibly some configuration settings for the protocol. You can right-click this cell and choose Edit Inspected Protocol to edit this; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page</a> , page 17-17 for more information.                                                                                                                                                                                                                                                          |
| Time Range         | The time range policy object assigned to the rule. This object defines the time window within which inspection occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Category           | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-13.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description        | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 17-1** *Inspection Rules Page (continued)*

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-72</a> ). |
| Page elements below the rules table       |                                                                                                                                                                                                                                                                                                                                                                                          |
| Query                                     | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports, page 12-28</a>                                                                                                                                                                                                          |
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables, page 12-16</a> .                                                                                                                                                                                                    |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order, page 12-19</a> .                                                                                                                                                                                               |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add or Edit Inspect/Application FW Rule Wizard, page 17-11</a> . If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules, page 12-9</a> .                                              |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules, page 12-10</a> .                                                                                                                                                                                                                                   |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                                                           |

## Add or Edit Inspect/Application FW Rule Wizard

Use the Add or Edit Inspect/Application FW Rule wizard to add and edit inspection rules. The wizard steps you through the process of configuring an inspection rule based on your selection in the **Match Traffic By** group on this page.

Read the following topics before you configure inspection rules:

- [Understanding Inspection Rules, page 17-2](#)
- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices, page 17-5](#)
- [Configuring Inspection Rules, page 17-5](#)

### Navigation Path

From the [Inspection Rules Page, page 17-8](#), click the **Add Row** button or select a row and click the **Edit Row** button.

**Field Reference****Table 17-2 Add and Edit Inspect/Application FW Rule Wizard Step 1: Traffic Match Method**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule       | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules, page 12-20</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Apply the Rule to | <p>The interface to which the rule applies:</p> <ul style="list-style-type: none"> <li>• <b>All Interfaces</b>—Apply the rule to all interfaces. The rule becomes a global rule on ASA, PIX, and FWSM devices. For IOS devices, the rule is configured for each interface in the In direction.</li> <li>• <b>Interface (PIX 7.x+, ASA, FWSM 3.x+, IOS)</b>—Apply the rule only to those interfaces identified in the Interfaces field. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</li> </ul> <p>For IOS devices only, you can select the direction of the traffic to which this rule applies, either traffic entering an interface (<b>In</b>) or exiting it (<b>Out</b>). For other devices, leave <b>In</b> as the direction.</p> |

**Match Traffic By**

How you want to identify the traffic to inspect. If you select something other than Default Protocol Ports (by itself), you are prompted for the other port or address information when you click **Next**.

|                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Protocol Ports                                                                  | Inspect traffic based on the default ports assigned to a protocol. You will select a protocol on the next page ( <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17</a> ).                                                                                                                                                                                                                                                            |
| Limit inspection between source and destination IP addresses (PIX 7.x+, ASA, FWSM 3.x+) | <p>You can also select <b>Limit inspection between source and destination IP addresses</b> to configure the inspection to occur only between a specified source and destination. Do not select this option if you want to inspect a protocol without applying any constraints to the inspected traffic.</p> <p>If you also select this option, the next page of the wizard is described in <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-13</a>.</p> |

**Table 17-2 Add and Edit Inspect/Application FW Rule Wizard Step 1: Traffic Match Method**

| Element                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom Destination Ports                                         | <p>Inspect traffic based on specified non-default TCP or UDP destination ports. Select this option if you want to associate additional TCP or UDP traffic with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic.</p> <p>You will specify the protocol and port(s) on the next page of the wizard; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-13</a>.</p>                                                                         |
| Destination Address and Port (IOS devices only)                  | <p>Inspect traffic on IOS devices based on destination IP address and port. Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10.</p>                                                                                                                           |
| Source and Destination Address and Port (PIX 7.x, ASA, FWSM 3.x) | <p>Inspect traffic on PIX 7.x+, ASA, and FWSM 3.x+ devices based on source and destination IP addresses and services. Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic.</p> <p>You will specify the action, sources, destinations, and Services on the next page of the wizard; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-13</a>.</p> |
| Category                                                         | <p>The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                     |
| Description                                                      | <p>An optional description of the rule (up to 1024 characters).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Add or Edit Inspect/Application FW Rule Wizard, Step 2

The options presented on the second page of the Inspect/Application FW Rule Wizard depend on your **Match Traffic By** selection on the first page (see [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#)). The possibilities are as follows:

- If you select Default Protocol Ports on the first page and *do not* select Limit inspection between source and destination IP addresses, the second page consists of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#).
- If you select Default Protocol Ports on the first page and *do* select Limit inspection between source and destination IP addresses, the second page consists of the options described in the second table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#).)
- If you select Custom Destination Ports on the first page, the second page consists of the options described in the first table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#).)
- If you select Source and Destination Address and Port on the first page, the second page consists of the options described in the second table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#).)

**Navigation Path**

From the [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#), select a Match Traffic By option and click Next.

**Field Reference**

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Custom Destination Ports** on the first page of the wizard (described in [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#)).

**Table 17-3 Add and Edit Inspect/Application FW Rule Wizard Step 2: Protocol and Port Page**

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol | <p>The protocol for the ports you are specifying, either TCP, UDP, or both TCP/UDP.</p> <p>When configuring Custom Destination Ports for an IOS device, you must select TCP/UDP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Ports    | <p>The port(s) used by the traffic you want to inspect. Valid values range from 1 to 65535.</p> <ul style="list-style-type: none"> <li>• Single—Specify one port number only.</li> <li>• Range—Specify a range of ports, for example, 10000-11000.</li> </ul> <p>When configuring custom ports, be aware that port ranges might not be supported on all platforms or OS versions. Any conflicts are identified during policy validation, not while you are editing this rule.</p> <p><b>Tip</b> If you specify a port or port range that conflicts with a pre-defined port mapping, the device does not allow the port to be remapped.</p> |

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Default Protocol Ports** and **Limit inspection between source and destination IP addresses** on the first page of the wizard, and when you select **Source and Destination Address and Port** on the first page. The first page of the wizard is described in [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#).

**Table 17-4** *Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page*

| Element | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | <p>Whether you are identifying traffic that should be inspected based on the conditions set. Typically, you will create Permit rules.</p> <ul style="list-style-type: none"><li>• Permit—Identifies traffic that will be inspected.</li><li>• Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked.</li></ul> |

**Table 17-4** *Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page (continued)*

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects, page 6-80</a>, <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a> and <a href="#">Understanding Interface Role Objects, page 6-73</a> for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies, page 14-16</a>, <a href="#">Configuring TrustSec-Based Firewall Rules, page 14-17</a> and <a href="#">Creating Security Group Objects, page 14-14</a> for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>– Individual user names: NetBIOS_DOMAIN\username</li> <li>– User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>– Identity user group object names.</li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>– <a href="#">Selecting Identity Users in Policies, page 13-21</a></li> <li>– <a href="#">Configuring Identity-Based Firewall Rules, page 13-21</a></li> <li>– <a href="#">Creating Identity User Group Objects, page 13-19</a></li> </ul> </li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

**Table 17-4 Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page (continued)**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destinations | Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.                                                                                                                                                                                                           |
| Services     | The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).<br><br>Enter more than one value by separating the items with commas.<br><br>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-100</a> . |
| Time Range   | The name of a time range policy object that defines the times when this rule applies. The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock.<br><br>Enter the name or click <b>Select</b> to select the object. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                      |

## Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page

Use the Inspect/Application FW Rule wizard's inspected protocol page to configure the protocol monitored by this inspection rule.

The options in this section are presented when you add or edit a firewall inspection rule, and when you right-click the Inspected Protocol cell of an existing rule in the table on the [Inspection Rules Page, page 17-8](#).

### Note

Beginning with version 4.9, Security Manager supports SIP protocol for ASA cluster devices running the software version 9.4.0 or later.

### Navigation Path

Do one of the following:

- In the [Add or Edit Inspect/Application FW Rule Wizard, page 17-11](#), click Next until you reach this page.
- To open the Edit Inspected Protocols dialog box, right-click the Inspected Protocol cell of an inspection rule and choose **Edit Inspected Protocol**. If you select multiple rows, your changes replace the inspected protocol defined for all selected rules.

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocols table                    | <p>Lists the protocols that can be inspected. You can select one protocol per rule. The list includes information on the device operating systems that allow inspection of the protocol: do not select protocols that are not supported by the device type to which you will apply the inspection rule.</p> <p><b>Tip</b> For IOS devices, if you selected Custom Destination Ports or Destination Address and Port for the match type on the first page of the wizard, you can select <b>custom protocol</b> and click Configure to give your protocol a name. For other device types, select the protocol that you associate with the ports previously specified.</p> <p>The Options column displays configured options for the selected protocol, if any.</p> <p>The Group column provides additional information on the use of some of the protocols.</p> |
| Selected Protocol Configure button | <p>Displays the protocol you selected. If the protocol allows additional configuration, the Configure button becomes active; click it to see your options, and click the Help button in the dialog box that is opened for information about the options. For more information about protocols that allow configuration, see <a href="#">Configuring Protocols and Maps for Inspection, page 17-22</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 17-5** *Inspected Protocol Options (continued)*

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Settings (IOS) | <p>Additional settings for the rule if it is used on devices running Cisco IOS software. If you select Use Default Inspection settings, the IOS defaults, or the settings defined in the inspection settings policy (see <a href="#">Configuring Settings for Inspection Rules for IOS Devices, page 17-112</a>), are used. These are the settings you can enable or disable:</p> <ul style="list-style-type: none"> <li>• <b>Alert</b>—Whether to generate stateful packet inspection alert messages on the console.</li> <li>• <b>Audit</b>—Whether audit trail messages are logged to the syslog server or router.</li> <li>• <b>Timeout</b>—Whether to configure the length of time, in seconds, for which a session is managed while there is no activity. If you select Specify Timeout, enter the timeout value; the range is 5 to 43200 seconds.</li> <li>• <b>Inspect Router Generated Traffic</b>—Whether to inspect traffic that is generated by the device itself. This option is available for a limited number of the protocols.</li> </ul> |

## Configure DNS Dialog Box

Use the Configure DNS dialog box to configure settings for DNS inspection on PIX 7.0+, ASA, FWSM, and IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select DNS in the protocols table, and click **Configure**.

### Field Reference

**Table 17-6** *Configure DNS Dialog Box*

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum DNS Packet Length      | The maximum DNS packet length. Values are 512 to 65535.                                                                                                                                                                                                                                                                                                                                                                               |
| DNS Map                        | The DNS policy map object that defines traffic match conditions and actions, protocol conformance policies, and filter settings. Enter the object name, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                  |
| Enable Dynamic Filter Snooping | <p>Whether to allow the security appliance to snoop DNS packets in order to build a database of DNS lookup information. This information is used by botnet traffic filtering to match DNS names to IP addresses.</p> <p>If you configure a botnet traffic filtering rules policy, select this option. Otherwise, do not select the option. For more information, see <a href="#">Botnet Traffic Filter Rules Page, page 19-9</a>.</p> |

## Configure SMTP Dialog Box

Use the SMTP dialog box to edit settings for Simple Mail Transfer Protocol (SMTP) inspection. SMTP is used to transfer email between servers and clients on the Internet.

SMTP inspection drops any packets with illegal commands. You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select SMTP in the protocols table, and click **Configure**.

## Configure ESMTP Dialog Box

Use the Configure ESMTP dialog box to edit settings for Extended Simple Mail Transport Protocol (ESMTP) inspection. You can configure these settings based on platform:

- IOS devices—You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.
- ASA/PIX 7.x+ devices—You can specify an ESMTP policy map object to define deep inspection parameters. Enter the name of the object or click **Select** to select it from a list or to create a new object.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select ESMTP in the protocols table, and click **Configure**.

## Configure Fragments Dialog Box

Use the Configure Fragments dialog box to edit settings for fragment inspection on IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select fragment in the protocols table, and click **Configure**.

### Field Reference

**Table 17-7** *Configure Fragments Dialog Box*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Fragments | <p>The maximum number of unassembled packets for which state information (structures) is allocated by Cisco IOS software. Unassembled packets are packets that arrive at the router interface before the initial packet for a session. Values are 0-10000 state entries. The default is 256.</p> <p><b>Note</b> Memory is allocated for the state structures, and setting this value to a larger number may cause memory resources to be exhausted.</p> |

**Table 17-7** *Configure Fragments Dialog Box (continued)*

| Element       | Description                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout (sec) | The number of seconds that a packet state structure remains active. When the timeout value expires, the router drops the unassembled packet, freeing that structure for use by another packet. Values are 1-1000. The default timeout value is one second. |

## Configure IMAP or POP3 Dialog Boxes

Use the Configure IMAP or POP3 dialog boxes to edit settings for Internet Message Access Protocol (IMAP) or Post Office Protocol 3 (POP3) inspection on IOS devices.

- IMAP is a method for accessing electronic mail or bulletin board messages that are kept on a mail server that may be shared. It permits a client email program to access remote messages as though they were local.
- POP3 is used to receive email that is stored on a mail server. Unlike IMAP, POP retrieves mail only from a remote host.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select IMAP or POP3, and click **Configure**.

### Field Reference

**Table 17-8** *Configure IMAP or POP3 Dialog Boxes*

| Element                                      | Description                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reset Connection on Invalid IMAP/POP3 packet | Whether to reset, or drop, the connection between the client and server if an invalid packet is encountered. The client will have to repeat the validation process to reconnect to the server. |
| Enforce Secure Authentication                | Whether to require that the client use a secure login to the server, that is, so that passwords are not sent in clear text.                                                                    |

## Configure RPC Dialog Box

Use the RPC dialog box to edit settings for RPC inspection on IOS devices. RPC inspection blocks traffic for all RPC programs except for those you specify. To allow more than one RPC program, create a rule for each program number you want to allow.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select RPC in the protocols table, and click **Configure**.

### Field Reference

**Table 17-9** *Configure RPC Dialog Box*

| Element        | Description                                            |
|----------------|--------------------------------------------------------|
| Program Number | The program number to permit. Values are 1-4294967295. |

**Table 17-9** Configure RPC Dialog Box (continued)

| Element   | Description                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wait Time | The number of minutes to keep a hole in the firewall open to allow subsequent connections from the same source address to the same destination address and port. Values are 0-35791 minutes. The default is 0. |

## Custom Protocol Dialog Box

Use the Custom Protocol dialog box to assign a name to the protocol and port specification you made on the [Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-13](#) for IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select custom protocol in the protocols table, and click **Configure**.

## Configure Dialog Box

Use the Configure dialog box to select a policy map object for HTTP or IM inspection. The maps used for these types of inspection differ depending on the operating system version used on the device. Select the desired version and then click **Select** to select the desired policy map object or to create a new one.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17](#), select HTTP or IM in the protocols table, and click **Configure**.

# Configuring Protocols and Maps for Inspection

When you configure inspection rules for a device, you select the protocols that you want to inspect. Some of these protocols allow additional configuration for deep inspection. Deep inspection allows you to specify additional requirements that packets must meet in order to traverse the device. For example, you can drop HTTP connections where the content type of the request and response do not match. (For a full list of inspectible protocols, click **Add Row** on the Inspection Rule page and click Next to view the protocols list.)

What you can configure depends not only on the protocol but on the device's operating system and version number. Typically, your ability to fine-tune inspection is higher on an ASA device compared to an IOS device. (If you are configuring an IOS device and you want greater control over inspection, consider configuring zone-based firewall inspection; for more information, see [Understanding the Zone-based Firewall Rules, page 21-3](#).)

Some deep inspection configuration is done directly in the inspection rule. However, for some protocols, you can configure the inspection rule to include a policy map that you create as an independent policy object. (You need to configure policy maps only if you want something other than the default inspection options.) You can configure these maps from the policy object selector dialog box while configuring the policy, or from the Policy Object Manager window (select **Manage > Policy Objects**).

For protocols that use policy maps, you can select the desired policy map, which defines the match conditions for the targeted traffic. For ASA, PIX, and FWSM devices, these policy maps might point to class maps that define the match conditions. To create these policy maps in the Policy Object Manager,

select one of the maps listed in the following table in the **Maps > Policy Maps > Inspect** folder and review the detailed usage information in the references mentioned. For information on creating class maps, which are in the **Maps > Class Maps > Inspect** folder, see the references to the match criterion dialog boxes and [Configuring Class Maps for Inspection Policies](#), page 17-28.

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules

| Protocol   | Device Types        | Policy Map | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|---------------------|------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS        | ASA, PIX, FWSM, IOS | DNS        | DNS                             | Inspect traffic based on a wide variety of criteria using the class and policy map, which allow extensive control over DNS packets. In addition, you can configure a maximum length in the inspection rule, and enable dynamic DNS snooping for use with Botnet rules (on ASA devices). See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Configuring DNS Maps</a>, page 17-32</li> <li>• <a href="#">DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes</a>, page 17-36</li> <li>• <a href="#">Configure DNS Dialog Box</a>, page 17-19</li> </ul> |
| FTP Strict | ASA, PIX, FWSM, IOS | FTP        | FTP                             | Inspect traffic based on file name, type, server, user, or FTP command. See <a href="#">Configuring FTP Maps</a> , page 17-42 and <a href="#">FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes</a> , page 17-43.                                                                                                                                                                                                                                                                                                                                                               |
| GTP        | ASA, PIX, FWSM, IOS | GTP        | GTP                             | Inspect traffic based on timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance. See <a href="#">Configuring GTP Maps</a> , page 17-45 and <a href="#">GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes</a> , page 17-49.                                                                                                                                                                                                                                                                                                                        |

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules (continued)

| Protocol                 | Device Types        | Policy Map                                                              | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The maps used differ based on the operating system and version.<br><br><b>For ASA/PIX 7.2+</b> , see <a href="#">Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices, page 17-65</a> and <a href="#">HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes, page 17-67</a> .<br><br><b>For ASA/PIX 7.1.x, FWSM 3.x+, and IOS</b> , see <a href="#">Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices, page 17-56</a> . |
| SIP                      | ASA, PIX, FWSM      | SIP (ASA, PIX, FWSM)                                                    | SIP (ASA, PIX, FWSM)            | Inspect traffic based on a wide variety of criteria. See <a href="#">Configuring SIP Maps, page 17-84</a> and <a href="#">SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, page 17-86</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Skinny                   | ASA, PIX, FWSM, IOS | Skinny                                                                  | (none)                          | Inspect traffic based on a wide variety of criteria. See <a href="#">Configuring Skinny Maps, page 17-88</a> and <a href="#">Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-90</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules (continued)

| Protocol           | Device Types                  | Policy Map         | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|-------------------------------|--------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SMTP               | ASA, PIX 7.x+, FWSM 3.x+, IOS | (none)             | (none)                          | Inspect Simple Mail Transfer Protocol (SMTP) traffic and drop any that use illegal commands. You can configure a maximum data length for packets. See <a href="#">Configure SMTP Dialog Box</a> , page 17-20.                                                                                                                                                                                                                               |
| SNMP               | ASA, PIX, FWSM 3.x+, IOS      | SNMP               | (none)                          | Inspect SNMP traffic based on SNMP version. See <a href="#">Configuring SNMP Maps</a> , page 17-91.                                                                                                                                                                                                                                                                                                                                         |
| NetBIOS            | ASA, PIX 7.x+, FWSM           | NetBIOS            | (none)                          | Inspect NetBIOS traffic to translate IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration. You can drop packets that violate the protocol. See <a href="#">Configuring NetBIOS Maps</a> , page 17-82.                                                                                                                                                                              |
| IPSec Pass Through | ASA, PIX 7.x+                 | IPsec Pass Through | (none)                          | Inspect IPSec traffic and control whether ESP or AH traffic is allowed. See <a href="#">Configuring IPsec Pass Through Maps</a> , page 17-81.                                                                                                                                                                                                                                                                                               |
| DCE/RPC            | ASA 7.2+, PIX 7.2+, FWSM 3.2+ | DCE/RPC            | (none)                          | Inspect traffic based on timeouts and enforcing the mapper service. See <a href="#">Configuring DCE/RPC Maps</a> , page 17-29.                                                                                                                                                                                                                                                                                                              |
| IP options         | ASA 8.2(2)+                   | IP Options         | (none)                          | Allow IP packets that have certain options configured in the Options section of the IP header. In routed mode, packets that contain the router-alert option are allowed. Otherwise, if any option is set, packets are dropped. IP options are unnecessary for most communication, but the NOP (no operation) option might be used for padding, so you might want to allow it. See <a href="#">Configuring IP Options Maps</a> , page 17-76. |

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules (continued)

| Protocol                                                                 | Device Types                  | Policy Map | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------|-------------------------------|------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6                                                                     | ASA 8.4(2)+                   | IPv6       | (none)                          | Inspect IPv6 traffic based on the following types of extension headers found anywhere in an IPv6 packet: Hop-by-Hop Options, Routing (Type 0), Fragment, Destination Options, Authentication, and Encapsulating Security Payload. See <a href="#">Configuring IPv6 Maps, page 17-78</a> and <a href="#">IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-79</a> . |
| ESMTP                                                                    | ASA, PIX 7.x+, FWSM 3.x+, IOS | ESMTP      | (none)                          | Inspect ESMTP traffic. For IOS, you can configure only maximum data length. For ASA, PIX, FWSM, you can inspect traffic based on a wide variety of criteria. See <a href="#">Configuring ESMTP Maps, page 17-39</a> .                                                                                                                                                                          |
| Fragment                                                                 | IOS                           | (none)     | (none)                          | Inspect traffic based on a maximum allowed number of unassembled packet fragments. See <a href="#">Configure Fragments Dialog Box, page 17-20</a> .                                                                                                                                                                                                                                            |
| IMAP (Internet Message Access Protocol)<br>POP3 (Post Office Protocol 3) | IOS                           | (none)     | (none)                          | Inspect traffic based on invalid commands or clear text logins. See <a href="#">Configure IMAP or POP3 Dialog Boxes, page 17-21</a> .                                                                                                                                                                                                                                                          |
| RPC (Sun Remote Procedure Call)                                          | FWSM 2.x,<br>IOS              | (none)     | (none)                          | Inspect traffic based on the RPC protocol number. See <a href="#">Configure RPC Dialog Box, page 17-21</a> .                                                                                                                                                                                                                                                                                   |

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules (continued)

| Protocol | Device Types       | Policy Map                          | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|--------------------|-------------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IM       | ASA, PIX 7.x+, IOS | IM (ASA 7.2+, PIX 7.2+)<br>IM (IOS) | IM (only for ASA, PIX)          | Inspect traffic based on a wide variety of criteria. The allowed maps differ based on operating system version.<br><br><b>For ASA, PIX</b> , see <a href="#">Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices</a> , page 17-71 and <a href="#">IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes</a> , page 17-72.<br><br><b>For IOS</b> , see <a href="#">Configuring IM Maps for IOS Devices</a> , page 17-74. |
| SCTP     | ASA 9.5(2)+        | SCTP                                | (none)                          | Inspect traffic based on Payload PID (PPID). See <a href="#">Configuring SCTP Maps</a> , page 17-92 and <a href="#">SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes</a> , page 17-93                                                                                                                                                                                                                                                          |
| Diameter | ASA 9.5(2)+        | Diameter                            | Diameter                        | Inspect traffic based on application ID, command codes, and AVP. ## Configuring Class Maps for Inspection Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring inspection rules for devices running ASA/PIX 7.2 or later, or FWSM, you can create class maps for the inspection of the following types of traffic: DNS, FTP, H.323, HTTP, IM, SIP, and ScanSafe.

You can also define class criteria in the related policy map. However, creating class maps allows you to reuse the map in multiple policy maps.

The following topics describe the available match criteria:

- [DNS Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-36](#)
- [FTP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-43](#)
- [H.323 Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-55](#)
- [HTTP Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-67](#)
- [IM Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-72](#)
- [SIP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-86](#)
- [Diameter Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-96](#)

### Navigation Path

Select **Manage > Policy Objects**, then select DNS, FTP, H.323 (ASA/PIX/FWSM), HTTP (ASA/PIX/FWSM), IM, SIP (ASA/PIX/FWSM), Diameter in the **Maps > Class Maps > Inspect** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

## Configuring DCE/RPC Maps

Use the Add or Edit DCE/RPC Map dialog boxes to define a map for DCE/RPC inspection. A DCE/RPC inspection policy map lets you change the default configuration values used for DCE/RPC inspection.

DCE/RPC is a protocol widely used by Microsoft distributed client and server applications that allows software clients to execute programs on a server remotely.

This typically involves a client querying a server called the Endpoint Mapper listening on a well-known port number for the dynamically allocated network information of a required service. The client then sets up a secondary connection to the server instance providing the service. The security appliance allows the appropriate port number and network address and also applies NAT, if needed, for the secondary connection.

DCE/RPC inspection maps inspect for native TCP communication between the EPM and client on well-known TCP port 135. Map and lookup operations of the EPM are supported for clients. Client and server can be located in any security zone. The embedded server IP address and port number are received from the applicable EPM response messages. Because a client may attempt multiple connections to the server port returned by EPM, multiple use of pinholes are allowed, which have user configurable timeouts.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DCE/RPC** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 17-12 Add and Edit DCE/RPC Dialog Boxes**

| Element                               | Description                                                                                                                                                                                                                                                                                             |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                  | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                   |
| Description                           | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                             |
| Pinhole Timeout                       | The timeout for DCE/RPC pinholes. The default is 2 minutes (00:02:00). Valid values are between 00:00:01 and 1193:00:00.                                                                                                                                                                                |
| Enforce Endpoint Mapper Service       | Whether to enforce the endpoint mapper service during binding. Using this service, a client queries a server, called the Endpoint Mapper, for the dynamically allocated network information of a required service.                                                                                      |
| Enable Endpoint Mapper Service Lookup | Whether to enable the lookup operation of the endpoint mapper service. If you select this option, you can enter the time out for the lookup operation. If you do not specify a timeout, the pinhole timeout or default pinhole timeout value is used. Valid values are between 00:00:01 and 1193:00:00. |
| Service Lookup Timeout                |                                                                                                                                                                                                                                                                                                         |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [DCE/RPC Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-31](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|                                 |                                                                                                                                                                                                                                                                        |

| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## DCE/RPC Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DCE/RPC Match Criterion (for DCE/RPC class maps) or Match Condition and Action (for DCE/RPC policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DCE/RPC class map.
- Select a DCE/RPC class map when creating a DCE/RPC policy map.
- Define the match criterion, value, and action directly in a DCE/RPC policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a DCE/RPC class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DCE/RPC, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring DCE/RPC Maps, page 17-29](#).

|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action<br>(Policy Map only) | <p>The action you want the device to take for traffic that matches the defined criteria.</p> <ul style="list-style-type: none"> <li>Reset—Drop the packet, close the connection, and send a TCP reset to the server or client.</li> <li>Log—Send a system log message. You can use this option alone or with one of the other actions.</li> <li>Reset and Log— Perform the reset and log actions.</li> </ul> |

## Configuring DNS Maps

Use the Add and Edit DNS Map dialog boxes to define DNS Maps for inspection. A DNS map lets you change the default configuration values used for DNS application inspection.

DNS application inspection supports DNS message controls that provide protection against DNS spoofing and cache poisoning. You can configure rules for certain DNS types to be allowed, dropped, or logged, while others are blocked. For example, you can restrict zone transfer between servers.

The Recursion Desired and Recursion Available flags in the DNS header can be masked to protect a public server from attack if that server only supports a particular internal zone. In addition, DNS randomization can be enabled to avoid spoofing and cache poisoning of servers that either do not support randomization or that use a weak pseudo random number generator. Limiting the domain names that can be queried protects the public server further.

You can configure a DNS mismatch alert as notification if an excessive number of mismatching DNS responses are received, which could indicate a cache poisoning attack.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DNS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Values are 0 to 4294967295.</li> <li>• <b>Time Interval</b>—The time period to monitor (in seconds). Values are 1 to 31536000.</li> </ul>                                                                                                                                   |                                                                                                                                                                                                                                                                        |
| <b>Umbrella Connector Tab</b>                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                        |
| Defines DNS umbrella connector settings for a DNS. For a description of the options on this tab, see <a href="#">DNS Umbrella Connector Tab, page 17-35</a> .                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                        |
| <b>Match Condition and Action Tab</b>                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                        |
| The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.                                                                                                                 |                                                                                                                                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>• To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see <a href="#">DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, page 17-36</a>).</li> <li>• To edit a criterion, select it and click the Edit button.</li> <li>• To delete a criterion, select it and click the Delete button.</li> </ul> |                                                                                                                                                                                                                                                                        |
| Category                                                                                                                                                                                                                                                                                                                                                                                                            | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                              |
| Allow Value Override per Device                                                                                                                                                                                                                                                                                                                                                                                     | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Overrides                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                        |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                         | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## DNS Map Protocol Conformance Tab

Use the Protocol Conformance tab to define DNS security settings and actions for a DNS map.

### Navigation Path

Click the Protocol Conformance tab on the Add and Edit DNS Map dialog boxes. See [Configuring DNS Maps, page 17-32](#).

**Field Reference****Table 17-15 DNS Map Protocol Conformance Tab**

| Element                                                       | Description                                                                                                                                                                                     |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable DNS Guard Function                                     | Whether to perform a DNS query and response mismatch check using the identification field in the DNS header. One response per query is allowed to go through the security appliance.            |
| Generate Syslog for ID Mismatch                               | Whether to create syslog entries for excessive instances of DNS identifier mismatches.                                                                                                          |
| Randomize the DNS Identifier for DNS Query                    | Whether to randomize the DNS identifier in the DNS query message.                                                                                                                               |
| Enable NAT Rewrite Function                                   | Whether to enable IP address translation in the A record of the DNS response.                                                                                                                   |
| Enable Protocol Enforcement                                   | Whether to enable DNS message format check, including domain name, label length, compression, and looped pointer check.                                                                         |
| Enable DNS on TCP                                             | Whether to enable inspection of DNS over TCP traffic. Ensure that DNS/TCP port 53 traffic is part of the class to which you apply DNS inspection. The inspection default class includes TCP/53. |
| Require Authentication Between DNS Server (RFC2845)<br>Action | Whether to require authentication between DNS servers as defined in RFC 2845. If you select this option, select the action to take when there is no authentication.                             |

**DNS Map Filtering Tab**

Use the Filtering tab to define DNS filtering settings and actions for a DNS map.

**Navigation Path**

Click the Filtering tab on the Add and Edit DNS Map dialog boxes. See [Configuring DNS Maps, page 17-32](#).

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Fail-Open | <p>Select this check box if you want DNS resolution to work when the Umbrella DNSserver is unavailable.</p> <p>When fail-open is selected, if the Cisco Umbrella DNS server is unavailable, Umbrella disables itself on this policy map and allows DNS requests to go to the other DNS servers configured on the system, if any. When the Umbrella DNS servers are available again, the policy map resumes using them. If you do not select this option, DNS requests continue to go to the unreachable Umbrella resolver and will not get a response.</p>                                                                           |
| Device ID        | <p>The device ID is generated after a successful registration of the device with the umbrella server. The ID is displayed in this field only after you rediscover the device in the Cisco Security Manager.</p> <p><b>Note</b> Whenever there is a change in the device ID, ensure to rediscover the device in Cisco Security Manager to be in sync with the change.</p>                                                                                                                                                                                                                                                             |
| Enable DNScrypt  | <p>Select this check box to enable the DNS crypt in the Umbrella datapath. For every hour, the secret key is exchanged between the key exchange thread and the Umbrella resolver.</p> <p>Ensure that the <b>Enable Umbrella Connector</b> check box is selected. If the check box is not selected, an error message is displayed for configuration discrepancy.</p> <p><b>Note</b> If the Umbrella global policy is not configured, Cisco Security Manager displays activity validation error. For more information on Umbrella global policy configuration, see <a href="#">Configuring Umbrella Global Policy, page 48-17</a>.</p> |

## DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DNS Match Criterion (for DNS class maps) or Match Condition and Action (for DNS policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DNS class map.
- Select a DNS class map when creating a DNS policy map.
- Define the match criterion, value, and action directly in a DNS policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a DNS class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DNS, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring DNS Maps, page 17-32](#).

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value<br>(for DNS Type criterion)               | <p>The DNS type you want to inspect:</p> <ul style="list-style-type: none"> <li>• DNS Type Field Name—Matches the name of a DNS type: <ul style="list-style-type: none"> <li>- A—IPv4 address.</li> <li>- AXFR—Full (zone) transfer.</li> <li>- CNAME—Canonical name.</li> <li>- IXFR—Incremental (zone) transfer.</li> <li>- NS—Authoritative name server.</li> <li>- SOA—Start of a zone of authority.</li> <li>- TSIG—Transaction signature.</li> </ul> </li> <li>• DNS Type Field Value—Matches the specified number.</li> <li>• DNS Type Field Range—Matches the specified range of numbers.</li> </ul>                                                                                                                                        |
| Value<br>(for Domain Name criterion)            | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| Options<br>Value<br>(for Header Flag criterion) | <p>The header flag you want to inspect. Use the Options field to indicate whether you want an exact match (Equals) or a partial match (Contains).</p> <ul style="list-style-type: none"> <li>• Header Flag Name—Matches the selected header flag names: <ul style="list-style-type: none"> <li>- AA (authoritative answer)</li> <li>- QR (query)</li> <li>- RA (recursion available)</li> <li>- RD (recursion denied)</li> <li>- TC (truncation) flag bits</li> </ul> </li> <li>• Header Flag Value—Matches the specified 16-bit hexadecimal value.</li> </ul>                                                                                                                                                                                      |
| Resource Record                                 | <p>Lists the sections to match:</p> <ul style="list-style-type: none"> <li>• Additional—DNS additional resource record.</li> <li>• Answer—DNS answer resource record.</li> <li>• Authority—DNS authority resource record.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring ESMTP Maps

Use the Add and Edit ESMTP Map dialog boxes to define the match criterion and values for the ESMTP inspect map. An ESMTP policy map lets you change the default configuration values used for ESMTP inspection.

ESMTP inspection detects attacks, including spam, phishing, malformed message attacks, and buffer overflow/underflow attacks. It also provides support for application security and protocol conformance, which enforce the sanity of the ESMTP messages as well as detect several attacks, block senders/receivers, and block mail relay.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > ESMTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row and select **Edit Object**.

| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                        |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a>.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## ESMTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for an ESMTP policy map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Body Length—Matches the message body length.
- Body Line Length—Matches the length of a line in the message body.
- Commands—Matches ESMTP commands.
- Command Recipient Count—Matches the number of recipient email addresses.
- Command Line Length—Matches the number of characters of a command line.
- EHLO Reply Parameters—Matches the ESMTP EHLO reply parameters.
- Header Length—Matches the number of characters of the header.
- Header Line Length—Matches the number of characters of a line in the message header.
- To Recipients Count—Matches the number of recipients in the To field of the header.
- Invalid Recipients Count—Matches the number of invalid recipients in the header.
- MIME File Type—Matches the MIME file type.
- MIME Filename Length—Matches the number of characters of the filename.
- MIME Encoding—Matches the MIME encoding scheme.
- Sender Address—Matches the address of the sender.
- Sender Address Length—Matches the number of characters of the sender's address.

**Navigation Path**

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit ESMTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring ESMTP Maps, page 17-39](#).

**Related Topics**

**Field Reference**

**Table 17-20 ESMTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of ESMTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                           |
| Type      | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul> |
| Action    | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                            |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|                     |                                                                                                                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Greater Than Length | The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.<br><br>The dialog box indicates the valid range for the length, except for Body Length and Header length, which can be 1 to 4294967295. |
| Commands            | The ESMTP command verbs you want to inspect.                                                                                                                                                                                                                                                                                     |
| Greater Than Count  | The number of evaluated items. The criterion matches if the count is greater than the specified number, and does not match if the count is less than the specified number.                                                                                                                                                       |
| Parameters          | The ESMTP EHLO reply parameters you want to inspect.                                                                                                                                                                                                                                                                             |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value         | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| MIME Encoding | The type of MIME encoding schemes you want to inspect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring FTP Maps

Use the Add and Edit FTP Map dialog boxes to define the match criterion and values for an FTP inspect map. You can use an FTP map to block specific FTP protocol methods, such as an FTP PUT, from passing through the security appliance and reaching your FTP server.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > FTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                        |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a>.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |
| Validate For Validate button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The device platforms for which to validate the object. Select the platform for which you intend to use this object and click <b>Validate</b> to determine if the object is configured in a way that will prevent policy deployment.                                                                                                                                                                                                                                                              |

## FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit FTP Match Criterion (for FTP class maps) or Match Condition and Action (for FTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an FTP class map.
- Select an FTP class map when creating an FTP policy map.
- Define the match criterion, value, and action directly in an FTP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating an FTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for FTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating an FTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit FTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring FTP Maps, page 17-42](#).

Table 17-22 FTP Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type<br>Class Name<br>(Policy Map only) | Enables you to use an existing FTP class map or define a new FTP class map. <ul style="list-style-type: none"> <li>Use Specified Values—You want to define the class map on this dialog box.</li> <li>Use Values in Class Map—You want to select an existing FTP class map policy object. Enter the name of the FTP class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul> |
| Criterion                                     | Specifies which criterion of FTP traffic to match: <ul style="list-style-type: none"> <li>Request Command—Matches an FTP request command.</li> <li>Filename—Matches a filename for FTP transfer.</li> <li>File Type—Matches a file type for FTP transfer.</li> <li>Server—Matches an FTP server name.</li> <li>Username—Matches an FTP username.</li> </ul>                                                                                                     |
| Type                                          | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. <ul style="list-style-type: none"> <li>Matches—Matches the criterion.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul>                                                                                    |
| Action<br>(Policy Map only)                   | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                                                                                                           |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

**Table 17-22** FTP Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request Commands | <p>The FTP commands you want to inspect:</p> <ul style="list-style-type: none"> <li>• Append (APPE)—Appends to a file.</li> <li>• Delete (DELE)—Deletes a file at the server site.</li> <li>• Help (HELP)—Provides help information from the server.</li> <li>• Put (PUT)—FTP client command for the stor (store a file) command.</li> <li>• Rename From (RNFR)—Specifies rename-from filename.</li> <li>• Server Specific Command (SITE)—Specifies commands that are server specific. Usually used for remote administration.</li> <li>• Change to Parent (CDUP)—Changes to the parent directory of the current working directory.</li> <li>• Get (GET)—FTP client command for the retr (retrieve a file) command.</li> <li>• Create Directory (MKD)—Creates a directory.</li> <li>• Remove Directory (RMD)—Removes a directory.</li> <li>• Rename To (RNTO)—Specifies rename-to filename.</li> <li>• Store File with Unique Name (STOU)—Stores a file with a unique filename.</li> </ul> |
| Value            | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul>                                                                                                                                                                                                                                        |

## Configuring GTP Maps

Use the Add and Edit GTP Map dialog boxes to define the match criterion and values for a GTP inspect map.

The GPRS Tunnel Protocol (GTP) provides uninterrupted connectivity for mobile subscribers between GSM networks and corporate networks or the Internet. GTP uses a tunneling mechanism to provide a service for carrying user data packets.

A GTP map object lets you change the default configuration values used for GTP application inspection. The GTP protocol is designed to provide security for wireless connections to TCP/IP networks such as the Internet. You can use a GTP map to control timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance.

Starting from version 4.18, Cisco Security Manager supports anti-replay feature of ASA 9.10.1. By enabling data packet replay, your network is protected from replay attacks.

**Tip**

GTP inspection requires a special license. If you do not have the required license, you will see device errors if you try to deploy a GTP map.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > GTP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters tab</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Country and Network Codes Table | The three-digit Mobile Country Code (mcc) and Mobile Network Code (mnc) to include in the map. The codes are 000 to 999. <ul style="list-style-type: none"> <li>• To add codes, click the Add button and fill in the dialog box.</li> <li>• To edit a row, select it and click the Edit button.</li> <li>• To delete a row, select it and click the Delete button.</li> </ul>                                                                                                                            |
| Permit Response Table           | The Network/Host policy objects for which you will allow GTP responses from a GSN that is different from the one to which the response was sent. <ul style="list-style-type: none"> <li>• To add objects, click the Add button and fill in the dialog box. For more information, see <a href="#">Add and Edit Permit Response Dialog Boxes, page 17-48</a>.</li> <li>• To edit a row, select it and click the Edit button.</li> <li>• To delete a row, select it and click the Delete button.</li> </ul> |
| Request Queue                   | The maximum requests allowed in the queue. When the limit has been reached and a new request arrives, the request that has been in the queue for the longest time is removed. Values are 1-9999999. The default is 200.                                                                                                                                                                                                                                                                                  |

**Table 17-23 Add and Edit GTP Map Dialog Boxes (continued)**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Limit                     | The maximum number of tunnels allowed.                                                                                                                                                                                                                                                                                                                |
| Permit Errors                    | Whether to permit packets with errors or different GTP versions. By default, all invalid packets or packets that failed during parsing are dropped.                                                                                                                                                                                                   |
| Enable Data Packet Replay Window | Select the check box to configure the anti-replay and select one of the four window sizes—128, 256, 512, or 1024. Messages that are outside of the window size are dropped.<br><br>For information on configuration of GTP Map policy, refer to <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-17</a> . |
| Enable Header                    | Check Select the check box to enable header check of the data packets.                                                                                                                                                                                                                                                                                |
| Anti-User Spoofing               | This field is enabled only when you select the Enable Header Check check box. Select the relevant option: <ul style="list-style-type: none"> <li>• Bypass—to forward the packets that pass the header check.</li> <li>• Drop—to drop the packets that pass the header check.</li> </ul>                                                               |
| Edit Timeouts button             | Click this button to configure time out values for various operations. For more information about the options, see <a href="#">GTP Map Timeouts Dialog Box, page 17-48</a> .                                                                                                                                                                          |
| Enable Logging Location          | Select the check box to get the location information through a syslog message containing the mobile country code and mobile network code. This syslog message is displayed when activating/updating a PDP context on Gn/Gp in GTPv0/v1 or S5/S8 in GTPv2.                                                                                             |
| Enable Cell ID                   | (Optional) Select this check box to add a cell ID to the syslog message.<br><br><b>Note</b> This option is enabled only when you select the Enable Logging Location check box.                                                                                                                                                                        |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-49](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

**Table 17-23 Add and Edit GTP Map Dialog Boxes (continued)**

| Element                         | Description                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Validate For<br>Validate button | The device platforms for which to validate the object. Select the platform for which you intend to use this object and click <b>Validate</b> to determine if the object is configured in a way that will prevent policy deployment. |

## Add and Edit Country Network Codes Dialog Boxes

Use the Add and Edit Country Network Codes dialog boxes to add Mobile Country Code (mcc) and Mobile Network Code (mnc) values to the GTP policy map. The codes can be 000 to 999.

### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Country and Network codes table, or select a row and click the **Edit** button. See [Configuring GTP Maps, page 17-45](#).

## Add and Edit Permit Response Dialog Boxes

Use the Add and Edit Permit Response dialog boxes to permit GTP responses from a GSN that is different from the one to which the response was sent.

Enter the name of a Network/Host policy object that defines the destination (**To Object Group**) and source (**From Object Group**) of the traffic. You can click **Select** to select the object from a list, where you can also create a new object by clicking the **Create** button in the Object Selector dialog box.

You cannot use the Network/Host object named “any.”

### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Permit Response table, or select a row and click the **Edit** button. See [Configuring GTP Maps, page 17-45](#).

## GTP Map Timeouts Dialog Box

Use the GTP Map Timeouts dialog box to set timeout values for a GTP Map.

### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Edit Timeouts** button on the Parameters tab. See [Configuring GTP Maps, page 17-45](#).

### Field Reference

**Table 17-24 GTP Map Timeouts Dialog Box**

| Element                                | Description                                                                                                                          |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| GSN Timeout (Prior to ASA 9.5(1))      | The period of inactivity (hh:mm:ss) after which a GSN is removed. The default is 30 minutes. Enter 0 to never tear down immediately. |
| Endpoint Timeout (ASA 9.5(1) or later) |                                                                                                                                      |

**Table 17-24 GTP Map Timeouts Dialog Box (continued)**

| Element                       | Description                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDP Context Timeout           | The maximum period of time allowed (hh:mm:ss) before beginning to receive the PDP context. The default is 30 minutes. Enter 0 to specify no limit.                                                  |
| Request Queue Timeout         | The maximum period of time allowed (hh:mm:ss) before beginning to receive the GTP message. The default is 60 seconds. Enter 0 to specify no limit.                                                  |
| Signaling Connections Timeout | The period of inactivity (hh:mm:ss) after which the GTP signaling is removed. The default is 30 minutes. Enter 0 to not remove the signal.                                                          |
| Tunnel Timeout                | The period of inactivity (hh:mm:ss) after which the GTP tunnel is torn down. The default is 60 seconds (when a Delete PDP Context Request is not received). Enter 0 to never tear down immediately. |
| T3 Response Timeout           | The maximum wait time for a response before removing the connection.                                                                                                                                |

## GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a GTP policy map.

The fields on this dialog box change based on the criterion you select.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit GTP Map dialog box, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring GTP Maps, page 17-45](#).

**Field Reference****Table 17-25** GTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | <p>Specifies which criterion of GTP traffic to match:</p> <ul style="list-style-type: none"> <li>• Access Point Name—Matches the access point name so you can define the access points to drop when GTP application inspection is enabled.</li> <li>• Message ID—Matches the numeric identifier for the message that you want to drop. By default, all valid message IDs are allowed.</li> <li>• Message Length—Matches the length of the UDP packet. Use this criterion to change the default for the maximum allowed message length for the UDP payload.</li> <li>• Version—Matches the GTP version.</li> <li>• MSISDN—Matches the MSISDN with regular expressions or class and drop all GTP packets that have matching MSISDN.</li> <li>• Selection Mode—Ranges between 0 and 3.</li> </ul> |
| Type      | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |
| Action    | <p>The action you want the device to take for traffic that matches the defined criteria.</p> <ul style="list-style-type: none"> <li>• Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped.</li> <li>• Drop Packet and Log</li> <li>• Rate Limit</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

**Table 17-25 GTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes (continued)**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Point Name        | <p>The access points to act on when GTP application inspection is enabled.</p> <ul style="list-style-type: none"> <li>Specified By—An access point name to be dropped. By default, all messages with valid APNs are inspected, and any APN is allowed.</li> <li>Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| ID type                  | <p>The numeric identifier of the message that you want to act on.</p> <ul style="list-style-type: none"> <li>Value—A single message ID. The Value can be between 1 and 255.</li> <li>Range—A range of message IDs. The Range can be between 1 and 255.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Minimum Length           | The minimum number of bytes in the UDP payload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Maximum Length           | The maximum number of bytes in the UDP payload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Version                  | <p>Beginning with version 4.9, Security Manager provides support for GPRS Tunnel Protocol (GTP) v2 and enhanced v1 in the GTP Map Object for ASA devices 9.5(1) or later. You can now configure separate message ID matching for GTPv1 and GTPv2.</p> <p>For ASA devices 9.5(1) or later, if you select Message ID as the Criterion, two options for Version, v1 and v2, are displayed. Select v1 or v2 and enter a single Value between 1 and 255, or a Range of values from 1 to 255.</p>                                                                                                                                                                                                                                                                                                                                                                                     |
| Version Type             | Prior to ASA version 9.5(1)—Use 0 to identify Version 0 and 1 to identify Version 1. Version 0 of GTP uses port 2123, while Version 1 uses port 3386. By default all GTP versions are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Regular Expression       | Beginning with version 4.18, Cisco Security Manager allows configuring of MSISDN with regular expressions and drop all GTP packets that have matching MSISDN. This field appears when you select MSISDN in the Criterion drop-down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Regular Expression Group | Beginning with version 4.18, Cisco Security Manager allows configuring of MSISDN with regular expressions class and drop all GTP packets that have matching MSISDN. This field appears when you select MSISDN in the Criterion drop-down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Mode Value               | If Selection is selected in the Criterion drop-down, this field appears. Enter the mode value in the range of 0 – 3. This is a mandatory field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Configuring H.323 Maps

Use the Add and Edit H.323 Map dialog boxes to define the match criterion and values for an H.323 inspect map. An H.323 policy map lets you change the default configuration values used for H.323 inspection.

H.323 inspection supports H.323 compliant applications such as Cisco CallManager and VocalTec Gatekeeper. H.323 is a suite of protocols defined by the International Telecommunication Union for multimedia conferences over LANs. The security appliance supports H.323 through Version 4, including H.323 v3 feature Multiple Calls on One Call Signaling Channel.

With H.323 inspection enabled, the security appliance supports multiple calls on the same call signaling channel, a feature introduced with H.323 Version 3. This feature reduces call setup time and reduces the use of ports on the security appliance. The two major functions of H.323 inspection are as follows:

- NAT the necessary embedded IPv4 addresses in the H.225 and H.245 messages. Because H.323 messages are encoded in PER encoding format, the security appliance uses an ASN.1 decoder to decode the H.323 messages.
- Dynamically allocate the negotiated H.245 and RTP/RTCP connections.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > H.323 (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Name                  | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description           | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| HSI Group table       | <p>The HSI groups to include in the map. The group number, IP address of the HSI host, and IP addresses and interface names of the clients connected to the security appliance are shown in the table. Up to five HSI hosts per group, and up to ten end points per HSI group, are allowed.</p> <ul style="list-style-type: none"> <li>• To add a group, click the Add button and fill in the dialog box (see <a href="#">Add or Edit HSI Group Dialog Boxes, page 17-54</a>).</li> <li>• To edit a group, select it and click the Edit button.</li> <li>• To delete a group, select it and click the Delete button.</li> </ul> |

**Table 17-26 Add and Edit H.323 Map Dialog Boxes (continued)**

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Duration Limit                                             | The call duration limit in seconds. The range is from 0:0:0 to 1163:0:0. A value of 0 means never timeout.                                                                                                                                                                                                                                                                                                                                              |
| Enforce Presence of Calling and Called Party Numbers            | Whether to enforce calling and called party numbers used in call setup.                                                                                                                                                                                                                                                                                                                                                                                 |
| Allow the facility message before SETUP for H.460.18            | Whether to allow the FACILITY message to be sent before the SETUP message as part of the Incoming Call Message Procedure.<br><b>Note</b> H.460.18 defines a method for traversal of H.323 signaling across network address translators and firewalls.                                                                                                                                                                                                   |
| Check State Transition on H.225 Messages                        | Whether to enable state checking validation on H.225 messages.                                                                                                                                                                                                                                                                                                                                                                                          |
| Check State Transition on RAS Messages                          | Whether to enable state checking validation on RAS messages.                                                                                                                                                                                                                                                                                                                                                                                            |
| Create Pinholes on Seeing RCF Packets                           | Whether to enable call setup between H.323 endpoints when the Gatekeeper is inside the network. The device opens pinholes for calls based on Registration Request/Registration Confirm (RRQ/RCF) messages. Because these RRQ/RCF messages are sent to and from the Gatekeeper, the calling endpoint's IP address is unknown and the device opens a pinhole through source IP address/port 0/0.<br><br>This option is available for ASA 8.0(5)+ devices. |
| Check for H.245 Tunneling Action                                | Whether to enforce H.245 tunnel blocking and perform the action you select in the Action list box.                                                                                                                                                                                                                                                                                                                                                      |
| Check RTP Packets for Protocol Conformance                      | Whether to check RTP packets flowing through the pinholes for protocol conformance.                                                                                                                                                                                                                                                                                                                                                                     |
| Payload Type must be Audio or Video based on Signaling Exchange | Whether to enforce the payload type to be audio or video based on the signaling exchange.                                                                                                                                                                                                                                                                                                                                                               |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [H.323 Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-55](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|          |                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> . |

|                                 | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Add or Edit HSI Group Dialog Boxes

Use the Add or Edit HSI group dialog boxes to add HSI groups to an H.323 policy inspection map.

### Navigation Path

From the Parameters tab on the Add and Edit H.323 Map dialog boxes, click the **Add Row** button in the HSI group table, or select a row and click the **Edit Row** button. See [Configuring H.323 Maps, page 17-52](#).

### Field Reference

**Table 17-27 Add and Edit HSI Group Dialog Boxes**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group ID       | The HSI group ID number (0 to 2147483647).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IP Address     | The IP address of the HSI host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Endpoint table | <p>The end points associated with HSI group. You can add up to 10 end points per group. For each end point, you specify the IP address and interface policy group.</p> <ul style="list-style-type: none"> <li>To add an end point, click the Add button and fill in the dialog box (see <a href="#">Add or Edit HSI Endpoint IP Address Dialog Boxes, page 17-54</a>).</li> <li>To edit an end point, select it and click the Edit button.</li> <li>To delete an end point, select it and click the Delete button.</li> </ul> |

## Add or Edit HSI Endpoint IP Address Dialog Boxes

Use the Add or Edit HSI Endpoint IP Address dialog box to add end points to an HSI group.

### Navigation Path

From the Add and Edit HSI Group dialog boxes, click the **Add Row** button in the end point table, or select a row and click the **Edit Row** button. See [Configuring H.323 Maps, page 17-52](#).

**Field Reference****Table 17-28 Add and Edit HSI Endpoint IP Address Dialog Boxes**

| Element      | Description                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network/Host | The IP address of the end point host or network.                                                                                                                                                                              |
| Interface    | The Interface policy group that identifies the interface connected to the security appliance. Enter the name of a policy group, or click <b>Select</b> to select it from a list, where you can also create new policy groups. |

**H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes**

Use the Add or Edit H.323 Match Criterion (for H.323 class maps) or Match Condition and Action (for H.323 policy maps) dialog boxes to do the following:

- Define the match criterion and value for an H.323 class map.
- Select an H.323 class map when creating an H.323 policy map.
- Define the match criterion, value, and action directly in an H.323 policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

**Navigation Path**

When creating an H.323 class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for H.323, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating an H.323 policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit H.323 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring H.323 Maps, page 17-52](#).

| <b>Variable Fields</b>                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Value                                                                                                                            | The regular expression you want to evaluate. You can select one of the following: <ul style="list-style-type: none"> <li>Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| Media Type                                                                                                                       | The type of media you want to inspect, audio, video, or data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices

### Note

From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Use the Add and Edit HTTP Map dialog boxes to define HTTP maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x, and IOS devices.

The enhanced HTTP inspection feature, which is also known as an application firewall, verifies that HTTP messages conform to RFC 2616, use RFC-defined methods, and comply with various other criteria. This can help prevent attackers from using HTTP messages for circumventing network security policy.

When you enable HTTP inspection with an HTTP map, strict HTTP inspection with the action reset and log is enabled by default. You can change the actions performed in response to inspection failure, but you cannot disable strict inspection as long as the HTTP map remains enabled. Security Manager uses the **http-map** command to configure the map on the device.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.1.x/PIX 7.1.x/FWSM3.x/IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Generate Syslog                                                             | <p><b>Tip</b> You can select multiple methods at a time using Ctrl+click if the action and syslog requests are the same for each.</p> <p>The actions you can specify are:</p> <ul style="list-style-type: none"> <li>• Allow Packet—Allow the message.</li> <li>• Drop Packet—Close the connection.</li> <li>• Reset Connection (default)—Send a TCP reset message to client and server.</li> </ul> |
| Specify the action to be applied for the remaining available methods above. | Whether to define a default action for the methods for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.                                                                                                                                                                                         |

**HTTP Map Port Misuse Tab**

Use the Port Misuse tab to enable port misuse application firewall inspection. The application categories you can configure are:

- IM—Instant Messaging. The applications checked for are Yahoo! Messenger, AIM, and MSN IM.
- P2P—Peer-to-peer applications. The Kazaa application is checked.
- Tunneling—Tunneling applications. The applications checked for are HTTPPort/HTTHost, GNU Httptunnel, GotoMyPC, Firethru, and Http-tunnel.com Client.

**Navigation Path**

Click the Port Misuse tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices, page 17-56](#).

**HTTP Map Transfer Encoding Tab**

Use the Transfer Encoding tab to enable inspection based on the transfer encoding type. The encoding types that you can configure are:

- Chunked—Identifies the transfer encoding type in which the message body is transferred as a series of chunks.
- Compressed—Identifies the transfer encoding type in which the message body is transferred using UNIX file compression.
- Deflate—Identifies the transfer encoding type in which the message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).
- GZIP—Identifies the transfer encoding type in which the message body is transferred using GNU zip (RFC 1952).
- Identity—Identifies connections in which no transfer encoding is performed in the message body.

**Navigation Path**

Click the Transfer Encoding tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#), page 17-56.

## Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add and Edit HTTP Map dialog boxes to define the match criterion and values for the HTTP inspect map for ASA and PIX software releases 7.2 and later.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

## Field Reference

Table 17-37 Add and Edit HTTP Map Dialog Boxes (ASA 7.2+/PIX 7.2+)

| Element                       | Description                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                          | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                             |
| Description                   | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                       |
| <b>Parameters tab</b>         |                                                                                                                                                                                   |
| Body Match Maximum            | The maximum number of characters in the body of an HTTP message that should be searched in a body match.<br><b>Tip</b> A high value can have a significant impact on performance. |
| Check for protocol violations | Whether to check for protocol violations.                                                                                                                                         |
| Action                        | The action to take based on the defined settings. You can drop, reset, or log the connection.                                                                                     |
| Spoof Server                  | Enables you to replace the server HTTP header value with the specified string.                                                                                                    |

## Match Condition and Action Tab

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [HTTP Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-67](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|                                 |                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                       |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                          |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                 |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                    |
| Overrides: None                 | Shows that no overrides exist on the device. You must manually set overrides in order to change the display. For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><b>Note</b> Selecting Allow Value Override per Device does not automatically set overrides. |

## HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add or Edit HTTP Match Criterion (for HTTP class maps) or Match Condition and Action (for HTTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an HTTP class map.
- Select an HTTP class map when creating an HTTP policy map.
- Define the match criterion, value, and action directly in an HTTP policy map.

These types of maps are used only for devices running ASA 7.2 or later, or PIX 7.2 or later, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map. You can use the following criteria:

- Request/Response Content Type Mismatch—Specifies that the content type in the response must match one of the MIME types in the accept field of the request.
- Request Arguments—Applies the regular expression match to the arguments of the request.
- Request Body—Applies the regular expression match to the body of the request.
- Request Body Length—Specifies that the body length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Count—Specifies that the number of headers in the request be matched as greater than or less than the specified number.
- Request Header Length—Specifies that the header length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Field—Applies the regular expression match to the header of the request.
- Request Header Field Count—Applies the regular expression match to the header of the request based on a specified number of header fields.
- Request Header Field Length—Applies the regular expression match to the header of the request based on a specified field length.
- Request Header Content Type—Specifies the content type to evaluate in the content-type header field of the request.
- Request Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the request.
- Request Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the request.
- Request Method—Specifies the method of the request to match.
- Request URI—Applies the regular expression match to the URI of the request.
- Request URI Length—Specifies that the URI length of the request be matched as greater than or less than the specified number of bytes.
- Response Body ActiveX—Specifies whether there is ActiveX content in the body of the request.
- Response Body Java Applet—Specifies whether there is a Java applet in the body of the request.

- **Response Body**—Applies the regular expression match to the body of the response.
- **Response Body Length**—Specifies that the body length of the response be matched as greater than or less than the specified number of bytes.
- **Response Header Count**—Specifies that the number of headers in the response be matched as greater than or less than the specified number.
- **Response Header Length**—Specifies that the header length of the response be matched as greater than or less than the specified number of bytes.
- **Response Header Field**—Applies the regular expression match to the header of the response.
- **Response Header Field Count**—Applies the regular expression match to the header of the response based on a specified number of header fields.
- **Response Header Field Length**—Applies the regular expression match to the header of the response based on a specified field length.
- **Response Header Content Type**—Specifies the content type to evaluate in the content-type header field of the response.
- **Response Header Transfer Encoding**—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the response.
- **Response Header Non-ASCII**—Specifies whether there are non-ASCII characters in the header of the response.
- **Response Status Line**—Applies the regular expression match to the status line of the response.

#### Navigation Path

When creating an HTTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for HTTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating an HTTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit HTTP Map dialog boxes for ASA/PIX 7.2+ devices, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices, page 17-65](#).

**Field Reference****Table 17-38 HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes**

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type<br>Class Name<br>(Policy Map only) | Enables you to use an existing HTTP class map or define a new HTTP class map. <ul style="list-style-type: none"> <li>Use Specified Values—You want to define the class map on this dialog box.</li> <li>Use Values in Class Map—You want to select an existing HTTP class map policy object. Enter the name of the HTTP class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul> |
| Criterion                                     | Specifies which criterion of HTTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                                                                                                               |
| Type                                          | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. <ul style="list-style-type: none"> <li>Matches—Matches the criterion. For some criteria, this is the only available option.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul>                                  |
| Action<br>(Policy Map only)                   | The action you want the device to take for traffic that matches the defined criteria. The types of action depend on the criterion you select.                                                                                                                                                                                                                                                                                                                       |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field Name | The name of the header field to evaluate. You can select one of the following: <ul style="list-style-type: none"> <li>Predefined—The predefined HTTP header fields.</li> <li>Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> </ul> |

**Table 17-38** HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes (continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value               | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> <p>When you are evaluating the Request Header Transfer Encoding or Response Header Transfer Encoding criteria, you can also select these options:</p> <ul style="list-style-type: none"> <li>• Specified By—One of the following predefined types of transfer encoding: <ul style="list-style-type: none"> <li>– Chunked—The message body is transferred as a series of chunks.</li> <li>– Compressed—The message body is transferred using UNIX file compression.</li> <li>– Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).</li> <li>– GZIP—The message body is transferred using GNU zip (RFC 1952).</li> <li>– Identity—No transfer encoding is performed.</li> </ul> </li> <li>• Empty—The transfer-encoding field in request header is empty.</li> </ul> |
| Greater Than Length | <p>The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Greater Than Count  | <p>The number of evaluated items. The criterion matches if the count is greater than the specified number, and does not match if the count is less than the specified number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add and Edit IM Map dialog boxes to define settings for define an Instant Messenger (IM) inspect map for devices running ASA/PIX 7.2 or later. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

For ASA and PIX devices, IM application inspection provides detailed access control to control network usage. You can use regular expressions to help stop leakage of confidential data and the propagation of network threats. You can inspect Yahoo! Messenger or MSN Messenger traffic.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 17-39 Add and Edit IM Map Dialog Boxes**

| Element     | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description | A description of the policy object. A maximum of 200 characters is allowed. |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [IM Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-72](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

**IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes****Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add or Edit IM Match Criterion (for IM class maps) or Match Condition and Action (for IM policy maps) dialog boxes to do the following:

- Define the match criterion and value for an IM class map.
- Select an IM class map when creating an IM policy map.
- Define the match criterion, value, and action directly in an IM policy map.

These types of maps are used only for devices running ASA 7.2 or later, or PIX 7.2 or later, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

**Navigation Path**

When creating an IM class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for IM, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating an IM policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit IM Map dialog boxes for ASA 7.2/PIX 7.2, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices, page 17-71](#).

| IP Address                                                                                                                       | The IP address you want to match.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Protocol                                                                                                                         | The IM protocol, either MSN Messenger or Yahoo! Messenger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Services                                                                                                                         | The IM services you want to inspect. Select one or more of the listed services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring IM Maps for IOS Devices

### Note

From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Use the Add and Edit IM Map (IOS) dialog boxes to configure Instant Messaging (IM) inspection policy map objects for IOS devices. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

IM application inspection provides detailed access control to control network usage. It also helps stop leakage of confidential data and the propagation of network threats. The scope can be limited by identifying permitted or denied servers. Inspection of Yahoo! Messenger, MSN Messenger, and AOL instant messages are supported.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

**Field Reference****Table 17-41 Add and Edit IM Map (IOS) Dialog Boxes**

| Element     | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description | A description of the policy object. A maximum of 200 characters is allowed. |

**Service Tabs**

The tabs represent different IM service providers. The settings available on each tab are identical. You must configure the settings separately for each service provider. The descriptions of the following fields apply to each of the services: Yahoo!, MSN, and AOL.

|                                           |                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Text Chat                                 | How you want the text chat service to be handled, for example, allowed, denied, logged, or some combination.                                                                                                                                                                 |
| Other Services                            | How you want services other than text chat to be handled, for example, allowed, denied, logged, or some combination. IOS software recognizes all services other than text chat, such as voice-chat, video-chat, file sharing and transferring, and gaming as a single group. |
| Permit Servers                            | The servers from which to permit traffic. Accepted formats are IP addresses, IP ranges, and hostnames separated by commas.                                                                                                                                                   |
| Deny Servers                              | The servers from which to deny traffic. Accepted formats are IP addresses, IP ranges, and hostnames separated by commas.                                                                                                                                                     |
| Alert                                     | Whether you want to enable or disable alerts. The default is to use the default inspection settings.                                                                                                                                                                         |
| Audit                                     | Whether you want to enable or disable an audit trail. The default is to use the default inspection settings.                                                                                                                                                                 |
| Timeout                                   | A timeout for the service. You can use the default inspection settings, or you can elect to specify a timeout. If you select Specify Timeout, enter the timeout value in seconds.                                                                                            |
| Category                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                    |
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .       |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                 |

## Configuring IP Options Maps

Use the Add and Edit IP Options Map dialog boxes to define maps for the inspection of the options in an IP packet header on ASA 8.2(2)+ devices. The options field provides for control functions that are required in some situations but unnecessary for most common communications.

If you do not configure IP options inspection, the ASA device drops packets that have any options configured, with one exception. In routed mode, packets that contain the router alert option are allowed. (To disallow router alert packets, create an IP options map with router alert deselected, and configure an inspection rule to inspect IP Options using the policy map.)

### Tip

Because the no operation (NOP) option might be used as padding to ensure proper packet-header size and alignment, you might want to allow NOP.

For each option, you can select whether to:

- **Allow**—Allow the packet and do not change the IP header options field.
- **Clear**—Allow the packet and clear the option from the IP header options field.

If you do not select an option, the option is prohibited, and packets containing the option are dropped. Any option not listed here also results in a dropped packet; you cannot change this behavior.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IP Options** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                |
| Description         | A description of the policy object.                                                                                                                                                                                                                                                                                                                                                   |
| End of Options List | End of Options List (EOOL), or IP Option 0, contains just a single zero byte and appears at the end of all options to mark the end of a list of options. This might not coincide with the end of the header according to the header length.                                                                                                                                           |
| No operation        | No Operation (NOP), or IP Option 1, is used for padding. The Options field in the IP header can contain zero, one, or more options, which makes the total length of the field variable. However, the IP header must be a multiple of 32 bits. If the number of bits of all options is not a multiple of 32 bits, the NOP option is used as to align the options on a 32-bit boundary. |

| Element                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router alert                                                     | Router Alert (RTRALT), or IP Option 20, notifies transit routers to inspect the contents of the packet even when the packet is not destined for that router. This inspection is valuable when implementing RSVP and similar protocols require relatively complex processing from the routers along the packet's delivery path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Basic Security ( <i>ASA devices 9.5(1) or later</i> )            | IP-option Basic Security (number 130) from RFC 1108, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Commercial Security ( <i>ASA devices 9.5(1) or later</i> )       | IP-option Commercial Security (number 134), default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Default ( <i>ASA devices 9.5(1) or later</i> )                   | IP-option default configuration, default is drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Experimental Flow Control ( <i>ASA devices 9.5(1) or later</i> ) | IP-option Experimental Flow Control (number 205), default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Experimental Measurement ( <i>ASA devices 9.5(1) or later</i> )  | IP-option Experimental Measurement (number 10), default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Extended-Security ( <i>ASA devices 9.5(1) or later</i> )         | IP-option Extended Security (number 133) from RFC 1108, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IMI Traffic Descriptor ( <i>ASA devices 9.5(1) or later</i> )    | IP-option IMI Traffic Descriptor (number 144), default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Quick Start ( <i>ASA devices 9.5(1) or later</i> )               | IP-option Router Alert (number 25) from RFC 4782, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Record Route ( <i>ASA devices 9.5(1) or later</i> )              | IP-option Record Route (number 7) from RFC 791, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Time Stamp ( <i>ASA devices 9.5(1) or later</i> )                | IP-option Router Alert (number 68) from RFC 791, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Note</b>                                                      | Beginning with version 4.9, Security Manager supports 10 new IP Options for ASA devices running the software version 9.5(1) or later. You can tune the inspection to allow, clear, or drop any standard or experimental options. You can also configure specific IP Options apart from the ones that are defined. For example, a value ranging between 0 and 255 can be used to configure an IP Option directly. Security Manager supports the CLI '[no] 0-255 allow   clear'. You can also set a default behavior for options not explicitly defined in an IP options inspection map. You now select which options to allow and optionally clear. For a list of IP options, with references to the relevant RFCs, see the IANA page, <a href="http://www.iana.org/assignments/ip-parameters/ip-parameters.xhtml">http://www.iana.org/assignments/ip-parameters/ip-parameters.xhtml</a> |
| Category                                                         | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-13.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Allow Value Override per Device                                  | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , page 6-18.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Edit button                                                      | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring IPv6 Maps

Use the Add and Edit IPv6 Map dialog boxes to define the match criteria and values for an IPv6 inspect map. You can use an IPv6 map to selectively drop IPv6 packets based on following types of extension headers found anywhere in the IPv6 packet:

- Hop-by-Hop Options
- Routing (Type 0)
- Fragment
- Destination Options
- Authentication
- Encapsulating Security Payload

Service objects corresponding to these protocols are available in the Services table in the [Policy Object Manager, page 6-4](#).

### Note

With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies for configuring IPv4 and IPv6 inspection rules were unified. However, IPv6 maps are still provided in support of earlier versions.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPv6** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                              | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides in the <a href="#">Policy Object Overrides Window</a> , page 6-20. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define an Extension Header match criterion and action for an IPv6 policy map. The contents of the Extension Headers are not processed; an action is applied based solely on the presence of a specified EH type.

The fields in these dialog boxes change based on the criterion you select.

### Note

You can apply multiple match definitions to one IPv6 policy map.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IPv6 Maps](#), page 17-78.

| Action  | <p>Choose the action you want the device to take for traffic that matches the defined criteria:</p> <ul style="list-style-type: none"> <li>• Drop Packet—Matching packets are dropped without notification.</li> <li>• Drop Packet and Log—Matching packets are logged and then dropped.</li> <li>• Log—Matching packets are logged and processing continues.</li> </ul> |

## Configuring IPsec Pass Through Maps

Use the Add and Edit IPsec Pass Through Map dialog boxes to configure settings for the IPsec Pass Through Map policy object. An IPsec Pass Through policy map lets you change the default configuration values used for IPsec Pass Through inspection.

The IPsec Pass Through inspection engine lets the security appliance pass ESP (IP protocol 50) and AH (IP protocol 51) traffic that is formed between two hosts because of successful IKE (UDP port 500) negotiation without the requirement of specific ESP or AH access lists.

The ESP or AH traffic is permitted by the inspection engine with the configured idle timeout if there is an existing control flow and it is within the connection limit defined in the MPF framework. A new control flow is created for IKE UDP port 500 traffic with the configured UDP idle timeout if there is not one, or it uses the existing flow.

To ensure that the packet arrives into the inspection engine, a hole is punched for all such traffic (ESP and AH). This inspect is attached to the control flow. The control flow is present as long as there is at least one data flow (ESP or AH) established, but the traffic always flows on the same connection. Because this IKE connection is kept open as long as data flows, a rekey would always succeed. The flows are created irrespective of whether NAT is being used. However, PAT is not supported.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPsec Pass Through** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow ESP<br>Maximum ESP Tunnels per Client<br>ESP Idle Timeout | Whether to allow ESP traffic. If you select this option, you can configure the maximum number of ESP tunnels that each client can have and the amount of time that an ESP tunnel can be idle before it is closed (in hours:minutes:seconds format). The default timeout is 10 minutes (00:10:00).                                                                                                                                                                                          |
| Allow AH<br>Maximum AH Tunnels per Client<br>AH Idle Timeout    | Whether to allow AH traffic. If you select this option, you can configure the maximum number of AH tunnels that each client can have and the amount of time that an AH tunnel can be idle before it is closed (in hours:minutes:seconds format). The default timeout is 10 minutes (00:10:00).                                                                                                                                                                                             |
| Category                                                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device<br>Overrides<br>Edit button     | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring NetBIOS Maps

Use the Add or Edit NetBIOS Map dialog boxes to define maps for NetBIOS inspection. A NetBIOS policy map lets you change the default configuration values used for NetBIOS inspection.

The NetBIOS inspection engine translates IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > NetBIOS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Check for Protocol Violation Action                   | Whether to check for NETBIOS protocol violations. If you select this option, select the action you want to take when violations occur.                                                                                                                                                                                                                                                                                                                                                 |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                              |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring ScanSafe Maps

Use the Add or Edit ScanSafe Map dialog boxes to define maps for ScanSafe inspection. A ScanSafe policy map lets you change the default configuration values used for ScanSafe inspection.

The fields on this dialog box change, depending upon whether you are creating a class map or a policy map.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > ScanSafe** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring SIP Maps

Use the Add and Edit SIP Map dialog boxes to configure values used for SIP application inspection. A SIP inspection map lets you change the default configuration values used for SIP application inspection.

SIP is a widely used protocol for Internet conferencing, telephony, presence, events notification, and instant messaging. Partially because of its text-based nature and partially because of its flexibility, SIP networks are subject to a large number of security threats.

SIP application inspection provides address translation in message header and body, dynamic opening of ports and basic sanity checks. It also supports application security and protocol conformance, which enforce the sanity of the SIP messages, as well as detect SIP-based attacks.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SIP (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Permit Non-SIP Traffic on SIP Port                                                                            | Whether to permit non-SIP traffic on the SIP port.                                                                                                                                                               |
| Hide Server's and Endpoint's IP Address                                                                       | Whether to hide the IP addresses, which enables IP address privacy.                                                                                                                                              |
| Check RTP Packets for Protocol Conformance<br>Limit Payload to Audio or Video based on the Signaling Exchange | Whether to check RTP/RTCP packets flowing on the pinholes for protocol conformance. If you select this option, you can also elect to enforce the payload type to be audio/video based on the signaling exchange. |
| If Number of Hops to Destination is Greater Than 0                                                            | Whether to check if the value of Max-Forwards header is zero. When it is greater than zero, the action you select in the Action field is implemented. The default is to drop the packet.                         |
| If State Transition is Detected                                                                               | Whether to check SIP state transitions. When a transition is detected, the action you select in the Action field is implemented. The default is to drop the packet.                                              |
| If Header Fields Fail Strict Validation                                                                       | Whether to take the action specified in the Action field if the SIP header fields are invalid. The default is to drop the packet.                                                                                |
| Inspect Server's and Endpoint's Software Version                                                              | Whether to inspect the SIP endpoint software version in User-Agent and Server headers. The default is to mask the information.                                                                                   |
| If Non-SIP URI is Detected                                                                                    | Whether to take the action specified in the Action field if a non-SIP URI is detected in the Alert-Info and Call-Info headers. The default is to mask the information.                                           |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [SIP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-86](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit SIP Match Criterion (for SIP class maps) or Match Condition and Action (for SIP policy maps) dialog boxes to do the following:

- Define the match criterion and value for a SIP class map.
- Select a SIP class map when creating a SIP policy map.
- Define the match criterion, value, and action directly in a SIP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a SIP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for SIP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating a SIP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit SIP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring SIP Maps, page 17-84](#).

| Content Type    | <p>The content type to evaluate as specified in the content-type header field. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• SDP—Matches an SDP SIP content header type.</li> <li>• Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Resource Method | <p>The request method you want to inspect:</p> <ul style="list-style-type: none"> <li>• ack—Confirms that the client has received a final response to an INVITE request.</li> <li>• bye—Terminates a call and can be sent by either the caller or the called party.</li> <li>• cancel—Cancels any pending searches but does not terminate a call that has already been accepted.</li> <li>• info—Communicates mid-session signaling information along the signaling path for the call.</li> <li>• invite—Indicates a user or service is being invited to participate in a call session.</li> <li>• message—Sends instant messages where each message is independent of any other message.</li> <li>• notify—Notifies a SIP node that an event which has been requested by an earlier SUBSCRIBE method has occurred.</li> <li>• options—Queries the capabilities of servers.</li> <li>• prack—Provisional response acknowledgment.</li> <li>• refer—Requests that the recipient REFER to a resource provided in the request.</li> <li>• register—Registers the address listed in the To header field with a SIP server.</li> <li>• subscribe—Requests notification of an event or set of events at a later time.</li> <li>• unknown—Uses a nonstandard extension that could have unknown security impacts on the network.</li> <li>• update—Permits a client to update parameters of a session but has no impact on the state of a dialog.</li> </ul> |

## Configuring Skinny Maps

Use the Add or Edit Skinny Map dialog boxes to define Skinny maps for Skinny inspection. A Skinny policy map lets you change the default configuration values used for Skinny inspection.

Skinny (SCCP) is a simplified protocol used in VoIP networks. Cisco IP Phones using SCCP can coexist in an H.323 environment. When used with Cisco CallManager, the SCCP client can interoperate with H.323 compliant terminals. Application layer functions in the security appliance recognize SCCP version 3.3. There are 5 versions of the SCCP protocol: 2.4, 3.0.4, 3.1.1, 3.2, and 3.3.2.

The security appliance supports all versions through 3.3.2. The security appliance supports PAT and NAT for SCCP. PAT is necessary if you have more IP phones than global IP addresses for the IP phones to use. By supporting NAT and PAT of SCCP Signaling packets, Skinny application inspection ensures that all SCCP signaling and media packets can traverse the security appliance.

Normal traffic between Cisco CallManager and Cisco IP Phones uses SCCP and is handled by SCCP inspection without any special configuration. The security appliance also supports DHCP options 150 and 66, which it accomplishes by sending the location of a TFTP server to Cisco IP Phones and other DHCP clients. Cisco IP Phones might also include DHCP option 3 in their requests, which sets the default route.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > Skinny** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

| Overrides                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                        |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a Skinny policy map.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit Skinny Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring SIP Maps, page 17-84](#).

**Table 17-51 Skinny Policy Maps Add and Edit Match Condition and Action Dialog Boxes**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of Skinny traffic to match.                                                                                                                                                                                                                                                                                                                |
| Type      | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on 0xFFFF, then any traffic that has the message ID 0xFFFF is excluded from the map.</p> <ul style="list-style-type: none"> <li>Matches—Matches the criterion.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul> |

**Table 17-51** Skinny Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element | Description                                                                                                                                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID Type | The hexadecimal value for the message ID to inspect: <ul style="list-style-type: none"> <li>Value—Matches a single hexadecimal value.</li> <li>Range—Matches a range of values.</li> </ul> |
| Action  | The action you want the device to take for traffic that matches the defined criteria.                                                                                                      |

## Configuring SNMP Maps

Use the Add and Edit SNMP Map dialog boxes to define maps for SNMP inspection. An SNMP policy map lets you change the default configuration values used for SNMP application inspection.

SNMP application inspection lets you restrict SNMP traffic to a specific version of SNMP. Earlier versions of SNMP are less secure; therefore, denying certain SNMP versions may be required by your security policy. The security appliance can deny SNMP versions 1, 2, 2c, or 3. You control the versions permitted by creating an SNMP map. You then apply the SNMP map when you enable SNMP inspection.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SNMP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

## Configuring SCTP Maps

SCTP is a transport-layer protocol operating on top of IP in the protocol stack, similar to TCP and UDP. SCTP creates a logical communication channel, called an association, between two end nodes over multiple source or destination IP addresses. An association defines a set of IP addresses on each node (source and destination) and a port on each node. Any IP address can be used as either a source or a destination IP address of data packets in the association. Messages can be transmitted between a pair of IP addresses, which is defined as a stream.

If you have SCTP traffic going through the ASA, you can configure Cisco Security Manager to control access based on SCTP ports, and implement application layer inspection to enable connections and to optionally filter on payload protocol ID (PPID) to selectively drop, log, or rate limit applications.

You can refine your access rules by adding an SCTP inspect map and filtering on SCTP applications. You can selectively drop, log, or rate limit SCTP traffic classes based on the payload protocol identifier (PPID).

When you filter on PPID, keep the following in mind:

- PPIDs are in data chunks, and a given packet can have multiple data chunks. If a packet includes data chunks with different PPIDs, the packet will not be filtered, and the assigned action will not be applied to the packet.
- If you use PPID filtering to drop or rate-limit packets, be aware that the transmitter will resend any dropped packets. Although a packet for a rate-limited PPID might make it through on the next attempt, a packet for a dropped PPID will again be dropped. You might want to evaluate the eventual consequence of these repeated drops on your network.

Use the Add and Edit SCTP Map dialog boxes to define the match criteria and values for an SCTP inspect map. You can use an SCTP map to inspect packets based on the Payload PID criteria. You can perform the following actions on the packets, based on the PPID match criteria:

- No Action
- Drop Packet
- Log Packet
- Rate Limit

Service objects corresponding to the SCTP protocol are available in the Services table in the [Policy Object Manager, page 6-4](#).

### Note

SCTP inspect maps are supported from Security Manager 4.10 and ASA versions 9.5.2 and later.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SCTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

**Field Reference**

**Table 17-53 Add and Edit SCTP Map Dialog Boxes**

| Element     | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description | A description of the policy object. A maximum of 200 characters is allowed. |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

These criteria entries are created and edited in the [SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-93](#).

**SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes**

Use the Add or Edit Match Condition and Action dialog boxes to define a Payload PID match criterion and action for a SCTP policy map. Repeat the process until you identify all PPIDs you want to selectively handle.

**Navigation Path**

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IPv6 Maps, page 17-78](#).

| Type                                                                                                                                                                                                                                             | Specifies that the map is applied only to traffic that matches or does not match the defined criteria.                                                                                                                                                                                        |
| You can find the current list of SCTP PPIDs at <a href="http://www.iana.org/assignments/sctp-parameters/sctp-parameters.xhtml#sctp-parameters-25">http://www.iana.org/assignments/sctp-parameters/sctp-parameters.xhtml#sctp-parameters-25</a> . |                                                                                                                                                                                                                                                                                               |
| Min. Payload PID                                                                                                                                                                                                                                 | Enter a PPID number. There are certain PPIDs associated with a name, which Cisco Security Manager accepts, and processes internally. Enter the PPID number in the text box, and click OK. The corresponding name will be displayed in the match action table if it matches the default names. |
| Max. Payload PID                                                                                                                                                                                                                                 | (Optional) Enter a second, higher PPID to specify a range of PPIDs.                                                                                                                                                                                                                           |
| Action                                                                                                                                                                                                                                           | Choose the action based on the PPID in SCTP data chunks: <ul style="list-style-type: none"> <li>• Drop Packet—Drop and log all packets that match.</li> <li>• Log—Send a system log message.</li> <li>• Rate Limit—Limit the rate of messages. The rate is in packets per second.</li> </ul>  |

## Configuring Diameter Maps

Diameter is an Authentication, Authorization, and Accounting (AAA) protocol used in next-generation mobile and fixed telecom networks such as EPS (Evolved Packet System) for LTE (Long Term Evolution) and IMS (IP Multimedia Subsystem). It replaces RADIUS and TACACS in these networks.

Diameter uses TCP and SCTP as the transport layer, and secures communications using TCP/TLS and SCTP/DTLS. It can optionally provide data object encryption as well. For detailed information on Diameter, see RFC 6733.

Diameter applications perform service management tasks such as deciding user access, service authorization, quality of service, and rate of charging. Although Diameter applications can appear on many different control-plane interfaces in the LTE architecture, the ASA inspects Diameter command codes and attribute-value pairs (AVP) for the following interfaces only:

- S6a: Mobility Management Entity (MME) - Home Subscription Service (HSS).
- S9: PDN Gateway (PDG) - 3GPP AAA Proxy/Server.
- Rx: Policy Charging Rules Function (PCRF) - Call Session Control Function (CSCF).

Diameter inspection opens pinholes for Diameter endpoints to allow communication. The inspection supports 3GPP version 12 and is RFC 6733 compliant.

You can use the Add and Edit Diameter Map dialog boxes to filter traffic based on application ID, command codes, and AVP, to apply special actions such as dropping packets or connections, or logging them. You can create custom AVP for newly-registered Diameter applications. Filtering lets you fine-tune the traffic you allow on your network. For more information see [Create and Add Custom AVPs](#), page 17-98

**Note**

Diameter messages for applications that run on other interfaces will be allowed and passed through by default. However, you can configure a Diameter inspection policy map to drop these applications by application ID, although you can specify actions based on the command codes or AVP for these unsupported applications.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > Diameter** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Edit button                                                                                                                                                                                                                                                                                                                                                                                                        | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit Diameter Match Criterion (for Diameter class maps) or Match Condition and Action (for Diameter policy maps) dialog boxes to do the following:

- Define the match criterion and value for a Diameter class map.
- Select a Diameter class map when creating a Diameter policy map.
- Define the match criterion, value, and action directly in a Diameter policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a Diameter class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for Diameter, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-28](#).

When creating a Diameter policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit Diameter Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Diameter Maps, page 17-94](#).

| Match Type<br>(Only Policy Map) | <p>Enables you to use an existing Diameter class map or define a new Diameter class map.</p> <ul style="list-style-type: none"> <li>• Use Specified Values—You want to define the class map on this dialog box.</li> <li>• Use Values in Class Map—You want to select an existing Diameter class map policy object. Enter the name of the Diameter class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Criterion                       | <p>Specifies which criterion of Diameter traffic to match.</p> <ul style="list-style-type: none"> <li>• Application ID—Matches the application identifier, where the application identifier is the Diameter application name or number (0-4294967295) in the <b>Begin Value</b> field. If there is a range of consecutively-numbered applications that you want to match, you can include a second ID in the <b>End Value</b> field. You can define the range by application name or number, and it applies to all the numbers between the <b>Begin Value</b> and the <b>End Value</b>.</li> <li>• Command Code—Matches the command code, where <i>code</i> is the Diameter command code name or number (0-4294967295) in the <b>Begin Value</b> field. If there is a range of consecutively-numbered command codes that you want to match, you can include a second code in the <b>End Value</b> field. You can define the range by command code name or number, and it applies to all the numbers between the <b>Begin Value</b> and the <b>End Value</b>.</li> <li>• AVP—Matches the Attribute Value Pair. <ul style="list-style-type: none"> <li>– To match AVP based on attribute only, specify the name or number (1-4294967295) of an attribute-value pair. For the first code, you can specify the name of a custom AVP or one that is registered in RFCs or 3GPP technical specifications and is directly supported in the software in the <b>Begin Value</b> field. If you want to match a range of AVP, specify the second code by number only in the <b>End Value</b> field. If you want to match an AVP by its value, you cannot specify a second code. Specify the ID number of the vendor to also match, from 0-4294967295 in the <b>Vendor ID</b> field. For example, the 3GPP vendor ID is 10415, the IETF is 0.</li> <li>– To match AVP based on the value of the attribute, additionally specify the value of the attribute in the <b>AVP Data Type</b> field.</li> </ul> </li> </ul> <p><b>Note</b> You can create and add custom AVPs to new diameter applications. For more information see, <a href="#">Create and Add Custom AVPs, page 17-98</a></p> |

## Create and Add Custom AVPs

Use the Add AVP dialog boxes to create and add custom AVPs. These can be registered with the IETF and added to new Diameter applications.

**Note**

Cisco Security Manager does not allow you to edit a custom AVP object, once created. However the Device Override option allows you to edit the custom AVP for a particular device. If you want to change any parameter in the custom AVP object, you have to remove the custom AVP reference from the diameter building block (if it is referred), deploy to the device (if it is present in the device) and re-create the object with the required values and refer it back in the diameter building block and deploy it again.

**Navigation Path**

When creating a custom AVP, in the Policy Object Manager, from the Add Match Criterion dialog box for Diameter, select **AVP in the Criterion**, then select **Begin Value and right click in the AVP Maps Selector dialog box to Add AVP**.

**Field Reference**

**Table 17-57 Add AVP Dialog Boxes**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name        | The name of the custom AVP. A maximum of 32 characters is allowed.<br><b>Note</b> At least one character of the name must be an alphabet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description | A description of the AVP. A maximum of 80 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AVP Code    | Set a value for the AVP Code (256- 4294967295), that belongs to the specific vendor code address space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DataType    | You can configure this only if the data type of the AVP is supported. For example, you can specify an IP address for AVP that have the address data type. Following are the specific syntax of the value option for the supported data types <ul style="list-style-type: none"> <li>• Address—Specify the IPv4 or IPv6 address to match. For example, 10.100.10.10 or 2001:DB8::0DB8:800:200C:417A</li> <li>• Diameter Identity, Diameter URI, Octet String, UTF8tString—Use regular expression or regular expression class objects to match these data types.</li> <li>• Enumerated—Specify a range of numbers in the Begin Range and End Range fields. The range is 0 - 4294967295.</li> <li>• Float32: decimal point representation with 8 digit precision</li> <li>• Float64: decimal point representation with 16 digit precision</li> <li>• Integer32: -2147483647 to 2147483647</li> <li>• Integer64: -9223372036854775807 to 9223372036854775807</li> <li>• Unsigned32: 0 to 4294967295</li> <li>• Unsigned64: 0 to 18446744073709551615</li> <li>• Time— Specify the start and end dates and time. Both are required. Time is in 24-hour format.</li> </ul> |
| Vendor ID   | Specify the ID number of the vendor, from 0-4294967295 in the <b>Vendor ID</b> field. For example, the 3GPP vendor ID is 10415, the IETF is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 17-57 Add AVP Dialog Boxes (continued)**

| Element                                   | Description                                                                                                                                                                                                                                                             |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-13.                                                                                                               |
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , page 6-18. |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                            |

## Create and Add TLS Proxy Objects

If a Diameter application uses encrypted data over TCP, inspection cannot see inside the packets to implement your message filtering rules. Thus, if you create filtering rules, and you want them to also apply to encrypted TCP traffic, you must configure a TLS proxy. You also need a proxy if you want strict protocol enforcement on encrypted traffic. This configuration does not apply to SCTP/DTLS traffic.

The TLS proxy acts as a man-in-the-middle. It decrypts traffic, inspects it, then encrypts it again and sends it to the intended destination. Thus, both sides of the connection, the Diameter server and Diameter client, must trust the ASA, and all parties must have the required certificates. You must have a good understanding of digital certificates to implement TLS proxy.

**Note** The TLS proxy feature is supported in multi-context devices for version ASA 9.7.1 and later.

You have the following options for configuring TLS proxy for Diameter inspection:

- Full TLS proxy—Encrypt traffic between the ASA and Diameter clients and the ASA and Diameter server. You have the following options for establishing the trust relationship with the server:
  - Use a static proxy client trustpoint. The ASA presents the same certificate for every Diameter client when communicating with the Diameter server. Because all clients look the same, the Diameter server cannot provide differential services per client. On the other hand, this option is faster than the LDC method.
  - Use local dynamic certificates (LDC). With this option, the ASA presents unique certificates per Diameter client when communicating with the Diameter server. This method gives the Diameter server better visibility into client traffic, which makes it possible to provide differential services based on client characteristics.
- TLS offload—Encrypt traffic between the ASA and Diameter client, but use a clear-text connection between the ASA and Diameter server. This option is viable if the Diameter server is in the same data center as the ASA, where you are certain that the traffic between the devices will not leave the protected area. Using TLS offload can improve performance, because it reduces the amount of encryption processing required. It should be the fastest of the options. The Diameter server can apply differential services based on client IP address only.

### Navigation Path

Select **Manage > Policy Objects**, then select **TLS Proxy** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Name                                                                                                                                                                                                                                     | The name of the TLS Proxy object. A maximum of 63 characters is allowed.<br><b>Note</b> At least one character of the name must be an alphabet.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description                                                                                                                                                                                                                              | A description of the TLS Proxy object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Server Configuration</b>                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Server Proxy Certificate                                                                                                                                                                                                                 | Click <b>Select</b> to import the CA certificate that is used to sign the Diameter client's certificate into an ASA trustpoint. This step specifies the proxy trustpoint certificate to be presented during TLS handshake. The trustpoint could be self-signed or issued by a third party.<br><br>This allows the ASA to trust the Diameter clients.                                                                                                                                                                                                                |
| Enable client authentication during TLS proxy handshake                                                                                                                                                                                  | Select to require the ASA to present a certificate and authenticate the TLS client during TLS handshake.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Encryption (Optional)                                                                                                                                                                                                                    | Beginning with 4.14, Cisco Security Manager allows you to configure cipher suites, when TLS Proxy is used as server.<br><br>This field defines the cipher suites to be announced/matched during the TLS handshake.<br><br>Select the Hashing algorithms, which are needed for encryption of data, from the Available Members List and add them to Selected Members list.<br><br><b>Note</b> Beginning from 4.19, Cisco Security Manager displays activity validation error message if you configure TLS proxy with NULL SHA1 in SSL cipher for ASA 9.12(1) devices. |
| <b>Client Configuration</b>                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Configure the proxy client to use clear text to communicate with the remote TCP server                                                                                                                                                   | Select proxy client to use clear text, if encryption is not needed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Specify the proxy certificate for the TLS client. The client proxy certificate could either be self-signed, enrolled with a CA or issued by a third party.                                                                               | Select to specify Client Proxy Certificate.<br><br>Alternately, click <b>Select</b> to import the CA certificate for the TLS client.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Specify the internal Certificate Authority to sign the local dynamic certificates for phones. This local CA can be self-signed certificate with proxy-ldc-issuer enabled or you may use embedded Local CA Server to issue LDC to phones. | Select to specify Local Dynamic Certificate Issuer.<br><br>Alternately, click <b>Select</b> to import the CA certificate, which could serve as Local Dynamic certificate (LDC) issuer                                                                                                                                                                                                                                                                                                                                                                               |

**Table 17-58 Add TLS Proxy Dialog Boxes (continued)**

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Dynamic Certificate Key Pair |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Key Pair Name                      | Specifies the RSA key pair to be used by the client or server's dynamic certificates. The key pair must have been generated with the "crypto key generate" command.<br><br>The keypair must exist on the device before deployment.                                                                                                                                                                                                                                                                                                                                                      |
| Encryption (Optional)              | Defines the cipher suites to be announced/matched during the TLS handshake. For client proxy (the proxy acts as a TLS client to the server), the user-defined cipher suites replace the original ones from the Hello message for asymmetric encryption method between the two TLS legs.<br><br>Select the Hashing algorithms, which are needed for encryption of data, from the Available Members List and add them to Selected Members list.<br><br><b>Note</b> From ASA version 9.7.1, the Cisco Security Manager supports TLS1.2 new cipher suites— aes256-sha384 and aes128-sha256. |
| Category                           | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Allow Value Override per Device    | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                                                                                                                                                                                  |
| Overrides                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Edit button                        | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                                                            |

## Editing TLS Proxy Object

Cisco Security Manager does not allow you to edit a TLS proxy object, once created. However, the Device Override option allows you to edit the TLS proxy object for a particular device.

If you want to change any parameter in the TLS proxy object, you have to remove the TLS proxy reference from the diameter building block (if it is referred), deploy to the device (if it is present in the device) and re-create the object with a new name, with the required values and refer it back in the diameter building block and deploy it again.

To edit a TLS proxy in class-map, execute the following deployment procedure:

1. Remove the relevant class map with existing TLS proxy server from the device by navigating to **Platform > Service Policy > Rules**.
2. Deploy the relevant class map with new TLS proxy server to the device by navigating to **Platform > Service Policy > Rules**.

## Configuring LISP Maps

The Locator ID Separation Protocol (LISP) is a network architecture and protocol. LISP replaces a single IP address with two numbering spaces—Routing Locators (RLOCs), which are topologically assigned to network attachment points and used for routing and forwarding of packets through the network; and Endpoint Identifiers (EIDs), which are assigned independently from the network topology and used for numbering devices, and are aggregated along administrative boundaries.

LISP defines functions for mapping between the two numbering spaces and encapsulating traffic originated by devices using non-routable EIDs for transport across a network infrastructure that routes and forwards using RLOCs. LISP provides a set of functions for devices to exchange information that is used to map non-routable EIDs to routable RLOCs.

When considering the deployment of ACLs with LISP, the following aspects are important.

- LISP encapsulation utilizes a UDP header just prior to the LISP header for all packets to distinguish between two distinct packet groups: LISP control plane packets, which utilize a UDP destination port of 4342, and LISP data plane packets, which utilize a UDP destination port of 4341. ACLs may need to consider this distinction between these two groups of packets.
- LISP is an encapsulation protocol and, because ACLs only filter based on Layer 3 and Layer 4 header information, ACLs may need to be applied at a specific point or at several different points within the packet forwarding and LISP encapsulation process in order to implement a site security policy. The application point and direction of the ACL will dictate whether EID namespace or RLOC namespace is used within the ACL itself. Packets can be filtered using EID namespace just prior to LISP encapsulation or just after LISP decapsulation; packets can be filtered using RLOC namespace just after LISP encapsulation or just prior to LISP decapsulation.

You can use the Add and Edit LISP Map dialog boxes to filter traffic based on EID access-list and validation key. Filtering lets you fine-tune the traffic you allow on your network.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > LISP** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring M3UA Maps

MTP3 User Adaptation (M3UA) is a client/server protocol that provides a gateway to the SS7 network for IP-based applications that interface with the SS7 Message Transfer Part 3 (MTP3) layer. M3UA makes it possible to run the SS7 User Parts (such as ISUP) over an IP network. M3UA is defined in RFC 4666.

M3UA uses SCTP as the transport layer. SCTP port 2905 is the expected port, although you can configure the signaling gateways to use a different port.

The MTP3 layer provides networking functions such as routing and node addressing, but uses point codes to identify nodes. The M3UA layer exchanges Originating Point Codes (OPC) and Destination Point Codes (DPC). This is similar to how IP uses IP addresses to identify nodes.

M3UA inspection provides limited protocol conformance. You can optionally apply access policy based on point codes or Service Indicators (SI). You can also apply rate limiting based on message class and type.

## M3UA Protocol Conformance

M3UA inspection provides the following limited protocol enforcement. Inspection drops and logs packets that do not meet requirements.

- Common message header. Inspection validates all fields in the common header.
  - Version 1 only.
  - Message length must be correct.
  - Message type class with a reserved value is not allowed.
  - Invalid message ID within the message class is not allowed.
- Payload data message.
  - Only one parameter of a given type is allowed.
  - Data messages on SCTP stream 0 are not allowed.

## M3UA Inspection Limitations

M3UA inspection has the following limitations.

- NAT is not supported for IP addresses embedded in M3UA data.
- Segmented M3UA messages will not be inspected and are likely to be dropped.
- SCTP does not support multi-homing or multi-streaming. If you need to support multi-homed flows you need to create access lists to allow them.
- Stateful failover is not supported for call flows and messages. Any failure occurring during a call flow might cause packets to be dropped and calls to be disconnected.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > M3UA** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## M3UA Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Match Condition and Action dialog boxes to define the match criterion, value, and action directly in a M3UA policy map.

The fields on this dialog box change based on the criterion you select while creating a policy map.

### Navigation Path

When creating a M3UA policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit M3UA Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring M3UA Maps, page 17-104](#).

| Service Indicator criterion | <p>Matches the service indicator number, 0-15. The available service indicators are listed in the variables section. Consult M3UA RFCs and documentation for detailed information about these service indicators</p> <ul style="list-style-type: none"> <li>• 0—Signaling Network Management Messages</li> <li>• 1—Signaling Network Testing and Maintenance Messages</li> <li>• 2—Signaling Network Testing and Maintenance Special Messages</li> <li>• 3—SCCP</li> <li>• 4—Telephone User Part</li> <li>• 5—ISDN User Part</li> <li>• 6—Data User Part (call and circuit-related messages)</li> <li>• 7—Data User Part (facility registration and cancellation messages)</li> <li>• 8—Reserved for MTP Testing User Part</li> <li>• 9—Broadband ISDN User Part</li> <li>• 10—Satellite ISDN User Part</li> <li>• 11—Reserved</li> <li>• 12—AAL type 2 Signaling</li> <li>• 13—Bearer Independent Call Control</li> <li>• 14—Gateway Control Protocol</li> <li>• 15—Reserved</li> </ul> |
| Type                        | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Action                      | <p>The action you want the device to take for traffic that matches the defined criteria.</p> <ul style="list-style-type: none"> <li>• Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped.</li> <li>• Drop Packet and Log— Same as drop packet and additionally send a system log message.</li> <li>• Rate Limit— Limit the rate of messages. This option is available when the message criterion is selected.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring Regular Expression Groups

Use the Add and Edit Regular Expression Groups dialog boxes to define regular expression groups, which contain multiple regular expressions. Groups make it possible for you to create modular regular expressions and group them in multiple ways for various uses. The objects can be used in some inspection class maps and inspection policy maps.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Regular Expressions Groups** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Element                         | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                  |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                            |
| Regular Expressions             | The Regular Expression policy objects that include the expressions you want to include in the group. Enter the name of the objects or click <b>Select</b> to select them from a list or to create a new object.                                                        |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                              |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Add/Edit Regular Expressions

Use the Add and Edit Regular Expression dialog boxes to define regular expressions for use in class and policy inspection maps or in regular expression group policy objects. Regular expressions are also used in remote access SSL VPN client settings.

A regular expression matches text strings either literally as an exact string or by using metacharacters so you can match multiple variants of a text string. You can use regular expressions in various type of class and policy inspection maps to match various target items, for example, the content of certain application traffic such as the body text inside an HTTP packet.

**Navigation Path**

- Select **Manage > Policy Objects**, then select **Maps > Regular Expressions** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.
- From the Client Settings tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the AnyConnect Client Image table, or select an image and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN AnyConnect Client Settings \(ASA\), page 31-64](#). On the Add AnyConnect Client Image dialog box, click **Select** to open the Regular Expressions Selector dialog box. To add a new regular expression, click the **Add (+)** button on the Regular Expressions Selector dialog box.

| Element                         | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                  |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                            |
| Value                           | The regular expression, up to 100 characters in length. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions, page 17-110</a> .                                            |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                              |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

**Metacharacters Used to Build Regular Expressions**

The following table explains the metacharacters you can use to build regular expressions in the Add and Edit Regular Expression dialog boxes (see [Add/Edit Regular Expressions, page 17-109](#)).

Keep the following tips in mind when creating regular expressions:

- If you enter any metacharacters in your text string that you want to be used literally, add the backslash (\) escape character before them. For example, “example\.com”.
- If you want to match upper and lower case characters, enter text in both upper- and lowercase. For example, “cats” is entered as “[cC][aA][tT][sS]”.

**Table 17-64 Metacharacters Used to Build Regular Expressions**

| Character | Description               | Notes                                                                                                                                                                                                                                                                                                                                                            |
|-----------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .         | Dot                       | Matches any single character. For example, d.g matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.                                                                                                                                                                                                                            |
| (exp)     | Subexpression             | A subexpression segregates characters from surrounding characters, so that you can use other metacharacters on the subexpression. For example, d(ola)g matches dog and dag, but dolag matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, ab(xy){3}z matches abxyxyz. |
|           | Alternation               | Matches either expression it separates. For example, dog cat matches dog or cat.                                                                                                                                                                                                                                                                                 |
| ?         | Question mark             | A quantifier that indicates that there are 0 or 1 of the previous expression. For example, lo?se matches lse or lose.                                                                                                                                                                                                                                            |
| *         | Asterisk                  | A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, lo*se matches lse, lose, loose, etc.                                                                                                                                                                                                                      |
| +         | Plus                      | A quantifier that indicates that there is at least 1 of the previous expression. For example, lo+se matches lose and loose, but not lse.                                                                                                                                                                                                                         |
| {x}       | Repeat Quantifier         | Repeat exactly x times. For example, ab(xy){3}z matches abxyxyz.                                                                                                                                                                                                                                                                                                 |
|           | Minimum repeat quantifier | Repeat at least x times. For example, ab(xy){2,}z matches abxyxyz, abxyxyz, etc.                                                                                                                                                                                                                                                                                 |
| [abc]     | Character class           | Matches any character in the brackets. For example, [abc] matches a, b, or c.                                                                                                                                                                                                                                                                                    |
| [^abc]    | Negated character class   | Matches a single character that is not contained within the brackets. For example, [^abc] matches any character other than a, b, or c. [^A-Z] matches any single character that is not an uppercase letter.                                                                                                                                                      |
| [a-c]     | Character range class     | Matches any character in the range. [a-z] matches any lowercase letter. You can mix characters and ranges: [abcq-z] matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does [a-cq-z].<br><br>The dash (-) character is literal only if it is the last or the first character within the brackets: [abc-] or [-abc].                                           |
| ""        | Quotation marks           | Preserves trailing or leading spaces in the string. For example, " test" preserves the leading space when it looks for a match.                                                                                                                                                                                                                                  |
| ^         | Caret                     | Specifies the beginning of a line.                                                                                                                                                                                                                                                                                                                               |
| \         | Escape character          | When used with a metacharacter, matches a literal character. For example, \[ matches the left square bracket.                                                                                                                                                                                                                                                    |

**Table 17-64 Metacharacters Used to Build Regular Expressions (continued)**

| Character | Description                | Notes                                                                                                          |
|-----------|----------------------------|----------------------------------------------------------------------------------------------------------------|
| char      | Character                  | When character is not a metacharacter, matches the literal character.                                          |
| \r        | Carriage return            | Matches a carriage return 0x0d.                                                                                |
| \n        | Newline                    | Matches a new line 0x0a.                                                                                       |
| \t        | Tab                        | Matches a tab 0x09.                                                                                            |
| \f        | Formfeed                   | Matches a form feed 0x0c.                                                                                      |
| \xNN      | Escaped hexadecimal number | Matches an ASCII character using hexadecimal (exactly two digits).                                             |
| \NNN      | Escaped octal number       | Matches an ASCII character as octal (exactly three digits). For example, the character 040 represents a space. |

## Configuring Settings for Inspection Rules for IOS Devices

### Note

From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

If you configure inspection rules, you can also configure inspection settings to change the default settings for some global inspection parameters for IOS devices. Most of the inspection settings relate to preventing or mitigating Denial of Service (DoS) attacks. The default settings for most of these options are appropriate for most networks, so configure this policy only if you need to adjust one or more settings. If you do not change a setting, it is not configured on the device (the default remains configured).

To open the Inspection settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Inspection** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Inspection** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Inspection**.

The following table explains the available inspection settings.

**Table 17-65 Inspection Page**

| Element                         | Description                                                                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global Timeout Values</b>    |                                                                                                                                                                                                             |
| TCP Establish Timeout (seconds) | How long to wait for a TCP session to reach the established state before dropping the session, in seconds, from 1-2147483. The default is 30.                                                               |
| FIN Wait Time (seconds)         | How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds, from 1-2147483. The FIN-exchange occurs when the TCP session is ready to close. The default is 5. |

**Table 17-65** *Inspection Page (continued)*

| <b>Element</b>                              | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Idle Time (seconds)                     | How long to maintain a TCP session while there is no activity in the session, in seconds, from 1-2147483. The default is 3600 (one hour).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| UDP Idle Time (seconds)                     | <p>How long to maintain a UDP session while there is no activity in the session, in seconds, from 1-2147483. The default is 30.</p> <p>When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet.</p> <p>If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.</p> |
| DNS Timeout (seconds)                       | The length of time for which a DNS lookup session is managed while there is no activity, in seconds, from 1-2147483. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYN Flooding DoS Attack Thresholds</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Maximum 1 Minute Connection Rate - low      | The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. Possible values are from 1-2147483647 per minute. The default is 400 for low and 500 for high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Maximum 1 Minute Connection Rate - high     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Maximum Incomplete Sessions Stop Threshold  | The number of existing half-open sessions that will cause the software to start and stop deleting half-open sessions. Ensure that you enter a lower number in the stop field than you enter in the start field. Possible values are from 1-2147483647. The default is 400 for low and 500 for high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Maximum Incomplete Sessions Start Threshold |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Thresholds per Host</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Max Sessions Per Host                       | <p>The number of half-open TCP sessions with the same host destination address that can exist at a time before the software starts deleting half-open sessions to the host. Possible values are 1-4294967295. The default is 50.</p> <p>A large number of half-open sessions can indicate there is a Denial of Service attack against the host.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Sessions Blocking Interval (min)           | <p>If the maximum sessions per host threshold is reached, the blocking time to apply to help mitigate the potential TCP host-specific denial-of-service (DoS) attack. Possible values are 0-35791 minutes. The default is 0.</p> <ul style="list-style-type: none"> <li>If the blocking time value is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host above the maximum session limit. This ensures that the number of half-open sessions to a given host will never exceed the threshold.</li> <li>If the blocking time value is greater than 0, the software deletes all existing half-open sessions for the host, then blocks all new connection requests to the host. The software will continue to block all new connection requests until the block-time expires.</li> </ul> |
| <b>Other</b>                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Session Hash Table Size (buckets)              | <p>The size of the hash table in terms of buckets. Possible values for the hash table are 1024, 2048, 4096, and 8192. The default is 1024.</p> <p>You should increase the hash table size when the total number of sessions running through the device is approximately twice the current hash size; decrease the hash table size when the total number of sessions is reduced to approximately half the current hash size. Essentially, try to maintain a 1:1 ratio between the number of sessions and the size of the hash table.</p>                                                                                                                                                                                                                                                                                                                    |
| Enable Alert Messages                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Audit Trail Messages                    | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Permit DHCP Passthrough (Transparent Firewall) | <p>Whether to permit a transparent firewall to forward DHCP packets across the bridge without inspection.</p> <p>Permitting DHCP passthrough overrides an ACL for DHCP packets, so DHCP packets are forwarded even if the ACL is configured to deny all IP packets. Thus, clients on one side of the bridge can get an IP address from a DHCP server on the opposite side of the bridge.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Block Non-SYN Packets                          | Whether to drop TCP packets that do not belong to an established session. These are TCP packets that do not initiate sessions, that is, the SYN bit is not set in them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Log Dropped Packets                            | Whether to create log messages for dropped packets to specify the reason for dropping them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Managing Firewall Web Filter Rules

---

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

How you configure web filter rules is different depending on whether the device uses ASA, PIX or FWSM software as opposed to Cisco IOS Software.

The following topics help you work with web filter rules:

- [Understanding Web Filter Rules, page 18-1](#)
- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices, page 18-2](#)
- [Configuring Web Filter Rules for IOS Devices, page 18-10](#)
- [Configuring Settings for Web Filter Servers, page 18-15](#)

## Understanding Web Filter Rules

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

Web, or URL, filtering allows you to control which web sites and web content your users have access to. For example, you might consider some types of content to create a hostile work environment for the people in your organization (for example, web sites that provide pornography). You might consider some web sites to be unsafe and a source of potential viral applications. Using web filter rules, you can block access to these objectionable or unsafe sites.

To filter web requests, you should install an external web filtering server, either Websense or SmartFilter (N2H2). For ASA, PIX, and FWSM devices, these external servers are required for URL, FTP, or HTTPS filtering. For IOS devices, you can also use these servers, but additionally you can create local lists of allowed (always allowed) or blocked (always denied) URLs. You configure the filtering servers in the web filter settings policy; see [Configuring Settings for Web Filter Servers, page 18-15](#).

**Tip**

For IOS devices, you have the option of configuring web filtering using zone-based firewall rules instead of web filter rules, which allows you the additional option of using Trend Micro web filtering servers. For more information, see [Chapter 21, “Managing Zone-based Firewall Rules”](#).

---

Beside filtering requests based on URL, you can do some applet filtering, stripping out ActiveX or Java applets. You might want to do this to prevent applet downloads from sites you otherwise want to allow if you do not fully trust the site. You can configure your rules to block these applets from specific sites while allowing them from trusted sites.

The policies and procedures for configuring web filter rules differs based on the device type. See the following topics for more information:

- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices, page 18-2](#)
- [Configuring Web Filter Rules for IOS Devices, page 18-10](#)

## Configuring Web Filter Rules for ASA, PIX, and FWSM Devices

### Note

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Web filter rules policies for ASA, PIX, and FWSM devices define how you want to handle HTTP, FTP, and HTTPS traffic. You can also filter ActiveX and Java applets. Web filter rules permit or deny traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web or FTP site, or you can strip out ActiveX or Java applets from untrusted sources.

To configure web filtering rules for ASA, PIX, and FWSM devices:

1. Configure the rules that identify traffic that should be subject to filtering, and the traffic that should be exempt from filtering rules (see below for the procedure).
2. Configure web filter settings to identify the URL filtering server and other settings. For more information, see [Configuring Settings for Web Filter Servers, page 18-15](#).

- 
- Step 1** Do one of the following to open the [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#):
- Device view—Select **Firewall > Web Filter Rules** from the Policy selector.
  - Policy view—Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type select. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes, page 18-5](#).

**Tip**

If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-10](#).

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes, page 18-5](#).

- **Filtering and Type**—Whether you are creating a rule that identifies traffic to be filtered (Filter) or exempted from an existing filter rule (Filter Except), and the type of filtering to be done:
  - **URL**—To filter traffic based on web address.
  - **HTTPS**—To filter web traffic to secure sites. This does not include SSL VPN traffic.
  - **FTP**—To filter FTP traffic.
  - **ActiveX or Java**—To remove ActiveX or Java applets. These options delete all entities within applet or object tags, so you might remove more than just ActiveX or Java applets.
- **Source and Destination addresses**—If the rule should apply no matter which addresses generated the traffic or their destinations, use “any” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition, page 6-87](#).
- **Service**—Primarily defines the port that should be monitored. You must specify some type of TCP service. Typically, you would use the pre-defined services HTTP, HTTPS, or FTP, which should be the same as the type of filtering you are performing, but you can specify any TCP port on your network that might contain the traffic to be filtered.
- **Options**—The options you want to include, if any. The main options of interest are whether you want to allow traffic if the filtering servers are unavailable, and whether you want to truncate long URLs or URLs that have parameters. Truncating URLs that have parameters is typically a good idea, because if you are going to drop a URL, it is not normally because of a parameter value.

Click **OK** when you are finished defining your rule.

**Step 4** If you did not select the desired row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Order is not as important for web filtering rules, however, because filter except rules always create exceptions to the related filter rule, whether they come before or after the filter rule. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).

## Web Filter Rules Page (ASA/PIX/FWSM)

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Web Filter Rules page for ASA, PIX, and FWSM devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic, you can configure rules to apply server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. You must configure a web filtering server for your URL, FTP, or HTTPS filter rules to be deployed. For more information, see [Web Filter Settings Page, page 18-16](#).

**Tip**

Rules cannot overlap. For example, if you create two rules with the same, or overlapping, source, destination, and service, you cannot deploy them. Also, you should order any filter-except rules below the filter rule to which they are creating an exemption.

**Navigation Path**

To access the Web Filter Rules page for ASA, PIX, and FWSM devices, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Policies > Web Filter Rules**.

**Field Reference**

**Table 18-1** *Web Filter Rules Page (ASA, PIX, FWSM)*

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                   | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                                    |
| Source<br>Destination | The source and destination addresses for the rule. The “any” address does not restrict the rule to specific hosts, networks, or interfaces. These addresses are IP addresses for hosts or networks, network/host objects, interfaces, or interface roles. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Networks/Hosts Objects, page 6-80</a> . |
| Service               | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-100</a> .                                                                                                          |

**Table 18-1 Web Filter Rules Page (ASA, PIX, FWSM) (continued)**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                                      | The type of filtering action for the rule, either filtering the identified traffic, or exempting the identified traffic from filtering (Filter Except). For a full explanation, see <a href="#">Edit Web Filter Type Dialog Box, page 18-8</a> .                                                                                                                                         |
| Options                                   | Additional configuration options for the selected protocol, if any. For detailed descriptions, see <a href="#">Edit Web Filter Options Dialog Box, page 18-9</a> .                                                                                                                                                                                                                       |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                  |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                     |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-72</a> ). |
| Query                                     | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports, page 12-28</a>                                                                                                                                                                                                          |
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables, page 12-16</a> .                                                                                                                                                                                                    |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order, page 12-19</a> .                                                                                                                                                                                               |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes, page 18-5</a> . If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules, page 12-9</a> .                                       |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules, page 12-10</a> .                                                                                                                                                                                                                                   |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                                                           |

## Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes

### Note

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Add and Edit PIX/ASA/FWSM Web Filter Rule dialog boxes to configuring web filtering rules for these types of devices.

**Navigation Path**

From the [Web Filter Rules Page \(ASA/PIX/FWSM\)](#), page 18-3, click the **Add Row** button or select a row and click the **Edit Row** button.

**Related Topics**

- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices](#), page 18-2

| Enable Rule | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules</a> , page 12-20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Filtering   | The type of rule you are defining: <ul style="list-style-type: none"> <li>• Filter—The rule filters the identified type of traffic between source and destination.</li> <li>• Filter Except—The rule creates an exemption to a filter rule. The identified traffic between the source and destination is not filtered.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type        | The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the <a href="#">Web Filter Settings Page</a> , page 18-16. <ul style="list-style-type: none"> <li>• URL—HTTP traffic. Filtering is done using an external filtering server.</li> <li>• HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server.</li> <li>• Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed.</li> <li>• ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed.</li> <li>• FTP—FTP traffic. Filtering is done using an external filtering server.</li> </ul> |

**Table 18-2 Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes (continued)**

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources<br>Destinations                                                    | <p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a>.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses, page 6-81</a>).</li> </ul> |
| Services                                                                   | <p>The services that define the port number of the traffic to act on. You can enter more than one value by separating the items with commas.</p> <p>The service must use TCP. Your specification defines the port that you want filtered (the service name has no meaning). For example, if you want to filter port 80, use the HTTP service object. If HTTP traffic on your network uses a different port, specify TCP/port number (for example, TCP/8080). You can enter TCP by itself to filter all ports.</p> <p>You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-100</a>.</p>                                                                                                |
| Allow traffic if URL Filter Server unavailable<br>(URL, FTP, HTTPS only)   | Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Block connection to HTTP Proxy Server<br>(URL only)                        | Whether to prevent users from connecting to an HTTP proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Truncate CGI request by removing CGI parameters<br>(URL only)              | When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Block outbound requests if absolute FTP path is not provided<br>(FTP only) | Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Long URL<br>(URL only) | How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the <b>Truncate CGI request by removing CGI parameters</b> option to handle those URLs. For other long URLs, select from the following options: <ul style="list-style-type: none"> <li>• Drop—Drop the long URL request.</li> <li>• Truncate—Truncate the URL request to only the hostname or IP address portion of the URL.</li> <li>• Deny—Deny the URL request.</li> </ul> |
| Category               | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description            | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Edit Web Filter Type Dialog Box

Use the Edit Web Filter Type dialog box to edit the type of filtering to be done by a web filter rule for ASA, PIX, and FWSM devices.

### Navigation Path

Right-click the Type cell in a web filter rule for ASA/PIX/FWSM (on the [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#)) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | <p>The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the <a href="#">Web Filter Settings Page, page 18-16</a>.</p> <ul style="list-style-type: none"> <li>• URL—HTTP traffic. Filtering is done using an external filtering server.</li> <li>• HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server.</li> <li>• Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed.</li> <li>• ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed.</li> <li>• FTP—FTP traffic. Filtering is done using an external filtering server.</li> </ul> |

## Edit Web Filter Options Dialog Box

Use the Edit Web Filter Options dialog box to edit the filtering options defined for a web filter rule for ASA, PIX, and FWSM devices.

The options displayed on this dialog box differ depending on the type of filtering configured for the rule. For some types, there are no options and the dialog box is empty. The reference table below includes all possible options.

### Navigation Path

Right-click the Options cell in a web filter rule for ASA/PIX/FWSM (on the [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#)) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

| Element                                                                  | Description                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow traffic if URL Filter Server unavailable<br>(URL, FTP, HTTPS only) | Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available. |

**Table 18-4** Edit Web Filter Options Dialog Box (continued)

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block connection to HTTP Proxy Server<br>(URL only)                        | Whether to prevent users from connecting to an HTTP proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Truncate CGI request by removing CGI parameters<br>(URL only)              | When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.                                                                                                                                                                                                                                                                                                                                                                  |
| Block outbound requests if absolute FTP path is not provided<br>(FTP only) | Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Long URL<br>(URL only)                                                     | How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the <b>Truncate CGI request by removing CGI parameters</b> option to handle those URLs. For other long URLs, select from the following options: <ul style="list-style-type: none"> <li>• Drop—Drop the long URL request.</li> <li>• Truncate—Truncate the URL request to only the hostname or IP address portion of the URL.</li> <li>• Deny—Deny the URL request.</li> </ul> |

## Configuring Web Filter Rules for IOS Devices

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Web filter rules policies for IOS devices define how you want to handle HTTP traffic. The web filter rules are a type of inspection rule that permits or denies traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic on an interface in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web site.

To configure web filtering rules for IOS devices:

1. Configure the interfaces that should filter web traffic (see below for the procedure).
2. Configure the local web filtering list to identify web sites that should always be permitted or denied (see below for the procedure).
3. Configure web filter settings to identify the URL filtering server and other settings. For more information, see [Configuring Settings for Web Filter Servers, page 18-15](#).

### Tip

You can also configure web filtering as a zone based firewall rule. For more information, see [Adding Zone-Based Firewall Rules, page 21-13](#).

**Related Topics**

- [Understanding Web Filter Rules, page 18-1](#)
- [Understanding Interface Role Objects, page 6-73](#)
- [Understanding Networks/Hosts Objects, page 6-80](#)

- 
- Step 1** Do one of the following to open the [Web Filter Rules Page \(IOS\), page 18-12](#):
- Device view—Select **Firewall > Web Filter Rules** from the Policy selector.
  - Policy view—Select **Firewall > Web Filter Rules (IOS)** from the Policy Type select. Select an existing policy or create a new one.
- Step 2** Configure the interfaces on which you will filter HTTP traffic. Create rules for each interface on which you will enable filtering:
- a. Select the Web Filter Rules tab if it is not already selected and do one of the following to open the [IOS Web Filter Rule and Applet Scanner Dialog Box, page 18-13](#):
    - To create a new rule, right-click inside the work area and select **Add Row**.
    - To edit an existing rule, right-click the rule and select **Edit Row**.
  - b. Identify the interface for which this rule applies. You can either enter the interface name or click **Select** to select it or an interface role from the list. Also configure the following:
    - Traffic direction with respect to the interface—Typically, you want to select **In** so that undesired traffic is dropped before the device spends more time processing the packet.
    - Java applet scanning—If you enable web filtering on an interface, Java applets are inspected, which can affect performance. Typically, you want to enable Java applet scanning so that you can identify permitted and denied sources and avoid the scanning of denied applets. If you want to configure both permitted and denied sources for an interface, you must configure two rules for the interface.
  - c. Click **OK** to add the rule to the web filtering rules table.
- Step 3** (Optional) Configure the list of exclusive domains, which define the local filtering list. This list is applied before web requests are sent to the external web filtering server (defined on the [Web Filter Settings Page, page 18-16](#)). If you know there are web sites that you will always permit (such as your organization's web site) or deny, configure them in the local list. Configure as many rules as needed to define the complete list.
- a. Click the **Exclusive Domains** tab and do one of the following to open the [IOS Web Filter Exclusive Domain Name Dialog Box, page 18-14](#).
    - To create a new rule, right-click inside the work area and select **Add Row**.
    - To edit an existing rule, right-click the rule and select **Edit Row**.
  - b. Select whether you are permitting or denying the specified domains, and enter the domain names or host IP addresses. You can enter either full domain names (the names of specific web sites) or partial names (for entire domains you want to treat the same way).
  - c. Click **OK** to add your exclusive domain rule to the policy.
-

## Web Filter Rules Page (IOS)

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Web Filter Rules page for IOS devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic on an interface, you can configure rules to apply local and server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. For example, you can use the settings policy to allow all web traffic if the filtering server becomes unavailable. For more information, see [Web Filter Settings Page, page 18-16](#).

**Tip**

You can also configure web filtering as a zone based firewall rule. For more information, see [Zone-based Firewall Rules Page, page 21-58](#).

**Navigation Path**

To access the Web Filter Rules page for IOS devices, do one of the following:

- (Device view) Select an IOS device and select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (IOS)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an IOS device and select **Edit Firewall Policies > Web Filter Rules**.

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web Filter Rules tab  | <p>The URL filtering rules defined for the policy. Each rule shows the interface on which it is defined, whether the rule is applied to incoming or outgoing traffic, and the permitted or denied Java applet sources if Java applet scanning is enabled. You might have more than one rule for an interface if you configure both a permit and deny list for Java applet scanning.</p> <ul style="list-style-type: none"> <li>To add a rule, click the Add Row button and fill in the <a href="#">IOS Web Filter Rule and Applet Scanner Dialog Box</a>, page 18-13.</li> <li>To edit a rule, select it and click the Edit Row button.</li> <li>To delete a rule, select it and click the Delete Row button.</li> </ul>                                                                                                             |
| Exclusive Domains tab | <p>The local web filter list. This list is checked before web requests are sent to the filtering server and applies to all interfaces on which you configure web filtering.</p> <p>If you know there are specific domains that you will always allow (such as your organization's own domain name), or disallow, you can list them here. By configuring a local filter list, you can improve performance because the device does not need to wait for a response from the filtering server.</p> <ul style="list-style-type: none"> <li>To add a domain, click the Add Row button and fill in the <a href="#">IOS Web Filter Exclusive Domain Name Dialog Box</a>, page 18-14.</li> <li>To edit a domain, select it and click the Edit Row button.</li> <li>To delete a domain, select it and click the Delete Row button.</li> </ul> |

## IOS Web Filter Rule and Applet Scanner Dialog Box

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the IOS Web Filter Rule and Applet Scanner dialog box to create web filtering rules for IOS devices.

### Navigation Path

To open this dialog box, select the Web Filter Rules tab on the [Web Filter Rules Page \(IOS\)](#), page 18-12, click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

| Interface                                          | <p>The interface or interface role to which the rule is assigned. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects, page 6-73</a>.</p>                                                                                                                                                                                                                                                                                                                                                    |
| Traffic Direction                                  | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering an interface.</li> <li>• Out—Packets exiting an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Java Applet Scanning<br>Enable Java Applet Scanner | <p>If you select <b>Enable Java Applet Scanning</b>, the device checks for the presence of Java applets in HTTP traffic coming from web servers to internal hosts. If a Java applet is present and the web server (applet source) is in the list of permitted sources, the Java applet is left unmodified in the HTTP traffic. Otherwise, the Java applets are removed from HTTP pages.</p> <p><b>Tip</b> When you enable web filtering, Java applets are inspected, which can affect performance. By enabling the Java applet scanner, you can identify a list of permitted or denied sources and avoid inspection for those applets. Even if you do not want to deny any sources, enable scanning and permit the <b>any</b> source.</p>                                                                                                     |
| Permit Traffic<br>Applet Sources                   | <p>The list of permitted or denied source addresses for Java applets. To configure a list of permitted or denied sources:</p> <ul style="list-style-type: none"> <li>• Select either <b>Permit from Specified Sources</b> or <b>Deny from Specified Sources</b>. If you want to create both a permit and deny list, create two separate web filter rules. If you do not configure a permit list, all sources are denied.</li> <li>• Enter the list of permitted or denied addresses in the <b>Applet Sources</b> field. The list can include host IP addresses, network addresses, address ranges, or network/host objects, but cannot include domain names. Separate multiple addresses with commas. For more information on entering addresses, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a>.</li> </ul> |

## IOS Web Filter Exclusive Domain Name Dialog Box

**Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the IOS Web Filter Exclusive Domain Name dialog box to configure local web filtering rules for IOS devices. You can create a list of permitted or denied domain names or IP addresses. The device checks this list before forwarding web requests to your web filtering server.

Using local filtering saves the wait time for getting a response from the server when a user requests a web site that you know you will either always permit or always deny.

### Navigation Path

To open this dialog box, select the Exclusive Domains tab on the [Web Filter Rules Page \(IOS\)](#), page 18-12, click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

### Field Reference

**Table 18-7 IOS Web Filter Exclusive Domain Name Dialog Box**

| Element     | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic     | Whether you want to permit access to the listed web sites or deny access to them.                                                                                                                                                                                                                                            |
| Domain Name | The domain names or host IP addresses of web sites that you are permitting or denying. Separate multiple entries with commas.<br><br>For domain names, you can enter a full or partial name. For example, cisco.com covers all web servers on the cisco.com domain, whereas www.cisco.com specifies only the www web server. |

## Configuring Settings for Web Filter Servers

Use the Web Filter settings policy to configure the web filter servers and other settings to use with your web filter rules policy. You can use Websense or Smartfilter (N2H2) filtering servers, or no external servers (for IOS devices).

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

### Tip

These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

### Related Topics

- [Configuring Web Filter Rules for IOS Devices](#), page 18-10

- 
- Step 1** Do one of the following to open the [Web Filter Settings Page, page 18-16](#):
- (Device view) Select **Firewall > Settings > Web Filter** from the Policy selector.
  - (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the type of web filtering server you use in the **Web Filter Server Type** field, and then add the servers to the table of web filtering servers. If you have more than one server, add them in priority order; the first server in the list is the primary server.
- To add a server, click the Add Row button and fill in the [Web Filter Server Configuration Dialog Box, page 18-19](#).
  - To edit a server, select it and click the Edit Row button.
  - To delete a server, select it and click the Delete Row button.
- Step 3** The bottom half of the settings policy includes device-specific options that you can also configure. For specific information on each setting, see [Web Filter Settings Page, page 18-16](#). The following is an overview of the settings:
- IOS devices—The most interesting setting is **Allow Traffic when Servers Unreachable**, which determines whether you allow any web connections if the filtering servers are unavailable. If you do not select this option, all web traffic is cut off if the servers go offline for any reason.  
The remaining settings configure logging and cache size options.
  - ASA, PIX, FWSM devices—These options configure the cache size and buffer limits used with the filtering servers. You can also control whether the cached responses include both source and destination (if you have different filtering policies per user) or destination only (one policy for all), as configured in the filtering server.
- 

## Web Filter Settings Page

Use the Web Filter settings page to configure the web filter servers and other settings to use with your web filter rules policy.

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

### Tip

These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

---

### Navigation Path

To access the Web Filter settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Web Filter** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Web Filter**.

| Enable Audit Trail                     | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Web Filter Server Logging       | Whether to send system messages to the URL filtering server for logging. The device sends a log request immediately after the URL lookup request. The log request contains the URL, hostname, source IP address, and the destination IP address. The server records the log request into its own log server so you can view this information as necessary.                                                                                                                                                                                                                                                                                                                |

**Table 18-8** Web Filter Page (continued)

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache Size                                             | <p>The maximum number of destination IP addresses (and their authorization status) that can be cached in the device. The default value is 5000.</p> <p>When the cache reaches 80% full, the device starts removing older inactive entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Maximum Requests                                       | <p>The maximum number of outstanding requests that can exist at any given time. If the specified number is exceeded, new requests are dropped. The default is 1000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Packet Buffer                                          | <p>The maximum number of HTTP responses that can be stored in the packet buffer of the device while it waits for the web filter server to allow or deny the request. The device drops responses when the maximum is reached. The default (and maximum) value is 200.</p> <p>When users make web requests, the device simultaneously sends the request to the web site and to the web filtering server. If the response from the web site is received before the server provides a permit or deny response, the device keeps the request in the packet buffer until it gets a response from the server.</p> <p>The response is removed from the buffer when the server responds or if the device determines that the server is unavailable and you also selected <b>Allow Traffic when Servers Unreachable</b>.</p> |
| <b>PIX/ASA/FWSM Specific Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Cache Match Criteria                                   | <p>How to cache web requests:</p> <ul style="list-style-type: none"> <li>• Source and Destination—Cache entries are based on both the address initiating the request and the destination web address. Select this mode if users do not share the same filtering policy on the filtering server.</li> <li>• Destination—Cache entries are based on the destination web address. Select this mode if all users share the same filtering policy on the filtering server.</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| URL Buffer Memory<br>(ASA 7.2+, PIX 7.2+ only.)        | <p>The size of the URL buffer memory pool in KB. Values are 2 to 10240.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Maximum Allowed URL Size<br>(ASA 7.2+, PIX 7.2+ only.) | <p>The maximum allowed URL size in KB for each URL being buffered. The possible values differ depending on server type:</p> <ul style="list-style-type: none"> <li>• Websense—From 2 to 4.</li> <li>• Smartfilter (N2H2)—2 or 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Cache Size                                             | <p>The size of the cache, in KB, for storing responses from the filtering server. Values are 1 to 128.</p> <p>Caching stores URL access privileges in memory on the security appliance. When a host requests a connection, the security appliance first looks in the URL cache for matching access privileges instead of forwarding the request to the Websense server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 18-8** Web Filter Page (continued)

| Element                | Description                                                                                                                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URL Block Buffer Limit | The size of the buffer for storing web server responses while waiting for a filtering decision from the filtering server. The values are 1 to 128, which specifies the number of 1550-byte blocks. |

## Web Filter Server Configuration Dialog Box

Use the Web Filter Server Configuration dialog box to configure the external web filter servers you want to use with your Web Filter Rules policies. You can configure Websense or Smartfilter (N2H2) servers.

### Navigation Path

From the [Web Filter Settings Page, page 18-16](#), click **Add Row** beneath the Web Filter Servers table, or select a row and click **Edit Row**.

|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Common</b>                         |                                                                                                                                                                                                                                                                                                                                                                               |
| IP Address                            | The IP address of the web filter server.                                                                                                                                                                                                                                                                                                                                      |
| Timeout                               | The length of time, in seconds, that the device will wait for a response from the web filter server. The default is 5 seconds.<br><br>If the request times out, the device tries the next server, if you configure more than one.                                                                                                                                             |
| <b>PIX/ASA/FWSM Specific Settings</b> |                                                                                                                                                                                                                                                                                                                                                                               |
| Interface                             | The network interface where the authentication server resides, for example, FastEthernet0. If not specified, the default is inside.<br><br>Enter the name of the interface or the interface role that identifies it, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. |
| Protocol                              | The protocol to use when communicating with the web filtering server. Select the option for which the server is configured: <ul style="list-style-type: none"> <li>• TCP (version 1)</li> <li>• TCP version 4</li> <li>• UDP version 4</li> </ul>                                                                                                                             |
| Connection Number                     | (Optional) The maximum number of TCP connections allowed between the device and the server.                                                                                                                                                                                                                                                                                   |

**Table 18-9** *Web Filter Server Configuration Dialog Box (continued)*

| <b>Element</b>               | <b>Description</b>                                                                                                         |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>IOS Specific Settings</b> |                                                                                                                            |
| Retransmit                   | The number of times the device will retransmit a request when the server does not respond. The default value is two times. |
| Port                         | The port number that the server listens on. The default port is 15868.                                                     |

## Managing Firewall Botnet Traffic Filter Rules

---

Malware is malicious software that is installed on an unknowing host. Malware that attempts network activity such as sending private data (passwords, credit card numbers, key strokes, or proprietary data) can be detected by the Botnet Traffic Filter when the malware starts a connection to a known bad IP address. The Botnet Traffic Filter checks incoming and outgoing connections against a dynamic database of known bad domain names and IP addresses, and then logs any suspicious activity.

You can also supplement the Cisco dynamic database with blocked addresses of your choosing by adding them to a static block list; if the dynamic database includes blocked addresses that you think should not be blocked, you can manually enter them into a static allow list. Addresses in the allow list still generate syslog messages, but because you are only targeting syslog messages in the block list, they are informational. If you do not want to use the Cisco dynamic database at all, because of internal requirements, you can use the static block list alone if you can identify all the malware sites that you want to target.

- [Task Flow for Configuring the Botnet Traffic Filter, page 19-2](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

## Understanding Botnet Traffic Filtering

### Botnet Traffic Filter Address Categories

Addresses monitored by the Botnet Traffic Filter include:

- **Known malware addresses**—These addresses are on the block list identified by the dynamic database and the static block list.
- **Known allowed addresses**—These addresses are on the allow list. To be allowed, an address must be blocked by the dynamic database and also identified by the static allow list.
- **Ambiguous addresses**—These addresses are associated with multiple domain names, but not all of these domain names are on the block list. These addresses are on the graylist.
- **Unlisted addresses**—These addresses are unknown, and not included on any list.

### Botnet Traffic Filter Actions for Known Addresses

You can configure the Botnet Traffic Filter to log suspicious activity, and you can optionally configure it to block suspicious traffic automatically.

Unlisted addresses do not generate any syslog messages, but addresses on the block list, allow list, and graylist generate syslog messages differentiated by type.

### Botnet Traffic Filter Databases

The Botnet Traffic Filter uses two databases for known addresses. You can use both databases together, or you can disable use of the dynamic database and use the static database alone. This section includes the following topics:

- Information About the Dynamic Database
- Information About the Static Database

### Information About the Dynamic Database

The Botnet Traffic Filter can receive periodic updates for the dynamic database from the Cisco update server. This database lists thousands of known bad domain names and IP addresses.

The security appliance uses the dynamic database as follows:

1. When the domain name in a DNS reply matches a name in the dynamic database, the Botnet Traffic Filter adds the name and IP address to the DNS reverse lookup cache.
2. When the infected host starts a connection to the IP address of the malware site, the security appliance sends a syslog message informing you of the suspicious activity.
3. In some cases, the IP address itself is supplied in the dynamic database, and the Botnet Traffic Filter logs any traffic to that IP address without having to inspect DNS requests.

#### Note

To use the database, be sure to configure a domain name server for the security appliance so that it can access the URL.

To use the domain names in the dynamic database, you need to enable DNS packet inspection with Botnet Traffic Filter snooping; the security appliance looks inside the DNS packets for the domain name and associated IP address.

### Information About the Static Database

You can manually enter domain names or IP addresses (host or subnet) that you want to tag as bad names in a block list. You can also enter names or IP addresses in an allow list, so that names or addresses that appear on both the allow list and the dynamic block list are identified only as allowed addresses in syslog messages and reports.

You can alternatively enable DNS packet inspection with Botnet Traffic Filter snooping. With DNS snooping, when an infected host sends a DNS request for a name on the static database, the security appliance looks inside the DNS packets for the domain name and associated IP address and adds the name and IP address to the DNS reverse lookup cache.

## Task Flow for Configuring the Botnet Traffic Filter

To configure the Botnet Traffic Filter, follow these steps:

- 
- Step 1** Enable use of a DNS server.
- This procedure enables security appliance use of a DNS server. In multiple context mode, enable DNS per context.
- For more information, see [DNS Page, page 52-14](#)
- Step 2** Enable use of the dynamic database.
- This procedure enables database updates from the Cisco update server, and also enables use of the downloaded dynamic database by the security appliance. Disallowing use of the downloaded database is useful in multiple context mode so you can configure use of the database on a per-context basis.
- For more information, see [Configuring the Dynamic Database, page 19-4](#)
- Step 3** (Optional) Add static entries to the database.
- This procedure lets you augment the dynamic database with domain names or IP addresses that you want to add to the block list or allow list. You might want to use the static database instead of the dynamic database if you do not want to download the dynamic database over the Internet.
- For more information, see [Adding Entries to the Static Database, page 19-5](#)
- Step 4** Enable DNS snooping.
- This procedure enables inspection of DNS packets, compares the domain name with those in the dynamic database or the static database (when a DNS server for the security appliance is unavailable), and adds the name and IP address to the DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.
- For more information, see [Enabling DNS Snooping, page 19-6](#)
- Step 5** Enable traffic classification and actions for the Botnet Traffic Filter.
- This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic or drops that traffic.
- For more information, see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#)
- Step 6** Monitor and Mitigate Botnet Activity.
- After configuring the Botnet Traffic Filter on a device, the device will begin generating syslog messages to notify you of botnet activity. You should verify the syslog configuration on the device so that messages are appropriately logged and that notifications are sent as needed. As malicious traffic is identified, you will need to perform necessary actions to stop such traffic and to clean any infected computers that are generating the malicious traffic.
- For more information, see the following references:
1. [Chapter 54, “Configuring Logging Policies on Firewall Devices”](#)

  3. [Understanding Firewall Summary Botnet Reports, page 70-15](#)
-

## Configuring the Dynamic Database

This procedure enables database updates, and also enables use of the downloaded dynamic database by the security appliance.

In multiple context mode, you enable downloading of the dynamic database on the System context so that it is available to all security contexts. You can then decide, on a per-context basis, whether to enable use of the dynamic database or not.

By default, downloading and using the dynamic database is disabled.

- [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

### Before You Begin

Enable security appliance use of a DNS server (see [DNS Page, page 52-14](#)). In multiple context mode, enable DNS per context.

- 
- Step 1** Do one of the following:
- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

---

**Note** For devices in multiple context mode, you enable downloading of the dynamic database on the System context and enable use of the dynamic database on each security context, as needed.

---

This opens the [Botnet Traffic Filter Rules Page, page 19-9](#).

- Step 2** On the Dynamic Blacklist Configuration tab, select **Enable Dynamic Blacklist From Server** to enable downloading of the dynamic database.

---

**Note** In multiple context mode, you enable downloading of the dynamic database on the System context.

---

This setting enables downloading of the dynamic database from the Cisco update server. If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour.

- Step 3** (Multiple context mode only) Click **Save** to save the changes to the System context. Then change to the context where you want to configure the Botnet Traffic Filter, select **Firewall > Botnet Traffic Filter Rules** for that context, and then proceed to [Step 4](#).

- Step 4** On the Dynamic Blacklist Configuration tab, select **Use Dynamic Blacklist** to enable use of the dynamic database.

**Note** In multiple context mode, these settings are disabled on the System context.

## Adding Entries to the Static Database

The static database lets you augment the dynamic database with domain names, IP addresses, or network addresses that you want to add to the block list or allow list. For more information, see [Understanding Botnet Traffic Filtering, page 19-1](#).

### Related Topics

- [Allow List/Block List Tab, page 19-14](#)
- [Device Whitelist or Device Blacklist Dialog Box, page 19-15](#)
- [Understanding Botnet Traffic Filtering, page 19-1](#)
- [Task Flow for Configuring the Botnet Traffic Filter, page 19-2](#)

- [Enabling DNS Snooping, page 19-6](#)
- [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

### Before You Begin

- Enable security appliance use of a DNS server (see [DNS Page, page 52-14](#)). In multiple context mode, enable DNS per context.

- Step 1** Do one of the following:
- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Note** For devices in multiple context mode, you configure the static database on the security context.

This opens the [Botnet Traffic Filter Rules Page, page 19-9](#).

- Step 2** On the Whitelist / Blacklist tab, click the **Add Rows** button that corresponds with the type of entry you are adding (Whitelist or Blacklist).

This opens the [Device Whitelist or Device Blacklist Dialog Box, page 19-15](#).

- Step 3** In the Domain or IP Address field, enter one or more domain names, IP addresses, and IP address/netmasks. Enter multiple entries separated by commas or on separate lines. You can enter up to 1000 entries for each type.

**Step 4** Click **OK**.

---

## Enabling DNS Snooping

This procedure enables inspection of DNS packets and enables Botnet Traffic Filter snooping, which compares the domain name with those on the dynamic database or static database, and adds the name and IP address to the Botnet Traffic Filter DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.

The default configuration for DNS inspection inspects all UDP DNS traffic on all interfaces, and does not have Botnet Traffic Filter snooping enabled. We suggest that you enable Botnet Traffic Filter snooping only on interfaces where external DNS requests are going. Enabling Botnet Traffic Filter snooping on all UDP DNS traffic, including that going to an internal DNS server, creates unnecessary load on the security appliance.

**Note** TCP DNS traffic is not supported.

---

- 
- Step 1** You must first configure DNS inspection for traffic that you want to snoop using the Botnet Traffic Filter. See [Chapter 17, “Managing Firewall Inspection Rules”](#).
- Step 2** While defining a new inspection rule or editing an existing inspection rule, select DNS as the protocol you want to inspect.
- The Configure button to the right of the Selected Protocol field becomes active.
- Step 3** Click **Configure**.
- This opens the [Configure DNS Dialog Box, page 17-19](#).
- Step 4** To enable DNS snooping, select **Enable Dynamic Filter Snooping**.
- Step 5** Click **OK**.
- 

## Enabling Traffic Classification and Actions for the Botnet Traffic Filter

This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic. The

Botnet Traffic Filter can also drop the connection when matching traffic is encountered. For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

The DNS snooping is enabled separately (see [Enabling DNS Snooping, page 19-6](#)). Typically, for maximum use of the Botnet Traffic Filter, you need to enable DNS snooping, but you can use Botnet Traffic Filter logging independently if desired. Without DNS snooping for the dynamic database, the Botnet Traffic Filter uses only the static database entries, plus any IP addresses in the dynamic database; domain names in the dynamic database are not used.

### What You Need To Know About Botnet Traffic Classification ACLs

When you configure the enable and drop rules, you have the option of specifying an extended ACL policy object to limit the traffic to which Botnet Traffic Filtering will be applied. If you do not specify an ACL object, filtering is done for all traffic: this is equivalent to specifying an ACL with the single rule permit IP any any.

If you want to specify an ACL so that filtering is performed on less than all traffic, keep the following in mind:

- Permit rules identify the traffic that is subject to Botnet Traffic Filtering. In drop rules, permit entries identify the traffic that the ASA is allowed to drop.
- Deny rules identify the traffic that should not be subject to filtering. The Botnet Traffic Filter ignores traffic that matches deny entries.
- The ACL that you select for drop rules should be a subset of the ACL used in the enable rules for the interface. For traffic to be dropped, there must not only be a permit rule in the drop rule's ACL, the traffic must also fall under a permit rule in the enable rule's ACL. This is because the drop rule is not considered until traffic permitted in an enable rule has first been identified as blocked.

We recommend enabling the Botnet Traffic Filter on all traffic on the Internet-facing interface, and enabling dropping of traffic with a severity of moderate and higher.

### Related Topics

- [Traffic Classification Tab, page 19-11](#)
- [BTF Enable Rules Editor, page 19-12](#)
- [BTF Drop Rules Editor, page 19-13](#)
- [Understanding Botnet Traffic Filtering, page 19-1](#)
- [Task Flow for Configuring the Botnet Traffic Filter, page 19-2](#)
- [Configuring the Dynamic Database, page 19-4](#)
- [Adding Entries to the Static Database, page 19-5](#)
- [Enabling DNS Snooping, page 19-6](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

---

#### Step 1 Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

---

**Note** For devices in multiple context mode, you configure traffic classification on the security context.

---

This opens the [Botnet Traffic Filter Rules Page, page 19-9](#).

**Step 2** To enable the Botnet Traffic Filter on specified traffic, follow these steps:

- a. On the Traffic Classification tab, click **Add Row** under the Enable Rules table.

This opens the [BTF Enable Rules Editor, page 19-12](#).

- b. In the Interfaces field, specify the interface or interfaces on which you want to enable the Botnet Traffic Filter. Normally, you want to enable the Internet-facing interface only. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see [Understanding Interface Role Objects, page 6-73](#)).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

- c. Do one of the following to identify the traffic that you want to monitor:
- To monitor all traffic, leave the ACL field blank.
  - To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see [Creating Access Control List Objects, page 6-53](#).

---

**Note** You can specify only one enable rule per interface.

---

- d. Click **OK**.

The BTF Enable Rules Editor closes and the rule is added to the Enable Rules table.

**Step 3** To automatically drop malware traffic, follow these steps:

---

**Note** You must enable the Botnet Traffic Filter for the traffic you want to automatically drop before creating a drop rule for that traffic.

---

- a. On the Traffic Classification tab, click **Add Row** under the Drop Rules table.

This opens the [BTF Drop Rules Editor, page 19-13](#).

- b. In the Interfaces field, specify the interface or interfaces on which you want to drop traffic. There must be a corresponding enable rule for the interface. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see [Understanding Interface Role Objects, page 6-73](#)).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

- c. Do one of the following to identify the traffic that you want to drop:
- To monitor all traffic, leave the ACL field blank.

- To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see [Creating Access Control List Objects, page 6-53](#).
- d. In the Threat Level area, choose one of the following options to drop traffic specific threat levels. The default level is a range between Moderate and Very High.

**Note** We highly recommend using the default setting unless you have strong reasons for changing the setting.

- Value—Specify the threat level you want to drop.
- Range—Specify a range of threat levels.

**Note** Static block list entries are always designated with a Very High threat level.

- e. Click **OK**.

The BTF Drop Rules Editor closes and the rule is added to the Drop Rules table.

**Step 4** To add more rules, repeat steps 2 and 3, as required. When finished adding rules, click **Save** to save your changes.

**Step 5** To treat graylisted traffic as blocked traffic for action purposes, on the Dynamic Blacklist Configuration tab, check the **Treat Ambiguous traffic as Blacklist** check box.

If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic.

## Botnet Traffic Filter Rules Page

You can use the Botnet Traffic Filter Rules page to define rules for identifying malicious traffic passing through your ASA security device.

The Botnet Traffic Filter Rules page is divided into three sections:

- [Dynamic Blacklist Configuration Tab, page 19-10](#)
- [Traffic Classification Tab, page 19-11](#)
- [Allow List/Block List Tab, page 19-14](#)

### Navigation Path

To access the Botnet Traffic Filter Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Botnet Traffic Filter Rules**.

If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour.</p> <p><b>Note</b> If the device is in multiple context mode, configure this option on the System context for that device.</p> |

**Table 19-1** *Dynamic Blacklist Configuration Tab (continued)*

| Element                              | Description                                                                                                                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use Dynamic Blacklist                | Enables use of the dynamic database for the Botnet Traffic Filter.<br><b>Note</b> In multiple context mode, you configure use of the database on a per-context basis.                                                    |
| Treat Ambiguous traffic as Blacklist | When selected, graylisted traffic will be treated as blocked traffic for action purposes.<br><br>If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic. |

## Traffic Classification Tab

Use the Traffic Classification tab to view or to configure the traffic classification definitions for a device or shared policy and to identify malicious traffic that you want automatically dropped. Traffic classification definitions (enable rules) consist of an interface or interface role with an associated ACL that identifies the traffic that is monitored by the Botnet Traffic Filter. You can configure settings for specific interfaces or for interface roles. You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override any settings defined for an interface role.

For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

### Note

We highly recommend configuring Dynamic Filter Snooping for proper functioning of the Botnet Traffic Filter. When in Device view, Cisco Security Manager provides a link at the bottom of the Traffic Classification tab that will take you directly to the Inspection Rules page so that you can enable Dynamic Filter Snooping. For more information, see [Enabling DNS Snooping, page 19-6](#).

The columns in the tables summarize the settings for an entry and are explained in [BTF Enable Rules Editor, page 19-12](#) and [BTF Drop Rules Editor, page 19-13](#).

To configure traffic classification and actions:

- Click the **Add Row** button to add an interface or interface role to the table, and fill in the [BTF Enable Rules Editor, page 19-12](#) or [BTF Drop Rules Editor, page 19-13](#).
- Select an entry and click the **Edit Row** button to edit an existing entry.
- Select an entry and click the **Delete Row** button to delete it.

### Navigation Path

From the [Botnet Traffic Filter Rules Page, page 19-9](#), click the **Traffic Classification** tab.

## BTF Enable Rules Editor

Use the BTF Enable Rules Editor to specify the interfaces on which you want to enable the Botnet Traffic Filter and to identify the traffic that you want to monitor. You can specify only one enable rule per interface.

### Navigation Path

To access the BTF Enable Rules Editor, right-click inside the work area of the Enable Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACL     | <p>Specifies the access-list to use for identifying the traffic that you want to monitor. If you do not specify an access list, by default you monitor all traffic.</p> <p>To specify the traffic that you want to monitor, click <b>Select</b> to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see <a href="#">Creating Access Control List Objects, page 6-53</a>.</p> |

## BTF Drop Rules Editor

Use the BTF Drop Rules Editor to identify malware traffic that you want to automatically drop. You can specify multiple drop rules per interface.

### Navigation Path

To access the BTF Drop Rules Editor, right-click inside the work area of the Drop Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

## Whitelist/Blacklist Tab

Use the Whitelist/Blacklist tab to view or to configure the static database entries for a device or shared policy. The Device Blacklist contains domain names or IP addresses of malicious or undesirable sites. You can use the static block list to supplement the Cisco dynamic database or you can use the static block list alone if you can identify all the malware sites that you want to target.

The Device Allow List contains domain names or IP addresses of sites that are deemed to be acceptable. If the dynamic database includes blocked addresses that you think should not be blocked, you can manually enter them into a static allow list. Static allow list entries take precedence over entries in the static block list and the Cisco dynamic database. Addresses on the allow list still generate syslog messages, but because you are only targeting block list syslog messages, they are informational.

To configure the static database:

- Click the **Add Row** button to define static database entries using the [Device Whitelist or Device Blacklist Dialog Box](#), page 19-15.
- Select an entry and click the **Edit Row** button to edit an existing entry.

**Timesaver**

---

Select an entry and press **F2** or double-click on an entry in the Device Whitelist or Device Blacklist to edit that entry in place.

---

- Select an entry and click the **Delete Row** button to delete it.

**Navigation Path**

From the [Botnet Traffic Filter Rules Page](#), page 19-9, click the **Whitelist/Blacklist** tab.

**Related Topics**

- [Botnet Traffic Filter Rules Page](#), page 19-9
- [Dynamic Blacklist Configuration Tab](#), page 19-10
- [Traffic Classification Tab](#), page 19-11

## Device Whitelist or Device Blacklist Dialog Box

Use the Device Whitelist or Device Blacklist dialog box to manually define domain names or IP addresses that you want to add to the allow lists (safe) or block lists (malicious). You can use the static block list to supplement the Cisco dynamic database or you can use the static blacklist alone if you can identify all the malware sites that you want to target. Names or addresses that appear on both the allow list and the dynamic block list are identified only as allowed addresses in syslog messages and reports.

Domain names can be complete (including the host name, such as [www.cisco.com](#)), or partial (such as [cisco.com](#)). For partial names, all web site hosts on that domain are either on the allow list or block list. You can also enter host IP addresses. Use a comma or new line to separate multiple entries.

**Navigation Path**

From the [Allow List/Block List Tab](#), page 19-14, click the **Add Rows** button beneath the Device Whitelist or Device Blacklist tables, or select an entry and click the **Edit Row** button.

## Working with ScanSafe Web Security

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Invoking ScanSafe Web Security from Security Manager, you can define policies and settings in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features. The following table details the scope of support for scanning and AAA policy types.

| Supported Type        | Example                                                                                                                                                                                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content Scan Settings | Primary server IP, secondary server IP, server timeouts                                                                                                                                                                                                                                                    |
| Content Scan Policies | Global whitelist policies<br>Include/exclude user groups, default user configuration, default user group configuration<br>Interfaces that must have content scanning enabled                                                                                                                               |
| AAA Server Settings   | Identity policy object used in http-basic and NTLM policy<br>Http-basic and NTLM related timeouts<br>Order of occurrence for proxy, http-basic, and NTLM<br>LDAP server and LDAP attribute map configuration for IOS<br><b>Note</b> Radius and TACAS servers are also supported.<br>Per interface AAA list |
| AAA Policies          | Http-basic and NTLM admission rule support (authentication methods) now join the previously available Auth-Proxy method                                                                                                                                                                                    |

Security Manager does *not* support the following features:

- PAM configuration when inspect or ZBF rules for http/https are not present
- Auth-proxy using LDAP on older IOS versions. (That is, only IOS versions that support ScanSafe Web Security)
- Identity policy with auth-proxy as AAA method. (Support only for NTLM and http-basic.)
- Validation of Virtual Template number for identity policy creation
- Validation of the Secure Trust Point for LDAP server
- Inheritance of content scanning rules
- AD browsing of user groups and users
- Tool support for newer policies (such as policy query)
- Control tag policy

For more information on the ScanSafe Web Security product, go to <http://www.cisco.com/en/US/partner/products/ps11720/index.html>.

This chapter contains the following topics:

- [Configuring ScanSafe Web Security, page 20-2](#)
- [ScanSafe Web Security Page, page 20-4](#)
- [ScanSafe Web Security Settings Page, page 20-6](#)

## Configuring ScanSafe Web Security

Use the ScanSafe Web Security Settings page to define the settings for the default user group. As with other settings policies, you can share the default user group policy settings.

#### Related Topics

- [ScanSafe Web Security Page, page 20-4](#)
- [ScanSafe Web Security Settings Page, page 20-6](#)
- [Chapter 20, “Working with ScanSafe Web Security”](#)
- [Add and Edit Default User Groups Dialog Box, page 20-6](#)
- [AAA Rules Page, page 15-10](#)

#### Note

---

All steps are shown as performed from the Policy view.

---

To configure ScanSafe Web Security, perform the following steps:

---

- Step 1** From the Policy Types selector, select Firewall > ScanSafe Web Security.

The ScanSafe Web Security page appears with the Interfaces tab selected.

- Step 2** Enable those interfaces by which web requests are to be forwarded to the ScanSafe Web Security server by selecting them from the list in the **Available Interfaces** column and moving them to the **Selected Interfaces** column.
- Step 3** Select the **WhiteListing Regular Expressions** tab.
- Step 4** Select the **Notify Tower** checkbox to send notifications to the ScanSafe Web Security server regarding the whitelisting. It is applicable to all whitelisting except that which is IP-based.  
(ScanSafe Web Security receives a warning when no regular expression is specified for white listing.)
- Step 5** In the HTTP Host area specify the regular expressions to be whitelisted (using regular expression matching) by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.
- Step 6** In the HTTP User Agent area specify the regular expressions to be whitelisted by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.
- Step 7** Select the **WhiteListing ACLs** tab.
- Step 8** Specify the type of ACLs to operate upon by selecting either **Extended** or **Standard** from the Type list.
- Step 9** Specify the ACLs to whitelist by selecting them from the list in the column on the left and moving them to the **Selected items** column.
- Step 10** Select the **User Groups** tab.

**Tip**

---

You can use the User Groups page to define user groups, specify both the default user and default user group, and to include or exclude user groups. You can also edit or delete entries in all three of these lists.

---

- Step 11** Specify a default user by entering the user name in the **Default User** field (optional).
- Step 12** Specify a default user group by entering the user group name in the **Default User Group** field.
- Step 13** Include a user group by selecting the interface and then adding the user group to the Include list.
- Step 14** Exclude a user group by selecting the interface and then adding the user group to the Exclude list.
- Step 15** Select **Policy > Firewall > Settings > ScanSafe Web Security** from the policy selector.
- Step 16** With the **Details** tab selected, specify the Primary ScanSafe Server by entering the following values:
- IP Address/Name
  - HTTP Port (default 8080)
  - HTTPS Port (default 8080)
- Step 17** With the **Details** tab selected, specify the Secondary ScanSafe Server by entering the following values:
- IP Address/Name (only a valid IP address or FQDN).
  - HTTP Port (default 8080)
  - HTTPS Port (default 8080)
- Step 18** Specify the **Server Timeout** period in seconds (default 300).
- Step 19** Specify the **Session Idle Timeout** period in seconds (default 300).
- Step 20** Specify the source address by doing *one* of the following:
- Click the **IP Address** button and then enter the IP address.

- Click the **Interface** button, and then click the **Select** button and browse the Interface Selector to select an interface.

**Note** A valid source IP or interface must be one of the interfaces on which ScanSafe Web Security is enabled (on the Firewall > ScanSafe Web Security page > Interface tab).

**Step 21** Enter the **License** and select the checkbox if it is encrypted.

**Tip** If Encrypted is not selected, the value entered must be 32 hexadecimal characters.

**Step 22** If desired, select the **Enable Logging** checkbox.

## ScanSafe Web Security Page

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Using ScanSafe Web Security in Security Manager, you can define settings and policies in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features.

For information on how best to configure the ScanSafe Web Security Page for your particular purposes, see [Working with ScanSafe Web Security](#).

### Navigation Path

(Policy view) Select Firewall and open Settings from the Policy Type selector. Then click ScanSafe Web Security to open the ScanSafe Web Security Settings Page.

**Note** Configuration of the ScanSafe Web Security policies and settings is also possible by way of the Map view.

|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interfaces Tab</b>                            |                                                                                                                                                                                                                                                                                                          |
| —Filter                                          | Details on using filters in Security Manager are found at <a href="#">Filtering Tables, page 1-48</a> .                                                                                                                                                                                                  |
| Interfaces                                       | This tab allows you to select interfaces and Security Manager-defined interface roles on which web requests will be forwarded to the ScanSafe Web Security server for content scanning.                                                                                                                  |
| —Available Interfaces                            | Interfaces that are available to be selected for ScanSafe Web Security.                                                                                                                                                                                                                                  |
| —Selected Interfaces                             | Interfaces selected must be facing the WAN on which hosts' requests for web services are forwarded to ScanSafe Web Security server                                                                                                                                                                       |
| -                                                | -                                                                                                                                                                                                                                                                                                        |
| <b>Whitelisting Regular Expressions Tab</b>      |                                                                                                                                                                                                                                                                                                          |
| —Notify Tower                                    | This checkbox, when selected, specifies that the ScanSafe Web Security tower must be notified regarding the whitelisting. It is applicable to all ACL-based whitelisting variants except IP based whitelisting. The default behavior is that the notification is not sent.                               |
| —Available Regular Expressions (HTTP Host)       | Lists the regular expressions available and considered for delivery to the ScanSafe Web Security server.                                                                                                                                                                                                 |
| —Filter (HTTP Host)                              | Enables the administrator to filter whitelisted regular expressions sent to ScanSafe Web Security server by specifying include and exclude user group list. It operates on a match-all or match-any basis.                                                                                               |
| —Selected Regular Expressions (HTTP Host)        | A host that matches the selected regular expressions is whitelisted, and is not redirected to the ScanSafe Web Security server.                                                                                                                                                                          |
| —Available Regular Expressions (HTTP User Agent) | An agent that matches the available regular expressions is whitelisted, and is not redirected to the ScanSafe Web Security server.                                                                                                                                                                       |
| —Selected Regular Expressions (HTTP User Agent)  | When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.                                                                                                                                                                                  |
| <b>Whitelisting ACLs Tab</b>                     |                                                                                                                                                                                                                                                                                                          |
| —ACL Type                                        | Specifies the type of ACL Whitelisting, either standard or extended.<br><br><b>Note</b> Standard ACLs used for whitelisting are discovered as extended ACLs. A prefix of "CSM_EXT_" is added to the ACL name. Standard ACLs are converted to extended ACLs as extended ACLs are complete and recommended |
| —Selected ACLS                                   | When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.                                                                                                                                                                                  |

| Element                                 | Description                                                                                                                                                                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Groups Tab</b>                  |                                                                                                                                                                                                                                  |
| —Default User                           | A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all users in a branch office (for example).       |
| —Default User Group                     | A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all user groups in a branch office (for example). |
| —Interface Specific Default User Groups | Lists default user group for each interface.                                                                                                                                                                                     |
| —Include/Exclude                        | You can use the Include and Exclude lists to specify the particular user groups to be included or excluded.                                                                                                                      |

## Add and Edit Default User Groups Dialog Box

Use the Default User Groups dialog box to specify the default user group for a particular interface.

This dialog box is only useful when the ISR cannot determine user credentials, but would like to assign the users (that is, the IP addresses) to a user group so that other group-based policies in the ISR can be enforced. Only one group can be configured on an interface.

For details on these ScanSafe Web Security server configuration settings, see the [ScanSafe Web Security Settings Page](#).

### Field Reference

**Table 20-1 ScanSafe Web Security Settings**

| Element                                   | Description                                                                                                                                                 | Usage    |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| IP Address/Name (Primary ScanSafe Server) | The primary FQDN or IP address of the server configured to operate ScanSafe Web Security.                                                                   | Both     |
| HTTP Port (Primary ScanSafe Server)       | Default primary port for proxied HTTP traffic (default=8080).                                                                                               | Both     |
| HTTPS Port (Primary ScanSafe Server)      | Default primary port for proxied HTTPS traffic (default=8080).                                                                                              | Both     |
| IP Address/Name (Backup ScanSafe Server)  | The secondary FQDN or IP address of the server configured to operate ScanSafe Web Security.                                                                 | Both     |
| HTTP Port (Backup ScanSafe Server)        | Default secondary port for proxied HTTP traffic (default=8080).                                                                                             | Both     |
| HTTPS Port (Secondary ScanSafe Server)    | Default secondary port for proxied HTTPS traffic (default=8080).                                                                                            | Both     |
| Server Timeout                            | Polling timeout when checking the availability of the ScanSafe Web Security server.                                                                         | IOS Only |
| Session Idle Timeout                      | Inactivity timeout of the ScanSafe Web Security server (default=300 seconds). Used to remove the session if it is found inactive.                           | IOS Only |
| On Failure                                | Determines the action to be taken (Drop all Traffic or Allow All Traffic) when both primary and secondary ScanSafe Web Security servers are found inactive. | IOS Only |
| IP Address (Source Address)               | IP address from which a packet to the ScanSafe Web Security server originates from the router.                                                              | IOS Only |
| Interface (Source Address)                | Interface address from which a packet to the ScanSafe Web Security server originates from the router.                                                       | IOS Only |
| License                                   | The license sent to the ScanSafe Web Security server (32 hexadecimal characters).                                                                           | Both     |
| Encrypted                                 | When selected, enables the encryption. ASA does not accept encrypted license text to be configured.                                                         | IOS Only |
| Enable Logging Checkbox                   | Enables IOS syslogs (default=not enabled).                                                                                                                  | IOS Only |
| Public Key File                           | Name of the public key file                                                                                                                                 | ASA Only |

## Managing Zone-based Firewall Rules

---

The Zone-based Firewall feature (also known as Zone-based Policy Firewall) allows unidirectional application of IOS firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and firewall rules are applied to specific types of traffic moving in one direction between the zones. Beginning with 4.16, Cisco Security Manager allows sub-interfaces to be assigned to zones. Zone-based firewalls enforce a secure inter-zone policy by default, meaning traffic cannot pass between security zones until an explicit policy allowing that traffic is defined.

The “zone” itself is an abstraction—multiple interfaces with the same or similar security requirements that can be logically grouped together. For example, router interfaces Ethernet 0/0 and Ethernet 0/1 might be connected to the local LAN. When viewed from a firewall perspective, these two interfaces are similar in that they represent the internal network, and they can be grouped into a single zone for the purposes of firewall configuration. Then you can specify firewall policies between that and other zones. These inter-zone policies offer considerable flexibility and granularity, so different inspection policies can be applied to multiple host groups connected to the same router interface.

**Note**

---

The zone-based firewall feature is supported on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.

---

### A Simple Example

A security zone should be configured for each region of similar security within the network, so that all interfaces assigned to the same zone are protected with a similar level of security. For example, consider an access router with three interfaces:

- One interface is connected to the public Internet
- One interface is connected to a private LAN that must not be accessible from the public Internet
- One interface is connected to an Internet-service “demilitarized zone” (DMZ), where a Web server, Domain Name System (DNS) server, and e-mail server must have access to the public Internet

Each interface in this network would be assigned to its own zone, as shown in the following figure.

**Figure 21-1 Basic Security Zone Topology**

This example configuration typically would have three main policies (sets of rules) defining:

- Private zone connectivity to the Internet
- Private zone connectivity to DMZ hosts
- Internet zone connectivity to DMZ hosts

Zone-based firewalls impose a prohibitive default security posture. In other words, for example, unless the DMZ hosts are specifically allowed access to other networks, those networks are protected against any undesired connections from the DMZ hosts. Similarly, unless access is specifically provided for Internet hosts to access the Private zone directly, the Private zone hosts are safe from unwanted access by Internet hosts.

In this simple example, each zone has only one member interface. If an additional interface is added to the Private zone, for example, the hosts connected to that new interface can immediately pass traffic to all hosts connected to the existing interface in the zone. Additionally, traffic to hosts in other zones is immediately controlled by existing Private zone policies.

In a more realistic example, you might allow varied access from the public Internet to specific hosts in the DMZ, and varied application-use policies for hosts in the protected LAN.

## Understanding the Zone-based Firewall Rules

Zones establish the security borders of your network. A zone defines a boundary where traffic is subjected to inspection or filtering as it crosses to another region of your network. The default zone-based firewall policy between zones is “deny all.” Thus, if no zone-based firewall rules are explicitly configured, all traffic moving between all zones is blocked.

Zone-based firewall rules apply specific actions—Drop, Pass, Inspect, and Content Filter—to various types of unidirectional traffic between pairs of zones. The direction of the traffic is determined by specifying a source and destination zone as part of each rule.

### Logging

Zone-based firewall rules offer syslog, alert, and audit-trail logging options. Most messages are logged to the router console unless a syslog server is configured. See [Logging on Cisco IOS Routers, page 65-1](#) for information about configuring syslog logging.

### Important Points

Please note the following points regarding zones and zone-based firewall rules:

- Zone-based firewall rules are supported only on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.
- If a zone-based firewall rule and an IOS Inspection rule use the same interface, an error results.  
The zone-based firewall model and the earlier interface-based inspection rules model are not mutually exclusive on the router, but they cannot be combined on any given interface. That is, an interface cannot be configured as a member of a security zone if it is configured with Inspection rules. Further, configuring a router to use both models at the same time is not recommended.
- An interface can be assigned to only one security zone, but zones can include multiple interfaces. If an interface is assigned to more than one zone, an error results.
- All traffic to and from a given interface is implicitly blocked when the interface is assigned to a zone (except traffic to and from other interfaces in the same zone, and traffic to any interface on the router). Thus, to permit traffic to and from a zone-member interface, one or more rules allowing or inspecting traffic must be configured between that zone and any other zone.
- Traffic is implicitly allowed to flow between interfaces that are members of the same zone. However, you can define rules that require inspection of traffic between same-zone members.
- The “Self” zone is a default zone that defines the router itself as a separate security zone, which you can specify as either the source or destination zone. The Self zone is the only exception to the default “deny all” policy. All traffic to any router interface is allowed until explicitly denied.

A zone-based firewall rule that includes the Self zone applies to local traffic—that is, traffic directed to the router, or to traffic generated by the router; it does not apply to traffic through the router. See [The Self Zone, page 21-5](#) for more information.

- The Inspect action is not allowed in rules that apply to the Self zone.
- The Pass action permits traffic in one direction only. You must explicitly define rules for return traffic. However, with the Inspect action, return traffic is automatically allowed for established connections.
- Traffic cannot flow between a zone-member interface and any interface that is not a zone member.

- Interfaces that have not been assigned to a zone can still function as classical router ports and might still have other types of firewall rules configured on them.

However, if an interface is not part of your zone-based firewall policy, it might still be necessary to add that interface to a zone and configure a “pass all” policy (sort of a “dummy policy”) between that zone and any other zone to which inter-zone traffic flow is desired.

- Access-control list (ACL) rules applied on interfaces that are also zone members are processed before the zone rules are applied. Therefore, to continue using both rule types, it may be necessary to relax the interface ACLs to ensure certain traffic flows are processed by the zone-based rules.
- All interfaces in a zone must belong to the same Virtual Routing and Forwarding (VRF) instance. Zone-based rules can be configured between zones whose member interfaces are in separate VRFs. However, if traffic cannot flow between these VRFs, these rules will never be executed. See [Zones and VRF-aware Firewalls, page 21-7](#) for more information.
- Zones are defined using Interface Role objects. If you change the definition of an interface role that you are using for a zone, you are changing the zone, which can affect existing traffic flows. In addition, if you use wildcards in the interface role to specify an interface name pattern, be aware that interfaces may automatically be added to the zone when you create new interfaces on the router.
- If zone-based firewall rules contain conflicting zone information, the first rule defined in the table takes precedence. Rules that do not reference valid zones are not deployed and an activity validation warning is shown.
- Empty zones result in activity validation errors for certain devices; refer to the following restriction lists.
- Source and destination zones cannot be the same for certain devices; refer to the following restriction lists.
- For devices that support nested class-maps (IOS devices running 12.4(6)T+ and ASR devices running 3.5S+/15.2(1)S+), Security Manager will configure multiple traffic classes as a single traffic class when appropriate.
- When discovering policies on an ISR, Security Manager will discover the zone-based firewall policies as they are on the device. When discovering policies on an ASR, Security Manager will try to match policies to existing object-groups and reuse them when possible.

### ASR Restrictions

The following are restrictions specific to ASR devices:

- Deep Packet Inspection (DPI) is not allowed.
- Source and destination zones can be the same. This is possible because intra-zone traffic inspection is allowed.
- Content (URL) Filtering is not allowed.
- Only certain protocols are supported, such as DNS, FTP, H.323, ICMP, RTSP, SIP, Skinny, TCP, TFTP, and UDP.
- Although IOS-XE only supports security group tags, Security Manager allows the use of security group names for ASR devices, either directly or as part of a security group object group, and will automatically convert security group names to their tag number during deployment. However, if the ISE is not reachable, Security Manager will not be able to resolve the security group names. In such situations, Security Manager will not generate the rule for the configuration and an appropriate warning/error message will be displayed.

- IOS-XE only supports the use of security group object groups. Security Manager will generate a validation error message if inline security group tags or names are deployed to an ASR. Also, when discovering policies on an ASR, Security Manager will try to match security group object groups to existing object groups and reuse them when possible.

### ISR Restrictions

The following are restrictions specific to ISR devices:

- Empty zones cannot exist.
- Source and destination zones cannot be the same.
- Cisco TrustSec Support for IOS feature is supported on the Cisco Integrated Services Router Generation 2 (ISR G2) only.
- Destination security group tags are not supported.
- Although IOS only supports security group tags, Security Manager allows the use of security group names for ISR devices and will automatically convert security group names to their tag number during deployment. However, if the ISE is not reachable, Security Manager will not be able to resolve the security group names. In such situations, Security Manager will not generate the rule for the configuration and an appropriate warning/error message will be displayed.
- Although IOS does not support security group object groups, Security Manager allows the use of security group object groups for ISR devices and will automatically expand the object groups to their tag numbers during deployment.

## The Self Zone

The router itself is defined as a separate security zone, with the fixed name **Self**, and since IOS firewalls support examination of traffic (TCP, UDP and H.323 only) that terminates or originates on the router (together known as “local” traffic), incoming and outgoing router traffic can be subject to rules in the same way as routed inter-zone traffic.

When an interface is assigned to a zone, the hosts connected to that interface are included in that zone. By default, traffic is allowed to flow between interfaces that are members of the same zone, while a default “deny-all” policy is applied to traffic moving between zones.

However, traffic flowing directly between other zones and the router’s IP interfaces (the Self zone) is implicitly allowed. This ensures that connectivity to the router’s management interfaces is maintained when a zone firewall configuration is applied to the router.

This also means that traffic flowing to and from the IP addresses of the router's interfaces is not initially controlled by zone policies. If you wish to control traffic moving between the router interfaces and other zones, you must apply rules that block or allow this local traffic.

When configuring the rules for the Self zone, consider the following:

- All IP addresses configured on the router belong to the Self zone, regardless of interface zone membership.
- Traffic to and from the Self zone is unrestricted until you configure explicit rules to the contrary. That is, when you configure a zone-based firewall rule that includes the Self zone, traffic between the Self zone and the other zone is immediately restricted in both directions. For example, if you define a rule affecting traffic from the "Private" zone to the Self zone, the router cannot originate any traffic to the Private zone until you define one or more rules for Self to Private. Traffic between the router itself and other zones that are not included in the Self-zone rules remains unaffected.
- The Inspect action is not allowed in rules that apply to the Self zone.

When configuring restrictions on inbound Self-zone traffic, consider the necessary outbound traffic (including the routing and network management protocols). For example, if you restrict inbound traffic from a zone to the router itself, the routing protocols could stop working on all interfaces belonging to that zone.

## Using VPNs with Zone-based Firewall Policies

Recent enhancements to the IP Security (IPsec) VPN implementation simplify firewall policy configuration for VPN connectivity. IPsec Virtual Tunnel Interface (VTI) and GRE+IPsec allow the confinement of VPN site-to-site and client connections to a specific security zone by placing the tunnel interfaces in that security zone. Connections can be isolated in a VPN DMZ if connectivity must be limited by a specific policy. Or, if VPN connectivity is implicitly trusted, VPN connections can be placed in the same security zone as the trusted inside network.

To configure the router to use zone-based firewall rules with dynamic VPNs (those which dynamically create Tunnel/Loopback/Virtual interfaces):

- Define a zone specifically for the VPN interfaces.
- Enter this zone in the **VPN Zone** field on the VPN tab of the [Zone Based Firewall Page, page 21-50](#).
- Create zone-based firewall rules to allow the VPN traffic, as appropriate.

If non-VTI IPsec is employed, you must exercise caution when you configure a zone-based firewall policy for VPN. The zone policy must specifically allow access to protected hosts by remote VPN hosts or clients if they are in a different zone than the ingress interface for encrypted VPN traffic. This access policy must be configured by including an access control list (ACL) enumerating the source IP addresses of the VPN clients, and the destination IP addresses of all protected hosts the VPN clients are allowed to reach. If the access policy is not properly configured, the policy could expose vulnerable hosts to hostile traffic.

Refer to this white paper on cisco.com "[Using VPN with Zone-Based Policy Firewall](#)" for further discussion of these topics.

## Zones and VRF-aware Firewalls

Cisco IOS firewalls are VRF-aware (Virtual Routing and Forwarding), providing management of IP address overlap across different VRFs, separate thresholds and timeouts for VRFs, and so forth. For application of zone-based firewall rules, all interfaces in a zone must belong to the same VRF.

When multiple VRFs are configured on a router and one interface provides common services to all the VRFs (for example, Internet service), you should place that interface in a separate zone. You can then define policies between the common zone and other zones. (There can be one or more zones per VRF.)

You can configure rules between two zones that contain different VRFs, as shown in the following illustration.

**Figure 21-2 Zones and VRF**

In this illustration:

- The interface providing common services is a member of the zone “common.”
- All of VRF A is in a single zone, “vrf\_A.”
- VRF B, which has multiple interfaces, is partitioned into two zones “vrf\_B\_1” and “vrf\_B\_2.”
- Zone Z1 does not have VRF interfaces.

Based on this configuration:

- You can specify policies between each of these zones and the common zone. Additionally, you can specify policies between each of the zones vrf\_A, vrf\_B\_n and Z1 if VRF route export is configured and the traffic patterns make sense.
- You can configure a policy between zones vrf\_A and vrf\_B\_1, but be sure that traffic can flow between them.
- You do not need to specify the global thresholds and timers on a per-VRF basis. Instead, parameters are supplied to the Inspect action through a parameter map.

# Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules

When you create a zone-based firewall rule, you must specify two execution-related settings: Permit/Deny and an Action (Drop, Pass, Inspect, or Content Filter). To obtain the results you want, you must clearly understand the relationship between these two parameters:

- **Permit/Deny**—The Permit/Deny setting appears to correspond to Permit/Deny in an access control list (ACL) entry. However, in zone-based firewall rules, unlike in standard access rules, these keywords do not permit or deny traffic. Instead, they specify whether you want to apply an Action to the traffic flow defined by the Source, Destination, and Services fields, and they affect processing of related class maps.

- **Permit** – Applies the specified Action to traffic that matches the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the Action is further limited to those protocols.)

**Tip:** Essentially all of your zone-based rules should be Permit rules. This is the easiest configuration to understand—it means you are identifying the traffic to which you want the chosen Action applied.

- **Deny** – Exempts the traffic defined by the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the exemption is further limited to those protocols.) In other words, treat the traffic as not matching the rule. Instead, evaluate subsequent class maps (which are not the same as zone rules) for the zone pair and look for a subsequent map that matches the traffic. If no subsequent map matches the traffic, apply the default rule to the traffic (see [Changing the Default Drop Behavior, page 21-48](#)).

It is important to understand that there is not a one-to-one relationship between zone rules and class maps. Therefore, you cannot determine just by looking at the rules table how the rules will be converted to class maps. You must preview the configuration to see which subsequent rules might be applied to traffic that matches your Deny rule. (To preview the configuration, save your changes and select **Tools > Preview Configuration**. For more information, see [Previewing Configurations, page 8-44](#).)

In general, you might use a Deny rule to exempt a specific IP address within a subnet from a Permit rule you want to apply to the subnet in general; for example, exempting 10.100.10.1 from a rule applying to 10.100.10.0/24. However, it is much easier to create a Permit rule for the specific IP address and apply a desired Action, and ensure that the rule is listed above the general rule in the zone-based rules table.

If you decide to use Deny rules, be sure to also read [Troubleshooting Zone-based Rules and Configurations, page 21-54](#).

- **Action**—The Action parameters define what happens to traffic that matches a Permit rule. These parameters are ignored for Deny rules, except to determine to which class map the rule is added.

When you create a Permit rule, traffic that matches the Source, Destination, Services, and Protocol fields is processed according to the Action you choose: drop the traffic (and optionally log it), pass the traffic (and optionally log it), inspect the traffic, or apply content filtering (for Web traffic only).

When you inspect traffic for some protocols, or perform content filtering, you have the option of specifying a policy map to use for deep inspection. The deep inspection policy map also specifies actions based on the deeper characteristics of the traffic. This additional inspection applies to packets that meet the requirements of the class map to which the assigned policy map refers. Packets that do not match the deep inspection class map are allowed. Thus, deep inspection might reset TCP connections if the policy map specifies that action.

The following table illustrates the relationship between Permit/Deny and the chosen Action in a zone-based firewall rule. The table uses the TCP service as an example, but the general explanation applies to the IP service as well. The result applies only to the From and To zones specified in the rule.

**Table 21-1 Relationship Between Permit/Deny and Action in Zone-based Rules**

| Permit / Deny | Service | Rule Action | Protocol | Result                                                                                                                                                                                                                                       |
|---------------|---------|-------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit        | TCP     | Pass        | (None)   | Pass all TCP traffic.                                                                                                                                                                                                                        |
| Deny          | TCP     | Pass        | (None)   | Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Pass action is ignored.                                                         |
| Permit        | TCP     | Drop        | (None)   | Drop all TCP traffic.                                                                                                                                                                                                                        |
| Deny          | TCP     | Drop        | (None)   | Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Drop action is ignored.                                                         |
| Permit        | TCP     | Pass        | DNS      | Only DNS traffic passes. Other TCP traffic is handled by subsequent rules.                                                                                                                                                                   |
| Permit        | TCP     | Drop        | DNS      | DNS traffic is dropped. Other TCP traffic is handled by subsequent rules.                                                                                                                                                                    |
| Deny          | TCP     | Pass        | DNS      | Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Pass action is ignored.                                         |
| Deny          | TCP     | Drop        | DNS      | Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Drop action is ignored.                                         |
| Permit        | TCP     | Inspect     | HTTP     | Allow and inspect HTTP traffic. If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations). |

Table 21-1 Relationship Between Permit/Deny and Action in Zone-based Rules (continued)

| Permit / Deny | Service | Rule Action    | Protocol | Result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny          | TCP     | Inspect        | HTTP     | <p>Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Inspect action is ignored.</p> <p><b>Tip</b> If subsequent rules, or the class default, pass the traffic without inspection, you need to create a Permit/Pass rule in the other direction (or an access rule) to allow return traffic for the HTTP connection. If your intention is to prohibit HTTP connections, create a Permit/Drop rule instead of a Deny/Inspect rule.</p> |
| Permit        | TCP     | Content Filter | HTTP     | <p>Allow and inspect HTTP traffic, and apply URL filtering maps to selectively permit or deny Web connections based on the Web sites requested.</p> <p>If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations).</p> <p>Thus, traffic can be dropped either because the Web site is on the block list, or because the HTTP packets violate your deep inspection rules.</p>                                    |

**Table 21-1** Relationship Between Permit/Deny and Action in Zone-based Rules (continued)

| Permit / Deny | Service | Rule Action    | Protocol | Result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny          | TCP     | Content Filter | HTTP     | <p>Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Content Filter action is ignored.</p> <p><b>Tip</b> This type of rule can exempt the specified source/destination from content filtering if no subsequent class maps drop the traffic or apply content filtering. However, if you want to allow HTTP connections for this traffic, you must create a Permit/Inspect rule for the traffic.</p> |

## Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules

When you create a zone-based firewall rule, there are two seemingly similar parameters which help identify the characteristics of the target traffic: Services and Protocols. The entries in these fields can provide very similar information, but it is used differently when constructing zone-based firewall policies in the device configuration. This section describes the recommended uses of these fields.

- **Services** – The Services field is used to define traffic protocol(s) in an access control list (ACL) entry. Along with the Sources and Destinations specified, this ACL entry is used by a class map to define the traffic to which you want to apply a policy. However, unlike in standard access rules, the Services information is not the primary means of identifying the traffic protocol. It is required only because ACLs must have a service designation for each entry.

In general, you can leave the default entry (IP) in the Services field for all of your zone-based firewall rules, using the Protocol table to identify specific protocols that you want to Drop, Pass, or Inspect.

If you do elect to specify a Service other than IP, ensure that your selection does not conflict with any protocols listed in the Protocol table. For example, do not specify UDP in the Services field, and then list a TCP-based protocol in the table. In general, for a given rule, if you specify a specific service in the Services field, do not enter any protocols in the Protocol table.

- **Protocol** – The Protocol table, in the Action area of the Add and Edit Zone Based Rule dialog boxes, is used to select one or more protocols, add custom port application mappings (if you specify non-default ports), and apply deep inspection policy maps. You can specify very specific protocols, such as DNS, general protocols such as TCP and UDP, and even custom protocols that identify ports you use for special applications.

As a general rule, leave Services set to IP and use the Protocol table to identify the protocols (which are also services) for all of your zone-based rules for the Drop, Pass, and Inspect actions. (The Content Filter action automatically uses the HTTP protocol, which you can configure but not change.) Following this approach will create a configuration that is as “clean” and easy to interpret (and troubleshoot) as possible.

For more detailed information on how these fields are used when generating device configurations, see [Troubleshooting Zone-based Rules and Configurations, page 21-54](#).

## General Recommendations for Zone-based Firewall Rules

Zone-based firewall rules allow a wide variety of configurations. You can quickly generate a set of rules that will be very complex and difficult to analyze, because you can use the zone-based rules in place of the standard access rules, inspection rules, and Web filter rules.

When defining zone-based rules, strive to keep them as simple and straightforward as possible. Consider the following recommendations for helping to maintain simplicity in your zone-based firewall policy:

- Only use **Permit** rules. The chosen Action determines what happens to matched traffic, and **Deny** rules are difficult to analyze. For more information, see [Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules, page 21-8](#).
- The **Drop** and **Pass** rules are equivalent to standard interface access rules, but are applied to the specified zone pair. You can use either the Services field or the Protocol table to identify the type of traffic, but we recommend using the Protocol table exclusively. To drop traffic, specify **Permit** with the Action **Drop**.
- You do not need to first pass traffic before inspecting it. For example, if you want to allow HTTP traffic between zones, you need only a single Permit/Inspect rule; you do not need to first create a Permit/Pass rule. If you do use Pass rules, note that you must also create a Pass rule in the return direction if you want to allow returning traffic. In practice, you generally can avoid creating Pass rules, using only Inspect rules.
- You can use Permit/Pass and Permit/Drop rules to perform the same functions as standard access rules. Thus, you can eliminate your access rules policy and use only zone-based firewall rules.

However, because there are several tools available for analyzing interface access rules, and Security Manager allows you to use the same interface roles in zone-base rules and access rules, you might find it more convenient to create your Pass/Drop policies (which are Permit/Deny in standard access rules) in the access rules table instead of the zone rules table. Use the zone rules table primarily for zone-based Inspection and Content Filter rules.

- Use sections to organize the rules for each zone pair. Sections make it easy for you to see all of the rules for a pair, which can be critical if your rules have sequential dependencies. For more information on working with sections, see [Using Sections to Organize Rules Tables, page 12-20](#).

## Developing and Applying Zone-based Firewall Rules

The following is a general overview of how to develop and apply zone-based firewall rules to your network.

- Consider your network, and its sub-networks, in terms of security zones—think about the security requirements of the various zones. As a general guideline, group router interfaces that are similar when viewed from a security perspective.

- Determine the types of traffic to be examined as it travels from one zone to another, decide how each type is to be examined and handled.
- Define zone-based firewall rules that implement these decisions. This process may include some or all of the following procedures, which you can perform prior to defining the rules themselves, or which you can perform as necessary during rule definition:
  - Define the zones by creating named Interface Role objects, assigning the appropriate interfaces and interface patterns to them.
  - Define/edit Port Application Mapping (PAM) settings for specific Layer 4 protocols and ports, and optionally specific networks and hosts.
  - Configure Deep Packet Inspection (DPI) policies for Layer 7 protocols—HTTP, IMAP, instant messaging (IM), and peer-to-peer (P2P).
  - Configure Protocol Info parameter maps; these define DNS servers that interact with the IM applications.
  - Configure Inspect parameter maps that define connection, timeout, and other settings for the Inspect action.
  - Define WebFilter parameter or policy maps for URL-based content filtering.

The following topics provide additional information about these procedures:

- [Understanding Map Objects, page 6-78](#)
- [Configuring Content Filtering Maps for Zone-based Firewall Policies, page 21-36](#)
- [Configuring Inspection Maps for Zone-based Firewall Policies, page 21-16](#)

## Adding Zone-Based Firewall Rules

This procedure explains how to configure a zone-based firewall rule in Security Manager.

### Related Topics

- [Understanding the Zone-based Firewall Rules, page 21-3](#)
- [Configuring Settings for Zone-based Firewall Rules, page 21-49](#)
- [Understanding Map Objects, page 6-78](#)
- [Enabling and Disabling Rules, page 12-20](#)
- [Adding and Removing Rules, page 12-9](#)
- [Moving Rules and the Importance of Rule Order, page 12-19](#)

- 
- Step 1** Access the [Zone-based Firewall Rules Page, page 21-58](#) as follows:
- (Device view) Select an IOS router and then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Select an existing policy or create a new one.

- Step 2** Click the Add Row button below the rules table, or right-click anywhere inside the table, and choose **Add Row** to open the Add Zone Based Firewall Rule dialog box.

Refer to [Adding and Editing Zone-based Firewall Rules, page 21-62](#) for a complete description of this dialog box.

**Step 3** Define the base Traffic flow for this rule.

**Note** Together, the Permit/Deny, Sources, Destinations, and Services options can be thought of as defining a simple access rule that can be enhanced by the application of in-depth Action-related policies, and restricted to a specific direction between a specific pair of zones.

- a. Choose whether to Permit or Deny further processing of traffic that matches this rule. See [Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules, page 21-8](#) for more information.
- b. Optionally, provide Source and Destination hosts/networks or Security Groups (IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+ only).  
By default, the traffic definition encompasses packets from “any” source, to “any” destination. You can use these fields to refine this base traffic definition by providing one or more source and destination hosts/networks. (See [Understanding Networks/Hosts Objects, page 6-80](#) and [Selecting Security Groups in Policies, page 14-16](#) for more information.)
- c. Specify one or more Services (protocols) that indicate the type of traffic; for example, IP, TCP, etc. You can provide more than one Service; however, IP generally stands alone. (See [Understanding and Specifying Services and Service and Port List Objects, page 6-100](#).)
- d. Provide the From Zone; that is, the only zone from which matched traffic can originate.
- e. Provide the To Zone; that is, the only zone to which matched traffic can flow.

Refer to [Understanding Interface Role Objects, page 6-73](#) for more information about zone/interface objects.

**Note** Together, the From Zone and the To Zone constitute what is sometimes referred to as a “zone-pair.”

- f. Click the Advanced button to add a time range, or to apply a packet-fragment or an established-connection restriction to this zone-based firewall rule.  
See [Zone-based Firewall Rule: Advanced Options Dialog Box, page 21-67](#) for more information about these options.

**Step 4** Specify the actions to be applied to traffic matching this definition by choosing a base Action, and supplying additional parameters as necessary.

- a. Choose a base Action:
  - **Drop** – Matching traffic is silently dropped; no notification of the drop is sent to the originating host.
  - **Drop and Log** – Matching traffic is dropped and a syslog message generated; no notification of the drop is sent to the originating host.
  - **Pass** – Traffic is forwarded. This action is unidirectional; Pass allows traffic in only the specified direction.
  - **Pass and Log** – Traffic is forwarded and a syslog message generated.

**Note**

The Pass actions do not track the state of connections or sessions within the traffic. Pass only allows the traffic in one direction. A corresponding rule must be defined to allow return traffic. The Pass actions are useful for protocols such as IPSec ESP, IPSec AH, ISAKMP, and other inherently secure protocols with predictable behavior. However, most application traffic is better handled in the zone-based firewall rules with the Inspect action.

- **Inspect** – This option offers state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.

Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit the Port Application Mapping (PAM) settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols.

- **Content Filter** – Lets you configure HTTP content inspection (URL filtering) based on a WebFilter parameter map, or a WebFilter policy map. This action is generally equivalent to a Web Filter rule; however, zone-based firewall rules support additional advanced options, such as HTTP deep packet inspection (DPI).

The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.

- b. For any Action except Content Filter, you can select and edit the specific traffic Protocol(s) to be considered:

Click Select next to the Protocol table to open the [Protocol Selector Dialog Box, page 21-68](#). Select one or more protocols and click >> to move them to the Selected Protocol list. You can edit the Port Application Mapping (PAM) settings for the selected protocols; see [Configure Protocol Dialog Box, page 21-69](#) for more information.

The Instant Messaging and Stun-ice protocols also allow selection of Protocol Info parameter maps. Further, when Inspect is the chosen Action, some protocols allow selection of deep-inspection policy maps.

See [Configuring Inspection Maps for Zone-based Firewall Policies, page 21-16](#), and [Configuring Protocol Info Parameter Maps, page 21-33](#) for more information.

**Note**

It is not necessary to specify protocols for the Drop, Drop and Log, Pass, and Pass and Log actions. You can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters.

- c. When the chosen Action is Content Filter, configure the URL filtering:
  1. Click Configure next to the Protocol field to customize the HTTP PAM settings, and to apply an HTTP deep-inspection policy map. See the [Configure Protocol Dialog Box, page 21-69](#) for more information
  2. Select either WebFilter Parameter Map, or WebFilter Policy Map, and enter or Select the name of the appropriate WebFilter map. See [Configuring Content Filtering Maps for Zone-based Firewall Policies, page 21-36](#) for more information.

- d. When the chosen Action is Inspect or Content Filter, you can enter or Select the name of an Inspect Parameter map to apply a customized set of connection, timeout, and other settings. See [Configuring Inspect Parameter Maps, page 21-31](#) for more information.
- Step 5** (Optional) Enter a description to help you identify the rule.
- Step 6** (Optional) Under Category, select a category to help you identify this rule in the rules table. See [Using Category Objects, page 6-13](#).
- Step 7** Click **OK** to close the Add Zone Based Firewall Rule dialog box and return to the Zone Based Firewall Rules table.

The new rule is listed in the table.

---

## Configuring Inspection Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to inspect traffic by choosing Inspect as the Action for the rule. You can then select the specific protocols to inspect.

For some protocols, you can select policy maps to perform deep inspection on packets that match your criteria. You can configure these maps from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**). In addition to policy maps, there are some parameter maps you can configure for inspection.

- For protocols that allow deep inspection, you can select a related policy map, which in turn incorporates class maps that define match conditions for the targeted traffic. To create these policy maps in the Policy Object Manager, select one of the available map types (which are listed in the following table) from the **Maps > Policy Maps > Inspect** folder, and review the detailed usage information in [Configuring Policy Maps for Zone-Based Firewall Policies, page 21-34](#).

For information on creating class maps for use in your deep-inspection policy maps, see the references to the match criterion dialog boxes in the following table, as well as the topic [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#). These class map are found in the **Maps > Class Maps > Inspect** folder in the Policy Object Manager.

- When Inspect (or Content Filter) is the chosen Action, you can also apply an Inspect Parameters map in the [Adding and Editing Zone-based Firewall Rules](#). Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you must create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters** and review the detailed usage information in [Configuring Inspect Parameter Maps, page 21-31](#).

**Table 21-2 Policy Objects for Zone-based Firewall Inspection Rules**

| <b>Protocol</b>                                                                | <b>Minimum IOS Software Version</b> | <b>Policy Map</b>     | <b>Class Map</b>                                                    | <b>Parameter Map</b> | <b>Description and Match Criteria Reference</b>                                                                                                                                                                                                                                                                                                                                                         |

## Configuring Class Maps for Zone-Based Firewall Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring zone-based firewall rules for devices running Cisco IOS Software, you can create class maps for the following purposes:

- For 12.4(6)T and higher, you can create classes for the inspection of the following types of traffic: H.323, HTTP, IMAP, POP3, SIP, SMTP, and Sun RPC. You can create classes for web filtering using the following class types: Local, N2H2 (SmartFilter), and WebSense. See the following topics for information on the match criteria:
  - [H.323 \(IOS\) Class Maps Add or Edit Match Criterion Dialog Boxes, page 21-22](#)
  - [HTTP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes, page 21-22](#)

  - [Local Web Filter Class Add or Edit Match Criterion Dialog Boxes, page 21-29](#)
  - [N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes, page 21-30](#)
- For 12.4(9)T and higher, you can create classes for the inspection of the following types of traffic: AOL, eDonkey, FastTrack, Gnutella, ICQ, Kazaa2, MSN Messenger, Windows Messenger, and Yahoo Messenger. See the following topics for information on the match criteria:
  - [Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes, page 21-21](#)
  - [Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes, page 21-21](#)
- For 12.4(20)T and higher, you can create classes for web filtering using the Trend policy object. Match criteria for Trend Content Filter class maps is described in the table below.

### Navigation Path

Select **Manage > Policy Objects**, then select any zone-based class map object in the folders in the **Maps > Class Maps** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description                                                                | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Match table<br>Match Type<br>(Except for Trend Content Filter class maps.) | <p>The Match table lists the criteria included in the class map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion and the criterion and value that is inspected.</p> <p>The name of the table indicates whether every one of the criteria must be met for the traffic to match the class (Match All), or whether matching any of the listed criteria is sufficient (Match Any). For the HTTP (IOS) and SMTP classes, you can choose whether to match all or any. When using a Match All table, if you add more than one criteria, ensure that you are not defining a set of characteristics that no traffic can match.</p> <p><b>Tip</b> Match All works for devices running Cisco IOS Software version 12.4(20)T or later only.</p> <ul style="list-style-type: none"> <li>• To add a criterion, click the Add button and fill in the Match Criterion dialog box. For more information, see the topics referenced above.</li> <li>• To edit a criterion, select it and click the Edit button.</li> <li>• To delete a criterion, select it and click the Delete button.</li> </ul> |
| Trend Content Filter Match Criteria                                        | <p>The match criteria for Trend Content Filter class maps differs from that of all other class maps. Instead of adding items to a table, you simply select the items you want from a list. Select the Enable checkbox for any of the Trend-Micro classifications on the following tabs. Traffic matches the class if it matches any of your selections.</p> <ul style="list-style-type: none"> <li>• Productivity Categories—Matches the traffic to the category to which the URL belongs. For example, you can target traffic associated with gambling or pornography.</li> <li>• Security Ratings—Matches the traffic to the security rating assigned to it by Trend-Micro. For example, you can target adware, which is traffic associated with advertising.</li> </ul> <p>See the Trend-Micro documentation for specific information on these categories or security classifications.</p>                                                                                                                                                                                                                                                    |
| Category                                                                   | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 21-3 Add or Edit Class Maps Dialog Boxes for Zone-Based Firewall Policies (continued)**

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various instant messenger (IM) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can define a match for the following types of traffic:

- Any—Any type of traffic from the application except text chat traffic.
- Text-chat—Text chat traffic.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for AOL, ICQ, MSN Messenger, Windows Messenger, or Yahoo Messenger classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

## Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various peer-to-peer (P2P) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for eDonkey, FastTrack, Gnutella, or Kazaa2 classes, right-click inside the table and select **Add Row**, or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

**Field Reference****Table 21-4 Zone-based Firewall P2P Application Class Maps Add or Edit Match Condition Dialog Boxes**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Choose which criterion to match: <ul style="list-style-type: none"> <li>File Transfer – Matches file-transfer traffic.</li> <li>Search Filename – Matches the names of files for which the user is searching. You can use this criterion to block users from searching for particular files using eDonkey.</li> <li>Text Chat – Matches eDonkey text chat traffic.</li> </ul> |
| Type      | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                           |
| File Name | The name of the file associated with the traffic. You can use regular expressions to specify a name pattern. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions, page 17-110</a> .<br><b>Tip</b> eDonkey does not require a file name.                                          |

**H.323 (IOS) Class Maps Add or Edit Match Criterion Dialog Boxes****Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the H.323 (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map. You can match traffic based on the H.323 protocol message type. Select the message that you want to match.

**Navigation Path**

From the Add or Edit Class Maps dialog boxes for the H.323 (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

**HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes****Note**

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the HTTP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Request/Response Body Length, Request Body Length, Response Body Length—Specifies that the body length of the request, response, or both, is less than or greater than the specified number. This allows you to set a minimum or maximum message length.
- Request/Response Body, Request Body, Response Body—Applies a regular expression to match the body of the request, response, or both.
- Request/Response Header, Request Header, Response Header—You can match a regular expression against the header, test for repeated fields, check the content type, or check the total length or number of records in the header.
- Request/Response Protocol Violation—Matches non-compliant HTTP traffic.
- Request Argument, Request URI—Matches the length or content (with a regular expression) of the argument (parameters) or uniform resource identifier (URI) in a request message.
- Request Port Misuse—Matches the misuse of ports by certain types of applications.
- Response Body Java Applet—Matches Java applets in an HTTP connection.
- Response Header Status Line—Applies a regular expression to match the content of the status line in the header.

#### Navigation Path

From the Add or Edit Class Maps dialog boxes for the HTTP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

#### Related Topics

- [Understanding Map Objects, page 6-78](#)

#### Field Reference

**Table 21-5 HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes**

| Element   | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of HTTP traffic to match. The criteria are described above. |
| Type      | Specifies that the map includes traffic that matches the criterion.                   |

#### Variable Fields

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|                     |                                                                                                                               |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Less Than Length    | The minimum length in bytes of the evaluated field. The criterion matches if the length is less than the specified number.    |
| Greater Than Length | The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number. |

Table 21-5 HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes (continued)

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Header Option        | The type of header record. If you do not select a record type, the count or expression is applied to all records in the header. If you select a record type, those selections are applied only to the records of the selected type. If you select content type or transfer encoding, you can make additional selections related to those types.                                                                                                                                                                                                                                                                                                 |
| Request Method       | The request method you want to match.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Value (Content Type) | If you select content-type in the Header Option field, you can select these types: <ul style="list-style-type: none"> <li>• Mismatch—Verifies the content-type of the response message against the accept field value of the request message.</li> <li>• Unknown—The content type is not known. Select Unknown when you want to evaluate the item against all known MIME types.</li> <li>• Violation—The content-type definition and the content type of the actual body do not match.</li> </ul>                                                                                                                                               |
| Encoding Type        | If you select transfer encoding in the Header Option field, you can select these types: <ul style="list-style-type: none"> <li>• All—All of the transfer encoding types.</li> <li>• Chunked—The message body is transferred as a series of chunks; each chunk contains its own size indicator.</li> <li>• Compress—The message body is transferred using UNIX file compression.</li> <li>• Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).</li> <li>• GZIP—The message body is transferred using GNU zip (RFC 1952).</li> <li>• Identity—No transfer encoding is performed.</li> </ul> |
| Greater Than Count   | The maximum number of records allowed in the header. If you select a specific header option, the count applies to those types of records. If you do not select a specific header option, the count applies to the total number of records in the header without regard to type.                                                                                                                                                                                                                                                                                                                                                                 |
| Regular Expression   | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.                                                                                                                                                                                                                                                                                                                                                                               |
| Port Misuse          | The type of request port misuse you want to match. Your options are: <ul style="list-style-type: none"> <li>• Any—Any of the listed types of misuse.</li> <li>• IM—Instant messaging protocol applications subject to inspection.</li> <li>• P2P—Peer-to-peer protocol applications subject to inspection.</li> <li>• Tunneling—Tunneling applications subject to inspection: HTTPPort/HTTPHost.</li> </ul>                                                                                                                                                                                                                                     |

## IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Internet Message Access Protocol (IMAP) and Post Office Protocol 3 (POP3) classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can select the following criteria to identify matching traffic:

- Invalid Command—Matches commands that are not valid on a POP3 server or IMAP connection.
- Login Clear Text—Matches non-secure logins, where the password is being provided in clear text.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the IMAP or POP3 classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

## SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes

### Note

---

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

---

Use the Add or Edit Match Criterion dialog boxes for the SIP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the SIP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

## Field Reference

Table 21-6 SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | <p>Specifies which criterion of traffic to match. You can select from the following:</p> <ul style="list-style-type: none"> <li>• Protocol Violation—Matches traffic that violates the protocol.</li> <li>• Request/Response Header Options—Matches a regular expression against the selected request or response header field.</li> <li>• Request Options—Matches the request method or matches a regular expression against the selected request header field.</li> <li>• Response Options—Matches a regular expression against the selected response header field or status message.</li> </ul> |
| Type      | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Variable Fields

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Header | The type of header in the request or response message. The regular expression is matched against the content of headers of the selected type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Method | <p>The request method you want to inspect:</p> <ul style="list-style-type: none"> <li>• ack—Acknowledges that the previous message is valid and accepted.</li> <li>• bye—Signifies the intention to terminate a call.</li> <li>• cancel—Terminates any pending request.</li> <li>• info—Communicates mid-session signaling information along the signaling path for the call.</li> <li>• invite—Sets up a call.</li> <li>• message—Sends an instant message.</li> <li>• notify—Informs subscribers of state changes.</li> <li>• options—Queries the capabilities of another user agent or a proxy server.</li> <li>• prack—Provides reliable transfer of provisional response messages.</li> <li>• refer—Indicates that the recipient should contact a third party using the contact information provided in the request.</li> <li>• register—Includes a contact address to which SIP requests for the address-of-record should be forwarded.</li> <li>• subscribe—Requests notification of an event or set of events at a later time.</li> <li>• update—Permits a client to update parameters of a session but has no impact on the state of a dialog.</li> </ul> |

**Table 21-6 SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes (continued)**

| Element            | Description                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status             | The regular expression is matched against the status line in the response.                                                                                                                                                                                        |
| Regular Expression | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object. |

## SMTP Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the SMTP classes used with zone-based firewall policies to define a match criterion and value for the class map.

**Tip**

Only the Data Length criterion is available for routers running Cisco IOS Software lower than 12.4(20)T.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- **Data Length**—Specifies that the data length of the traffic is greater than the specified number. You can match the data length of the traffic to determine if the data transferred in an SMTP connection exceeds the specified length in bytes. By default, inspection keeps data length below 20.
- **Body Regular Expression**—Applies a regular expression to match the content types and content encoding types for text and HTML in the body of an e-mail message. Only text or HTML that uses 7-bit or 8-bit encoding is checked. The regular expression cannot be scanned in messages that use another encoding type (such as base64 or zip files).
- **Command Line Length**—Specifies that the length of the ESMTP command line not be greater than the specified number. Use this to thwart Denial of Service (DoS) attacks.
- **Command Verb**—Limits inspection to the selected SMTP or ESMTP command. If you configure inspection for SMTP, all commands are inspected unless you limit them.
- **Header Length**—Specifies that the length of the SMTP header is greater than the specified number. Use this to thwart DoS attacks by limiting the possible size of the header.
- **Header Regular Expression**—Applies a regular expression to match the content of the header of an e-mail message. For example, you can use this to test for particular patterns in the subject, from, or to fields.
- **Mime Content-Type Regular Expression**—Applies a regular expression to match the Multipurpose Internet Message Exchange (MIME) content type of an e-mail attachment. Use this to prevent the transmission of undesired types of attachments.
- **Mime Encoding**—Specifies the MIME encoding type for e-mail attachments that you want to inspect. You can use this to identify unknown or non-standard encodings to restrict their transmission.
- **Recipient Address**—Applies a regular expression to match the recipient of an e-mail message in the SMTP RCPT command. Use this to search for a non-existent recipient, which might help you identify the source of spam.
- **Recipient Count**—Specifies that the number of recipients for an e-mail message cannot be greater than the specified number. Use this to prevent spammers from sending e-mails to a large number of users.

- **Recipient Invalid Count**—Specifies that the number of invalid recipients for an e-mail message cannot be greater than the specified number. Use this prevent spammers from sending e-mails to a large number common names, where they are fishing for real addresses. SMTP typically replies with a “no such address” message when an address is invalid; by putting a limit on the number of invalid addresses, you can prevent these replies to spammers.
- **Reply EHLO**—Specifies the service extension parameter in an EHLO server reply. Use this to prevent a client from using a particular service extension.
- **Sender Address**—Applies a regular expression to match the sender of an e-mail message. Use this to block specific senders, such as known spammers, from sending e-mail messages through the device.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for SMTP classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), page 21-19.

### Field Reference

**Table 21-7 SMTP Class Add or Edit Match Criterion Dialog Boxes**

| Element   | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of SMTP traffic to match. The criteria are described above. |
| Type      | Specifies that the map includes traffic that matches the criterion.                   |

### Variable Fields

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|                                                                                       |                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Greater Than Length                                                                   | The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.                                                                                                                                    |
| Greater Than Count                                                                    | The maximum number of recipients or invalid recipients allowed in the e-mail message. The criterion matches if the number is greater than the specified number.                                                                                                  |
| Verb Option<br>User Defined Format<br>(For the Command Verb criterion.)               | The SMTP or ESMTP command that you want to inspect. If you select User Defined, you must enter the text string that corresponds to a word in the body of the e-mail message. The word cannot include spaces or special characters; only alphanumeric characters. |
| Service Extension Parameter<br>User Defined Format<br>(For the Reply EHLO criterion.) | The service extension parameter of an EHLO server reply that you want to inspect. Select one of the well-known parameters, or select User Defined to specify a private extension in the User Defined Format field.                                               |

**Table 21-7 SMTP Class Add or Edit Match Criterion Dialog Boxes (continued)**

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encoding Format<br>User Defined Format | <p>The MIME encoding format for which you want to test. Encoding types are:</p> <ul style="list-style-type: none"> <li>• 7-bit—ASCII encoding.</li> <li>• 8-bit—Used for the exchange of e-mail messages containing octets outside the 7-bit ASCII range.</li> <li>• base64—Encodes binary data by treating it numerically and translating it into a base 64 representation.</li> <li>• quoted-printable—Encoding that uses printable characters to transmit 8-bit data over a 7-bit data path.</li> <li>• binary—Encodes using only 0 and 1.</li> <li>• unknown—Encoding type is not known.</li> <li>• x-uuencode—Nonstandard encoding.</li> <li>• user defined—An encoding type you define. If you select User Defined, you must enter the text string that defines the encoding type you are looking for.</li> </ul> |
| Regular Expression                     | <p>The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Sun Remote Procedure Call (RPC) classes used with zone-based firewall policies to define a match criterion and value for the class map. You can enter the RPC protocol number that you want to match. See the Sun RPC documentation for information about protocol numbers.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for Sun RPC classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

## Local Web Filter Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Local web filter class to define a match criterion and value for the class map.

**Navigation Path**

From the Add or Edit Class Maps dialog boxes for the Local web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

**Field Reference****Table 21-8 Local Web Filter Class Add or Edit Match Criterion Dialog Boxes**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion               | Specifies which criterion of traffic to match. You can select from the following: <ul style="list-style-type: none"> <li>• Server Domain—Matches traffic based on the name of the server. The URLF Glob parameter map you select should specify server domain names such as *.cisco.com or www.cisco.com.</li> <li>• URL Keyword—Matches traffic based on keywords in the URLs. A key word is any complete string that occurs between / characters in a URL. For example, in the URL segment www.cisco.com/en/US, en and US are examples of keywords.</li> </ul> |
| Type                    | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| URLF Glob Parameter Map | The URLF Glob parameter map object that defines the URL patterns that you want to match. Ensure that the object you select has the appropriate content for the type of matching you selected.<br><br>Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new object.                                                                                                                                                                                                                      |

**N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes**

Use the Add or Edit Match Criterion dialog boxes for the N2H2 (SmartFilter) and Websense web filter classes to define a match criterion and value for the class map. The only match criterion available is to match any response from the SmartFilter or Websense server.

**Navigation Path**

From the Add or Edit Class Maps dialog boxes for the N2H2 or Websense web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

## Configuring Inspect Parameter Maps

Use the Add and Edit Inspect Parameter Map dialog boxes to define a parameter map for inspection for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect or Content Filter, you can select an inspect parameter map to define connection, timeout, and other settings for the inspection action. If you do not select an inspect parameter map for a zone-based firewall rule, the system uses default values for these settings.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Inspect Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                      | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                      |
| Description                               | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                |
| DNS Timeout                               | The length of time, in seconds, for which a DNS lookup session is managed while there is no activity.                                                                                                                                                                                                                                      |
| ICMP Timeout                              | The length of time, in seconds, for which an inactive ICMP (Internet Control Message Protocol) session is maintained.                                                                                                                                                                                                                      |
| Max Incomplete Low<br>Max Incomplete High | The number of existing half-open sessions that will cause the software to start (at the high threshold) and stop (at the low threshold) deleting half-open sessions.<br><br>Ensure that you enter a lower number in the Low field than you enter in the High field, for example, 400 and 500. The default is unlimited half-open sessions. |
| One Minute Low<br>One Minute High         | The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. The default is unlimited.                                                                                                           |
| Max Sessions                              | The maximum number of inspection sessions on a zone pair, for example, 200. The default is unlimited.                                                                                                                                                                                                                                      |
| TCP FINWAIT Timeout                       | How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds. The FIN-exchange occurs when the TCP session is ready to close.                                                                                                                                                                  |

**Table 21-9 Add or Edit Inspect Parameter Map Dialog Boxes (continued)**

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| TCP SYNWAIT Timeout                                       | How long to wait for a TCP session to reach the established state before dropping the session, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TCP Idle Timeout                                          | How long to maintain a TCP session while there is no activity in the session, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TCP Max Incomplete Hosts<br>TCP Max Incomplete Block Time | <p>The threshold and blocking time (in minutes) for TCP host-specific denial-of-service (DoS) detection and prevention.</p> <p>The maximum incomplete hosts is the number of half-open TCP sessions with the same host destination address that can simultaneously exist before the software starts deleting half-open sessions to that host. An unusually high number of half-open sessions with the same destination host address could indicate that a DoS attack is being launched against the host.</p> <p>When the threshold is exceeded, half-open sessions are dropped based on the maximum incomplete block time:</p> <ul style="list-style-type: none"> <li>• If the block time is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host. This ensures that the number of half-open sessions to a given host never exceeds the threshold.</li> <li>• If the block time is greater than 0, the software deletes all existing half-open sessions for the host and then blocks all new connection requests to the host. The software continues to block all new connection requests until the block time expires.</li> </ul> <p>The software sends syslog messages whenever the specified threshold is exceeded and when blocking of connection initiations to a host starts or ends.</p> |
| UDP Idle Timeout                                          | <p>How long to maintain a UDP session while there is no activity in the session, in seconds.</p> <p>When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet.</p> <p>If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Alert                                              | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Audit Trail                                        | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Category                                                  | The category assigned to the object. Categories help you organize and identify rules and objects. ## Configuring Protocol Info Parameter Maps

Use the Add and Edit Protocol Info Parameter Map dialog boxes to define a parameter map for the inspection of Instant Messaging (IM) applications or the Stun-ice protocol for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect, you must select a protocol info parameter map when you configure any of these applications: AOL, ICQ, MSN Messenger, Windows Messenger, Yahoo Messenger, Stun-ice. The protocol info parameter map defines the DNS servers that interact with these applications, which helps the instant messenger application engine to recognize the instant messenger traffic and to enforce the configured policy for that instant messenger application.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Protocol Info Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

## Add or Edit DNS Server for Protocol Info Parameters Dialog Box

Use the Add or Edit DNS Server dialog box to identify DNS servers for which traffic will be permitted (and inspected) or denied. These servers are defined in a Protocol Info parameter map for use with the inspection of protocols that require them in a zone-based firewall policy.

You can identify a server using any of these types:

- **Server Name**—The name of the DNS server. You can use an asterisk (\*) as a wildcard character to match one or more characters. For example, if you want to identify all DNS servers on the cisco.com domain, you can specify \*.cisco.com.
- **IP Address**—The IP address of a single DNS server.
- **IP Address Range**—A range of IP addresses identifying any DNS server within the start and end addresses.

### Navigation Path

From the Add or Edit Protocol Info Parameter Map dialog boxes, click the **Add** button beneath the server table, or select a server and click the **Edit** button. See [Configuring Protocol Info Parameter Maps](#), page 21-33.

## Configuring Policy Maps for Zone-Based Firewall Policies

Use the Add and Edit Policy Map dialog boxes for zone-based firewall policies to define the match criterion and values for an inspection map used in a zone-based firewall policy for a Cisco IOS router. You can create policy inspection maps for H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC inspection, and the name of the dialog box indicates the type of map you are creating.

When defining the inspection map, you select class maps of the same type and define the action to take for matching traffic. You can configure the required class maps before creating the policy maps or while you are creating them.

### Navigation Path

Select **Manage > Policy Objects**, then any of the following items in the **Maps > Policy Maps > Inspect** folder in the table of contents: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Match All table                 | The Match All table lists class maps included in the policy map, and the action to take for traffic that matches the class. For traffic to match this class, all criteria defined in the selected class maps must be met. <ul style="list-style-type: none"> <li>• To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see <a href="#">Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies, page 21-35</a>).</li> <li>• To edit a criterion, select it and click the Edit button.</li> <li>• To delete a criterion, select it and click the Delete button.</li> </ul> |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                                                                                                                                                                                                                                                            |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
