| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies

Use the Add or Edit Match Condition and Action dialog boxes for zone-based firewall and web filter policies to select the class maps for inspection and to define the action to take for traffic that matches the class. This dialog box is used for the following types of policy maps: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, Sun RPC, Web Filter.

The fields on this dialog box differ slightly depending on the type of policy map you are defining.

**Navigation Path**

From the Add or Edit Policy Maps dialog boxes for Zone-Based Firewall Policies, right-click inside the match table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Policy Maps for Zone-Based Firewall Policies, page 21-34](#).

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type                                            | Indicates that you are selecting a class map. You must define class maps when creating policy maps for zone-based firewall policies.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Class Map<br>P2P, IM, and Web Filter class map types. | The name of the class map for the type of policy map you are creating. Click <b>Select</b> to select the map from a list or to create a new class map object.<br><br>For P2P, IM, and Web Filter policy maps, you must also select the type of policy map you are creating. For example, in a P2P map you must select between eDonkey, FastTrack, Gnutella, and Kazaa2. In an IM (Zone Based IOS) map, you must select between AOL, MSN Messenger, Yahoo Messenger, Windows Messenger, and ICQ. In a Web Filter map, you must select between Local, N2H2, WebSense, and Trend. |
| Action                                                | The action you want the device to take for traffic that matches the selected class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring Content Filtering Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to filter Web content by choosing Content Filter as the Action for the rule.

To filter Web content, you must configure certain map objects, which you can do from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**).

The type of maps required depends on the technique you are using to filter content, and on the Cisco IOS software version you are using. You can filter content based on URL lists defined locally on the device, or you can use external filtering servers such as SmartFilter (N2H2), Websense, or Trend Micro.

**Tip**

If you use an external server, you must have set up and configured the server appropriately based on the documentation for the type of server you select. If you use Trend Micro servers, you must specify the server details, and register the product and download certificates, on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See [Zone Based Firewall Page, page 21-50](#).

The following are requirements for the map objects used with zone-based content filtering:

- For devices running releases below 12.4(20)T, you must create a URL Filter parameter map. In the Policy Object Manager, select **Maps > Parameter Maps > Web Filter > URL Filter**, and review the detailed usage information in [Configuring URL Filter Parameter Maps, page 21-43](#).
  - To perform local filtering on the router using lists of hosts on the allow list and block list, create the lists on the Local Filtering tab. Any Web access request is first compared to these lists before the request is sent on to an external filtering server (if you have configured one). These lists contain either complete domain names (such as www.cisco.com), or partial names (such as cisco.com), but they do not include paths or page names, and you cannot use wildcards.
  - To use a SmartFilter (N2H2) or Websense server, configure the type of server you are using and its address information on the External Filter tab. You can also configure other settings that control communication with the server. You cannot configure a Trend Micro server using the URL Filter parameter map.
- For devices running release 12.4(20)T and later, the preferred approach is to use a Web Filter policy map. Although Web Filter policy maps are more complex, they provide added flexibility, and they let you access Trend Micro filtering servers. In the Policy Object Manager, select **Maps > Policy Maps > Web Filter > Web Filter**, and review the detailed usage information in [Configuring Web Filter Maps, page 21-47](#).

A Web Filter policy map incorporates other types of maps. To create the policy map, you will need one or more of these other types of maps:

- Parameter maps – On the Parameters tab of the Add and Edit Web Filter Map dialog boxes, you can select parameter maps for the various types of Web filtering if you do not want to use the default settings. If you are using SmartFilter (N2H2) or Websense, you need to select a parameter map because the map identifies those servers. For Local and Trend Micro filtering, parameter maps configure some general settings, the most interesting of which is whether to display a message or Web page when a URL is blocked. In the Policy Object Manager, you can find parameter maps for Local, N2H2, Trend, and Websense in the **Maps > Parameter Maps > Web Filter** folder. For detailed usage information, see [Configuring Local Web Filter Parameter Maps, page 21-38](#), [Configuring N2H2 or WebSense Parameter Maps, page 21-39](#), or [Configuring Trend Parameter Maps, page 21-42](#).

---

**Note** You configure Trend Micro server information on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See [Zone Based Firewall Page, page 21-50](#).

---

- Class maps for match conditions – These class maps define the type of traffic you want to target and specify the action to be taken. You select a type of filtering (Local, SmartFilter/N2H2, Websense, or Trend Micro), specify the class map that identifies the targeted traffic, and choose an action (such as Allow, Reset, etc.) to be taken for that traffic. In the Policy Object Manager, you can find class maps for Local, N2H2, Trend, and Websense in the **Maps > Class Maps > Web Filter** folder.

These class-map configurations depend on the type of filtering:

**Local Filtering** – The Local WebFilter class map is a list of one or more URLF Glob parameter maps that specify either domain names or URL keywords that you want to target. A URL keyword is any text string delineated by forward-slash (/) characters in a URL. These class maps help you define allowed (allow list) and blocked (block list) URL lists for a WebFilter policy—create separate maps for each list. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#), [Local Web Filter Class Add or Edit Match Criterion Dialog Boxes, page 21-29](#), and [Configuring URLF Glob Parameter Maps, page 21-45](#).

**SmartFilter (N2H2) or Websense Filtering**—The class maps for N2H2 and Websense define any server response as the matching criterion. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

**Trend Micro Filtering** – The Trend class map lets you select various Productivity Categories and Security Ratings, as defined by Trend Micro, that you want to target. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

Besides the maps used to define content filtering, you can also configure the following maps for content filter rules:

- **Inspect Parameters maps** – Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you can create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters**, and review the detailed usage information in [Configuring Inspect Parameter Maps, page 21-31](#).
- **HTTP policy map** – If you want to use deep inspection on the individual HTTP packets in addition to Web filtering, you can configure an HTTP policy map by clicking **Configure** next to the Protocol field in the Action section of the [Adding and Editing Zone-based Firewall Rules, page 21-62](#). The HTTP policy map incorporates HTTP class maps that define the type of traffic you want to match and then defines the action to take. For example, you can target traffic that includes Java applets. In the Policy Object Manager, select **Maps > Policy Maps > Inspect > HTTP (Zone Based IOS)**, and review the detailed usage information in [Configuring Policy Maps for Zone-Based Firewall Policies, page 21-34](#), [HTTP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes, page 21-22](#), and [Configuring Class Maps for Zone-Based Firewall Policies, page 21-19](#).

## Configuring Local Web Filter Parameter Maps

Use the Add and Edit Local Parameter Map dialog boxes to define a parameter map for local web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Local web filter parameter map (when you select Local for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps, page 21-47](#).

#### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Local** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                             |
| Enable Alert                    | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                           |
| Enable Allow Mode               | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                          |
| Block Page                      | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>None—The user is not presented with any information.</li> <li>Message—The user is presented with the text message you enter in the edit box.</li> <li>Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul> |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                               |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                                                                                                                  |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                            |

## Configuring N2H2 or WebSense Parameter Maps

Use the Add and Edit N2H2 or Websense Parameter Map dialog boxes to define a parameter map for Smartfilter (N2H2) or Websense web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates an N2H2 or Websense web filter parameter map (when you select N2H2 or Websense for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps, page 21-47](#).

**Navigation Path**

Select **Manage > Policy Objects**, then select N2H2 or WebSense from the **Maps > Parameter Maps > Web Filter** folder in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

### Field Reference

**Table 21-14 Add or Edit N2H2 or WebSense Parameter Map Dialog Boxes**

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                       | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                         |
| Description                | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| URL Filtering Server Table | The list of URL filtering servers and their attributes. <ul style="list-style-type: none"> <li>• To add servers, click the Add button and fill in the Add External Filter dialog box (see <a href="#">Add or Edit External Filter Dialog Box, page 21-41</a>).</li> <li>• To edit a server, select it and click the Edit button.</li> <li>• To delete a server, select it and click the Delete button.</li> </ul>             |
| Enable Alert               | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                 |
| Enable Allow Mode          | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                                |
| Block Page                 | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul> |
| Source Interface           | The interface whose IP address should be used as the source IP address when a TCP connection is established between the system and the URL filtering server.                                                                                                                                                                                                                                                                  |
| Maximum Cache Entries      | The maximum number of entries to store in the categorization cache. The default is 5000.                                                                                                                                                                                                                                                                                                                                      |
| Cache Life Time            | How long, in hours, an entry remains in the cache table. The default is 24.                                                                                                                                                                                                                                                                                                                                                   |
| Maximum Requests           | The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.                                                                                                                                                                                                                                                                                                                               |
| Maximum Responses          | The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.                                                                                                                                                                                                                                                                                                                 |

**Table 21-14 Add or Edit N2H2 or WebSense Parameter Map Dialog Boxes (continued)**

| Element                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Truncate Hostname<br>Truncate Script Parameters             | Whether to truncate the URLs: <ul style="list-style-type: none"> <li>If you do not select an option, URLs are not truncated.</li> <li>If you select Hostname, URLs are truncated at the end of the domain name.</li> <li>If you select Script Parameters, URLs are truncated at the left-most question mark in the URL.</li> </ul> <b>Tip</b> Although you can select both options, it is illogical to do so.                                                                              |
| Enable Server Log                                           | Whether to send information about HTTP requests to the URL filtering server's log server. The information includes the URL, the hostname, the source IP address, and the destination IP address.                                                                                                                                                                                                                                                                                           |
| Category                                                    | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device<br>Overrides<br>Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit External Filter Dialog Box

Use the Add or Edit External Filter dialog box to add a URL filtering server to an N2H2, Websense, or URL Filter parameter map policy object.

### Navigation Path

Click the **Add** button beneath the server table, or select a server and click the **Edit** button, from any of the following dialog boxes:

- Add or Edit N2H2 or WebSense Parameter Map dialog boxes. See [Configuring N2H2 or WebSense Parameter Maps, page 21-39](#).
- Add or Edit URL Filter Parameter Map dialog boxes. See [Configuring URL Filter Parameter Maps, page 21-43](#).

### Field Reference

**Table 21-15 Add or Edit External Filter Dialog Box**

| Element              | Description                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Server               | The fully-qualified domain name or IP address of the URL filtering server.                                                                |
| Port                 | The port that is listening for requests.                                                                                                  |
| Retransmission Count | The number of times the router retransmits the lookup request when a response is not received from the server. The range is from 1 to 10. |

**Table 21-15** Add or Edit External Filter Dialog Box (continued)

| Element | Description                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------|
| Timeout | The number of seconds that the router waits for a response from the server. The range is from 1 to 300. |
| Outside | Whether the server is outside the network.                                                              |

## Configuring Trend Parameter Maps

Use the Add and Edit Trend Parameter Map dialog boxes to define a parameter map for Trend Micro web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Trend web filter parameter map (when you select Trend for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps, page 21-47](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Trend** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                         |
| Description       | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| Enable Allow Mode | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                                |
| Block Page        | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul> |
| Maximum Requests  | The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.                                                                                                                                                                                                                                                                                                                               |

**Table 21-16 Add or Edit Trend Parameter Map Dialog Boxes (continued)**

| Element                         | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Responses               | The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.                                                                                                                                                          |
| Truncate Hostname               | Whether to truncate URLs at the end of the domain name.                                                                                                                                                                                                                |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                              |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> . |
| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring URL Filter Parameter Maps

Use the Add and Edit URL Filter Parameter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a URL Filter parameter map to define web filtering parameters and match criteria. However, if the router is running Cisco IOS Software release 12.4(20)T or later, the recommended approach is to configure a Web Filter policy map along with parameter and class maps for the appropriate server type (local, N2H2, Trend, or Websense). For more information, see [Configuring Web Filter Maps, page 21-47](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URL Filter** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

### Field Reference

**Table 21-17 Add or Edit URL Filter Parameter Map Dialog Boxes**

| Element     | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description | A description of the policy object. A maximum of 200 characters is allowed. |

### Local Filtering Tab

The fields on this tab define the properties for local URL filtering.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                         |

## Add or Edit URL Domain Name Dialog Box for URL Filter Parameters

Use the Add URL Domain Name dialog box to add web site domain names to the allowed or blocked lists.

Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either permitted or denied. You can also enter host IP addresses.

### Navigation Path

From the Add or Edit URL Filter Parameter Map dialog boxes, click the **Add** button beneath the allow list or block list tables, or select a name and click the **Edit** button. See [Configuring URL Filter Parameter Maps, page 21-43](#).

## Configuring URLF Glob Parameter Maps

Use the Add and Edit URLF Glob Parameter Map dialog boxes to define a parameter map for the inspection of URLs in a Local web filter class map.

A single URLF Glob should contain only segments of URLs that you want to block or allow. Your goal is to create class maps of allowed or blocked URLs. You can then define Local web filter policy maps to allow or block the identified URLs.

A single URLF Glob must also be limited to one of these types of URL segments:

- Strings that appear in the server name of a URL, which includes the name of the server and the domain name of the network. For example, `www.cisco.com`.
- Strings that appear in URL keywords, which are the strings that appear between `/` characters in a URL, or which are the file names. For example, in the URL segment `www.cisco.com/en/US/`, both `en` and `US` are keywords. The file name in a URL, such as `index.html`, is also considered a keyword.

You cannot use the characters `/`, `{`, `}`, and `?` in a URLF glob.

To match a server name or URL keyword, the string in the URL must match exactly the string included in the URLF glob unless you use wildcard metacharacters to specify a variable string pattern. You can use the following metacharacters for pattern matching for either server names or URL keywords:

- `*` (Asterisk). Matches any sequence of zero or more characters. For example, `*.edu` matches all servers in the education domain, and you could use `hack*` to block `www.example.com/hacksite/123.html`.
- `[abc]` (Character class). Matches any character in the brackets. The character matching is case sensitive. For example, `[abc]` matches `a`, `b`, or `c`, but not `A`, `B`, or `C`. Thus, you could use `www.[ey]xample.com` to block both `www.example.com` and `www.yxample.com`.
- `[a-c]` (Character range class). Matches any character in the range. The character matching is case sensitive. `[a-z]` matches any lowercase letter. You can mix characters and ranges; for example, `[abcq-z]` matches `a`, `b`, `c`, `q`, `r`, `s`, `t`, `u`, `v`, `w`, `x`, `y`, `z`, and so does `[a-cq-z]`. The dash (`-`) character is literal only if it is the last or the first character within the brackets, `[abc-]` or `[-abc]`.
- `[0-9]` (Numerical range class). Matches any number in the brackets. For example `[0-9]` matches `0`, `1`, `2`, `3`, `4`, `5`, `6`, `7`, `8`, or `9`. Thus, you can use `www.example[0-9][0-9].com` to block `www.example01.com`, `www.example33.com`, and `www.example99.com` (and so forth).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URLF Glob Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

## Configuring Web Filter Maps

Use the Add and Edit Web Filter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map to define web filtering parameters and match criteria. You can select Web Filter policy maps only for routers running Cisco IOS Software release 12.4(20)T and later. If you are configuring zone-based firewalls for routers running Cisco IOS Software release 12.4(6)T up to 12.4(20)T, you must configure a URL Filter parameter map instead of a Web Filter policy map. For more information, see [Configuring URL Filter Parameter Maps, page 21-43](#).

You can configure a mix of local and server-based web filtering. To do this, you should select a parameter map appropriate for the type of server you are using, and for the match criteria, an appropriate mix of local and server class maps. Do not mix class and parameter maps for different types of servers.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Web Filter > Web Filter** from the Object Type selector. Right-click inside the table and select **New Object** or right-click a row and select **Edit Object**.

| Allow Value Override per Device                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , page 6-18.     |
| Overrides                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                             |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                |

## Changing the Default Drop Behavior

By default, all traffic between zones is dropped unless explicitly allowed. However, you can change this default behavior, as described in this section.

Security Manager converts the parameters—including class, parameter, and policy maps—that you supply for zone-based firewall rules into a series of IOS commands that the router will recognize. These are the so-called "CLI" (command line interface) configuration commands, which you can preview in separate window by choosing Tools > Preview Configuration. See [Previewing Configurations](#), page 8-44 for more information. In addition, the section, [Troubleshooting Zone-based Rules and Configurations](#), page 21-54, discusses an example of zone-based firewall CLI commands.

For the purposes of this discussion, the most interesting of these commands is **policy-map**, which is used to apply your zone policy for each pair of zones. That is, for any given zone-pair, all rules defining traffic (classes) and actions are applied within one policy-map. Further, Security Manager appends the current **class-default** class to the end of each policy-map's class list to capture any packets not processed by a zone rule.

The default class-default is drop—appending this class to each policy-map is how the implicit dropping of traffic between zones is accomplished. However, as mentioned, you can change this default behavior for any zone-pair. For example, you might elect to pass all unmatched traffic, or you might change the default to drop and log so you can determine what traffic is not being matched by your existing rules.

**Note**

---

The only options for the default behavior are Drop, Drop and Log, Pass, and Pass and Log.

---

If you want the default policy to continue to drop packets, you do not have to do anything in Security Manager. This rule is generated automatically. If you do want to change the default behavior for a zone-pair, you must provide a **Permit any any IP** rule (that is, Match: Permit; Sources: any; Destinations: any; Services: IP in the [Adding and Editing Zone-based Firewall Rules, page 21-62](#)), with **Drop and Log, Pass, or Pass and Log** as the chosen Action. You must also ensure that this rule appears last in the list of rules for a zone pair. Security Manager interprets this as the intended class-default rule.

If your zone-based rules table includes a large number of rules, it might be difficult to ensure that this rule comes after all other rules for a zone pair. Here are a couple of techniques you can use to alleviate this:

- Use sections to organize the table, with one section per zone-pair. This will make it easier for you to order the rules for a zone-pair, as well as ensuring that the class-default rule comes last. For more information on working with sections, see [Using Sections to Organize Rules Tables, page 12-20](#).
- Create a shared zone-based rules policy that includes the class-default rule in the Default scope, and inherit this rule in the device's local zone-based rule policy. For more information on inheritance and creating shared policies, see [Inheriting or Uninheriting Rules, page 5-47](#) and [Creating a New Shared Policy, page 5-54](#).

## Configuring Settings for Zone-based Firewall Rules

Use the Zone Based Firewall settings page to: identify unreferenced zones; specify a zone for VPN interfaces; enable or disable WAAS support; maintain Trend Micro server and certificate information; and specify global Log settings on supported ASR devices.

### Related Topics

- [Zone Based Firewall Page, page 21-50](#)
- [Understanding the Zone-based Firewall Rules, page 21-3](#)

- 
- Step 1** Access the [Zone Based Firewall Page, page 21-50](#) as follows:
- (Device view) Select an IOS device and then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
  - (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** (Optional) On the Zones tab: add, edit and delete unreferenced zones.

The Zones tab lists all unreferenced zones defined on the device; that is, zones without any associated interfaces, rules or policies. Unreferenced zones are usually found and listed during device discovery, but you also can create named, “empty” zones here.

**Step 3** (Optional) On the VPN tab, supply the name of the zone specifically set up for VPN traffic.

This zone ensures that dynamic VPN traffic can be processed by the zone-based firewall rules on this router. See [Using VPNs with Zone-based Firewall Policies, page 21-6](#) for more information.

**Step 4** (Optional) On the WAAS tab, select Enable WAAS to enable Wide Area Application Services interoperability.

If this option is not enabled, packets being optimized by a WAAS device may be dropped because WAAS increases the TCP packet sequence number during the TCP handshake. This behavior may be viewed as a possible attack by the IOS device.

**Step 5** (Optional) On the Content Filter Settings tab, provide server settings for Trend Micro-based content filtering.

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

For more information, see [Zone Based Firewall Page - Content Filter Tab, page 21-52](#).

**Step 6** (Optional) On the Global Parameters (ASR) tab, you can configure global, logging-related settings specific to ASR devices:

- Log Dropped Packets – Select this option to log all packets dropped by the device; syslog logging must be enabled to view the information.
- Log Flow export timeout rate – NetFlow logs are created after a flow either expires or is timed out, and it is important to put a time limit on how long a flow can be active before expiring. This value is maximum number of minutes a flow can remain active before it is expired. The value can be any integer from 1 to 3600; the default is 30.
- Log Flow export destination IP – The IP address or host name of the NetFlow collector to which flow data is to be sent.
- Log Flow export destination port – The UDP port monitored by the NetFlow collector for flow data.

## Zone Based Firewall Page

Use the Zone Based Firewall page to configure and identify unreferenced zones, specify a VPN zone, enable or disable WAAS support, maintain Trend Micro server and certificate information, and specify global Log settings on supported ASR devices.

The following tabs are described in the table on this page:

- **Zones**
- **VPN**
- **WAAS**
- **Global Parameters (ASR)**

The **Content Filtering** tab is detailed in [Zone Based Firewall Page - Content Filter Tab, page 21-52](#).

**Navigation Path**

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

## Zone Based Firewall Page - Content Filter Tab

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

### Navigation Path

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

| Element                                              | Description                                                                                                                                                            |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trend Micro Server Settings</b>                   |                                                                                                                                                                        |
| Cache-entry-lifetime (hrs)                           | How long, in hours, a look-up request to the Trend Micro server remains in the router's local URL cache table. The allowed range is 0 to 120; the default value is 24. |
| Cache-size (KBytes)                                  | The maximum amount of memory to be used by the router's local URL cache. The allowed range is 0 to 120,000 KB; the default value is 250.                               |
| Server                                               | The fully-qualified domain name or IP address of the Trend Micro URL filtering server.                                                                                 |
| HTTP Port                                            | The port the Trend Micro server is listening to for HTTP requests. The default is 80.                                                                                  |
| HTTPS Port                                           | The port the Trend Micro server is listening to for HTTPS requests. The default is 443.                                                                                |
| Retransmission Count                                 | The number of times the router retransmits a look-up request when a response is not received from the server. The range is 1 to 10.                                    |
| Retransmission Timeout                               | The number of seconds that the router waits for a response from the server. The range is 1 to 300.                                                                     |
| Alert                                                | Whether stateful packet inspection messages are copied to the syslog.                                                                                                  |
| <b>Trend Micro Server Certificate Download Links</b> |                                                                                                                                                                        |
| Link to download certificates                        | Opens the page for installing Trusted Authority Certificates on Cisco IOS Routers for Trend URL Filtering Support.                                                     |
| Link for product registration                        | Opens the page for Product License Registration. You must enter the Product Authorization Key and register the router.                                                 |

**Zone Dialog Box**

Use the Add and Edit Zone dialog boxes to add and edit unreferenced zones—zones without any associated interfaces, rules or policies.

**Navigation Path**

To access the Add and Edit Zone dialog boxes, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector. Right-click inside the Zones table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector. Right-click inside the table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Map view) Right-click a device and select **Edit Firewall Policies > Settings > Zone Based Firewall Rules**.

Enter a zone name in the Zone field, or click **Select** to choose one from the Interfaces Selector dialog box.

## Troubleshooting Zone-based Rules and Configurations

Zone-based firewall rules are powerful, but also complex. Using zone rules, you can replace access rules, inspection rules, and Web filter rules with a single type of firewall rule. Because zone-based firewall rules can perform so many possible actions, the configuration generated from them uses many different types of configuration commands, including structures for access control lists (ACLs), class maps, and policy maps. There is no one-to-one correspondence between a zone-based firewall rule and a line in the configuration (unlike access rules, for example).

To illustrate this complexity, this topic describes the relationship between zone-based firewall rules and the configuration generated from them. You do not need to know any of the information in this topic to create and deploy zone-based firewall rules. However, if you are familiar with the CLI (command line interface), or if you find that your rules are generating undesired results, this information can help you understand and troubleshoot zone-based firewall rules.

Consider the set of rules shown in the following illustration. These rules form a policy for a single zone pair, affecting traffic moving from the Inside zone to the Outside zone. This is traffic from your internal network going to the Internet. The rules define the following actions:

- Drop all traffic from the 10.100.10.0/24 and 10.100.11.0/24 networks.
- Drop all FTP and FTPS traffic from the 10.100.12.0/24 network.
- Drop all peer-to-peer traffic from any network.
- Inspect (and allow) all FTP/FTPS traffic (except for that from 10.100.12.0/24, which is already dropped).
- Inspect all HTTP traffic using an additional deep-inspection policy map.
- And finally, perform generic inspection of all remaining TCP/UDP traffic.

**Figure 21-3** Example of Zone-based Rules for a Zone Pair

| No.                         | Permit | Source         | Destination | Service | From Zone | To Zone | Inspected Protocol                                  | Action  |
|-----------------------------|--------|----------------|-------------|---------|-----------|---------|-----------------------------------------------------|---------|
| Local - Mandatory (7 Rules) |        |                |             |         |           |         |                                                     |         |
| 1                           | ✓      | 10.100.10.0/24 | any         | IP      | Inside    | Outside |                                                     | Drop    |

!
```

**L.**

```
ip access-list extended CSM_ZBF_CMAP_ACL_2
 permit ip 10.100.12.0 0.0.0.255 any
```

!

The following list explains how the rules in Security Manager are converted to device-configuration commands, to aid your understanding of the relationship between the two. The list numbering corresponds to the rule numbers from the rules table in Security Manager (see the previous illustration):

1. This rule drops all traffic from the 10.100.10.0/24 network. The Permit, Source, Destination, and Service fields are used to create the first access control entry (ACE) in the ACL named CSM\_ZBF\_CMAP\_ACL\_1 defined in (K). This ACL is referenced from the class map CSM\_ZBF\_CLASS\_MAP\_1 defined in (C), which then defines the first drop rule in the policy map CSM\_ZBF\_POLICY\_MAP\_1, defined in (I).

The policy map (I) is used to define the zone service policy in (J). Because this policy map is how all of the rules are assigned to the zone pair, (J) is not mentioned again.

2. This rule drops all traffic from the 10.100.11.0/24 network. This rule is combined with rule 1 by adding an ACE to the ACL defined in (K). The rest of the configuration is identical to rule 1. Thus, rules 1 and 2 essentially become a single rule in the device configuration.
3. This rule drops all FTP/FTPS traffic from the 10.100.10.12/24 network. The Permit, Source, Destination, and Service fields are used to create the ACL named CSM\_ZBF\_CMAP\_ACL\_2 defined in (L). The Protocol table generates the class map CSM\_ZBF\_CMAP\_PLMAP\_1 defined in (D), which specifies the FTP and FTPS protocols. The ACL and FTP/FTPS class map are then used in a new class map, CSM\_ZBF\_CLASS\_MAP\_2 defined in (E), which completes the characterization of the traffic based on the combination of source and protocol. Finally, (E) is referenced in the policy map (I) as the second rule.
4. This rule drops peer-to-peer traffic from any source that uses any of these protocols: Bittorrent, eDonkey, FastTrack, ICQ, or Kazaa2. This rule prevents any of your internal servers from being used as a file-sharing source for these services. Because the rule applies to all sources and destinations for the default IP service, no ACL is required. Instead, the configuration starts with the class map CSM\_ZBF\_CLASS\_MAP\_3 defined in (F). This class map is referenced by the third drop rule in the policy map (I).
5. This rule inspects FTP/FTPS traffic from any source to any destination, which means these services are allowed. Note that rule 3, because it comes above rule 5, already drops FTP/FTPS traffic from the 10.100.12.0/24 network, so the combination of these rules means that FTP/FTPS traffic is inspected for all sources except 10.100.12.0/24. Because the Protocol table specifies the same protocols as it does for rule 3, no new class map is needed. Instead, the policy map (I) simply refers to the class map (D) as the fourth class type, but this time with the Inspect action.
6. This rule inspects HTTP traffic and applies a deep-inspection policy map named HTTPpmap. The HTTPpmap policy map (B) defines the action to take when traffic matches the criteria defined in the class map HTTPcmap (A). These maps specify that any HTTP connection that violates the HTTP protocol, or that misuses ports, should be reset (dropped) and a syslog entry generated. (Protocol violation and port misuse can characterize Denial of Service attacks.) The combination of (A) and (B) define the deep-inspection rules for this policy.

An additional class map, CSM\_ZBF\_CLASS\_MAP\_4, is needed to specify the HTTP protocol (G). Then, the fifth class type rule in the policy map (I) refers to class map (G) for inspection, and the service-policy command refers to the policy map (B) for deep inspection.

7. This rule provides generic inspection on TCP/UDP traffic, allowing and inspecting the remaining TCP/UDP traffic from the internal network to the Internet and back. The class map CSM\_ZBF\_CLASS\_MAP\_5 defined in (H) is generated from the Protocols table. This class map then becomes the next-to-last rule in the policy map (I).

8. Finally, there is an automatic rule, which appears as the final class-default rule in the policy map (I). This rule drops any traffic that does not match one of the class maps referenced in the policy map (I). For example, ICMP traffic from the internal network to the Internet will not be allowed. For information on configuring a different class-default rule, see [Changing the Default Drop Behavior, page 21-48](#).

## Zone-based Firewall Rules Page

Zone-based firewall rules provide unidirectional application of firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and specific inspection policies are applied to traffic moving between zones in one direction or the other.

A zone defines a boundary where traffic is subjected to specific restrictions as it crosses into another region of your network. The default zone-based firewall policy between zones is **deny all**. Thus, if no policy is explicitly configured, all traffic between zones is blocked.

### Note

Zone-based firewall policies can be configured only on Cisco IOS and ASR devices.

The Zone Based Firewall Rules page displays a list of currently configured zone-based firewall rules, and lets you add, edit and delete rules.

### Tip

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

### Navigation Path

To access the Zone Based Firewall Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
- (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Zone Based Firewall Rules**.

| Action                                    | <p>Identifies how matched protocols are processed:</p> <ul style="list-style-type: none"> <li>• Drop – Matched traffic is silently dropped. The default action for all traffic.</li> <li>• Drop and Log – Matched traffic is logged and dropped.</li> <li>• Pass – The router forwards matched traffic from the source zone to the destination zone.</li> <li>• Pass and Log – Traffic is logged and forwarded.</li> <li>• Inspect – State-based traffic control; Inspect can provide application inspection and control for certain protocols, based on Port to Application Mapping (PAM).</li> <li>• Content Filter – HTTP content inspection based on a WebFilter parameter map, or a WebFilter policy map.</li> </ul> <p><b>Note</b> The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.</p> |
| Options                                   | The Inspect Parameter map assigned to this rule; available only with Inspect and Content Filter actions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description                               | The description of this rule, if provided. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-72</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Query button                              | To run policy queries, which can help you evaluate your rules and identify ineffective rules that you can delete. See <a href="#">Generating Policy Query Reports, page 12-28</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Find and Replace button (binoculars icon) | Searches for values in rules tables, such as IP addresses and policy object names, to facilitate locating and making changes to rules in tables. See <a href="#">Finding and Replacing Items in Rules Tables, page 12-16</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Up button                                 | Moves the selected rule up one row in the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Down button                               | Moves the selected rule down one row in the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Add button                                | Opens the Add Zone-based Firewall Rule dialog box, where you can create a new rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Edit button                               | Used to edit the selected rule in the table; opens the Edit Zone-based Firewall Rule dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Delete button                             | Deletes the selected rule from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Adding and Editing Zone-based Firewall Rules

Use the Add and Edit Zone based Firewall Rule dialog boxes to add and edit zone-based firewall rules on Cisco IOS and ASR devices.

### Navigation Path

From the [Zone-based Firewall Rules Page, page 21-58](#), click the **Add Row** button, or select a row and click the **Edit Row** button.

**Table 21-23 Add and Edit Zone based Firewall Rule Dialog Boxes**

| Element     | Description                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | When selected, the rule is enabled on the device after the configuration is generated and deployed. Deselect this option to disable the rule without deleting it.                                                         |
| Traffic     | Define the traffic flow to which this rule is applied.                                                                                                                                                                    |
| Match       | Choose whether to Permit or Deny matched traffic. See <a href="#">Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules, page 21-8</a> for additional information about this option. |

**Table 21-23 Add and Edit Zone based Firewall Rule Dialog Boxes (continued)**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources | <p>Provide traffic sources for this rule; can be networks or security groups. You can enter values, enter object names, or select objects for one or more of the following types of sources:</p> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <ul style="list-style-type: none"> <li>• Network – You can specify various network, host, and IP address definitions, either individually or as objects. The “All-Address” objects do not restrict the rule to specific hosts or networks. See <a href="#">Understanding Networks/Hosts Objects, page 6-80</a> and <a href="#">Specifying IP Addresses During Policy Definition, page 6-87</a> for additional information about these definitions.</li> <li>• Security Groups (IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+ only) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies, page 14-16</a>, <a href="#">Configuring TrustSec-Based Firewall Rules, page 14-17</a> and <a href="#">Creating Security Group Objects, page 14-14</a> for more information about security groups.</li> </ul> <p><b>Note</b> Security groups are part of the Cisco TrustSec Support for IOS feature which is supported on Cisco Integrated Services Router Generation 2 (ISR G2) only.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

| Element                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Action</b><br><br>Action: Drop, Drop and Log, Pass, Pass and Log | <p>The action applied to traffic that matches this rule. Choose the desired Action:</p> <ul style="list-style-type: none"> <li>• <b>Drop</b> – Silently drops all packets for the specified Services. The default action for all traffic.</li> <li>• <b>Drop and Log</b> – Matched traffic is logged and dropped.</li> <li>• <b>Pass</b> – The router forwards matched packets from the From Zone to the To Zone. Return traffic is not recognized, so you have to specify additional rules for return traffic. This option is useful only for protocols such as IPsec-encrypted traffic.</li> <li>• <b>Pass and Log</b> – Traffic is logged and forwarded.</li> </ul> <p>For any of these Actions, you can select one or more protocols to be matched by clicking the <b>Select</b> button next to the Protocol table to open the <a href="#">Protocol Selector Dialog Box, page 21-68</a>. However, this is not necessary; you can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters; in effect, these are standard access rules.</p> <p>The Protocol Selector dialog box also provides access to the <a href="#">Configure Protocol Dialog Box, page 21-69</a>, where you can edit the Port Application Mapping (PAM) parameters for the selected protocol.</p> <p><b>Note</b> The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.</p> |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action: Inspect | <p><b>Inspect</b> provides state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.</p> <p>Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit PAM settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols. See <a href="#">Configuring Inspection Maps for Zone-based Firewall Policies</a>, page 21-16 for more information.</p> <ol style="list-style-type: none"> <li>1. You can select one or more protocols for inspection by clicking the <b>Select</b> button next to the Protocol table to open the <a href="#">Protocol Selector Dialog Box</a>, page 21-68.</li> <li>2. The Protocol Selector dialog box also provides access to the <a href="#">Configure Protocol Dialog Box</a>, page 21-69, where you can create custom protocols, and edit the PAM and DPI parameters for the selected protocol.</li> <li>3. <b>Inspect Parameters</b> – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see <a href="#">Configuring Inspect Parameter Maps</a>, page 21-31 for more information.</li> </ol> <p>If you do not specify an Inspect Parameters map, the default settings are used.</p> |

**Table 21-23 Add and Edit Zone based Firewall Rule Dialog Boxes (continued)**

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action: Content Filter | <p><b>Content Filter</b> provides URL filtering based on a supplied parameter or policy map. The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.</p> <ol style="list-style-type: none"> <li>1. When <b>Content Filter</b> is the chosen Action, HTTP is the specified Protocol. You can click Configure to open the <a href="#">Configure Protocol Dialog Box, page 21-69</a>, where you can edit the HTTP PAM settings, and apply an HTTP DPI map.</li> <li>2. Select <b>WebFilter Parameter Map</b>, or <b>WebFilter Policy Map</b>, and supply the name of an appropriate map. You can click the appropriate Select button to select the map from a list; you also can create new maps from the selection-list dialog box. See <a href="#">Configuring Content Filtering Maps for Zone-based Firewall Policies, page 21-36</a> for information about configuring these maps.</li> <li>3. <b>Inspect Parameters</b> – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see <a href="#">Configuring Inspect Parameter Maps, page 21-31</a> for more information.</li> </ol> <p>If you do not specify an Inspect Parameters map, the default settings are used.</p> |
| Description            | (Optional) You can enter a description of up to 1024 characters to help you identify the rule when viewing the rules table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Category               | (Optional) You can assign a category to the rule, to help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Zone-based Firewall Rule: Advanced Options Dialog Box

Use the Zone-Based Firewall Rule Advanced Options dialog box to apply specific time-range information to a zone-based firewall rule.

### Navigation Path

In the Traffic section of the Add or Edit Zone based Firewall Rule dialog box, click the **Advanced** button.

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time Range | <p>This feature lets you define time periods during which this zone-based firewall rule is active. If you do not specify a time range, the rule is immediately and always active.</p> <p>Enter the name of a time-range object, or click <b>Select</b> to choose one from a list in the Time Ranges Selector dialog box. You can create and edit time-range objects from this dialog box. For more information, see <a href="#">Configuring Time Range Objects, page 6-71</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options    | <p>This feature lets you apply an initial-packet-fragment or an established-connection restriction to this zone-based firewall rule. Choose one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No packet-fragment or established-connection restrictions are applied.</li> <li>• <b>Fragment</b> – If chosen, the rule is applied to non-initial packet fragments; the fragment is either permitted or denied accordingly. The white paper, “<a href="#">Access Control Lists and IP Fragments</a>,” provides additional information that is also relevant to zone-based firewall rules.</li> <li>• <b>Established</b> – For the TCP protocol only; requires an established connection. A match occurs if the TCP datagram has the ACK or RST control bits set. The non-matching case is that of the initial TCP datagram to form a connection.</li> </ul> |

## Protocol Selector Dialog Box

Use the Protocol Selector dialog box to specify one or more communication protocols as part of the definition of traffic for a zone-based firewall rule.

The Protocol Selector dialog box also provides access to the Configure Protocol dialog box, which you can use to create custom protocols and edit Port Application Mapping (PAM) parameters for existing protocols. The Configure Protocol dialog box is also where you select Deep Inspection policy maps, and Protocol Info parameter maps, for certain protocols. See [Configure Protocol Dialog Box, page 21-69](#) for more information.

**Navigation Path**

The Protocol Selector dialog box can be accessed from the Add and Edit Zone based Firewall Rule dialog boxes (described in [Adding and Editing Zone-based Firewall Rules, page 21-62](#)). In either dialog box, choose any Action except Content Filter and then click the Select button next to the Protocol table.

You can also open the Protocol Selector dialog box by right-clicking the Inspected Protocol column for any entry in the Zone Based Firewall Rules table, and then choosing Edit Protocols.

You can select multiple protocols using the standard Shift-click and Ctrl+click functions.                                                                                                                                          |

## Configure Protocol Dialog Box

Packet inspection can be configured in zone-based firewall rules by the selection of specific protocol objects, which define Port Application Mapping (PAM) parameters (Layer 4 protocols and ports, and optionally specific networks and hosts). A Layer 7 (HTTP, IMAP, Instant Messaging, and peer-to-peer) protocol can also include a deep-packet inspection policy specific to that protocol. Refer to [Adding and Editing Zone-based Firewall Rules, page 21-62](#) for information about selecting protocols during zone-based firewall rule definition.

The Configure Protocol dialog box is used to edit existing protocol definitions, and to create custom definitions, for use with zone-based firewall rules. For example, if a protocol does not use its default ports for some or all networks, you can configure different port mappings.

### Navigation Path

The Configure Protocol dialog box is accessed from the [Protocol Selector Dialog Box, page 21-68](#), as follows:

- Click the Create (+) button below the Selected Protocols list to create a new protocol.
- Select a protocol in the Selected Protocols list, and click the Edit (pencil) button to edit that protocol.

Custom protocol names must begin with <b>user-</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Signature                | <p>This option is available only when editing the peer-to-peer (eDonkey, FastTrack, Gnutella, Kazaa2) protocols.</p> <p>Enabling this option means Network-based Application Recognition (NBAR) heuristics will be applied to the traffic to detect “telldates” that signify specific P2P application activity. These telldates includes port-hopping and other changes in application behavior to avoid traffic detection.</p> <p><b>Note</b> This level of traffic inspection comes at the price of increased CPU utilization and reduced network throughput capability.</p>                                                                |
| Deep Inspection                 | <p>This option is available only when editing the H.323, HTTP, IM (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), IMAP, P2P (eDonkey, FastTrack, Gnutella, Kazaa2), POP3, SIP, SMTP, Sun RPC protocols, and <b>Inspect</b> is the chosen Action for the zone-based firewall rule.</p> <p>Enter or Select the name of the Inspect policy map to be used with the selected protocol. See <a href="#">Configuring Inspection Maps for Zone-based Firewall Policies, page 21-16</a> for more information about these policy maps.</p>                                                                                          |
| Protocol Info                   | <p>This option is available only when editing the Instant Messaging (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger) and Stun-ice protocols.</p> <p>Enter or Select the name of the Protocol Info parameter map to be used with the selected protocol. These parameter maps define the DNS servers that interact with these applications, which helps the Instant Messaging (IM) application engine recognize the IM traffic and enforce the configured policy for that IM application.</p> <p>See <a href="#">Configuring Protocol Info Parameter Maps, page 21-33</a> for more information about these parameter maps.</p> |
| <b>Port Application Mapping</b> | These options let you customize the Port Application Mapping (PAM) parameters for the selected protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Protocol                        | <p>Select the transport protocol(s) for this mapping:</p> <ul style="list-style-type: none"> <li>• TCP/UDP</li> <li>• TCP</li> <li>• UDP</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Ports                           | Enter any combination of a single port number, multiple port numbers, or a range of ports (for example, 60000-60005). Separate multiple entries with commas. Do not specify a range that overlaps already mapped ports.                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 21-26** *Configure Protocol Dialog Box (continued)*

| <b>Element</b> | <b>Description</b>                                                                                                                                                                                                                                                         |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks       | If this protocol/port mapping is only for specific networks or hosts, enter the names or IP addresses of the networks or hosts, or the names of the network/host objects. You can click Select to open the Networks/Hosts Selector. Separate multiple entries with commas. |

## Managing Traffic Zones

---

You can assign multiple interfaces to a traffic zone, which lets traffic from an existing flow exit or enter the ASA on any interface within the zone. This capability allows Equal-Cost Multi-Path (ECMP) routing on the ASA as well as external load balancing of traffic to the ASA across multiple interfaces.

### Non-Zoned Behavior

The Adaptive Security Algorithm takes into consideration the state of a packet when deciding to permit or deny the traffic. One of the enforced parameters for the flow is that traffic enters and exits the same interface. Any traffic for an existing flow that enters a different interface is dropped by the ASA.

Traffic zones let you group multiple interfaces together so that traffic entering or exiting any interface in the zone fulfills the Adaptive Security Algorithm security checks.

## Why Use Zones?

### Asymmetric Routing

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. Due to asymmetric routing on the destination network, return traffic arrived from ISP 2 on the Outside2 interface.

**Non-Zoned Problem:** The ASA maintains the connection tables on a per-interface basis. When the returning traffic arrives at Outside2, it will not match the connection table and will be dropped.

**Zoned Solution:** The ASA maintains connection tables on a per-zone basis. If you group Outside1 and Outside2 into a zone, then when the returning traffic arrives at Outside2, it will match the per-zone connection table, and the connection will be allowed.

### Lost Route

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. Due to a lost or moved route between Outside1 and ISP 1, traffic needs to take a different route through ISP 2.

**Non-Zoned Problem:** The connection between the inside and outside host will be deleted; a new connection must be established using a new next-best route. For UDP, the new route will be used after a single packet drop, but for TCP, a new connection has to be reestablished.

**Zoned Solution:** The ASA detects the lost route and switches the flow to the new path through ISP 2. Traffic will be seamlessly forwarded without any packet drops.

### Load Balancing

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. A second connection was established through an equal cost route through ISP 2 on Outside2.

**Non-Zoned Problem:** Load-balancing across interfaces is not possible; you can only load-balance with equal cost routes on one interface.

**Zoned Solution:** The ASA load-balances connections across up to eight equal cost routes on all the interfaces in the zone.

# ECMP Routing

The ASA supports Equal-Cost Multi-Path (ECMP) routing.

**Non-Zoned ECMP Support**

Without zones, you can have up to three equal cost static or dynamic routes per interface. For example, you can configure three default routes on the outside interface that specify different gateways:

```
route outside 0 0 10.1.1.2
route outside 0 0 10.1.1.3
```

```
route outside 0 0 10.1.1.4
```

In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses.

ECMP is not supported across multiple interfaces, so you cannot define a route to the same destination on a different interface. The following route is disallowed when configured with any of the routes above:

```
route outside2 0 0 10.2.1.1
```

### Zoned ECMP Support

With zones, you can have up to 8 equal cost static or dynamic routes across up to 8 interfaces within a zone. For example, you can configure three default routes across three interfaces in the zone:

```
route outside1 0 0 10.1.1.2
```

```
route outside2 0 0 10.2.1.2
```

```
route outside3 0 0 10.3.1.2
```

Similarly, your dynamic routing protocol can automatically configure equal cost routes. The ASA load-balances traffic across the interfaces with a more robust load balancing mechanism.

When a route is lost, the ASA seamlessly moves the flow to a different route.

### How Connections Are Load-Balanced

The ASA load balances connections across equal cost routes using a hash made from the packet 6-tuple (source and destination IP address, source and destination port, protocol, and ingress interface). Unless the route is lost, a connection will stay on the chosen interface for its duration.

Packets within a connection are not load-balanced across routes; a connection uses a single route unless that route is lost.

The ASA does not consider the interface bandwidth or other parameters when load balancing. You should make sure all interfaces within the same zone have the same characteristics such as MTU, bandwidth, and so on.

The load-balancing algorithm is not user configurable.

### Falling Back to a Route in Another Zone

When a route is lost on an interface, if there are no other routes available within the zone, then the ASA will use a route from a different interface/zone. If this backup route is used, then you may experience packet drops as with non-zoned routing support.

# Understanding Traffic Zones

## Interface-Based Security Policy

Zones allow traffic to and from any interface in the zone, but the security policy itself (access rules, NAT, and so on) is still applied per interface, not per zone. If you configure the same security policy for all interfaces within the zone, then you can successfully implement ECMP and load balancing for that traffic. For more information about required parallel interface configuration, see [Prerequisites for Traffic Zones, page 22-7](#).

## Supported Services for Traffic Zones

The following services are supported with zones:

- Access Rules
- NAT
- Service Rules, except for QoS traffic policing.
- Routing

You can also configure to- and from-the-box services (see below), although full zoned support is not available.

Do not configure other services (such as VPN or Botnet Traffic Filter) for interfaces in a traffic zone; they may not function or scale as expected.

### Note

For detailed information about how to configure the security policy, see [Prerequisites for Traffic Zones, page 22-7](#).

## Security Levels

The first interface that you add to a zone determines the security level of the zone. All additional interfaces must have the same security level. To change the security level for interfaces in a zone, you must remove all but one interface, and then change the security levels, and re-add the interfaces.

## Primary and Current Interface for the Flow

Each connection flow is built based on the initial ingress and egress interfaces. These interfaces are the *primary* interfaces.

If a new egress interface is used because of route changes or asymmetric routing, then the new interfaces are the *current* interfaces.

## Joining or Leaving a Zone

When you assign an interface to a zone, any connections on that interface are deleted. The connections must be reestablished.

If you remove an interface from a zone, any connections that have the interface as the primary interface are deleted. The connections must be reestablished. If the interface is the current interface, the ASA moves the connections back to the primary interface. The zone route table is also refreshed.

## To- and From-the-Box Traffic

- You cannot add management-only or management-access interfaces to a zone.
- For management traffic on regular interfaces in a zone, only asymmetric routing on existing flows is supported; there is no ECMP support.

- You can configure a management service on only one zone interface, but to take advantage of asymmetric routing support, you need to configure it on all interfaces. Even when the configurations are parallel on all interfaces, ECMP is not supported.
- The ASA supports the following to- and from-the-box services in a zone:
  - Telnet
  - SSH
  - HTTPS
  - SNMP
  - Syslog
  - BGP

### Overlapping IP Addresses Within a Zone

For non-zoned interfaces, the ASA supports overlapping IP address networks on interfaces so long as you configure NAT properly. However, overlapping networks are not supported on interfaces in the same zone.

### Related Topics

- [Prerequisites for Traffic Zones, page 22-7](#)
- [Guidelines for Traffic Zones, page 22-8](#)
- [Configuring Traffic Zones, page 22-9](#)

## Prerequisites for Traffic Zones

- Configure all interface parameters including the name, IP address, and security level. Note that the security level must match for all interfaces in the zone. You should plan to group together like interfaces in terms of bandwidth and other Layer 2 properties.
- Configure the following services to match on all zone interfaces:
  - Access Rules—Apply the same access rule to all zone member interfaces, or use a global access rule.
  - NAT—Configure the same NAT policy on all member interfaces of the zone or use a global NAT rule.

Interface PAT is not supported.

**Note** When you use interface-specific NAT and PAT pools, the ASA cannot switch connections over in case of the original interface failure.

If you use interface-specific PAT pools, multiple connections from the same host might load-balance to different interfaces and use different mapped IP addresses. Internet services that use multiple concurrent connections may not work correctly in this case.

- Service Rules—Use the global service policy, or assign the same policy to each interface in a zone.

QoS traffic policing is not supported.

**Note** For VoIP inspections, zone load balancing can cause increased out-of-order packets. This situation can occur because later packets might reach the ASA before earlier packets that take a different path. Symptoms of out-of-order packets include:

–Higher memory utilization at intermediate nodes (firewall and IDS) and the receiving end nodes if queuing is used.

–Poor video or voice quality.

To mitigate these effects, we recommend that you use IP addresses only for load distribution for VoIP traffic.

- Configure routing with ECMP zone capabilities in mind.

## Guidelines for Traffic Zones

### Firewall Mode

Supported in routed firewall mode only. Does not support transparent firewall mode.

### Failover

- You cannot add the failover or state link to a zone.
- In Active/Active failover mode, you can assign an interface in each context to an asymmetrical routing (ASR) group. This service allows traffic returning on a similar interface on the peer unit to be restored to the original unit. You cannot configure both ASR groups and traffic zones within a context. If you configure a zone in a context, none of the context interfaces can be part of an ASR group.
- Only the primary interfaces for each connection are replicated to the standby unit; current interfaces are not replicated. If the standby unit becomes active, it will assign a new current interface if necessary.

### Clustering

You cannot add the cluster control link to a zone.

**Additional Guidelines**

- You can create a maximum of 256 zones.
- You can only add physical interfaces to a zone.
- An interface can be a member of only one zone.
- You can include up to 8 interfaces per zone.
- The first interface that you add to a zone determines the security level of the zone. All additional interfaces must have the same security level.
- For ECMP, you can add up to 8 equal cost routes per zone, across all zone interfaces. You can also configure multiple routes on a single interface as part of the 8 route limit.

## Configuring Traffic Zones

You can assign multiple interfaces to a traffic zone, which lets traffic from an existing flow exit or enter the ASA on any interface within the zone. This capability allows Equal-Cost Multi-Path (ECMP) routing on the ASA as well as external load balancing of traffic to the ASA across multiple interfaces.

- 
- Step 1** Do one of the following:
- (Device view) Select **Firewall > Settings > Zone** from the Policy selector.
  - (Policy view) Select **Firewall > Settings > Zone** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Click the **Add Row** button beneath the Zone table to open the Zone dialog box.
- Step 3** Enter the name of an interface role that identifies the interfaces that belong to the traffic zone you are configuring and then click **OK**. For more information about interface role object, see [Understanding Interface Role Objects, page 6-73](#).

---

**Tip** You can click **Select** to select the interface role from a list of interface role objects or to define a new interface role object.

---

**Step 4** Click **Save** to save the changes.

---

## Managing Transparent Firewall Rules

---

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet.

This chapter contains the following topics:

- [Configuring Transparent Firewall Rules, page 23-1](#)
- [Transparent Rules Page, page 23-3](#)

### Configuring Transparent Firewall Rules

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet. These rules create Ethertype access control lists on the device. With transparent rules, you can control the flow of non-IP traffic across the device. (To control IP traffic, use access rules; see [Understanding Access Rules, page 16-1](#).)

Transparent firewalls are devices that you place within a single subnet to control traffic flow across a bridge. They allow you to insert a firewall on a subnet without renumbering your networks.

You can configure transparent rules only on the following types of interfaces:

- **IOS 12.3(7)T or later devices**—On layer-3 interfaces that are part of a bridge group:
  - Configure the interfaces you want to bridge as layer 3 in the **Interfaces > Interfaces** policy.
  - Configure a bridge group with two or more layer 3 interfaces in the **Platform > Device Admin > Bridging** policy (see [Bridging on Cisco IOS Routers, page 63-18](#) and [Defining Bridge Groups, page 63-20](#)).
  - Create a bridge group virtual interface (BVI) using the same number as the bridge group (see [Bridge-Group Virtual Interfaces, page 63-19](#)). For example, if you create bridge group 12, create BVI12.
- **ASA, PIX 7.0+, FWSM devices**—On any interface when the device is running in transparent mode. If you are using multiple contexts, configure the rules on the individual security contexts.

There are several other bridging policies that you can configure in the **Platform > Bridging** policy group including: ARP table and ARP inspection, MAC table and the ability to disable MAC learning, and the ability to configure a management IP address so that you can remotely manage the device. For more detail about transparent firewalls, see [Chapter 47, “Configuring Bridging Policies on Firewall Devices”](#) and [Interfaces in Routed and Transparent Modes, page 46-5](#).

**Tip**

On ASA, PIX, and FWSM in transparent mode, you must configure access rules to allow any IP traffic to pass through the device. Transparent rules control layer 2 non-IP traffic only.

Also, see [NAT in Transparent Mode, page 24-16](#) for information about using network address translation on security devices.

You can also configure other types of firewall rules on these interfaces. The other types of rules apply to layer-3 and higher traffic.

**Tip**

If you configure any transparent rule, an implicit **deny all** rule is added at the end of the rule list for each interface. You must ensure that you permit all desired traffic. You might want to include a **permit any** (for ASA/PIX/FWSM devices) or **permit 0x0000 0xFFFF** (for IOS devices) rule as the final rule in the table if your desire is simply to deny specific types of traffic, rather than permitting only specific types of traffic.

**Related Topics**

- [Adding and Removing Rules, page 12-9](#)
- [Editing Rules, page 12-10](#)
- [Enabling and Disabling Rules, page 12-20](#)

**Step 1**

Do one of the following to open the [Transparent Rules Page, page 23-3](#):

- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit Transparent Firewall Rule Dialog Boxes, page 23-5](#).

**Tip**

If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-10](#).

**Step 3**

Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit Transparent Firewall Rule Dialog Boxes, page 23-5](#).

- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
- Interfaces—The interface or interface role for which you are configuring the rule.
- The direction of traffic to which this rule should apply (in or out). The default is in.
- EtherType—The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic. For a list of codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for “Ether Type.” For ASA/PIX/FWSM, you can select a keyword to identify some EtherTypes. For ASA/PIX/FWSM, the code must be 0x0600 at minimum.
- Mask—For rules applied to IOS devices, you must also specify a mask to apply to the EtherType. Use 0xFFFF to have the EtherType interpreted literally.

If you want to create a single rule to apply to a group of EtherTypes, convert the EtherTypes to binary and calculate an appropriate mask where 1 means to interpret the EtherType literally, and 0 means that any value should be allowed in the position. You must then convert your mask into hexadecimal.

Click **OK** when you are finished defining your rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).
- Step 5** (IOS devices only) If you are configuring transparent rules on an IOS device, you can forward DHCP traffic across the bridge without inspection. To configure this, select the **Firewall > Settings > Inspection** policy and select the **Permit DHCP Passthrough (Transparent Firewall)** option. This setting is not supported on all IOS versions, so carefully inspect validation results to see if it will be configured on your device.

## Transparent Rules Page

Use the Transparent Rules page to control access for non-IP layer-2 traffic. (To control IP traffic access, use access rules; see [Understanding Access Rules, page 16-1](#).)

Transparent rules are limited to transparent firewalls, which are ASA, PIX 7.0+, and FWSM devices running in transparent mode, or layer-3 interfaces that are part of a bridge group on IOS 12.3(7)T+ devices. When deployed, transparent rules become Ethertype access control lists.

Configure the same rules on all bridged interfaces to allow traffic to pass both ways through the device.

For more detailed information about configuring transparent firewalls and the device requirements for deploying these rules, see [Configuring Transparent Firewall Rules, page 23-1](#).

### Tip

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

### Navigation Path

To access Transparent Rules, do one of the following:

- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Transparent Rules**.

**Table 23-1** *Transparent Rules Page*

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                                       | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                               |
| Permit                                    | Whether a rule permits or denies traffic based on the conditions set: <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                                                                                                                        |
| EtherType                                 | The Ethernet packet type, which is the EtherType value in the packet. This can be a hexadecimal code or a keyword.                                                                                                                                                                                                                                                                                     |
| Mask                                      | The 16-bit hexadecimal mask for the EtherType (for IOS devices only). A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position). |
| Interface                                 | The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects, page 6-73</a> .                                                            |
| Dir.                                      | The direction of the traffic to which this rule applies: <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                          |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                   |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-72</a> ).               |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order, page 12-19</a> .                                                                                                                                                                                                             |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit Transparent Firewall Rule Dialog Boxes, page 23-5</a> . If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules, page 12-9</a> .                                                        |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules, page 12-10</a> .                                                                                                                                                                                                                                                 |

**Table 23-1** *Transparent Rules Page (continued)*

| Element           | Description                                    |
|-------------------|------------------------------------------------|
| Delete Row button | Click this button to delete the selected rule. |

## Add and Edit Transparent Firewall Rule Dialog Boxes

Use the Add and Edit Transparent Firewall Rule dialog boxes to add and edit transparent firewall rules, which are configured as EtherType access control lists on the device. Before you configure transparent rules, read [Configuring Transparent Firewall Rules, page 23-1](#).

### Navigation Path

From the [Transparent Rules Page, page 23-3](#), click the **Add Row** button or select a row and click the **Edit Row** button.

| Enable Rule | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules, page 12-20</a> .                                                                                                                                                                                                                                                                                                                                                                          |
| Action      | Whether the rule permits or denies traffic based on the conditions you define.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interfaces  | The interfaces or interface roles to which the rule is assigned. You must select only bridged, transparent interfaces (for more specific information, see <a href="#">Configuring Transparent Firewall Rules, page 23-1</a> ).<br>Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.<br>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects, page 6-73</a> . |

**Table 23-2 Add and Edit Transparent Firewall Rule Dialog Boxes (continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Direction   | The direction of the traffic to which this rule applies: <ul style="list-style-type: none"> <li>In—Packets entering an interface.</li> <li>Out—Packets exiting an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| EtherType           | The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic based on the EtherType value in the packet. Enter or select the following: <ul style="list-style-type: none"> <li>The hexadecimal EtherType value. For a list of codes, see RFC 1700 at <a href="http://www.ietf.org/rfc/rfc1700.txt">http://www.ietf.org/rfc/rfc1700.txt</a> and search for “Ether Type.” <ul style="list-style-type: none"> <li>IOS devices—You can enter any value from 0x0000 to 0xFFFF.</li> <li>ASA/PIX/FWSM devices—The value must be 0x0600 or later.</li> </ul> </li> <li>For ASA/PIX/FWSM devices, you can also select these keywords: <ul style="list-style-type: none"> <li>bpdu—Spanning Tree Bridge Protocol Data Units</li> <li>ipx—Internet Packet Exchange</li> <li>mpls-unicast—Multi-Protocol Label Switching, unicast.</li> <li>mpls-multicast—MPLS multicast.</li> <li>isis—IS-IS pass-through</li> <li>any—Any packet regardless of EtherType.</li> <li>eii-ipx</li> <li>raw-ipx</li> </ul> </li> </ul> <p><b>Tip</b> The keyword "isis" in the list above refers to IS-IS pass-through support, which is new in Security Manager 4.4. "IS-IS pass-through support" means that IS-IS traffic can flow through the ASA in transparent mode.</p> <p><b>Note</b> Beginning from 4.16, the ethertype dsap CLI is used to interpret the installed ACEs—regardless of whether it was created with ether type bpdu, ipx, or isis— in ether type dsap format. This feature is supported for ASA 9.9(1) and later devices.</p> |
| Wildcard Mask (IOS) | The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.<br><br>A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category            | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description         | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Edit Transparent EtherType Dialog Box

Use the Edit Transparent EtherType dialog box to edit the EtherType in a transparent firewall rule. Enter the hexadecimal code that identifies the traffic. For ASA/PIX/FWSM devices, you can also select the keyword for some types of traffic. For a list of codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for “Ether Type.” For a more detailed description of EtherType, see [Add and Edit Transparent Firewall Rule Dialog Boxes, page 23-5](#).

For more information, see [Configuring Transparent Firewall Rules, page 23-1](#).

### Navigation Path

Right-click the EtherType cell in a transparent rule (on the [Transparent Rules Page, page 23-3](#)) and select **Edit EtherType**. You can edit the EtherType for one row at a time.

## Edit Transparent Mask Dialog Box

Use the Edit Transparent Mask dialog box to edit the mask in a transparent firewall rule for an IOS device. The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.

A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).

For more information, see [Configuring Transparent Firewall Rules, page 23-1](#).

### Navigation Path

Right-click the Mask cell in a transparent rule (on the [Transparent Rules Page, page 23-3](#)) and select **Edit Mask**. You can edit the mask for one row at a time.

# Configuring Network Address Translation

These topics provide conceptual information about network address translation (NAT) in general, and about translation types and various implementations:

- [Understanding Network Address Translation, page 24-2](#)
  - [Types of Address Translation, page 24-3](#)
  - [About “Simplified” NAT on ASA 8.3+ Devices, page 24-4](#)

The following topics describe configuration and management of NAT rules on various Cisco devices:

**Note**

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM, and IPS, it does not support any enhancements.

## Understanding Network Address Translation

Address translation substitutes the real address in a packet with a mapped address that is routable on the destination network. As part of the process, the device also records the substitution in a translation database; these records are known as “xlate” entries. The appropriate xlate entry must exist to allow address translation on return packets—the substitution of the original real address for the mapped address; this procedure is sometimes referred to as “untranslation.” Thus, network address translation (NAT) actually consists of two steps: the translation of a real address into a mapped address, and the reverse translation for returning traffic.

One of the main functions of NAT is to enable private IP networks to connect to the Internet. Network address translation replaces a private IP address with a public IP address, translating the private addresses in the internal network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses; for example, NAT rules can be configured to utilize only one public address for the entire network in communications with the outside world.

Other functions of NAT include:

- Security – Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions – Overlapping IP addresses are not a problem.
- Flexibility – You can change internal IP addressing schemes without affecting the public addresses available externally. For example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.

Cisco devices support both NAT, which provides a globally unique address for each outbound host session, and Port Address Translation (PAT), which provides the same single address combined with a unique port number, for up to 64,000 simultaneous outbound or inbound host sessions. The global addresses used for NAT come from a pool of addresses specifically designated for address translation. The unique global address that is used for PAT can be either one global address, or the IP address of a given interface.

The device translates an address when an existing NAT rule matches the specific traffic. If no NAT rule matches, processing for the packet continues. The exception is when you enable NAT control. NAT control requires that packets traversing from a higher security interface (inside) to a lower security interface (outside) match a NAT rule, or processing for the packet stops.

Cisco devices can perform NAT or PAT on both inbound and outbound connections. This ability to translate inbound addresses is called “Outside NAT” because addresses on the outside, or less secure, interface are translated to a usable inside IP address. Just as when you translate outbound traffic, you may choose dynamic NAT, static NAT, dynamic PAT, or static PAT. If necessary, you can use outside NAT together with inside NAT to translate the both source and destination IP addresses of a packet.

### Note

In this document, all types of translation are generally referred to as NAT; see [Types of Address Translation, page 24-3](#) for descriptions of the various types. When describing NAT, the terms inside and outside represent the security relationship between any two interfaces. The higher security level is inside and the lower security level is outside.

The release of ASA version 8.3 provides a simplified, interface-independent approach to configuring network address translation, as compared to earlier ASA versions and other devices. See [About “Simplified” NAT on ASA 8.3+ Devices, page 24-4](#) for more information.

## Types of Address Translation

The following table briefly describes the various types of address translation.

**Table 24-1** *Types of Address Translation*

|                    |                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static NAT         | Fixed translation of real source addresses to specific mapped addresses—each source address is always translated to the same mapped address, regardless of IP protocol and port number.                                                                                                                    |
| Static PAT         | Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. That is, each source address/port is always translated to the same mapped address/port.                                                                                          |
| Policy Static NAT  | Fixed translation of real source addresses to specific mapped addresses. Destination networks/hosts are also specified, and the service is always IP.                                                                                                                                                      |
| Policy Static PAT  | Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. Destination networks/hosts and services are also specified.                                                                                                                      |
| Dynamic NAT        | Dynamic translation of real source addresses to mapped addresses obtained from a pool of shared addresses. Each source address can be mapped to any available address in the pool.                                                                                                                         |
| Dynamic PAT        | Translation of real source addresses to a single mapped address; singularity is provided by dynamic translation of related port numbers. That is, each real address/port combination is translated to the same mapped address, but assigned a unique port. This is sometimes referred to as “overloading.” |
| Policy Dynamic NAT | Dynamic translation of specific source-address/destination-address/service combinations on a given interface, using a pool of shared addresses. Translation direction—outbound or inbound—is also specified.                                                                                               |
| Identity NAT       | The specified address is translated to itself—that is, it is effectively not translated; applies to outbound connections only. Identity NAT is a particular type of Static NAT.                                                                                                                            |
| NAT Exempt         | Translation is bypassed for specified source/destination address combinations; connections can be initiated in both the outbound and inbound directions.                                                                                                                                                   |

#### Note

While certain of these types do not apply to ASA 8.3 and later devices, the ASA 8.3+ devices do provide a Dynamic NAT and PAT option, which is Dynamic NAT with a Dynamic PAT back-up feature.

## About “Simplified” NAT on ASA 8.3+ Devices

The release of ASA version 8.3 provides a simplified approach to configuring network address translation (NAT), as compared to earlier ASA versions and other devices. Configuration of NAT was simplified by replacing the earlier flow-based scheme with an “original packet” to “translated packet” approach.

All NAT rules on the device—static NAT, dynamic PAT, and dynamic NAT—are presented in a single table, and essentially the same dialog box is used to configure all NAT rules. The NAT rules are interface independent (that is, interfaces are optional), meaning the rules are independent of security levels also.

NAT rules are no longer dependent on security levels. A global address space consisting of all interfaces is available, and is specified using the keyword “any.” All Interface fields default to **any**, so unless a specific interface is provided, the rule is applicable to all interfaces.

### Network Object NAT

You also can define NAT properties on Host, Address Range, and Network objects, such that corresponding NAT rules are applied automatically to the designated security device. Using these objects means you need enter the necessary IP addresses, services, ports, and optional interfaces only once. These automatically generated, object-based rules are referred to as “Network Object NAT” rules. Note that these rules cannot be created or deleted from the rules table; you must edit the appropriate objects in the Policy Object Manager. You can, however, edit these rules from the rules table after they have been defined for the network object. For more information, see [Add or Edit Network/Host Dialog Box: NAT Tab, page 24-43](#).

#### Note

Network Object NAT rules are not displayed in the Translation Rules table in Policy View because these rules are device-specific.

### The NAT Table

As mentioned, all NAT rules on a device are presented in a single table, which is divided into three sections: a “manual” section, the Network Object NAT rules section, and another manual-rules section. You can add, edit and order rules in both manual sections; the Network Object NAT rules are added and ordered automatically, and as mentioned, to edit these rules you must edit the related objects.

The NAT rules in the table are applied on a top-down, first-match basis. That is, a packet is translated only when it matches a NAT rule, and as soon as a match is made, regardless of its location or section, NAT rule processing stops.

You can use this table to organize and manage the manual rules—you can insert rules in any order, and you can re-order them. The two sections of manual rules are provided to let you order manual rules both before and after the automatic object rules.

Network Object NAT rules are automatically ordered such that static rules appear before dynamic rules. These two types are each further ordered as follows:

- Fewest number of IP addresses – Rules for objects with one IP address are listed before those for objects with two addresses, which are before those with three addresses, and so on.
- IP address numbers – For objects having the same number of IP addresses, the rules are arranged such that the IP addresses themselves are in numerical order, from lower to higher. For example, 10.1.1.1 rules are listed before 11.1.1.1 rules.
- Object names – If the IP address is the same, the rules are ordered by alphabetizing the object names.

And remember, translation is based on the first matching rule.

### Destination Translation

With manual static rules, in addition to source address translation, you also can configure destination address translation. Source and destination translation are defined at the same time, in the same dialog box. Again, while source translation can be static or dynamic, destination translation is always static, and is only available with manual rules.

### Bi-directional or Twice NAT

When creating a manual static rule, you can select the “Bi-directional” option, which will produce an entry in the rules table that actually represents two static NAT rules, encompassing both translation directions. That is, a static rule is created for the specified source/translated address pairing, along with a mirror rule for the translated address/source pairing.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

This is sometimes referred to as “Twice NAT” because only one look-up is required to fetch and process what is in effect two rules.

### Many-to-one Addressing

Generally, static NAT rules are configured with one-to-one address mapping. However, you can now define static NAT rules in which many IP addresses map to a few or one IP address. Functionally, many-to-few is the same as many-to-one, but because the configuration is more complicated, we recommend creating a many-to-one rule for each address as needed.

Many-to-one addressing might be useful, for example, in a situation where a range of public IP addresses is used to reach a load balancer which redirects requests to an internal network.

### Related Topics

- [Configuring NAT on ASA 8.3+ Devices, page 24-34](#)

## NAT Policies on Cisco IOS Routers

You can configure NAT policies on a Cisco IOS router from the following tabs on the NAT policy page:

- [NAT Page: Interface Specification, page 24-6](#)
- [NAT Page: Static Rules, page 24-6](#)
- [NAT Page: Dynamic Rules, page 24-10](#)
- [NAT Page: Timeouts, page 24-13](#)

Network Address Translation (NAT) converts private, internal LAN addresses into globally routable IP addresses. NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

For more information, see [Understanding Network Address Translation, page 24-2](#).

### Navigation Path

- (Device view) Select **NAT** from the Policy selector.

- (Policy view) Select **NAT (Router)** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## NAT Page: Interface Specification

Before creating NAT rules, you must define the “direction” of the traffic to be translated by specifying the Inside and Outside interfaces. Inside interfaces typically connect to a LAN that the router serves. Outside interfaces typically connect to your organization’s WAN or to the Internet. You must designate at least one Inside interface and one Outside interface to enable the router to perform network address translation.

The Inside and Outside designations are used when interpreting translation rules: addresses connected to the Inside interface are translated to addresses on the Outside interface. After these interfaces are defined, they are used in all static and dynamic NAT translation rules.

Use the Interface Specification tab of the NAT policy page to specify the Inside and Outside interfaces.

### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Interface Specification** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Interface Specification** tab.

### Defining the Inside and Outside Interfaces

In the **NAT Inside Interfaces** and **NAT Outside Interfaces** fields, enter or Select the names of the interfaces or interface roles for the Inside and Outside interfaces, respectively. Separate multiple names or roles with commas (for example, Ethernet1/1, Ethernet1/2). Note that you cannot enter the same name in both fields.

## NAT Page: Static Rules

You define a static NAT rule by specifying a local address that must be translated, as well as the global address to which it is translated. This is a static or fixed mapping—the local address is always translated to the same global address.

You can define static NAT rules that translate the addresses of single hosts, as well as static rules that translate multiple addresses in a subnet. When multiple local addresses must use the same global address, you must define the necessary port redirection information, which defines a different port for each local address using the global address.

**Note**

We strongly recommend that you do not perform NAT on traffic that will be transmitted over a VPN. Translating addresses on this traffic causes it to be sent out unencrypted instead of encrypted over the VPN.

The procedure for creating a static rule depends on whether the address being translated represents a port, a single host, or an entire subnet:

- You define a **static NAT rule for a single host** by entering the original address to translate and the global address to which it is translated. The global address may be taken from an interface on the device.
- You define a **static NAT rule for a subnet** by entering one of the addresses in the subnet (including the subnet mask) as the original address, and one of the global addresses that you want to use as the translated address. The router configures the remaining addresses based on the subnet mask you provide.
- You define a **static NAT rule for a port** by entering the original IP address and the global address to which it should be translated. The global address may be taken from an interface on the device. In addition, you must select the protocol used by the port, as well as the local and global port numbers.

The Add Static NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to [NAT Static Rule Dialog Boxes, page 24-7](#) for descriptions of the fields displayed in the table on this page.

**Before You Begin**

- Define the inside and outside interfaces used for NAT. See [NAT Page: Interface Specification, page 24-6](#).

**Navigation Path**

- (Device view) Select **NAT** from the Policy selector, then click the **Static Rules** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Static Rules** tab.

## NAT Static Rule Dialog Boxes

Use the Add/Edit NAT Static Rule dialog boxes to add or edit static address translation rules. Except for their titles, the two dialog boxes are identical.

**Navigation Path**

Go to the [NAT Page: Static Rules, page 24-6](#) tab; click the **Add** button beneath the table to add a new rule, or select a rule in the table and click **Edit** to update that rule.

| Port Redirection | <p>These parameters specify port information for the address translations. Port address translation lets you to use the same public IP address for multiple devices as long as the port specified for each device is different.</p> <p><b>Note</b> These parameters are available only when Static Port is the chosen rule type.</p> <p><b>Redirect Port</b> – When Static Port is chosen as the rule type, this box is automatically checked; it cannot be changed. Enter the appropriate information in the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Protocol</b> – The communications protocol used for these ports: TCP or UDP.</li> <li>• <b>Local Port</b> – The port number on the source network. Valid values range from 1 to 65535.</li> <li>• <b>Global Port</b> – The port number on the destination network that the router is to use for this translation. Valid values range from 1 to 65535.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Advanced         | <p>This section contains optional, advanced translation options.</p> <p><b>Note</b> The Advanced options are available only when the Specify IP option is the selected method for defining the translated address(es).</p> <ul style="list-style-type: none"> <li>• <b>No Alias</b> – When selected, disables automatic aliasing for the global IP address translation.</li> </ul> <p>If the NAT pool used as an inside global pool consists of addresses on an attached subnet, an alias is generated for that address so that the router can answer Address Resolution Protocol (ARP) requests for those addresses.</p> <p>When deselected, global address aliases are permitted.</p> <ul style="list-style-type: none"> <li>• <b>No Payload</b> – When selected, prohibits an embedded address or port in the payload from being translated.</li> </ul> <p>The payload option performs NAT between devices on overlapping networks that share the same IP address. When an outside device sends a DNS query to reach an inside device, the local address inside the payload of the DNS reply is translated to a global address according to the relevant NAT rule.</p> <p>You can disable this feature by selecting the No Payload option. Otherwise, embedded addresses and ports in the payload may be translated. See <a href="#">Disabling the Payload Option for Overlapping Networks, page 24-10</a> for more information.</p> <ul style="list-style-type: none"> <li>• <b>Create Extended Translation Entry</b> – When checked, extended translation entries (addresses and ports) are created in the translation table. This lets you associate multiple global addresses with a single local address. This is the default.</li> </ul> <p>When this option is deselected, simple translation entries are created, allowing association of a single global address with the local address.</p> <p><b>Note</b> This option is not available when Static Port is the chosen rule type.</p> |

## Disabling the Payload Option for Overlapping Networks

Overlapping networks result when you assign an IP address to a device on your network that is already legally owned and assigned to a different device on the Internet or outside network. Overlapping networks can also result after the merger of two companies using RFC 1918 IP addresses in their networks. These two networks need to communicate, preferably without your having to re-address all their devices.

This communication is achieved as follows. The outside device cannot use the IP address of the inside device because it is the same as the address assigned to itself (the outside device). Instead, the outside device sends a Domain Name System (DNS) query for the inside device's domain name. The source of this query is the IP address of the outside device, which is translated to an address from a designated address pool. The DNS server located on the inside network replies with the IP address associated with the inside device's domain name in the data portion of the packet. The destination address of the reply packet is translated back to the outside device's address, and the address in the data portion of the reply packet is translated to an address from a different address pool. In this way, the outside device learns that the IP address for the inside device is one of the addresses from that second address pool, and it uses this address when it communicates with the inside device. The router running NAT takes care of the translations at this point.

To disable the translation of the address inside the payload, check the **No Payload** option when you create a static NAT rule based on a global IP translation.

## NAT Page: Dynamic Rules

Use the NAT Dynamic Rules tab of the router's NAT page to manage dynamic address translation rules. A dynamic address translation rule dynamically maps hosts to addresses, using either the IP address of a specific interface (with dynamic port translation), or the addresses included in an address pool that are globally unique in the destination network.

### Defining Dynamic NAT Rules

You define a dynamic NAT rule by first selecting an access control list (ACL) whose rules specify the traffic requiring translation.

Then, you must either select an interface with an IP address to which the addresses should be translated, or define a pool of addresses to be used. You define the pool by specifying a range of addresses and giving the range a unique name; you can specify multiple ranges. The router uses the available addresses in the pool (those not used for static translations, or for its own WAN IP address) for connections to the Internet or another outside network. When an address is no longer in use, it is returned to the address pool to be dynamically assigned later to another device.

If the addressing requirements of your network exceed the available addresses in your dynamic NAT pool, you can use the Port Address Translation (PAT) feature (also called Overloading) to associate many private addresses with one or a small group of public IP address, using port addressing to make each translation unique. With PAT enabled, the router chooses a unique port number for the IP address of each outbound translation slot. This feature is useful if you cannot allocate enough unique IP addresses for your outbound connections. Note that Port Address Translation does not occur until the address pool is depleted.

#### Note

By default, Security Manager does not perform NAT on traffic that is meant to be transmitted over a VPN. Otherwise, any traffic appearing in both the NAT ACL and the crypto ACL defined on an interface would be sent out unencrypted because NAT is always performed before encryption. However, you can change this default setting.

**Tip**

You can perform PAT on split-tunneled traffic on the spokes of your VPN topology directly from the Global VPN Settings page. There is no need to create a dynamic NAT rule for each spoke. Any NAT rules that you define on an individual device override the VPN setting. For more information, see [Configuring VPN Global NAT Settings, page 26-42](#).

The Add Dynamic NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to [NAT Dynamic Rule Dialog Box, page 24-11](#) for descriptions of the fields displayed in the table on this page.

**Before You Begin**

- Define the inside and outside interfaces used for NAT. See [NAT Page: Interface Specification, page 24-6](#).

**Navigation Path**

- (Device view) Select **NAT** from the Policy selector, then click the **Dynamic Rules** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Dynamic Rules** tab.

## NAT Dynamic Rule Dialog Box

Use the Add/Edit NAT Dynamic Rule dialog boxes to add or edit dynamic address translation rules. Except for their titles, the two dialog boxes are identical.

**Navigation Path**

Go to the [NAT Page: Dynamic Rules, page 24-10](#) tab; click the **Add** button beneath the table to add a new rule, or select a rule in the table and click **Edit** to update that rule.

| Traffic Flow       | <p>In the <b>Access List</b> field, enter or Select the name of the access control list (ACL) object whose entries define the addresses requiring dynamic translation.</p> <p><b>Note</b> Make sure that the specified ACL does not permit the translation of Security Manager management traffic over any device address on this router. Translating this traffic will cause a loss of communication between the router and Security Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Translated Address | <p>Use the options in this section of the dialog box to specify the method and address(es) used for dynamic translation:</p> <ul style="list-style-type: none"> <li>• <b>Use Interface IP</b> – Select this option to specify that the globally registered IP address assigned to a particular interface be used as the translated address; port addressing ensures each translation is unique. (The Enable Port Translation (Overload) option is checked automatically when you select Use Interface IP.)</li> </ul> <p>Enter or Select the name of the desired <b>Interface</b>. This is typically the interface from which translated packets leave the router, meaning the interface or interface role must represent an outside interface on the router (see <a href="#">NAT Page: Interface Specification, page 24-6</a>).</p> <ul style="list-style-type: none"> <li>• <b>Address Pool</b> – Select this option to base address translation on the addresses you specify in the <b>Network Ranges</b> pool.</li> </ul> <p>Enter one or more address ranges, including the prefix, using the format <code>min1-max1/prefix</code> (in CIDR notation), where “prefix” represents a valid netmask. For example, <code>172.16.0.0-172.31.0.223/12</code>.</p> <p>You can add as many address ranges to the address pool as required, but all ranges must share the same prefix. Separate multiple entries with commas.</p> |

Table 24-3 NAT Dynamic Rule Dialog Box (continued)

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Settings | <p>This section contains two options</p> <ul style="list-style-type: none"> <li>• <b>Enable Port Translation (Overload)</b> – When selected, the router uses port addressing (PAT) if supply of global addresses in the address pool is depleted; when deselected, PAT is not used.</li> </ul> <p><b>Note</b> When you use select Use Interface IP in the Translated Address section, this box is checked automatically; it cannot be changed.</p> <ul style="list-style-type: none"> <li>• <b>Do Not Translate VPN Traffic (Site-to-Site VPN only)</b> – Deselect this option to allow address translation on traffic intended for a site-to-site VPN.</li> </ul> <p>When selected, address translation is not performed on VPN traffic. When deselected, the router performs address translation on VPN traffic in cases of overlapping addresses between the NAT ACL and the crypto ACL.</p> <p><b>Note</b> We strongly recommend that you not deselect this option, or any traffic defined in both the NAT ACL and the crypto ACL will be sent unencrypted. When you perform NAT into IPsec, we also recommend that you leave this option selected; it does not interfere with the translation of addresses arriving from overlapping networks.</p> <p>This setting applies only in situations where the NAT ACL overlaps the crypto ACL used by the site-to-site VPN. Because the interface performs NAT first, any traffic arriving from an address within this overlap would get translated, causing the traffic to be sent unencrypted. Leaving this box checked prevents that from happening.</p> <p><b>Note</b> This option does not apply to remote access VPNs.</p> |

## NAT Page: Timeouts

Use the NAT Timeouts tab of the router's NAT page to manage the timeout values for port address (overload) translations. These timeouts cause a dynamic translation to expire after a specified period of inactivity. In addition, you can use options on this page to place a limit on the number of entries allowed in the dynamic NAT table, and to modify the default timeout on all dynamic translations that do not include PAT processing.

### About Dynamic NAT Timeouts

Dynamic NAT translations have a timeout period for non-use, after which they expire and are purged from the translation table. If you enable the Overload feature for performing PAT, you can specify a variety of values that provide finer control over these timeouts, because each translation entry contains additional contextual information about the traffic using it.

For example, non-DNS translations time out by default after five minutes, but DNS translations time out after 1 minute. Further, TCP translations time out after 24 hours, unless an RST or FIN is seen on the stream, in which case they time out after one minute. You can change any of these timeout values.

**Note**

If you disable the Port Translation (Overload) feature for all dynamic rules, you need not enter any PAT-related timeout values. However, you can still modify the default timeout value for non-PAT dynamic translations. (By default, all dynamic translations expire after 24 hours.) For more information about the Overload feature, see [NAT Dynamic Rule Dialog Box, page 24-11](#).

**Navigation Path**

- (Device view) Select **NAT** from the Policy selector, then click the **Timeouts** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Timeouts** tab.

**Field Reference****Table 24-4 NAT Timeouts Tab**

| Element            | Description                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Entries        | The maximum number of entries allowed in the dynamic NAT table. You can enter a value between 1 and 2147483647, or you can leave the field blank (the default), which means that the number of entries in the table is unlimited.                                                         |
| Timeout (sec.)     | The number of seconds after which dynamic translations expire; this does not apply to PAT (overload) translations. The default is 86400 seconds (24 hours).                                                                                                                               |
| UDP Timeout (sec.) | The timeout value applied to User Datagram Protocol (UDP) ports. The default is 300 seconds (5 minutes).<br><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a> .         |
| DNS Timeout (sec.) | The timeout value applied to Domain Naming System (DNS) server connections. The default is 60 seconds.<br><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a> .           |
| TCP Timeout (sec.) | The timeout value applied to Transmission Control Protocol (TCP) ports. The default is 86400 seconds (24 hours).<br><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a> . |

Table 24-4 NAT Timeouts Tab (continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FINRST Timeout (sec.) | <p>The timeout value applied when a Finish (FIN) packet or Reset (RST) packet (both of which terminate connections) is found in the TCP stream. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a>.</p> |
| ICMP Timeout (sec.)   | <p>The timeout value applied to Internet Control Message Protocol (ICMP) flows. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a>.</p>                                                                 |
| PPTP Timeout (sec.)   | <p>The timeout value applied to NAT Point-to-Point Tunneling Protocol (PPTP) flows. The default is 86400 seconds (24 hours).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a>.</p>                                               |
| SYN Timeout (sec.)    | <p>The timeout value applied to TCP flows after a synchronous transmission (SYN) message (used for precise clocking) is encountered. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 24-11</a>.</p>            |

## NAT Policies on Security Devices

The following topics describe configuring network address translation (NAT) options on managed security appliances: PIX firewalls, Firewall Service Modules (FWSMs) on Catalyst switches, pre-version-8.3 Adaptive Security Appliances (ASAs), and ASA 8.3+ devices. The topics are arranged as follows:

- [NAT in Transparent Mode, page 24-16](#)
- [Translation Options Page, page 24-17](#)
- **PIX, FWSM, and pre-8.3 ASA**
  - [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 24-19](#)
  - [Address Pools, page 24-19](#)
  - [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#)
- **ASA 8.3+**
  - [Configuring NAT on ASA 8.3+ Devices, page 24-34](#)
  - [Translation Rules: ASA 8.3+, page 24-35](#)

## NAT in Transparent Mode

Using NAT on a security appliance operating in transparent mode eliminates the need for upstream or downstream routers to perform NAT for their networks. NAT in transparent mode has the following requirements and limitations:

- When the mapped addresses are not on the same network as the transparent firewall, you need to add a static route for the mapped addresses on the upstream router that points to the downstream router (through the security appliance).
- If the real destination address is not directly connected to the security appliance, you also need to add a static route on the security appliance for the real destination address that points to the downstream router. Without NAT, traffic from the upstream router to the downstream router does not need any routes on the security appliance because it uses the MAC address table. Using NAT, however, causes the security appliance to use a route look-up instead of a MAC address look-up, so it needs a static route to the downstream router.
- Because the transparent firewall does not have any interface IP addresses, you cannot use interface PAT.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the security appliance sends an ARP request to a host on the other side of the security appliance, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.

## CGNAT MAP Page

Beginning with version 4.20, Cisco Security Manager supports Carrier-Grade NAT Mapping of Address and Port (CGNAT MAP) domains for ASA 9.13(1) devices operating in single, multi-context, and routed modes. This feature helps configure MAP domains using default or basic mapping rules.

### Note

CGNAT MAP is not supported in transparent mode.

### Navigation Path

- (Device view) Select **NAT > CGNAT MAP** from the Device Policy selector.
- (Policy View) Select **NAT (PIX/ASA/FWSM) > CGNAT MAP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **CGNAT MAP** to create a new CGNAT MAP policy.

| Element         | Description                                                                    |
|-----------------|--------------------------------------------------------------------------------|
| Add Map Domain  | When selected, lets you add a map domain using basic or default mapping rules. |
| Map Domain Name | Enter the name of the map domain for which the mapping rule must be applied.   |

**Table 24-5** CGNAT MAP Page (continued)

| Element              | Description                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------|
| Basic Mapping Rule   | Select the Basic Mapping Rule check box to specify the IPv4 and IPv6 prefixes, Share Ratio, and Start Port number. |
| Default Mapping Rule | Enter the IPv6 prefix to apply the default mapping rule.                                                           |

## Global Options Page

Security Manager version 4.9 supports CGNAT to configure the block size and maximum blocks per host limit for port block allocation, for ASA devices 9.5(1) or later. Use the Global Options page to configure these options.

### Navigation Path

- (Device view) Select **NAT > Global Options** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Global Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Global Options** to create a new policy.

| Element                                 | Description                                                                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xlate block-allocation size             | Enter a value between 32 and 4096. The default value is 512.                                                                                                                  |
| xlate block-allocation maximum-per-host | Enter a value between 1 to 8. The default value is 4.                                                                                                                         |
| xlate block-allocation interim logging  | Configure a timer interval to generate syslog for all the active port blocks allocated at that time for ASA 9.12(1) devices and later. Enter a value between 43200 to 604800. |

## Translation Options Page

Use the Translation Options page to set options that affect network address translation for the selected security appliance. These settings apply to all interfaces on the device.

### Navigation Path

- (Device view) Select **NAT > Translation Options** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Options** to create a new policy.

|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable traffic through the firewall without address translation | <p>When selected, lets traffic pass through the security appliance without address translation. If this option is not selected, any traffic that does not match a translation rule will be dropped.</p> <p><b>Note</b> This option is available only on PIX 7.x, FWSM 3.x, and ASA devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable xlate bypass                                             | <p>When selected, establishment of NAT sessions for untranslated traffic is disabled (this feature is called “xlate bypass”).</p> <p><b>Note</b> This option is available only on FWSM 3.2 and later.</p> <p>By default, the FWSM creates NAT sessions for all connections even if NAT is not used. For example, a session is created for each untranslated connection even if NAT control is not enabled, if NAT exemption or identity NAT is used, or if you use same-security interfaces and do not configure NAT. Because there is a maximum number of NAT sessions (266,144 concurrent), these kinds of NAT sessions might cause you to run into the limit. To avoid reaching the limit, enable xlate bypass.</p> <p>If you disable NAT control and have untranslated traffic or use NAT exemption, or if you enable NAT control and use NAT exemption, then with xlate bypass, the FWSM does not create a session for those types of untranslated traffic. However, NAT sessions are still created in the following instances:</p> <ul style="list-style-type: none"> <li>• You configure identity NAT (with or without NAT control)—identity NAT is considered to be a translation.</li> <li>• You use same-security interfaces with NAT control. Traffic between same-security interfaces create NAT sessions even when you do not configure NAT for the traffic. To avoid NAT sessions in this case, disable NAT control, or use NAT exemption as well as xlate bypass.</li> </ul> |
| Do not translate VPN traffic                                    | <p>When selected, VPN traffic passes through the security appliance without address translation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Clear translates for existing connections                       | <p>When selected, the translation slots assigned to dynamic translations and any associated connections are cleared following each session.</p> <p>Each session connecting through the security appliance, and undergoing some form of NAT or PAT, is assigned a translation slot known as an “xlate.” These translation slots can persist after the session is complete, which can lead to a depletion of translation slots, unexpected traffic behavior, or both.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functions, it does not support any enhancements.

The following sections describe configuring network address translation on PIX and FWSM devices, and on pre-8.3-version ASAs. (See [Configuring NAT on ASA 8.3+ Devices, page 24-34](#) for information about configuring NAT on ASA 8.3+ devices.)

- [Address Pools, page 24-19](#)
- [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#)
  - [Translation Exemptions \(NAT 0 ACL\), page 24-21](#)
  - [Dynamic Rules Tab, page 24-23](#)
  - [Policy Dynamic Rules Tab, page 24-25](#)
  - [Static Rules Tab, page 24-27](#)
  - [General Tab, page 24-32](#)

### Address Pools

Use the Address Pools page to view and manage the global address pools used in dynamic NAT rules. The Address Pool dialog box is used to add and edit these address pools. Refer to [Address Pool Dialog Box, page 24-19](#) for descriptions of the fields displayed in the Global Address Pools table on this page.

**Navigation Path**

- (Device view) Select **NAT > Address Pools** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Address Pools** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Address Pools** to create a new policy.

**Related Topics**

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 24-19](#)

### Address Pool Dialog Box

Use the Address Pool dialog box to add or edit a global address pool for use in dynamic NAT rules.

**Navigation Path**

You open the Address Pool dialog box by clicking the Add Row or Edit Row buttons on the [Address Pools, page 24-19](#).

**Related Topics**

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 24-19](#)

Table 24-8 Address Pools Dialog Box

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name       | Enter or Select the name of the device interface on which the mapped IP addresses will be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Pool ID              | Enter a unique identification number for this address pool, an integer between 1 and 2147483647. When configuring a dynamic NAT rule, you select a Pool ID to specify the pool of addresses to be used for translation.                                                                                                                                                                                                                                                                                                                                                                                                    |
| IP address ranges    | Enter or Select the addresses to be assigned to this address pool. You can specify these addresses as follows: <ul style="list-style-type: none"> <li>• Address range for dynamic NAT (e.g., 192.168.1.1-192.168.1.15)</li> <li>• Subnetwork (e.g., 192.168.1.0/24)</li> <li>• List of addresses separated by commas (e.g., 192.168.1.1, 192.168.1.2, 192.168.1.3)</li> <li>• Single address to use for PAT (e.g., 192.168.1.1)</li> <li>• Combinations of the above (e.g., 192.168.1.1-192.168.1.15, 192.168.1.25)</li> <li>• Names of hosts on the connected network; these will be resolved to IP addresses.</li> </ul> |
| Description          | Enter a description for the address pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Interface PAT | When checked, port address translation is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Translation Rules: PIX, FWSM, and pre-8.3 ASA

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Translation Rules page to define network address translation (NAT) rules on the selected device. The Translation Rules page consists of the following tabs:

- [Translation Exemptions \(NAT 0 ACL\), page 24-21](#) – Use this tab to configure rules specifying traffic that is exempt from address translation.

**Note**

Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- [Dynamic Rules Tab, page 24-23](#) – Use this tab to configure dynamic NAT and PAT rules.

---

**Note** Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

---

- [Policy Dynamic Rules Tab, page 24-25](#) – Use this tab to configure dynamic translation rules based on source and destination addresses and services.

---

**Note** Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

---

- [Static Rules Tab, page 24-27](#) – Use this tab to configure static translation rules for a security appliance or shared policy.
- [General Tab, page 24-32](#) – Use this tab to view all current translation rules, listed in the order that they will be evaluated on the device.

---

**Note** The General tab is visible only for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

---

#### Navigation Path

To access the Translation Rules page, do one of the following:

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

## Translation Exemptions (NAT 0 ACL)

Use the Translation Exemptions (NAT 0 ACL) tab of the Translation Rules page to view and specify rules that exempt traffic from address translation. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Translation Exemption \(NAT-0 ACL\) Rule Dialog Box, page 24-22](#) for descriptions of the fields displayed in the table on this page.

**Note**

---

Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

---

#### Navigation Path

You can access the Translation Exemptions (NAT 0 ACL) tab from the [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#) page.

**Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box**

Use the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box to define and edit translation exemption rules on PIX, FWSM and pre-8.3 ASA devices in router mode, and FWSM 3.2 devices in transparent mode.

**Navigation Path**

You can access the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box from the Translation Exemptions (NAT 0 ACL) tab. See [Translation Exemptions \(NAT 0 ACL\), page 24-21](#) for more information.

**Field Reference**

**Table 24-9 Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                                                                             |
| Action                | Select the action for this rule: <ul style="list-style-type: none"> <li>• exempt – The rule identifies traffic that is exempt from NAT.</li> <li>• do not exempt – The rule identifies traffic that is not exempt from NAT.</li> </ul>                                                     |
| Original: Interface   | Enter the name of (or Select) the device interface to which the rule applies.                                                                                                                                                                                                              |
| Original: Sources     | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.<br><br>Note that this parameter is displayed in the Translation Exemptions (NAT 0 ACL) table under the column heading “Original Address.” |
| Translated: Direction | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                                                                     |

**Table 24-9 Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box (continued)**

| Element                     | Description                                                                                                                                                                                                                                                                                              |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic flow: Destinations  | Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                    |
| Category                    | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects, page 6-13</a> for more information.<br><br><b>Note</b> No commands are generated for the Category attribute. |
| Description                 | Enter a description of the rule.                                                                                                                                                                                                                                                                         |
| Advanced button (FWSM only) | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> to configure advanced settings for this rule.                                                                                                                                                                              |

## Dynamic Rules Tab

Use the Dynamic Rules tab of the Translation Rules page to view and configure dynamic NAT and PAT rules. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With dynamic NAT, internal IP addresses are dynamically translated using IP addresses from a pool of global addresses. With dynamic PAT, internal IP addresses are translated to a single mapped address by using dynamically assigned port numbers with the mapped address. Dynamic translations are often used to map local RFC 1918 IP addresses to addresses that are Internet-routable.

The Add/Edit Dynamic Translation Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Dynamic Translation Rule Dialog Box, page 24-24](#) for descriptions of the fields displayed in the table on this page.

### Note

Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

### Navigation Path

You can access the Dynamic Rules tab from the Translation Rules page. For more information about the Translation Rules page, see [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#).

### Note

By default, only standard Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab, page 24-32](#).)

| Element               | Description                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                          |
| Original: Interface   | Enter the name or Select the device interface to which the rule applies.                                                                                                                                                                |
| Original: Address     | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                        |
| Translated: Pool      | Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the <a href="#">Select Address Pool Dialog Box, page 24-24</a> .<br>Enter a value of zero to specify this as an identity NAT rule. |
| Translated: Direction | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                  |
| Advanced button       | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> to configure advanced settings for this rule.                                                                                                             |

### Select Address Pool Dialog Box

The Select Address Pool dialog box presents a list of global address pools; these pools are defined and managed via the [Address Pools, page 24-19](#). Use this dialog box to select an address pool for use by a dynamic translation rule, or a policy dynamic translation rule.

**Navigation Path**

You can access the Select Address Pool dialog box from the [Add/Edit Dynamic Translation Rule Dialog Box, page 24-24](#) when adding or editing a dynamic translation rule, or from the [Add/Edit Policy Dynamic Rules Dialog Box, page 24-26](#) when adding or editing a policy dynamic translation rule.

**Field Reference****Table 24-11** *Select Address Pool Dialog Box*

| Element           | Description                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool ID           | The identification number of the address pool.                                                                                                           |
| Interface         | The name of the device interface to which the address pool applies.                                                                                      |
| IP Address Ranges | The IP addresses assigned to the pool; “interface” in this list indicates PAT is enabled on the specified Interface.                                     |
| Description       | The description provided for the address pool.                                                                                                           |
| Selected Row      | This field identifies the pool currently selected in the list. When you click OK to close the dialog box, this pool is assigned to the translation rule. |

**Policy Dynamic Rules Tab**

Use the Policy Dynamic Rules tab of the Translation Rules page to view and configure dynamic translation rules based on source and destination addresses and services. Rules are evaluated sequentially in the order listed. The row number indicates the rule’s position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Policy Dynamic Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Policy Dynamic Rules Dialog Box, page 24-26](#) for a description of the fields displayed in the table on this page.

**Note**

Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

**Navigation Path**

You can access the Policy Dynamic Rules tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#) for more information.

**Note**

By default, only standard Policy Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab, page 24-32](#).)

**Field Reference****Table 24-12 Add/Edit Policy Dynamic Rules Dialog Box**

| Element             | Description                                                                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule         | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                                                               |
| Original: Interface | Enter the name of (or Select) the device interface to which the rule applies.                                                                                                                                                                                                |
| Original: Sources   | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.<br><br>Note that this parameter is displayed in the Policy Dynamic Rules table under the column heading “Original Address.” |
| Translated: Pool    | Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the <a href="#">Select Address Pool Dialog Box, page 24-24</a> .<br><br>Enter a value of zero to specify this as an identity NAT rule.                                  |

**Table 24-12 Add/Edit Policy Dynamic Rules Dialog Box (continued)**

| Element                    | Description                                                                                                                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translated: Direction      | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                                                                                   |
| Traffic flow: Destinations | Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                    |
| Traffic flow: Services     | Enter (or Select) the services to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                                                                  |
| Category                   | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects, page 6-13</a> for more information.<br><br><b>Note</b> No commands are generated for the Category attribute. |
| Description                | Enter a description of the rule.                                                                                                                                                                                                                                                                         |
| Advanced button            | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> to configure advanced settings for this rule.                                                                                                                                                                              |

## Static Rules Tab

Use the Static Rules tab of the Translation Rules page to view and configure static translation rules for a security appliance or shared policy. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With static translation, internal IP addresses are permanently mapped to a global IP address. These rules map a host address on a lower security-level interface to a global address on a higher security-level interface. For example, a static rule would be used for mapping the local address of a web server on a perimeter network to a global address that hosts on the outside interface would use to access the web server.

### Caution

The order of Static NAT rules on a security device is important, and Security Manager preserves this ordering during deployment. However, security appliances do not support in-line editing of Static NAT rules. This means that if you move, edit, or insert a rule anywhere above the end of the list, Security Manager will remove from the device all Static NAT rules that follow the new or modified rule, and then re-send the updated list from that point. Depending on the length of the list, this can require substantial overhead, and may result in traffic interruption. Whenever possible, add any new Static NAT rules to the end of the list.

The Add/Edit Static Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Static Rule Dialog Box, page 24-28](#) for descriptions of the fields displayed in the table on this page.

### The "Nailed" Column in the Static Rules Table

In addition to the columns representing parameters specified in the [Add/Edit Static Rule Dialog Box, page 24-28](#), the Static Rules table displays a column labeled "Nailed." This value is a product of device discovery; it cannot be changed in Security Manager.

The entry in the "Nailed" Column indicates whether TCP state tracking and sequence checking is skipped for the connection: true or false.

**Navigation Path**

You can access the Static Rules tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#) for more information.

**Note**

By default, only standard Static Rules elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab, page 24-32](#).)

| Translated Interface                  | <p>Enter (or Select) the interface on which the translated addresses are to be used.</p> <p>To specify this as an identity NAT rule, enter the same interface in both this and the Original Interface fields.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use Interface IP/Use Selected Address | Specify the address used for the Translated Interface: select Use Interface IP (address), or select Use Selected Address and enter an address, or Select a network/host object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Policy NAT                     | Select this option to enable Policy NAT for this translation rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Dest Address                          | If Policy NAT is enabled, specify the destination addresses of the hosts or networks to which the rule applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Services                              | <p>If Policy NAT is enabled, enter or Select the Services to which the rule applies.</p> <p><b>Note</b> For Static Policy NAT, IP is the only Service that can be specified.</p> <p>The syntax for service and service-object specification is:</p> <pre>{tcp   udp   tcp&amp;udp}/{source_port_number   port_list_object}/ {destination_port_number   port_list_object}</pre> <p>Note that if you enter only one port parameter, it is interpreted as the destination port (with a source port of “any”). For example, <b>tcp/4443</b> means tcp, source port any, destination port 4443, while <b>tcp/4443/Default Range</b> means tcp, source port 4443, and destination port Default Range (generally 1-65535).</p> <p>As with all text-entry fields, Security Manager may display auto-complete options. For example, if you type <b>tcp/</b> in this field, an auto-complete list of all Port Lists objects defined in Security Manager is displayed. This list will include system-generated objects such as DEFAULT RANGE, HTTPS and WEBPORTS.</p> <p>Refer to <a href="#">Configuring Port List Objects, page 6-102</a> for more information about Port Lists, and <a href="#">Configuring Service Objects, page 6-103</a> for more information about defining Services.</p> |
| Protocol                              | If PAT is the selected Translation Type, select the protocol, TCP or UDP, to which the rule applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Original Port                         | <p>If PAT is the selected Translation Type, enter the port number to be translated.</p> <p>Note that this parameter is displayed in the Static Rules table under the column heading “Local Port.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Translated Port                       | <p>If PAT is the selected Translation Type, enter the port number to which the original port number will be translated.</p> <p>Note that this parameter is displayed in the Static Rules table under the column heading “Global Port.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 24-13 Add/Edit Static Rule Dialog Box (continued)**

| Element         | Description                                                                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category        | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects, page 6-13</a> for more information.<br><b>Note</b> No commands are generated for the Category attribute. |
| Description     | Enter a description of the rule.                                                                                                                                                                                                                                                                     |
| Advanced button | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> to configure advanced settings for this rule.                                                                                                                                                                          |

### Edit Translated Address Dialog Box

Use the Edit Translated Address dialog box to change just the translated address assigned to a static translation rule. The translated address is the address to which the original address is changed. The interface's IP address can be used, or you can enter a specific IP address. See [Static Rules Tab, page 24-27](#) for more information about static rules and translated addresses.

For detailed information on editing firewall rules cells, see [Editing Rules, page 12-10](#).

#### Navigation Path

Right-click the Translated Address cell in the Static Rules table (on the NAT > Translation Rules page) and choose **Edit Translated Address**.

### Advanced NAT Options Dialog Box

Use the Advanced NAT Options dialog box to configure the advanced connection settings—DNS Rewrite, Maximum TCP and Maximum UDP Connections, Embryonic Limit, Timeout (PIX 6.x), and Randomize Sequence Number—for NAT and Policy NAT. You can also configure these options for Translation Exemption (NAT 0 ACL) rules on an FWSM.

#### Navigation Path

You can access the Advanced NAT Options dialog box by clicking the **Advanced** button when adding or editing a translation rule. See the following topics for more information:

- [Add/Edit Translation Exemption \(NAT-0 ACL\) Rule Dialog Box, page 24-22](#)
- [Add/Edit Dynamic Translation Rule Dialog Box, page 24-24](#)
- [Add/Edit Policy Dynamic Rules Dialog Box, page 24-26](#)
- [Add/Edit Static Rule Dialog Box, page 24-28](#)

## Field Reference

Table 24-14 Advanced NAT Options Dialog Box

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translate the DNS replies that match the translation rule | <p>If checked, the security appliance rewrites DNS replies so an outside client can resolve the name of an inside host using an inside DNS server, and vice versa. For instance, if your NAT rule includes the real address of a host with an entry in a DNS server, and the DNS server is on a different interface from a client, then the client and the DNS server need different addresses for the host: one needs the mapped address and one needs the real address. This option rewrites the address in the DNS reply to the client.</p> <p>As an example, assume an inside web server, <code>www.example.com</code>, has the IP address <code>192.168.1.1</code>, which is translated to <code>10.1.1.1</code> on the outside interface of the appliance. An outside client sends a DNS request to an inside DNS server, which will resolve <code>www.example.com</code> to <code>192.168.1.1</code>. When the reply comes to the security appliance with DNS Rewrite enabled, the security appliance will translate the IP address in the payload to <code>10.1.1.1</code>, so that the outside client will get the correct IP address.</p> <p>Note that the mapped host needs to be on the same interface as either the client or the DNS server. Typically, hosts that need to allow access from other interfaces use a static translation, so this option is more likely to be used with a static rule.</p> |
| Max TCP Connections per Rule                              | Enter the maximum number of TCP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Max UDP Connections per Rule                              | Enter the maximum number of UDP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Max Embryonic Connections                                 | <p>Enter the number of embryonic connections allowed to form before the security appliance begins to deny these connections. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. Set this limit to prevent attack by a flood of embryonic connections. Valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.</p> <p>Any positive value enables the TCP Intercept feature. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP Intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help to minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 24-14** Advanced NAT Options Dialog Box (continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout                   | For PIX 6.x devices, enter a timeout value for this translation rule, in the format <i>hh:mm:ss</i> . This value overrides the default translation timeout specified in Platform > Security > Timeouts, unless this value is 00:00:00, in which case translations matching this rule use the default translation timeout (specified in Platform > Security > Timeouts).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Randomize Sequence Number | <p>If checked, the security appliance randomizes the sequence numbers of TCP packets. Each TCP connection has two Initial Sequence Numbers (ISNs): one generated by the client and one generated by the server. The security appliance randomizes the ISN of the TCP SYN in both the inbound and outbound directions. Randomizing the ISN of the protected host prevents an attacker from predicting the next ISN for a new connection and potentially hijacking the new session.</p> <p>Disable this feature only if:</p> <ul style="list-style-type: none"> <li>• Another in-line security appliance is also randomizing initial sequence numbers and data is being scrambled.</li> <li>• You are using eBGP multi-hop through the security appliance, and the eBGP peers are using MD5. Randomization breaks the MD5 checksum.</li> <li>• You are using a WAAS device which requires that the security appliance not randomize the sequence numbers of connections.</li> </ul> <p>Disabling this option opens a security hole in the security appliance.</p> |

## General Tab

Use the General tab of the Translation Rules page to view a summary of all translation rules defined for the current device or shared policy. The translation rules are listed in the order that they will be evaluated on the device.

### Note

The General tab is only visible for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

### Navigation Path

You can access the General tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 24-20](#) for more information.

**Table 24-15** *General Tab - Translation Rules Summary Table*

| Element                 | Description                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b>             | Hatching (a series of slanted lines) across an entry in the table indicates that rule is currently disabled. (See Enable Rule in <a href="#">Add/Edit Dynamic Translation Rule Dialog Box, page 24-24</a> for information about enabling and disabling these rules.)                                                     |
| No.                     | Rules are evaluated sequentially in the order listed. This number indicates the rule's position in the ordering of the list.                                                                                                                                                                                             |
| Type                    | The type of translation rule; for example, Static, Dynamic, Exemption, etc.                                                                                                                                                                                                                                              |
| Action                  | Displays "exempt" if the rule is exempt from NAT.                                                                                                                                                                                                                                                                        |
| Original Interface      | The ID of the device interface to which the rule is applied.                                                                                                                                                                                                                                                             |
| Original Address        | The object names or IP addresses of the source hosts and networks to which the rule applies.                                                                                                                                                                                                                             |
| Local Port              | The port number supplied by the host or network (for static PAT).                                                                                                                                                                                                                                                        |
| Translated Pool         | The ID number of the address pool used for translation.                                                                                                                                                                                                                                                                  |
| Translated Interface    | The interface on which the translated addresses are to be used.                                                                                                                                                                                                                                                          |
| Translated Address      | The translated addresses.                                                                                                                                                                                                                                                                                                |
| Global Port             | The port number to which the original port number will be translated (for static PAT).                                                                                                                                                                                                                                   |
| Destination             | The object names and IP addresses of the destination hosts or networks to which the rule applies.                                                                                                                                                                                                                        |
| Protocol                | The protocol to which the rule applies.                                                                                                                                                                                                                                                                                  |
| Service                 | The services to which the rule applies.                                                                                                                                                                                                                                                                                  |
| Direction               | The traffic direction (Inbound or Outbound) on which the rule is applied.                                                                                                                                                                                                                                                |
| DNS Rewrite             | Whether the DNS Rewrite option is enabled: Yes or No. This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> .                                                                                                                                                                            |
| Maximum TCP Connections | The maximum number of TCP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> .                                                                               |
| Embryonic Limit         | The number of embryonic connections allowed to form before the security appliance begins to deny these connections. If zero, the number of connections is unlimited. A positive number enables the TCP Intercept feature.<br><br>This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> . |

**Table 24-15** General Tab - Translation Rules Summary Table (continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum UDP Connections   | The maximum number of UDP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> .                                                                                                                                               |
| Timeout                   | For PIX 6.x devices, this is the timeout value for a static translation rule. This value overrides the default translation timeout specified in Platform > Security > Timeouts. A Timeout value of 00:00:00 here means that translations matching this rule should use the default translation timeout specified in Platform > Security > Timeouts.                                      |
| Randomize Sequence Number | Whether the security appliance will randomize the sequence number of TCP packets: Yes or No. This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 24-30</a> , and is enabled by default.                                                                                                                                                                          |
| Category                  | The category to which the rule is assigned. Categories use labels and color-coding to help identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> for more information.<br><b>Note</b> No commands are generated for the Category attribute.                                                                                                                  |
| Description               | The description of the rule, if provided.                                                                                                                                                                                                                                                                                                                                                |
| Last Ticket(s)            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-72</a> ). |

## Configuring NAT on ASA 8.3+ Devices

The following section describes configuring network address translation on version 8.3 or later ASA devices:

- [Translation Rules: ASA 8.3+, page 24-35](#)
  - [Add and Edit NAT Rule Dialog Boxes, page 24-37](#)
  - [Add or Edit Network/Host Dialog Box: NAT Tab, page 24-43](#)
- [Per-Session NAT Rules: ASA 9.0\(1\)+](#)

See [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 24-19](#) for information about configuring NAT on other security appliances. Refer to [About “Simplified” NAT on ASA 8.3+ Devices, page 24-4](#) for general information about NAT rules, and the changes to NAT configuration implemented on the ASA 8.3.

**Note** You can create a NAT object only if you have the Modify privilege mapped to your role. Cisco Security Manager displays error message for authorization.

## Translation Rules: ASA 8.3+

Use the Translation Rules page to manage network address translation (NAT) rules on the selected ASA 8.3+ device. See [NAT Policies on Security Devices, page 24-15](#) for information about configuring Translation Rules on other security devices.

Two types of NAT rules are displayed in this table: “manual” rules added by you and any other users, and “automatic” rules generated and applied by Security Manager when an object with NAT properties is assigned to the device. These are referred to as “NAT rules” and “Network Object NAT rules,” respectively.

### Some Features of the Translation Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in [Using Rules Tables, page 12-8](#). For example, you can move, show and hide columns; you can re-order the manual rules; and you can right-click certain table cells to edit that parameter. In addition, the following features are specific to this Translation Rules table:

- All rules are assigned to one of three pre-defined sections in the table:
  - **NAT Rules Before** – These are rules you or another user have “manually” defined on the device. You can specify that a rule be added to this section by clicking the section heading before adding the rule, although if you do not specify a section, the new rule will be added to this section by default.
  - **Network Object NAT Rules** – These are rules generated and ordered automatically by Security Manager when network objects that include NAT properties are assigned to the device. See [Add or Edit Network/Host Dialog Box: NAT Tab, page 24-43](#) for information about assigning NAT properties to objects. See the section “The NAT Table” in [About “Simplified” NAT on ASA 8.3+ Devices, page 24-4](#) for information about how these rules are ordered.

---

**Note** This section is not displayed in the Translation Rules table in Policy View because these rules are device-specific.

---

- **NAT Rules After** – These also are rules you or another user have manually defined on the device. You can specify that a rule is added to this section by clicking the section heading before adding the rule.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important. Providing a manual section both before and after the automatic rules lets you ensure all your rules are in the appropriate order, since you can re-order rules only within their section. The rules in each section take precedence over the rules in the section below it. For example, the rules in the top, “Before” section take precedence over the rules in the Network Object NAT section, and so on.

- The type of each rule—Static, Dynamic PAT, or Dynamic NAT and PAT—is indicated visually in the table by presenting (*S*), (*DP*), or (*DNP*) in blue following the Source parameter in the “Translated” column.
- A Bi-directional rule is a static rule that actually consists of two paired rules, one each for outgoing and incoming translation of the specified source and destination values. Each Bi-directional rule entry in the rules table is presented as two lines.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

### Related Topics

- [NAT Policies on Security Devices, page 24-15](#)

- Standard rules table topics:
  - [Using Rules Tables, page 12-8](#)
  - [Filtering Tables, page 1-48](#)
  - [Table Columns and Column Heading Features, page 1-49](#)

### Navigation Path

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Translation Rules page is displayed. Note that in Policy View, the Network Object NAT Rules section is not displayed because those rules are device-specific.

### Adding, Editing and Deleting Rules

To **add** a NAT rule:

1. Select the heading of the section to which the rule is to be added. If you do not select a heading, the rule will be added to *NAT Rules Before* by default.
2. Open the Add NAT Rule dialog box: either click the Add Row button at the bottom of the table, or right-click anywhere in the table (except on an existing rule entry) and choose Add Row from the pop-up menu.
3. Define the rule and then click OK to close the dialog box, adding the rule to the table.

To **edit** a NAT rule:

1. Open the Edit NAT Rule dialog box for the desired rule: either select the rule in the NAT rules table and then click the Edit Row button at the bottom of the table, or simply right-click the desired rule entry and choose Edit Row from the pop-up menu.
2. Edit the rule and then click OK to close the dialog box.

See [Add and Edit NAT Rule Dialog Boxes, page 24-37](#) for a complete description of the Add NAT Rule dialog box.

To **delete** a NAT rule, select the rule in the table and click the Delete Row button at the bottom of the table, or simply right-click the desired rule entry and choose Delete Row from the pop-up menu.

#### Note

To remove a Network Object NAT rule from this table, you must uncheck the Add Automatic Address Translation NAT Rule option, or change the device to which the rule is assigned, in the related Edit Network Host dialog box. See [Add or Edit Network/Host Dialog Box: NAT Tab, page 24-43](#) for additional information.

### Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

### Add and Edit NAT Rule Dialog Boxes

Use the Add NAT Rule dialog box to add a NAT rule to the selected ASA 8.3+ device; this dialog box is not available on earlier-version ASAs, nor on PIX or FWSM devices. Refer to [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 24-19](#) for information about adding and editing NAT rules on those devices.

#### Note

Except for their titles, the Add NAT Rule and Edit NAT Rule dialog boxes are identical, and the following descriptions apply to both.

#### Navigation Path

To add a rule, select the section to which you want the rule added (NAT Rules Before or NAT Rules After), and then click the Add Row button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add NAT Rule dialog box. Note that if you do not select a section, the new rule is added to the NAT Rules Before section.

To edit a rule, select the rule and click the Edit Row button, or simply right-click the rule and choose the Edit Row command, to open the Edit NAT Rule dialog box for that rule.

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source NAT Type                           | <p>The type of translation rule you are creating:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> – Provides static assignment of real addresses to mapped addresses.</li> <li>• <b>Dynamic PAT (Hide)</b> – Provides dynamic assignment of multiple local addresses to a single global IP address and a unique port number, in effect “hiding” the local addresses behind the one global address.</li> <li>• <b>Dynamic NAT and PAT</b> – Provides dynamic assignment of real addresses to mapped addresses, and real ports to mapped ports.</li> </ul> <p>Selecting this option adds the PAT Pool Address Translation options to the dialog box. On devices operating in routed mode, this option also provides the fallthrough option described below.</p> <p><b>Note</b> This selection applies only to the specified source translation; destination translation is always static.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Source Translation</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Original Source                           | The source address the NAT rule will translate. If this is a range or network, all addresses in the range or network are translated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Translated Source<br>Address<br>Interface | <p>Whether the translation is based on an address or an interface on the device. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Address</b> – Translate the original address using the Networks/Hosts object specified in the Translated Source field. This entry represents the pool of translation addresses: enter or Select the desired Networks/Hosts; defaults to the Original Source (which will produce an Identity NAT rule).</li> <li>• <b>Interface</b> – Translate the original address based on the interface specified in the Destination Interface field.</li> </ul> <p>For port address translation based on this interface, be sure to configure the options in the Service Translation section (in the Advanced panel of this dialog box).</p> <p>If the Destination Interface is not defined, the Address/Interface selection reverts to Address and the Original Source is inserted into the Address field. This produces an Identity NAT rule, meaning the specified address(es) are translated to themselves (effectively not translated); Identity NAT applies to outbound connections only.</p> <p><b>Note</b> These options are not available when Dynamic NAT and PAT is the selected Type, nor are they available on devices operating in transparent mode.</p> |

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PAT Pool Address Translation | <p>This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a “pool” of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to <a href="#">PAT Pools and Round Robin Allocation, page 24-42</a> for additional information about these features.</p> <p>Check the PAT Pool Address Translation box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Address or Interface</b> – Select Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Interface to provide a Fallthrough Interface.</li> <li>• <b>Address</b> – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above.</li> <li>• <b>Use Round Robin Allocation</b> – Check this box to map addresses/ports using a “round-robin” approach. See <a href="#">PAT Pools and Round Robin Allocation, page 24-42</a> for more information about this option.</li> <li>• <b>Extended PAT Table</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1).</li> <li>• <b>Flat Port Range</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select <b>Include Reserve Ports</b>.</li> <li>• <b>Include Reserve Ports</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.</li> <li>• <b>Block Allocation</b> (Available for ASA 9.5(1) and later) – Check this box to allocate a block of ports per host. This feature is supported from Security Manager version 4.9 onwards for ASA devices 9.5(1) or later.</li> </ul> |

| These service objects represent a service protocol (TCP or UDP), and one or more ports. The mapping of original ports to translated port is circular. That is, the first original value is mapped to the first translated value, and the second original value is mapped to the second translated value, and so on until all original values are translated. If the pool of translated port is exhausted before that point, mapping continues using the first translated value again. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , page 6-100 for information about configuring service objects. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Note</b> Service Translation and the following <b>Translate DNS replies that match this rule</b> option cannot be used together.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Translate DNS replies that match this rule           | <p>When checked, addresses embedded in DNS replies that match this rule are rewritten.</p> <p>For DNS replies traversing from a mapped interface to a real interface, the Address (or “A”) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.</p>                                                                                                                                                                                                                                                                                                                             |
| Fallthrough to Interface PAT (Destination Interface) | <p>When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IPv6                                                 | <p>When selected, the IPv6 address of the interface is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Net to net mapping of IPv4 to IPv6                   | <p>When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Do not proxy ARP on Destination Interface            | <p>Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type.</p> <p><b>Note</b> This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction.</p> <p>By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.)</p> <p><b>Note</b> You also can disable Proxy ARP on individual interfaces, as described in <a href="#">Configuring No Proxy ARP, page 56-1</a>.</p> |
| Perform route lookup for Destination Interface       | <p>If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT.</p> <p><b>Note</b> This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction. The option is not available on devices operating in transparent mode.</p>                                                                                                                                                                                                                                                                                                                                                                    |

**Table 24-16 Add and Edit NAT Rule Dialog Boxes (continued)**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unidirectional | This feature lets you configure a static NAT rule in a single direction only; or dual rules, one each for both directions (forward and reverse).<br>When selected, a single static NAT is created, as specified by the other options in this dialog box. Dynamic rules are uni-directional by default.<br>If deselected, two linked static NAT rules are created, encompassing both directions of the translation, as specified by the other options in this dialog box. Note that each bi-directional rule entry in the rules table consists of two lines. |
| Description    | (Optional) Provide a description of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Category       | (Optional) Choose a category to assign to the rule. Categories can help you organize and identify rules and objects; see <a href="#">Using Category Objects, page 6-13</a> for more information.<br><br><b>Note</b> This option is not available when Dynamic NAT and PAT is the chosen rule Type.                                                                                                                                                                                                                                                          |

## PAT Pools and Round Robin Allocation

Adaptive Security Appliances, version 8.4.2 and later, include two features that let you alter how port address translation (PAT) occurs: you can explicitly define a pool of IP addresses specifically for PAT, and you can select a “round robin” algorithm for port allocation during PAT.

These features simplify configuration of large numbers of PAT addresses, and help prevent a large number of connections from a single PAT address, which can appear to be part of a DoS attack.

### Explicit PAT Pool Definition

Prior to version 8.4.2, when you defined a Dynamic NAT and PAT rule, you provided a “pool” of IP addresses (in the Translated Source field of the Add/Edit NAT Rule dialog boxes) to be used for translation. This pool could consist of individual IP addresses, ranges of addresses, Networks/Hosts objects, or Network/Host group objects, and combinations thereof.

Ranges and objects with more than one IP address were considered to be in the “NAT Pool,” while individual IP addresses and group objects consisting of one or more individual addresses were considered to be part of the “PAT Pool.”

Address translation on the device would work its way through the NAT Pool until all available addresses were exhausted. Port address translation would then begin using the PAT Pool—assigning ports on the first IP address in the PAT Pool until all ports (approximately 64,000) are assigned, then assigning ports on the next address in the pool, and so on. When all ports are fully subscribed on all IP addresses in the PAT Pool, no further translation could occur.

On version 8.4.2 and later ASA devices, you can explicitly define a separate PAT Pool for a Dynamic NAT and PAT rule. If you do so, the first collection of addresses (defined in the Translated Source field) is considered the NAT Pool, while the PAT Pool addresses are specified in the PAT Pool Address Translation field.

#### Note

If you do not explicitly specify a PAT Pool, address translation takes place as described for pre-8.4.2 devices.

Refer to [Add and Edit NAT Rule Dialog Boxes, page 24-37](#) for more information about the defining translation rules.

### Round Robin Port Assignment

On version 8.4.2 and later ASA devices, you also can specify an alternate method of port assignment during PAT processing. As mentioned earlier, PAT port numbers are assigned to a single IP address in succession until the final port number is assigned, and then the process begins again with the next available IP address in the pool.

However, a new parameter on 8.4.2 and later devices—Use Round Robin Allocation for PAT Pool—lets you specify “round robin” cycling through available IP addresses and port numbers. This method assigns an address/port combination using each successive address in the pool; it then uses the first address again with a different port, proceeds to the second address again, and so on.

Further, the round-robin algorithm incorporates two additional principles it will attempt to adhere to when assigning address/port combinations during PAT processing:

- If a specific source-to-destination mapping already exists, the algorithm attempts to use the existing translation for the new connection. If this is not possible (for example, when all ports for that IP address have been exhausted), the algorithm proceeds with standard round-robin cycling.
- If possible, the original source port number is used as the mapped port number. That is, if the port number of the address/port combination to be translated is 4904, for example, and 4904 is available with the next IP address in the PAT Pool, the translated address will be *PAT\_address/4904*. Note if this is not possible (that port is not available with the next PAT address), the algorithm proceeds with standard round-robin cycling.

#### Note

If you do not explicitly specify Round Robin Allocation, port-allocation cycling occurs as described for pre-8.4.2 devices.

### Add or Edit Network/Host Dialog Box: NAT Tab

Use the NAT tab in any of the dialog boxes used to add or edit host, network, or address range objects to create or update object NAT rules. This NAT configuration is used only for ASA 8.3+ devices; if you use the object on any other type of device, the NAT configuration is ignored.

The NAT configuration is created as a device override and is not kept in the global object. Therefore, you must select the **Allow Value Override per Device** option if you configure these NAT options. (This option is selected automatically when you close the dialog box.)

This topic describes the fields on the NAT tab. For information about the fields on the General tab, see [Add or Edit Network/Host Dialog Box, page 6-83](#).

#### Navigation Path

Select the NAT tab on the [Add or Edit Network/Host Dialog Box](#) when creating or editing a host, network, or address range object.

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PAT Pool Address Translation | <p>This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a “pool” of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to <a href="#">PAT Pools and Round Robin Allocation, page 24-42</a> for additional information about these features.</p> <p>Check the PAT Pool Address Translation box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Use Address or Use Interface</b> – Select Use Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Use Interface to provide a Fallthrough Interface.</li> <li>• <b>PAT Pool Address</b> – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above.</li> <li>• <b>Use Round Robin Allocation for PAT Pool</b> – Check this box to map addresses/ports using a “round-robin” approach. See <a href="#">PAT Pools and Round Robin Allocation, page 24-42</a> for more information about this option.</li> <li>• <b>Extended PAT Table</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1).</li> <li>• <b>Flat Port Range</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select <b>Include Reserve Ports</b>.</li> <li>• <b>Include Reserve Ports</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.</li> </ul> |

| Translate DNS replies that match this rule                                                                                                | <p>When checked, addresses embedded in DNS replies that match this rule are rewritten.</p> <p>For DNS replies traversing from a mapped interface to a real interface, the Address (or “A”) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.</p> <p><b>Note</b> This option and Service Translation cannot be used together.</p>                                                                                                                         |
| Fallthrough to Interface PAT (Destination Interface)                                                                                      | When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.                                                                                                                                                                                                                                                                                                                                                                                 |
| IPv6                                                                                                                                      | When selected, the IPv6 address of the interface is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Net to net mapping of IPv4 to IPv6                                                                                                        | When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.                                                                                                                                                                                                                                                                                                                                                                                          |
| Do not proxy ARP on Destination Interface                                                                                                 | <p>Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type.</p> <p>By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.)</p> <p><b>Note</b> You also can disable Proxy ARP on individual interfaces, as described in <a href="#">Configuring No Proxy ARP, page 56-1</a>.</p> |

**Table 24-17 Network/Host Dialog Box NAT Tab (continued)**

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Perform route lookup for Destination Interface | <p>If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. This option is supported only for Static Identity NAT.</p> <p><b>Note</b> This option is not available on devices operating in transparent mode.</p> |

## Per-Session NAT Rules: ASA 9.0(1)+

Use the Per-Session NAT Rules page to configure per-session PAT rules on the selected ASA 9.0(1)+ device. By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. You can configure per-session rules to use multi-session PAT for specific traffic.

### Per-Session PAT vs. Multi-Session PAT (Version 9.0(1) and Later)

The per-session PAT feature improves the scalability of PAT and, for clustering, allows each member unit to own PAT connections; multi-session PAT connections have to be forwarded to and owned by the control unit. At the end of a per-session PAT session, the ASA sends a reset and immediately removes the xlate. This reset causes the end node to immediately release the connection, avoiding the TIME\_WAIT state. Multi-session PAT, on the other hand, uses the PAT timeout, by default 30 seconds. For "hit-and-run" traffic, such as HTTP or HTTPS, the per-session feature can dramatically increase the connection rate supported by one address. Without the per-session feature, the maximum connection rate for one address for an IP protocol is approximately 2000 per second. With the per-session feature, the connection rate for one address for an IP protocol is 65535/average-lifetime.

By default, all TCP traffic and UDP DNS traffic use a per-session PAT xlate. For traffic that can benefit from multi-session PAT, such as H.323, SIP, or Skinny, you can disable per-session PAT by creating a per-session deny rule.

### Some Features of the Per-Session NAT Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in [Using Rules Tables, page 12-8](#). For example, you can move, show and hide columns; you can re-order the rules; and you can right-click certain table cells to edit that parameter.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important.

### Related Topics

- [Add and Edit Per Session NAT Rule Dialog Boxes, page 24-48](#)
- [NAT Policies on Security Devices, page 24-15](#)
- [About "Simplified" NAT on ASA 8.3+ Devices, page 24-4](#)
- Standard rules table topics:
  - [Using Rules Tables, page 12-8](#)
  - [Filtering Tables, page 1-48](#)
  - [Table Columns and Column Heading Features, page 1-49](#)

### Navigation Path

- (Device view) Select **NAT > Per-Session NAT Rules** from the Device Policy selector.

- (Policy view) Select **NAT (PIX/ASA/FWSM) > Per-Session NAT Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Per-Session NAT Rules page is displayed.

### Adding, Editing and Deleting Rules

To **add** a per-session NAT rule:

1. Select the rule under which the rule is to be added. If you do not select a heading, the rule will be added to the end of the table by default.
2. Open the Add Per-Session NAT Rule dialog box: either click the **Add Row** button at the bottom of the table, or right-click anywhere in the table and choose **Add Row** from the pop-up menu.
3. Define the rule and then click **OK** to close the dialog box, adding the rule to the table.

See [Add and Edit Per Session NAT Rule Dialog Boxes, page 24-48](#) for a complete description of the Add Per-Session NAT Rule dialog box.

To **edit** a per-session NAT rule:

1. Open the Edit Per-Session NAT Rule dialog box for the desired rule: either select the rule in the Per-Session NAT rules table and then click the **Edit Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Edit Row** from the pop-up menu.
2. Edit the rule and then click **OK** to close the dialog box.

See [Add and Edit Per Session NAT Rule Dialog Boxes, page 24-48](#) for a complete description of the Edit Per-Session NAT Rule dialog box.

To **delete** a per-session NAT rule, select the rule in the table and click the **Delete Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Delete Row** from the pop-up menu.

### Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

## Add and Edit Per Session NAT Rule Dialog Boxes

By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. To use multi-session PAT for traffic, you can configure per-session PAT rules: a permit rule uses per-session PAT, and a deny rule uses multi-session PAT.

For more information about per-session vs. multi-session PAT, see [Per-Session NAT Rules: ASA 9.0\(1\)+](#).

### Defaults

By default, the following rules are installed:

- Permit TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)

- Permit UDP from any (IPv4 and IPv6) to domain

These rules do not appear in the rule table.

#### Note

You cannot remove these rules, and they always exist after any manually-created rules. Because rules are evaluated in order, you can override the default rules. For example, to completely negate these rules, you could add the following:

```
Deny TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)
Deny UDP from any (IPv4 and IPv6) to domain
```

#### Navigation Path

From the [Per-Session NAT Rules: ASA 9.0\(1\)+](#) page, do one of the following:

- To add a rule, select the rule under which you want the rule added, and then click the **Add Row** button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add Per-Session NAT Rule dialog box.
- To edit a rule, select the rule and click the **Edit Row** button, or simply right-click the rule and choose **Edit Row** to open the Edit Per-Session NAT Rule dialog box for that rule.

## **PART 3**

### **VPN Configuration**

## Managing Site-to-Site VPNs: The Basics

---

A virtual private network (VPN) consists of multiple remote peers transmitting private data securely to one another over an unsecured network, such as the Internet. Site-to-site VPNs use tunnels to encapsulate data packets within normal IP packets for forwarding over IP-based networks, using encryption to ensure privacy and authentication to ensure integrity of data.

In Cisco Security Manager, site-to-site VPNs are implemented based on IPsec policies that are assigned to VPN topologies. An IPsec policy is a set of parameters that define the characteristics of the site-to-site VPN, such as the security protocols and algorithms that will be used to secure traffic in an IPsec tunnel. Security Manager translates IPsec policies into CLI commands that can be deployed to the devices in the VPN topology. Several policy types might be required to define a full configuration image that can be assigned to a VPN topology, depending on the IPsec technology type.

The Site-to-Site VPN Manager defines and configures site-to-site VPN topologies and policies on Cisco IOS security routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) firewall devices.

**Tip**

---

In ASA documentation, site-to-site VPNs are called LAN-to-LAN VPNs. These phrases are equivalent, and we use “site-to-site VPN” in this documentation.

---

You can access the Site-to-Site VPN Manager by selecting **Manage > Site-To-Site VPNs** or clicking the Site-To-Site VPN Manager button on the toolbar.

You can also configure shared policies in Policy view and view and configure topologies in Device view. In Policy View, you can assign IPsec policies to VPN topologies.

This chapter contains the following topics:

- [Understanding VPN Topologies, page 25-2](#)
- [Understanding IPsec Technologies and Policies, page 25-5](#)

- [Deleting a VPN Topology, page 25-71](#)

## Understanding VPN Topologies

A VPN topology specifies the peers and the networks that are part of the VPN and how they connect to one another. After you create a VPN topology, the policies that can be applied to your VPN topology become available for configuration, depending on the assigned IPsec technology.

Security Manager supports three main types of topologies—hub and spoke, point to point, and full mesh, with which you can create a site-to-site VPN. Not all policies can be applied to all VPN topologies. The policies that can be applied depend on the IPsec technology that is assigned to the VPN topology. In addition, the IPsec technology that is assigned to a VPN depends on the topology type. For example, the DMVPN and Easy VPN technologies can only be applied in a hub-and-spoke topology.

For more information, see [Understanding IPsec Technologies and Policies, page 25-5](#).

The following topics describe:

- [Hub-and-Spoke VPN Topologies, page 25-2](#)
- [Point-to-Point VPN Topologies, page 25-3](#)
- [Full Mesh VPN Topologies, page 25-4](#)
- [Implicitly Supported Topologies, page 25-5](#)

## Hub-and-Spoke VPN Topologies

In a hub-and-spoke VPN topology, multiple remote devices (spokes) communicate securely with a central device (hub). A separate, secured tunnel extends between the hub and each individual spoke.

The following illustration shows a typical hub-and-spoke VPN topology.

**Figure 25-1** Hub-and-Spoke VPN Topology

This topology usually represents an intranet VPN that connects an enterprise's main office with branch offices using persistent connections to a third-party network or the Internet. VPNs in a hub-and-spoke topology provide all employees with full access to the enterprise network, regardless of the size, number, or location of its remote operations.

A hub is generally located at an enterprise's main office. Spoke devices are generally located at an enterprise's branch offices. In a hub-and-spoke topology, most traffic is initiated by hosts at the spoke site, but some traffic might be initiated from the central site to the spokes.

If the hub in a hub-and-spoke configuration becomes unavailable for any reason, IPsec failover transfers tunnel connections seamlessly to a failover (backup) hub, which is used by all spokes. You can configure multiple failover hubs for a single primary hub.

In a hub-and-spoke VPN topology, all IPsec technology types can be assigned except GET VPN.

- [Implicitly Supported Topologies, page 25-5](#)
- [Creating or Editing VPN Topologies, page 25-28](#)
- [Chapter 26, “Configuring IKE and IPsec Policies”](#)

## Point-to-Point VPN Topologies

In a point-to-point VPN topology, two devices communicate directly with each other, without the option of IPsec failover as in a hub-and-spoke configuration. To establish a point-to-point VPN topology, you specify two endpoints as peer devices. Because either of the two devices can initiate the connection, the assigned IPsec technology type can be only regular IPsec or IPsec/GRE.

In Security Manager, you can configure a special type of regular IPsec point-to-point VPN called an Extranet. An Extranet VPN is a connection between a device in your managed network and an unmanaged device, such as a router in your service provider's network, a non-Cisco device, or simply a device in your network that is being managed by a different group (that is, one that does not appear in the Security Manager inventory).

The following illustration shows a typical point-to-point VPN topology.

**Figure 25-2** Point-to-Point VPN Topology

- [Creating or Editing Extranet VPNs, page 25-66](#)
- [Chapter 26, “Configuring IKE and IPsec Policies”](#)

## Full Mesh VPN Topologies

A full mesh topology works well in a complicated network where all peers need to communicate with each other. In this topology type, every device in the network communicates with every other device through a unique IPsec tunnel. All devices have direct peer relationships with one another, preventing a bottleneck at the VPN gateway device, and saving the overhead of encryption and decryption on the device.

You can assign only Regular IPsec, IPsec/GRE, and GET VPN technologies to a full mesh VPN topology.

The following illustration shows a typical full mesh VPN topology.

**Figure 25-3** Full Mesh VPN Topology

A full mesh network is reliable and offers redundancy. When the assigned technology is GRE and one device (or node) can no longer operate, all the rest can still communicate with one another, directly or through one or more intermediate nodes. With regular IPsec, if one device can no longer operate, a crypto access control list (ACL) that specifies the protected networks, is created per two peers.

GET VPN is based on the group trust model. In this model, group members register with a key server. The key server uses the Group Domain of Interpretation (GDOI) protocol for distributing the security policy and keys for encrypting traffic between the group members. Because you can configure a primary key server and secondary key servers that synchronize their policies with the primary one, if the primary key server becomes unavailable, a secondary key server can take over.

### Note

When the number of nodes in a full mesh topology increases, scalability may become an issue—the limiting factor being the number of tunnels that the devices can support at a reasonable CPU utilization.

- [Implicitly Supported Topologies, page 25-5](#)
- [Creating or Editing VPN Topologies, page 25-28](#)
- [Chapter 26, “Configuring IKE and IPsec Policies”](#)

## Implicitly Supported Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- **Partial mesh**—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are generally used in peripheral networks that connect to a fully meshed backbone.
- **Tiered hub-and-spoke**—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.
- **Joined hub-and-spoke**—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.

## Understanding IPsec Technologies and Policies

Security Manager provides seven types of IPsec technologies that you can configure on the devices in your site-to-site VPN topology—Regular IPsec, IPsec/GRE, GRE Dynamic IP, standard and large scale DMVPN, Easy VPN, and GET VPN. The assigned technology determines which policies you can configure for the VPN.

You assign an IPsec technology to a VPN topology during its creation. After an IPsec technology is assigned to a VPN topology, you cannot change the technology, other than by deleting the VPN topology and creating a new one. See [Defining the Name and IPsec Technology of a VPN Topology, page 25-30](#).

The following topics explain some basic concepts about IPsec technologies and site-to-site VPN policies:

- [Understanding Mandatory and Optional Policies for Site-to-Site VPNs, page 25-6](#)
- [Overview of Site-to-Site VPN Policies, page 25-8](#)
- [Understanding Devices Supported by Each IPsec Technology, page 25-9](#)

- [Including Unmanaged or Non-Cisco Devices in a VPN](#), page 25-11
- [Understanding and Configuring VPN Default Policies](#), page 25-12
- [Using Device Overrides to Customize VPN Policies](#), page 25-13
- [Understanding VRF-Aware IPsec](#), page 25-14

## Understanding Mandatory and Optional Policies for Site-to-Site VPNs

Some site-to-site VPN policies are mandatory, which means that you must configure them to create a VPN topology or to save your changes when editing them. Most mandatory policies have predefined defaults, which you can use to complete the definition of a VPN topology, but you typically must edit the policies to ensure their settings work for your network.

Optional policies, which you need to configure only if you desire the services defined by the policy, do not come with predefined defaults.

**Tip**

You can configure your own mandatory policy defaults by creating shared policies that specify the desired settings, and then by selecting these shared policies when creating a VPN. You can even make the shared policies the defaults for the Create VPN wizard. However, these default policies do not apply when you create Extranet VPNs; with Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow. In addition, you cannot create a default policy for IKEv2 Authentication. For more information, see [Understanding and Configuring VPN Default Policies](#), page 25-12.

Some mandatory policies are mandatory only under certain conditions. For example, an IKEv1 preshared key policy is mandatory only if the default (mandatory) IKEv1 proposal uses preshared key authentication. If the selected IKE authentication method is Certificate (RSA Signature), an IKEv1 Public Key Infrastructure policy is mandatory (see [Deciding Which Authentication Method to Use](#), page 26-8). If you allow IKEv2 negotiations in the topology, an IKEv2 Authentication policy is mandatory.

The following table lists the mandatory and optional policies for each predefined technology that you can assign to the devices in your site-to-site VPN topology.

**Table 25-1** Site-to-Site VPN IPsec Technologies and Policies

| Technology                                                                                             | Mandatory Policies                                                                                                                                                                                                                             | Optional Policies                                                       |

## Overview of Site-to-Site VPN Policies

You can access site-to-site VPN policies by selecting **Manage > Site-To-Site VPNs**, or by clicking the **Site-To-Site VPN Manager** button on the toolbar, and then selecting the required policy in the Policies selector of the Site-to-Site VPN window. You can also access site-to-site VPN policies from Device view or Policy view. For more information, see [Accessing Site-to-Site VPN Topologies and Policies, page 25-17](#).

The following is a summary of all of the site-to-site VPN policies, some of which you cannot create as shared policies. Note that some of these policies are documented in the sections that explain remote access VPNs, because the policies are used for both remote access and site-to-site VPNs. However, you must configure these policies separately for each type of VPN.

## Understanding Devices Supported by Each IPsec Technology

Each IPsec technology supports different devices as members of their topology. The following table describes the basic device support. These requirements are enforced when you select devices for a VPN; in some cases, the device lists are filtered to show only supported devices. In other cases, a device might be supported in one role (for example, as a spoke), but not supported in another role; in these cases, you can select the wrong device type, but you are prevented from saving the change (a message will explain the specific problem).

Tip

Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

**Table 25-2** *Devices Supported by Each IPsec Technology*

| Technology                                                                              | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regular IPsec<br>See <a href="#">Chapter 26, “Configuring IKE and IPsec Policies”</a> . | Regular IPsec policies can be configured on Cisco IOS security routers (including Aggregation Service Routers, or ASRs), PIX Firewalls, and ASA 5500 series devices. Except for Extranet VPNs, Catalyst VPN service modules are also supported.<br><br>IKEv2 is supported on ASA release 8.4(x) only. If you limit the topology to IKEv2 only, all devices must support IKEv2. If you allow both IKEv1 and IKEv2, devices that do not support IKEv2 automatically use IKEv1. |

**Table 25-2** *Devices Supported by Each IPsec Technology (continued)*

| Technology                                                                                                                                                                            | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Including Unmanaged or Non-Cisco Devices in a VPN

Your VPN might include devices that you cannot, or should not, manage in Security Manager. These include:

- Cisco devices that Security Manager supports, but for which your organization is not responsible. For example, you might have a VPN that includes spokes in networks managed by other organizations within your company, or a connection to a service provider or partner network.
- Non-Cisco devices. You cannot use Security Manager to create and deploy configurations to non-Cisco devices.

You have two options for handling these kinds of devices:

- If the connection is a regular IPsec point-to-point connection, you can configure the connection as an Extranet VPN as described in [Creating or Editing Extranet VPNs, page 25-66](#).
- For other types of connections, you can include these devices in the Security Manager inventory as “unmanaged” devices. These devices can serve as endpoints in a VPN topology, but Security Manager does not discover any configurations from the device, nor does it deploy configurations to them.

When the Extranet VPN option will not work, you must do the following before you can add an unmanaged device to a VPN topology:

- Manually add the device as an unmanaged device to the device inventory using the procedure described in [Adding Devices by Manual Definition, page 3-26](#). Ensure that you make the following selections:
  - Select a Cisco device type that is comparable to the device you are adding in terms of VPN-supported technologies. The device type controls the types of VPN topologies to which you can add the device. For example, for GRE/DMVPN, you might select an integrated services router such as an 1800 or 2800 series, whereas in Easy VPN you could also select an ASA or PIX device if appropriate.
  - Deselect the **Manage in Cisco Security Manager** option. This is very important, because the default is to make all new devices managed devices. If you forget to do this while adding the device, you can deselect the option later on the General tab in the device properties (right-click the device and select **Device Properties**).
- Using the interface policy for the device, define the external VPN interface to which managed devices will point. Because the device is unmanaged, your definitions in this policy are never configured on the device; the policy simply represents what you have configured on the device outside of Security Manager.

## Understanding and Configuring VPN Default Policies

For most VPN policies that are mandatory, Security Manager includes “factory default” settings for the policies. These defaults are generic, and might not be appropriate for your network, but they do allow you to complete the creation of a VPN without having to stop and start over when you do not have the needed shared policy configured. Therefore, you can, and should, create your own default VPN policies for mandatory policies. You can also create defaults for certain optional policies.

Before configuring new defaults, consider the types of VPNs you are likely to configure, then review the types of policies for which you can create defaults. Select **Tools > Security Manager Administration**, then select **VPN Policy Defaults** from the table of contents. Select the tabs for the desired IPsec technologies to see which policies are available. If a policy is assigned Factory Default, or if this option is available from the drop-down list, the policy is mandatory; other policies are optional. You can also create default policies for remote access VPNs, and for site-to-site endpoint configurations. Click the **View Content** button next to a selected policy to see the policy definition.

The following procedure explains how to create and use VPN policy defaults.

### Tips

- When you configure VPN default policies, you are selecting shared policies. Although you can configure only one default per policy per IPsec technology, users can select different shared policies when configuring VPNs. Thus, you might want to configure more than one shared policy that users can select, and configure the most commonly-used policy as the default policy. For more information about how users can select different policies when configuring a VPN, see [Assigning Initial Policies \(Defaults\) to a New VPN Topology, page 25-62](#).
- Although the IKEv2 Authentication policy is a mandatory policy for topologies that allow IKEv2 negotiations, there are no IKEv2 Authentication factory default settings, and you cannot create IKEv2 Authentication shared policies. Therefore, whenever you allow IKEv2 in a topology, you must manually configure the IKEv2 Authentication policy before the topology is valid.
- The Public Key Infrastructure policy is required for IKEv1 if you configure the IKE Proposal policy to use certificate authentication. However, there are no factory default settings for this policy, so if you intend to use certificate authentication for IKEv1, consider creating default Public Key Infrastructure policies.
- Keep in mind that any change to a shared policy affects all VPNs that are using the policy. This can make it easy to implement across-the-board changes that are required for every VPN. However, after creating the VPN, the user can switch from a shared policy to a local policy, so that any changes to the configuration must be done specifically for the VPN topology. For more information about shared policies, see [Managing Shared Policies in Policy View, page 5-50](#).
- These default policies do not apply when you create Extranet VPNs. With Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow.

- 
- Step 1** Create the default policies. All default policies are shared policies.
- In Policy view (select **View > Policy View**), select the policy for which you want to configure defaults. The policies are in the **Site-to-Site VPN** or **Remote Access VPN** folders.
  - Click the **Create a Policy (+)** button at the bottom of the shared policy selector, enter a name for the policy, and click **OK**.
  - Configure the desired settings. Click the **Help (?)** button in the toolbar to get reference information about the settings available in the selected policy.
  - Repeat the process until you have created at least one shared policy for each policy for which you want to define a default policy.

- Step 2** If desired, create defaults for the VPN endpoints. These defaults are interface role objects, which identify the interface names used for VPN connections (for example, GigabitEthernet0/1). Create separate roles for internal and external VPN interfaces.
- Select **Manage > Policy Objects** to open the [Policy Object Manager, page 6-4](#).
  - Select **Interface Roles** from the table of contents.
  - Click the **New Object (+)** button, enter the interface name patterns that identify the most commonly used interfaces for VPN internal or external interfaces in your network, and click **OK**.  
For more information about interface roles and the wildcards you can use to configure them, see [Understanding Interface Role Objects, page 6-73](#) and [Creating Interface Role Objects, page 6-74](#).
- Step 3** Submit the policies and policy objects to the database. You will have to resolve any validation errors.
- In non-Workflow mode, select **File > Submit**.
  - In Workflow mode without an activity approver, select **Activities > Approve Activity**.
  - In Workflow mode with an activity approver, select **Activities > Submit Activity**. You will have to wait for the activity to be approved before you can select the policies and objects as defaults.
- Step 4** Select your newly-configured policies and policy objects as VPN policy defaults.
- Select **Tools > Security Manager Administration**, and then select **VPN Policy Defaults** from the table of contents (see [VPN Policy Defaults Page, page 11-74](#)).
  - Select the desired tabs, then select the policies you configured from the drop-down lists for each of the mandatory or optional policies for which you configured defaults.  
On the S2S Endpoints tab, select the appropriate interface role objects.
  - Click **Save** to save your defaults.  
The next time a user runs the Create VPN wizard, the defaults you selected will be used as the wizard's defaults. Users can select any other shared policy or interface role to override the default.
- 

## Using Device Overrides to Customize VPN Policies

Many VPN policies use Security Manager policy objects in their configuration. Policy objects are containers that allow you to create reusable configurations.

Because a VPN policy applies to every device in a VPN topology, you might need to make modifications to a policy object used in a policy for certain devices within the VPN topology. There might even be situations where you need to make modifications for all devices within a topology. You accomplish these modifications with device-level overrides on the policy objects.

For example, when defining a PKI policy, you need to select a PKI enrollment object. If the hub of your VPN uses a different CA server than the spokes, you must use device-level overrides to specify the CA server used by the hub. Although the PKI policy references a single PKI enrollment object, the actual CA server represented by this object differs for the hub, based on the device-level override you define.

To enable a policy object to be overridden, you must select the **Allow Override per Device** option in the policy object definition. You can then create device-level overrides. For more information about overriding a VPN policy object at the device level, see the following topics:

- [Understanding Policy Object Overrides for Individual Devices, page 6-18](#)
- [Allowing a Policy Object to Be Overridden, page 6-18](#)
- [Creating or Editing Object Overrides for a Single Device, page 6-19](#)

- [Creating or Editing Object Overrides for Multiple Devices At A Time](#), page 6-19

## Understanding VRF-Aware IPsec

One obstacle to successfully deploying peer-to-peer VPNs is the separation of routing tables, and the use of overlapping addresses, which usually results from using private IP addresses in customer networks. The VRF-Aware IPsec feature, which introduces IPsec tunnel mapping to Multiprotocol Label Switching (MPLS) VPNs, solves this problem.

The VRF-Aware IPsec feature enables you to map IPsec tunnels to Virtual Routing Forwarding (VRF) instances, using a single public-facing address. A VRF instance defines the VPN membership of a customer site attached to the Provider Edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A set of routing and CEF tables is maintained for each VPN customer across the MPLS/VPN network.

Since each VPN has its own routing and forwarding table in the router, any customer or site that belongs to a VPN is provided access only to the set of routes contained within that table. Any PE router maintains a number of routing tables and a global routing table per VPN, which can be used to reach other routers in the provider network. Effectively, a number of virtual routers are created in a single physical router. Across the MPLS core to the other PE routers, this routing separation is maintained by adding unique VPN identifiers, such as the route distinguisher (RD).

### Note

VRF-Aware IPsec can also be configured on devices in a remote access VPN. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\)](#), page 33-7.

In Security Manager, you can configure VRF-Aware IPsec in your hub-and spoke VPN topology, with either a single device providing all functionality (“one-box” solution) or with multiple devices, each providing a part of the functionality (“two-box” solution). The solution of one device providing all the functionality can affect performance by overloading the system, whereas separating the functionality in a two-box solution provides better scaling for each function.

The following topics describe:

- [VRF-Aware IPsec One-Box Solution](#), page 25-14
- [VRF-Aware IPsec Two-Box Solution](#), page 25-15
- [Enabling and Disabling VRF on Catalyst Switches and 7600 Devices](#), page 25-17

For information on configuring VRF-aware IPsec, see [Configuring VRF Aware IPsec Settings](#), page 25-48.

## VRF-Aware IPsec One-Box Solution

In the one-box solution, IPsec tunnels terminate on a Cisco IOS router, which serves as the Provider Edge (PE) device. The PE device maps these tunnels to the appropriate MPLS/VPN network and serves as the IPsec Aggregator, by performing IPsec encryption and decryption from the Customer Edge (CE) devices.

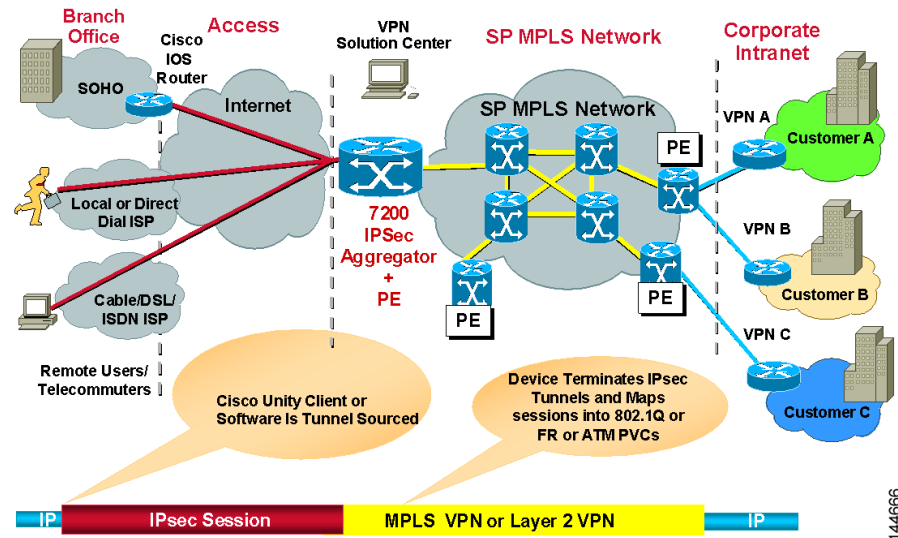

### Note

The configuration of routing between the PE device and the MPLS cloud is done by Cisco IP Solution Center. See the [Cisco IP Solution Center MPLS VPN User Guide](#).

The following illustration shows the topology of a one-box solution.

**Figure 25-4 VRF-Aware IPsec One-Box Solution**

#### Related Topics

- [Understanding VRF-Aware IPsec, page 25-14](#)
- [Configuring VRF Aware IPsec Settings, page 25-48](#)
- [Defining the Endpoints and Protected Networks, page 25-34](#)

## VRF-Aware IPsec Two-Box Solution

In the two-box solution, the PE device does just the MPLS mapping, while a separate IPsec Aggregator device does the IPsec encryption and decryption from the CEs.

#### Note

Security Manager fully manages the IPsec Aggregator, including routing to the PE device. The PE device is fully managed by Cisco IP Solution Center. This includes routing between the PE device and the MPLS cloud, and routing from the PE to the IPsec Aggregator. For more information, see the [Cisco IP Solution Center MPLS VPN User Guide](#).

The following illustration shows the topology of a two-box solution.

Figure 25-5 VRF-Aware IPsec Two-Box Solution

Using the two-box solution, you configure VRF-Aware IPsec on devices in your VPN topology, as follows:

1. Configure the connection between the IPsec Aggregator and the PE device.

Create a hub-and-spoke VPN topology and assign an IPsec technology to it. In this topology, the hub is the IPsec Aggregator, and the spokes may be Cisco IOS routers, PIX Firewalls, Catalyst VPN service modules, or Adaptive Security Appliance (ASA) devices. The IPsec Aggregator may be a security router or a Catalyst VPN service module. You then define the VRF parameters (VRF name and unique routing identifier) on the hub.

**Note** VRF-Aware IPsec supports the configuration of IPsec, GRE, or Easy VPN technologies on Cisco IOS routers and Catalyst VPN service modules. DMVPN is also supported, but only on Cisco IOS routers.

2. Specify the VRF forwarding interface (or VLAN for a Catalyst VPN service module) between the IPsec Aggregator and the PE device.
3. Define the routing protocol and autonomous system (AS) number to be used between the IPsec Aggregator and the PE. Available routing protocols include BGP, EIGRP, OSPF, RIPv2, and Static Route.

If the routing protocol defined between the IPsec Aggregator and the PE differs from the routing protocol used for the secured IGP, routing is redistributed to the secured IGP, using this routing protocol and AS number. Routing is also redistributed from the secured IGP to the PE.

**Note** Redistributing the routing is only relevant when IPsec/GRE or DMVPN is the selected technology.

## Enabling and Disabling VRF on Catalyst Switches and 7600 Devices

### Note

From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, it does not support any enhancements as Cisco Catalyst switches is now End of Life.

Deployment fails when you change the virtual routing and forwarding (VRF) mode on the Catalyst switches and 7600 hub of an existing site-to-site VPN. For example, if you initially configured VRF in the Create VPN wizard and deployed, but later return to the Peers policy and deselect the Enable VRF Settings check box, deployment fails. (This setting is found in the VRF Aware IPsec tab of the Edit Endpoints dialog box; see [Configuring VRF Aware IPsec Settings, page 25-48](#).) Deployment likewise fails if you try to enable VRF on a VPN that was not initially configured with it.

You cannot change the VRF mode on a Catalyst 6500/7600 during VPN operation. This restriction applies only to Catalyst 6500/7600 hubs, not to any other device type.

This restriction does not apply to changes made to the VRF settings themselves. For example, if VRF is configured on the VPN topology, you can return to the Peers policy and change the VRF name or route distinguisher.

If you need to change the VRF mode of a VPN, and you are using Catalyst 6500/7600 devices as hubs, use the following procedure.

### Related topics

- [Understanding VRF-Aware IPsec, page 25-14](#)
- [VRF-Aware IPsec One-Box Solution, page 25-14](#)
- [VRF-Aware IPsec Two-Box Solution, page 25-15](#)

- 
- Step 1** Delete the VPN topology from Security Manager.
- Step 2** Deploy your changes.
- Step 3** Reload (restart) the Catalyst 6500/7600 device.
- Step 4** Right-click the device in Security Manager and select **Discover Policies on Device**. Perform a complete policy rediscovery.
- Step 5** Open the Create VPN wizard and redefine the VPN topology. At this point, you can select a different VRF mode. See [Configuring VRF Aware IPsec Settings, page 25-48](#) and [Creating or Editing VPN Topologies, page 25-28](#).
- 

## Accessing Site-to-Site VPN Topologies and Policies

You can use the following methods to access and configure site-to-site VPN topologies and policies:

- **Site-to-Site VPN Manager**—This is the main tool for configuring VPN topologies. You can view a list of all site-to-site VPNs configured in Security Manager and edit their configurations and policies, including device membership. For information on using this tool, see [Site-to-Site VPN Manager Window, page 25-18](#).

- **Site-to-Site VPN policy in Device view**—When you select a device in device view, you can select the Site-to-Site VPN policy in the Policies selector to see a list of all site-to-site VPNs in which the device participates and edit those topologies. You can also create new VPNs, or select a VPN and open the Site-to-Site VPN Manager to edit the policies for the selected VPN. This device view policy is essentially a short-cut into the Site-to-Site VPN Manager. For more information about using this policy, see [Configuring VPN Topologies in Device View, page 25-19](#).
- **Site-to-Site VPN folder in Policy view**—Policy view is used to create shared policies. Many of the site-to-site VPN policies are shareable. Thus, you can configure shared policies that you can assign to more than one VPN topology while configuring the topology in the Site-to-Site VPN Manager. You can configure shared policies as defaults for the Create VPN wizard, as described in [Understanding and Configuring VPN Default Policies, page 25-12](#).

You can also create shared policies from the Site-to-Site VPN Manager window in much the same way you can create them from local policies in Device view, although all sharing commands in the Site-to-Site VPN Manager window are available only on the right-click context menu (when right-clicking a shareable policy).

For more information on creating shared policies in Policy view, see [Managing Shared Policies in Policy View, page 5-50](#).

## Site-to-Site VPN Manager Window

The Site-to-Site VPN Manager lists all site-to-site VPNs configured in Security Manager. The VPNs selector, in the upper left pane of the window, lists all existing VPN topologies (see [Understanding VPN Topologies, page 25-2](#)). An icon indicates the type of VPN (hub and spoke, point to point, or full mesh). To view or edit a topology, select it, and its policies are loaded into the policy selector in the lower left pane. Select a policy to see its definition in the right pane.

To open the Site-to-Site VPN Manager, click the **Site-To-Site VPN Manager** button on the toolbar or select **Manage > Site-To-Site VPNs**.

Use the Site-to-Site VPN Manager window to:

- Create, edit, and delete VPN topologies.
  - To create a VPN topology, click the **Create VPN Topology (+)** button above the VPN selector and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see [Creating or Editing VPN Topologies, page 25-28](#) or [Creating or Editing Extranet VPNs, page 25-66](#).
  - To edit a VPN topology, select it and click the **Edit VPN Topology (pencil)** button, or right-click it and select **Edit**. This opens the Edit VPN or Edit Extranet VPN dialog box, which contains the most of the same pages as the Create VPN wizard in a tabbed layout.
  - To delete a VPN topology, select it and click the **Delete VPN Topology (trash can)** icon, or right-click it and select **Delete**. You are asked to confirm the deletion. See [Deleting a VPN Topology, page 25-71](#).
- View detailed information about each VPN topology; select the topology, then select the VPN Summary policy. See [Viewing a Summary of a VPN Topology's Configuration, page 25-63](#).
- View and configure the endpoints defined for a VPN topology. You can see endpoints on the Endpoints tab or when editing a VPN topology, or by selecting the **Peers** policy. For GET VPN topologies, there is no Peers policy; instead, use the **Key Servers** and **Group Members** policies to view and configure endpoints. For Extranet VPNs, the endpoints are on the Device Selection tab when editing the VPN, or also in the Peers policy.

- View and edit the policies assigned to a VPN topology, assign shared policies, or create shared policies from existing policies. For information on individual policies, see [Overview of Site-to-Site VPN Policies, page 25-8](#).

The options and methods for configuring shared policies from the Site-to-Site VPN Manager are the same as those from Device view, as explained in the sections under [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-37](#) and [Using the Policy Banner, page 5-38](#). You can share, assign, unassign, edit assignments, and rename policies, but no VPN policies allow inheritance. To perform these tasks, select the VPN topology, then right-click the desired policy and select the desired command.

You can also use Policy view to configure shared VPN policies.

## Configuring VPN Topologies in Device View

Use the Site-to-Site VPN Device view policy to view and edit the site-to-site VPN topologies to which a device belongs, if any. You can edit the VPN policies and change whether the device participates in the topology. You can also create new VPN topologies.

This policy is essentially an access point for the Site-to-Site VPN Manager (see [Site-to-Site VPN Manager Window, page 25-18](#)).

To open this policy, in Device view, select the desired device and then select **Site-to-Site VPN** from the Policy selector.

The VPN topologies table lists all of the site-to-site VPNs to which this device belongs. Information includes the type of VPN, its name, IPsec technology, and description. Beginning with version 4.9, Security Manager also displays the Last Modified Ticket information for the VPN topologies. The VPN topologies that have been created or edited using the Ticket Management system will have the last Modified Ticket ID information available on this page. You can also filter the VPN topologies by the Last Modified Ticket ID.

- To add a VPN, click the **Create VPN Topology** button, or right-click in the table and select **Create VPN Topology** and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see [Creating or Editing VPN Topologies, page 25-28](#) or [Creating or Editing Extranet VPNs, page 25-66](#).
- To edit a VPN, select it and click the **Edit VPN Topology** button, right-click the VPN and select **Edit VPN Topology**, or simply double-click the entry. This opens the Edit VPN or Edit Extranet VPN dialog box, which is a tabbed version of the Create VPN wizard (see [Creating or Editing VPN Topologies, page 25-28](#) or [Creating or Editing Extranet VPNs, page 25-66](#)).
- To edit the policies for a VPN, select it and click the **Edit VPN Policies** button. The Site-to-Site VPN Window opens displaying information about the VPN topology; select the desired policy from the Policies selector to edit it.
- To delete a VPN, select it and click the **Delete VPN Topology** button, or right-click the VPN and select **Delete VPN Topology**. You are asked to confirm the deletion. For more information, see [Deleting a VPN Topology, page 25-71](#).

# Site-To-Site VPN Discovery

You can discover the VPN topologies that are already deployed in your network so that you can use Security Manager to manage them. Your VPN configurations are brought into Security Manager and displayed as site-to-site VPN policies.

Except for Extranet VPNs, you can also rediscover the configurations of existing VPN topologies that are already managed with Security Manager. For information about Site-to-Site VPN rediscovery, see [Rediscovering Site-to-Site VPNs, page 25-27](#).

## Note

You can also discover configurations on devices in remote access VPNs that are already deployed in your network. See [Discovering Remote Access VPN Policies, page 30-12](#).

These topics provide information about Site-to-Site VPN discovery:

- [Supported and Unsupported Technologies and Topologies for VPN Discovery, page 25-20](#)
- [Prerequisites for VPN Discovery, page 25-21](#)
- [VPN Discovery Rules, page 25-22](#)
- [Discovering Site-to-Site VPNs, page 25-24](#)
- [Defining or Repairing Discovered VPNs with Multiple Spoke Definitions, page 25-26](#)
- [Rediscovering Site-to-Site VPNs, page 25-27](#)

## Supported and Unsupported Technologies and Topologies for VPN Discovery

This topic lists the technologies and topologies that Security Manager can discover, as well as the VPN features that are provisioned by Security Manager but cannot be discovered.

### Supported Technologies for VPN Discovery

- IPsec, including LAN-to-LAN configurations on ASA devices.
- IPsec + GRE
- IPsec + GRE dynamic IP
- DMVPN
- Easy VPN
- GET VPN

### Supported Topologies for VPN Discovery

- Point to point
- Hub and spoke
- Full mesh
- Extranet VPN (point-to-point to an unmanaged device)

### VPN Features Provisioned by Security Manager but Unsupported for VPN Discovery

- Large Scale DMVPN with IPsec Terminator (high-concentration hub)
- VRF-Aware IPsec

- Dial backup
- IPsec and ISAKMP profiles for Easy VPN
- Easy VPN with High Availability

If you define and deploy policies of these types using Security Manager, your policies overwrite the device configurations that were not discovered. Therefore, if you want Security Manager to manage existing configurations, you should define policies that match the existing configurations as closely as possible. (Use **Tools > Preview Configuration** to examine the results before deploying.) The VPN provisioning mechanism leverages the content of the existing configuration as much as possible (assuming the content matches the policies configured in Security Manager), but does not retain the naming conventions used in the CLI commands.

## Prerequisites for VPN Discovery

For successful VPN discovery, the following prerequisites must be met:

- Except for Extranet VPNs, all devices participating in the VPN must be added to the Security Manager inventory.
- You must provide Security Manager with some basic information about the VPN. The VPN discovery wizard prompts you for the following information:
  - VPN topology (hub and spoke, point to point, full mesh, Extranet).
  - VPN technology (Regular IPsec, IPsec/GRE, GRE dynamic IP, DMVPN, Easy VPN, GET VPN).
  - Devices in the VPN and their roles (hub/spoke). For Extranet VPNs, you specify the managed device only.
  - Source of the VPN configuration. The VPN can be discovered directly from the live network or from Security Manager's Configuration Archive.
- Each device in the VPN must have a crypto map associated with a physical interface. This rule does not apply to the remote (unmanaged) devices in an Extranet VPN.
- If you use OSPF as your routing protocol in a VPN topology, all devices in the VPN must use the same OSPF process number.
- Each PIX 6.3 or ASA 5505 client device in an Easy VPN topology must have a vpnclient configuration.

## VPN Discovery Rules

The following table describes the rules by which Security Manager translates and discovers your VPN configurations, and how it handles instances where your configuration on the device does not match what is supported by Security Manager.

**Tip**

Because Extranet VPN discovery involves the analysis of a single device (the managed device), most of these rules do not apply to Extranet VPN discovery. Any rule that involves consistency of values among devices in the VPN is not applicable.

**Table 25-3** VPN Discovery Rules

| If this condition exists:                                                      | The VPN discovery is handled as follows:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Manager cannot contact a device in the VPN for live device discovery. | <ul style="list-style-type: none"> <li>• If the device is the only hub or spoke in the VPN, discovery fails.</li> <li>• If there are other hubs or spokes in the VPN, discovery proceeds but the unavailable device is not discovered.</li> <li>• Except for Extranet VPNs, if the device is a peer in a point-to-point topology, discovery fails. For Extranet VPNs, only the managed device is contacted, and discovery fails if it cannot be contacted.</li> <li>• If the device is a peer in a full mesh topology and there are only two devices, including the unavailable one, in the topology, discovery fails. If there are more than two devices, discovery proceeds but the unavailable device is not discovered.</li> </ul> |
| The VPN is a LAN-to-LAN VPN on an ASA.                                         | <p>The ASA documentation uses “LAN-to-LAN” as a synonym for “site-to-site.” In a LAN-to-LAN VPN configuration, the ASA uses tunnel groups, which when used in a remote access VPN configuration, Security Manager discovers as connection profiles.</p> <p>When discovering site-to-site VPNs on an ASA that uses LAN-to-LAN (L2L) tunnel groups, Security Manager creates a site-to-site VPN topology, and the L2L tunnel groups are not presented to you as connection profiles. Instead, you edit the properties of the VPN topology, and during deployment, Security Manager will translate the configuration into the appropriate L2L tunnel group commands.</p>                                                                  |

**Table 25-3** VPN Discovery Rules (continued)

| <b>If this condition exists:</b>                                                                                   | <b>The VPN discovery is handled as follows:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| There are inconsistencies in the policies or values in the VPN configurations across the devices in the VPN.       | <ul style="list-style-type: none"> <li>• If the values on the hub and the spokes differ, preference is given to the values on the hub.</li> <li>• If a simple selection of one policy or value from several eligible policies or values is required and does not put functionality at risk, Security Manager selects a single policy/value that is common to all devices. For example, a VPN can have a single IKE policy only, whereas there can be more than one IKE policy on the devices.</li> <li>• If selecting one value puts the functionality at risk, no value is discovered for the policy and a validation message is received upon deployment.</li> <li>• If numeric values differ, a message is generated during discovery, and the lower value is discovered. For example, the lowest SA lifetime value in an IPsec policy.</li> <li>• If none of the above options are possible, VPN discovery fails.</li> </ul> |
| Preshared key configuration—there is a different key per set of peers.                                             | The preshared key policy is not discovered; you will have to configure it after discovery is completed. Security Manager discovers preshared key policies only when the preshared key has the same value on all devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| There is more than one eligible crypto map on the device.                                                          | The crypto map that is associated with all or the majority of the devices selected for VPN discovery is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| A spoke does not have a crypto map associated with the hub.                                                        | VPN discovery proceeds but the spoke is not discovered and an error message is generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| A device does not have the selected transform set value.                                                           | VPN discovery proceeds but the device might be removed from the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| A device does not have the selected IKE proposal.                                                                  | VPN discovery proceeds but the device might be removed from the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| A device supports DVTI, but does not have DVTI or a crypto map configured.                                         | VPN discovery fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| A server supports DVTI, but does not have an IP address configured in the DVTI configuration.                      | VPN discovery proceeds but with a warning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| A client does not support DVTI.                                                                                    | If the hub is configured with DVTI, discovery proceeds without any warning or Error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| A Hub and Spoke topology where the spokes are not using the same VPNSPA/VSPA slot on the hub (Catalyst 6500/7600). | VPN discovery fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| The same set of key servers and group members are participating in more than one GET VPN.                          | Security Manager discovers only one of the topologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 25-3** VPN Discovery Rules (continued)

| If this condition exists:                                                                         | The VPN discovery is handled as follows:                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A User Group policy is configured with backup servers using hostnames instead of an IP addresses. | VPN policy discovery fails with the following error:<br>Policy Discovery Failed:<br>com.cisco.nm.vms.discovery.DiscoveryException: Internal Error<br><br>In order for discovery to be successful, you need to reconfigure the user group policy on the device with backup servers using IP address, not hostnames. |

## Discovering Site-to-Site VPNs

This procedure describes how to discover a Site-to-Site VPN that is already working in your network but that has not yet been defined in Security Manager.

**Related Topics**

**Step 1** In Device view, select **Policy > Discover VPN Policies** to open the Discover VPN Policies Wizard—Name and Technology page.

**Step 2** Specify the following information:

- **VPN Name**—The name of the VPN being discovered.  
 You cannot specify the name when discovering Extranet VPNs. Instead, Security Manager discovers all Extranets defined on the device, and for each Extranet, the VPN name is a hyphenation of the local and remote IP addresses. For example, if the local address is 10.100.10.1 and the remote address is 10.100.11.1, the Extranet VPN is named **10.100.10.1-10.100.11.1**.
- **Description**—An optional description of the VPN. You cannot add a description to Extranet VPN discovery.
- **Topology**—The type of VPN that you are discovering—Hub and Spoke, Point to Point, Full Mesh, or Extranet.

- **IPsec Technology**—The IPsec technology assigned to the VPN—Regular IPsec, IPsec/GRE, GRE Dynamic IP (sub-technology), DMVPN, Easy VPN, GET VPN, or Regular IPSEC VTI. The topology you select controls what is available in this list.

If you selected IPsec/GRE, you must also specify the type which may be **Standard** (for IPsec/GRE) or **Spokes with Dynamic IP** (to configure GRE Dynamic IP).

---

**Note** You can select Regular IPSEC VTI for tunnel based routing as applicable for Hub and Spoke, and Point to Point topologies.

---

- **Discover From**—You can either discover the VPN directly from the network or from Configuration Archive.
  - Network—Security Manager connects to all live devices to obtain the device configuration. For Extranet VPN discovery, Security Manager connects to the single managed device that you specify.
  - Config Archive—Discovery from Configuration Archive is recommended if you deploy to configuration files instead of live devices. The most recent version of the device configuration in Configuration Archive is used for all devices.

**Step 3** Click **Next** to open the Discover VPN Policies Wizard—Device Selection Page.

**Step 4** Select the devices participating in the VPN and their role in the VPN (hub, spoke, peer one, peer two, local device, key server, group member, or simply selected devices for full-mesh VPNs) depending on the topology type. For Easy VPN topologies, servers are hubs and clients are spokes.

If there are two or more IPsec terminators in a hub-and-spoke VPN, use the Up and Down arrow buttons to ensure the primary hub is listed first. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

For more detailed information on selecting devices for a VPN, see [Selecting Devices for Your VPN Topology, page 25-32](#).

**Step 5** Click **Finish** to close the wizard and start the discovery process. The Discovery Status window opens and displays the status of the discovery and indicates whether the discovery of each device has been successful or has failed (see [Viewing Policy Discovery Task Status, page 5-22](#)). Error or warning messages are provided to indicate the source of any problems, which may be VPN specific or device specific.

Except for Extranet discovery, when the discovery process completes successfully, and you close the Discovery Status dialog box, the Site-to-Site VPN Manager window opens, displaying summary information for the VPN that was discovered. For Extranet discovery, you must either manually open the Site-to-Site VPN Manager, or select the Site-to-Site VPN policy in Device view, to see the list of discovered Extranet VPNs.

**Step 6** Verify that the VPN polices are as required. Edit the policies as necessary.

---

**Tip** When discovering Extranet VPNs, all Extranet VPNs defined on the selected device are discovered. Delete the ones that you do not want to manage in Security Manager.

---

## Defining or Repairing Discovered VPNs with Multiple Spoke Definitions

If you discover a VPN whose spokes contain different definitions (for example, different client modes for Easy VPN spokes), Security Manager changes the definitions during discovery to create a uniform definition for all spokes. This behavior occurs because VPN topologies in Security Manager can contain only one set of spoke definitions.

If you want to maintain your original definitions, or create a new VPN that has spokes with different definitions, you can choose one of two approaches:

- Define multiple VPN topologies in Security Manager, where each topology includes spokes containing matching spoke definitions.
- Define a FlexConfig policy that contains the specialized definition, then assign the policy to the spokes that require this definition, as described in the following procedure.

### Related Topics

- [Creating a New Shared Policy, page 5-54](#)
- [Creating FlexConfig Policy Objects, page 7-28](#)
- [Modifying Policy Assignments in Policy View, page 5-54](#)
- [Site-To-Site VPN Discovery, page 25-20](#)
- [Discovering Site-to-Site VPNs, page 25-24](#)
- [VPN Discovery Rules, page 25-22](#)

- 
- Step 1** Create a shared FlexConfig policy in Policy view:
- Select **View > Policy View**.
  - Right-click **FlexConfigs** in the Policy Type selector, then select **New FlexConfigs Policy**.
  - Enter a name for the policy and click **OK**.
- Step 2** Define the FlexConfig policy by creating and selecting a FlexConfig object:
- In the work area of Policy view, click the **Add** button on the Details tab.
  - In the FlexConfigs Selector, click the **Create** button in the lower-left corner of the window to open [Add or Edit FlexConfig Dialog Box, page 7-30](#).
  - Define an appended FlexConfig object that contains the required client definition. For example, to define the client mode on an Easy VPN spoke, enter the following commands:
 

```
crypto ipsec client ezvpn CSM_EASY_VPN_CLIENT_1
mode client
exit
```
  - After you create the FlexConfig object, add it to the FlexConfig policy using the selector.
- Step 3** In the work area of Policy view, use the Assignments tab to select the spokes to which this policy should be assigned, then click **Save**.
- Step 4** Deploy the policy.
-

## Rediscovering Site-to-Site VPNs

You can rediscover the configurations of existing VPN topologies that are already managed with Security Manager so that you do not have to recreate policies changes in the application.

The same rules by which Security Manager translates and discovers VPN configurations apply also to rediscovery. However, you can perform rediscovery only on devices that participate in a VPN topology, and you cannot make any changes to the IPsec technology or topology type. Only the configurations of device specific policies, such as VPN interfaces and protected networks, and any High Availability (HA) policies that are configured on hubs, can be rediscovered. VPN global policies, such as IKE proposals or PKI enrollments, cannot be rediscovered. In addition, you cannot rediscover the following topologies:

- Easy VPN topologies with Dynamic VTI
- Extranet VPNs

This procedure describes how to rediscover the configurations of a Site-to-Site VPN topology that already exists in Security Manager.

- [VPN Discovery Rules, page 25-22](#)
- [Understanding Devices Supported by Each IPsec Technology, page 25-9](#)
- [Including Unmanaged or Non-Cisco Devices in a VPN, page 25-11](#)

- 
- Step 1** In the Site-to-Site VPN Manager window, right-click the VPN topology whose configurations you want to rediscover and select **Rediscover Peers**. This opens the Rediscover VPN Policies Wizard—Name and Technology page.
- This page displays the type of topology and IPsec technology used in the VPN, which you cannot change.
- Step 2** Specify the following information:
- **VPN Discovery Name**—The name of the rediscover VPN job.
  - **Description**—An optional description of the VPN.
  - **Discover From**—You can either rediscover the VPN directly from the network or from Configuration Archive.
    - Network—Security Manager connects to all live devices to obtain the device configuration.
    - Config Archive—Rediscovery from Configuration Archive is recommended if you deploy to configuration files instead of live devices. The most recent version of the device configuration in Configuration Archive is used for all devices.
- Step 3** Click **Next** to open the Rediscover VPN Policies Wizard—Device Selection page.
- Step 4** Select the devices whose peer level policies need to be rediscovered and their role in the VPN (hub, spoke, peer one, peer two, key server, group member, or simply selected devices for full-mesh VPNs) depending on the topology type. For Easy VPN topologies, servers are hubs and clients are spokes.

If there are two or more IPsec terminators in a hub-and-spoke VPN, use the Up and Down arrow buttons to ensure the primary hub is listed first. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

For more detailed information on selecting devices for a VPN, see [Selecting Devices for Your VPN Topology, page 25-32](#).

- Step 5** Click **Finish** to close the wizard and start the rediscovery process. The Discovery Status window opens and displays the status of the rediscovery and indicates whether the rediscovery of each device has been successful or has failed (see [Viewing Policy Discovery Task Status, page 5-22](#)). Error or warning messages are provided to indicate the source of any problems, which may be VPN specific or device specific.

When the rediscovery process completes successfully, and you close the Discovery Status dialog box, the Site-to-Site VPN Manager window opens, displaying summary information for the VPN that was rediscovered.

## Creating or Editing VPN Topologies

Security Manager supports three basic types of topologies with which you can create a site-to-site VPN. Use the Create VPN wizard to create a hub-and-spoke, point-to-point, or full mesh VPN topology across multiple device types. For more information about these topologies, see [Understanding VPN Topologies, page 25-2](#).

**Tip**

If you want to create an Extranet point-to-point VPN, read [Creating or Editing Extranet VPNs, page 25-66](#) instead of this topic.

Creating a VPN topology involves specifying the devices and the networks that make up the site-to-site VPN. You define the devices and their roles (such as hub, spoke, peer, key server, group member), the VPN interfaces that are the source and destination endpoints of the VPN tunnel, and the protected networks that will be secured by the tunnel. When you create a VPN topology, you assign to it the IPsec technology (such as Regular IPsec, IPsec/GRE, GRE Dynamic IP, DMVPN, Large Scale DMVPN, Easy VPN, GET VPN) with which a predefined set of policies is associated. See [Understanding Mandatory and Optional Policies for Site-to-Site VPNs, page 25-6](#).

**Note**

When you complete the Create VPN wizard, your topology might be immediately deployable, because Security Manager provides defaults for mandatory policies. However, if you use Security Manager defaults, be sure to verify that the settings will work properly in your network. For more information, see [Understanding and Configuring VPN Default Policies, page 25-12](#).

When you edit a VPN topology, the Edit VPN dialog box contains the same pages as the Create VPN wizard (except for the VPN defaults page), but the pages are laid out in a tabbed format rather than being presented as a wizard. The only exception is for GET VPN topologies, where you can edit only the name and description of the topology (you must edit GET VPN policies to change topology attributes, see [Configuring GET VPN, page 29-12](#)). Clicking **OK** on any tab in the dialog box saves your definitions on all the tabs. For all topologies, you must edit mandatory and optional policies originally presented on the VPN defaults page directly.

By editing a VPN topology, you can change its device structure (adding or removing devices), change the VPN interfaces and protected networks defined for a device, or modify the policies that are assigned to the VPN. For example, if your organization frequently opens new sites, you might need to add spokes to an existing hub-and-spoke VPN while applying all policies of the VPN to the new spokes. Or, you might want to increase resiliency by adding a secondary hub to a VPN that has only one hub. While editing a VPN topology, you might also need to modify the policies assigned to it, for example, to change an IKE algorithm to a more secured one, or to change the DES encryption algorithm for a VPN to make it more secure.

**Tip**

After you create a topology, you cannot change the technology used in the VPN. Instead, you must delete the old VPN and create a new one using the desired technology.

To start the Create VPN wizard, or to edit an existing VPN topology:

- To open the Create VPN wizard, in the [Site-to-Site VPN Manager Window](#) or the Site-to-Site VPN policy page (Device View), click the **Create VPN Topology (+)** button and select the type of VPN topology you want to create from the options that are displayed—Hub and Spoke, Point to Point, or Full Mesh. Use the Back and Next buttons to move through the pages; when finished, click Finish to create the topology.
- To open the Edit VPN dialog box, select the VPN topology in the Site-to-Site VPN Manager window or the Site-to-Site VPN policy page (Device View) and click the **Edit VPN Topology (pencil)** button.

The pages or tabs that appear and their sequence depend on the type of VPN topology you are creating, as explained in the following table.

**Table 25-4** Create/Edit VPN Wizard Pages

| Page                                                                                                                                                                                                                                        | Hub and Spoke VPN | Point to Point VPN | Full Mesh VPN                          |

| Page                                                                                                                                                                                                                                                   | Hub and Spoke VPN | Point to Point VPN | Full Mesh VPN                |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|--------------------|------------------------------|
| GET VPN Peers Page.<br>See <a href="#">Defining GET VPN Peers, page 25-60</a> .                                                                                                                                                                        | —                 | —                  | Step 4 (GET VPN only.)       |
| VPN Defaults Page.<br>See <a href="#">Assigning Initial Policies (Defaults) to a New VPN Topology, page 25-62</a> .                                                                                                                                    | Step 5            | Step 4             | Step 4 (Step 5 for GET VPN.) |
| Synchronize Keys dialog box. When completing the Create VPN wizard for a GET VPN, you are asked if you want to synchronize keys. Clicking <b>Yes</b> initiates the process.<br>See <a href="#">Generating and Synchronizing RSA Keys, page 29-13</a> . | —                 | —                  | Step 6 (GET VPN only.)       |

Either during or after you create a VPN topology, you can also create the following advanced configurations when editing endpoints:

- VRF-Aware IPsec on a hub in a hub-and-spoke topology (see [Configuring VRF Aware IPsec Settings, page 25-48](#)).
- A VPNSM or VPNSPA/VSPA on a Catalyst 6500/7600 in a hub-and-spoke, point-to-point, or full mesh VPN topology (see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 25-42](#)).
- A Firewall Services Module together with a VPN Services Module or VPN SPA on a Catalyst 6500/7600 device in a hub-and-spoke, point-to-point, or full mesh VPN topology (see [Configuring a Firewall Services Module \(FWSM\) Interface with VPNSM or VPNSPA/VSPA, page 25-47](#)).

**Note**

You can create a visual representation of your VPN topology with all its elements in the Map view. For more information, see [Creating VPN Topologies in Map View, page 35-21](#).

## Defining the Name and IPsec Technology of a VPN Topology

**Note**

This topic does not apply to Extranet VPNs. For information about configuring the name of an Extranet VPN, see [Creating or Editing Extranet VPNs, page 25-66](#).

Use the Name and Technology page (or tab) of the Create VPN wizard and Edit VPN dialog box to define a name and description for the VPN topology. When creating a new topology, you must select the IPsec technology that will be assigned to it, but you cannot change the technology when editing an existing topology.

For information on opening the Create VPN wizard or Edit VPN dialog box, see [Creating or Editing VPN Topologies, page 25-28](#).

**Note**

If you are editing an existing VPN, the assigned IPsec technology and type is displayed, but you cannot change them. To change the technology or type, you must delete the topology and create a new one.

The following table describes the options you can configure when defining the name and technology.

**Table 25-5** *Name and Technology Page*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | A unique name that identifies the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description      | Information about the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IPsec Technology | The IPsec technology used in the VPN topology: <ul style="list-style-type: none"> <li>• Regular IPsec</li> <li>• IPsec/GRE</li> <li>• DMVPN (Hub and Spoke VPN only)</li> <li>• Easy VPN (Hub and Spoke VPN only)</li> <li>• GET VPN (Full Mesh VPN only)</li> <li>• Regular IPsec VTI</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| Type             | The technology type field appears if you have selected IPsec/GRE or DMVPN as IPsec technology for a hub-and-spoke topology: <ul style="list-style-type: none"> <li>• IPsec/GRE—Select either <b>Standard</b> (for IPsec/GRE) or <b>Spokes with Dynamic IP</b> (for GRE Dynamic IP). For more information, see <a href="#">Understanding GRE Configuration for Dynamically Addressed Spokes, page 27-5</a>.</li> <li>• DMVPN—Select either <b>Standard</b> (for regular DMVPN) or <b>Large Scale with IPsec Terminator</b> (for a large scale DMVPN). For more information, see <a href="#">Configuring Large Scale DMVPNs, page 27-16</a>.</li> </ul> |

**Table 25-5** Name and Technology Page (continued)

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE version | <p>The Internet Key Exchange (IKE) version to allow in IKE negotiations. When configuring regular IPsec VTI topology, you can allow version 1 (<b>IKEv1</b>) or version 2 (<b>IKEv2</b>).</p> <p>When configuring regular IPsec topology, you can allow version 1 (<b>IKEv1</b>), version 2 (<b>IKEv2</b>), or both <b>IKEv1 &amp; IKEv2</b>.</p> <p>If you select <b>IKEv1 &amp; IKEv2</b>, IKEv1 is automatically used by any device that does not support IKEv2. However, if you select IKEv2 only, you must ensure that you do not select any devices that do not support IKEv2 (the wizard does not prevent an invalid selection). You can edit the IKE Proposal and IPsec Proposal policies to change which IKE versions are supported after creating the VPN if you select the wrong option.</p> <p>For information on IKE and how these versions differ, see <a href="#">Overview of IKE and IPsec Configurations, page 26-2</a>. For information on devices that support IKEv2, see <a href="#">Understanding Devices Supported by Each IPsec Technology, page 25-9</a>.</p> <p><b>Tip</b> When using the Create VPN wizard, if you select an option that allows IKEv2, the wizard never creates a valid topology. After completing the wizard, you must manually configure the IKEv2 Authentication policy to complete the configuration.</p> |

## Selecting Devices for Your VPN Topology

**Note**

This topic does not apply to Extranet VPNs. For information about selecting devices in an Extranet VPN, see [Creating or Editing Extranet VPNs, page 25-66](#).

Use the Device Selection page (or tab) of the Create VPN wizard and Edit VPN dialog box to select the devices to include in the VPN topology. The contents of this page differ depending on whether you are creating or editing a hub-and-spoke, large scale DMVPN, point-to-point, or full mesh VPN topology. Also, you cannot use this page to edit the membership in a GET VPN (instead, see [Configuring GET VPN Group Members, page 29-20](#) and [Configuring GET VPN Key Servers, page 29-18](#) when working with an existing GET VPN).

For information on opening the Create VPN wizard or Edit VPN dialog box, see [Creating or Editing VPN Topologies, page 25-28](#).

In most cases, the devices that are listed in the **Available Devices** list include only those that can be used for the selected VPN topology type, that support the IPsec technology type, and which you are authorized to view. In addition, the available devices depend on the selected IPsec technology—for example, if the IPsec technology is IPsec/GRE, GRE Dynamic IP, or DMVPN, PIX Firewalls and ASA devices are not displayed. The lists are not adjusted to account for the IKE versions you are supporting in the topology. However for regular IPsec VTI topology configuration, when IKEv1 is selected,

ASA 9.7.1 and above single context devices are displayed; for IKEv2, ASA 9.8.1 and above single context devices are displayed. For more information, see the supported platforms described in [Understanding Devices Supported by Each IPsec Technology, page 25-9](#).

**Tip**

When selecting devices, you can select a device group to select all of the eligible devices in the group.

The following list explains how to add or remove devices based on the type of topology:

- **To select devices for a full mesh VPN topology with Regular IPsec or IPsec/GRE technology,** select them in the Available Devices list and click >>.
- **To select devices for a full mesh VPN topology that uses the GET VPN technology:**
  - Select the devices that you want to define as key servers and click >> next to the **Key Servers** field.

If you have more than one key server, use the **Up** and **Down** arrow buttons to ensure the primary key server is listed first. Group members register with the first key server in the list. If the first key server cannot be reached, they try to register with the second key server, and so on.

- Select the devices that you want to define as group members and click >> next to the **Group Members** field.
- **To select devices for a hub-and-spoke VPN topology:**
  - Select the devices that you want to define as hubs (or servers in an Easy VPN configuration) and click >> next to the **Hubs** list.

If you have more than one hub, ensure the hubs list is in priority order with the primary hub listed first. To change the order, select a hub and click the **Up** and **Down** arrow buttons until the device is ordered as desired.

**Note**

You need to select the primary hub only when there are two or more IPsec terminators. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

- Select the devices that you want to define as spokes (or clients in an Easy VPN configuration) and click >> next to the **Spokes** list.
- If you are configuring a **Large Scale DMVPN with IPsec Terminator** topology, you must also select the Catalyst 6500/7600 devices you want to be **IPsec Terminators** in your Large Scale DMVPN configuration. If you select more than one IPsec Terminator, use the **Up** and **Down** arrow buttons to put them in priority order. For more information, see [Configuring Large Scale DMVPNs, page 27-16](#).
- **To select devices for a point-to-point VPN topology:**
  - From the Devices list, select a device to be **Peer One** and click >>.
  - Select another device to be **Peer Two** and click >>.
- **To remove devices (any topology or technology combination),** select them from one of the selected devices lists and click << to move them back to the Available Devices list.

If you are editing an existing VPN topology, you can remove devices from the VPN topology, but you cannot save your changes if your device selections result in an invalid VPN configuration. When removing devices, you should be aware of the following:

- You cannot remove a device if it is the only hub in a hub-and-spoke VPN topology, unless you replace it with a different hub.
- You cannot remove a device that is one of the two devices in a point-to-point VPN topology, unless you replace it with a different device.
- In a VPN topology with multiple hub devices, deleting a hub causes the appropriate tunnels to be removed.
- If some, but not all, spokes in a VPN topology are deleted, the hub side crypto statements change to reflect the removal.
- GET VPNs must have at least one key server and one group member.

## Defining the Endpoints and Protected Networks

Use the Endpoints page of the Create VPN wizard and Edit VPN dialog box, or the Peers policy, to view the devices in your VPN topology and to define or edit their VPN characteristics and features. You are primarily defining the external or internal VPN interfaces and the protected networks for the devices in the VPN topology. The VPN interfaces are the interfaces that encrypt the data. The protected networks are the networks that are encrypted.

To get to the Endpoints page, do any of the following:

- Open the Create VPN wizard or the Edit VPN dialog box; for the procedure, see [Creating or Editing VPN Topologies, page 25-28](#).
- In the Site-to-Site VPN Manager, select the desired VPN topology (excepting GET VPN topologies) and select the **Peers** policy.

#### Tips:

- This configuration applies to all IPsec technology types except GET VPN. To configure GET VPN endpoints when creating the VPN, see [Defining GET VPN Peers, page 25-60](#). For existing GET VPNs, configure endpoints using the Key Servers and Group Members policies; see [Configuring GET VPN Key Servers, page 29-18](#) and [Configuring GET VPN Group Members, page 29-20](#).
- The devices listed on this page are selected in the Device Selection Page (see [Selecting Devices for Your VPN Topology, page 25-32](#)). You can change the list only when editing the Peers policy, where you can select a device and click the **Delete (trash can)** button to remove it. To add devices, you must edit the VPN topology itself.
- Although you can edit the endpoints for an Extranet VPN using the Peers policy, you should instead edit the endpoints through the Edit Extranet VPN dialog box by editing the VPN topology. The Endpoints page does not appear in the Create Extranet VPN wizard.

The table shows the role each device plays in the VPN (hub, spoke, peer, or IPsec Terminator), the device name, and the VPN interface and protected networks. Initially, the VPN interface and protected network is set to the default interface roles defined in the Security Manager Administrative settings for external and internal interfaces (see [VPN Policy Defaults Page, page 11-74](#)). The endpoint configuration might include configurations not shown in this table, but the VPN interface and protected network are the only required settings.

- To change the endpoint configuration for a device, select it and click the **Edit Row** button beneath the table. You can select more than one device to edit at a time, but the devices must serve the same role, and you cannot include Catalyst 6500/7600 devices or VPN service modules when selecting multiple devices. You perform endpoint editing in the Edit Endpoints Dialog Box, whose content differs depending on the selected device type and IPsec technology.

See the following topics for detailed information about the options you can configure in the Edit Endpoints dialog box:

- **VPN Interface tab**—To configure the VPN interface and other required interface settings (see [Configuring VPN Interface Endpoint Settings, page 25-36](#)). In some cases, you can also configure dial backup (for more information about dial backup, see [Configuring Dial Backup, page 25-40](#)).

For Catalyst 6500/7600 devices, the VPN Interface tab provides settings that enable you to configure a VPN Services Module (VPNSM) or a VPNSPA/VSPA blade on the device (which might be an IPsec Terminator in a large scale DMVPN), and are described in [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 25-42](#).

For configuring tunnel based VPN, only the VPN Interface tab appears. Use the **Select** button to choose the tunnel interface.

Easy VPN works by determining the highest and lowest security level interfaces during ASA bootup. VPN client rejects two or more interfaces having same highest security level. In BVI, Easy VPN determines that there are more than two interfaces with same highest security level because of which VPN client is not enabled. In order to overcome this issue, vpnclient secure interface CLI was introduced for all ASA 5506, 5508, and 5512 [x/h/w] devices from ASA 9.9(2) onwards. Thus, to support the CLI in Cisco Security Manager, starting from version 4.17, a new component “VPN Client Interface” is introduced in Hub & Spoke Topology of type (Easy VPN).

- **Extranet Device Details**—To configure the endpoint settings for the remote (unmanaged) device in an Extranet VPN. The tab appears in the Peers policy only. Instead of editing the information on this tab, the preferred method is to edit the VPN topology and change the settings there. For more information, see [Creating or Editing Extranet VPNs, page 25-66](#).
- **Hub Interface tab**—If the selected device is a hub in a large scale DMVPN, specify the interface that is connected to the IPsec Terminator. See [Configuring Large Scale DMVPNs, page 27-16](#).
- **Protected Networks tab**—To define the networks that are encrypted (see [Identifying the Protected Networks for Endpoints, page 25-46](#)). The protected network can be an interface role, network/host group object, or in the case of regular IPsec, an ACL policy object.
- **FWSM tab**—To define the settings that enable you to connect between a Firewall Services Module (FWSM) and an IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA that is already configured on a Catalyst 6500/7600 device. This is possible only in a hub-and-spoke topology where the hub is a Catalyst 6500/7600 device that has these modules installed. For more information, see [Configuring a Firewall Services Module \(FWSM\) Interface with VPNSM or VPNSPA/VSPA, page 25-47](#).
- **VRF Aware IPsec tab**—To configure a VRF-Aware IPsec policy on a hub (IPsec Aggregator) in a hub-and-spoke VPN topology. For more information, see [Configuring VRF Aware IPsec Settings, page 25-48](#) and [Understanding VRF-Aware IPsec, page 25-14](#).

- **Crypto Map tab**—To manually configure the Crypto Map name and Crypto ACL name for each peer, which is supported by Security Manager starting with version 4.7. Crypto Map and Crypto ACL are supported in regular IPsec technology. Therefore, this configuration is applicable only for the topologies with regular IPsec technology. For more information see, [Configuring Crypto Map, page 25-50](#).
- To view the actual interfaces associated with an interface role for each device, select **Matching Interfaces** in the **Show** list beneath the table. If there are no matching interfaces, “No Match” is displayed. The default is to show the interface role policy object names. To create a valid VPN, these roles must match to actual interfaces defined on the device.

## Configuring VPN Interface Endpoint Settings

Use the VPN Interface tab in the Edit Endpoints dialog box to edit the VPN interfaces defined for devices in the Endpoints table. When defining a primary VPN interface for a router device, you can also configure a backup interface to use as a fallback link for the primary route VPN interface, if its connection link becomes unavailable. You can configure a backup interface on a Cisco IOS security router, that is in a point-to-point or full mesh topology, or that is a spoke in a hub-and-spoke topology, or is a remote client in an Easy VPN topology. For more information, see [Configuring Dial Backup, page 25-40](#).

#### Tips

- If the device is a hub in a large scale DMVPN, this tab is called **Hub Interface**. Specify the interface that is connected to the IPsec Terminator in the **Hub Interface Toward the IPsec Terminator** field. Enter the name of the interface or interface role, or click **Select** to select it from a list. For more information, see [Configuring Large Scale DMVPNs, page 27-16](#).
- If the device is a Catalyst 6500/7600 device, the VPN Interface tab provides settings that enable you to configure a VPN Services Module (VPNSM) or a VPNSPA/VSPA blade on the device. For a description of the elements that appear on the VPN Interface tab for a Catalyst 6500/7600 device, see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 25-42](#). The table below assumes the device is not a Catalyst 6500/7600 device.

#### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **VPN Interfaces** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 25-34](#).

## Field Reference

Table 25-6 Edit Endpoints Dialog Box, VPN Interface Tab

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Enable the VPN Interface Changes on All Selected Peers | <p>Available if you selected more than one device on the Endpoints page for editing.</p> <p>When selected, applies any changes you make in the VPN interface tab to all the selected devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VPN Interface                                          | <p>The VPN interface defined for the selected device. Enter the name of the interface role policy object that defines identifies the interface, or click <b>Select</b> to select it from a list or to create a new interface role object. (See <a href="#">Creating Interface Role Objects</a>, page 6-74.)</p> <p><b>Note</b> When manually configuring Crypto Map in devices, you must specify the IP Address of the peer interface and not its name.</p> <p>If the device is an ASA 5505 version 7.2(1) or later, it must have two interfaces defined with different security levels. For more information, see <a href="#">Managing Device Interfaces, Hardware Ports, and Bridge Groups</a>, page 46-26.</p>  |
| VPN Client Interface                                   | <p>The VPN client interface defined for the selected device. Click <b>Select</b> to select it from a list. From Cisco Security Manager 4.17, you can specify the client interface for the Easy VPN. This is applicable for:</p> <ul style="list-style-type: none"> <li>• ASA 5506 devices and later</li> <li>• BVI interface or any other physical interface and not for the BVI member interfaces</li> <li>• Devices in hub and spoke topology</li> </ul>                                                                                                                                                                                                                                                         |
| VPN Client Secure Interface                            | <p>Beginning from 4.17, Cisco Security Manager supports ASA 9.9(2)s' EzVPN feature support for BVI. This field allows you to define the secured interface. Select the interface to act as the protected network for tunnel establishment. This feature is applicable only for:</p> <ul style="list-style-type: none"> <li>• EasyVPN topology</li> <li>• spoke interface</li> <li>• ASA 9.9.2 devices onwards</li> </ul>                                                                                                                                                                                                                                                                                            |
| Connection Type                                        | <p>Only available in a hub-and-spoke VPN topology, if the selected device is an ASA or PIX 7.0+ device, and the selected technology is Regular IPsec.</p> <p>Select the type of connection that the hub or spoke will use during an SA negotiation:</p> <ul style="list-style-type: none"> <li>• <b>Answer Only</b>—To configure the hub to only respond to an SA negotiation, but not initiate it. This is the default for hubs.</li> <li>• <b>Originate Only</b>—To configure the device to only initiate an SA negotiation, but not respond to one. This is the default for spokes.</li> <li>• <b>Bidirectional</b>—To configure the hub or spoke to both initiate and respond to an SA negotiation.</li> </ul> |

Table 25-6 Edit Endpoints Dialog Box, VPN Interface Tab (continued)

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Peer IPsec Termination | <p>Unavailable if the selected technology is Easy VPN.</p> <p>Specifies the IP address of the VPN interface of the local router. You can select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Tunnel Source IP Address</b>—Use the IP address of the tunnel source.</li> <li>• <b>VPN Interface IP Address</b>—Uses the configured IP address on the selected VPN interface. Only one VPN interface can match the interface role. This option is available only if you select <b>Configure Unique Tunnel Source for each Tunnel</b> in the GRE Modes policy.</li> </ul> <p><b>Note</b> Beginning with version 4.9, Security Manager enables you to select IPv6 addresses. This feature is supported for interfaces that have IPv6 addresses and is applicable for devices running the ASA software version 9.0 or later. Also, the option of IPv6 address is available only with Regular IPsec technology.</p> <ul style="list-style-type: none"> <li>• <b>IP Address</b>—Explicitly specify the IP address of the VPN interface of the local router. Use this option when the device is behind a NAT boundary to specify the NAT IP Address. Beginning with version 4.9, Security Manager enables you to specify IPv6 addresses.</li> </ul> <p><b>Note</b> If you select a tunnel source as the VPN interface, it is likely that the VPN interface has a dynamically assigned IP address.</p> <ul style="list-style-type: none"> <li>• <b>IP Address of Another Existing Interface to be Used as Local Address</b> (unavailable if IPsec technology is DMVPN)—To use the configured IP address on any interface as a local address, not necessarily a VPN interface. Enter the interface in the field provided.</li> </ul> <p>You can choose the required interface by clicking <b>Select</b>. A dialog box opens that lists all available predefined interface roles, and in which you can create an interface role object.</p> |
| Tunnel Source                | <p>Available only for IPsec/GRE or DMVPN.</p> <p>If you have enabled the setting to use a unique tunnel source per tunnel interface in the GRE Modes &gt; Tunnel Parameters tab, the <b>Override Unique Tunnel Source per Tunnel Interface</b> check box is available. Select this option to specify a different tunnel source for the selected device.</p> <p>Specifies the tunnel source address to be used by the GRE or DMVPN tunnel on the spoke side. You can select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>VPN Interface</b>—Uses the VPN interface as the tunnel source address.</li> <li>• <b>Interface</b>—To use any interface as the tunnel source address, not necessarily a VPN interface. Enter the interface name or click <b>Select</b> to select an interface role that identifies the interface (you can also create a role from the selection dialog box).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Dialer Interface            | <p>The logical interface through which the secondary route traffic is directed when the dialer interface is activated. This can be a Serial, Async, or BRI interface.</p> <p>Enter the name of the interface or interface role object, or click <b>Select</b> to select it from a list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Primary Next Hop IP Address | <p>Available only if the selected technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN.</p> <p>The IP address to which the primary interface connects when it is active. This is known as the next hop IP address.</p> <p>If you do not specify the next hop IP address, Security Manager configures a static route using the VPN interface name. The VPN interface must be point-to-point or deployment fails.</p> <p>You can choose the required IP address by clicking <b>Select</b>. The Network/Hosts selector opens, in which you can select a network from which the IP address will be allocated.</p>                                                                                                         |
| Tracking IP Address         | <p>The IP address of the destination device to which connectivity must be maintained from the primary VPN interface connection. This is the device that is pinged by the Service Assurance agent through the primary route to track connectivity. The backup connection is triggered if connectivity to this device is lost.</p> <p>If you do not specify an IP address, the primary hub VPN interface is used in a hub-and-spoke or Easy VPN topology. In a point-to-point or full mesh VPN topology, the peer VPN interface is used.</p> <p>You can choose the required IP address by clicking <b>Select</b>. The Network/Hosts selector opens, in which you can select a network from which the IP address will be allocated.</p> |
| Advanced button             | <p>Available if the selected technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN.</p> <p>Click this button to configure additional optional settings using the <a href="#">Dial Backup Settings Dialog Box, page 25-41</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring Dial Backup

You can use dial backup to provide a fallback link for a primary, direct connection when the primary link becomes unavailable. You can configure dial backup on Cisco IOS security routers that participate in a point-to-point, Extranet, or full mesh VPN topology, or that are spokes in a hub-and-spoke topology. You can also configure it on a remote client router running IOS version 12.3(14)T+ in an Easy VPN topology.

Implementation of the dial backup feature is based on the assumption that two static routes exist:

- A primary route through a primary gateway, which has highest priority.
- A secondary route through a secondary gateway, which has lower priority and only appears in the routing table when the primary gateway is down.

Security Manager configures a logical dialer interface on the spoke. The dialer interface is associated with a physical backup interface. When the primary route is down, the dialer interface is activated and traffic is redirected through this backup interface along the secondary route. To ensure that the spoke-hub traffic is encrypted, Security Manager applies a crypto map to the dialer interface. This crypto map is identical to the crypto map on the VPN interface (the primary route interface). In Easy VPN, the backup configuration is attached to the dialer interface.

Depending on the IOS version, Response Time Reporter (RTR) or Service Level Agreement (SLA) IOS technology is used to detect loss of network performance on the primary route. If the assigned IPsec technology is DMVPN, Dialer Watch-List (DWL) is used.

ISDN Basic Rate Interface (BRI) and analog modem interfaces can be configured as backup interfaces to other primary interfaces. In such a case, an ISDN or analog modem connection is made if the primary interface goes down. Should the primary interface and connection go down, the ISDN or analog modem interface immediately dials out to establish a connection so that network services are not lost.

### Before You Begin

- Configure the dialer interface settings on the Cisco IOS routers. This requires defining the relationship between the physical BRI and Async interfaces, and the virtual dialer interfaces used when configuring dial backup. For more information, see [Dialer Interfaces on Cisco IOS Routers, page 62-28](#).
- Make sure that the primary route is functioning.
- For Extranet VPNs, you can configure dial backup on the local (managed) device only.

---

**Step 1** For most VPN topologies, you configure dial backup when creating or editing a site-to-site VPN. You can also edit the Peers policy for existing VPN topologies. For Extranet VPNs, you configure dial backup through the Peers policy only.

Do one of the following:

- In the Create VPN wizard, proceed to the Endpoints page (see [Creating or Editing VPN Topologies, page 25-28](#) and [Defining the Endpoints and Protected Networks, page 25-34](#)).
- In the Edit VPN dialog box, click the **Endpoints** tab (see [Creating or Editing VPN Topologies, page 25-28](#) and [Defining the Endpoints and Protected Networks, page 25-34](#)).
- For Extranet VPNs, or for editing any other VPN topology, select the Peers policy. For general information on editing endpoints, see [Defining the Endpoints and Protected Networks, page 25-34](#).

**Step 2** Select the router on which you want to configure dial backup and click the **Edit (pencil)** button. If there is more than one router that will have the same dialer configuration, you can select and edit them all at once.

This action opens the Edit Endpoints dialog box. Select the **VPN Interface** tab if it is not already selected.

- Step 3** On the VPN Interface tab, configure the following options related to dial backup. If you are creating a new VPN, you need to configure the other settings (such as VPN interface) as well. For detailed reference information for these options, see [Configuring VPN Interface Endpoint Settings, page 25-36](#).
- **Enable Backup**—Select this option.
  - **Dialer Interface**—Specify the physical interface through which the secondary route traffic will be directed when the logical dialer interface is activated.
  - **Primary Next Hop IP Address**—If the selected IPsec technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN, enter the next hop IP address. If you do not enter the next hop IP address, Security Manager configures a static route using the interface name.
  - **Tracking IP Address**—Specify the IP address of the destination device to which connectivity must be maintained from the primary VPN interface connection. This is the device that is pinged through the primary route to track connectivity. The backup connection is triggered if connectivity to this device is lost.
- If you do not specify an IP address, the primary hub VPN interface is used in a hub-and-spoke or Easy VPN topology. In a point-to-point or full mesh VPN topology, the peer VPN interface is used.
- Step 4** If the selected IPsec technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN, click **Advanced** to configure additional (optional) settings in the Dial Backup Settings dialog box. These settings are explained in [Dial Backup Settings Dialog Box, page 25-41](#). Click **OK** to save your changes.
- Step 5** Click **OK** in the Edit Endpoints dialog box.
- 

## Dial Backup Settings Dialog Box

Use the Dial Backup Settings dialog box to define optional settings for configuring a dial backup policy for your site-to-site VPN. These settings are available for Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN technologies.

Mandatory settings for dial backup are configured in the VPN Interface tab on the Edit Endpoints dialog box. See [Configuring VPN Interface Endpoint Settings, page 25-36](#).

### Note

You must configure the dialer interface settings before dial backup can work properly. For more information, see [Dialer Interfaces on Cisco IOS Routers, page 62-28](#).

---

### Navigation Path

To open the Dial Backup Settings dialog box, enable dial backup and click **Advanced** on the **VPN Interface** tab of the Edit Endpoints dialog box. For information on opening the Edit Endpoints dialog box, see [Defining the Endpoints and Protected Networks, page 25-34](#).

|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Next Hop Forwarding<br>Backup Next Hop IP Address | If required, enter the next hop IP address of the ISDN BRI or analog modem backup interface (that is, the IP address to which the backup interface will connect when it is active). You can enter an IP address or the name of a network/host object, or click Select to select a network/host object that specifies the IP address.<br><br>If you do not enter the next hop IP address, Security Manager configures a static route using the interface name. |
| <b>Tracking Object Settings</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Timeout                                           | The number of milliseconds the Service Assurance Agent operation waits to receive a response from the destination device. The default is 5000 ms.                                                                                                                                                                                                                                                                                                             |
| Frequency                                         | How often Response Time Reporter (RTR) should be used to detect loss of performance on the primary route. The default is every 60 seconds.                                                                                                                                                                                                                                                                                                                    |
| Threshold                                         | The rising threshold in milliseconds that generates a reaction event and stores history information for the RTR operation. The default is 5000 ms.                                                                                                                                                                                                                                                                                                            |

**Configuring VPNSM or VPN SPA/VSPA Endpoint Settings**

When you select a Catalyst 6500/7600 device in the Endpoints table for editing, the VPN Interface tab of the Edit Endpoints dialog box provides settings for configuring Cisco VPN Services Modules (VPNSM), Cisco VPN Shared Port Adapters (VPN SPAs), and Cisco VPN Service Port Adapters (VSPAs) on the device. You can select more than one Catalyst 6500/7600 device at the same time. Your changes are applied to all the selected devices.

The device can be in a point-to-point or full mesh VPN topology, or a hub or spoke in a hub-and-spoke VPN topology managed by Security Manager (except in an Easy VPN configuration, where the device cannot be a spoke). These settings must also be configured if the selected device is an IPsec Terminator in a large scale DMVPN, although not all settings described below are available. See [Configuring Large Scale DMVPNs, page 27-16](#).

**General Notes**

- A Catalyst 6500/7600 device can contain from 3 to 13 chassis slots. Due to the design of the blades, you can install one VPNSM or two VPNSPA/VSPA per slot. The location of a VPNSPA/VSPA is identified with a slot and subslot number. Security Manager stores this information in its inventory, so that Security Manager can manage the VPN topologies.
- If you are configuring intra-chassis high availability, you cannot use a VPNSM blade and a VPNSPA/VSPA blade on the same device as primary and failover blades.
- In a remote access VPN, you can configure only one failover unit for each IPsec proposal. See [VPNSM/VPN SPA/VSPA Settings Dialog Box, page 33-6](#).
- If the Catalyst 6500/7600 has a Firewall Services Module (FWSM), you can configure it to work with these modules. For more information, see [Configuring a Firewall Services Module \(FWSM\) Interface with VPNSM or VPNSPA/VSPA, page 25-47](#).

- If you are configuring a VPNSM or VPNSPA/VSPA with VRF-Aware IPsec on a device, the device cannot belong to a different VPN topology in which VRF-Aware IPsec is not configured. For more information, see [Configuring VRF Aware IPsec Settings, page 25-48](#).
- Create an inside VLAN on the Catalyst 6500/7600 device, or edit an existing port or VLAN configuration. If the device is configured with VRF-Aware IPsec, you must create a forwarding VLAN.

#### Notes for VPNSMs

- Security Manager supports the configuration of multiple VPNSMs on a Catalyst 6500/7600 device, but only one module (or two if you are configuring intra chassis high availability) can be configured per VPN topology.
- VPNSM configuration requires that its parent Catalyst 6500/7600 device is running Cisco IOS Software release 12.2(18)SXD1 and later.
- You can use only Layer 3 VLANs for VPNSM configuration.

#### Notes for VPNSPA/VSPAs

- This configuration also applies if you are configuring an IPsec Terminator in a large scale DMVPN configuration. For more information, see [Configuring Large Scale DMVPNs, page 27-16](#).
- The VPN SPA supports the AES encryption algorithm for all key sizes (128-, 192-, and 256-bit), as well as the DES and 3DES encryption algorithms. For more information, see [Deciding Which Encryption Algorithm to Use, page 26-6](#).

In VRF mode, the **crypto engine slot slot/subslot {inside | outside}** command is deployed on the inside and outside VPN interfaces.

- Make sure that the Catalyst 6500/7600 device is running Cisco IOS Software release 12.2(18)SXE2 or later.
- If you plan to use Crypto Connect Alternate mode (whereby encrypted traffic entering the VPNSM/VPN SPA is passed through and clear text traffic is bypassed), the Catalyst 6500 device must be running Cisco IOS Software version 12.2(33)SXH or later, and the 7600 router must be running 12.2(33)SRA or later.
- In the case of a DMVPN topology in which multiple hubs participate, if one hub is configured with a VPN SPA blade, a tunnel key must not be configured on *any* of the devices, whether they are spokes or hubs. Devices that participate in such a topology must be running Cisco IOS Software version 12.3T and later in order to support tunnels without keys.

#### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a Catalyst 6500/7600 device, then click **Edit** to open the Edit Endpoints Dialog Box. Select the **FWSM** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 25-34](#).

| VPNSM/VPN SPA/VSPA Settings                            | <ul style="list-style-type: none"> <li>• <b>Use Crypto Connect Alternate</b>—When selected, only encrypted traffic entering the VPNSM/VPN SPA on the Catalyst 6500/7600 is passed through. Clear text traffic does not go through (bypasses) the adapters. To use this option, the Catalyst 6500 must be running version 12.2(33)SXH or later, and the 7600 router must be running 12.2(33)SRA or later. <p>This mode is recommended as an alternate to Crypto connect mode for enterprise customers who have a need to support large VPN topologies (financial institutions, for example) or need to pass large amounts of data over an encrypted channel (remote disaster recovery or backup over the Internet).</p> </li> <li>• <b>Inside VLAN</b>—The VLAN that serves as the inside interface to the service module or adapter. It is also the hub endpoint of the VPN tunnel (unless VRF-Aware IPsec is configured on the device). Enter the name of the VLAN or interface role object, or click <b>Select</b> to select it from a list.</li> <li>• <b>Slot and Subslot</b>—The number designating the slot location of the VPNSM or VPNSPA/VSPA. If you are configuring a VPNSPA/VSPA, the subslot number is also required.</li> <li>• <b>Outside VLAN/External port</b>—The external port or VLAN that connects to the inside VLAN. Enter the name of the VLAN or interface role object, or click <b>Select</b> to select it from a list. You must select an interface or interface role that differs from the one selected for the inside VLAN.</li> </ul> <p><b>Note</b> If VRF-Aware IPsec is configured on the device, the external port or VLAN must have an IP address.</p> |

Table 25-8 Edit Endpoints Dialog Box, VPN Interface Tab's VPNSM/VPN SPA/VSPA Settings

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Source                | <p><b>Note</b> Available only for a hub when the selected technology is IPsec/GRE or DMVPN.</p> <p>Specifies the tunnel source address to be used by the GRE or DMVPN tunnel on the spoke side. You can select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Override Unique Tunnel Source per Tunnel Interface</b>—If you have enabled the setting to use a unique tunnel source per tunnel interface in the GRE Modes &gt; Tunnel Parameters tab, this option is available. Select this option to specify a different tunnel source for the selected device.</li> <li>• <b>Outside VLAN/External Port (When CCA/VRF is Enabled)</b>—When the <b>Use Crypto Connect Alternate</b> check box is selected, this radio button is available. When selected, specifies the outside VLAN/external port as the tunnel source.</li> <li>• <b>Inside VLAN</b>—When selected, uses the interface configured for the inside VLAN as the tunnel source.</li> <li>• <b>Interface</b>—To use any interface as the tunnel source address, not necessarily a VPN interface, enter the interface name or click <b>Select</b> to select an interface role that identifies the interface. You can create new roles from the selection list.</li> </ul> |
| Local Peer IPsec Termination | <p>Define the IPsec termination point of the VPN interface on the local router:</p> <ul style="list-style-type: none"> <li>• <b>Inside VLAN</b>—Use the interface configured as the inside VLAN.</li> <li>• <b>IP Address</b>—Use the IP address of the VPN interface on the local router. Enter the IP address.</li> </ul> <p><b>Note</b> If you select a tunnel source as the VPN interface, it is likely that the VPN interface has a dynamically assigned IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Failover Blade        | <p>Whether to configure a failover VPNSM or VPNSPA/VSPA blade for intra-chassis high availability.</p> <p><b>Note</b> A VPNSM and VPNSPA/VSPA blade cannot be used on the same device as primary and failover blades.</p> <p>Specify the failover blade, as follows:</p> <ul style="list-style-type: none"> <li>• <b>Slot</b>—The slot number that identifies where the VPNSM blade or VPNSPA/VSPA blade is located.</li> <li>• <b>Subslot</b>—If you are configuring a VPNSPA/VSPA, select the number of the subslot (0 or 1) on which the failover VPN SPA blade is installed.</li> </ul> <p><b>Note</b> If you are configuring a VPNSM, select the blank option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Identifying the Protected Networks for Endpoints

Use the Protected Networks tab on the Edit Endpoints dialog box to edit the protected networks that are defined on devices in the Endpoints table. (See [Defining the Endpoints and Protected Networks](#), page 25-34.)

You can specify the protected networks as interface roles whose naming patterns match the internal VPN interface of the device, as network/host group objects containing one or more network or host IP addresses, interfaces, or other network objects, or as access control list objects (if Regular IPsec is the assigned technology).

- If you are editing more than one device at a time, select **Enable the Protected Networks Changes on All Selected Peers** to apply any changes you make in the Protected Networks tab to all the selected devices.
- To add a protected network, select it from the Available Protected Networks list and click >> to move it to the Selected Protected Networks list. You can use any combination of interface role objects, network/host group objects (listed in the Protected Networks folder), or Access Control List objects to define the protected network for the device. (ACL objects are available only if Regular IPsec is the assigned technology.)

Beginning with version 4.9, Security Manager supports IPv6 addresses.

- The Protected Networks folder now supports IPv6 objects.
- Access Control Lists folder now supports Extended and Unified ACLs.
- For Interface Roles, if you select an IPv6 enabled interface and click >>, a popup window appears with a list of all the IPv6 addresses that are configured. You can select an address from the list and then click **OK** to move the address to the Selected Protected Networks list. To edit an address, select it in the Selected Protected Networks list and click the **Edit Selection** link.
- For Extranet VPNs, remote backup peer supports IPv6 addresses.

---

**Note** In a hub-and-spoke VPN topology in which Regular IPsec is the assigned technology, when an ACL object is used to define the protected network on a spoke, Security Manager mirrors the spoke's ACL object on the hub to the matching crypto map entry.

---

If you do not provide a crypto map entry, then during deployment Security Manager generates the crypto ACL name on the hub device as the ACL object name on the spoke device appended with an "\_1". For example, if the ACL object name of a spoke is, say, "spokeACL", Security Manager generates the Crypto ACL name on the hub device as "spokeACL\_1". If there are multiple spoke devices with the same ACL object name, Security Manager generates the crypto ACL name on the hub device as "ACLObjectName\_spokeDisplayName\_1".

where, "ACLObjectName" is the ACL object name for all the spoke devices in the topology, and, "spokeDisplayName" is the display name of the spoke devices, which is different for each spoke.

---

**Note** Cisco Security Manager creates a new ACL for ASA devices, irrespective of topology type, when you execute any of the following:

- Add an extra entry to a protected network.
- Select Enable Spoke to spoke connectivity check box in the **VPN Global Setting > General Settings** tab for an existing hub and spoke topology.
- Add a new peer (as a spoke) to the existing hub and spoke topology.

This new ACL that is generated on-the-fly may disrupt the VPN traffic. Hence, we recommend you to directly make changes using the ACL building block in protected networks.

- To remove a selected protected network, select it and click the << button.
- If the order of the objects matters, you can adjust the priority order of the selected objects using the Move Up, Move Down buttons to position the objects in the selected list as desired. These buttons are not available if order does not matter.
- If an object that you need to define the protected network is not listed, click the **Create (+)** button to add the object; you are prompted to select the type of object you want to add. You can also modify the definition of an existing object by selecting it and clicking the **Edit (pencil)** button. For more information, see the following topics:
  - [Understanding Interface Role Objects, page 6-73](#) and [Creating Interface Role Objects, page 6-74](#).
  - [Understanding Networks/Hosts Objects, page 6-80](#) and [Creating Networks/Hosts Objects, page 6-82](#).
  - [Creating Access Control List Objects, page 6-53](#).

#### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the Peers policy, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **Protected Networks** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 25-34](#).

## Configuring a Firewall Services Module (FWSM) Interface with VPNSM or VPNSPA/VSPA

#### Note

From 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any enhancements as FWSM is now End of Life.

Security Manager supports the configuration of a Firewall Services Module (FWSM) with an IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA on a Catalyst 6500/7600 device. This feature enables a FWSM to apply firewall policies to untrusted clients, while the VPNSM or VPN SPA/VSPA provides secure access to the internal network.

Use the FWSM tab on the Edit Endpoints dialog box to define the settings that enable you to connect between the FWSM and a VPNSM or VPNSPA/VSPA that is already configured on a Catalyst 6500/7600 device. The FWSM tab is available only in a hub-and-spoke VPN topology when the selected hub is a Catalyst 6500/7600 device.

#### Tips

- Before you can define the FWSM settings, you must add the hosting Catalyst 6500/7600 device to the Security Manager inventory and discover its FWSM and its policies and security contexts. See [Adding Devices from the Network, page 3-12](#) and [Managing Security Contexts, page 59-7](#).
- If an inside interface is not already created on the Catalyst 6500/7600 device, you must create it (see [Creating or Editing VLANs, page 68-26](#)). Then, you must assign the FWSM inside interface (VLAN) to the appropriate security context, or directly to the FWSM blade.

- You also must configure the settings on the VPN Interfaces tab related to IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA. For more information, see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 25-42](#).

### Navigation Path

On the Endpoints Page of the Create VPN wizard or **Edit** VPN dialog box, or on the VPN Peers policy, select a Catalyst 6500/7600 device that contains an FWSM, then click **Edit** to open the Edit Endpoints Dialog Box. Select the **FWSM** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 25-34](#).

### Field Reference

**Table 25-9** Edit Endpoints Dialog Box, FWSM Tab

| Element              | Description                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable FWSM Settings | Whether you want to configure the connection between the Firewall Services Module (FWSM) and the VPN Services Module (VPNSM) or VPN SPA on the Catalyst 6500/7600 device.                                                         |
| FWSM Inside VLAN     | The VLAN that serves as the inside interface to the Firewall Services Module (FWSM). Enter the name of the interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role object. |
| FWSM Blade           | From the list of available blades, select the blade number to which the selected FWSM inside VLAN interface is connected.                                                                                                         |
| Security Context     | If the FWSM inside VLAN is part of a security context (that is, the FWSM is running in multiple-context mode), specify the security context name in this field. The name is case-sensitive.                                       |

## Configuring VRF Aware IPsec Settings

Use the VRF-Aware IPsec tab on the Edit Endpoints dialog box to configure a VRF-Aware IPsec policy on a hub in your hub-and-spoke VPN topology. You can configure VRF-Aware IPsec as a one-box or two-box solution. For more information about VRF-Aware IPsec, see [Understanding VRF-Aware IPsec, page 25-14](#).

### Tips

- VRF-Aware IPsec can be configured only on hubs in a hub-and-spoke VPN topology.
- In a VPN topology with two hubs, you must configure VRF-Aware IPsec on both devices.
- You cannot configure VRF-Aware IPsec on a device that belongs to another VPN topology in which VRF-Aware IPsec is not configured.
- You cannot configure VRF-Aware IPsec on hubs that have been configured with high availability. See [Configuring High Availability in Your VPN Topology, page 25-52](#).
- Deployment might fail if the IPsec Aggregator is configured with the same **keyring** CLI command as the existing preshared key (keyring) command, and is not referenced by any other command. In this case, Security Manager does not use the VRF keyring CLI, but generates the keyring with a different name, causing deployment to fail. You must manually remove the preshared key keyring command through the CLI before you can deploy the configuration.

### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a device that supports VRF-Aware IPsec configuration in a hub-and-spoke topology, and click **Edit** to open the Edit Endpoints Dialog Box. Select the **VRF-Aware IPsec** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks](#), page 25-34 and [Creating or Editing VPN Topologies](#), page 25-28.

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable the VRF Settings Changes on All Selected Peers | Available if you selected more than one device for editing in the Endpoints page.<br>When selected, applies any changes you make in the VRF Settings tab to all the selected devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable VRF Settings                                   | Whether to enable the configuration of VRF settings on the device.<br><b>Note</b> You can remove VRF settings that were defined for the VPN topology by deselect this check box. However, if VRF-Aware IPsec is configured on a Catalyst 6500/7600 device, disabling it requires additional steps, as explained in <a href="#">Enabling and Disabling VRF on Catalyst Switches and 7600 Devices</a> , page 25-17.                                                                                                                                                                                                                                                                                                                 |
| VRF Solution                                          | The type of VRF solution you want to configure: <ul style="list-style-type: none"> <li>1-Box (IPsec Aggregator + MPLS PE)—In the one-box solution, one device serves as the Provider Edge (PE) router that does the MPLS tagging of the packets in addition to IPsec encryption and decryption from the Customer Edge (CE) devices. For more information, see <a href="#">VRF-Aware IPsec One-Box Solution</a>, page 25-14.</li> <li>2-Box (IPsec Aggregator Only)—In the two-box solution, the PE device does just the MPLS tagging, while the IPsec Aggregator device does the IPsec encryption and decryption from the CEs. For more information, see <a href="#">VRF-Aware IPsec Two-Box Solution</a>, page 25-15.</li> </ul> |
| VRF Name                                              | The name of the VRF routing table on the IPsec Aggregator. The VRF name is case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Route Distinguisher                                   | The unique identifier of the VRF routing table on the IPsec Aggregator. This unique route distinguisher maintains the routing separation for each VPN across the MPLS core to the other PE routers.<br>The identifier can be in either of the following formats: <ul style="list-style-type: none"> <li><i>IP address:X</i> (where <i>X</i> is in the range 0- 2147483647).</li> <li><i>N:X</i> (where <i>N</i> is in the range 0-65535, and <i>X</i> is in the range 0-2147483647).</li> </ul> <b>Note</b> You cannot override the RD identifier after deploying the VRF configuration to your device. To modify the RD identifier after deployment, you must manually remove it using the device CLI, and then deploy again.    |

| Element                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Towards Provider Edge<br>(2-Box solution only.)               | <p>The VRF forwarding interface on the IPsec Aggregator towards the PE device. If the IPsec Aggregator (hub) is a Catalyst VPN service module, you must specify a VLAN.</p> <p>Enter the name of the interface or interface role object, or click <b>Select</b> to select it from a list or to create a new interface role object.</p>                                                                                                                                                                                                                                                                                                                                                   |
| Routing Protocol<br>(2-Box solution only.)                              | <p>The routing protocol to be used between the IPsec Aggregator and the PE. The options are BGP, EIGRP, OSPF, RIPv2, or Static route. The default is BGP.</p> <p>If the routing protocol used for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, select the routing protocol to use for redistributing the routing to the secured IGP.</p> <p>For information about protocols, see <a href="#">Chapter 61, “Managing Routers”</a>.</p> <p><b>Note</b> In a one-box solution, these fields are unavailable as you do not need to specify the routing protocol and AS number. In the one-box solution, only the BGP protocol is supported.</p> |
| AS Number<br>(2-Box solution, BGP or EIGRP routing only.)               | <p>The number that will be used to identify the autonomous system (AS) area between the IPsec Aggregator and the PE. The AS number must be within the range 1-65535.</p> <p>If the routing protocol used for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, enter an AS number that will be used to identify the secured IGP into which the routing will be redistributed from the IPsec Aggregator and the PE. This is relevant only when IPsec/GRE or DMVPN are applied.</p>                                                                                                                                                               |
| Process Number<br>(2-Box solution, OSPF routing only.)                  | <p>The routing process ID number that will be used to identify the secured IGP if you are using OSPF routing.</p> <p>The range is 1-65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OSPF Area ID<br>(2-Box solution, OSPF routing only.)                    | <p>The ID number of the area in which the packet belongs. You can enter any number from 0-4294967295.</p> <p><b>Note</b> All OSPF packets are associated with a single area, so all devices must have the same area ID number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Next Hop IP Address<br>(2-Box solution, static routing only.)           | <p>The IP address of the Provider Edge (PE) or the interface that is connected to the IPsec Aggregator, if you are using static routing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Redistribute Static Route<br>(2-Box solution, non-static routing only.) | <p>Whether to have static routes advertised in the routing protocol configured on the IPsec Aggregator towards the PE device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Configuring Crypto Map

Beginning with version 4.7, Security Manager enables you to manually configure the Crypto Map name and Crypto ACL name for each peer device in a VPN topology. This feature is supported only in Regular IPsec topologies.

Use the Crypto Map tab in the Edit Endpoints dialog box to list the peer devices along with the Crypto Map Name and Crypto ACL Name configured for the peers. Selecting any peer device in the list and clicking the **Edit (pencil)** button opens the Edit Crypto Map Entry dialog box.

**Note**

If the topology supports dynamic Crypto Map, the dialog box that opens on clicking the **Edit** button enables you to enter the Dynamic Crypto Map Name.

**Navigation Path**

On the Edit Endpoints Page of the Create VPN wizard or Edit VPN dialog box, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **Crypto Map** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 25-34](#).

**Field Reference**

**Table 25-11** *Edit Endpoints Dialog Box, Crypto Map Tab*

| Element                 | Default Value                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Crypto Map Name         | There is no default value. If you do not enter any value, Security Manager uses the Crypto Map Name of the device or generates a new Crypto Map Name. If a Crypto Map already exists on the VPN interface, Security Manager will reuse the same name.                                                             |
| Crypto Map Sequence     | Security Manager displays the sequence number of the device in this field after it has discovered the device in the managed network. You cannot edit this value.<br><br>If you are adding a new VPN topology, Security Manager populates the Sequence Number field with a value of #. You cannot edit this value. |
| Crypto ACL Name         | There is no default value. If you do not enter any value, Security Manager generates a new Crypto ACL name.                                                                                                                                                                                                       |
| Dynamic Crypto Map Name | There is no default value. If you do not enter any value, Security Manager uses the Crypto Map Name of the device or generates a new Crypto Map Name.                                                                                                                                                             |

- You can apply only one crypto map to an interface.
- You cannot assign the same Crypto Map Name on multiple interfaces of a device.
- You cannot assign different Crypto Map names on the same interface of a device.

**Edit Crypto Map Entry Dialog Box****Field Reference**

| Element             | Default Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Crypto Map Sequence | <p>Security Manager displays the sequence number of the device in this field after it has discovered the device in the managed network. You cannot edit this value.</p> <p>If you are adding a new VPN topology, Security Manager populates the Sequence Number field with a value of #. You cannot edit this value.</p>                                                                                                                                                                                                                                                                       |
| Crypto Mode         | <p>Beginning with Security Manager version 4.12 for ASA devices version 9.6(2) or later, you can select an option from the following Crypto Modes:</p> <ul style="list-style-type: none"> <li>• Tunnel - Default value. Encapsulation mode will be tunnel mode.</li> <li>• Transport - Encapsulation mode will be Transport mode with option to fallback on tunnel mode, if peer does not support it.</li> <li>• Transport-Require - Encapsulation mode will be Transport-Require mode only.</li> </ul> <p><b>Note</b> Transport and Transport-Require modes are supported only for IKEv2"</p> |

## Configuring High Availability in Your VPN Topology

Use the High Availability page of the Create VPN wizard and Edit VPN dialog box to define a group of hubs as a high availability (HA) group. Configuring high availability is optional.

For information on opening the Create VPN wizard or Edit VPN dialog box, see [Creating or Editing VPN Topologies, page 25-28](#).

High Availability (HA) policies provide automatic device backup when configured on Cisco IOS routers or Catalyst 6500/7600 devices that run IP over LANs. You can configure high availability in a hub-and-spoke VPN topology that uses Regular IPsec or Easy VPN technologies.

In Security Manager, HA is supported by an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. By sharing a virtual IP address, the hubs in the HA group present the appearance of a single virtual device or default gateway to the hosts on a LAN. One hub in the HA group is always active and assumes the virtual IP address, while the others are standby hubs. The hubs in the group watch for hello packets from active and standby devices. If the active device becomes unavailable for any reason, a standby hub takes ownership of the virtual IP address and takes over the hub functionality. This transfer is seamless and transparent to hosts on the LAN and to the peering devices.

Keep the following points in mind when working with HA groups:

- You can configure High Availability only on hubs in a hub-and-spoke VPN topology that uses Regular IPsec or Easy VPN technologies.
- You can configure high availability only on Cisco IOS routers or Catalyst 6500/7600 devices; however, an HA group cannot contain both Cisco IOS routers and Catalyst 6500/7600 devices.
- If you want to configure stateful failover, the HA group can contain only two hubs, and they must be Cisco IOS routers. You cannot use Catalyst 6500/7600 devices.
- You cannot configure High Availability on hubs that have been configured with VRF-Aware IPsec. See [Understanding VRF-Aware IPsec, page 25-14](#).

- You cannot configure GRE on an HA group.
- A device in an HA group can belong to more than one hub-and-spoke topology.
- A device configured as a hub in a site-to-site VPN with an HA configuration cannot be configured as a hub in a different site-to-site VPN with an HA configuration using the same outside interface. Similarly, such a device cannot be configured as a remote access VPN server on which HA is configured using the same outside interface.
- The same auto-generated preshared key must be used for authentication on all peers. If you specified not to use this option when configuring a preshared key policy, this is overridden during configuration of High Availability. For more information, see [Configuring IKEv1 Preshared Key Policies, page 26-48](#).
- During generation of configurations, all hubs in the HA group receive the same commands, which must be deployed to the HA group as a unit. You cannot deploy to individual hubs in the group.

The following table describes the options for configuring high availability.

**Table 25-13 High Availability Page**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable                        | Whether to enable high availability configuration on a group of hubs. If you already configured high availability, you can remove the configuration by deselecting this option.                                                                                                                                                                                                                                                                                                                  |
| Inside Virtual IP             | The IP address that is shared by the hubs in the HA group and that represents the inside interface of the HA group. The virtual IP address must be on the same subnet as the inside interfaces of the hubs in the HA group, but must not be identical to the IP address of any of these interfaces.<br><br><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device. |
| Inside Mask                   | The subnet mask for the inside virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VPN Virtual IP                | The IP address that is shared by the hubs in the HA group and represents the VPN interface of the HA group. This IP address serves as the hub endpoint of the VPN tunnel.<br><br><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.                                                                                                                           |
| VPN Mask                      | The subnet mask for the VPN virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Hello Interval                | The duration in seconds (within the range of 1-254) between each hello message sent by a hub to the other hubs in the group to indicate status and priority. The default is 5 seconds.                                                                                                                                                                                                                                                                                                           |
| Hold Time                     | The duration in seconds (within the range of 2-255) that a standby hub will wait to receive a hello message from the active hub before concluding that the hub is down. The default is 15 seconds.                                                                                                                                                                                                                                                                                               |
| Standby Group Number (Inside) | The standby number of the inside hub interface that matches the internal virtual IP subnet for the hubs in the HA group. The number must be within the range of 0-255. The default is 1.                                                                                                                                                                                                                                                                                                         |

**Table 25-13** High Availability Page (continued)

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standby Group Number (Outside) | <p>The standby number of the outside hub interface that matches the external virtual IP subnet for the hubs in the HA group. The number must be within the range of 0-255. The default is 2.</p> <p><b>Note</b> The outside standby group number must be different from the inside standby group number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Stateful Failover       | <p>Whether to enable stateful failover, which uses Stateful SwitchOver (SSO) to ensure that state information is shared between the HSRP devices in the HA group. If a device fails, the shared state information enables the standby device to maintain IPsec sessions without having to re-establish the tunnel or renegotiate the security associations.</p> <p>You can configure stateful failover only on an HA group that contains two hubs that are Cisco IOS routers. This check box is disabled if the HA group contains more than two hubs.</p> <p>In an Easy VPN topology, this check box appears selected and disabled, as stateful failover must always be configured.</p> <p><b>Tips:</b></p> <ul style="list-style-type: none"> <li>• When deselected in a Regular IPsec topology, stateless failover is configured on the HA group. Stateless failover will also be configured if the HA group contains more than two hubs. You can configure stateless failover on Cisco IOS routers or Catalyst 6500/7600 devices.</li> <li>• Stateful failover cannot be used when RSA Signature is the IKE authentication method.</li> <li>• Stateful failover can be configured together with PKI configuration, but only on devices with Cisco IOS version 12.3(14)T and later.</li> </ul> |

## Defining GET VPN Group Encryption

Use the GET VPN Group Encryption page to define the group settings and security associations for a GET VPN topology.

The contents of this page differ depending on whether you are using the Create VPN wizard or you are editing the Group Encryption Policy. The wizard page is not tabbed, whereas the policy is tabbed. There is an extra field on the wizard page to allow the security association configuration.

To open the GET VPN Group Encryption page:

- When creating a new GET VPN, use the Create VPN wizard. For information on starting the wizard, see [Creating or Editing VPN Topologies, page 25-28](#).

- ([Site-to-Site VPN Manager Window](#)) Select an existing GET VPN topology and then select **Group Encryption Policy** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Group Encryption Policy**, and then select an existing policy or create a new one.

The following table describes the options you can configure when defining the GET VPN group encryption settings.

**Table 25-14** GET VPN Group Encryption Policy Page

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Settings Tab</b>                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Group Name                                   | The name of the Group Name of Interpretation (GDOI) group. This name is the same as a VPN name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Group Identity                               | A parameter that is used to identify the group. All key servers and group members use this parameter to identify with the group.<br>The identity can be either a number (such as 3333) or any IP address (such as the multicast address used for rekey).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Receive Only                                 | If enabled, group members decrypt traffic and forward it in clear text. This feature is useful for testing the VPN. In normal operation, ensure that this option is not selected. For detailed information, see <a href="#">Using Passive Mode to Migrate to GET VPN, page 29-23</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Security Policy<br>(Create VPN wizard only.) | An ACL policy object to be used as the security policy. For a detailed explanation of the contents of this object and how it relates to the group member security policy, see <a href="#">Understanding the GET VPN Security Policy and Security Associations, page 29-10</a> .<br>This field appears only if you are using the Create VPN wizard. In the Group Encryption Policy, you configure the security policy on the Security Associations tab (described below).<br><b>Note</b> If you are using multicast as the method to distribute the keys, then the ACL policy object must contain a deny rule (ACE) for the multicast address. In this way, the rekey packets sent using multicast will not be encrypted by the TEK. This statement allows the group members to receive rekey packets sent using the multicast protocol. |

Table 25-14 GET VPN Group Encryption Policy Page (continued)

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authorization Type | <p>The type of authorization mechanism used by the group: None, Certificates, or Preshared Key. Selecting Certificates or Preshared Key provides additional security in allowing only authorized group members to register with the key server. This type of additional security is required when a key server serves multiple GDOI groups.</p> <p>If you select <b>Certificates</b>, you must create a list of certificate filters (using some combination of distinguished name or full-qualified domain name attributes). This filter, located on the key server, specifies the attributes and values used to validate whether the group member is authorized to join the GDOI group. Enter a name for the certificate filter, click the <b>Add Row (+)</b> button, and fill in the <a href="#">Add Certificate Filter Dialog Box</a>, page 25-58.</p> <p><b>Note</b> To configure certificate authorization, you must also configure a Public Key Infrastructure (PKI) policy for the GET VPN. The PKI enrollment object that you use should define the same distinguished names, or include the device's fully-qualified domain name, as appropriate.</p> <p>If you select <b>Preshared Key</b>, also select an ACL policy object to identify the authorized group members. Use permit rules to identify the host or network addresses of group members.</p> |
| Key Distribution   | <p>The transport method to be used to distribute keys to each group member, either unicast or multicast. For help deciding which to use, see <a href="#">Choosing the Rekey Transport Mechanism</a>, page 29-6.</p> <p>If you select <b>unicast</b>, the key server sends a rekey message to each registered group member and waits for an acknowledgment. If you select <b>multicast</b>, the key server sends a rekey message to all group members at once and does not wait for acknowledgment. Rekey messages are retransmitted after the retransmit interval configured in this policy.</p> <p>If you select <b>multicast</b>, make sure that the router used as the key server is multicast enabled, and also configure the following options:</p> <ul style="list-style-type: none"> <li>• <b>Group IP Address</b>—The IP address of the multicast group to be used for key distribution.</li> <li>• <b>Use Static IGMP Joins on Group Members</b>—If you select this option, the static Source Specific Multicast (SSM) mappings are enabled, which reveal the source of multicast traffic to the group member. In the case of GET VPN, the group member learns the key server address.</li> </ul>                                                                                                                                                        |

**Table 25-14** GET VPN Group Encryption Policy Page (continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSA Key Label                    | <p>The label for the RSA key, which is used to encrypt a variety of messages. This key can either already exist on the device, or it can be an unused new label.</p> <p>If you are creating a new VPN, you are asked at the end of the Create VPN wizard whether you want this key synchronized among the key servers; if you click <b>Yes</b>, Security Manager generates the key if it does not already exist. If you change this value for an existing GET VPN, you need to synchronize keys from the Key Servers policy. For more detailed information about how this key is used, and the key generation and synchronization process, see <a href="#">Generating and Synchronizing RSA Keys, page 29-13</a>.</p>                                                              |
| Lifetime (KEK)                   | <p>The number of seconds that the key encryption key (KEK) is valid. This key is used for encrypting rekey messages. Before the end of this lifetime, the key server sends rekey messages to the group, which includes a new KEK encryption key and transforms and new TEK encryption keys and transforms.</p> <p>The KEK lifetime value should be greater than the TEK lifetime value (it is recommended that the KEK lifetime value be at least three times greater than the TEK lifetime value). The default value of 86,400 seconds is usually appropriate. The TEK lifetime value is configured for each security association (see <a href="#">Add New or Edit Security Association Dialog Box, page 25-58</a>).</p>                                                          |
| Encryption Algorithm             | The algorithm used to encrypt the rekey message from the key server to the group member.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Retransmits                      | The number of times the rekey message can be sent if one or more group members do not receive it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interval                         | The number of seconds between retries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Security Associations Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Security Associations table      | <p>Use the Security Associations table to define security associations for the VPN. The columns in the table summarize the settings for an entry and are explained in <a href="#">Add New or Edit Security Association Dialog Box, page 25-58</a>. When creating a new VPN, the Security Policy field (explained above) is used instead of this tab, which does not appear in the wizard.</p> <p>To configure security associations:</p> <ul style="list-style-type: none"> <li>• Click the <b>Add</b> button to add an entry to the table, and fill in the Add New Security Association dialog box.</li> <li>• Select an entry and click the <b>Edit</b> button to edit an existing entry.</li> <li>• Select an entry and click the <b>Delete</b> button to delete it.</li> </ul> |

## Add Certificate Filter Dialog Box

Use the Add Certificate Filter dialog box to define a certificate filter for the group encryption policy for GET VPNs. This filter, located on the key server, specifies the attributes and values used to validate whether the group member is authorized to join the group.

Select one of the following filter types:

- **dn**—(Distinguished name.) Specify a comma separated list of *name=value* pairs in the **Subject** field. For example, OU=Cisco, C=US. When you configure the Public Key Infrastructure policy, the PKI enrollment object you select should define the same values on the Certificate Subject Name tab (see [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 26-66](#)). Using a distinguished name can let you match multiple devices with a single filter.
- **fqdn**—(Fully-qualified domain name.) Specify the fully qualified domain name of a single device (for example, router1.example.com) in the **Domain Name** field. When you configure the Public Key Infrastructure policy, the PKI enrollment object you select should have the **Include Device's FQDN** option selected. Because each device has a unique name, an FQDN filter matches a single device only.

**Tip**

To configure certificate authorization, you must also configure a Public Key Infrastructure (PKI) policy for the GET VPN. The PKI policy is configured on all devices in the VPN.

### Navigation Path

From the Group Settings tab on the GET VPN Group Encryption page, select Certificates as the authorization type and click the **Add Row** button under the Authorization Filter table, or select a filter and click the **Edit Row** button. For information on opening the Group Encryption page, see [Defining GET VPN Group Encryption, page 25-54](#).

## Add New or Edit Security Association Dialog Box

Use the Add New or Edit Security Association dialog boxes to define an IPSec profile (name and transform set only) and security policy used by the selected GET VPN topology.

### Navigation Path

To open the Add New Security Association dialog box, from the Security Associations tab on the GET VPN Group Encryption page, click the **Add Row (+)** button or select an existing association and click the **Edit Row (pencil)** button. For information on opening the Group Encryption page, see [Defining GET VPN Group Encryption, page 25-54](#).

| ID                 | <p>The sequence number of the profile. This number defines the relative priority of the security association (1 being the highest). If you have more than one security association, the ACLs for each are concatenated (and merged) in the order represented by this number, and the group members process the collected ACL as a single ACL.</p> <p>Keep the default number or enter a new one.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| IPSec Profile Name | The name of the IPSec profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Transform Sets     | The transform set policy objects (security protocols, algorithms, and other settings) defined for the IPSec profile. Separate multiple entries with commas, and place them in priority order. Click <b>Select</b> to choose from a list of predefined transform sets or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Security Policy    | <p>The access control list policy object defined for the security association. Click <b>Select</b> to choose from a list of predefined ACL objects or to create a new one. For a detailed explanation of the contents of this object and how it relates to the group member security policy, see <a href="#">Understanding the GET VPN Security Policy and Security Associations, page 29-10</a>.</p> <p><b>Note</b> If you are using multicast as the method to distribute the keys, then the ACL policy object must contain a deny rule (ACE) for the multicast address. In this way, the rekey packets sent using multicast will not be encrypted by the TEK. This statement allows the group members to receive rekey packets sent using the multicast protocol.</p> |

Table 25-15 Add New Security Association Dialog Box (continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Anti-Replay    | <p>Whether to enable the anti-replay feature, which helps prevent eavesdroppers from inserting packets into the data stream. You can configure anti-replay based on traffic counters or time:</p> <ul style="list-style-type: none"> <li>• <b>Counter Window Size</b>—Although this is the default, it is not recommended. Counter-based anti-replay is useful only if there are two group members (essentially a point-to-point VPN). Select a window size.</li> <li>• <b>Time Window Size</b>—This is the preferred method, but it requires that there are more than two group members. Enter the number of seconds of the interval duration of the Synchronous Anti-Replay (SAR) clock. The value range is 1 through 100. The default value is 100. For more information on time-based anti-replay, see <a href="#">Understanding Time-Based Anti-Replay, page 29-11</a>.</li> </ul> <p><b>Note</b> If you are encrypting high packet rates for count-based anti-replay, ensure that you do not make the KEK or TEK lifetime too long or it can take several hours for the sequence number to wrap. For example, if the packet rate is 100 kilopackets per second, the lifetime should be configured as less than 11.93 hours so that the SA is used before the sequence number wraps.</p> |
| Enable IPsec Lifetime | <p>Whether to configure an IPsec security association lifetime that overrides the global setting, which is configured in the Global Settings for GET VPN policy (see <a href="#">Configuring Global Settings for GET VPN, page 29-16</a>). This lifetime value controls how long the traffic encryption key (TEK) can be used before a rekey is required.</p> <p>Configure a value based on the volume of traffic (in kilobytes) between group members, seconds, or both. The key expires when either of the values is reached. Use the following recommendations:</p> <ul style="list-style-type: none"> <li>• The lifetime should be significantly shorter than the one used for the key encryption key (KEK) (see <a href="#">Defining GET VPN Group Encryption, page 25-54</a>), perhaps a third of the length.</li> <li>• The timed lifetime is the recommended approach, because high traffic volumes can cause excessive rekeys (with potential data loss).</li> <li>• Leave a field blank to not override that global setting.</li> </ul>                                                                                                                                                                                                                                             |

## Defining GET VPN Peers

Use the GET VPN Peers page of the Create VPN wizard to configure peer properties for the key servers and group members in a GET VPN topology. After creating the topology, use the **Key Servers** and **Group Members** policies to modify these settings. The policies are the same as the wizard page, except that the key server and group member tables are split into separate policies.

**Tip**

The list of key servers and group members includes those devices you selected on the Device Selection page of the wizard (see [Selecting Devices for Your VPN Topology, page 25-32](#)), however, you can use the **Add (+)** and **Delete (trash can)** buttons to add or remove devices from this page.

Examine the list of key servers and group members to determine if the default settings are appropriate for your VPN. You can select **Matching Interfaces** from the **Show** field below each table to display the actual interfaces that will be selected by the default interface roles. The interface roles must resolve to actual interfaces on the device for the GET VPN configuration to be valid.

**Before You Begin**

This procedure describes how to define peers for GET VPN when creating a new VPN, and explains just the GET VPN peers configuration. For information on opening the Create VPN wizard, see [Creating or Editing VPN Topologies, page 25-28](#).

**Related Topics**

- [Configuring Fail-Close to Protect Registration Failures, page 29-8](#)
- [Using Passive Mode to Migrate to GET VPN, page 29-23](#)
- [Configuring GET VPN Key Servers, page 29-18](#)
- [Configuring GET VPN Group Members, page 29-20](#)

**Step 1**

Configure the key servers if the default settings are not appropriate.

For each key server you want to modify, select it, click the **Edit (pencil)** button beneath the table, and configure at least following settings. For information on all available settings, see [Edit Key Server Dialog Box, page 29-19](#).

- **Identity Interface**—Select the interface that group members use to identify the key server and register with it. The default is the Loopback interface role, which identifies all Loopback interfaces defined on the key server.
- **Priority**—Define the role of the key server as primary or secondary by entering a priority value between 1-100. The key server with the highest priority becomes the primary key server. If two or more key servers are assigned the same priority value, the device with the highest IP address is used. The default priority is 100 for the first key server, 95 for the second, and so on.

**Note**

There can be more than one primary key server if the network is partitioned.

**Step 2**

Move key servers up or down in the table to specify the order that group members use to register with key servers. Group members register with the first key server in the list. If the first key server cannot be reached, they will register with the second key server, and so on. Note that this order does not define the overall key server priority, which is used to determine which key server is the primary key server.

**Step 3**

Configure the group members if the default settings are not appropriate.

For each group member you want to modify, select it, click the **Edit (pencil)** button beneath the table, and configure at least the following settings:

- **GET-Enabled Interface**—This is the VPN-enabled outside interface to the provider edge (PE). Traffic originating or terminating on this interface is evaluated for encryption or decryption, as appropriate. You can configure multiple interfaces by selecting an interface role object that resolves to more than one interface. Click **Select** to select an interface role object or to create a new object.

- **Interface To Be Used As Local Address**—The interface whose IP address is used to identify the group member to the key server for sending data, such as rekey information. If GET is enabled on only one interface, you do not need to specify the interface to be used as the local address. If GET is enabled on more than one interface, you must specify the interface to be used as the local address. Enter the name of the interface or interface role, or click **Select** to select an interface role.

For information on the other available settings, see [Edit Group Member Dialog Box, page 29-21](#).

## Assigning Initial Policies (Defaults) to a New VPN Topology

Use the VPN Defaults page of the Create VPN wizard to view and select the shared site-to-site VPN policies that will be assigned to the VPN topology you are creating. The page displays all the available mandatory and optional policies that can be assigned to your VPN topology, according to the selected IPsec technology. (For more information, see [Understanding Mandatory and Optional Policies for Site-to-Site VPNs, page 25-6](#).)

For information on opening the Create VPN wizard, see [Creating or Editing VPN Topologies, page 25-28](#). After you create the topology, you edit these policies directly.

For each policy type, select the shared VPN policy you want to assign to your VPN topology. Only shared policies are available for selection. Use the following tips to guide your selection:

- The initial defaults listed in this page are configured in the Security Manager Administration [VPN Policy Defaults Page, page 11-74](#). If no specific default was configured for a mandatory policy, the Factory Default policy is selected. For more information about configuring default policies, see [Understanding and Configuring VPN Default Policies, page 25-12](#).
- The shared policies listed are only those that have been committed to the database. For example, if you create a new shared IPsec Proposal policy before using the Create VPN wizard, but you do not submit (and have approved, if necessary) the policy beforehand, the new policy does not appear in the list. Ensure that you submit policies before creating a VPN if you need to use the new policies.
- If a policy is mandatory, you must make a selection. If there are no shared policies, Factory Default is your only option. You can always edit the policy after you create the topology.

### Note

If you try to select a shared policy that is currently locked by another user, a message is displayed warning you of a lock problem. To bypass the lock, select a different policy or cancel the VPN topology creation until the lock is removed. For more information, see [Understanding Policy Locking, page 5-8](#).

- If a policy is optional, and there are no shared policies, you cannot select anything. If you want the features provided by that policy, configure it after you finish creating the topology.
- To view the contents of the policy in a read-only dialog box, select the policy and click the **View Contents** button beside the policy list.
- If you are creating a topology that supports IKEv2 only, the Create VPN wizard will still create either an IKEv1 Preshared Key or IKEv1 Public Key Infrastructure policy according to your selection. There are no default configurations for IKEv2 Authentication policies. Whenever you choose to support IKEv2, you must manually edit the IKEv2 Authentication policy after creating the VPN to define at least the global IKEv2 settings. You can also create peer-specific IKEv2 overrides. When supporting IKEv2 only, you can unassign the IKEv1-specific policies created by the wizard.

When you are done, click **Finish** to create the new VPN topology. The new VPN topology appears in the VPNs selector in the Site-to-Site VPN window, with the VPN Summary page displayed. See [Viewing a Summary of a VPN Topology's Configuration, page 25-63](#).

## Viewing a Summary of a VPN Topology's Configuration

Use the VPN Summary page to view a summary of the configuration of a selected VPN topology. This includes information about the type of VPN topology, its devices, the assigned technology, and specific policies that are configured in it. The summary page is opened automatically after you create a VPN topology. When creating an Extranet VPN, it is also shown as the final step of the Create Extranet VPN wizard.

To open the VPN Summary page for a VPN topology:

- (Site-to-Site VPN Manager Window, page 25-18) Select the VPN topology, then select **VPN Summary** from the Policies list.
- (Device view) Select a device that participates in the VPN and select the **Site-to-Site VPN** policy from the Policies list. Select the VPN topology, then click the **Edit VPN Policies** button. This opens the Site-to-Site VPN Manager window with the topology selected, where you can select **VPN Summary** from the Policies list.

The following table describes the information shown on this page.

### Note

The summary for standard VPNs is significantly different from the summary for Extranet VPNs. This table is divided in two, with the top half explaining summaries for standard VPNs, and the bottom half explaining summaries for Extranet VPNs.

**Table 25-16** VPN Summary Page

| Element                                      | Description                                                                                                                                                     |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary Information for Standard VPNs</b> |                                                                                                                                                                 |
| Name                                         | The name of the VPN topology.                                                                                                                                   |
| Technology                                   | The IPsec technology assigned to the VPN topology. See <a href="#">Understanding IPsec Technologies and Policies, page 25-5</a> .                               |
| Type                                         | The VPN topology type: Hub-and-Spoke, Point-to-Point, or Full Mesh.                                                                                             |
| Description                                  | A description of the VPN topology.                                                                                                                              |
| IPsec Terminator                             | Available if the VPN topology is large scale DMVPN.<br>The name of the IPsec Terminators used to load balance GRE traffic to the hubs in the large scale DMVPN. |
| Primary Hub                                  | Available if the VPN topology type is hub-and-spoke.<br>The name of the primary hub in the hub-and-spoke topology.                                              |
| Failover Hubs                                | Available if the VPN topology type is hub-and-spoke.<br>The name of any secondary backup hubs that are configured in the hub-and-spoke topology.                |
| Number of Spokes                             | Available if the VPN topology type is hub-and-spoke.<br>The number of spokes that are included in the hub-and-spoke topology.                                   |

Table 25-16 VPN Summary Page (continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Creating or Editing Extranet VPNs

Security Manager provides a simplified method of creating a regular IPsec point-to-point VPN between a device that you are managing in Security Manager and one that is not managed. This type of VPN is called an *Extranet*.

Typically, an Extranet is a site-to-site VPN connection between your network and the network of a partner or a service provider. However, it can also be a VPN connection within your organization's network, but between devices managed by different groups, or between a Cisco device and a non-Cisco device (which Security Manager cannot manage).

Use the Create Extranet VPN wizard to create this type of point-to-point VPN topology. Creating an Extranet VPN involves specifying the devices, the VPN interfaces that are the source and destination endpoints of the VPN tunnel, and the protected networks that will be secured by the tunnel. You also specify the IKE and IPsec proposals and preshared key or certificates required to complete a secure connection.

When you edit an Extranet VPN topology, the Edit Extranet VPN dialog box contains the same pages as the Create Extranet VPN wizard, with the exception of the IKE proposal page, but the pages are laid out in a tabbed format rather than being presented as a wizard. Clicking **OK** on any tab in the dialog box saves your definitions on all the tabs. For IKE proposals, IPsec proposals, preshared keys, and Public Key Infrastructure certificates, you must edit the policies directly.

### Tips

- VPN default policies do not apply to Extranet VPNs. The settings defined on the Security Manager Administration VPN Defaults page are ignored. If you have shared policies that you want to use in the Extranet VPN configuration, you can assign them to the VPN after you create it with the Create Extranet VPN wizard. Assigning the shared policy replaces the policy created by the wizard.
- You cannot select your pre-defined IKE proposal or IPsec transform set policy objects when creating an Extranet VPN. If you have existing objects that you want to use, you can edit the relevant policies after creating the VPN and select the objects. You can then delete the objects created by the Create Extranet VPN wizard, if desired.
- After creating an Extranet VPN, you cannot convert it to a standard point-to-point VPN, where you are managing both ends of the VPN in Security Manager. Instead, you must delete and recreate the VPN.
- You can configure Extranet VPN connections for regular IPsec point-to-point connections only. For example, you cannot use this method to identify a GET VPN key server that exists in your service provider's network. To configure all other types of Extranet connections, you must add dummy unmanaged devices to the Security Manager inventory as described in [Including Unmanaged or Non-Cisco Devices in a VPN, page 25-11](#).

- [Understanding VPN Topologies, page 25-2](#)
- [Configuring VPN Topologies in Device View, page 25-19](#)
- [Understanding IPsec Technologies and Policies, page 25-5](#)
- [Using Wizards, page 1-47](#)

- 
- Step 1** Do one of the following
- To create a new Extranet VPN, in the [Site-to-Site VPN Manager Window](#) or the Site-to-Site VPN policy page (Device View), click the **Create VPN Topology (+)** button and select **Extranet VPN**. The Create Extranet VPN wizard starts with the Name and Technology page.
  - To edit an existing Extranet VPN, select the VPN topology in the Site-to-Site VPN Manager window or the Site-to-Site VPN policy page (Device View) and click the **Edit VPN Topology (pencil)** button. The Edit Extranet VPN dialog box opens to the Device Selection tab.
- Step 2** On the Name and Technology page or tab, configure the following; only the name is required:
- **Name**—A unique name that identifies the VPN topology.
  - **Description**—A description of the VPN, up to 1024 characters.

- **Creation Date**—The date on which the VPN was created. When creating the VPN, today's date is the default. However, you can click the calendar icon beside the edit box and select the desired date.
- **Ticket Number**—If you use a ticket system, and the action you are taking relates to a tracked requirement, enter the number in this field. Security Manager does not use this number; it is for your internal tracking purposes only.
- **Last Modified By**—The name, user ID, email address, or other indicator of the person who last changed the settings for the VPN. Security Manager does not use this field; it is for your internal tracking purposes only.

In the wizard, click **Next**; in the Edit Extranet VPN dialog box, click the **Device Selection** tab.

**Step 3** On the Device Selection page or tab, configure the devices, interfaces, and protected networks for each end of the connection:

- **Local**—This is the device in your managed network. The device must be in the Security Manager inventory. Configure all of these properties:
  - **Device**—Enter the display name of the device or click **Select** to select it from the list of devices in the inventory. You can select ASA 5500 series devices, PIX firewalls, or Cisco IOS routers (including ASRs).
  - **VPN Tunnel Interface**—The name of the interface or interface role that identifies the external interface for the VPN connection. Click **Select** to select an existing interface or interface role, or to create a new interface role.  
 When you select an interface or role, the IP address for the matching interface are listed in the drop-down list next to the IP Address field. Beginning with version 4.9, Security Manager supports IPv6 addresses in Extranet VPN. You can see a list of IPv4 and IPv6 addresses, by default the IPv4 address will be displayed. If no address appears, Security Manager could not determine the IP address. Check your configuration or object selection.
  - **Protected Networks**—The networks that the device is protecting for this VPN. Click **Select** to display the Protected Network Selection dialog box in which you can specify the protected networks using an interface name, interface role object, network/host group object, or ACL object. You can also use the Protected Network Selection dialog box to define new network/host group or ACL objects.

---

**Note** You can also edit the local device endpoint settings as described in [Defining the Endpoints and Protected Networks, page 25-34](#). The settings are similar to these, with the added ability to define interface role objects.

---

- **Crypto Map name**—You can manually enter the Crypto Map name for the device. There is no default value. If you do not enter any value, Security Manager uses the Crypto Map Name of the device or generates a new Crypto Map Name. If a Crypto Map already exists on the VPN interface, Security Manager will reuse the same name.
- **Crypto ACL name**—You can manually enter the Crypto ACL name for the device. There is no default value. If you do not enter any value, Security Manager generates a new Crypto ACL name.
- **Crypto Map Sequence**—Security Manager displays the sequence number of the device in this field after it has discovered the device in the managed network. You cannot edit this value. If you are adding a new VPN topology, Security Manager populates the Sequence Number field with a value of #. You cannot edit this value.

For more information see, [Configuring Crypto Map, page 25-50](#)

- **Crypto Mode**—Beginning with Security Manager version 4.12 for ASA devices version 9.6(2) or later, you can select an option from the following Crypto Modes:
  - Tunnel—Default value. Encapsulation mode will be tunnel mode.
  - Transport—Encapsulation mode will be Crypto mode with option to fallback on tunnel mode, if peer does not support it.
  - Transport-Require—Encapsulation mode will be Transport mode only. Transport Mode is supported only for IKEv2.
- **Remote**—This is the device that you are not managing in Security Manager. Configure all of these properties:
  - **Name**—The name of the device, equivalent to the display name used in the Security Manager inventory.
  - **IP Address**—The IP address of the VPN interface on the device. You can enter a maximum of 10 IP addresses using space as the delimiter. Beginning with version 4.9, Security Manager supports IPv6 addresses in addition to IPv4 addresses.

---

**Note** Beginning from version 4.8, Security Manager enables you to configure multiple peer IP addresses for the same extranet VPN configuration. This allows the next peer device in the list to act as a failover when the first device is not available for VPN services. This backup peer support is available for Cisco Adaptive Security Appliance (ASA) devices and Cisco IOS routers.

---

- **Protected Networks**—The networks that the device is protecting for this VPN. Click **Select** to display the Protected Network Selection dialog box in which you can specify the protected networks using a network/host group object or ACL object. You can also use the Protected Network Selection dialog box to define new network/host group or ACL objects.

---

**Note** You can also edit the remote device endpoint settings as described in [Defining the Endpoints and Protected Networks, page 25-34](#). However, the settings are identical to these, and you cannot specify the protected networks using an interface name or interface role object.

---

In the wizard, click **Next**. In the Edit VPN dialog box, you are finished; to edit the remaining characteristics, you must edit the IKE Proposal, IPsec Proposal, IKEv1 Preshared Key, IKEv1 Public Key Infrastructure, IKEv2 Authentication, and VPN Global Settings policies to change the settings described in the next step.

**Step 4** On the IKE Proposal page of the Create Extranet VPN wizard, define the IKE proposal, the IPsec proposal, and either the preshared key or the certificate:

- Select **IKEv1** or **IKEv2**. You can use IKEv2 on ASA 5500 series devices running release 8.4(x) only.

If you want to change IKE versions after creating the Extranet VPN, you must edit all of these policies to unassign or replace the old configuration while configuring options for the desired version: IKE Proposal, IPsec Proposal, IKEv1 Preshared Key, IKEv1 Public Key Infrastructure, IKEv2 Authentication, VPN Global Settings. For information on how IKEv1 and IKEv2 differ, see [Comparing IKE Version 1 and 2, page 26-4](#).

- Configure the IKE Phase 1 Proposal parameters. These parameters will be used to create an IKE proposal policy object with the name *ExtranetName\_ikeBB*. For an explanation of the parameters, see [Configuring IKEv1 Proposal Policy Objects, page 26-11](#) or [Configuring IKEv2 Proposal Policy Objects, page 26-14](#).

To edit these values after creating the VPN, you simply need to edit the object. You can edit the object in the Policy Object Manager or directly through the IKE Proposal policy for the VPN.

**Note** The **DH Group** attribute (for Diffie-Hellman modulus group) is called **Modulus Group** in other policies and policy objects.

- Configure the IKE Phase 2 (IPsec) Proposal parameters. Most of these parameters will be used to create an IPsec transform set policy object with the name *ExtranetName\_transformSet*. For an explanation of the parameters, see [Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 26-27](#). Note that the AH Hash Algorithm setting is available only if the local device is a router.

To edit these values after creating the VPN, you simply need to edit the object. You can edit the object in the Policy Object Manager or directly through the IPsec Proposal policy for the VPN.

The following settings are not part of the IPsec transform set object:

- **Enable Perfect Forward Secrecy, DH Group**—Whether to use a unique session key for each encrypted exchange, which prevents an attacker from decrypting a captured exchange even if the attacker knows the preshared or private keys used by both ends of the tunnel. If you select this option, also select the Diffie-Hellman (DH) modulus group to use for deriving the key. For more information on the modulus group, see [Deciding Which Diffie-Hellman Modulus Group to Use, page 26-7](#).

To change this option after creating the VPN, edit the IPsec Proposal policy.

- **Lifetime**—The number of seconds a security association will exist before expiring. The default is 3,600 seconds (one hour).

To change this option after creating the VPN, edit the VPN Global Settings policy.

- If you select **Preshared Key** for authentication, enter the key used to authenticate connections with the remote host.

To edit the key after creating the VPN, you must edit either the IKEv1 Preshared Key or IKEv2 Authentication policy depending on the IKE version you are using. The key is masked in these policies, but you can display the key by selecting the VPN Summary policy and clicking the Show Key button beside the preshared key.

- If you select **Certificate**, select the PKI enrollment object that defines the certificate name. If the required object is not yet defined, select **<Add New>** to open the Add PKI selector, from which you can add new, or edit existing, PKI enrollment objects. For more information about PKI enrollment objects, see [PKI Enrollment Dialog Box, page 26-58](#).

To edit the certificate settings after creating the VPN, you can edit the object in the Policy Object Manager or directly through either the IKEv1 Public Key Infrastructure or IKEv2 Authentication policy depending on the IKE version you are using.

In the wizard, click **Next**.

- Step 5** (Create Extranet VPN wizard only.) On the Summary page, verify that the settings are correct and click **Finish**.

Security Manager creates the topology and the required policy objects, and adds the VPN to the list of VPNs in the Site-to-Site VPN Manager.

- Step 6** If you want to configure dial backup, select the **Peers** policy and follow the instructions in [Configuring Dial Backup, page 25-40](#).
- 

## Deleting a VPN Topology

Deleting a VPN topology removes IPsec tunnels between peers and all configurations associated with the VPN topology from the devices and networks assigned to the site-to-site VPN. The actual VPN is not removed from the network until you deploy configurations.

- 
- Step 1** Do one of the following:
- Select **Manage > Site-To-Site VPNs** to open the [Site-to-Site VPN Manager Window, page 25-18](#).
  - In Device view, select a device that participates in the VPN you want to delete, then select the **Site to Site VPN** policy from the policy selector (see [Configuring VPN Topologies in Device View, page 25-19](#)).
- Step 2** Select the VPN topology you want to delete and click the **Delete VPN Topology (trash can)** button. You are asked to confirm the deletion.
-

## Configuring IKE and IPsec Policies

---

This chapter describes how to configure Internet Protocol Security (IPsec) and the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) standards to build site-to-site and remote access IPsec Virtual Private Networks (VPNs). These policies are used in regular IPsec and other types of IPsec-based VPN technologies to build VPN tunnels.

Tunneling makes it possible to use a public TCP/IP network, such as the Internet, to create secure connections between remote users and a private corporate network. Each secure connection is called a tunnel.

IPsec-based VPN technologies use the ISAKMP and IPsec tunneling standards to build and manage tunnels. ISAKMP and IPsec accomplish the following:

- Negotiate tunnel parameters.
- Establish tunnels.
- Authenticate users and data.
- Manage security keys.
- Encrypt and decrypt data.
- Manage data transfer across the tunnel.
- Manage data transfer inbound and outbound as a tunnel endpoint or router.

A device in a VPN functions as a bidirectional tunnel endpoint. It can receive plain packets from the private network, encapsulate them, create a tunnel, and send them to the other end of the tunnel where they are unencapsulated and sent to their final destination. It can also receive encapsulated packets from the public network, unencapsulate them, and send them to their final destination on the private network.

The following topics explain the basic IKE and IPsec policies and how to configure them:

- [Overview of IKE and IPsec Configurations, page 26-2](#)
- [Understanding IKE, page 26-5](#)
- [Understanding IPsec Proposals, page 26-19](#)
- [Configuring VPN Global Settings, page 26-30](#)
- [Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs, page 26-47](#)
- [Understanding Public Key Infrastructure Policies, page 26-51](#)
- [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#)

# Overview of IKE and IPsec Configurations

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection.

An IKE proposal is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations. For IKE version 1 (IKEv1), IKE proposals contain a single set of algorithms and a modulus group. You can create multiple, prioritized policies at each peer to ensure that at least one policy matches a remote peer's policy. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation, potentially making it possible to create a single IKE proposal (although you might want different proposals to give higher priority to your most desired options). You can define several IKE proposals per VPN.

You must configure several policies to define the settings required to make successful regular IPsec connections in a site-to-site or remote access VPN. The following procedure provides an overview of the steps required to complete the configuration, and points to other topics that provide detailed information for each step.

## Related Topics

- [Understanding IKE, page 26-5](#)
- [Understanding IPsec Proposals, page 26-19](#)
- [Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs, page 26-47](#)
- [Understanding Public Key Infrastructure Policies, page 26-51](#)

---

### Step 1 Configure the **IKE Proposal** policy.

In the IKE Proposal policy, you define the IKE proposal policy objects to use for making VPN connections. When defining the IKE proposal object, you select the algorithms to use for encrypting the IKE negotiation and for integrity checking, and the Diffie-Hellman group to use to operate the encryption algorithm. For IKEv1, you also determine whether you are using preshared keys or Public Key Infrastructure, whereas in IKEv2, the IKE proposal does not include a specification for authentication mode.

The following topics explain how to configure the IKE Proposal policy:

- [Configuring an IKE Proposal, page 26-9](#)
  - [Configuring IKEv1 Proposal Policy Objects, page 26-11](#)
  - [Configuring IKEv2 Proposal Policy Objects, page 26-14](#)
- [Configuring the IKE Proposal for GET VPN, page 29-15](#)

### Step 2 Complete the authentication mode configuration.

Your selection for authentication mode in the IKEv1 proposal, and your decision on which mode to use for IKEv2, controls what other policies are required to complete the authentication mode configuration:

- Preshared keys—For remote access IKEv1 IPsec VPNs, you define the preshared keys in the **Connection Profiles** policy; preshared keys are not supported for IKEv2 in remote access VPNs. For site-to-site VPNs, you define the keys in the **IKEv1 Preshared Keys** or the **IKEv2 Authentication** policy based on the IKE version you are using.

The following topics explain preshared key configuration:

- [IPSec Tab \(Connection Profiles\), page 31-19](#)
  - [Configuring IKEv1 Preshared Key Policies, page 26-48](#)
  - [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#)
- Public Key Infrastructure Certificate Authority servers—If you configure IKE to use Certificate Authority (CA) servers, you must configure the **Public Key Infrastructure** policy. You also use this policy to define the Public Key Infrastructure for SSL VPNs. For site-to-site VPNs, the policy is **IKEv1 Public Key Infrastructure** or **IKEv2 Authentication**, based on the IKE version you are using.

The Public Key Infrastructure policy identifies the PKI enrollment object that identifies the Certificate Authority server. For site-to-site VPNs, you can select a single PKI enrollment object; for remote access VPNs, you can select all objects needed for your remote access connections. These trustpoints are then identified in the remote access **Connection Profiles** policy (on the IPsec tab).

The following topics explain public key infrastructure configuration:

- [Understanding Public Key Infrastructure Policies, page 26-51](#)
- [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 26-54](#)
- [Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs, page 26-55](#)
- [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#)
- [IPSec Tab \(Connection Profiles\), page 31-19](#)
- [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#)

- Step 3** Configure the **IPsec Proposal** policy. The IPsec Proposal policy defines the IPsec transform set policy objects used to create a secure IPsec tunnel for the VPN.

The following topics explain how to configure the IPsec Proposal policy:

- [Configuring IPsec Proposals in Site-to-Site VPNs, page 26-22](#)
  - [Selecting the IKE Version for Devices in Site-to-Site VPNs, page 26-26](#)
  - [Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 26-27](#)
- [Configuring an IPsec Proposal for Easy VPN, page 28-10](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 31-40](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\), page 33-3](#)

- Step 4** Configure the **Global Settings** policy.

The **Global Settings** (remote access) and **VPN Global Settings** (site-to-site) policies define various ISAKMP, IKEv1, IKEv2, IPsec, NAT, fragmentation, and other settings. These settings have default values that are frequently adequate, so normally you need to configure the Global Settings policy only if you want non-default behavior. However, you must configure the policy for remote access IKEv2 IPsec VPNs, because you must specify a remote access global trustpoint on the **IKEv2 Settings** tab.

The following topics explain how to configure the Global Settings policy:

- [Configuring VPN Global Settings, page 26-30](#)

- [Configuring VPN Global ISAKMP/IPsec Settings, page 26-33](#)
- [Configuring VPN Global IKEv2 Settings, page 26-37](#)
- [Configuring VPN Global NAT Settings, page 26-42](#)
- [Configuring VPN Global General Settings, page 26-44](#)
- [Configuring Global Settings for GET VPN, page 29-16](#)

**Step 5** If you are configuring a remote access IKEv2 IPsec VPN, you must also configure several policies for SSL VPN. IKEv2 shares several configuration settings with SSL VPNs. For information on the other policies you need to configure, see [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\), page 30-25](#).

## Comparing IKE Version 1 and 2

There are two versions of IKE: version 1 (IKEv1) and version 2 (IKEv2). When you configure IKE on a device that supports IKEv2, you have the option of configuring either version alone, or both versions together. When the device attempts to negotiate a connection with another peer, it uses whichever versions you allow and that the other peer accepts. If you allow both versions, the device automatically falls back to the other version if negotiations are unsuccessful with the initially chosen version (IKEv2 is always tried first if it is configured). Both peers must support IKEv2 to use it in a negotiation.

### Tip

Security Manager supports IKEv2 on ASA 8.4(1)+ only. For remote access IPsec VPNs, users must use the AnyConnect 3.0+ client to complete IKEv2 connections, and IKEv2 connections use the same license pool that is used for SSL VPN connections. The legacy VPN Client is used for IKEv1 remote access connections on ASAs. For more information about device support in VPNs, see [Understanding Devices Supported by Each IPsec Technology, page 25-9](#).

IKEv2 differs from IKEv1 in the following ways:

- IKEv2 fixes the Photuris style cookie mechanism.
- IKEv2 has fewer round trips in a negotiation than IKEv1, two round trips versus five for IKEv1 for a basic exchange.
- Transform options are OR'ed, which means that you can specify multiple options in a single proposal rather than creating separate unique proposals for each allowed combination.
- Built-in dead peer detection (DPD).
- Built-in configuration payload and user authentication mode.
- Built-in NAT traversal (NAT-T). IKEv2 uses ports 500 and 4500 for NAT-T.
- Improved re-keying and collision handling.
- A single security association (SA) can protect multiple subnets, which improves scalability.
- Asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys, different certificates, or one side a key and the other side a certificate.
- For remote access IPsec VPNs, you can configure double authentication for IKEv2 connections in the same way that you configure them for remote access SSL VPNs. IKEv1 does not support double authentication.

- [Configuring an IKE Proposal, page 26-9](#)

## Understanding IKE

Internet Key Exchange (IKE), also called Internet Security Association and Key Management Protocol (ISAKMP), is the negotiation protocol that lets two hosts agree on how to build an IPsec security association (SA). It provides a common framework for agreeing on the format of SA attributes. This includes negotiating with the peer about the SA, and modifying or deleting the SA. IKE creates the cryptographic keys used to authenticate IPsec peers, negotiates and distributes IPsec encryption keys, and automatically establishes IPsec security associations.

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, creating the first tunnel that enables the peers to communicate securely in Phase 2, protecting later ISAKMP negotiation messages. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec, which protects the data sent between peers. Both phases use proposals when they negotiate a connection.

An IKE proposal is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations. In remote access IPsec VPNs, you can define several IKE proposals per VPN to create multiple, prioritized policies at each peer to ensure that at least one policy matches a remote peer's policy. For site-to-site VPNs, you can create a single IKE proposal.

To define an IKE proposal, you must specify:

- A unique priority (1 through 65,543, with 1 the highest priority).
- An encryption method for the IKE negotiation, to protect the data and ensure privacy. See [Deciding Which Encryption Algorithm to Use, page 26-6](#).
- A Hashed Message Authentication Codes (HMAC) method (called *integrity algorithm* in IKEv2) to ensure the identity of the sender, and to ensure that the message has not been modified in transit. See [Deciding Which Hash Algorithm to Use, page 26-6](#).
- For IKEv2, a separate pseudo-random function (PRF) used as the algorithm to derive keying material and hashing operations required for the IKEv2 tunnel encryption. The options are the same as those used for the hash algorithm; see [Deciding Which Hash Algorithm to Use, page 26-6](#).
- A Diffie-Hellman group to determine the strength of the encryption-key-determination algorithm. The device uses this algorithm to derive the encryption and hash keys. See [Deciding Which Diffie-Hellman Modulus Group to Use, page 26-7](#).
- An authentication method, to ensure the identity of the peers. See [Deciding Which Authentication Method to Use, page 26-8](#).
- A limit to the time the device uses an encryption key before replacing it.

**Tip**

(ASA devices only.) With IKEv1 policies, for each parameter, you set one value. For IKEv2, you can configure multiple encryption, integrity, PRF, and Diffie-Hellman options. The ASA orders the settings from the most secure to the least secure and negotiates with the peer using that order. This allows you to potentially send a single proposal to convey all the allowed transforms instead of the need to send each allowed combination as with IKEv1.

When IKE negotiation begins, the peer that initiates the negotiation sends all of its policies to the remote peer, and the remote peer searches for a match with its own policies, in priority order.

A match between IKE policies exists if they have the same encryption, hash (integrity and PRF for IKEv2), authentication, and Diffie-Hellman values, and an SA lifetime less than or equal to the lifetime in the policy sent. If the lifetimes are not identical, the shorter lifetime—from the remote peer policy—applies. If no match exists, IKE refuses negotiation and the IKE SA is not established.

The following topics explain how to configure IKE proposals:

- [Configuring an IKE Proposal, page 26-9](#)
- [Configuring IKEv1 Proposal Policy Objects, page 26-11](#)
- [Configuring IKEv2 Proposal Policy Objects, page 26-14](#)
- [Configuring the IKE Proposal for GET VPN, page 29-15](#)

## Deciding Which Encryption Algorithm to Use

When deciding which encryption and hash algorithms to use for the IKE proposal, your choice is limited to algorithms that are supported by the devices in the VPN.

You can choose from the following encryption algorithms:

- DES (Data Encryption Standard) is a symmetric secret-key block algorithm. It is faster than 3DES and uses less system resources, but it is also less secure. If you do not need strong data confidentiality, and if system resources or speed is a concern, you should choose DES.
- 3DES (Triple DES) is more secure because it processes each block of data three times, each time with a different key. However, it uses more system resources and is slower than DES. 3DES is the recommended encryption algorithm, assuming that the devices support it.
- AES (Advanced Encryption Standard) provides greater security than DES and is computationally more efficient than 3DES. AES offers three different key strengths: 128-, 192- and 256-bit keys. A longer key provides higher security but a reduction in performance. When you configure IKE on a router, the router must use Cisco IOS Software 12.3T or later to use AES.

---

**Note** AES cannot be used in conjunction with a hardware encryption card.

---

- [Understanding IKE, page 26-5](#)
- [Configuring an IKE Proposal, page 26-9](#)

## Deciding Which Hash Algorithm to Use

You can choose from the following hash algorithms. In IKEv2, the hash algorithm is separated into two options, one for the integrity algorithm, and one for the pseudo-random function (PRF).

- SHA (Secure Hash Algorithm) is more resistant to brute-force attacks than MD5. However, it is also more resource intensive than MD5. For implementations that require the highest level of security, use the SHA hash algorithm.

Standard SHA produces a 160-bit digest.

The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices:

- SHA512—A 512-bit key.
  - SHA384—A 384-bit key.
  - SHA256—A 256-bit key.
- MD5 (Message Digest 5) produces a 128-bit digest and uses less processing time for an overall faster performance than SHA, but it is considered to be weaker than SHA.

## Deciding Which Diffie-Hellman Modulus Group to Use

Security Manager supports the following Diffie-Hellman key derivation algorithms to generate IPsec security association (SA) keys. Each group has a different size modulus. A larger modulus provides higher security, but requires more processing time. You must have a matching modulus group on both peers.

Tip

---

If you select AES encryption, to support the large key sizes required by AES, ISAKMP negotiation should use Diffie-Hellman (DH) Group 5 or later. For IKEv1, ASA devices support DH group 14 only.

---

- Diffie-Hellman Group 1: 768-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 768 bits.

---

**Note** Beginning with Cisco Security Manager 4.19, DH group 1 option is not supported for ASA 9.12(1) and later devices.

---

- Diffie-Hellman Group 2: 1024-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 1024 bits. Cisco VPN Client Version 3.x or later requires a minimum of Group 2.
- Diffie-Hellman Group 5: 1536-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 2048 bits. Considered good protection for 128-bit keys, but group 14 is better.
- Diffie-Hellman Group 7: Use to generate IPsec SA keys when the elliptical curve field size is 163 characters. Group 7 is not supported on a Catalyst 6500/7600 device with VPNSM or VPN SPA configuration.
- Diffie-Hellman Group 14: 2048-bit modulus. Considered good protection for 128-bit keys. (ASA 9.0.1+ devices only).

---

**Note** Beginning with Cisco Security Manager 4.20, DH group 14 is supported, and is the default DH group, for IKEv1 and IKEv2 on ASA 9.13(1) and later devices.

---

- Diffie-Hellman Group 15: 3072-bit modulus. Considered good protection for 192-bit keys.
- Diffie-Hellman Group 16: 4096-bit modulus. Considered good protection for 256-bit keys.

**Note** Beginning with Cisco Security Manager 4.20, DH groups 15 and 16 are supported for IKEv2 on ASA 9.13(1) and later devices.

- Diffie-Hellman Group 19: (256-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 20: (384-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 21: (521-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 24: ( 2048-bit modulus and 256-bit prime order subgroup). (ASA 9.0.1+ devices only).

**Note** DH groups 2, 5, and 24 will not be supported for ASA 9.14.(1) and later devices.

## Deciding Which Authentication Method to Use

Security Manager supports two methods for peer device authentication in a VPN communication:

- **Preshared Key**—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. The same shared key must be configured at each peer or the IKE SA cannot be established.

To use IKE successfully with this device authentication method, you must define various preshared key parameters. For more information, see the appropriate topic:

- Site-to-site VPN, IKEv1 configuration—See [Configuring IKEv1 Preshared Key Policies, page 26-48](#).
- Site-to-site VPN, IKEv2 configuration—See [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).
- Remote access IPsec VPN, IKEv1—Configured on the IPsec tab of the connection profile. See [IPSec Tab \(Connection Profiles\), page 31-19](#).
- Remote access IPsec VPN, IKEv2—You cannot use preshared keys when using IKEv2 in a remote access IPsec VPN. You must use certificates.
- **Certificate**—An authentication method in which RSA key pairs are used to sign and encrypt IKE key management messages. Certificates provide non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When using this authentication method, peers are configured to obtain digital certificates from a Certification Authority (CA). CAs manage certificate requests and issue certificates to participating IPsec network devices. These services provide centralized key management for the participating devices.

While the use of preshared keys does not scale well, using a CA does improve the manageability and scalability of your IPsec network. With a CA, you do not need to configure keys between all encrypting devices. Instead, each participating device is registered with the CA, and requests a certificate from the CA. Each device that has its own certificate and the public key of the CA can authenticate every other device within a given CA's domain.

To use IKE successfully with the Certificate authentication method, you must define parameters for CA authentication and enrollment. For more information, see the appropriate topic:

- Site-to-site VPN, IKEv1 configuration—See [Understanding Public Key Infrastructure Policies, page 26-51](#).
- Site-to-site VPN, IKEv2 configuration—[Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).
- Remote access IPsec VPN, IKEv1—Configured on the IPsec tab of the connection profile as explained in [IPsec Tab \(Connection Profiles\), page 31-19](#). You must also configure the Public Key Infrastructure policy with the same trustpoint; see [Understanding Public Key Infrastructure Policies, page 26-51](#).
- Remote access IPsec VPN, IKEv2—Configure the global trustpoint on the IKEv2 Settings tab of the Global Settings policy as explained in [Configuring VPN Global IKEv2 Settings, page 26-37](#). You must also configure the Public Key Infrastructure policy with the same trustpoint; see [Understanding Public Key Infrastructure Policies, page 26-51](#).

#### Related Topics

- [Understanding IKE, page 26-5](#)
- [Configuring an IKE Proposal, page 26-9](#)

## Configuring an IKE Proposal

In Security Manager, an IKE proposal is a mandatory policy when you configure a site-to-site or remote access IPsec VPN. When you use the configuration wizard to create a new IPsec VPN, an IKE Proposal policy is automatically assigned to the VPN; the policy might be the factory default, or it might be a shared policy specifically selected for the VPN. For more information about the IKE (Internet Key Exchange) key management protocol, see [Understanding IKE, page 26-5](#).

Use the IKE Proposal policy to examine the current IKE proposals and to configure new proposals except for GET VPN topologies. For GET VPN, see [Configuring the IKE Proposal for GET VPN, page 29-15](#).

#### Note

Beginning with Cisco Security Manager version 4.17, you can configure and deploy IKE Proposal policy on ASA multi-context devices running the software version 9.9(2) or later.

#### Tips

- For site-to-site VPNs, you can select at most one IKE proposal per IKE version. For remote access IPsec VPNs, you can select multiple proposals for each IKE version; select all IKE proposals that are allowed in the remote access VPN.
- To configure IKEv2 (version 2), the device must be an ASA running ASA Software release 8.4(1) or later.
- The IPsec Proposal policy must enable IKEv1, IKEv2, or both, to match the IKE proposals you configure in this policy. In cases where you cannot configure IKEv2 in the IPsec proposal, such as in Easy VPN topologies, IKEv2 is not supported. For more information, see [Understanding IPsec Proposals, page 26-19](#).
- The IKEv1 Proposal objects specify whether preshared keys or certificates are used for authentication. If the IKEv1 Proposal object is of certificate authentication type, ensure that you specify the appropriate CA Server in the IKEv1 Public Key Infrastructure (from Policy Selector) policy. For preshared keys, ensure that the IKEv1 Preshared Key policy is assigned. For IKEv2, the

object does not specify whether preshared keys or certificates are used, but other policies must define the authentication requirements. For more information, see [Deciding Which Authentication Method to Use, page 26-8](#).

- For Regular IPsec VTI technology, you can specify only one of the IKE Proposals—IKEv1 proposal or IKEv2 proposal. That is, if you have selected IKE version 1 for the Regular IPsec VTI, (in the IKE Proposal window) you must be specifying the IKEv1 Proposal and leave the IKEv2 Proposal field blank and vice versa.

- 
- Step 1** Do one of the following to open the IKE Proposal policy based on the type of VPN you are configuring:
- For remote access VPNs, do one of the following:
    - (Device View) Select **Remote Access VPN > IPsec VPN > IKE Proposal** from the Policy selector.
    - (Policy View) Select **Remote Access VPN > IPsec VPN > IKE Proposal** from the Policy Type selector. Select an existing policy or create a new one.
  - For site-to-site VPNs, do one of the following:
    - Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a topology (other than GET VPN) in the VPNs selector, then select **IKE Proposal** in the Policies selector.
    - (Policy view) Select **Site-to-Site VPN > IKE Proposal** from the Policy Types selector. Select an existing shared policy or create a new one.
- Step 2** Click **Select** against the appropriate IKE versions to choose the policy objects that define the settings for an IKE version 1 or version 2 proposal. Configure proposals only for those IKE versions supported in the VPN.

**Note** Beginning with 4.16, Cisco Security Manager does not support IKEv1 configuration for Firepower 9300 devices with distributed mode.

- To select an IKE proposal for site-to-site VPNs, simply highlight it in the available proposals list. For remote access IPsec VPNs, highlight the desired objects in the available proposals list and click >> to move them to the selected proposals list.
  - To remove an IKE proposal for remote access IPsec VPNs, highlight it in the selected proposals list and click << to move it to the available proposals list.
  - To create a new IKE proposal, click the **Create (+)** button beneath the available proposals list. The Add IKEv1 or IKEv2 Proposal dialog box opens. For instructions on creating the object, see the following topics:
    - [Configuring IKEv1 Proposal Policy Objects, page 26-11](#)
    - [Configuring IKEv2 Proposal Policy Objects, page 26-14](#)
  - To edit an object, or to view its settings, select it and click the **Edit (pencil)** button beneath the list.
-

## Configuring IKEv1 Proposal Policy Objects

Use the IKEv1 Proposal dialog box to create, copy, and edit an IKEv1 proposal object.

Internet Key Exchange (IKE) version 1 proposal objects contain the parameters required for IKEv1 proposals when defining remote access and site-to-site VPN policies. IKE is a key management protocol that facilitates the management of IPsec-based communications. It is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes security associations (SAs) for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. For more information about IKE proposals, see the following topics:

- [Overview of IKE and IPsec Configurations, page 26-2](#)
- [Comparing IKE Version 1 and 2, page 26-4](#)
- [Understanding IKE, page 26-5](#)
- [Deciding Which Encryption Algorithm to Use, page 26-6](#)
- [Deciding Which Hash Algorithm to Use, page 26-6](#)
- [Deciding Which Diffie-Hellman Modulus Group to Use, page 26-7](#)
- [Deciding Which Authentication Method to Use, page 26-8](#)

### Navigation Path

Select **Manage > Policy Objects**, then select **IKE Proposals > IKEv1 Proposals** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

#### Tip

You can also access this dialog box when configuring the IKE Proposal policy as explained in [Configuring an IKE Proposal, page 26-9](#).

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority             | <p>The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, the device tries to use the parameters defined in the policy with the next lowest priority number.</p> <p>Valid values range from 1 to 10000. The lower the number, the higher the priority. If you leave this field blank, Security Manager assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.</p>                                                                                               |
| Encryption Algorithm | <p>The encryption algorithm used to establish the Phase 1 SA for protecting Phase 2 negotiations:</p> <ul style="list-style-type: none"> <li>• AES-128—Encrypts according to the Advanced Encryption Standard using 128-bit keys.</li> <li>• AES-192—Encrypts according to the Advanced Encryption Standard using 192-bit keys.</li> <li>• AES-256—Encrypts according to the Advanced Encryption Standard using 256-bit keys.</li> <li>• DES—Encrypts according to the Data Encryption Standard using 56-bit keys.</li> <li>• 3DES—Encrypts three times using 56-bit keys. 3DES is more secure than DES, but requires more processing for encryption and decryption. It is less secure than AES. A 3DES license is required to use this option.</li> </ul> |
| Hash Algorithm       | <p>The hash algorithm used in the IKE proposal. The hash algorithm creates a message digest, which is used to ensure message integrity. Options are:</p> <ul style="list-style-type: none"> <li>• SHA (Secure Hash Algorithm)—Produces a 160-bit digest. SHA is more resistant to brute-force attacks than MD5.</li> <li>• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA.</li> </ul>                                                                                                                                                                                                                                                                                                                            |

Table 26-1 IKEv1 Proposal Dialog Box (continued)

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modulus Group | <p>The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Options are:</p> <p><b>Tip</b> For IKEv1, ASA devices support DH group 14 only.</p> <ul style="list-style-type: none"> <li>• 1—Diffie-Hellman Group 1 (768-bit modulus).</li> </ul> <p><b>Note</b> Beginning with Cisco Security Manager 4.19, DH group 1 option is not supported for ASA 9.12(1) and later devices. The default value will be Group 2.</p> <ul style="list-style-type: none"> <li>• 2—Diffie-Hellman Group 2 (1024-bit modulus).</li> <li>• 5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or later).</li> </ul> <p><b>Note</b> DH groups 2, 5, and 24 will not be supported for ASA 9.14.(1) and later devices.</p> <ul style="list-style-type: none"> <li>• 7—Diffie-Hellman Group 7 (163-bit elliptical curve field size).</li> <li>• 14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys).</li> </ul> <p><b>Note</b> Beginning with Cisco Security Manager 4.20, DH group 14 is supported, and is the default DH group, for IKEv1 on ASA 9.13(1) and later devices.</p> <ul style="list-style-type: none"> <li>• 15—Diffie-Hellman Group 15 (3072-bit modulus, considered good protection for 192-bit keys).</li> <li>• 16—Diffie-Hellman Group 16 (4096-bit modulus, considered good protection for 256-bit keys).</li> </ul> <p><b>Note</b> Although Diffie-Hellman groups 15 and 16 are listed, they are not supported for IKEv1 and will cause a validation error if selected for IKEv1 policies.</p> |
| Lifetime      | <p>The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. As a general rule, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.</p> <p>You can specify a value from 60 to 2147483647 seconds. The default is 86400.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Method | <p>The method of authentication to use between the two peers. For information on how this selection determines which other policies you must configure, see <a href="#">Deciding Which Authentication Method to Use, page 26-8</a>. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Preshared Key</b>—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.</li> <li>• <b>Certificate</b>—An authentication method in which RSA key pairs are used to sign and encrypt IKE key management messages. This method provides non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When you use this authentication method, the peers are configured to obtain digital certificates from a Certification Authority (CA).</li> </ul> |
| Category              | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring IKEv2 Proposal Policy Objects

Use the IKEv2 Proposal dialog box to create, copy, and edit an IKEv2 proposal object. You can use IKEv2 proposals with ASA Software release 8.4(1)+ only.

Internet Key Exchange (IKE) version 2 proposal objects contain the parameters required for IKEv2 proposals when defining remote access and site-to-site VPN policies. IKE is a key management protocol that facilitates the management of IPsec-based communications. It is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes security associations (SAs) for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation. For more information about IKE proposals, see the following topics:

- [Overview of IKE and IPsec Configurations, page 26-2](#)
- [Comparing IKE Version 1 and 2, page 26-4](#)
- [Understanding IKE, page 26-5](#)
- [Deciding Which Encryption Algorithm to Use, page 26-6](#)
- [Deciding Which Hash Algorithm to Use, page 26-6](#)
- [Deciding Which Diffie-Hellman Modulus Group to Use, page 26-7](#)

**Tip**

Unlike IKEv1, you do not specify the authentication method in the IKE proposal. For more information on how to configure the authentication method in IKEv2, see [Deciding Which Authentication Method to Use, page 26-8](#).

**Navigation Path**

Select **Manage > Policy Objects**, then select **IKE Proposals > IKEv2 Proposals** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

**Tip**

You can also access this dialog box when configuring the IKE Proposal policy as explained in [Configuring an IKE Proposal, page 26-9](#).

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description | A description of the policy object. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Priority    | The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, the device tries to use the parameters defined in the policy with the next lowest priority number.<br><br>Valid values range from 1 to 65535. The lower the number, the higher the priority. If you leave this field blank, Security Manager assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5. |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Integrity (Hash) Algorithm | <p>The integrity portion of the hash algorithm used in the IKE proposal. The hash algorithm creates a message digest, which is used to ensure message integrity. Click <b>Select</b> and select all of the algorithms that you want to allow in the VPN:</p> <p><b>Note</b> If using AES-GCM, AES-GCM-192, or AES-GCM-256, you must select Null as the Integrity Algorithm.</p> <ul style="list-style-type: none"> <li>• SHA (Secure Hash Algorithm)—SHA is more resistant to brute-force attacks than MD5.<br/>Standard SHA produces a 160-bit digest.<br/>The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices: <ul style="list-style-type: none"> <li>– SHA512—A 512-bit key.</li> <li>– SHA384—A 384-bit key.</li> <li>– SHA256—A 256-bit key.</li> </ul> </li> <li>• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA.</li> <li>• Null—No encryption algorithm. For use with AES-GCM, AES-GCM-192, and AES-GCM-256 only.</li> </ul> |
| Prf Algorithm              | <p>The pseudo-random function (PRF) portion of the hash algorithm used in the IKE proposal. In IKEv1, the Integrity and PRF algorithms are not separated, but in IKEv2, you can specify different algorithms for these elements. Click <b>Select</b> and select all of the algorithms that you want to allow in the VPN. The options are described above under Integrity Algorithm.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 26-2 IKEv2 Proposal Dialog Box (continued)

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modulus Group | <p>The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Click <b>Select</b> and select all of the groups that you want to allow in the VPN:</p> <ul style="list-style-type: none"> <li>1—Diffie-Hellman Group 1 (768-bit modulus).</li> </ul> <p><b>Note</b> Beginning with Cisco Security Manager 4.19, DH group 1 option is not supported for ASA 9.12(1) and later devices.</p> <ul style="list-style-type: none"> <li>2—Diffie-Hellman Group 2 (1024-bit modulus).</li> <li>5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or later).</li> <li>14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys). (ASA 9.0.1+ devices only).</li> </ul> <p><b>Note</b> Beginning with Cisco Security Manager 4.20, DH group 14 is supported, and is the default DH group, for IKEv2 on ASA 9.13(1) and later devices.</p> <ul style="list-style-type: none"> <li>15—Diffie-Hellman Group 15 (3072-bit modulus, considered good protection for 192-bit keys). (ASA 9.13.1+ devices only).</li> <li>16—Diffie-Hellman Group 16 (4096-bit modulus, considered good protection for 256-bit keys). (ASA 9.13.1+ devices only).</li> <li>19—Diffie-Hellman Group 19 (256-bit elliptical curve field size). (ASA 9.0.1+ devices only).</li> <li>20—Diffie-Hellman Group 20 (384-bit elliptical curve field size). (ASA 9.0.1+ devices only).</li> <li>21—Diffie-Hellman Group 21 (521-bit elliptical curve field size). (ASA 9.0.1+ devices only).</li> <li>24—Diffie-Hellman Group 24 (2048-bit modulus and 256-bit prime order subgroup). (ASA 9.0.1+ devices only).</li> </ul> <p><b>Note</b> DH groups 2, 5, and 24 will not be supported for ASA 9.14.(1) and later devices.</p> |
| Lifetime      | <p>The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. As a general rule, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.</p> <p>You can specify a value from 120 to 2147483647 seconds. The default is 86400.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Category      | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Understanding IPsec Proposals

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers, which can be devices in a site-to-site VPN or a device and user in remote access IPsec VPNs. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms called a transform set.

An IPsec proposal is used in Phase 2 of an IKE negotiation, as explained in [Understanding IKE, page 26-5](#). The specific content of the proposal varies according to topology type (site-to-site or remote access) and device type, although the proposals are broadly similar and contain many of the same elements, such as IPsec transform sets.

The following topics explain IPsec proposal concepts and procedures in more detail:

## Understanding IPsec Proposals for Site-to-Site VPNs

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. Pure IPsec configurations cannot use routing protocols—the policy created is used for pure IPsec provisioning. You can configure pure IPsec on Cisco IOS routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) devices.

With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms called a transform set.

In Security Manager, you use an IPsec Proposal policy to define the settings required for a IPsec tunnels. An IPsec proposal is a collection of one or more crypto maps that are applied to the VPN interfaces on the devices. A crypto map combines all the components required to set up IPsec security associations, including transform sets. A crypto map can also be configured with Reverse Route Injection (RRI).

The following topics provide more information:

- [Understanding Crypto Maps, page 26-20](#)
- [Understanding Transform Sets, page 26-20](#)

## Understanding Crypto Maps

A crypto map combines all components required to set up IPsec security associations (SA), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. A crypto map entry is a named series of CLI commands. Crypto map entries with the same crypto map name (but different map sequence numbers) are grouped into a crypto map set, which is applied to the VPN interfaces on relevant devices. All IP traffic passing through the interface is evaluated against the applied crypto map set.

When two peers try to establish an SA, they must each have at least one compatible crypto map entry. The transform set defined in the crypto map entry is used in the IPsec security negotiation to protect the data flows specified by that crypto map's IPsec rules.

Dynamic crypto map policies are used in site-to-site VPNs when an unknown remote peer tries to initiate an IPsec security association with the local hub. The hub cannot be the initiator of the security association negotiation. Dynamic crypto policies allow remote peers to exchange IPsec traffic with a local hub even if the hub does not know the remote peer's identity. You can create a dynamic crypto policy on individual hubs or on a device group that contains hubs. The policy is written only to the hubs, not to any spokes that might be contained in the group. A dynamic crypto map policy essentially creates a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer's requirements. The peer addresses for dynamic or static crypto maps are deduced from the VPN topology.

Dynamic crypto map policies apply only in a hub-and-spoke VPN configuration—in a point-to-point or full mesh VPN topology, you can apply only static crypto map policies.

**Note**

---

(Site-to-site VPNs.) Except for Extranet VPNs, Security Manager can manage an existing VPN tunnel only if the tunnel's peers are managed by Security Manager. In such a case, Security Manager uses the same crypto map name for the tunnel on the peers. On subsequent deployments, only Security Manager tunnels are managed (Security Manager maintains a log of all tunnels that were configured).

## Understanding Transform Sets

A transform set is a combination of security protocols and algorithms that secure traffic in an IPsec tunnel. During the IPsec security association (SA) negotiation, peers search for a transform set that is the same at both peers. When such a transform set is found, it is applied to create an SA that protects data flows in the access list for that crypto map, protecting the traffic in the VPN.

There are separate IPsec transform sets for IKEv1 and IKEv2. With IKEv1 transform sets, for each parameter, you set one value. For IKEv2 transform sets, you can configure multiple encryption and integration algorithms for a single proposal. ASA devices order the settings from the most secure to the least secure and negotiate with the peer using that order. This allows you to potentially send a single proposal to convey all the allowed combinations instead of the need to send each allowed combination individually as with IKEv1.

You can specify a number of transform sets per IPsec proposal policy. If you are defining the policy on a spoke or a group of spokes, you do not usually have to specify more than one transform set. This is because the spoke's assigned hub would typically be a higher performance router capable of supporting any transform set that the spoke supports. However, if you are defining the policy on a hub for dynamic crypto, you should specify more than one transform set to ensure that there will be a transform set match between the hub and the unknown spoke. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security is used.

Security Manager provides predefined transform sets that you can use in your tunnel policies. You can also create your own transform sets. For more information, see [Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects](#), page 26-27.

### Selecting Tunnel Mode for IKEv1 Transform Sets

When defining an IKEv1 transform set, you must specify which IPsec mode of operation to use—tunnel mode or transport mode. You can use the AH and ESP protocols to protect an entire IP payload (Tunnel mode) or just the upper-layer protocols of an IP payload (Transport mode).

In tunnel mode (the default), the entire original IP datagram is encrypted, and it becomes the payload in a new IP packet. This mode allows a router to act as an IPsec proxy. That is, the router performs encryption on behalf of the hosts. The source's router encrypts packets and forwards them along the IPsec tunnel. The destination's router decrypts the original IP datagram and forwards it on to the destination system. The major advantage of tunnel mode is that the end systems do not need to be modified to enjoy the benefits of IPsec. Tunnel mode also protects against traffic analysis. With tunnel mode, an attacker can only determine the tunnel endpoints and not the true source and destination of the tunneled packets, even if they are the same as the tunnel endpoints.

In transport mode, only the IP payload is encrypted, and the original IP headers are left intact. This mode has the advantage of adding only a few bytes to each packet. It also allows devices on the public network to see the final source and destination of the packet. However, by passing the IP header in the clear, transport mode allows an attacker to perform some traffic analysis. For example, an attacker could see when a company's CEO sent many packets to another senior executive. However, the attacker would only know that IP packets were sent; the attacker would not be able to decipher the contents of the packets. With transport mode, the destination of the flow must be an IPsec termination device.

#### Note

---

You cannot use transport mode for VPN topologies using regular IPsec or Easy VPN.

## Understanding Reverse Route Injection

Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities. Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote VPN router as the next hop, the traffic is forced through the crypto process to be encrypted.

After the static route is created on the VPN router, this information is propagated to upstream devices, allowing them to determine the appropriate VPN router to which to send returning traffic in order to maintain IPsec state flows. This is particularly useful if multiple VPN routers are used at a site to provide

load balancing or failover, or if the remote VPN devices are not accessible through a default route. Routes are created in either the global routing table or the appropriate virtual route forwarding (VRF) table.

**Note**

Security Manager automatically configures RRI on devices with High Availability (HA) or on the IPsec Aggregator when VRF-Aware IPsec is configured. You can also configure RRI on a device's crypto map in a remote access VPN. See [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\)](#), page 31-40 and [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 33-3.

In Security Manager, the following options are available for configuring Reverse Route Injection:

- For dynamic crypto maps, routes are created upon the successful establishment of IPsec security associations (SAs) for those remote proxies. The next hop back to those remote proxies is through the remote VPN router whose address is learned and applied during the creation of the dynamic crypto map template. The routes are deleted after the SAs are deleted.
- The Remote Peer option (available for IOS devices only) enables you to specify an interface or address as the explicit next hop to the remote VPN device. Two routes are created. One route is the standard remote proxy ID and the next hop is the remote VPN client tunnel address. The second route is the actual route to the remote tunnel endpoint, when a recursive lookup is forced to impose that the remote endpoint is reachable via “next-hop.” Creation of the second route for the actual next hop is very important for VRF-Aware IPsec when a default route must be overridden by a more explicit route.

**Note**

For devices using a VPN Services Module (VPSM), the next hop is the interface or subinterface/VLAN on which the crypto map is applied.

- In the case of Remote Peer IP (available for IOS devices only), one route is created to a remote proxy by way of a user-defined next hop. The next hop can be used to override a default route to properly direct outgoing encrypted packets. This option reduces the number of routes created and supports those platforms that do not readily facilitate route recursion.

## Configuring IPsec Proposals in Site-to-Site VPNs

Use the IPsec Proposal page to configure the IPsec proposal used during IKE Phase 2 negotiations for site-to-site VPN topologies with the exception of Easy VPN topologies.

IPsec proposals used with Easy VPN topologies, and with remote access VPNs, are significantly different than the basic site-to-site proposal explained in this topic. For information on IPsec proposals in these other topologies, see the following topics:

- [Configuring an IPsec Proposal for Easy VPN](#), page 28-10
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\)](#), page 31-40

- [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 33-3

#### Navigation Path

- ([Site-to-Site VPN Manager Window](#), page 25-18) Select a non-Easy VPN topology in the VPNs selector, then select **IPsec Proposal** in the Policies selector. If necessary, click the **IPsec Proposal** tab.
- (Policy view) Select **Site-to-Site VPN > IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one.

When two peers try to establish an SA, they must each have at least one compatible crypto map entry. For more information, see <a href="#">Understanding Crypto Maps</a>, page 26-20.</p> <p>Select the type of crypto map you want to generate:</p> <ul style="list-style-type: none"> <li>• <b>Static</b>—Use a static crypto map in a point-to-point or full mesh VPN topology.</li> <li>• <b>Dynamic</b>—Dynamic crypto maps can only be used in a hub-and-spoke VPN topology. Dynamic crypto map policies allow remote peers to exchange IPsec traffic with a local hub, even if the hub does not know the remote peer’s identity.</li> </ul>                                                                                                                                                                                                                                                                                                     |
| Enable IKEv1<br>Enable IKEv2                                      | <p>The IKE versions to use during IKE negotiations. IKEv2 is supported on ASA Software release 8.4(x) only. Similarly, beginning with 4.16, Cisco Security Manager does not support IKEv1 configurations for Firepower 9300 devices configured with distributed mode. Select either or both options as appropriate; you must select IKEv1 if any device in the topology does not support IKEv2.</p> <p>When you select both options in hub-and-spoke or full mesh topologies, Security Manager automatically assigns the IKE version to devices based on the OS type and version used by the device. You can change these assignments by clicking the <b>IKE Version</b> tab, then click the Select button beneath the IKEv1 Enabled Peers or IKEv2 Enabled Peers to change which version is assigned to the device. You can change the assignments for devices that support each version only; other devices are not selectable. For more information, see <a href="#">Selecting the IKE Version for Devices in Site-to-Site VPNs</a>, page 26-26.</p> |

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transform Sets<br>IKEv2 Transform Sets          | <p>The transform sets to use for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. The transform sets are different for each IKE version; select objects for each supported version. You can select up to 11 transform sets for each. For more information, see <a href="#">Understanding Transform Sets, page 26-20</a>.</p> <p>If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used.</p> <p>Click <b>Select</b> to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 26-27</a>.</p> <p><b>Note</b> IKEv1 Transform sets can use tunnel mode or transport mode of IPsec operation. However, you cannot use transport mode in IPsec or Easy VPN topologies.</p> |
| Enable Perfect Forward Secrecy<br>Modulus Group | <p>Whether to use Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. The unique session key protects the exchange from subsequent decryption, even if the entire exchange was recorded and the attacker has obtained the preshared or private keys used by the endpoint devices.</p> <p>If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the <b>Modulus Group</b> list. For an explanation of the options, see <a href="#">Deciding Which Diffie-Hellman Modulus Group to Use, page 26-7</a>.</p> <p><b>Note</b> DH group 1 is deprecated and will be removed in later ASA version. In later ASA versions, the default value will be Group 2.</p>                                                                                                                                                                                                                                                                                                                                                                          |
| Lifetime (sec)<br>Lifetime (kbytes)             | <p>The global lifetime settings for the crypto IPsec security association (SA). You can specify the IPsec lifetime in seconds, in kilobytes, or both.</p> <ul style="list-style-type: none"> <li>• Seconds (sec)—The number of seconds an SA will exist before expiring. The default is 3600 seconds (one hour).</li> <li>• Kilobytes (kbytes)—The volume of traffic (in kilobytes) that can pass between IPsec peers using a given SA before it expires. Valid values depend on the device type. Enter a value within the range 10-2147483647 for an IOS router, and 2560-536870912 for an ASA/PIX7.0+ device.</li> </ul> <p>The default value is 4,608,000 kilobytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Enable Do Not Fragment (DF) Policy                | <p>Define how the IPsec subsystem handles large packets that have the do-not-fragment (DF) bit set in the IP header. Choose one of the following:</p> <ul style="list-style-type: none"> <li>• Set—Sets and uses the DF bit.</li> <li>• Copy—Maintains the DF bit.</li> <li>• Clear—Ignores the DF bit.</li> </ul>                                                                                                                     |
| Enable Traffic Flow Confidentiality (TFC) Packets | <p>Enable dummy TFC packets that mask the traffic profile which traverses the tunnel.</p> <p><b>Note</b> You must have an IKEv2 IPsec proposal set on the Tunnel Policy (Crypto Map) Basic tab before enabling TFC. Traffic Flow Confidentiality is not available when IKEv1 is enabled.</p> <p>Use the Burst, Payload Size, and Timeout parameters to generate random length packets at random intervals across the specified SA.</p> |

## Selecting the IKE Version for Devices in Site-to-Site VPNs

Use the IKE Version tab in the IPsec Proposal page to select which version of IKE to use for each device in a hub-and-spoke or full mesh site-to-site VPN. This tab appears only in the Site-to-Site VPN Manager; you cannot configure the options in Policy view, because they are specific to the actual devices in a VPN topology.

The IKE Version tab contains two lists: IKEv1 Enabled Peers and IKEv2 Enabled Peers. When you configure the IPsec proposal, as described in [Configuring IPsec Proposals in Site-to-Site VPNs, page 26-22](#), you select which IKE versions to allow in the VPN (version 1, version 2, or both). Security Manager automatically chooses which IKE version to use for a device based on the OS version used by the device. For example, IOS routers always appear in the IKEv1 Enabled Peers list. If a device supports both IKEv1 and IKEv2, it appears in both lists.

You need to alter the selection only if you are allowing both IKE versions in a VPN and you want to specifically prevent some IKEv2-capable devices from using one of the IKE versions.

To change which IKE version is allowed for a device, click the **Select** button beneath the list from which you want to remove the device (or to add the device after previously removing it). A selection dialog box opens where you can do the following (click **OK** to confirm your choices):

- To remove a device, so that it cannot use the IKE version, highlight it in the Selected Peers list and click << to move it to the Available Peers list.
- To add a device, so that it is allowed to use the IKE version, highlight it in the Available Peers list and click >> to move it to the Selected Peers list.

### Tip

The selection lists include only those devices that support both IKE versions, because you cannot change the version selection for devices that support a single version. IKEv2 is supported on ASA Software 8.4(1)+.

## Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects

Use the Add or Edit IPsec Transform Set dialog box to configure IPsec transform sets for use in IKE negotiations.

You can create IPsec transform set objects for use in IPsec proposals when defining IPsec-protected traffic in site-to-site and remote access VPNs. During IPsec security association negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

Two different security protocols are included within the IPsec standard:

- Encapsulating Security Protocol (ESP)—Provides authentication, encryption, and anti-replay services. ESP is IP protocol type 50.
- Authentication Header (AH)—Provides authentication and anti-replay services. AH does not provide encryption and has largely been superseded by ESP. It is also supported on routers only. AH is IP protocol type 51.

**Note**

---

We recommend using both encryption and authentication on IPsec tunnels.

---

There are separate IPsec transform set objects based on the IKE version, IKEv1 or IKEv2:

- When you create an IPsec IKEv1 transform set object, you select the mode in which IPsec should operate, as well as define the required encryption and authentication types. Additionally, you can select whether to include compression in the transform set. You can select single options for the algorithms, so if you want to support multiple combinations in a VPN, you must create multiple IPsec IKEv1 transform set objects.
- When you create an IPsec IKEv2 transform set object, you can select all of the encryption and hash algorithms that you will allow in a VPN. During IKEv2 negotiations, the peers select the most appropriate options that each support.

**Note**

---

If you configure an IPsec IKEv1 or IKEv2 Proposal on a device, you must use the configured Proposal for that device. For example, in a Site-to-Site (Point-to-Point) VPN configuration, the endpoint (interface) configured with the IPsec Proposal can be used in generating the crypto map. However, if the configured Proposal is not used by Security Manager for that device, in the following preview configuration, Security Manager will generate a negate command and the configured IPsec Proposal will be negated by Security Manager.

| Name                  | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description           | A description of the policy object. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mode<br>(IKEv1 only.) | <p>The mode in which the IPSec tunnel operates:</p> <ul style="list-style-type: none"> <li>• <b>Tunnel</b>—Tunnel mode encapsulates the entire IP packet. The IPSec header is added between the original IP header and a new IP header. This is the default.</li> </ul> <p>Use tunnel mode when the firewall is protecting traffic to and from hosts positioned behind the firewall. Tunnel mode is the normal way regular IPSec is implemented between two firewalls (or other security gateways) that are connected over an untrusted network, such as the Internet.</p> <ul style="list-style-type: none"> <li>• <b>Transport</b>—Transport mode encapsulates only the upper-layer protocols of an IP packet. The IPSec header is inserted between the IP header and the upper-layer protocol header (such as TCP).</li> </ul> <p>Transport mode requires that both the source and destination hosts support IPSec, and can only be used when the destination peer of the tunnel is the final destination of the IP packet. Transport mode is generally used only when protecting a Layer 2 or Layer 3 tunneling protocol such as GRE, L2TP, and DLSW.</p> |

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESP Hash Algorithm (IKEv1)                  | The hash or integrity algorithm to use in the transform set for authentication. For IKEv1, the default is to use SHA for ESP authentication and to not use AH authentication. For IKEv2, there is no default. The AH hash algorithm is used on routers only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ESP Integration Algorithm (IKEv2)           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AH Hash Algorithm (IKEv1 only)              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                             | For IKEv1, select one of the following options. For IKEv2, click <b>Select</b> to open a dialog box where you can select all of the options you want to support. <ul style="list-style-type: none"> <li>• None—Does not perform ESP or AH authentication.</li> <li>• SHA, SHA-1 (Secure Hash Algorithm version 1)—Produces a 160-bit digest. SHA is more resistant to brute-force attacks than MD5, but requires more processing time.</li> </ul> <p>The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices:</p> <ul style="list-style-type: none"> <li>– SHA512—A 512-bit key.</li> <li>– SHA384—A 384-bit key.</li> <li>– SHA256—A 256-bit key.</li> </ul> <ul style="list-style-type: none"> <li>• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA, but is less secure.</li> <li>• Null—No encryption algorithm. For use with AES-GCM, AES-GCM-192, AES-GCM-256, AES-GMAC, AES-GMAC-192, and AES-GMAC-256 only.</li> </ul> |
| Compression (IKEv1 only, IOS devices only.) | Whether to compress the data in the IPsec tunnel using the Lempel-Ziv-Stac (LZS) algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Category                                    | The category assigned to the object. Categories help you organize and identify rules and objects. ## Configuring VPN Global Settings

You can define global settings that apply to all devices in your remote access or site-to-site VPN topology. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations in a remote access IPsec VPN.

### Note

The VPN Global Settings policy for site-to-site VPNs applies to all technologies except GET VPN. For an explanation of global settings for GET VPN, see [Configuring Global Settings for GET VPN, page 29-16](#).

**Step 1** Do one of the following to open the global settings policy based on the type of VPN you are configuring:

- For remote access VPNs, do one of the following:

- (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one.

**Step 2** Select the desired tab and configure the settings as needed:

- **ISAKMP/IPsec Settings**—To configure global settings for IKE and IPsec. For detailed information about the options, see [Configuring VPN Global ISAKMP/IPsec Settings, page 26-33](#).
- **IKEv2 Settings**—To configure global settings for IKE version 2 negotiations. For detailed information about the options, see [Configuring VPN Global IKEv2 Settings, page 26-37](#).
- **NAT Settings**—To configure NAT behavior. For detailed information about the options, see [Configuring VPN Global NAT Settings, page 26-42](#). Also see [Understanding NAT in VPNs, page 26-41](#).
- **Address Assignment**—To specify one or more methods of address assignment to remote clients, see [Configuring VPN Global Address Assignment Settings, page 26-31](#). The address assignment applies only to remote access VPN.
- **General Settings**—To configure fragmentation behavior and some other miscellaneous options. For detailed information about the options, see [Configuring VPN Global General Settings, page 26-44](#).

## Configuring VPN Global Address Assignment Settings

Use the Address Assignment tab of the VPN Global Settings page to specify one or more methods of address assignment to remote clients. The available methods are:

- Obtain IP addresses from an authentication server.
- Obtain IP addresses from a DHCP server.
- Obtain IP addresses from an internally configured pool.

### Note

You can configure address assignment on devices running the ASA software version 7.0(1) or later. By default all the methods are enabled.

Address Assignment is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **Address Assignment** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **Address Assignment** tab.

| <b>IPv4 Address Assignment Priority</b>                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Use Authentication Server                                                                                             | Choose to assign IPv4 addresses retrieved from an authentication server on a per-user basis. If you are using an authentication server (external or internal) that has IPv4 addresses configured, we recommend using this method. If you select this option, use the <b>Platform &gt; Device Admin &gt; AAA</b> policy to define the AAA server groups to use for authenticating user access. This method is available for IPv4 and IPv6 assignment policies.                                                                                                                                                        |
| Use DHCP                                                                                                              | Choose to obtain IP addresses from a DHCP server. If you use DHCP, you must configure the server using the <b>Platform &gt; Device Admin &gt; Server Access &gt; DHCP Server</b> from the Device Policy selector. You must also define the range of IP addresses that the DHCP server can use. This method is available for IPv4 assignment policies.                                                                                                                                                                                                                                                                |
| Use internal address pools                                                                                            | Choose to have the ASA assign IPv4 addresses from an internally configured pool. Internally configured address pools are the easiest method of address pool assignment to configure. If you use this method, you must configure the IP address pools. To configure IP address pools, on the Device view, select <b>NAT &gt; Address Pools</b> from the Device Policy Selector. Or on the Policy view, select <b>NAT (PIX/ASA/FWSM) &gt; Address Pools</b> from the Policy Type selector, then select an existing policy from the Shared Policy selector, or right-click <b>Address Pools</b> to create a new policy. |
| Allow the reuse of an IP address - minutes after it is released                                                       | Delays the reuse of an IP address after its return to the address pool. Adding a delay helps to prevent problems firewalls can experience when an IP address is reassigned quickly. By default, this is unchecked, meaning the ASA does not impose a delay. To add a delay, check the box and enter the number of minutes in the range 0 - 480 to delay IP address reassignment.<br><br><b>Note</b> This feature is available on devices running the ASA software version 8.0(3) or later.                                                                                                                           |
| <b>IPv6 Address Assignment Priority - Security Manager 4.12 onwards for ASA devices running version 9.0 or later.</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Use Authentication Server                                                                                             | Choose to assign IPv6 addresses retrieved from an authentication server on a per-user basis. If you are using an authentication server (external or internal) that has IPv6 addresses configured, we recommend using this method. If you select this option, use the <b>Platform &gt; Device Admin &gt; AAA</b> policy to define the AAA server groups to use for authenticating user access.                                                                                                                                                                                                                        |

| Use internal address pools | Choose to have the ASA assign IPv6 addresses from an internally configured pool. Internally configured address pools are the easiest method of address pool assignment to configure. If you use this method, you must configure the IP address pools. To configure IPv6 address pools, on the Device view, select <b>NAT &gt; Address Pools</b> from the Device Policy Selector. Or on the Policy view, select <b>NAT (PIX/ASA/FWSM) &gt; Address Pools</b> from the Policy Type selector, then select an existing policy from the Shared Policy selector, or right-click <b>Address Pools</b> to create a new policy. |

## Configuring VPN Global ISAKMP/IPsec Settings

Use the ISAKMP/IPsec Settings tab of the VPN Global Settings page to specify global settings for Internet Key Exchange (IKE) and IPsec.

The Internet Key Exchange (IKE) protocol, also called the Internet Security Association and Key Management Protocol (ISAKMP) is the negotiation protocol that lets two hosts agree on how to build an IPsec security association. Each ISAKMP negotiation is divided into a Phase 1 and Phase 2. Phase 1 creates the first tunnel, which protects ISAKMP negotiation messages. Phase 2 creates the tunnel that protects data.

To set terms for ISAKMP negotiations, you create an IKE proposal. For more information, see [Configuring an IKE Proposal, page 26-9](#).

### About IKE Keepalive

With IKE keepalive, tunnel peers exchange messages that demonstrate they are available to send and receive data in the tunnel. Keepalive messages transmit at set intervals, and any disruption in that interval results in the creation of a new tunnel, using a backup device.

Devices that rely on IKE keepalive for resiliency transmit their keepalive messages regardless of whether they are exchanging other information. These keepalive messages can therefore create a small but additional demand on your network.

A variation on IKE keepalive called keepalive dead-peer detection (DPD) sends keepalive messages between peer devices only when no incoming traffic is received and outbound traffic needs to be sent. If you want to send DPD keepalive messages when no incoming traffic is received regardless of whether there is any outbound traffic, you can specify this using the Periodic option.

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **ISAKMP/IPsec Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **ISAKMP/IPsec Settings** tab.
- For site-to-site VPNs, do one of the following:

- Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **ISAKMP/IPsec Settings** tab.
- (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **ISAKMP/IPsec Settings** tab.

|------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Xauth Timeout                                                                                                    | <p>Supported on Cisco IOS routers and Catalyst 6500/7600 devices in remote access VPN and Easy VPN topologies only.</p> <p>The number of seconds the device will wait for a system response to the Xauth challenge.</p> <p>When negotiating tunnel parameters for establishing IPsec tunnels in a remote access or Easy VPN configuration, Xauth adds another level of authentication that identifies the user who requests the IPsec connection. Using the Xauth feature, the client waits for a username/password (Xauth) challenge after the IKE SA has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication.</p>                                                                                                                                                                                                                                                                                                                      |
| Max Sessions                                                                                                     | <p>Supported on ASA devices and PIX 7.0+ devices.</p> <p>The maximum number of security associations (SAs) that can be enabled simultaneously on the device. The maximum number differs based on device model. For ASA devices, the limits are:</p> <ul style="list-style-type: none"> <li>• 5505—10 sessions.</li> <li>• 5510—250 sessions.</li> <li>• 5520—750 sessions.</li> <li>• 5540, 5550, 5585-X with SSP-10—5000 sessions.</li> <li>• 5580, 5585-X (other models)—10000 sessions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable IPsec via Sysopt                                                                                          | <p>Supported on ASA devices, and PIX Firewalls versions 6.3 or 7.0+.</p> <p>Whether to bypass the access rules defined on the VPN interface for VPN traffic.</p> <p>By default, the device allows VPN traffic to terminate on an interface; you do not need to allow IKE or ESP (or other types of VPN packets) in an interface access list. By default, you also do not need an interface access list for local IP addresses of decrypted VPN packets. Because the VPN tunnel was terminated successfully using VPN security mechanisms, this feature simplifies configuration and maximizes the device performance without any security risks. (Group policy and per-user authorization access lists still apply to the traffic.)</p> <p>If you deselect this option, the interface access rules are also applied to VPN traffic. The access list applies to the local IP address and not to the original client IP address used before the VPN packet was decrypted. The command applied is <b>no sysopt connection permit-vpn</b>.</p> |
| Enable IPsec inner routing lookup<br><br>(Security Manager version 4.12 onwards for ASA devices 9.6(2) or later) | <p>To enable per-packet routing lookups for the IPsec inner packets. | Enable SPI Recovery<br>(Site-to-site VPNs only.)   | Supported on routers running IOS version 12.3(2)T and later, in addition to Catalyst 6500/7600 devices running version 12.2(18)SXE and later.<br><br>When selected, enables the SPI recovery feature to configure your device so that if an invalid SPI (Security Parameter Index) occurs, an IKE SA will be initiated.<br><br>SPI is a number which, together with a destination IP address and security protocol, uniquely identifies a particular security association. When using IKE to establish security associations, the SPI for each security association is a pseudo-randomly derived number. Without IKE, the SPI is manually specified for each security association. When an invalid SPI occurs during IPsec packet processing, the SPI recovery feature enables an IKE SA to be established. |

## Configuring VPN Global IKEv2 Settings

Use the IKEv2 Settings tab of the VPN Global Settings page to specify global settings for Internet Key Exchange (IKE) version 2. These settings apply to ASA 8.4(x) devices only.

Internet Key Exchange (IKE), also called Internet Security Association and Key Management Protocol (ISAKMP), is the negotiation protocol that lets two hosts agree on how to build an IPsec security association (SA).

### Preventing DoS Attacks by Limiting IKEv2 Open SAs

You can prevent denial-of-service (DoS) attacks for IPsec IKEv2 connections by always cookie challenging incoming security associations (SAs) or by limiting the number of open SAs and cookie challenging any additional connections. By default, the ASA does not limit the number of open SAs and never cookie challenges SAs.

You can also limit the number of SAs allowed, which stops further connections from negotiating to protect against memory or CPU attacks that the cookie-challenge feature may be unable to thwart. Limiting the maximum number of SAs can protect the current connections.

With a DoS attack, an attacker initiates the attack when the peer device sends an SA initiate packet and the ASA sends its response, but the peer device does not respond further. If the peer device does this continually, all the allowed SA requests on the ASA can be used up until it stops responding.

Enabling a threshold percentage for cookie challenges limits the number of open SA negotiations. For example, with the default setting of 50%, when 50% of the allowed SAs are in-negotiation (open), the ASA cookie challenges any additional SA initiate packets that arrive. For the Cisco ASA 5580 with 10,000 allowed IKEv2 SAs, after 5000 SAs become open, any more incoming SAs are cookie-challenged.

If used in conjunction with the **Maximum SAs in Negotiation** option, configure a lower cookie-challenge threshold.

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **IKEv2 Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **IKEv2 Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **IKEv2 Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **IKEv2 Settings** tab.

| Load Balancing Settings<br>Redirect Connections During<br>(Remote access VPNs only.) | <p>If you configure load balancing, using the ASA Cluster Load Balance policy, you can specify the IKEv2 negotiation phase in which a user can be redirected to another device in the cluster. Select one of these options:</p> <ul style="list-style-type: none"> <li>• <b>INIT</b>—Redirect at unauthenticated initiation requests (the first IKEv2 message IKE_SA_INIT), before any group or user authentication. <ul style="list-style-type: none"> <li>– Pros—This option allows the main server to do minimal processing and state keeping (using CPU and memory) prior to redirecting the connection.</li> <li>– Cons—This option is not as secure as AUTH (even though security risks are minimal) because anyone can get a redirected IP address without authenticating at all.</li> </ul> </li> <li>• <b>AUTH</b> (the default)—Redirect during authentication (during IKE_AUTH). The device still has not identified or authenticated the user at this point, but it allows the client to authenticate the server to make sure it can trust the redirection that it receives. <ul style="list-style-type: none"> <li>– Pros—This option is more secure as the reply is encrypted in the IKEv2 tunnel and it allows the client side to authenticate the server before retrying with the redirected IP address, providing better DoS protection than the INIT option.</li> <li>– Cons—This option requires more processing as the IKEv2 tunnel needs to be almost brought up before redirecting, although child SAs and data tunnels do not need to be brought up. The client is not authenticated at all. Note that IKEv1 redirection occurs after group authentication of both sides of the tunnel.</li> </ul> </li> </ul> |
| Enable Invalid Selectors<br>Notification                                             | Whether to enable sending an IKE notification to the peer when an inbound packet is received on an SA that does not match the traffic selectors for that SA. This feature is available in Security Manager version 4.9 onwards for ASA devices version 9.4(1) or later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Fragmentation Settings (ASA devices 9.6(1) or later)                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Fragmentation before<br>Encryption                                            | Whether to enable fragmentation of IKEv2 messages. The Internet Key Exchange Version 2 (IKEv2) fragmentation protocol splits large IKEv2 message into a set of smaller ones, called IKE Fragment Messages.<br><br>Fragmentation is supported on the ASA devices running the software version 9.6(1) or later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Local MTU Size (ASA)                                                                 | Enter the MTU size value. MTU size is used to divide the clear text packet into chunks. The MTU value used includes the IP header plus UDP header size. The default MTU size is 576.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Understanding NAT in VPNs

Network Address Translation (NAT) enables devices that use internal IP addresses to send and receive data through the Internet. It converts private, internal LAN addresses into globally routable IP addresses when they try to access data on the Internet. In this way, NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

NAT enhances the stability of your hub-and-spoke VPN tunnels or remote access connections because resources required for VPN connections are not used for other purposes, and the VPN tunnel is kept available for traffic requiring complete security. Sites inside the VPN can use NAT through a split tunnel to exchange non secure traffic with outside devices, and they do not squander VPN bandwidth or overwhelm the hub at the tunnel head-end by directing nonessential traffic through it.

Security Manager supports NAT with dynamic IP addressing only, and applies to it an overload feature that permits what is known as port-level NAT or Port Address Translation (PAT). PAT uses port addressing to associate thousands of private NAT addresses with a small group of public IP address. PAT is used if the addressing requirements of your network exceed the available addresses in your dynamic NAT pool.

### Note

When you enable PAT on Cisco IOS routers, an additional NAT rule is implicitly created for split-tunneled traffic on deployment. This NAT rule, which denies VPN-tunneled traffic and permits all other traffic (using the external interface as the IP address pool), is not reflected as a router platform policy. You can remove the NAT rule by disabling this feature. For more information, see [NAT Page: Dynamic Rules, page 24-10](#).

You can configure traffic to bypass NAT configuration on site-to-site VPN traffic. To bypass NAT configuration on Cisco IOS routers, make sure the **Do Not Translate VPN Traffic** option is selected in the NAT Dynamic Rule platform policy (see [NAT Dynamic Rule Dialog Box, page 24-11](#)). To exclude NAT on PIX Firewalls or ASA devices, make sure this option is selected in the NAT Translation Options platform policy (see [Translation Options Page, page 24-17](#)).

### About NAT Traversal

NAT traversal is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow.

If the IP address of the VPN interface on the spoke is not globally routable, the NAT on the middle device replaces it with a new globally routable IP address. This change is made in the IPsec header, and violates the checksum of the spoke causing a mismatch with the hub's checksum calculation. This results in loss of connectivity between the hub and the spoke.

With NAT traversal, the spoke adds a UDP header to the payload. The NAT on the middle device changes the IP address in the UDP header, leaving the IPsec header and checksum intact. On a middle device that uses static NAT, you must provide the static NAT IP address (globally routable) on the inside interface. The static NAT IP address is provided for all traffic through that interface that requires NAT. However, if the middle device uses dynamic NAT where the NAT IP address is unknown, you must define dynamic crypto on the hub to serve any connection request from the spoke. Security Manager generates the required tunnel configuration for the spoke.

**Note**

NAT traversal is enabled by default on routers running IOS version 12.3T and later. If you want to disable the NAT traversal feature, you must do this manually on the device or using a FlexConfig (see [Chapter 7, “Managing FlexConfigs”](#)).

You can define global NAT settings on the NAT Settings tab of the Global VPN Settings page as described in [Configuring VPN Global NAT Settings, page 26-42](#).

## Configuring VPN Global NAT Settings

Use the NAT Settings tab of the Global Settings page to define global Network Address Translation (NAT) settings that enable devices that use internal IP addresses to send and receive data through the Internet.

**Note**

For site-to-site VPNs, if you want to bypass NAT configuration on IOS routers, make sure that the **Do Not Translate VPN Traffic** option is selected in the NAT Dynamic Rule platform policy (see [NAT Dynamic Rule Dialog Box, page 24-11](#)). To exclude NAT on PIX Firewalls or ASA devices, make sure this option is selected in the NAT Translation Options platform policy (see [Translation Options Page, page 24-17](#)).

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **NAT Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **NAT Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **NAT Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **NAT Settings** tab.

|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Traversal Keepalive Interval                                                              | <p>Whether to enable NAT traversal keepalive. NAT traversal keepalive is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow.</p> <p>If you select this option, configure the interval, in seconds, between the keepalive signals sent between the spoke and the middle device to indicate that the session is active. The value can be from 5 to 3600 seconds. The default is 10 seconds.</p> <p><b>Note</b> On Cisco IOS routers, NAT traversal is enabled by default. If you want to disable the NAT traversal feature, you must do this manually on the device or by using a FlexConfig (see <a href="#">Chapter 7, “Managing FlexConfigs”</a>).</p>                                                                                                                                                                            |
| Enable Traversal over TCP TCP Ports<br>(Remote access VPNs only.)                                | <p>Supported on ASA and PIX 7.0+ devices.</p> <p>When selected, encapsulates both the IKE and IPsec protocols within a TCP packet and enables secure tunneling through both NAT and PAT devices and firewalls.</p> <p>If you select this option, specify the TCP ports for which you want to enable NAT traversal (NAT-T). You must configure TCP ports on the remote clients and on the VPN device. The client configuration must include at least one of the ports you set for the security appliance. You can enter up to 10 ports.</p> <p><b>Tip</b> These ports are used for IKEv1 connections only. IKEv2 uses ports 500 and 4500 for NAT-T. Ensure that any ports that you specify are opened in the access rules for the applicable interface.</p>                                                                                                                                                                                                           |
| Enable PAT (Port Address Translation) on Split Tunneling for Spokes<br>(Site-to-site VPNs only.) | <p>Supported on Cisco IOS routers and Catalyst 6500/7600 devices.</p> <p>When selected, enables Port Address Translation (PAT) to be used for split-tunneled traffic on spokes in your VPN topology.</p> <p>PAT can associate thousands of private NAT addresses with a small group of public IP address through the use of port addressing. PAT is used if the addressing requirements of your network exceed the available addresses in your dynamic NAT pool.</p> <p><b>Note</b> When you select this option, Security Manager implicitly creates an additional NAT rule for split-tunneled traffic on deployment. This NAT rule, which denies VPN-tunneled traffic and permits all other traffic (using the external interface as the IP address pool), is not reflected as a router platform policy.</p> <p>For information on creating or editing a dynamic NAT rule as a router platform policy, see <a href="#">NAT Page: Dynamic Rules, page 24-10</a>.</p> |

## Configuring VPN Global General Settings

Use the General Settings tab of the VPN Global Settings page to define fragmentation settings including maximum transmission unit (MTU) handling parameters for site-to-site and remote access VPNs.

Fragmentation breaks a packet into smaller units when it is transmitted over a physical interface that cannot support the original size of the packet. Fragmentation minimizes packet loss in a VPN tunnel, because it enables transmission of secured packets that might otherwise be too large to transmit. This is particularly relevant when using GRE, because any packet of more than 1420 bytes will not have enough room in its header for the additional 80 bytes that the combined use of IPsec and GRE adds to the packet payload.

The maximum transmission unit (MTU) specifies the maximum packet size, in bytes, that an interface can handle. If a packet exceeds the MTU, it is fragmented, typically after encryption. If the DF (Do Not Fragment) bit is set, the packet is dropped. A DF bit is a bit within the IP header that indicates if a device can fragment a packet. You must specify whether the device can clear, set, or copy the DF bit from the encapsulated header.

Because reassembly of an encrypted packet is difficult, fragmentation can degrade network performance. To prevent network performance problems, you can select **Enable Fragmentation Before Encryption** so that fragmentation occurs before encryption.

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **General Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **General Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **General Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **General Settings** tab.

| <b>Fragmentation Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Fragmentation Mode            | Supported on Cisco IOS routers and Catalyst 6500/7600 devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Local MTU Size                | <p>Fragmentation minimizes packet loss in a VPN tunnel when packets are transmitted over a physical interface that cannot support the original size of the packet. Select the fragmentation mode:</p> <ul style="list-style-type: none"> <li>• <b>No Fragmentation</b>—Do not fragment before IPsec encapsulation. After encapsulation, the device fragments packets that exceed the MTU setting before transmitting them through the public interface.</li> <li>• <b>End to End MTU Discovery</b>—Use ICMP messages to determine the maximum MTU. Use this option with IPsec VPNs.</li> </ul> <p>End-to-end MTU discovery uses Internet Control Message Protocol (ICMP) messages to determine the maximum MTU that a host can use to send a packet through the VPN tunnel without causing fragmentation. The MTU setting for each link in a transmission path is checked to ensure that no transmitted packet exceeds the smallest MTU in that path. The discovered MTU is used to decide whether fragmentation is necessary. If ICMP is blocked, MTU discovery fails and packets are either lost (if the DF bit is set) or fragmented after encryption (if the DF bit is not set).</p> <p><b>Note</b> (Site-to-site VPNs) For Catalyst 6500/7600 devices, end-to-end path MTU discovery is supported only on images 12.2(33)SRA, 12.2(33)SRB, 12.2(33)SXH, 12.2(33)SXI or above.</p> <ul style="list-style-type: none"> <li>• <b>Local MTU Handling</b>—Set the MTU locally on the devices. This option is typically used when ICMP is blocked or in site-to-site IPsec/GRE VPNs. If you select this option, specify the local MTU size, which can be between 68 and 65535 bytes depending on the VPN interface.</li> </ul> |
| DF Bit                        | <p>Supported on Cisco IOS routers, Catalyst 6500/7600 devices, PIX 7.0+ and ASA devices.</p> <p>A Do Not Fragment (DF) bit within an IP header determines whether a device is allowed to fragment a packet. Select how to handle the DF bit:</p> <ul style="list-style-type: none"> <li>• <b>Copy</b>—Copy the DF bit from the encapsulated header in the current packet to all the device's packets. If the packet's DF bit is set to fragment, all future packets are fragmented. This is the default option.</li> <li>• <b>Set</b>—Set the DF bit in the packet you are sending. A large packet that exceeds the MTU is dropped and an ICMP message is sent to the packet's initiator.</li> <li>• <b>Clear</b>—Fragment packets regardless of the original DF bit setting. If ICMP is blocked, MTU discovery fails and packets are fragmented only after encryption.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Enable Fragmentation Before Encryption                    | <p>Supported on Cisco IOS routers, Catalyst 6500/7600 devices, PIX 7.0+ and ASA devices.</p> <p>When selected, enables fragmentation to occur before encryption if the expected packet size exceeds the MTU.</p> <p>Look ahead Fragmentation (LAF) is used before encryption takes place to calculate the packet size that would result after encryption, depending on the transform sets configured on the IPsec SA. If the packet size exceeds the specified MTU, the packet will be fragmented before encryption.</p>                                                                                                                                                                                                                                                                                                                                                             |
| Enable Notification on Disconnection                      | <p>Supported on ASA and PIX 7.0+ devices.</p> <p>When selected, enables the device to notify qualified peers of sessions that are about to be disconnected. The peer receiving the alert decodes the reason and displays it in the event log or in a pop-up window. This feature is disabled by default.</p> <p>IPsec sessions might be dropped for several reasons, such as a security appliance shutdown or reboot, session idle timeout, maximum connection time exceeded, or administrator cut-off.</p>                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Split Tunneling<br>(Site-to-site VPN only.)        | <p>When selected (the default), enables you to configure split tunneling in your site-to-site VPN topology.</p> <p>Split tunneling allows you to transmit both secured and unsecured traffic on the same interface. Split tunneling requires that you specify exactly which traffic will be secured and what the destination of that traffic is, so that only the specified traffic enters the IPsec tunnel, while the rest is transmitted unencrypted across the public network.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable Spoke-to-Spoke Connectivity through the Hub        | <p>Supported on ASA and PIX 7.0+ devices.</p> <p>When selected, enables direct communication between spokes in a hub-and-spoke VPN topology in which the hub is an ASA or PIX 7.0+ device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Default Route                                      | <p>Supported on Cisco IOS routers and Catalyst 6500/7600 devices.</p> <p>When selected, the device uses the configured external interface as the default outbound route for all incoming traffic.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Do not reboot until all the sessions are terminated (ASA) | <p>Select this option if you want the ASA to postpone a scheduled reboot until all active sessions terminate. This feature is disabled by default.</p> <p><b>Note</b> The <b>crypto isakmp reload-wait</b> command in ASA software is supported only in System context for ASA devices that are on multiple context mode. However, since System context is not supported on VPN configurations, Security Manager does not generate this command for devices in VPN configuration, that are on multiple context mode. You must use the FlexConfig policies in System context for the <b>crypto isakmp reload-wait</b> command to work on devices that are on multiple context mode. FlexConfig policies allow you to configure device commands that are not otherwise supported by Security Manager. For more information, see <a href="#">Chapter 7, “Managing FlexConfigs”</a>.</p> |

# Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs

If you want to use preshared key as your authentication method for IKEv1 negotiations, you must define a shared key for each tunnel between two peers that will be their shared secret for authenticating the connection. The key will be configured on each peer. If the key is not the same on both peers of the tunnel, the connection cannot be established. The peer addresses that are required for configuring the preshared key are deduced from the VPN topology.

**Tip**

You can also use preshared keys for IKEv2 negotiations, but the configuration is different from the one used for IKEv1, as are the rules and requirements. For information on configuring preshared keys for IKEv2 negotiations, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).

Preshared keys are configured on spokes. In a hub-and-spoke VPN topology, Security Manager mirrors the spoke's preshared key and configures it on its assigned hub, so that the key on the spoke and hub are the same. In a point-to-point VPN topology, you must configure the same preshared key on both peers. In a full mesh VPN topology, any two devices that are connected must have the same preshared key.

In a preshared key policy, you can use a specific key, or you can use automatically generated keys for peers participating in each communication session. Using automatically generated keys (the default method) is preferred, because security can be compromised if all connections in a VPN use the same preshared key.

**Note**

Beginning with 4.16, Cisco Security Manager does not support IKEv1 related configuration for Firepower 9300 devices with distributed mode.

While discovering a VPN topology, where one of the devices is in cluster distributed mode (IKEv2 configured), and other is a non-cluster mode (IKEv1 and IKEv2 configured), Cisco Security Manager does not display any error. However, during preview config, the activity validation error is displayed to remove IKEv1 related configuration.

There are three methods for negotiating key information and setting up IKE security associations (SAs):

- Main mode address—Negotiation is based on IP address. Main mode provides the highest security because it has three two-way exchanges between the initiator and receiver. This is the default negotiation method.

This method has three options for creating keys:

- You can create a key for each peer, based on the unique IP address of each peer, providing high security.
- You can create a group preshared key on a hub in a hub-and-spoke VPN topology, to be used for communication with any device in a specified subnet. Each peer is identified by its subnet, even if the IP address of the device is unknown. In a point-to-point or full mesh VPN topology, a group preshared key is created on the peers.
- You can create a wildcard key on a hub in a hub-and-spoke VPN topology, or on a group containing hubs, to be used for dynamic crypto where a spoke does not have a fixed IP address or belong to a specific subnet. All spokes connecting to the hub have the same preshared key, which could compromise security. In a point-to-point or full mesh VPN topology, a wildcard key is created on the peers.

**Note** If you are configuring DMVPN with direct spoke-to-spoke connectivity, you create a wildcard key on the spokes.

- Main mode fully qualified domain name (FQDN)—Negotiation is based on DNS resolution, with no reliance on IP address. This option can only be used if the DNS resolution service is available for the host. It is useful when managing devices with dynamic IP addresses that have DNS resolution capabilities.
- Aggressive mode—Negotiation is based on hostname (without DNS resolution) and domain name. Aggressive mode is less secure than main mode. However, it provides more security than using group preshared keys if the IP address of the VPN interface on the host is unknown, and the FQDN of the dynamic IP peer is not DNS resolvable. This negotiation method is recommended for use with a GRE Dynamic IP or DMVPN failover and routing policy.

## Configuring IKEv1 Preshared Key Policies

Use the IKEv1 Preshared Key page to define the preshared key configuration when using IKEv1 in a site-to-site VPN topology. For information on configuring preshared keys when using IKEv2, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).

**Note** The preshared key policy does not apply to Easy VPN topologies.

**Note** Beginning with 4.16, Cisco Security Manager does not support IKEv1 preshared key configuration for Firepower 9300 devices with distributed mode.

To open the IKEv1 Preshared Key page:

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select a topology in the VPNs selector, then select **IKEv1 Preshared Key** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKEv1 Preshared Key** from the Policy Types selector. Select an existing shared policy or create a new one.

The following table explains the settings you can configure in this policy.

**Table 26-10** *IKEv1 Preshared Key Page*

| Element                  | Description                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Key Specification</b> | Select whether to manually define the key (User Defined) or to have the key automatically generated. There are additional options you can configure when using auto generated keys. |

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Defined                             | When selected, enables you to use a manually defined preshared key.<br>Enter the required preshared key in the <b>Key</b> field, then enter it again in the <b>Confirm</b> field.                                                                                                                                                                                                                                                                                                                                                                                       |
| Auto Generated                           | When selected, allocates a random key to the participating peers. This ensures security because a different key is generated for every hub-spoke connection. Auto Generated is the default selection.<br><br>Auto generated is not a useful option when you do not manage all nodes in the VPN, for example, in the case of an Extranet VPN.<br><br><b>Note</b> The key is allocated during the first deployment to the devices and is used in all subsequent deployments to the same devices, until you select the Regenerate Key (Only in Next Deployment) check box. |
| Key Length                               | The required length of the preshared key to be automatically generated, from 1 to 127. The default is 24.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Same Key for All Tunnels                 | Unavailable in a point-to-point VPN topology.<br><br>When selected, enables you to use the same auto-generated key for all tunnels.<br><br><b>Note</b> If you do not select this option, different keys are used for the tunnels, except in cases, such as DMVPN configuration, when different multipoint GRE interfaces in the same network must use the same preshared key.                                                                                                                                                                                           |
| Regenerate Key (Only in Next Deployment) | When selected, enables Security Manager to generate a new key for the next deployment to the devices. This is useful if it is possible that the secrecy of the keys might be compromised.<br><br>When you submit the job for deployment, this check box is cleared. It does not remain selected because the new key will only be generated for the upcoming deployment, and not for subsequent deployments (unless you select it again).                                                                                                                                |

**Negotiation Method**

Select the type of negotiation method. The methods are explained in more detail in [Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs, page 26-47](#).

Table 26-10 IKEv1 Preshared Key Page (continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Main Mode Address | <p>Use this negotiation method for exchanging key information if the IP address of the devices is known. Negotiation is based on IP address. Main mode provides the highest security because it has three two-way exchanges between the initiator and receiver. Main mode address is the default negotiation method.</p> <p>Select one of the following options to define the negotiation address type:</p> <ul style="list-style-type: none"> <li>• <b>Peer Address</b>—Negotiation is based on the unique IP address of each peer. A key is created for each peer, providing high security. This is the default.</li> <li>• <b>Subnet</b>—Creates a group preshared key on a hub in a hub-and-spoke topology to use for communication with any device in a specified subnet, even if the IP address of the device is unknown. Each peer is identified by its subnet. In a point-to-point or full mesh VPN topology, a group preshared key is created on the peers. Enter the subnet in the field provided, for example, 10.10.10.0/24.</li> <li>• <b>Wildcard</b>—Creates a wildcard key on a hub or on a group of hubs in a hub-and-spoke topology to use when a spoke does not have a fixed IP address or belong to a specific subnet. In this case, all spokes connecting to the hub have the same preshared key, which could compromise security. Use this option if a spoke in your hub-and-spoke VPN topology has a dynamic IP address. In a point-to-point or full mesh VPN topology, a wildcard key is created on the peers.</li> </ul> <p><b>Note</b> When configuring DMVPN with direct spoke-to-spoke connectivity, you create a wildcard key on the spokes.</p> |
| Main Mode FQDN    | <p>Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution is available for the devices. Negotiation is based on DNS resolution, with no reliance on IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Aggressive Mode   | <p>Available only in a hub-and-spoke VPN topology.</p> <p>Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution might not be available on the devices. Negotiation is based on hostname and domain name.</p> <p><b>Note</b> If direct spoke to spoke tunneling is enabled, you cannot use aggressive mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Understanding Public Key Infrastructure Policies

Security Manager supports IPsec configuration with Certification Authority (CA) servers that manage certificate requests and issue certificates to devices in your VPN topology. You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and manage keys and certificates, providing centralized key management for the participating devices.

CA servers, also known as trustpoints, manage public CA certificate requests and issue certificates to participating IPsec network devices. When you use Certificates as the authentication method for IKE and IPsec proposal policies, peers are configured to obtain digital certificates from a CA server. With a CA server, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA server, which is explicitly trusted to validate identities and create a digital certificate for the device. When this has been accomplished, each participating peer can validate the identities of the other participating peers and establish encrypted sessions with the public keys contained in the certificates.

CAs can also revoke certificates for peers that no longer participate in an IPsec VPN topology. Revoked certificates are either managed by an Online Certificate Status Protocol (OCSP) server or are listed in a certificate revocation list (CRL) stored on an LDAP server, which each peer can check before accepting a certificate from another peer.

PKI enrollment can be set up in a hierarchical framework consisting of multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. Subordinate CAs within the hierarchy can enroll with either the root CA or with another subordinate CA. Within a hierarchical PKI, all enrolled peers can validate each other's certificate if the peers share a trusted root CA certificate or a common subordinate CA.

Keep the following in mind:

- PKI policies can be configured on Cisco IOS routers running version 12.3(7)T and later, PIX Firewalls, and Adaptive Security Appliance (ASA) devices for site-to-site and remote access VPNs.
- In site-to-site VPNs, you use the IKEv1 Public Key Infrastructure policy to identify CA servers for IKEv1 negotiations only. For IKEv2 negotiations, you identify the CA servers in the IKEv2 Authentication policy as described in [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).
- To save the RSA key pairs and the CA certificates between reloads permanently to Flash memory on a PIX Firewall release 6.3, you must configure the **ca save all** command. You can do this manually on the device or using a FlexConfig (see [Chapter 7, “Managing FlexConfigs”](#)).

## CA Server Authentication Methods

You can authenticate the CA server using one of the following methods:

- Using the Simple Certificate Enrollment Protocol (SCEP) to retrieve the CA's certificates from the CA server. Using SCEP, you establish a direct connection between your device and the CA server. Be sure your device is connected to the CA server before beginning the enrollment process. Because this method of retrieving CA certificates for routers is interactive, you can deploy your PKI policy to live devices only, not to files.

### Note

When using SCEP, you must enter the fingerprint for the CA server. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. You can obtain the CA's fingerprint by contacting the server directly, or by entering the following address in a web browser: **http://<URLHostName>/certsrv/mscep/mscep.dll**.

- Manually creating an enrollment request that you can submit to a CA server offline, by copying the CA server's certificates from another device.

Use this method if your device cannot establish a direct connection to the CA server or if you want to generate an enrollment request and send it to the server at a later time.

**Note** This method enables you to deploy the PKI policy either to devices or to files.

For more information, see [PKI Enrollment Dialog Box, page 26-58](#).

**Note**

You can also use Cisco Secure Device Provisioning (SDP) to enroll for a certificate for a router. For more information about using SDP for certificate enrollment, see [Secure Device Provisioning on Cisco IOS Routers, page 63-81](#).

The following topics explain Public Key Infrastructure configuration in more detail:

- [Requirements for Successful PKI Enrollment, page 26-52](#)
- [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 26-54](#)
- [Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs, page 26-55](#)
- [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#)
- [PKI Enrollment Dialog Box, page 26-58](#)

## Requirements for Successful PKI Enrollment

The following are prerequisites for configuring a PKI policy in your network:

- For IKEv1, the IKE proposal must specify Certificate for the IKE authentication method. See [Configuring IKEv1 Proposal Policy Objects, page 26-11](#).
- The domain name must be defined on the devices for PKI enrollment to be successful (unless you specify the CA server nickname).
- To enroll with the CA server directly, you must specify the server's enrollment URL.
- To enroll with the CA server by means of a TFTP server, you must ensure that the CA certificates file is saved to the TFTP server. After deployment of the PKI policy, you must copy the certificate request from your TFTP server to the CA server.
- You may specify an RSA public key to use in the enrollment request. If you do not specify an RSA key pair, the Fully Qualified domain Name (FQDN) key will be used.

If using RSA keys, once the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data sent to the device. The private key is kept on the device and used to decrypt data sent by peers, and to digitally sign transactions when negotiating with peers. You can use an existing key pair or generate a new one. If you want to generate a new key pair to use in the certificate for router devices, you must also specify the modulus to determine the size of the key.

For more information, see [PKI Enrollment Dialog Box—Enrollment Parameters Tab, page 26-63](#).

- If you are making a PKI enrollment request on a Cisco Easy VPN IPsec remote access system, you must configure each remote component (spoke) with the name of the user group to which it connects. You specify this information in the Organization Unit (OU) field in the Certificate Subject Name tab of the PKI Enrollment Editor dialog box.

**Note** You do not need to configure the name of the user group on the hub (Easy VPN server).

For more information, see [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 26-66](#).

- To deploy PKI policies to files (not to live devices), the following prerequisites must be met:
  - Routers must run Cisco IOS Software 12.3(7)T or later.
  - CA authentication certificates must be cut and pasted into the Security Manager user interface (so that CA authentication is not interactive and does not require communication with the live device).
- If you are deploying to live devices, the PKI server must be online.
- Security Manager supports the Microsoft, Verisign, and Entrust PKIs.
- Security Manager supports Cisco IOS Certificate Servers. The Cisco IOS Certificate Server feature embeds a simple certificate server, with limited CA functionality, into the Cisco IOS software. An IOS Certificate Server can be configured as a FlexConfig policy. For more information, see [Chapter 7, “Managing FlexConfigs”](#).
- To configure PKI with AAA authorization that uses the entire subject name on an IOS router, use the predefined FlexConfig object named IOS\_PKI\_WITH\_AAA.

#### Prerequisites for PKI Enrollment Using TFTP

If you do not have constant direct access to the CA server, you can enroll using TFTP if your devices are routers running Cisco IOS Software 12.3(7)T or later.

On deployment, Security Manager generates the corresponding CA trustpoint command and authenticate command. The trustpoint command is configured with the enrollment URL `tftp://<certserver><file_specification>` entry to retrieve the CA certificate using TFTP. If `file_specification` is not specified, the FQDN of the router is used.

Before using this option, you must make sure that the CA certificates file (.ca) is saved on the TFTP server. To do this, use this procedure:

1. Connect to `http://servername/certsrv`, where `servername` is the name of the Windows 2000 web server on which the CA you want to access is located.
2. Select **Retrieve the CA certificate or certificate revocation list**, then click **Next**.
3. Select **Base64 encoded**, then click **Download CA certificate**.
4. Save the .crt file as a .ca file on the TFTP server using your browser's Save As function.

After deployment, you must transfer the certificate request generated by Security Manager on the TFTP server to the CA, and then transfer the device's certificates from the CA to the device.

#### Transferring the Certificate Request from the TFTP Server to the CA Server

Security Manager creates a PKCS#10 formatted enrollment request (.req) on the TFTP server. You must transfer it to the PKI server using this procedure:

1. Connect to `http://servername/certsrv`, where `servername` is the name of the Windows 2000 web server where the CA you want to access is located.
2. Select **Request a certificate**, then click **Next**.
3. Select **Advanced request**, then click **Next**.
4. Select **Submit a certificate request using a base64 encoded PKCS #10 file or a renewal request using a base64 encoded PKCS #7 file**, then click **Next**.

5. Either select browse for a file (and browse to the TFTP server and select the .req file) or open the just received by TFTP .req file with WordPad/Notepad and copy/paste the contents in the first window.
6. Export the .crt file from the CA and put it on the TFTP server.
7. Configure the 'crypto ca import <label> certificate' to import the device's certificates from the tftp server.

## Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs

You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to the participating devices in your VPN topology.

In Security Manager, CA servers are predefined as PKI enrollment objects that you can use in your PKI policies. A PKI enrollment object contains the server information and enrollment parameters that are required for creating enrollment requests for CA certificates.

For more information about Public Key Infrastructure policies, see [Understanding Public Key Infrastructure Policies, page 26-51](#).

This procedure describes how to specify the CA server that will be used to create an IKEv1 Public Key Infrastructure (PKI) policy in your VPN topology.

#### Tip

For information on specifying CA servers for use in IKEv2 negotiations, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).

#### Before You Begin

For important information about successfully configuring PKI, see [Requirements for Successful PKI Enrollment, page 26-52](#).

#### Related Topics

- [Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs, page 26-55](#)
- [Deciding Which Authentication Method to Use, page 26-8](#)
- [Filtering Items in Selectors, page 1-45](#)

**Step 1** Do one of the following:

- ([Site-to-Site VPN Manager Window](#)) Select an existing topology and then select **IKEv1 Public Key Infrastructure** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKEv1 Public Key Infrastructure**, and then select an existing policy or create a new one.

The Public Key Infrastructure page opens, displaying the currently selected CA server, if any, in the **Selected** field.

**Step 2** Select the PKI enrollment policy object that defines the desired CA server in the Available CA Servers list. You can do the following to modify the listed objects:

- To add a new PKI enrollment object, click the **Create (+)** button. The Add PKI Enrollment dialog box opens. For detailed information about the attributes of a PKI enrollment object, see [PKI Enrollment Dialog Box, page 26-58](#).
- To change the configuration of an existing object, select it and click the **Edit (pencil)** button.

**Note** If you are making a PKI enrollment request on an Easy VPN topology, you must configure each remote component (spoke) with the name of the user group to which it connects. You specify this information in the Organization Unit (OU) field in the Certificate Subject Name tab of the PKI Enrollment dialog box. You do not need to configure the name of the user group on the hub (Easy VPN server). For more information, see [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 26-66](#).

## Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs

You can select only one CA server when defining an IKEv1 Public Key Infrastructure (PKI) policy on a site-to-site VPN. This creates a problem when the devices in the VPN enroll with different CA servers when using IKEv1. For example, the spoke devices might enroll with a different CA server than the hub, or the spokes in one part of the VPN might enroll with a different CA server than the spokes in another part of the VPN.

### Tip

When using IKEv2, you can configure different CA servers for various devices by creating overrides for the IKEv2 Authentication policy global settings rather than creating device-level overrides for PKI enrollment policy objects. However, you can also use device-level overrides for IKEv2 as described in this topic. For information on configuring CA servers for IKEv2, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).

To define an IKEv1 PKI policy, you select a PKI enrollment object that specifies the CA server to which the devices should enroll. Although by default the policy object refers globally to a single CA server, you can use device-level overrides to have the object refer to a different CA server on selected devices.

For example, if PKI enrollment object PKI\_1 refers to a CA server named CA\_1, you can create a device-level override for selected devices that has PKI\_1 refer to a different CA server, for example, CA\_2. Theoretically, you can use overrides to define a different CA server for each device in the VPN.

This procedure describes the basic steps for creating overrides for PKI enrollment objects.

### Note

You can also use device-level overrides when the CA servers are arranged in a PKI hierarchy beneath a common, trusted CA server. To do this, you must ensure that both the global definition of the object and the device-level override specify the trusted CA server in the Trusted CA Hierarchy tab of the PKI Enrollment dialog box. See [PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab, page 26-67](#).

**Related Topics**

- [Understanding Public Key Infrastructure Policies, page 26-51](#)
- [Deciding Which Authentication Method to Use, page 26-8](#)

- 
- Step 1** To create the PKI enrollment object, open the PKI Enrollment dialog box. You can access this dialog box in two ways:
- From the Public Key Infrastructure policy—Click the **Create (+)** button beneath the Selected field. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 26-54](#).
  - From the Policy Object Manager (select **Manage > Policy Objects**)—Select PKI Enrollments from the Object Type selector, then click the **New Object (+)** button.
- Step 2** Define the global definition of the PKI enrollment object, including the CA server to which the object refers. Be sure to select **Allow Value Override per Device**. This option makes the object overridable on individual devices. See [PKI Enrollment Dialog Box, page 26-58](#).
- Base the global definition of the object on the CA server that is used by the most devices in the VPN. Doing this reduces the number of device-level overrides that are required.
- Step 3** When you finish defining the PKI enrollment object, click **OK**. As a result:
- If you accessed the dialog box through the PKI policy, the new object appears in the Selected field of the policy page.
  - If you accessed the dialog box using the Policy Object Manager, the new object appears in the work area of the Policy Object Manager window. A green check mark in the Overridable column indicates that device-level overrides can be created for this object. (The check mark does not indicate whether any overrides actually exist.)
- Step 4** Create the device-level overrides for the PKI enrollment object. You can do this in one of two ways:
- From Device Properties (with the device selected in Device view, select **Tools > Device Properties**)—This option is recommended when you want to create a device-level override for a single device. In the device properties, select **Policy Object Overrides > PKI Enrollments**, select the PKI enrollment object that you want to override, then click the **Create Override** button. You can then define the content of the override, including the CA server defined by the object.  
For more information, see [Creating or Editing Object Overrides for a Single Device, page 6-19](#).
  - From the Policy Object Manager—This option is recommended when you want to create a device-level override for multiple devices at the same time. Double-click the green check mark in the Overridable column, select the devices to which the override should apply, then define the content of the override, including the CA server defined by the object.  
For more information, see [Creating or Editing Object Overrides for Multiple Devices At A Time, page 6-19](#).

## Configuring Public Key Infrastructure Policies for Remote Access VPNs

You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN.

In Security Manager, CA servers are predefined as PKI enrollment objects that you can use in your PKI policies. A PKI enrollment object contains the server information and enrollment parameters that are required for creating enrollment requests for CA certificates.

For more information about Public Key Infrastructure policies, see [Understanding Public Key Infrastructure Policies, page 26-51](#).

**Note**

Beginning with version 4.12, Security Manager provides support for Public Key Infrastructure policy for ASA multi-context devices running the software version 9.5(2) or later.

This procedure describes how to specify the CA servers that will be used to create a Public Key Infrastructure (PKI) policy in your remote access VPN.

**Before You Begin**

Keep the following in mind:

- For important information about successfully configuring PKI, see [Requirements for Successful PKI Enrollment, page 26-52](#).
  - The **IKE Proposal** policy for IPsec remote access VPNs should use an IKE Proposal object that requires certificate authorization when configuring IKEv1.
- 
- For remote access VPNs defined on an ASA or PIX 7.x+ device, be aware that the Public Key Infrastructure policy is directly related to the following policies. Any trustpoints defined in these policies must also be selected in the Public Key Infrastructure policy; they are not automatically added to the policy. You might want to first configure these policies to determine which PKI enrollment objects are required in your remote access VPNs.
    - **Connection Profiles**—When you create a IPsec connection profile for which CA trustpoints should be used, you select the PKI enrollment object that identifies the trustpoint on the IPsec tab.
    - **SSL VPN Access**—You can configure trustpoints for each interface and also a fallback trustpoint.
    - **Global Settings, IKEv2 Settings tab**—For IKEv2 IPsec, you must specify a global trustpoint.

**Related Topics**

- [Deciding Which Authentication Method to Use, page 26-8](#)
- [Filtering Items in Selectors, page 1-45](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Remote Access VPN > Public Key Infrastructure** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Public Key Infrastructure** from the Policy Type selector. Select an existing policy or create a new one.
- The Public Key Infrastructure page opens, displaying the currently available and selected CA servers (PKI enrollment objects), if any.
- Step 2** Select the PKI enrollment policy objects that define the desired CA servers in the Available CA Servers list and click >> to move them to the Selected CA Servers list. You can remove undesired objects by selecting them in the selected list and clicking <<.

**Note** When configuring IKEv2 in a Site-to-Site VPN, and choosing PKI as the authentication method, you are required to specify the object name that must be listed here, under Selected CA Servers (see Step 2 of [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#)). Hence, ensure that you include the required CA Servers in the Selected CA Servers list.

For ASA and PIX 7.x+ devices, the list of selected PKI enrollment objects must include all objects that are specified in the connection profiles defined for the remote access VPN. For more information on connection profiles, see [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 31-7](#). Also, any trustpoints configured for IKEv2 on the Global Settings policy must be included; see [Configuring VPN Global IKEv2 Settings, page 26-37](#).

You can do the following to modify the listed objects:

- To add a new PKI enrollment object, click the **Create (+)** button below the list of available servers. The Add PKI Enrollment dialog box opens. For detailed information about the attributes of a PKI enrollment object, see [PKI Enrollment Dialog Box, page 26-58](#).
- To change the configuration of an existing object, select it in either list and click the **Edit (pencil)** button.

## PKI Enrollment Dialog Box

Use the PKI Enrollment dialog box to view, create, copy, or edit Public-Key Infrastructure (PKI) enrollment objects. A PKI enrollment object represents an external certification authority (CA) server that responds to certificate requests from devices in the network.

You can create PKI enrollment objects to define the properties of a CA server used when devices exchange certificates as part of an IPsec network. When you create a PKI enrollment object, you define a name for the server and the URL for enrollment. You must specify whether the devices you wish to enroll with this server should retrieve the CA server's own certificate using the Simple Certificate Enrollment Process (SCEP) or use a certificate that you have entered manually into the device configuration. You must also select the method of support used by the CA server for revocation checking.

**Note** You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

In addition, you can optionally define the following:

- Whether the CA server is acting as a Registration Authority (RA) server.
- Enrollment parameters, including retry settings and RSA key pair settings.
- Additional attributes to include in the certificate request.
- The list of trusted CA servers located above this server in the PKI hierarchy.

### Navigation Path

Select **Manage > Policy Objects**, then select **PKI Enrollments** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Tip**

You can also open this dialog box from the **Public Key Infrastructure** policy for remote access or site-to-site VPNs.

| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-13</a> .                                                                                                                                                                   |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a> .                                                      |
| Overrides                       |                                                                                                                                                                                                                                                                                                                             |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                |

## PKI Enrollment Dialog Box—CA Information Tab

Use the CA Information tab of the PKI Enrollment dialog box to:

- Define the name and location of the external certificate authority (CA) server.
- Manually paste the certificate, if known.
- Define the server’s level of support for revocation checking.

### Navigation Path

Go to the PKI Enrollment dialog box and click the **CA Information** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 26-58](#).

|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enrollment URL<br>(URL enrollment only.)                                      | <p>The URL of the CA server to which devices should attempt to enroll. The URL can be in the following formats:</p> <ul style="list-style-type: none"> <li>• <b>SCEP</b>—Uses an HTTP URL in the form of <b>http://CA_name:port</b>, where CA_name is the host DNS name or IP address of the CA server. The port number is mandatory.</li> <li>• <b>TFTP</b>—Uses the format <b>tftp://certserver/file_specification</b>. Use this option when you do not have direct access to the CA server. The TFTP server transfers certificate requests and certificates.</li> <li>• Other supported formats include: bootflash, cns, flash, ftp, null, nvram, rcp, scp, system.</li> </ul> <p><b>Note</b> If the CA cgi-bin script location at the CA is not the default (/cgi-bin/pkclient.exe), you must also include the nonstandard script location in the URL, in the form of <b>http://CA_name:port/script_location</b>, where script_location is the full path to the CA scripts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CA Certificate Source<br>Fingerprint<br>Certificate<br>(URL enrollment only.) | <p>How to obtain the certificate:</p> <ul style="list-style-type: none"> <li>• <b>Retrieve CA Certificate Using SCEP</b> (the default)—Have the router retrieve the certificate from the CA server using the Simple Certificate Enrollment Process (SCEP). Enter the fingerprint for the CA server in hexadecimal format. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected.</li> </ul> <p>Using the <b>Fingerprint</b> to verify the authenticity of the CA's certificate helps prevent an unauthorized party from substituting a fake certificate in place of the real one.</p> <p><b>Tip</b> You can obtain the CA's fingerprint by contacting the server directly, or by entering the following address in a web browser: <b>http://URLHostName/certsrv/mscep/mscep.dll</b>. Using the fingerprint is supported only on Cisco IOS software releases 12.3(12) or later, 12.3(14)T or later, 12.4 or later (including 15.x), 12.2(33)XNA or later.</p> <ul style="list-style-type: none"> <li>• <b>Enter CA Certificate from CA Server Manually</b>—Copy and Paste up to three certificates from another device into the <b>Certificate</b> field (using your browser's Paste function or the Ctrl-V keyboard shortcut). Use this option when you want the PKI enrollment object to represent predefined certificates. Each certificate must begin with the word "certificate" and end with the word "quit".<br/>CMP authentication requires base 64 encoded CA certificate for authentication. For CMP, we can configure base 64 encoded CA certificate in this field. Copy and paste the base 64 encoded CA certificate from CA server and end with the word "quit".</li> </ul> <p><b>Note</b> Enter the certificate details within the words, ----BEGIN CERTIFICATE---- and ----END CERTIFICATE----.</p> |

| CA Certificate Check     | Certificates without the CA flag now cannot be installed on the ASA as CA certificates by default. The basic constraints extension identifies whether the subject of the certificate is a CA and the maximum depth of valid certification paths that include this certificate. Beginning with version 4.9, you can use Security Manager to configure the ASA to allow installation of these certificates if desired. This feature is supported only in devices running ASA software version 9.4(1) or later. CA Certificate check is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Revocation Check Support | <p>The type of certificate revocation checking to be performed:</p> <ul style="list-style-type: none"> <li>• <b>Checking Not Performed</b>—This is the default. The device does not perform any revocation checking, even if a CRL is on the device.</li> <li>• <b>CRL Check Required</b>—The device must check a CRL. If no CRL exists on the device and the device cannot obtain one, certificates are rejected and a tunnel cannot be established.</li> <li>• <b>OCSP Check Required</b>—The device must check revocation status from an OCSP server. If this check fails, certificates are rejected.</li> <li>• <b>CRL Check Attempted</b>—The device tries to download the latest CRL from the specified LDAP server. If the download fails, however, certificates are accepted.</li> <li>• <b>OCSP Check Attempted</b>—The device tries to check revocation status from an OCSP server. If this fails, however, certificates are accepted.</li> <li>• <b>CRL or OCSP Check Required</b>—The device first checks for a CRL. If a CRL does not exist or cannot be obtained, the device tries to check revocation status from an OCSP server. | Element                                      | Description                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Registration Authority Mode (PIX 6.3) | For PIX 6.3 devices, whether the CA server operates in RA (Registration Authority) mode. A Registration Authority is a server that acts as a proxy for the actual CA so that CA operations can continue when the CA server is offline.<br><br><b>Note</b> Cisco IOS routers configure RA mode automatically, if required. |

## PKI Enrollment Dialog Box—Enrollment Parameters Tab

Use the Enrollment Parameters tab of the PKI Enrollment dialog box to define the retry settings to use when the device contacts the CA server as well as the settings for generating the RSA key pair to associate with the certificate.

If the PKI enrollment object represents a Microsoft CA, you can define the challenge password required to validate the router's identity.

### Note

You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

### Navigation Path

Go to the PKI Enrollment dialog box and click the **Enrollment Parameters** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 26-58](#).

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Challenge Password<br><br>Confirm               | <p>The password used by the CA server to validate the identity of the device. This password is mandatory for PIX 6.3 devices, but optional for PIX/ASA 7.0+ devices and Cisco IOS routers.</p> <p>You can obtain the password by contacting the CA server directly or by entering the following address in a web browser:<br/><b>http://URLHostName/certsrv/mscep/mscep.dll</b>. The password is good for 60 minutes from the time you obtain it from the CA server. Therefore, it is important that you deploy the password as soon as possible after you create it.</p> <p><b>Note</b> Each password is valid for a single enrollment by a single device. Therefore, we do not recommend that you assign a PKI enrollment object where this field is defined to a VPN, unless you first configure a device-level override for each device in the VPN. For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-18</a>.</p> |
| Retry Period                                    | The interval between certificate request attempts, in minutes. Values can be 1 to 60 minutes. The default is 1 minute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Retry Count                                     | The number of retries that should be made if no certificate is issued upon the first request. Values can be 1 to 100. The default is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Certificate Auto-Enrollment (IOS devices only)  | <p>The percentage of the current certificate's lifetime after which the router requests a new certificate. For example, if you enter 70, the router requests a new certificate after 70% of the lifetime of the current certificate has been reached. Values range from 10% to 100%.</p> <p>If you do not specify a value, the router requests a new certificate after the old certificate expires.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Auto-Enrollment                          | <p>When enabled, certificates are automatically requested based on configurable triggers.</p> <p>The following specific parameters can also be further configured:</p> <ul style="list-style-type: none"> <li>• whether or not CMPv2 update will be used</li> <li>• when it will be triggered</li> <li>• whether the current key pair will be used or a new key pair will be generated</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Certificate Auto-Enrollment (ASA 9.7.1 onwards) | <p>The percentage of the current certificate's lifetime after which the router requests a new certificate. For example, if you enter 50, the router requests a new certificate after 50% of the lifetime of the current certificate has been reached. Values range from 10% to 99%.</p> <p>If you do not specify a value, the router requests a new certificate after the old certificate expires.</p> <p><b>Note</b> The default value is 70%.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Auto Enroll Regenerate Key (ASA 9.7.1 onwards)  | Select to generate a new key while renewing the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 26-13** PKI Enrollment Dialog Box—Enrollment Parameters Tab (continued)

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regenerate Key Pair (ASA 9.7.1 onwards)                 | Select to regenerate a new key pair before enrolling the trustpoint request.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Shared Key (ASA 9.7.1 onwards)                          | Specify the user credentials obtained from the CA, out of band. This will be used by the CA and ASA to confirm the authenticity and integrity of the messages that they exchange. The key length cannot exceed 64 characters.<br><b>Note</b> The shared key must be in the format, 'reference: <i>shared key</i> '.                                                                                                                                                                     |
| Signing Certificate (ASA 9.7.1 onwards)                 | Specify the name of the trust point that contains a previously issued device certificate to be used to sign the CMP enrollment request.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Note</b>                                             | For the CMP protocol, options like Certificate, Shared Key or Signing Certificate will not be discovered, for security reasons. As a result, the PKI enrollment dialog will be creating a override on rediscovery.                                                                                                                                                                                                                                                                      |
| Key Pair                                                | New key pairs will be automatically generated for all CMP manual and automatic enrollments. To support this, we the ability to configure key pair parameters in the trust point has been added.<br>Select the algorithm - RSA or EDCSA, that should be used to generate the key pair.<br><b>Note</b> The RSA algorithm has the following modulus options: 1024 2048 4096 512 768 and the EDCSA algorithm, has the following elliptic-curve options 256 384 521 to generate a key pair.  |
| Include Device's Serial Number                          | Whether to include the serial number of the device in the certificate.<br><b>Tip</b> The CA uses the serial number to either authenticate certificates or to later associate a certificate with a particular device. If you are in doubt, include the serial number, as it is useful for debugging purposes.                                                                                                                                                                            |
| RSA Key Pair Name<br>(PIX 7.0+, ASA, IOS devices only.) | If the key pair you want to associate with the certificate already exists, this field specifies the name of that key pair.<br>If the key pair does not exist, this field specifies the name to assign to the key pair that will be generated during enrollment.<br><b>Note</b> If you do not specify an RSA key pair, the fully qualified domain name (FQDN) key pair is used instead. On PIX and ASA devices, the key pair must exist on the device before deployment.                 |
| RSA Key Size<br>(IOS devices only.)                     | If the key pair does not exist, defines the desired key size (modulus), in bits. If you want a modulus between 512 and 1024, enter an integer that is a multiple of 64. If you want a value higher than 1024, enter 1536 or 2048. The recommended size is 1024.<br><b>Note</b> The larger the modulus size, the more secure the key. However, keys with larger modulus sizes take longer to generate (a minute or more when larger than 512 bits) and longer to process when exchanged. |

**Table 26-13** PKI Enrollment Dialog Box—Enrollment Parameters Tab (continued)

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSA Encryption Key Size<br>(IOS devices only.)            | The size of the second key, which is used to request separate encryption, signature keys, and certificates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Source Interface<br>(IOS devices and ASA 9.5(1) or later) | <p>The source address for all outgoing connections sent to a CA or LDAP server during authentication, enrollment, and when obtaining a revocation list. This parameter may be necessary when the CA server or LDAP server cannot respond to the address from which the connection originated (for example, due to a firewall).</p> <p>If you do not define a value in this field, the address of the outgoing interface is used.</p> <p>Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p><b>Note</b> Security Manager 4.9 supports separate routing table for Management traffic on devices running ASA 9.5(1) or later. This functionality enables to completely segregate management traffic from other data traffic on the ASA. Apart from IOS devices you can now select ASA devices running the software version 9.5(1) or later.</p> |

## PKI Enrollment Dialog Box—Certificate Subject Name Tab

Use the Certificate Subject Name tab of the PKI Enrollment dialog box to optionally define additional information about the device in certificate requests sent to the CA server. This information is placed in the certificate and can be viewed by any party who receives the certificate from the router.

Enter all information using the standard LDAP X.500 format.

### Navigation Path

Go to the PKI Enrollment dialog box and click the **Certificate Subject Name** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 26-58](#).

**Field Reference****Table 26-14** PKI Enrollment Dialog Box—Certificate Subject Name Tab

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Include FQDN                | Whether to include the device's fully qualified domain name (FQDN) in the certificate request.<br><br>The name is taken from the Hostname policy (ensure that you specify both the hostname and domain name in the policy to get a valid fully-qualified domain name). If you do not configure the Hostname policy, the name is derived from the display name for the device in Security Manager, <i>display_name.null</i> , which is unlikely to give you the desired results.                                                                                       |
| Include Device's IP Address | The interface whose IP address is included in the certificate request.<br><br>Enter the name of the interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                                                                                                                                                                         |
| Common Name (CN)            | The X.500 common name to include in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Organization Unit (OU)      | The name of the organization unit (for example, a department name) to include in the certificate.<br><br><b>Note</b> When you configure PKI enrollment objects for Cisco Easy VPN Remote components, this field must contain the name of the client group to which the component connects. Otherwise, the component will not be able to connect. Although this information is not required for the Easy VPN Server, including it does not create configuration problems. For more information about Easy VPN, see <a href="#">Understanding Easy VPN, page 28-1</a> . |
| Organization (O)            | The organization or company name to include in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Locality (L)                | The locality to include in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| State (ST)                  | The state or province to include in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Country (C)                 | The country to include in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Email (E)                   | The email address to include in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab**

Use the Trusted CA Hierarchy tab of the PKI Enrollment dialog box to define the trusted CA servers within an hierarchical PKI framework. Within this framework, all enrolled peers can validate each other's certificates if they share a trusted root CA certificate or a common subordinate CA.

Select the CA servers (as defined as PKI enrollment objects) to include in the hierarchy in the Available Servers list and click >> to move them to the selected list. You can do the reverse to remove servers.

If the PKI enrollment object you need is not yet defined, click the **Create (+)** button beneath the available servers list to create the object. You can also select an object and click the **Edit** button to change its definition, if needed.

**Navigation Path**

Go to the PKI Enrollment dialog box and click the **Trusted CA Hierarchy** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 26-58](#).

## Configuring IKEv2 Authentication in Site-to-Site VPNs

When you configure IKE version 2 (IKEv2) in a site-to-site VPN, you must configure the IKEv2 Authentication policy to define authentication settings. Unlike IKEv1, authentication settings are not part of the IKEv2 proposal.

In Security Manager, when you configure IKEv2 authentication for a site-to-site VPN, you configure default settings that will be used in the VPN topology. You can then configure exceptions to the default, specifying different preshared keys or trustpoints for specific segments of the VPN. You can use a mixture of preshared keys and trustpoints, for example, configuring a global preshared key, but trustpoints for selected members of the VPN.

**Configuring asymmetric authentication for IKEv2 tunnels**

IKEv2 allows you to use asymmetric authentication, unlike IKEv1. This means that two peers can have different preshared keys, different trustpoints, or one peer could use a preshared key and the other peer could use a trustpoint. In Security Manager, you can configure asymmetric authentication by doing any of the following:

- On the Global IKEv2 Authentication Settings tab, you can configure different preshared keys if you elect to auto-generate keys and **do not** select the Same Keys for All Tunnels or the Same Key at Tunnel Endpoints option. A different preshared key is generated for each end of each tunnel.
- On the Override IKEv2 Authentication Settings tab, you can create overrides for the global settings. You add overrides that specify different keys or trustpoints for subsets of local and remote peers. Because you can create more than one override for a device or a specific tunnel, you can configure a set of preshared keys and trustpoints from which peers will authenticate.

**Tip**

---

The IKEv2 Authentication policy is not a shared policy. You must configure the policy for each VPN topology in which you support IKEv2 negotiations. You cannot configure global IKEv2 authentication options for use by all of your VPN topologies. When using the Create VPN wizard, even if you elect to support IKEv2, the IKEv2 Authentication policy is never configured.

---

**Before You Begin**

The IKEv2 Authentication policy is used only if you enable IKEv2 in the VPN in the IKE Proposal and IPsec Proposal policies, and if at least some of the devices in the topology support IKEv2.

To configure IKEv2, the device must be an ASA running ASA Software release 8.4(1) or later. For more information on device support, see [Understanding Devices Supported by Each IPsec Technology, page 25-9](#).

**Tip**

---

If you support only IKEv2 in the topology, ensure that you unassign the IKEv1 Preshared Keys and IKEv1 Public Key Infrastructure policies to avoid validation warnings.

---

**Related Topics**

- [Understanding IKE, page 26-5](#)
- [Deciding Which Authentication Method to Use, page 26-8](#)

---

**Step 1** Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a regular IPsec topology (that supports IKEv2) in the VPNs selector, then select **IKEv2 Authentication** in the Policies selector.

For reference information on the policy, see [IKEv2 Authentication Policy, page 26-70](#).

**Step 2** On the **Global IKEv2 Authentication Settings** tab, configure the authentication type that should be used for devices in the VPN for which no override is configured on the Override IKEv2 Authentication Settings tab. Select the option that is used by most devices in the VPN. You can configure a global preshared key or trustpoint:

- **Global Preshared Keys**—To configure a global preshared key, select **Key Specification** and then configure one of the following options:
  - **User Defined**—Enter the desired global key and enter it again in the Confirm field.
  - **Auto Generated**—Enter the length of the key that should be generated and select whether you want to use the same key for all tunnels or the same key at both ends of a single tunnel. If you select neither of these options, unique keys are generated for every end point.

You can also select **Regenerate Key (On Next Deployment)** to have new keys generated. This allows you to periodically re-key the VPN. The check box is cleared after the next successful deployment.

- **Global Trustpoint (CA Servers)**—To configure trustpoint certificate authorization, select **PKI Specification** and enter the name of the PKI enrollment object that identifies the Certificate Authority (CA) server.

---

**Note** Ensure that you enter the same object name as deployed in the PKI policy (see Step 2 of [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#)).

---

Click **Select** to select the object from a list or to create a new object.

- **Sign IKEv2 Authentication Payload with SHA1**—To enable SHA1 authentication on IKEv2 payload, select the check box. This option is available only from Cisco Security Manager 4.19 and for ASA 9.12(1) or later devices.

**Step 3** If you want to override the global IKEv2 authentication configuration for specific devices, click the **Override IKEv2 Authentication Settings** tab and do any of the following:

- To add an override, click the **Add Row (+)** button and fill in the IKEv2 Authentication dialog box. You select the local and remote peers for which to create the override, and then specify the preshared key or CA server that should be used. See [IKEv2 Authentication \(Override\) Dialog Box, page 26-72](#).
- To edit an override, select it in the table and click the **Edit Row (pencil)** button.
- To delete an override, select it in the table and click the **Delete Row (trash can)** button.

---

**Note** Override IKEV2 authentication settings are applicable for only Hub & Spoke VPN and Full Mesh VPN topologies.

---

**Note**

You can configure asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys. To create asymmetric keys for IKEv2 authentication, for each peer device that is part of the site-to-site topology, you must add two rows on the Override IKEv2 Authentication Settings tab. For more information, see [IKEv2 Authentication \(Override\) Dialog Box, page 26-72](#).

## IKEv2 Authentication Policy

Use the IKEv2 Authentication policy to configure the device authentication settings for Internet Key Exchange (IKE) version 2 in site-to-site VPNs. These settings apply to ASA 8.4(1)+ devices only. For more information about configuring IKEv2 authentication, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).

The policy contains two tabs:

- **Global IKEv2 Authentication Settings**—The global settings apply to all devices in the VPN unless overrides are configured on the Overrides tab. Configure the global settings to represent the authentication scheme used by most devices in the VPN.
- **Override IKEv2 Authentication Settings**—The override settings apply unique authentication settings to specific tunnels, allowing you to create unique preshared key and trustpoint combinations that are required by various tunnels in the VPN. The settings you configure on this tab are used first and always take precedence over the global settings.

### Navigation Path

Open the [Site-to-Site VPN Manager Window, page 25-18](#), select a regular IPsec topology (that supports IKEv2) in the VPNs selector, then select **IKEv2 Authentication** in the Policies selector.

This policy is not available as a shared policy.

Table 26-15 IKEv2 Authentication Policy

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global IKEv2 Authentication Settings Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Key Specification                               | <p>Use a preshared key for authentication in the VPN. Configure one of the following:</p> <ul style="list-style-type: none"> <li>• <b>User Defined</b>—Enter the desired global key and enter it again in the Confirm field. The key can be 1 to 128 characters.</li> <li>• <b>Auto Generated</b>—Have Security Manager generate a key for you. Specify the following options to indicate how the key should be generated: <ul style="list-style-type: none"> <li>– <b>Key Length</b>—The length of the key that should be generated, from 1 to 128.</li> <li>– <b>Same Keys for All Tunnels</b>—Select this option to generate the same keys for all tunnels in the VPN. If you do not select this option, different keys or pair of keys (if you select Same Key for Tunnel Endpoints) are used for each tunnel.</li> <li>– <b>Same Key for Tunnel Endpoints</b>—Select this option to generate the same key on each end of each tunnel within the VPN. If you do not select this option, different keys are generated on each end of the tunnel.</li> <li>– <b>Regenerate Key (On Next Deployment)</b>—Select this option to generate new keys for the next deployment to the devices. This allows you to easily re-key the VPN.</li> </ul> <p>After a successful deployment, this check box is cleared so that keys are not regenerated on the subsequent deployment. Select the option each time you want to re-key the VPN.</p> </li> </ul> |
| PKI Specification                               | <p>The name of the PKI enrollment policy object that defines the trustpoint for IKEv2 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click <b>Select</b> to select the PKI enrollment object or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 26-15 IKEv2 Authentication Policy (continued)

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Override IKEv2 Authentication Settings</b> tab | <p>The table lists the IKEv2 authentication overrides defined for the VPN. These policies take precedence over the preshared key/PKI configuration defined in the global settings. Do any of the following to configure overrides:</p> <ul style="list-style-type: none"> <li>To add an override, click the <b>Add Row (+)</b> button and fill in the IKEv2 Authentication dialog box. You select the local and remote peers for which to create the override, and then specify the preshared key or CA server that should be used. See <a href="#">IKEv2 Authentication (Override) Dialog Box, page 26-72</a>.</li> <li>To edit an override, select it in the table and click the <b>Edit Row (pencil)</b> button.</li> <li>To delete an override, select it in the table and click the <b>Delete Row (trash can)</b> button.</li> </ul> <p><b>Note</b> You can configure asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys. To create asymmetric keys for IKEv2 authentication, for each peer device that is part of the site-to-site topology, you must add two rows on the Override IKEv2 Authentication Settings tab. For more information, see <a href="#">IKEv2 Authentication (Override) Dialog Box, page 26-72</a></p> |

## IKEv2 Authentication (Override) Dialog Box

Use the IKEv2 Authentication dialog box to configure overrides to the IKEv2 authentication global settings for a site-to-site VPN. For more information about IKEv2 global and override authentication settings, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 26-68](#).

### Navigation Path

From the Override IKEv2 Authentication Settings tab of the IKEv2 Authentication policy (see [IKEv2 Authentication Policy, page 26-70](#)), click the **Add Row (+)** button or select an override in the table and click **Edit Row (pencil)**.

Table 26-16 IKEv2 Authentication Dialog Box

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Peers<br>Remote Peers | <p>The local and remote sides of the tunnels for which you are defining this override.</p> <p>To add devices to the list, click the <b>Select</b> button to the right of the list to open the Local or Remote Peer Selection dialog box. In that dialog box, select the desired peers in the Available list and click &gt;&gt; to move them to the Selected list. You can deselect a device by doing the reverse (using the &lt;&lt; button).</p> <p>The list of available devices includes only those devices that support IKEv2 connections, which might not be all of the devices in the VPN.</p> |
| IKEv2 Authentication Mode   | <p>The IKEv2 authentication mode to use between the selected local and remote peers. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Key Specification</b>—A user-defined preshared key, from 1 to 128 characters. Enter the desired key and enter it again in the Confirm field.</li> <li>• <b>PKI Specification</b>—The name of the PKI enrollment policy object that defines the trustpoint for IKEv2 connections. Click <b>Select</b> to select the PKI enrollment object or to create a new object.</li> </ul>                                                     |

## Configuring Asymmetric keys for IKEv2 Authentication

You can configure asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys. To create asymmetric keys for IKEv2 authentication, for each peer device that is part of the site-to-site topology, you must add two rows on the Override IKEv2 Authentication Settings tab. Perform the following:

1. Click the **Override IKEv2 Authentication Settings** tab and then click the **Add Row (+)** button. The IKEv2 Authentication dialog box opens. On Peers specification, select the Local Peer device and the Remote Peer device that are part of the site-to-site VPN topology. On **IKEv2 Authentication Mode** select Key Specification and then specify a key and confirm. Security Manager considers this key as the local preshared key for the selected local peer device and the same key as the remote preshared key for the selected remote peer device. Click **OK** to return to the Override IKEv2 Authentication Settings tab.
2. With the **Override IKEv2 Authentication Settings** tab selected, click the **Add Row (+)** button. The IKEv2 Authentication dialog box opens. On Peers specification, for Local Peer, select the Remote Peer device of Step 1 and for Remote Peer, select the Local Peer device of Step 1. On **IKEv2 Authentication Mode** select Key Specification and then specify a key and confirm. This key must be different from the key that you specified in Step 1.

The following table illustrates the configuration of asymmetric keys for IKEv2 authentication:

|           | Local Peer Device | Remote Peer Device | Authentication method (Preshared Key) |
|-----------|-------------------|--------------------|---------------------------------------|
| Add Row 1 | Peer1             | Peer2              | test123                               |
| Add Row 2 | Peer2             | Peer1              | sample123                             |

## GRE and DM VPNs

---

You can configure Generic Routing Encapsulation (GRE) and Dynamic Multipoint (DM) VPNs that include GRE mode configurations. You can configure IPsec GRE VPNs for hub-and-spoke, point-to-point, and full mesh VPN topologies. DMVPN is available for hub-and-spoke topologies only.

This chapter contains the following topics:

- [Understanding the GRE Modes Page, page 27-1](#)
- [GRE and Dynamic GRE VPNs, page 27-2](#)
- [Dynamic Multipoint VPNs \(DMVPN\), page 27-9](#)

### Understanding the GRE Modes Page

Use the GRE Modes page to define the routing and tunnel parameters for IPsec tunneling with GRE, GRE Dynamic IP, and DMVPN policies.

The content of the policy differs depending on how you access it:

- ([Site-to-Site VPN Manager Window, page 25-18](#)) When you select a GRE VPN or DMVPN, the GRE Modes policy contains the properties related to the technology and technology type used in the VPN.
- (Policy view) When you select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy, there is an additional field in the policy called **GRE Method**. From the GRE Method list, you must select the VPN technology and technology type for which you are defining the policy: IPsec/GRE, GRE Dynamic IP, DMVPN, or Large Scale DMVPN. This option controls which fields are displayed in the policy. You cannot change the GRE Method after you save the policy.

When you assign a shared GRE Modes policy to a VPN, the GRE Method and the VPN's technology and type must match or the policy cannot be selected. For example, you cannot assign a shared DMVPN GRE Modes policy to an IPsec/GRE VPN.

The following topics describe the GRE Modes policy in detail based on the selected GRE Methods:

- IPsec/GRE or GRE Dynamic IP—See [Configuring GRE Modes for GRE or GRE Dynamic IP VPNs, page 27-6](#).
- DMVPN or Large Scale DMVPN—See [Configuring GRE Modes for DMVPN, page 27-12](#).

**Note**

---

When configuring an IPsec/GRE, GRE Dynamic IP, or DMVPN routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

## GRE and Dynamic GRE VPNs

You can use Generic Routing Encapsulation (GRE) to create VPNs using Cisco IOS security routers and Catalyst 6500/7600 devices in hub-and-spoke, point-to-point, and full mesh VPN topologies.

This section contains the following topics:

- [Understanding GRE, page 27-2](#)
- [Configuring IPsec GRE VPNs, page 27-5](#)
- [Configuring GRE Modes for GRE or GRE Dynamic IP VPNs, page 27-6](#)

## Understanding GRE

Generic Routing Encapsulation (GRE) is a tunneling protocol that encapsulates a variety of protocol packet types inside IP tunnels, creating a virtual point-to-point connection to devices at remote points over an IP network. With this technology, GRE encapsulates the entire original packet with a standard IP header and GRE header before the IPsec process. Then, IPsec views the GRE packet as an unremarkable IP packet and performs encryption and authentication services, as dictated by the IKE negotiated parameters. Because GRE can carry multicast and broadcast traffic, it is possible to configure a routing protocol for virtual GRE tunnels. The routing protocol detects loss of connectivity and reroutes packets to the backup GRE tunnel, thus providing high resiliency.

For VPN resilience, a spoke must be configured with two GRE tunnels, one to the primary hub and the other to the backup hub. Both GRE tunnels are secured with IPsec: each one has its own IKE security association (SA) and a pair of IPsec SAs. An associated routing protocol automates the failover mechanism, transferring to the backup tunnel if virtual link loss is detected.

**Note**

---

GRE can be configured on Cisco IOS security routers and Catalyst 6500/7600 devices in hub-and-spoke, point-to-point, and full mesh VPN topologies.

---

This section contains the following topics:

- [Advantages of IPsec Tunneling with GRE, page 27-3](#)
- [How Does Security Manager Implement GRE?, page 27-3](#)
- [Prerequisites for Successful Configuration of GRE, page 27-3](#)

- [Understanding GRE Configuration for Dynamically Addressed Spokes, page 27-5](#)

## Advantages of IPsec Tunneling with GRE

The main advantages of IPsec tunneling with GRE are the following:

- GRE uses a routing protocol by which every IPsec peer knows the status of every other peer at all times.
- GRE provides higher resiliency than IKE keepalive.
- Spoke-to-spoke connectivity is supported when you use GRE.
- GRE supports multicast and broadcast transmissions.

**Note**

GRE does not support the use of dynamic cryptographic tunnels.

## How Does Security Manager Implement GRE?

Security Manager implements an additional Interior Gateway Protocol (IGP) solution for GRE. An IGP refers to a group of devices that receive routing updates from one another by a routing protocol, EIGRP, OSPF, or RIP. Each “routing group” is identified by a logical number. For general routing purposes, the interfaces on the routers in your networks belong to an IGP. Security Manager adds an additional IGP that is dedicated for IPsec and GRE-secured communication. This additional IGP is the secured IGP. The existing IGP (unsecured IGP), is used for routing traffic that does not require encryption.

For a GRE tunnel to be established, Security Manager configures a virtual interface on each device. These virtual interfaces are the endpoints of the GRE tunnel. Each virtual interface is unique. The GRE tunnel interface has an IP address (inside tunnel IP address) which is taken from an interface that Security Manager creates. The GRE tunnel points to the source and destination IP addresses of either the physical or loopback interfaces on each device. The GRE virtual interfaces belong to the secured IGP, as do the inside interfaces. Routing updates within the secured IGP are GRE encapsulated and IPsec is applied. A flow whose destination is a secured interface (according to the routing updates of the secured IGP) is directed through the GRE interface where it is GRE encapsulated and then evaluated against the crypto ACL. If it matches the crypto ACL, it is routed through the GRE and VPN tunnels.

## Prerequisites for Successful Configuration of GRE

Consider the following prerequisites before using GRE in your network:

- You must identify the inside interfaces on your devices—the physical interfaces on the device that connect the device with its internal subnets and networks.
- You must select a routing protocol (known as an IGP) or a static route, whenever you enable GRE.

Security Manager supports the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes.

- EIGRP—Enhanced Interior Gateway Routing Protocol enables the exchange of routing information within an autonomous system and addresses some of the more difficult issues associated with routing in large, heterogeneous networks. Compared to other protocols, EIGRP provides superior convergence properties and operating efficiency, and combines the advantages of several different protocols. For more information, see [EIGRP Routing on Cisco IOS Routers, page 67-8](#).

- OSPF—Open Shortest Path First is a link-state, hierarchical protocol that features least-cost routing, multipath routing, and load balancing.

Using OSPF, a host that obtains a change to a routing table or detects a change in the network immediately multicasts the information to all other hosts in the network, so that all will have the same routing table information. For more information, see [OSPF Routing on Cisco IOS Routers, page 67-19](#).

- RIPv2—Routing Information Protocol is a distance-vector protocol that sends routing-update messages at regular intervals and whenever the network topology changes.

Using RIPv2, a gateway host (with a router) sends its entire routing table to its closest neighbor host every 30 seconds, which in turn passes the information on to its next neighbor, and so on, until all hosts within the network have the same knowledge of routing paths. RIPv2 uses a hop count to determine network distance. Each host with a router in the network uses the routing table information to determine the next host to route a packet to for a specified destination.

RIP is considered an effective solution for small homogeneous networks. For larger, more complicated networks, RIP's transmission of the entire routing table every 30 seconds may put a heavy amount of extra traffic in the network. For more information, see [RIP Routing on Cisco IOS Routers, page 67-42](#).

- Static route—Use a static routing policy to provide a robust, stable IPsec-protected GRE tunnel if there is a fixed, unchanging route between two devices. For each device subnet, a static route is created on the device pointing to the corresponding tunnel interface. For more information, see [Static Routing on Cisco IOS Routers, page 67-50](#).
- You must specify an IGP process number. The IGP process number identifies the IGP process to which the inside interface on the device belongs. When GRE is implemented, this will be the secured IGP. For secure communication, the inside interfaces on the devices in your VPN must use the same IGP process. The IGP process number must be within a specified range. If you have an existing IGP process on the device that is within this range, but is different from the IGP process number specified in your GRE settings, Security Manager removes the existing IGP process. If the existing IGP process matches the one specified in your GRE settings, any networks included in the existing IGP process that do not match the specified inside interfaces are removed.
- If the inside interfaces on your devices are configured to use an IGP process other than the IGP process specified in your GRE settings (meaning that the interfaces belong to an unsecured IGP):
  - For spokes: Manually remove the inside interfaces from the unsecured IGP through the device CLI before configuring GRE.
  - For hubs: If the hub inside interface is used as a network access point for Security Manager, then on deployment, the interface is advertised in both secured and unsecured IGPs. To ensure that the spoke peers use only the secured IGP, manually add the auto-summary command for the unsecured IGP or remove the unsecured IGP for that inside interface.
- You must provide a subnet that is unique yet it can be non-globally-routable for loopback. This subnet must only be used to support the implementation of loopback for GRE. The loopback interfaces are created, maintained, and used only by Security Manager. You should not use them for any other purpose.
- If you are using static routes, not unsecured IGP, make sure you configure static routes on the spokes through to the hub inside interfaces.

**Note**

---

You can configure the above settings in the GRE Modes page when IPsec/GRE is the selected IPsec technology.

---

## Understanding GRE Configuration for Dynamically Addressed Spokes

When a spoke has a dynamic IP address, there is no fixed GRE tunnel source address (to be used by the GRE tunnel on the spoke side) or destination address (to be used by the GRE tunnel on the hub side). Therefore, Security Manager creates additional loopback interfaces on the hub and the spoke, to be used as the GRE tunnel endpoints. You must specify a subnet from which Security Manager can allocate an IP address for the loopback interfaces.

**Note**

GRE Dynamic IP can only be configured on Cisco IOS routers and Catalyst 6500/7600 devices in hub-and-spoke VPN topologies.

Security Manager uses the Cisco Configuration Engine to retrieve device IP addresses and other information from dynamically addressed devices. Devices that have dynamic IP addresses connect to the Configuration Engine manager at periodic intervals to upgrade device configuration files and to pass device and status information.

For more information, see [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines, page 3-37](#).

**Note**

You can configure the GRE Dynamic IP settings in the GRE Modes page when GRE Dynamic IP is the selected IPsec technology.

## Configuring IPsec GRE VPNs

To configure an IPsec GRE (generic routing encapsulation) VPN, use the Create VPN wizard as described in [Creating or Editing VPN Topologies, page 25-28](#). You can also edit the membership of the VPN, or some of its policies, using the described procedures. If you are creating a hub-and-spoke VPN with dynamically addressed spokes, also see [Understanding GRE Configuration for Dynamically Addressed Spokes, page 27-5](#).

If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPsec settings, select **VPN Global Settings**. See [Configuring VPN Global Settings, page 26-30](#).
- For IKE proposal policies, select **IKE Proposal**. See [Configuring an IKE Proposal, page 26-9](#).
- For IPsec proposals, select **IPsec Proposal**. See [Configuring IPsec Proposals in Site-to-Site VPNs, page 26-22](#).
- For preshared key policies, select **IKEv1 Preshared Key**. See [Configuring IKEv1 Preshared Key Policies, page 26-48](#).
- For public key (PKI) policies, select **Public Key Infrastructure**. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 26-54](#).
- For Generic Routing Encapsulation configuration, select **GRE Modes**. See [Configuring GRE Modes for DMVPN, page 27-12](#).

## Configuring GRE Modes for GRE or GRE Dynamic IP VPNs

Use the GRE Modes policy to define the routing and tunnel parameters for IPsec tunneling in a GRE or GRE Dynamic IP VPN.

To open the GRE Modes policy:

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select an IPsec/GRE or GRE Dynamic IP topology, then select **GRE Modes** from the policies list.
- (Policy view) Select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy. Then, select either IPsec/GRE or Dynamic GRE from the **GRE Method** list.

The following table describes the elements on the GRE Modes page for configuring IPsec tunneling with GRE or GRE Dynamic IP.

**Note**

When configuring a GRE routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

**Table 27-1** GRE Modes Page for GRE or GRE Dynamic IP VPNs

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Routing Protocol                | Select the required dynamic routing protocol (EIGRP, OSPF, or RIPv2,) or static route to be used for GRE or GRE Dynamic IP.<br><br>The default routing protocol is EIGRP.<br><br>For more information about configuring these protocols, see <a href="#">Prerequisites for Successful Configuration of GRE, page 27-3</a> .                                                                                                                                                                                                                                                                  |
| AS Number<br>(EIGRP only.)      | The number that is used to identify the autonomous system (AS) area to which the EIGRP packet belongs. The range is 1-65535. The default is 110.<br><br>An autonomous system (AS) is a collection of networks that share a common routing strategy. An AS can be divided into a number of areas, which are groups of contiguous networks and attached hosts. Routers with multiple interfaces can participate in multiple areas. An AS ID identifies the area to which the packet belongs. All EIGRP packets are associated with a single area, so all devices must have the same AS number. |
| Hello Interval<br>(EIGRP only.) | The interval between hello packets sent on the interface, between 1 and 65535 seconds. The default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 27-1 GRE Modes Page for GRE or GRE Dynamic IP VPNs (continued)**

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold Time<br>(EIGRP only.)                      | The number of seconds the router will wait to receive a hello message before invalidating the connection. The range is between 1 and 65535. The default hold time is 15 seconds (three times the hello interval).                                                                                                                                                                                                                                                                                                                                                                           |
| Delay<br>(EIGRP only.)                          | The throughput delay for the primary route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Failover Delay<br>(EIGRP only.)                 | The throughput delay for the failover route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1500.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bandwidth<br>(EIGRP only.)                      | The amount of bandwidth available to the primary route interface for the EIGRP packets. You should enter a value that gives priority to the primary route over other routes.<br><br>You can enter a value in the range 1 to 10000000 kb. The default is 1000 kb.<br><br><b>Note</b> By default, the cost of sending a packet on an interface is calculated based on the bandwidth—the higher the bandwidth, the lower the cost.                                                                                                                                                             |
| Failover Bandwidth<br>(EIGRP only.)             | The amount of bandwidth available to the failover route interface for the EIGRP packets.<br><br>Enter a value in the range 1 to 10000000 kb. The default is 1000 kb.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Process Number<br>(OSPF only.)                  | The routing process ID number that will be used to identify the secured IGP that Security Manager adds when configuring GRE.<br><br>The range is between 1 and 65535. The default is 110.<br><br>Security Manager adds an additional Interior Gateway Protocol (IGP) that is dedicated for IPsec and GRE secured communication. An IGP refers to a group of devices that receive routing updates from one another by means of a routing protocol. Each “routing group” is identified by the process number.<br><br>For more information, see <a href="#">Understanding GRE, page 27-2</a> . |
| Hub Network Area ID<br>(OSPF only.)             | The ID number of the area in which the hub’s protected networks will be advertised, including the tunnel subnet. You can specify any number. The default is 0.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Spoke Protected Network Area ID<br>(OSPF only.) | The ID number of the area in which the remote protected networks will be advertised, including the tunnel subnet. You can specify any number. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authentication<br>(OSPF or RIPv2 only.)         | A string that specifies the OSPF or RIPv2 authentication key. The string can be up to eight characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Cost<br>(OSPF or RIPv2 only.)                   | The cost of sending a packet on the primary route interface.<br><br>If the selected protocol is OSPF, enter a value in the range 1-65535; the default is 100.<br><br>If the selected protocol is RIPv2, enter a value in the range 1-15; the default is 1.                                                                                                                                                                                                                                                                                                                                  |

Table 27-1 GRE Modes Page for GRE or GRE Dynamic IP VPNs (continued)

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Failover Cost<br>(OSPF or RIPv2 only.) | The cost of sending a packet on the secondary (failover) route interface.<br>You can enter a value in the range 1-65535 for OSPF (the default is 125), or in the range 1-15 for RIPv2 (the default is 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Filter Dynamic Updates on Spokes       | When selected, enables the creation of a redistribution list that filters all dynamic routing updates on the spokes. This forces the spoke devices to advertise (populate on the hub device) only their own protected subnets and not other IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Tunnel Parameters Tab</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Tunnel IP                              | <p>Select the required option to specify the GRE or GRE Dynamic IP tunnel interface IP address.</p> <ul style="list-style-type: none"> <li>• <b>Use Physical Interface</b>—When selected, uses the private IP address of the tunnel taken from the protected network.</li> <li>• <b>Use Subnet</b>—When selected, uses the tunnel IP address taken from an IP range. This is the default.</li> </ul> <p>In the Subnet field, enter the private IP address including the unique subnet mask (default is 1.1.1.0/24).</p> <p>If you are also configuring a dial backup interface, enter its subnet in the Dial Backup Subnet field provided (default is 1.1.2.0/24).</p> <p><b>Note</b> In most cases, when you use a subnet to specify a GRE tunnel interface IP address, Security Manager creates a loopback interface on the device which is used for the tunnel IP address. If the device belongs to a VPN topology whose configurations were discovered by Security Manager, and you configure an IP address directly on the device's GRE tunnel, Security Manager keeps that configuration and does not create a loopback interface on the device. However, a loopback is always configured on a hub in a VPN topology; in a hub-and-spoke VPN topology with multiple hubs, a loopback interface is also configured on the spokes.</p> <ul style="list-style-type: none"> <li>• <b>Use Loopback Interface</b>—When selected, uses the tunnel IP address taken from an existing loopback interface. In the Role field, enter the name of the interface role object that defines the loopback interface name, or click <b>Select</b> to select it from a list or to create a new object.</li> </ul> <p><b>Note</b> To view the new GRE tunnel or loopback interfaces in the Router Interfaces page, you must rediscover the device inventory details after successfully deploying the VPN to the device.</p> |

**Table 27-1** GRE Modes Page for GRE or GRE Dynamic IP VPNs (continued)

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configure Unique Tunnel Source for each Tunnel | <p>When enabled, each GRE tunnel interface in the VPN is assigned a unique tunnel source. In the <b>Tunnel Source IP Range</b> field, enter a subnet IP to be used as tunnel sources.</p> <p><b>Note</b> When enabled, this feature is set for all GRE tunnel interfaces in the VPN. If you want to assign a specific tunnel source for an interface, use the Peers policy to configure the endpoints for the desired devices; see <a href="#">Defining the Endpoints and Protected Networks, page 25-34</a>.</p>                                                                                                                                                                                                                              |
| Tunnel Source IP Range (GRE Dynamic IP only.)  | <p>The private IP address including the unique subnet mask that supports the loopback for GRE. The GRE tunnel interface has an IP address (inside tunnel IP address) which is taken from a loopback interface that Security Manager creates specifically for this purpose.</p> <p>When a spoke has a dynamic IP address, there is no fixed GRE tunnel source address (to be used by the GRE tunnel on the spoke side) or destination address (to be used by the GRE tunnel on the hub side). Therefore, Security Manager creates additional loopback interfaces on the hub and the spoke to use as the GRE tunnel endpoints. You must specify a subnet from which Security Manager can allocate an IP address for the loopback interfaces.</p> |
| Enable IP Multicast                            | <p>When selected, enables multicast transmissions across your GRE tunnels. IP multicast delivers application source traffic to multiple receivers without burdening the source or the receivers, while using a minimum of network bandwidth.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Rendezvous Point                               | <p>Only available if you selected the Enable IP Multicast check box.</p> <p>If required, you can enter the IP address of the interface that will serve as the rendezvous point (RP) for multicast transmission. Sources send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |

## Dynamic Multipoint VPNs (DMVPN)

Dynamic Multipoint VPN (DMVPN) is a hub-and-spoke VPN technology that enables better scaling of large and small IPsec VPNs by combining generic routing encapsulation (GRE) tunnels, IP Security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP) routing.

This section contains the following topics:

- [Understanding DMVPN, page 27-10](#)
- [Configuring DMVPN, page 27-12](#)
- [Configuring GRE Modes for DMVPN, page 27-12](#)
- [Configuring Large Scale DMVPNs, page 27-16](#)
- [Configuring Server Load Balancing in Large Scale DMVPN, page 27-17](#)

## Understanding DMVPN

Dynamic Multipoint VPN (DMVPN) enables better scaling of large and small IPsec VPNs by combining generic routing encapsulation (GRE) tunnels, IP Security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP) routing. (For information about large scale DMVPNs, see [Configuring Large Scale DMVPNs](#), page 27-16.)

Security Manager supports DMVPN using the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes. In addition, On-Demand Routing (ODR) is supported. ODR is not a routing protocol. It may be used in a hub-and-spoke VPN topology when the spoke routers do not connect to any router other than the hub. If you are running dynamic protocols, ODR is not suitable for your network environment.

You can use DMVPN on a hub-and-spoke VPN topology only with devices running Cisco IOS Software release 12.3T devices and later, or ASRs running Cisco IOS XE Software 2.x or later (known as 12.2(33)XNA+ in Security Manager). DMVPN is not supported on Catalyst VPN Services Module devices or on High Availability (HA) groups. If your device does not support DMVPN, use GRE dynamic IP to configure GRE for dynamically addressed spokes. See [Understanding GRE Configuration for Dynamically Addressed Spokes](#), page 27-5.

The following topics provide more overview information on DMVPN:

- [Enabling Spoke-to-Spoke Connections in DMVPN Topologies](#), page 27-10
- [Advantages of DMVPN with GRE](#), page 27-11

The following documents on Cisco.com explain DMVPN in further detail:

- [Cisco Dynamic Multipoint VPN: Simple and Secure Branch-to-Branch Communications](#)—Explains DMVPN technology and where and why you would use it. This data sheet explains the technologies used with DMVPN and the benefits derived from those technologies.
- [Migrating from Dynamic Multipoint VPN Phase 2 to Phase 3](#)—Explains the difference between phase 2 and phase 3 spoke-to-spoke connections. Creating spoke-to-spoke connections is a configuration option with DMVPN. Phase 3 uses shortcut switching enhancements to increase network performance and scalability.
- Additional white papers and presentations are available at [http://www.cisco.com/en/US/products/ps6658/prod\\_literature.html](http://www.cisco.com/en/US/products/ps6658/prod_literature.html).

## Enabling Spoke-to-Spoke Connections in DMVPN Topologies

You can use DMVPN to essentially create a full-mesh VPN, in which traditional hub-and-spoke connectivity is supplemented by dynamically-created IPsec tunnels directly between the spokes. With direct spoke-to-spoke tunnels, traffic between remote sites does not need to traverse the hub; this eliminates additional delays and conserves WAN bandwidth. Spoke-to-spoke capability is supported in a single-hub or multihub environment. Multihub deployments provide increased spoke-to-spoke resiliency and redundancy.

You can use the 80:20 traffic rule to determine whether to use a pure hub-and-spoke topology or to allow direct spoke-to-spoke connections:

- If 80 percent or more of the traffic from the spokes are directed into the hub network itself, deploy the hub-and-spoke model.
- If more than 20 percent of the traffic is meant for other spokes, consider the spoke-to-spoke model.

For networks with a high volume of IP Multicast traffic, the hub-and-spoke model is usually preferred.

When you configure the GRE Modes policy for a DMVPN, you can elect to allow spokes to create these direct connections. You must select the DMVPN phase to use for these connections:

- **Phase 2**—Spoke to spoke connections go through regional hubs and routing protocol updates from hubs to spokes are not summarized.
- **Phase 3 (Default)**—Spokes can create direct connections with each other and routing updates from hubs to spokes are summarized. This option allows the greatest scalability and reduces latency. Devices must run IOS Software release 12.4(6)T or later; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or later. Security Manager automatically creates a phase 2 configuration for devices running a lower OS version.

For more information on configuring the GRE Modes policy, see [Configuring GRE Modes for DMVPN, page 27-12](#).

## Advantages of DMVPN with GRE

Using DMVPN with GRE provides the following advantages:

- **Simplified GRE configuration on the hub**

With GRE, a tunnel is configured on the hub for each connected spoke. With GRE + DMVPN, only one tunnel is configured for all the connected spokes.

- **Support for dynamically addressed spokes**

When using GRE, the physical interface IP address of the spoke routers must be configured as the GRE tunnel destination address, when configuring the hub router. DMVPN enables spoke routers to have dynamic external interface IP addresses, and provides robust configuration that does not have to be redeployed to the device even if the external interface IP address changes. When the spoke comes online, it sends to the hub registration packets that contain the physical interface IP address of the spoke.

- **Dynamic tunnel creation for direct spoke-to-spoke communication**

NHRP enables spoke routers to dynamically learn the external interface IP address of the routers in the VPN network. Using NHRP, the hub maintains an NHRP database of the public interface addresses of all the spokes (the clients). Each spoke registers its real address with the hub when it boots.

When a spoke wants to transmit a packet to another spoke, it can use NHRP to dynamically determine the required destination address of the destination spoke. The hub acts as the NHRP server, handling the request for the source spoke. This enables the dynamic creation of an IPsec+GRE tunnel directly between spoke routers, without having to go through a hub router, thus reducing the delay of multiple encryption and decryption actions on the hub.

## Configuring DMVPN

To configure a hub-and-spoke Dynamic Multipoint VPN, use the Create VPN wizard as described in [Creating or Editing VPN Topologies, page 25-28](#). You can also edit the membership of the VPN, or some of its policies, using the described procedures. If you are creating a Large Scale DMVPN, also see [Configuring Large Scale DMVPNs, page 27-16](#).

If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPsec settings, select **VPN Global Settings**. See [Configuring VPN Global Settings, page 26-30](#).
- For IKE proposal policies, select **IKE Proposal**. See [Configuring an IKE Proposal, page 26-9](#).
- For IPsec proposals, select **IPsec Proposal**. See [Configuring IPsec Proposals in Site-to-Site VPNs, page 26-22](#).
- For preshared key policies, select **IKEv1 Preshared Key**. See [Configuring IKEv1 Preshared Key Policies, page 26-48](#).
- For public key (PKI) policies, select **Public Key Infrastructure**. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 26-54](#).
- For Generic Routing Encapsulation configuration, including the selection of phase 2 or 3 connections between spokes, select **GRE Modes**. See [Configuring GRE Modes for DMVPN, page 27-12](#).
- For server load balancing policies that are used with Large Scale DMVPN, select **Server Load Balance**. See [Configuring Server Load Balancing in Large Scale DMVPN, page 27-17](#).

## Configuring GRE Modes for DMVPN

Use the GRE Modes policy to define the routing and tunnel parameters for IPsec tunneling in a DMVPN.

To open the GRE Modes policy:

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select a DMVPN or Large Scale DMVPN topology, then select **GRE Modes** from the policies list.
- (Policy view) Select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy. Then, select either DMVPN or Large Scale DMVPN from the **GRE Method** list.

The following table describes the elements on the GRE Modes page for configuring a DMVPN.

### Note

When configuring a DMVPN routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

Table 27-2 GRE Modes Page for DMVPN

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing Parameters Tab</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Routing Protocol                | <p>Select the required dynamic routing protocol, or static route, to be used in the DMVPN tunnel.</p> <p>Options include the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes. On-Demand Routing (ODR) is also supported. On-Demand Routing is not a routing protocol. It can be used in a hub-and-spoke VPN topology when the spoke routers connect to no other router other than the hub. If you are running dynamic protocols, On-Demand Routing is not suitable for your network environment.</p> <p>For more information, see <a href="#">Understanding GRE, page 27-2</a>.</p> |
| AS Number<br>(EIGRP only.)      | <p>The number that is used to identify the autonomous system (AS) area to which the EIGRP packet belongs. The range is 1-65535. The default is 110.</p> <p>An autonomous system (AS) is a collection of networks that share a common routing strategy. An AS can be divided into a number of areas, which are groups of contiguous networks and attached hosts. Routers with multiple interfaces can participate in multiple areas. An AS ID identifies the area to which the packet belongs. All EIGRP packets are associated with a single area, so all devices must have the same AS number.</p>         |
| Hello Interval<br>(EIGRP only.) | The interval between hello packets sent on the interface, from 1 to 65535 seconds. The default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Hold Time<br>(EIGRP only.)      | The number of seconds the router will wait to receive a hello message before invalidating the connection. The range is 1-65535. The default hold time is 15 seconds (three times the hello interval)                                                                                                                                                                                                                                                                                                                                                                                                        |
| Delay<br>(EIGRP only.)          | The throughput delay for the primary route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Bandwidth<br>(EIGRP only.)      | The bandwidth for the primary route interface, in kilobits. The range of bandwidth is 1 to 10000000. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Bandwidth<br>(EIGRP only.)      | <p>The amount of bandwidth available to the primary route interface for the EIGRP packets. You should enter a value that gives priority to the primary route over other routes.</p> <p>You can enter a value in the range 1 to 10000000 kb. The default is 1000 kb.</p> <p><b>Note</b> By default, the cost of sending a packet on an interface is calculated based on the bandwidth—the higher the bandwidth, the lower the cost.</p>                                                                                                                                                                      |
| Process Number<br>(OSPF only.)  | <p>The routing process ID number that will be used to identify the secured IGP that Security Manager adds when configuring DMVPN.</p> <p>The valid range for either protocol is 1-65535. The default is 110.</p>                                                                                                                                                                                                                                                                                                                                                                                            |

Table 27-2 GRE Modes Page for DMVPN (continued)

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hub Network Area ID<br>(OSPF only.)             | The ID number of the area in which the hub's protected networks will be advertised, including the tunnel subnet. You can enter any number. The default is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Spoke Protected Network Area ID<br>(OSPF only.) | The ID number of the area in which the remote protected networks will be advertised, including the tunnel subnet. You can enter any number. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Authentication Key<br>(OSPF and RIPv2.)         | A string that indicates the OSPF or RIPv2 authentication key. The string can be up to eight characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Cost<br>(OSPF and RIPv2.)                       | The cost of sending a packet on the primary route interface.<br>If the selected protocol is OSPF, enter a value in the range 1-65535; the default is 100.<br>If the selected protocol is RIPv2, enter a value in the range 1-15; the default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Allow Direct Spoke to Spoke Connectivity        | Whether to enable direct communication between spokes without going through the hub. Select the DMVPN phase you want to use, which determines the types of connections that spokes can make: <ul style="list-style-type: none"> <li>• <b>Phase 2</b>—Spoke to spoke connections go through regional hubs and routing protocol updates from hubs to spokes are not summarized.</li> <li>• <b>Phase 3 (Default)</b>—Spokes can create direct connections with each other and routing updates from hubs to spokes are summarized. This option allows the greatest scalability and reduces latency. Devices must run IOS Software release 12.4(6)T or later; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or later. Security Manager automatically creates a phase 2 configuration for devices running a lower OS version.</li> </ul> For detailed information on how phase 2 and 3 differ, see <a href="#">“Migrating from Dynamic Multipoint VPN Phase 2 to Phase 3”</a> on Cisco.com.<br><b>Note</b> With direct spoke-to-spoke communication, you must use the Main Mode Address option for preshared key negotiation. For more information, see <a href="#">Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs</a> , page 26-47. |
| Filter Dynamic Updates On Spokes                | Unavailable if you are using On-Demand Routing or a static route for your DMVPN tunnel.<br>When selected, enables the creation of a redistribution list that filters all dynamic routing updates (EIGRP, OSPF, and RIPv2) on spokes. This forces the spoke devices to advertise (populate on the hub device) only their own protected subnets and not other IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Tunnel Parameters Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Tunnel IP Range              | <p>The IP address range of the inside tunnel interface IP address, including the unique subnet mask. This field defines a subnet, such as 10.1.1.0/24.</p> <p><b>Note</b> If Security Manager detects that a tunnel interface IP address already exists on the device, and its IP address matches the tunnel's IP subnet field, it will use that interface as the GRE tunnel.</p>                                                                                                                                                                                                                                                 |
| Dial Backup Tunnel IP Range  | If you are configuring a dial backup interface, enter its inside tunnel interface IP address range, including the unique subnet mask. This field defines a subnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Server Load Balance          | <p>When selected, enables the configuration of load balancing on a Cisco IOS router that serves as a hub in a multiple hubs configuration.</p> <p>Server load balancing optimizes performance in a multiple hubs configuration, by sharing the workload. In this configuration, the DMVPN server hubs share the same tunnel IP and source IP addresses, presenting the appearance of a single device to the spokes in a VPN topology.</p>                                                                                                                                                                                         |
| Enable IP Multicast          | <p>When selected, enables multicast transmissions across your GRE tunnels.</p> <p>IP multicast delivers application source traffic to multiple receivers without burdening the source or the receivers, while using a minimum of network bandwidth.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| Rendezvous Point             | <p>Only available if you selected the Enable IP Multicast check box.</p> <p>If required, you can enter the IP address of the interface that will serve as the rendezvous point (RP) for multicast transmission. Sources send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree.</p>                                                                                                                                                                                                                                                                                            |
| Tunnel Key                   | <p>A number that identifies the tunnel key. The default is 1.</p> <p>The tunnel key differentiates between different multipoint GRE (mGRE) tunnel Non Broadcast Multiple Access (NBMA) networks. All mGRE interfaces in the same NBMA network must use the same tunnel key value. If there are two mGRE interfaces on the same router, they must have different tunnel key values.</p> <p><b>Note</b> To view the newly created tunnel interfaces in the Router Interfaces page for routers that are members of the VPN, you must rediscover the device inventory details after successfully deploying the VPN to the device.</p> |
| <b>NHRP Parameters</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Network ID                   | All Next Hop Resolution Protocol (NHRP) stations within one logical Non-Broadcast Multi-Access (NBMA) network must be configured with the same network identifier. Enter a globally unique, 32-bit network identifier within the range of 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                        |

**Table 27-2** GRE Modes Page for DMVPN (continued)

| Element        | Description                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold time      | The time, in seconds, that routers will keep information provided in authoritative NHRP responses. The cached IP-to-NBMA address mapping entries are discarded after the hold time expires.<br><br>The default is 300 seconds.                             |
| Authentication | An authentication string that controls whether the source and destination NHRP stations allow intercommunication. All routers within the same network using NHRP must share the same authentication string. The string can be up to eight characters long. |

## Configuring Large Scale DMVPNs

You can configure DMVPN for large scale deployments that might comprise thousands of spokes. In large scale DMVPN topologies, IPsec Terminators, also referred to as Server Load Balance (SLB) devices, reside between the spokes and the hubs. The hubs must be directly connected to the IPsec Terminator—there can be no other device between them.

The IPsec Terminator, which is a Catalyst 6500/7600 device, performs encryption and decryption while the hubs handle all tasks related to Next Hop Resolution Protocol (NHRP) and multipoint generic routing encapsulation (mGRE). The IPsec Terminator is configured to specifically load balance GRE traffic to the hubs, and is configured with dynamic crypto to accept any spokes with any proxies. When using tunnel protection on spokes, these proxies are automatically set to match GRE traffic. One GRE tunnel is configured on the spokes. All hubs connecting to the same IPsec Terminator will use the same Tunnel IP address, and the tunnel source is the Virtual IP address of the IPsec Terminator.

In Security Manager, you configure a Large Scale DMVPN during the creation of a new hub-and-spoke VPN topology as described in [Creating or Editing VPN Topologies, page 25-28](#). You cannot edit an existing standard DMVPN and convert it to a Large Scale DMVPN. When you create the Large Scale DMVPN, keep the following points in mind:

- When you define the technology of the VPN, select **DMVPN** as the technology, and **Large Scale with IPsec Terminator** as the type. For the procedure, see [Defining the Name and IPsec Technology of a VPN Topology, page 25-30](#).
- When you select the devices for the VPN, select the required IPsec Terminators (Catalyst 6500/7600 devices), the hubs and all the spokes. For the procedure, see [Selecting Devices for Your VPN Topology, page 25-32](#).

There must be direct connectivity between the IPsec Terminators and the hubs.

- When you configure the endpoints, as described [Defining the Endpoints and Protected Networks, page 25-34](#), configure the following in the Edit Endpoints dialog box:
  - For each hub device, in the Hub Interface tab, select the interface that is connected to the IPsec Terminator. Each hub can be connected to only one IPsec Terminator. Also, identify the protected networks. Each hub in the Large Scale DMVPN must identify itself and its protected networks.
  - For each IPsec Terminator in the Large Scale DMVPN, specify a VPN external interface, the crypto engine slot, and the Inside VLAN. No protected networks are configured on an IPsec Terminator.

After you create the Large Scale DMVPN topology, a Server Load Balance policy is configured on the IPsec Terminators with all the required parameters, which you can edit if required. Initially, all hubs are given the same priority and number of VPN connections. For information on configuring the Server Load Balance policy, see [Configuring Server Load Balancing in Large Scale DMVPN, page 27-17](#).

**Note**

VRF-Aware IPsec cannot be configured in a Large Scale DMVPN.

## Configuring Server Load Balancing in Large Scale DMVPN

Use the Server Load Balance page to view or edit the server load balance policy configured on the IPsec Terminators in a large scale DMVPN. Server load balancing optimizes performance in multiple hub-and-spoke VPN topologies by sharing the workload among a group of hubs. In large scale DMVPN configurations, the IPsec Terminators perform the traffic load balancing. For more information, see [Configuring Large Scale DMVPNs, page 27-16](#).

A weighted round robin (WRR) scheduling algorithm is used to control the bandwidth allocated to output transmission queues. Weighting is based on the amount of bandwidth used by each transmit queue on an interface. Packets from queues with higher capacity are transmitted more often than those from queues with less capacity.

To open the Server Load Balance policy, in the [Site-to-Site VPN Manager Window](#), select an existing Large Scale DMVPN topology, then select **Server Load Balance** from the Policies list.

The table displays the hubs in the VPN, the hub's weight relative to other hubs connected to the same IPsec Terminator, and the maximum number of active connections allowed for the hub. To change the weight or maximum connections, select the hub and click the Edit (pencil) button beneath the table to open the [Edit Load Balancing Parameters Dialog Box, page 27-17](#).

| Max Connections | The maximum number of active connections to the IPsec Terminator that are permitted to the hub.<br>You can enter a value between 1 and 65535. The default is 500.                                             |

## Easy VPN

---

Easy VPN is a hub-and-spoke VPN topology that can be used with a variety of routers, PIX, and ASA devices. Policies are defined mostly on the hub and pushed to remote spoke VPN devices, ensuring that clients have up-to-date policies in place before establishing a secure connection.

This chapter contains the following topics:

- [Understanding Easy VPN, page 28-1](#)
- [Configuring Client Connection Characteristics for Easy VPN, page 28-7](#)
- [Configuring an IPsec Proposal for Easy VPN, page 28-10](#)
- [Configuring a Connection Profile Policy for Easy VPN, page 28-13](#)
- [Configuring a User Group Policy for Easy VPN, page 28-14](#)

## Understanding Easy VPN

Easy VPN simplifies VPN deployment for remote offices. With Easy VPN, security policies defined at the head end are pushed to remote VPN devices, ensuring that clients have up-to-date policies in place before establishing a secure connection.

Security Manager supports the configuration of Easy VPN policies on hub-and-spoke VPN topologies. In such a configuration, most VPN parameters are defined on the Easy VPN server, which acts as the hub device. The centrally managed IPsec policies are pushed to the Easy VPN client devices by the server, minimizing the remote (spoke) devices configuration.

The Easy VPN Server can be a Cisco IOS router, a PIX Firewall, or an ASA 5500 series device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running ASA Software release 7.2 or later.

Beginning with version 4.17, Cisco Security Manager provides Easy VPN support with BVI. Typically, Easy VPN determines the highest and lowest security level interfaces during ASA startup. The lowest security level interface is used as the External interface on which vpn client initiates tunnel to the head-end, and highest security level interface is used as Internal Secured interface.

On ASA5506 platform, the default configuration includes BVI with highest security level interface 100 with security level of its member interfaces also set at level 100, along with an external interface with security level 0 (zero). VPN client rejects two or more interfaces having same highest security level. Easy VPN determines that there are more than two interfaces with same highest security level and hence vpn client is not enabled.

In order to overcome this issue, `vpnclient secure interface CLI` was introduced for all ASA 5506, 5508, and 5512 [x/h/w] devices from ASA 9.9(2) onwards. Thus, to support the CLI in Cisco Security Manager, starting from version 4.17, a new component “VPN Client Interface” is introduced in Hub & Spoke Topology of type (Easy VPN).

**Note**

Some of the policies used in Easy VPN topologies are similar to those used in remote access VPNs. In remote access VPNs, policies are configured between servers and mobile remote PCs running VPN client software, whereas, in site-to-site Easy VPN topologies, the clients are hardware devices.

This section contains the following topics:

- [Easy VPN with Dial Backup, page 28-2](#)
- [Easy VPN with High Availability, page 28-3](#)
- [Easy VPN with Dynamic Virtual Tunnel Interfaces, page 28-3](#)
- [Easy VPN Configuration Modes, page 28-3](#)
- [Easy VPN and IKE Extended Authentication \(Xauth\), page 28-4](#)
- [Overview of Configuring Easy VPN, page 28-5](#)
- [Important Notes About Easy VPN Configuration, page 28-7](#)

## Easy VPN with Dial Backup

Dial backup for Easy VPN allows you to configure a dial backup tunnel connection on your remote client device. The backup feature is activated only when real traffic is ready to be sent, eliminating the need for expensive dialup or ISDN links that must be created and maintained even when there is no traffic.

**Note**

Easy VPN dial backup can be configured only on remote clients that are routers running IOS version 12.3(14)T or later.

In an Easy VPN configuration, when a remote device attempts to connect to the server and the tracked IP is no longer accessible, the primary connection is torn down and a new connection is established over the Easy VPN backup tunnel to the server. If the primary hub cannot be reached, the primary configuration switches to the failover hub with the same primary configuration and not to the backup configuration.

Only one backup configuration is supported for each primary Easy VPN configuration. Each inside interface must specify the primary and backup Easy VPN configuration. IP static route tracking must be configured for dial backup to work on an Easy VPN remote device. The object tracking configuration is independent of the Easy VPN remote dial backup configuration. The object tracking details are specified in the spoke’s Edit Endpoints dialog box.

For more information about dial backup, see [Configuring Dial Backup, page 25-40](#).

## Easy VPN with High Availability

You can configure High Availability (HA) on devices in an Easy VPN topology. High Availability provides automatic device backup when configured on Cisco IOS routers or Catalyst 6500/7600 devices that run IP over LANs. You can create an HA group made up of two or more hub devices in your Easy VPN that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see [Configuring High Availability in Your VPN Topology, page 25-52](#).

## Easy VPN with Dynamic Virtual Tunnel Interfaces

The IPsec virtual tunnel interface (VTI) feature simplifies the configuration of GRE tunnels that need to be protected by IPsec for remote access links. A VTI is an interface that supports IPsec tunneling, and allows you to apply interface commands directly to the IPsec tunnels. The configuration of a virtual tunnel interface reduces overhead as it does not require a static mapping of IPsec sessions to a particular physical interface where the crypto map is applied.

IPsec VTIs support both unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Dynamic or static IP routing can be used to route the traffic to the virtual interface. Using IP routing to forward traffic to the tunnel interface simplifies IPsec VPN configuration compared to the more complex process of using access control lists (ACLs) with a crypto map. Dynamic VTIs function like any other real interface so that you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

Dynamic VTIs use a virtual template infrastructure for dynamic instantiation and management of IPsec interfaces. In an Easy VPN topology, Security Manager implicitly creates the virtual template interface for the device. If the device is a hub, the user must provide the IP address on the hub that will be used as the virtual template interface—this can be a subnet (pool of addresses) or an existing loopback or physical interface. On a spoke, the virtual template interface is created without an IP address.

In Security Manager, you configure Dynamic VTI in the Easy VPN IPsec Proposal page. See [Configuring Dynamic VTI for Easy VPN, page 28-12](#).

### Notes

- Dynamic VTI can be configured only in a hub-and-spoke Easy VPN topology on routers running IOS version 12.4(2)T and later, except 7600 devices. It is not supported on PIX Firewalls, ASA devices, or Catalyst 6000 series switches.
- Not all the hubs/spokes require Dynamic VTI configuration during discovery or provision. You can extend the existing Easy VPN topology (including routers not supporting dVTI) to add routers that support dVTI.
- Dynamic VTI is supported on only servers, only clients (if server does not support dVTI), or both clients and servers.
- You cannot configure High Availability on hubs/servers that have been configured with dVTI.
- You can also configure Dynamic VTI in remote access VPNs. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\), page 33-7](#).

## Easy VPN Configuration Modes

Easy VPN can be configured in three modes—Client, Network Extension, and Network Extension Plus.

- **Client mode**—The default configuration that allows devices at the client site to access resources at the central site, but disallows access to the central site for resources at the client site. In client mode, a single IP address is pushed to the remote client from the server when the VPN connection is established. This address is typically a routable address in the private address space of the customer network. All traffic passing across the Easy VPN tunnel undergoes Port Address Translation (PAT) to that single pushed IP address.
- **Network Extension mode**—Allows users at the central site to access the network resources at the client site, and allows the client PCs and hosts direct access to the PCs and hosts at the central site. Network Extension mode specifies that the hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by the destination network. The devices at both ends of the connection will form one logical network. PAT is not used, so the hosts at the client end have direct access to the hosts at the destination network. In other words, the Easy VPN server (the hub) gives routable addresses to the Easy VPN client (the spoke), while the whole LAN behind the client will not undergo PAT.
- **Network Extension Plus mode**—An enhancement to Network Extension mode, which can be configured only on IOS routers. It enables an IP address that is received via mode configuration to be automatically assigned to an available loopback interface. This IP address can be used for connecting to your router for remote management and troubleshooting (ping, Telnet, and Secure Shell). If you select this option on some clients are not IOS routers, those clients are configured in Network Extension mode.

**Note**

---

All modes of operation can also support split tunneling, which allows secure access to corporate resources through the VPN tunnel while also allowing Internet access through a connection to an ISP or other service (thereby eliminating the corporate network from the path for web access).

---

You configure the mode in the Client Connection Characteristics policy as described in [Configuring Client Connection Characteristics for Easy VPN, page 28-7](#).

- [Understanding Easy VPN, page 28-1](#)

## Easy VPN and IKE Extended Authentication (Xauth)

When negotiating tunnel parameters for establishing IPsec tunnels in an Easy VPN configuration, IKE Extended Authentication (Xauth) adds another level of authentication that identifies the user who requests the IPsec connection. If the VPN server is configured for Xauth, the client waits for a username/password challenge after the IKE security association (SA) has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication.

The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, a user-specific attribute can be retrieved if the credentials of that user are validated via RADIUS.

**Note**

---

VPN servers that are configured to handle remote clients should always be configured to enforce user authentication.

---

Security Manager allows you to save the Xauth username and password on the device itself so you do not need to enter these credentials manually each time the Easy VPN tunnel is established. The information is saved in the device's configuration file and used each time the tunnel is established. Saving the credentials in the device's configuration file is typically used if the device is shared between several PCs and you want to keep the VPN tunnel up all the time, or if you want the device to automatically bring up the tunnel whenever there is traffic to be sent.

Saving the credentials in the device's configuration file, however, could create a security risk, because anyone who has access to the device configuration can obtain this information. An alternative method for Xauth authentication is to manually enter the username and password each time Xauth is requested. You can select whether to use a web browser window or the router console to enter the credentials. Using web-based interaction, a login page is returned, in which you can enter the credentials to authenticate the VPN tunnel. After the VPN tunnel comes up, all users behind this remote site can access the corporate LAN without being prompted again for the username and password. Alternatively, you can choose to bypass the VPN tunnel and connect only to the Internet, in which case a password is not required.

### Easy VPN Tunnel Activation

If the device credentials (Xauth username and password) are stored on the device itself, you must select a tunnel activation method for IOS router clients. Two options are available:

- **Auto**—The Easy VPN tunnel is established automatically when the Easy VPN configuration is delivered to the device configuration file. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely. This is the default option.
- **Traffic Triggered Activation**—The Easy VPN tunnel is established whenever outbound local (LAN side) traffic is detected. Traffic Triggered Activation is recommended for use with the Easy VPN dial backup configuration so that backup is activated only when there is traffic to send across the tunnel. When using this option, you must specify the Access Control List (ACL) that defines the “interesting” traffic.

#### Note

Manual tunnel activation is configured implicitly if you select to configure the Xauth password interactively. In this case, the device waits for a command before attempting to establish the Easy VPN remote connection. When the tunnel times out or fails, subsequent connections will also have to wait for the command.

You configure the xauth and tunnel activation mode in the Client Connection Characteristics policy as described in [Configuring Client Connection Characteristics for Easy VPN, page 28-7](#).

## Overview of Configuring Easy VPN

When a remote client initiates a connection to a VPN server, device authentication between the peers occurs using IKE, followed by user authentication using IKE Extended Authentication (Xauth), VPN policy push (in Client, Network Extension, or Network Extension Plus mode), and IPsec security association (SA) creation.

The following provides an overview of this process:

1. The client initiates IKE Phase 1 via aggressive mode if a preshared key is to be used for authentication, or main mode if digital certificates are used. If the client identifies itself with a preshared key, the accompanying user group name (defined during configuration) is used to identify the group profile associated with this client. If digital certificates are used, the organizational unit (OU) field of a distinguished name (DN) is used to identify the user group name. See [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 26-66](#).

---

**Note** Because the client may be configured for preshared key authentication, which initiates IKE aggressive mode, the administrator should change the identity of the VPN device via the `crypto isakmp identity hostname` command. This will not affect certificate authentication via IKE main mode.

---

2. The client attempts to establish an IKE SA between its public IP address and the public IP address of the VPN server. To reduce the amount of manual configuration on the client, every combination of encryption and hash algorithms, in addition to authentication methods and D-H group sizes, is proposed.
3. Depending on its IKE policy configuration, the VPN server determines which proposal is acceptable to continue negotiating Phase 1.

---

**Note** Device authentication ends and user authentication begins at this point.

---

4. After the IKE SA is successfully established, and if the VPN server is configured for Xauth, the client waits for a “username/password” challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, a user-specific attribute can be retrieved if the credentials of that user are validated via RADIUS.

---

**Note** VPN servers that are configured to handle remote clients should always be configured to enforce user authentication.

---

5. If the server indicates that authentication was successful, the client requests further configuration parameters from the peer. The remaining system parameters (for example, IP address, DNS, and split tunnel attributes) are pushed to the client using client or network extension mode configuration.

---

**Note** The IP address pool and group preshared key (if Rivest, Shamir, and Adelman [RSA] signatures are not being used) are the only required parameter in a group profile. All other parameters are optional.

---

6. After each client is assigned an internal IP address via mode configuration, Reverse Route Injection (RRI), if configured, ensures that a static route is created on the device for each client internal IP address.
7. IKE quick mode is initiated to negotiate and create IPsec SAs.

The connection is complete.

## Important Notes About Easy VPN Configuration

Before you configure an Easy VPN policy in your topology, you should know the following:

- In an Easy VPN topology configuration, deployment fails if a 72xx series router is used as a remote client device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running ASA Software release 7.2 or later.
- If you try to configure a Public Key Infrastructure (PKI) policy on a PIX 6.3 remote client in an Easy VPN topology configuration, deployment fails. For successful deployment on this device, you must first issue the PKI certificate on the CA server, and then try again to deploy the device. For more information about PKI policies, see [Understanding Public Key Infrastructure Policies, page 26-51](#).
- In some cases, deployment fails on a device that serves as an Easy VPN client if the crypto map is configured on the NAT (or PAT) internal interface instead of the external interface. On some platforms, the inside and outside interfaces are fixed. For example, on a Cisco 1700 series router the VPN interface must be the device's FastEthernet0 interface. On a Cisco 800 series router the VPN interface could be either the device's Ethernet0 or Dialer1 interface, depending on the configuration. On a Cisco uBR905/uBR925 cable access router, the VPN interface must be the Ethernet0 interface.

## Configuring Client Connection Characteristics for Easy VPN

Use the Client Connection Characteristics page to specify how traffic will be routed in the Easy VPN topology and how the VPN tunnel will be established. The characteristics defined in this policy are configured on the remote clients. Before configuring this policy, read the following topics:

- [Easy VPN Configuration Modes, page 28-3](#)
- [Easy VPN and IKE Extended Authentication \(Xauth\), page 28-4](#)

### Navigation Path

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select an Easy VPN topology in the VPNs selector, then select **Client Connection Characteristics** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Client Connection Characteristics** and create a new policy or edit an existing policy.

Table 28-1 Easy VPN Client Connection Characteristics Page

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                     | <p>The configuration mode for the remote devices:</p> <ul style="list-style-type: none"> <li>• <b>Client</b>—Specifies that all traffic from the remote client's inside network will undergo Port Address Translation (PAT) to a single IP address which was assigned for the device by the head end server at connect time.</li> <li>• <b>Network Extension</b>—Specifies that PCs and other hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by destination network. PAT is not used, allowing the client PCs and hosts to have direct access to the PCs and hosts at the destination network.</li> <li>• <b>Network Extension Plus</b>—An enhancement to Network Extension mode, that enables an IP address that is received via mode configuration to be automatically assigned to an available loopback interface. The IPsec SAs for this IP address are automatically created by the Easy VPN client. The IP address is typically used for troubleshooting (using ping, Telnet, and Secure Shell).</li> </ul> <p>If you select Network Extension Plus, this mode is configured on IOS routers only. Clients that are PIX or ASA devices are configured in Network Extension mode.</p> <p>For more information, see <a href="#">Easy VPN Configuration Modes</a>, page 28-3.</p> |
| Xauth Credentials Source | <p>Select how you want to enter the Xauth credentials for user authentication when you establish a VPN connection with the server:</p> <ul style="list-style-type: none"> <li>• <b>Device Stored Credentials (default)</b>—The username and password are saved on the device itself in the device's configuration file to be used each time the tunnel is established.</li> <li>• <b>Interactive Entered Credentials</b>—Enables you to manually enter the username and password each time Xauth is requested, in a web browser window or from the router console.</li> </ul> <p>For more information, see <a href="#">Easy VPN and IKE Extended Authentication (Xauth)</a>, page 28-4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Xauth Credentials        | <p>Available only if you selected <b>Device Stored Credentials</b> as the Xauth Credentials Source.</p> <p>The credentials policy object that defines the default Xauth credentials. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Configuring Credentials Policy Objects</a>, page 28-9.</p> <p><b>Note</b> If you want to configure different Xauth credentials on your remote client, you must configure the credentials policy object to allow overrides (select <b>Allow Value Override per Device</b> in the object definition).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 28-1 Easy VPN Client Connection Characteristics Page (continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Activation (IOS)          | <p>Available only if you selected the <b>Device Stored Credentials</b> option for the Xauth password source.</p> <p>For IOS router clients, select a tunnel activation method:</p> <ul style="list-style-type: none"> <li>• <b>Auto</b> (default)—The Easy VPN tunnel is established automatically when the Easy VPN configuration is delivered to the device configuration file. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely.</li> <li>• <b>Traffic Triggered Activation</b>—The Easy VPN tunnel is established whenever outbound local (LAN side) traffic is detected. If you select traffic triggered activation, also enter the name of the Access Control List (ACL) policy object that defines the traffic that should activate the tunnel. Click <b>Select</b> to select the object or to create a new object.</li> </ul> <p>Traffic Triggered Activation is recommended for use when Easy VPN dial backup is configured so that backup is activated only when there is traffic to send across the tunnel.</p> <p><b>Note</b> Manual tunnel activation is configured implicitly when you select to configure the Xauth password interactively.</p> |
| User Authentication Method (IOS) | <p>Available only if you selected the <b>Interactive Entered Credentials</b> option for the Xauth credentials source. The option applies to remote IOS routers only.</p> <p>Select one of these ways to enter the Xauth username and password interactively each time Xauth authentication is requested:</p> <ul style="list-style-type: none"> <li>• <b>Web Browser</b> (default)—Manually in a web browser window.</li> <li>• <b>Router Console</b>—Manually from the router's command line.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Configuring Credentials Policy Objects

Use the Credentials dialog box to create, copy and edit Credential objects.

Credential objects are used in Easy VPN configuration during IKE Extended Authentication (Xauth) when authenticating user access to the network and network services. When negotiating tunnel parameters for establishing IPsec tunnels in an Easy VPN configuration, Xauth identifies the user who requests the IPsec connection. If the VPN server is configured for Xauth, the client waits for a “username/password” challenge after the IKE SA has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication. You can save the Xauth credentials (username and password) on the device itself so you do not need to enter them manually each time the Easy VPN tunnel is established.

### Navigation Path

Select **Manage > Policy Objects**, then select **Credentials** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Edit button                                  | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring an IPsec Proposal for Easy VPN

Use the Easy VPN IPsec Proposal page to configure the IPsec proposal used during IKE Phase 2 negotiations for Easy VPN topologies. The IPsec proposal is configured on the IPsec Proposal tab; the options are described below.

In Easy VPN topologies, you can also configure a dynamic virtual interface on the Dynamic VTI tab. For an explanation of dVTI configuration, see [Configuring Dynamic VTI for Easy VPN, page 28-12](#).

### Note

This topic describes the IPsec Proposal page when the site-to-site VPN technology is Easy VPN. For a description of the IPsec Proposal page when the site-to-site VPN technology is something else, see [Configuring IPsec Proposals in Site-to-Site VPNs, page 26-22](#).

### Navigation Path

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select an Easy VPN topology in the VPNs selector, then select **Easy VPN IPsec Proposal** in the Policies selector. Click the **IPsec Proposal** tab.
- (Policy view) Select **Site-to-Site VPN > Easy VPN IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one. Click the **IPsec Proposal** tab.

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Network Address Translation Traversal          | <p>Supported on PIX 7.0+ and ASA 5500 series devices.</p> <p>Whether to allow Network Address Translation (NAT) traversal.</p> <p>Use NAT traversal when there is a device between a VPN-connected hub and spoke, and that performs Network Address Translation (NAT) on the IPsec traffic. For information about NAT traversal, see <a href="#">Understanding NAT in VPNs, page 26-41</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Group Policy Lookup/AAA Authorization Method          | <p>Supported on Cisco IOS routers only.</p> <p>The AAA authorization method list that will be used to define the order in which the group policies are searched. Group policies can be configured on both the local server or on an external AAA server. Remote users are grouped, so that when the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p>                                                                                                                                                                                                                                                                                                                                                |
| User Authentication (Xauth)/AAA Authentication Method | <p>Supported on Cisco IOS routers and PIX 6.3 firewalls only.</p> <p>The AAA or Xauth user authentication method used to define the order in which user accounts are searched.</p> <p>Xauth allows all AAA authentication methods to perform user authentication in a separate phase after the IKE authentication phase 1 exchange. The AAA configuration list-name must match the Xauth configuration list-name for user authentication to occur.</p> <p>After the IKE SA is successfully established, and if the device is configured for Xauth, the client waits for a username/password challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p> |

## Configuring Dynamic VTI for Easy VPN

Use the Dynamic VTI tab of the Easy VPN IPsec Proposal policy to configure a dynamic virtual tunnel interface on a device in a hub-and-spoke Easy VPN topology. For more information, see [Easy VPN with Dynamic Virtual Tunnel Interfaces, page 28-3](#).

**Note**

Dynamic VTI can be configured only on IOS routers running IOS version 12.4(2)T and later, except 7600 devices.

**Navigation Path**

- (Site-to-Site VPN Manager Window, page 25-18) Select an Easy VPN topology in the VPNs selector, then select **Easy VPN IPsec Proposal** in the Policies selector. Click the **Dynamic VTI** tab.
- (Policy view) Select **Site-to-Site VPN > Easy VPN IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one. Click the **Dynamic VTI** tab.

**Related Topics**

- [Understanding Easy VPN, page 28-1](#)

## Configuring a Connection Profile Policy for Easy VPN

A connection profile consists of a set of records that contain IPsec tunnel connection policies. Connection profiles, or tunnel groups, identify the group policy for a specific connection, and include user-oriented attributes. If you do not assign a particular group policy to a user, the default group policy for the connection applies. For a successful connection, the username of the remote client must exist in the database, otherwise the connection is denied.

In site-to-site VPNs, you configure connection profile policies on an Easy VPN server, which can be a PIX Firewall version 7.0+ or an ASA 5500 series device. The Easy VPN connection profile policy is similar to the one used for remote access VPNs. You can unassign the connection profile policy if none of the Easy VPN servers are ASA or PIX 7.0+ devices.

Creating a connection profile policy involves specifying:

- The group policy—A collection of user-oriented attributes stored either internally on the device or externally on RADIUS/LDAP server.
- Global AAA settings—Authentication, Authorization, and Accounting servers.
- The DHCP servers to be used for client address assignment, and the address pools from which the IP addresses will be assigned.
- Settings for Internet Key Exchange (IKE) and IPsec (such as preshared key).

On the PIX7.0+/ASA Connection Profiles page, you can connection profiles on your Easy VPN server.

- [Understanding Easy VPN, page 28-1](#)

---

**Step 1** Do one of the following:

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select an Easy VPN topology in the VPNs selector, then select **Connection Profiles (PIX 7.0/ASA)** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Connection Profiles (PIX 7.0/ASA)** from the Policy Types selector. Select an existing shared policy or create a new one.

For information on the policy, see [Connection Profiles Page, page 31-8](#).

**Step 2** On the **General** tab, specify the connection profile name and group policies and select which method (or methods) of address assignment to use. For a description of the available properties, see [General Tab \(Connection Profiles\), page 31-10](#).

**Step 3** Click the **AAA** tab and specify the AAA authentication parameters for an the connection profile. For a description of the elements on the tab, see [AAA Tab \(Connection Profiles\), page 31-13](#).

**Step 4** Click the **IPsec** tab and specify IPsec and IKE parameters for the connection profile. For a description of the elements on the tab, see [IPSec Tab \(Connection Profiles\), page 31-19](#).

---

## Configuring a User Group Policy for Easy VPN

Use the User Group Policy page to create or edit a user group policy on your Easy VPN server. When you configure an Easy VPN server, you create a user group to which remote clients belong. An Easy VPN user group policy can be configured on a Cisco IOS security router, PIX 6.3 Firewall, or Catalyst 6500 /7600 device. You can unassign the user group policy if none of the Easy VPN servers are IOS routers, Catalyst 6500/7600 devices, or PIX 6.3 firewalls.

Remote clients must have the same group name as the user group configured on the server in order to connect to the device, otherwise no connection is established. When the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.

Select the user group policy object that you want to use in the policy from the Available User Groups list. You can create a new user group object by clicking the **Create (+)** button, or edit an existing group by selecting it and clicking the **Edit (pencil icon)** button. For information about configuring the user group object, see [Add or Edit User Group Dialog Box, page 34-73](#).

#### Navigation Path

- ([Site-to-Site VPN Manager Window, page 25-18](#)) Select an Easy VPN topology in the VPNs selector, then select **User Group Policy** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > User Group Policy** from the Policy Types selector. Select an existing shared policy or create a new one.

## Group Encrypted Transport (GET) VPNs

---

Cisco Group Encrypted Transport virtual private network (GET VPN) is a full-mesh VPN technology that can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). GET VPN comprises a set of features that are necessary to secure IP multicast group traffic or unicast traffic over a private WAN that originates on or flows through a Cisco IOS device. GET VPN combines the keying protocol Group Domain of Interpretation (GDOI) with IP security (IPsec) encryption to provide users with an efficient method to secure IP multicast or unicast traffic. GET VPN enables the router to apply encryption to nontunneled (that is, “native”) IP multicast and unicast packets and eliminates the requirement to configure tunnels to protect multicast and unicast traffic.

Cisco Group Encrypted Transport VPN provides the following benefits:

- Provides data security and transport authentication, helping to meet security compliance and internal regulation by encrypting all WAN traffic.
- Enables high-scale network meshes and eliminates complex peer-to-peer key management with group encryption keys.
- For Multiprotocol Label Switching (MPLS) networks, maintains network intelligence such as full-mesh connectivity, natural routing path, and Quality of Service (QoS).
- Grants easy membership control with a centralized key server.
- Helps ensure low latency and jitter by enabling full-time, direct communications between sites, without requiring transport through a central hub.
- Reduces traffic loads on customer premises equipment (CPE) and provider-edge (PE) encryption devices by using the core network for replication of multicast traffic, avoiding packet replication at each individual peer site.

**Tip**

## Understanding Group Encrypted Transport (GET) VPNs

Networked applications such as voice and video increase the need for instantaneous, branch-interconnected, and QoS-enabled WANs. The distributed nature of these applications results in increased demands for scale. At the same time, enterprise WAN technologies force businesses to trade off between QoS-enabled branch interconnectivity and transport security. As network security risks increase and regulatory compliance becomes essential, Group Encrypted Transport VPN (GET VPN), a WAN encryption technology, eliminates the need to compromise between network intelligence and data privacy.

With GET, Cisco provides tunnelless VPN, which eliminates the need for IPsec tunnels. By removing the need for point-to-point tunnels, meshed networks can scale higher while maintaining network-intelligence features critical to voice and video quality. GET is a standards-based security model that is based on the concept of a trusted group to eliminate point-to-point IPsec tunnels and their associated overlay routing. Trusted group members share a common security association (SA), also known as a group SA. This enables group members to decrypt traffic that was encrypted by any other group member. By using trusted groups instead of point-to-point tunnels, full-mesh networks can scale higher while maintaining network-intelligence features (such as QoS, routing, and multicast), which are critical to voice and video quality.

GET-based networks can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). MPLS VPNs that use this encryption technology are highly scalable, manageable, and cost-effective, and they meet government-mandated encryption requirements. The flexible nature of GET allows security-conscious enterprises either to manage their own network security over a service provider WAN service or to offload encryption services to their providers. GET simplifies securing large Layer 2 or MPLS networks that require partial or full-mesh connectivity.

In addition to leveraging the existing IKE, IPsec and multicast technologies, a GET VPN topology includes these key elements and features:

- **Group members**—The routers that exchange the actual traffic within the VPN are called group members. Group members provide encryption services to the traffic. Encryption policies are defined centrally on the key server and downloaded to the group member at the time of registration. Based on these downloaded policies, a group member decides whether traffic needs to be encrypted or decrypted and what keys to use.

Although group members primarily obtain encryption policies from the key server, you can configure local service policy ACLs on the group members to exclude traffic from encryption based on local requirements. For more information, see [Understanding the GET VPN Security Policy and Security Associations, page 29-10](#).

---

**Note** A device can be a group member of more than one group.

---

- **Key servers**—The routers that act as key servers are the gatekeepers to the topology. The group member must successfully register with a key server before becoming an active member of the VPN. The key servers control the shared service policy, and generate and transmit keys to group members. Key servers cannot be group members themselves, but a single key server can service more than one topology. For more information, see [Understanding the GET VPN Registration Process, page 29-4](#).
- **The Group Domain of Interpretation (GDOI) group key management protocol** is used to provide a set of cryptographic keys and policies to a group of devices. In a GET VPN network, GDOI is used to distribute common IPsec keys to a group of enterprise VPN gateways (group members) that must communicate securely. Devices designated as key servers periodically refresh and send out the updated keys to the group members using a process called “rekeying.”

The GDOI protocol uses the Phase 1 Internet Key Exchange (IKE) SA. All participating VPN gateways authenticate themselves to the device providing keys using IKE. All IKE authentication methods, for example, pre-shared keys (PSKs) and public key infrastructure (PKI), are supported for initial authentication. After the VPN gateways are authenticated and provided with the appropriate security keys using the IKE SA, the IKE SA expires and GDOI is used to update the group members in a more scalable and efficient manner. For more information about GDOI, refer to RFC 3547.

- **Address preservation**—IPsec-protected data packets carry the original source and destination in the outer IP header rather than replacing them with tunnel endpoint addresses. Address preservation allows GET VPN to use the routing functionality present within the core network. Address preservation allows routing to deliver the packets to any customer-edge (CE) device in the network that advertises a route to the destination address. Any source and destination matching the policy for the group will be treated in a similar manner. In the situation where a link between IPsec peers is not available, address preservation also helps combat traffic “black-hole” situations.

Header preservation also maintains routing continuity throughout the enterprise address space and in the WAN. As a result, end host addresses of the campus are exposed in the WAN (for MPLS, this applies to the edge of the WAN). For this reason, GET VPN is applicable only when the WAN network acts as a “private” network (for example, in an MPLS network).

The following figure shows the general operation of a GET VPN topology.

**Figure 29-1** General GET VPN Operation

1. Group members register with the key server using the Group Domain of Interpretation (GDOI) protocol. The key server authenticates and authorizes the group members and downloads the IPsec policy and keys that are necessary for them to encrypt and decrypt IP multicast and unicast packets. The registration process can use unicast or multicast communications.

2. Group members exchange IP packets that are encrypted using IPsec. Only the group members are an active part of the VPN.
3. As needed, the key server pushes a rekey message to the group members. The rekey message contains new IPsec policy and keys to use when old IPsec security associations (SAs) expire. Rekey messages are sent in advance of the SA expiration time to ensure that valid group keys are always available.

GET VPN is provisioned using Security Manager with the following caveats:

- GET VPN-aware VRF is not supported.
- DMVPN with GET is not supported, because there is no way to define DMVPN without tunnel protection in Security Manager.
- Manual configuration of a group member to join a multicast group (ip igmp join-group) is not supported. Security Manager only provisions static source-specific multicast (SSM) mappings.

## Understanding the GET VPN Registration Process

In GET VPN, group members comprise the VPN topology. Traffic in the VPN is traffic between group members. For a device to become a group member, the device must successfully register with a key server. Key servers maintain the security association (SA) policy and create and maintain the keys for the group. When a group member registers, the key server downloads the policy and the keys to the group member. The key server also rekeys the group before existing keys expire.

The key server has two responsibilities: servicing registration requests and sending rekeys. A group member can register at any time and receive the most current policy and keys. When a group member registers with the key server, the key server verifies the group ID that the group member is attempting to join. If the group ID is valid, the key server sends the security association policy to the group member. After the group member acknowledges that it can handle the downloaded policy, the key server downloads the respective keys.

Communication among the key server and group members is encrypted and secured using two types of keys: the traffic encryption key (TEK) and the key encryption key (KEK). The TEK is downloaded by the key server to all the group members. The downloaded TEK is used by all the group members to communicate securely among each other. This key is essentially the group key that is shared by all the group members. The group policies and IPsec SAs are refreshed by the key server using periodic rekey messages to the group members. The KEK is also downloaded by the key server and is used by the group members to decrypt the incoming rekey messages from the key server.

The key server sends out rekey messages either because of an impending IPsec SA expiration or because the security policy has changed on the key server. A rekey can also happen if the KEK timer has expired (the key server sends out a KEK rekey). Rekey messages might also be retransmitted periodically to account for possible packet loss. If the rekey mechanism is multicast, there is no efficient feedback mechanism by which receivers can indicate that they did not receive a rekey message, so retransmission seeks to bring all receivers up to date. If the rekey mechanism is unicast, the receivers send an acknowledgment message.

The key server generates the group policy and IPsec security associations (SAs) for the GDOI group. The information generated by the key server includes multiple TEK attributes, traffic encryption policy, lifetime, source and destination, a Security Parameter Index (SPI) ID that is associated with each TEK, and the rekey policy (one KEK). Note that the group member might also have a local security policy configured that is merged with the one downloaded; for complete information see [Understanding the GET VPN Security Policy and Security Associations](#), page 29-10.

The following figure illustrates the communication flow between group members and the key server. The key server, after receiving registration messages from a group member, generates the information that contains the group policy and new IPsec SAs. The new IPsec SA is then downloaded to the group member. The key server maintains a table that contains the IP address of each group member per group. When a group member registers, the key server adds its IP address in its associated group table, thus allowing the key server to monitor an active group member. A key server can support multiple groups. A group member can be part of multiple groups.

**Figure 29-2** Communication Flow Between Group Members and the Key Server

When you configure the GET VPN topology, you can configure the following registration-related features:

- Decide whether to use unicast or multicast for group registration and rekeying. For more information, see [Choosing the Rekey Transport Mechanism](#), page 29-6.

**Note** If you use multicast, you need to enable multicast on the key servers and group members manually. Security Manager does not provision multicast commands.

- Decide whether to configure more than one key server to provide redundancy and load balancing. For more information, see [Configuring Redundancy Using Cooperative Key Servers](#), page 29-7.
- Decide whether to configure fail-close mode on group members to protect their traffic prior to successful registration with the key server. For more information, see [Configuring Fail-Close to Protect Registration Failures](#), page 29-8.

- Decide whether to require authorization for group members to join the group. You can use certificate authorization (which requires that you also configure the Public Key Infrastructure policy) or preshared keys. Configuring authorization is required if the key server serves more than one group. For information about the configuration options, see the Authorization Type setting described in [Defining GET VPN Group Encryption, page 25-54](#).

## Choosing the Rekey Transport Mechanism

When you configure the rekey settings in the Group Encryption Policy (as described in [Defining GET VPN Group Encryption, page 25-54](#)), you must select whether to use multicast or unicast as the rekey transport mechanism. The key server uses this method whenever sending new keys and IPsec security associations (SAs) to group members or each other. There are advantages and disadvantages to each method.

**Multicast** is the standard choice. Using multicast, the key server sends one copy of each rekey message to all group members at once using a multicast group address, so there is no rekey delay and group members can install the updated security policy essentially simultaneously (not accounting for regular network delay). However, in some networks, multicast is either an extra cost feature, or it is simply not allowed. If you configure multicast, you must supply the multicast address that will be used by the GET VPN topology.

**Unicast** can be used when multicast is unavailable or undesirable. Using unicast, the key server sends directed rekey and IPsec SAs to group members, and the group member sends an acknowledgment that the message was received. Because unicast requires sending direct messages and receiving acknowledgments, the key server sends the unicast messages to a subset of the group members at a time (unless you have a relatively small VPN, perhaps fewer than 30 group members, in which case all group members might be sent messages at the same time).

Thus, the relative benefits of multicast and unicast include the following:

- With multicast, the key server does not know if a group member receives a message, whereas with unicast, there are acknowledgments. With unicast, if the key server does not receive the acknowledgment, it resends the message.
- Multicast is faster than unicast, especially for large topologies with hundreds of group members. Multicast rekey uses the same low CPU overhead whether there is one group member in the group or a few thousand.
- With unicast, if a group member continuously fails to send acknowledgments, the key server decides the group member is no longer there and stops sending rekey messages. Thus, the key server always has a list of active group members. The unresponsive group member must reregister to rejoin the GET VPN topology. Because multicast does not use acknowledgments, the key server does not know if a group member becomes unresponsive, and it does not maintain a list of active group members.

#### Tip

To use multicast, you must enable multicast on the key servers and group members. Security Manager does not provision these commands; it only enables multicast rekey, it does not enable the router to send and receive multicast traffic. Therefore, you must manually enable multicast on the device, or use the FlexConfig policy to provision the commands (see [Creating FlexConfig Policy Objects, page 7-28](#)).

Fortunately, it is possible to mix multicast and unicast in a single GET VPN topology so long as all key servers support multicast. When deciding which transport mechanism to use, consider the following recommendations:

- If all key servers and group members, and the network, support multicast, use multicast.
- If all of the key servers and most of the group members support multicast, but a small number of group members do not support multicast, use multicast. Group members that do not support multicast will not receive rekey and IPsec SA updates. However, when the lifetime settings for these items are about to expire, unicast group members will reregister with the key server and obtain the new keys and IPsec SAs.
- If no group members, or only a few, support multicast, use unicast. The group members will then receive rekeys and IPsec SA updates from the key server and not need to reregister to get them.

#### Related Topics

- [Understanding the GET VPN Registration Process, page 29-4](#)
- [Generating and Synchronizing RSA Keys, page 29-13](#)
- [Configuring GET VPN, page 29-12](#)

## Configuring Redundancy Using Cooperative Key Servers

The key server is the most important entity in the GET VPN network because the key server maintains the control plane. Therefore, a single key server is a single point of failure for an entire GET VPN network. Because redundancy is an important consideration for key servers, GET VPN supports multiple key servers, called cooperative (COOP) key servers, to ensure seamless fault recovery if a key server fails or becomes unreachable.

You can configure a group member to register to any available key server from a list of all COOP key servers. The group member configuration determines the registration order (see [Configuring GET VPN Group Members, page 29-20](#) and [Edit Group Member Dialog Box, page 29-21](#)). The key server defined first is contacted first, followed by the second defined key server, and so on. It is a best practice to distribute group member registration to all available COOP key servers to reduce the IKE processing load on a single key server. Note that only the primary key server sends rekey messages.

When COOP key servers boot, all key servers assume a *secondary* role and begin an election process. One key server, typically the one having the highest priority, is elected as a *primary* key server. The other key servers remain in the secondary state. The primary key server is responsible for creating and distributing group policies to all group members and to periodically synchronize the COOP key servers.

Cooperative key servers exchange one-way announcement messages (primary to secondary). If a secondary key server does not hear from the primary key server for a certain length of time, the secondary key server tries to contact the primary key server and request updated information. If the primary key server does not respond, or if the secondary key server does not hear from the primary key server, a COOP key server reelection is triggered and a new primary key server is elected.

Up to eight key servers can be defined as COOP key servers, but more than four COOP key servers are seldom required. Because rekey information is generated and distributed from a single primary key server, the advantage of deploying more than two key servers is the ability to handle registration load in case of a network failure and reregistration taking place at the same time. This is especially important when using Public Key Infrastructure (PKI) group member authorization because IKE negotiation using PKI requires a lot more CPU power compared to IKE negotiation using pre-shared keys (PSKs).

**Tips**

- The RSA key must be the same on all cooperative key servers. For information on synchronizing the RSA key, see [Generating and Synchronizing RSA Keys, page 29-13](#).
- It is a best practice to enable periodic ISAKMP keepalives between key servers so that the primary key server can track and display the state of the other secondary key servers. IKE Keepalives between group members and the key server is not required and is not supported. For information on configuring keepalives, see [Configuring Global Settings for GET VPN, page 29-16](#).
- The COOP protocol is configured on a per GDOI group basis. A key server that is configured with multiple GDOI groups can maintain multiple unique COOP relationships with disparate key servers.

## Configuring Fail-Close to Protect Registration Failures

Group members must register with the key server to become members of the GET VPN. Before a group member successfully registers with the key server, traffic passing through the group member's GET VPN interface is not encrypted. The period of time in which clear-text transmissions occur can be short (if registration succeeds) or potentially long, if the group member fails to register for any reason.

This default behavior is known as fail-open. If you consider it a violation of your security standards that traffic is sent in clear text at any time, you can configure fail-close mode to protect traffic before (or during) registration. With fail-close mode, all traffic on the interface is dropped except for the traffic you specifically identify in the fail-close ACL. Fail-close mode essentially shuts down the interface until the group member successfully registers with the key server and downloads the required keys and security policy and associations. Note that the use of fail-close mode requires as a minimum Cisco IOS Software release 12.4(22)T or 15.0; you can also configure it on all supported ASRs (see [Understanding Devices Supported by Each IPsec Technology, page 25-9](#)).

Fail-close mode is used only during the initial registration. If a group member has already successfully registered, the group member keeps the downloaded policy from the key server even if future registrations fail. However, if you use the **clear crypto gdoi** command on the group member, the subsequent registration attempt is considered a first-time attempt and fail-close mode is enforced.

You configure fail-close mode on the individual group members as described in [Configuring GET VPN Group Members, page 29-20](#). Thus, you can enable the mode on selected group members rather than on all of them. You must specify a fail-close ACL to ensure that you do not lock yourself (and Security Manager) out of the device, preventing configuration updates and maintenance until registration succeeds.

The fail-close ACL is an extended ACL policy object and is configured as part of a crypto map on the device. You configure the rules from the perspective of the group member. Use the following tips to help you create an appropriate fail-close ACL:

- You can configure both **permit** and **deny** statements. In the fail-close ACL, “permit” means “do not send this traffic,” whereas “deny” means “send this traffic in clear text.” This behavior is different from that of the typical crypto map ACL, where the statements have the following meaning:
  - **Permit**—Means “encrypt this traffic.” Because the group member does not have the IPsec security association required to encrypt the traffic prior to registration, the result is that the traffic is dropped.
  - **Deny**—Means “do not encrypt this traffic.” In a typical crypto map ACL, a deny statement results in the matching packet being compared to the next crypto map ACL configured on the device (if any). However, if traffic matches a deny statement in the fail-close ACL, all crypto map ACL processing ends and the traffic is allowed in clear text.

The reason deny works this way in fail-close mode is because fail-close includes an implicit ACL statement that gets added at the bottom of the list of crypto map ACLs. This statement is **permit ip any any**, which matches all traffic. Because there is no IPsec security association due to the fact that registration has yet to occur, there is no way to encrypt the remaining traffic and it is dropped.

Note that because of this final permit ip any any statement, you might be able to limit yourself to deny statements in your fail-close ACL.

- The fail-close ACL is processed sequentially after the optional group member security policy ACL. However, all statements in the group member security policy ACL must be deny statements, which indicate that matching traffic should be sent in clear text. Because the security policy is processed according to normal crypto map rules, traffic that matches deny statements is subsequently compared to the fail-close ACL. If the fail-close ACL does not have matching deny statements, the traffic will subsequently be dropped by the implicit final fail-close permit ip any any statement.

Therefore, if you use a group member security policy ACL, and you want the identified traffic to be sent in clear text regardless of the registration status of the group member, your fail-close ACL should contain all of the same statements contained in the security policy ACL at the least. It might even be possible to use the same ACL object for both ACLs.

For more information about group member security policies, see [Understanding the GET VPN Security Policy and Security Associations, page 29-10](#).

- The fail-close ACL is inserted as the final crypto map ACL. Thus, if you configure other features on the GET VPN interface that use crypto maps, any traffic identified on deny statements in those other ACLs will also get trapped (and dropped) by the fail-close ACL and the implicit final permit ip any any statement. Thus, configuring fail-close mode for GET VPN can influence the non-GET VPN services you configure on the interface.
- Upon successful registration, the fail-close ACL and the implicit final permit ip any any statement are removed from the crypto maps. These policies are not persistent.
- You should consider including the following rules in the fail-close ACL policy object. Remember that these rules are from the perspective of the group member:
  - SSH, SSL (HTTPS) traffic—You, and Security Manager, need to be able to access the device to configure it. To ensure that you do not lock down the device, include deny statements for SSH and SSL. For SSH, **deny tcp any eq 22 <host or network address>**. For SSL, **deny tcp any eq 443 <host or network address>**. If you specify host addresses, ensure that the Security Manager server is one of the hosts.
  - Routing traffic—To enable routing, allow the traffic for your routing process. For example, if you are using OSPF, **deny ospf any any**.
  - GDOI traffic—Regardless of the contents of the fail-close ACL, the device looks for GDOI registration messages, so you do not need to explicitly allow them to enable successful registration. However, if a group member (1) is in the path between the key server and another group member (2), a registration failure by group member (1) will prevent successful registration by the blocked group member (2). For registration on group member (2) to succeed, the fail-close ACL on group member (1) would have to allow GDOI traffic to pass. Thus, you might want to make it a general practice to allow GDOI traffic in the fail-close ACL: **deny udp any eq 848 any eq 848**.

# Understanding the GET VPN Security Policy and Security Associations

GET VPN uses crypto map access control lists (ACLs) to identify the traffic that needs to be encrypted in the VPN. These ACLs also identify traffic that should be sent as clear text instead of being encrypted (essentially, traffic that lies outside of the VPN). The collection of these ACLs define the security policy for the VPN.

GET VPN provides a multi-layered security policy. You define the general policy for the entire VPN on the key server, but you can also define a separate security policy on group members to account for local variations. The group member security policy always takes priority over the policy received from the key server. When the group member registers with the key server, the group member downloads the key server's security policy and associations and the group member creates a new, single security policy crypto map ACL by concatenating the individual security policies in this order: first, the group member's ACL; second, the key server's first ACL; third, and so forth, any additional ACLs from the key server in the order defined on the key server. It is important to understand that these merged ACLs are treated as a single ACL; they are not searched as separate ACLs. Thus, if traffic matches a deny statement from the group member's ACL, that traffic is never tested against any ACL rules downloaded from the key server.

## Tip

If a group member leaves the GET VPN, the ACLs downloaded from the key server are removed, but the group member security policy ACL is retained and remains configured on the device.

In GET VPN security policy ACLs (and crypto map ACLs in general), the permit and deny keywords have special meaning:

- **Permit**—Means “encrypt this traffic.” Permit entries are allowed only in the security policy ACLs defined on the key server (in the **Group Encryption Policy**), because encrypted traffic needs to have a full IPsec security association, which includes the transform set used for encrypting traffic, and anti-replay and IPsec lifetime configurations. If a packet matches a permit entry, but no IPsec SA exists for that packet, the packet is dropped.

Normally, your permit rules should be symmetric, that is, the source and destination addresses should be the same. If you need to specify different source and destination addresses, you must create two rules; the second rule should be a mirror image of the first rule, with the source and destination address switched.

- **Deny**—Means “do not encrypt this traffic.” In practice, this typically means that the traffic that matches the deny statement is sent in the clear. However, if you configure other features that use crypto maps, “denied” traffic is actually compared to subsequent (lower priority) crypto map ACLs to see if there is a match. IPsec security associations (SAs) are not generated for deny rules.

Following is a summary of the security policies that you can configure, in priority order:

- **Group member security policy**—When you configure the group member, as described in [Configuring GET VPN Group Members, page 29-20](#), you can optionally select an ACL policy object that defines the local group member security policy.

This group member ACL policy object is allowed to have deny statements only. You use this ACL to identify any traffic that you want to exclude from encryption and send in the clear. For example, if a handful of group members in the group are running a different routing protocol than the usual one, you can configure a local entry to these group members' security policy ACL to bypass encryption of the routing protocol traffic instead of defining the policy globally at the key server level.

- **Key server security policies and security associations**—When you configure the Group Encryption Policy for the GET VPN, as described in [Defining GET VPN Group Encryption, page 25-54](#), you configure ACLs that identify the traffic that should be encrypted and protected in the VPN.

The security policies on the key server are coupled with transform sets and other settings to define security associations; two IPsec security associations (SAs) are actually configured for every rule within the ACL, and these SAs define how the selected traffic should be encrypted. Thus, all group members use the same group SAs and they do not need to negotiate them with each other.

Because the key server policy is appended to the group member policy, the policy might be as simple as **permit ip any any**, that is, encrypt all traffic that has not been excluded by the group member policy.

However, you can create more complex sets of security policies and associations, setting up several separate ACL policy objects that are coupled to different transform sets to define different types of encryption.

If you create more than one security association, you must identify their order, and they are appended to the group policy in that order. Remember, the end result is a single ACL, so if you include a deny statement in the first ACL, any permit rules for the same traffic in subsequent security associations are ignored, and the traffic is sent in clear text rather than being encrypted.

**Note**

---

When you consider the security associations defined in the Group Encryption Policy as a whole, you can define up to 100 ACL permit entries. Each permit entry results in a pair of IPsec SAs; the maximum number of IPsec SAs in a group can not exceed 200. It is a best practice to summarize interesting traffic to as few permit entries as possible, and to build symmetric policies, where the source and destination addresses are the same. Unlike traditional IPsec policies, where source and destination address ranges must be uniquely defined, GET VPN is optimized when the source and destination address range are the same. If you configure a rule that has different source and destination addresses, you must also configure the mirrored rule (where the source and destination address are flipped), meaning that four SAs are consumed.

---

In addition to these security policies, there is an additional fail-close ACL that influences traffic patterns if you configure fail-close mode on a group member. For a complete discussion, see [Configuring Fail-Close to Protect Registration Failures, page 29-8](#).

## Understanding Time-Based Anti-Replay

Anti-replay is an important feature in a data encryption protocol such as IPsec (RFC 2401). Anti-replay prevents a third party from eavesdropping on an IPsec conversation, stealing packets, and injecting those packets into a session at a later time. The time-based anti-replay mechanism helps ensure that invalid packets are discarded by detecting the replayed packets that have already arrived at an earlier time.

GET VPN uses the Synchronous Anti-Replay (SAR) mechanism to provide anti-replay protection for multisender traffic. SAR is independent of real-world Network Time Protocol (NTP) clock or sequential-counter mechanisms (which guarantee packets are received and processed in order). A SAR clock advances regularly. The time tracked by this clock is called pseudotime. The pseudotime is maintained on the key server and is sent periodically to the group members within a rekey message as a timestamp field called `pseudoTimeStamp`. Group members have to be resynchronized to the pseudotime of the key server periodically. The pseudotime of the key server starts ticking from when the first group member registers. Initially, the key server sends the current pseudotime value of the key server and window size to group members during the registration process. New attributes, such as time-based replay-enabled information, window size, and the pseudotime of the key server, is sent under the SA payload (TEK).

The group members use the pseudotime to prevent replay as follows: the `pseudoTimeStamp` contains the pseudotime value at which a sender created a packet. A receiver compares the pseudotime value of senders with its own pseudotime value to determine whether a packet is a replayed packet. The receiver uses a time-based anti-replay window to accept packets that contain a timestamp value within that window. The window size is configured on the key server and is sent to all group members.

The following figure illustrates an anti-replay window in which the value `Ptr` denotes the local pseudotime of the receiver, and `W` is the window size.

You configure anti-replay in the security association definitions in the Group Encryption Policy. For more information, see [Defining GET VPN Group Encryption, page 25-54](#) and [Add New or Edit Security Association Dialog Box, page 25-58](#).

**Figure 29-3 Anti-Replay Window**

## Configuring GET VPN

To configure a full mesh VPN with group encrypted transport (GET), use the Create VPN wizard as described in [Creating or Editing VPN Topologies, page 25-28](#). When you finish the wizard, you are asked if you want to synchronize RSA keys, which is required for normal VPN functioning; for detailed information, see [Generating and Synchronizing RSA Keys, page 29-13](#).

If you select multicast as the rekey transport mechanism, you must enable multicast on all key servers and the desired group members. For more information, see [Choosing the Rekey Transport Mechanism, page 29-6](#).

You can change only the name and description of a GET VPN using the Edit VPN wizard. If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPsec settings, select **Global Settings for GET VPN**. See [Configuring Global Settings for GET VPN, page 29-16](#).

- For IKE proposal policies, select **IKE Proposal Policy for GET VPN**. See [Configuring the IKE Proposal for GET VPN, page 29-15](#).
- For security associations (ACL rules) and IPSec policies, select **Group Encryption Policy > Security Associations**. See [Defining GET VPN Group Encryption, page 25-54](#).
- For preshared key policies, select **IKEv1 Preshared Key**. See [Configuring IKEv1 Preshared Key Policies, page 26-48](#).
- For public key (PKI) policies, select **Public Key Infrastructure**. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 26-54](#).
- For rekey settings, select **Group Encryption Policy > Group Settings**. See [Defining GET VPN Group Encryption, page 25-54](#) and [Generating and Synchronizing RSA Keys, page 29-13](#).
- For key server configuration, including RSA key synchronization, select **Key Servers**. See [Configuring GET VPN Key Servers, page 29-18](#) and [Generating and Synchronizing RSA Keys, page 29-13](#).
- For group membership and endpoint settings, select **Group Members**. See [Configuring GET VPN Group Members, page 29-20](#).

## Generating and Synchronizing RSA Keys

When you specify the RSA key label in the Group Encryption Policy (as described in [Defining GET VPN Group Encryption, page 25-54](#)), the corresponding RSA key (public and private keys) needs to be configured on all key servers in the GET VPN topology. The key can either be a pre-existing key that you defined on the device, or it could be a new key label, and Security Manager can generate the key for you and synchronize all key servers to use the same key.

You can use the following methods to have Security Manager generate and synchronize the RSA key:

- When creating a new GET VPN using the Create VPN wizard, you are asked at the end of the wizard if you want to synchronize the keys. If you click **Yes**, Security Manager does the key synchronization immediately, and generates a new key if the key does not already exist. For information on using the Create VPN wizard, see [Creating or Editing VPN Topologies, page 25-28](#).
- For an existing GET VPN, you can click the **Synchronize Keys** button on the Key Servers policy. Use this process whenever you add key servers or generate a new key on the primary key server. For information on configuring key server settings for existing topologies, see [Configuring GET VPN Key Servers, page 29-18](#).

**Tip**

For existing GET VPN topologies, if you want to generate a new RSA key, it might be easiest to update the Group Encryption Policy to specify a new, unused RSA key label, then click the Synchronize Keys button in the Key Servers policy. Because the key will not exist on any key server, Security Manager will generate the new key and import it into all key servers. You can then manually delete the old key from each key server.

Following are the uses for the RSA key:

- The key server uses the private RSA key to authenticate rekey messages from the group members.
- The key server provides the public RSA key to group members during registration.
- The key server uses the private key to sign the key encryption key (KEK) and traffic encryption key (TEK). The absence of an RSA key prevents the key server from creating the KEK and TEK.
- The RSA key is also used to sign messages between cooperative key servers.

When you start the RSA key synchronization process, the Synchronize Keys dialog box opens and shows you the overall progress as well as the results for each key server. (You can click the **Abort** button at any time to stop the process.) Security Manager performs the following steps:

1. Logs into all key servers and retrieves the RSA key information from each of them for the RSA key label configured for the VPN.
2. Determines whether any key server has a key with the required label:
  - If no key server has an RSA key with the required label, Security Manager generates the key on the primary key server (the one with the highest priority).
  - If one or more key server does not have the key, but all of the key servers that do have the key have the identical keys, Security Manager uses the existing key on any key server that has it.
  - If more than one key server has the key, but the contents of the key is different among the servers, you are asked if Security Manager can overwrite the keys. If you click **Yes**, Security Manager uses the existing key on the primary key server.

If you click **No**, you can log into the key servers outside of Security Manager and manually adjust the keys according to your requirements. However, all key servers must have the same key contents for the RSA key. See below for an explanation of the process.

3. Creates an exportable version of the key.
4. Imports the key into each of the remaining key servers.

**Tip**

For the synchronization process to succeed, the devices must be online and reachable and you must have Deploy authorization. If the device connection fails or times out, ensure that you can ping the key server from the Security Manager server. If it is your practice to deploy to file instead of to live devices, you might need to manually generate and synchronize the keys as described below. If you do not have sufficient authorization, you are prevented from initiating the process; someone else must do it.

### Manually Generating and Synchronizing the RSA Key

If you do not want Security Manager to generate and synchronize keys, or if for some reason Security Manager cannot complete the process, you can manually generate and synchronize keys using the following sequence in Privileged EXEC (enable) configuration mode:

1. Generate the key on a key server using the following command, where **rekeyrsa** is the name of the key (you can specify a name of your choosing). You must make the key exportable.

**crypto key generate rsa general-keys label rekeyrsa modulus 1024 exportable**

2. Create an exportable copy of the key using the following command, where **passphrase** is a string used to encrypt the key for import (you can specify your own pass phrase):

**crypto key export rsa rekeyrsa pem terminal 3des passphrase**

This command prints out the public and private keys to the terminal, where you can copy them to the clipboard for import into the other key servers. The keys are demarcated by **---BEGIN/END PUBLIC KEY---** and **---BEGIN/END RSA PRIVATE KEY---**. Note that you can also export to a URL; see the *Cisco IOS Security Command Reference* on Cisco.com for detailed usage information.

3. Import the key into each of the other key servers using the following command:

**crypto key import rsa rekeyrsa pem exportable terminal passphrase**

When copying and pasting the keys, include the begin/end lines.

## Configuring the IKE Proposal for GET VPN

Use the IKE Proposal for GET VPN page to define the IKE proposal to be used by the GET VPN topology. The IKE proposal is configured on the key servers and the group members.

These settings are for the ISAKMP security association (SA). If you are using a single key server, the ISAKMP SA is not used after initial group member registration. If you are using more than one key server (cooperative key servers), the ISAKMP SA is needed for communications among the key servers.

To open the IKE Proposal for GET VPN page:

- (Site-to-Site VPN Manager Window) Select an existing GET VPN topology and then select **IKE Proposal for GET VPN** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKE Proposal for GET VPN**, and then select an existing policy or create a new one.

The following table explains the settings you can configure in this policy.

**Table 29-1** IKE Proposal for GET VPN Policy

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE Proposal | <p>The IKE proposal policy object that defines the settings you want to use. There are several predefined objects that you might be able to use as is.</p> <p>Click <b>Select</b> to open the list of existing IKE proposal objects. The object you select needs to use the same authorization method you are configuring for the group (for example, an object name with the prefix <b>preshared</b> when using preshared keys, or with the prefix <b>cert</b> when using Public Key Infrastructure (PKI) certificates).</p> <p>When you select an object and click <b>OK</b>, the settings defined in the object are displayed in the IKE Proposal Settings display fields. You can also see the settings by editing them in the selection list. If you do not find an appropriate pre-existing object, click the <b>Add (+)</b> button in the selection list and create a new object (see <a href="#">Configuring IKEv1 Proposal Policy Objects</a>, page 26-11 for more information and detailed descriptions of the options).</p> |

**Table 29-1** *IKE Proposal for GET VPN Policy (continued)*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE Proposal Overrides | <p>The number of seconds that the ISAKMP SA for key servers and group members is valid. When the lifetime is exceeded, the SA expires and must be renegotiated between the peers. Values can be 1 to 86400.</p> <ul style="list-style-type: none"> <li>• If you are using cooperative key servers (more than one key server), set the key server lifetime high. The default 86400 is appropriate.</li> <li>• If you are using a single key server, you can set the lifetime low (but not less than 60 seconds) so that the ISAKMP SA is not retained unnecessarily. It is not used after a group member registers.</li> <li>• We recommend that you set the group member lifetime low as compared to the key server lifetime, especially when cooperative key servers are configured.</li> </ul> |

## Configuring Global Settings for GET VPN

Use the Global Settings for GET VPN page to define global settings for ISAKMP and IPsec that apply to devices in your GET VPN topology.

**Note**

The lifetime settings in this policy do not apply to the ISAKMP security association lifetime for the key server and group members. Those lifetime values are configured in the IKE Proposal for GET VPN policy. For more information, see [Configuring the IKE Proposal for GET VPN, page 29-15](#).

To open the Global Settings for GET VPN page:

- (Site-to-Site VPN Manager Window) Select an existing GET VPN topology and then select **Global Settings for GET VPN** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Global Settings for GET VPN**, and then select an existing policy or create a new one.

The following table explains the settings you can configure in this policy.

Table 29-2 Global Settings for GET VPN

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Keepalive (Key Servers Only) | <p>Whether to enable dead peer detection (DPD) keepalive messages between key servers. If there is more than one key server (cooperative key servers), you should enable periodic keepalive so the servers know each other's status and can elect a new primary server when necessary. Configure the following settings:</p> <ul style="list-style-type: none"> <li>• <b>Interval</b>—When you also select <b>Periodic</b>, the number of seconds between DPD messages. If you do not select Periodic, it is the number of seconds during which traffic is not received from the peer before DPD retry messages are sent. The range is from 10 to 3600 seconds.</li> <li>• <b>Retry</b>—The number of seconds between DPD retry messages if the DPD retry message is missed by the peer; the range is from 2 to 60 seconds. The default DPD retry message is sent every 2 seconds. Five aggressive DPD retry messages can be missed before the key server is marked as down.</li> <li>• <b>Periodic</b>—Whether to send DPD messages at regular intervals (regardless of traffic received from the other key servers). For GET VPN, you should select Periodic.</li> </ul> |
| Identity                            | <p>During Phase I IKE negotiations, peers must identify themselves to each other. Select the ISAKMP identity to use:</p> <ul style="list-style-type: none"> <li>• <b>Address</b>—(Default) The IP address of the interface that participates in IKE negotiations. Use the address if only one interface participates in negotiations, and its IP address is known (static).</li> <li>• <b>Hostname</b>—The fully-qualified host name (for example, router1.example.com).</li> <li>• <b>Distinguished Name</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SA Requests System Limit            | <p>The maximum number of SA requests allowed before IKE starts rejecting them. The specified value must equal or exceed the number of peers, or the VPN tunnels might be disconnected.</p> <p>You can enter a value in the range of 0-99999.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SA Requests System Threshold        | <p>The percentage of system resources that can be used before IKE starts rejecting new SA requests. The default is 75 percent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 29-2 Global Settings for GET VPN (continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPsec Settings | <p>Select <b>Enable Lifetime</b> if you want to change the default lifetime settings for IPsec SAs. You can configure a lifetime based on the volume of traffic (in kilobytes) between group members, seconds, or both. The key expires when either of the values is reached. The defaults (which are configured even if you do not select this option) are:</p> <ul style="list-style-type: none"> <li>• <b>Lifetime (secs)</b>—3600 seconds (one hour).</li> <li>• <b>Lifetime (kbytes)</b>—4,608,000 kilobytes.</li> </ul> <p><b>Tip</b> You can override these values for the traffic encryption key when configuring a security association. See <a href="#">Defining GET VPN Group Encryption, page 25-54</a> and <a href="#">Add New or Edit Security Association Dialog Box, page 25-58</a>.</p> |

## Configuring GET VPN Key Servers

Use the Key Servers policy to define key servers to be used by a GET VPN topology.

To open the Key Servers policy, in the [Site-to-Site VPN Manager Window](#), select an existing GET VPN topology, then select **Key Servers** from the Policies list.

The table lists the key servers used in the VPN, showing the device name, identity, priority, and registration interface. For detailed information about these attributes, see [Edit Key Server Dialog Box, page 29-19](#).

- To add a key server to the table, click the **Add Row** button and select the device from the list presented. Only devices that can be included as key servers are shown.
- To edit the characteristics of a key server, select it and click the **Edit Row** button. Fill in the Edit Key Server dialog box (see [Edit Key Server Dialog Box, page 29-19](#)).
- To delete a key server, select it and click the **Delete Row** button.
- To synchronize the RSA keys among the key servers, so that they all use the identical key, click the **Synchronize Keys** button. For detailed information about the key synchronization process, including when and why you would do it, see [Generating and Synchronizing RSA Keys, page 29-13](#).
- To change the order of a key server when using cooperative key servers, select it and click the up or down arrow button. This order does not define which server is the primary key server (this is determined by the Priority value, the higher the value, the higher the likelihood that the server will be elected the primary key server).

Instead, the order determines the default order in which group members will try to register with a key server. Group members register with the first key server in the list. If the first key server cannot be reached, group members register with the second key server, and so on. For more information

about key server redundancy, see [Configuring Redundancy Using Cooperative Key Servers, page 29-7](#). Note that you can override this order for individual group members; see [Configuring GET VPN Group Members, page 29-20](#) and [Edit Group Member Dialog Box, page 29-21](#).

**Tip**

You can toggle between showing the interface roles or the actual interfaces defined by those roles in the Identity and interfaces columns using the **Show** field below the table.

## Add Key Server, Group Member Dialog Box

Use the Add Key Server and Add Group Member dialog boxes to select key servers or group members to be used in the GET VPN topology. Select the check box next to the desired devices and click **OK**.

**Navigation Path**

To add key servers or group members to a GET VPN topology, click the **Add Row (+)** button beneath the Key Server or Group Member table in the **GET VPN Peers** page of the Create VPN wizard, or for existing topologies, the **Key Servers** or **Group Members** policies. For detailed information, see the following topics:

- [Defining GET VPN Peers, page 25-60](#)
- [Configuring GET VPN Key Servers, page 29-18](#)
- [Configuring GET VPN Group Members, page 29-20](#)

## Edit Key Server Dialog Box

Use the Edit Key Servers dialog box to change the attributes defined for a key server in a GET VPN topology.

**Navigation Path**

- (Create VPN Wizard) Go to the GET VPN Peers Page, select a key server and click the **Edit Row** button. See [Defining GET VPN Peers, page 25-60](#).
- (Site-to-Site VPN Manager Window, page 25-18) Select the **Key Servers** policy, select a key server and click the **Edit Row** button. See [Configuring GET VPN Key Servers, page 29-18](#).

**Field Reference****Table 29-3** *Edit Key Server Dialog Box*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Identity Interface     | The interface that group members use to identify the key server and register with it. The default is the Loopback interface role, which identifies all Loopback interfaces.                                                                                                                                                                                                                                                                                           |
| Priority               | A number between 1-100 that designates the role of the key server, either primary or secondary. The key server with the highest number becomes the primary key server. If two or more key servers are assigned the same priority, the device with the highest IP address is used. The default priority is 100 for the first key server, 95 for the second, and so on.<br><br><b>Note</b> There can be more than one primary key server if the network is partitioned. |
| Registration Interface | The interface on which group domain of interpretation (GDOI) registrations can be accepted. If you do not specify a registration interface, GDOI registrations can occur on any interface.                                                                                                                                                                                                                                                                            |

## Configuring GET VPN Group Members

Use the Group Members policy to define the group members in a GET VPN topology.

To open the Group Members policy, in the [Site-to-Site VPN Manager Window](#), select an existing GET VPN topology, then select **Group Members** from the Policies list.

The group members table lists the members of the GET VPN, showing the device name, GET-enabled interface, local interface, and security policy. For detailed information about these attributes, see [Edit Group Member Dialog Box](#), page 29-21.

- To add a group member to the table, click the **Add Row** button and select the device from the list presented. Only devices that can be included as group members are shown.
- To edit the endpoint characteristics of a group member, select it and click the **Edit Row** button. Fill in the Edit Group Member dialog box (see [Edit Group Member Dialog Box](#), page 29-21).

If you select multiple group members in the table, you can also right-click and select the following commands to edit just these attributes:

- **Edit Key Server Order**—To change the key server list and priority order for the selected group members.
- **Edit Passive SA Mode**—To change whether the selected group members use passive SA mode.
- To delete a group member, select it and click the **Delete Row** button.

**Tip**

You can toggle between showing the interface roles or the actual interfaces defined by those roles in the interfaces columns using the **Show** field below the table.

## Edit Group Member Dialog Box

Use the Edit Group Members dialog box to change the attributes defined for a group member of a GET VPN topology.

**Tip**

If you selected multiple devices and chose an edit command from the right-click menu, this dialog box shows only those options related to the edit command you chose.

### Navigation Path

- (Create VPN Wizard) Go to the GET VPN Peers page, select a group member and click the **Edit Row** button. See [Defining GET VPN Peers, page 25-60](#).
- (Site-to-Site VPN Manager Window, page 25-18) Select a GET VPN topology, then select the **Group Members** policy. Select a group member and click the **Edit Row** button. See [Configuring GET VPN Group Members, page 29-20](#).

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Policy                     | <p>The local group member security ACL used to deny some group member-specific traffic over and above the security ACL downloaded from the key server. Denied traffic is sent in clear text rather than encrypted. For detailed information, see <a href="#">Understanding the GET VPN Security Policy and Security Associations</a>, page 29-10.</p> <p>Enter the name of the ACL object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Fail Close<br>Fail Close ACL | <p>Whether to enable fail-close mode on the device, which prevents the device from transmitting clear text traffic before the device successfully registers with the key server. Fail-close mode requires as a minimum Cisco IOS Software release 12.4(22)T or 15.0; you can also configure it on all supported ASRs.</p> <p><b>Tip</b> Fail-close mode is a complex feature, and you must carefully construct the fail-close ACL or you might lock yourself out of the device. Before enabling fail-close mode, read <a href="#">Configuring Fail-Close to Protect Registration Failures</a>, page 29-8.</p> <p>You must select an ACL policy object that identifies allowable clear text traffic (using deny statements), such as SSH and SSL communications with the Security Manager server to allow for configuration updates. Enter then name of the object or click <b>Select</b> to select it or to create a new object.</p> |
| Override Key Servers                | <p>Whether to override the key server list configured for the GET VPN topology as a whole for this particular group member.</p> <p>If you select this option, you can choose a subset of the key servers configured for the topology to be used by the selected group member, and change their priority order. This can help you load-balance registration activity among a group of cooperative key servers. For more information, see <a href="#">Configuring Redundancy Using Cooperative Key Servers</a>, page 29-7.</p> <p>Click <b>Select</b> to change the key server list and priority order of the key servers using the Key Servers Selection dialog box. A key server must be defined for the GET VPN topology before you can modify its use for a group member.</p>                                                                                                                                                      |

**Table 29-4** Edit Group Member Dialog Box (continued)

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Passive SA Mode | <p>Whether to put the group member into passive security association (SA) mode, which means the group member installs the SA in the inbound direction only. This means the group member can receive encrypted data, but it sends clear text data only. This mode is useful for testing the VPN only, primarily when you are migrating from an existing VPN to a GET VPN. (The group member must be running Cisco IOS Software version 12.4(22)T or 15.0 at minimum, or be a supported ASR, to use this mode.)</p> <p>This setting is similar to the <b>Receive Only</b> setting in the Group Encryption Policy, which applies to the topology as a whole. This group member option overrides the setting in the Group Encryption Policy.</p> <p>For detailed information on how you can use these passive mode features to migrate or test a GET VPN, see <a href="#">Using Passive Mode to Migrate to GET VPN, page 29-23</a>.</p> |

## Using Passive Mode to Migrate to GET VPN

If you are migrating an existing VPN to the GET VPN technology, especially a clear-text VPN, you can use two features to help you migrate in a phased approach to help prevent network down-time. The features are essentially the same, and involve the passive acceptance of encrypted traffic, but you configure them on different devices in the GET VPN.

Normally, in a fully-deployed GET VPN, traffic is encrypted in both directions (bidirectional security associations, or SAs). However, during testing, you can use passive mode. In passive mode, the group member installs the SA in the inbound direction only, so that the group member receives encrypted traffic but sends traffic in clear text. You can then test the VPN to ensure that it is performing as expected before turning on full encryption.

Use the following features to configure passive mode in a GET VPN:

- **SA Receive-only mode**—You configure receive-only mode for security associations on the key servers in the topology using the Group Encryption Policy. Thus, the setting applies to the entire topology.
- **Passive SA mode**—You configure passive security association mode on individual group members. This setting overrides the SA receive-only setting; thus, you can turn on full encryption for the entire topology, but leave some group members in passive mode. This lets you test the group members in stages and enable full encryption after you verify each member device.

**Tip**

Passive SA mode on group members requires Cisco IOS Software release 12.4(22)T+ or 15.0+, or Release 2.3 (12.2(33)XNC)+ on ASRs.

The following procedure shows an example of the end-to-end migration process you might follow to convert to GET VPN using these passive mode features.

### Related Topics

- [Understanding Group Encrypted Transport \(GET\) VPNs, page 29-2](#)
- [Configuring GET VPN, page 29-12](#)

- Step 1** Create the new GET VPN topology in Security Manager using the Create VPN wizard. When you are in the wizard, ensure that you make these selections:
- When selecting devices, choose the key servers for the topology, but for group members, select the first set of group members that will be migrated. For more information, see [Selecting Devices for Your VPN Topology, page 25-32](#).
  - When configuring the group encryption settings, select **Receive Only**. This enables the SA receive-only feature for the entire topology. For more information, see [Defining GET VPN Group Encryption, page 25-54](#).
- For information about creating VPNs, see [Creating or Editing VPN Topologies, page 25-28](#).
- Step 2** Deploy the configurations to all devices in the VPN. The group members should now be able to receive encrypted traffic but not send it. For information on the deployment process, see the following topics based on the Workflow mode you are using:
- [Deploying Configurations in Non-Workflow Mode, page 8-28](#)
  - [Deploying Configurations in Workflow Mode, page 8-34](#)
- Step 3** Outside of Security Manager, verify that all of the group members are functioning properly. For example, you can test whether the group members are able to send and receive encrypted packets using some CLI commands on the group member devices:
- On group member 1, configure the following command, where “groupexample” is the name of the GDOI group for the VPN. This command sets the device to accept encrypted or clear text, but to send only clear text.  
**crypto gdoi gm group groupexample ipsec direction inbound only**
  - On group member 2, configure the following command. This command sets the device to accept encrypted or clear text, but to send encrypted text.  
**crypto gdoi gm group groupexample ipsec direction inbound optional**
  - Ping group member 1 from group member 2. Group member 2 should encrypt the packet before sending it, and group member 1 should accept it and decrypt it. If you ping member 2 from member 1, the ping should be sent in clear text and accepted by member 2. Ensure that your ACLs allow pings.
- Step 4** In Security Manager, select **Manage > Site-to-Site VPNs** (see [Site-to-Site VPN Manager Window, page 25-18](#)).
- Select the GET VPN topology, then select **Group Members**.
- Add the remaining group members that you want to add to the topology (click the **Add Group Member (+)** button, select the devices, and click **OK**).
- If you want to use passive mode to test the new group members before enabling full encryption, ensure that you select **Enable Passive SA Mode** when configuring the group members:
- To configure an individual group member, select it and click the **Edit Group Member (pencil)** button.
  - To enable passive mode on more than one device at a time, use Shift+click or Ctrl+click to select multiple devices, then right-click and select **Edit Passive SA Mode**. You can then select the option and click **OK**.
- For more information on configuring group members, see [Configuring GET VPN Group Members, page 29-20](#).
- Step 5** Deploy the configuration changes to all devices in the VPN. All devices should be operating in passive mode at this point.

- Step 6** In the Site-to-Site VPN Manager, select the GET VPN topology, then select **Group Encryption Policy**. Deselect **Receive Only**. This turns off SA receive-only mode at the topology level.
- Step 7** Deploy the configuration changes to all devices in the VPN. Now the GET VPN should be operating in fully encrypted mode for the original group members that you tested. Any new members that you added with passive SA mode enabled should be receiving encrypted traffic and sending clear text traffic.
- Step 8** Use the following process to verify the new devices and to turn off passive mode. You can follow this process for all new devices at once, or you can do smaller groups of them at a time. You can also use this process for new group members as you extend your network. Iterate the following steps as appropriate:
- Verify that the new group members are functioning properly using the same techniques that you used to verify the original group members.
  - When you are ready to move a set of group members to fully-encrypted mode, in the Site-to-Site VPN Manager, select the GET VPN topology and select **Group Members**.
  - Select all passive mode group members that should use full encryption, right-click and select **Edit Passive SA Mode**. Deselect the **Enable Passive SA Mode** option and click **OK**.
  - Deploy configurations to all devices in the VPN, not just the ones whose passive mode you changed. Normally, you should not deploy to less than all devices in a VPN.
- 

## Troubleshooting GET VPN Configurations

If after provisioning and deploying GET VPN using Security Manager, the GET VPN is not working, check the following:

- Ensure that the RSA key is synchronized among all cooperative key servers (that is, the RSA key is the same). For information on how to synchronize keys, see [Generating and Synchronizing RSA Keys, page 29-13](#).
- If desired traffic is not being encrypted, make sure the key server security policy ACL (security association) has a permit ACE for the desired traffic. For asymmetric ACEs (where the source and destination addresses are different), ensure that there is a mirrored ACE (with the source and destination addresses reversed). For more information, see [Understanding the GET VPN Security Policy and Security Associations, page 29-10](#).
- For multicast rekey, make sure that the network is multicast enabled and that all key servers and most group members are configured to enable multicast. You must enable multicast on the devices directly; Security Manager does not provision the commands required to enable multicast. For more information, see [Choosing the Rekey Transport Mechanism, page 29-6](#).
- When using multicast rekey, check whether there is a deny ACE in the key server security ACL for the multicast group address to prevent encryption of multicast rekey messages.
- Check that the local security ACL on the group member has only deny ACEs. If you include a permit statement in an attempt to identify traffic that should be encrypted, the matching traffic is actually dropped because there is no corresponding IPsec SA. Because the permit entry is defined in the group member, the key server is not aware of it and cannot generate the required IPsec SA. For more information, see [Understanding the GET VPN Security Policy and Security Associations, page 29-10](#).
- For group member authorization using certificates, check that the ISAKMP authentication uses certificates and that a PKI policy is configured. ISAKMP identity on the group member and key server should be set to use the distinguished name (dn).

- Normally, network address translation (NAT) is not used in the type of WAN environments where GET VPN is deployed. However, if you use NAT, ensure that the security policy ACL has permit statements for the translated addresses. Also, if you are using Network Address Translation-Traversal (NAT-T), the GDOI protocol port changes to 4500.
- A control plane replay protection mechanism was added to Cisco IOS Software releases 12.4(15)T10, 12.4(22)T3, 12.4(24)T2, 15.0(1)M, and 12.2(33)XNE. This mechanism is not backward-compatible, so if any GET VPN group member in the network is running any of these (or later) releases, you must also upgrade all key servers to one of these (or newer) releases. Otherwise, network disruption might occur because of a failed rekey, which causes one of the following system logging (syslog) messages to appear:
  - %GDOI-3-GDOI\_REKEY\_SEQ\_FAILURE: Failed to process rekey seq # 2 in seq payload for group get-group, last seq # 6
  - %GDOI-3-PSEUDO\_TIME\_TOO\_OLD: Rekey received in group get-group is too old and failed PST check: my\_pst is 184 sec, peer\_pst is 25 sec, allowable\_skew is 10 sec

## Managing Remote Access VPNs: The Basics

---

Cisco Security Manager lets you configure both remote access IPSec VPNs and remote access SSL VPNs. Security Manager provides flexible configuration and management of remote access VPNs:

- You can discover existing remote access VPN configuration policies from existing live devices or from configuration files. Then, you can change and deploy new or updated policies, as necessary.
- You can use the configuration wizard to help you quickly and easily set up these two types of remote access VPNs with basic functionality.
- If you know the functions and feature your network requires, you can configure remote access VPNs independently. You can also use the wizard to create a basic remote access VPN and then configure additional features that are not included in the wizard separately.

In addition, Cisco Security Manager provides flexibility in how remote access VPN configuration policies are assigned: Device view or Policy view.

For some policies, you can also assign either the factory default policy (a private policy), or a shared policy that you created using Security Manager.

This chapter contains the following topics:

- [Understanding Remote Access VPNs, page 30-1](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 30-8](#)

## Understanding Remote Access VPNs

Security Manager supports two types of remote access VPNs: IPSec and SSL.

This section contains the following topics:

- [Understanding Remote Access IPSec VPNs, page 30-2](#)
- [Understanding Remote Access SSL VPNs, page 30-2](#)

## Understanding Remote Access IPsec VPNs

Remote access IPsec VPNs permit secure, encrypted connections between a company's private network and remote users, by establishing an encrypted IPsec tunnel across the Internet using broadband cable, DSL, dial-up, or other connections.

A remote access IPsec VPN consists of a VPN client and a VPN headend device, or VPN gateway. The VPN client software resides on a user's workstation and initiates the VPN tunnel access to the corporate network. At the other end of the VPN tunnel is the VPN gateway at the edge of the corporate site.

When a VPN client initiates a connection to the VPN gateway device, negotiation consists of authenticating the device through Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth). Next the group profile is pushed to the VPN client using mode configuration, and an IPsec security association (SA) is created to complete the VPN connection.

**Tip**

---

For a remote access IPsec VPN hosted on an ASA 8.4(x) device, you have the option of configuring IKE version 2 (IKEv2). If you decide to use IKEv2, you must configure several SSL VPN policies in addition to the regular IPsec policies. The user also must use the AnyConnect 3.0+ VPN client to make an IKEv2 connection. For more information, see [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 30-25.

---

For remote access IPsec VPNs, AAA (authentication, authorization, and accounting) is used for secure access. With user authentication, a valid user name and password must be entered before the connection is completed. User names and passwords can be stored on the VPN device itself, or on an external AAA server that can provide authentication to numerous other databases. For more information on using AAA servers, see [Understanding AAA Server and Server Group Objects](#), page 6-27.

**Note**

---

Site-to-site Easy VPN topologies use some of the same policies and policy objects that are used in remote access IPsec VPNs, but the policies are kept distinct from the remote access policies. In Easy VPN, the remote clients are hardware clients, such as routers, whereas in remote access IPsec VPNs, remote clients are workstations or other devices that use VPN client software. For more information, see [Understanding Easy VPN](#), page 28-1.

## Understanding Remote Access SSL VPNs

An SSL VPN lets users access enterprise networks from any Internet-enabled location. Users can make clientless connections, which use only a Web browser that natively supports Secure Socket Layer (SSL) encryption, or they can make connections using a full client (such as AnyConnect) or a thin client.

**Note**

---

SSL VPN is supported on ASA 5500 devices running software version 8.0 and later, running in single-context and router modes, on Cisco 870, 880, 890, 1800, 2800, 3700, 3800, 7200, and 7301 Series routers running software version 12.4(6)T and later, and on Cisco 1900, 2900, and 3900 Series routers running software version 15.0(1)M and later. For the 880 Series routers, the minimum software version is 12.4(15)XZ, which is mapped to 12.4(20)T in Security Manager.

---

On IOS devices, remote access is provided through an SSL-enabled VPN gateway. Using an SSL-enabled Web browser, the remote user establishes a connection to the SSL VPN gateway. After the remote user is authenticated to the secure gateway via the Web browser, an SSL VPN session is established and the user can access the internal corporate network. A portal page lets users access all the resources available on the SSL VPN networks.

On ASA devices, remote users establish a secure, remote access VPN tunnel to the security appliance using the Web browser. The SSL protocol provides the secure connection between remote users and specific, supported internal resources that you configure at a central site. The security appliance recognizes connections that need to be proxied, and the HTTP server interacts with the authentication subsystem to authenticate users.

User authentication can be done using usernames and passwords, certificates, or both.

**Note**

---

Network administrators provide user access to SSL VPN resources on a group basis instead of on an individual user basis.

---

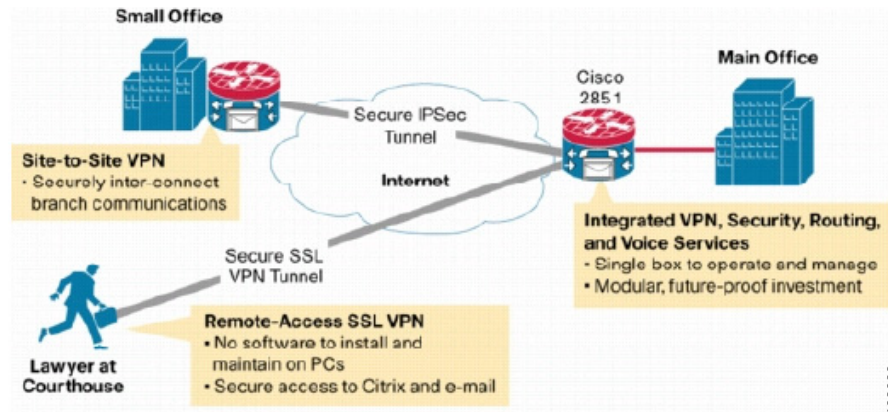

This section contains the following topics:

- [Remote Access SSL VPN Example, page 30-3](#)
- [SSL VPN Access Modes, page 30-4](#)

- [Prerequisites for Configuring SSL VPNs, page 30-7](#)
- [SSL VPN Limitations, page 30-8](#)

## Remote Access SSL VPN Example

The following illustration shows how a mobile worker can access protected resources from the main office and branch offices. Site-to-site IPsec connectivity between the main and remote sites is unaltered. The mobile worker needs only Internet access and supported software (Web browser and operating system) to securely access the corporate network.

Figure 30-1 Secure SSL VPN Access Example

## SSL VPN Access Modes

SSL VPN provides three modes of remote access on IOS routers: Clientless, Thin Client and Full Client. On ASA devices, there are two modes: Clientless (which includes Clientless and Thin Client port forwarding) and AnyConnect Client (a full client).

### Clientless Access Mode

In Clientless mode, the remote user accesses the internal or corporate network using a Web browser on the client machine. No applet downloading is required.

Clientless mode is useful for accessing most content that you would expect in a Web browser, such as Internet access, databases, and online tools that employ a Web interface. It supports Web browsing (using HTTP and HTTPS), file sharing using Common Internet File System (CIFS), and Outlook Web Access (OWA) email. For Clientless mode to work successfully, the remote user's PC must be running Windows 2000, Windows XP, or Linux operating systems.

Browser-based SSL VPN users connecting from Windows operating systems can browse shared file systems and perform the following operations: view folders, view folder and file properties, create, move, copy, copy from the local host to the remote host, copy from the remote host to the local host, and delete. Internet Explorer indicates when a Web folder is accessible. Accessing this folder launches another window, providing a view of the shared folder, on which users can perform web folder functions, assuming the properties of the folders and documents permit them.

### Thin Client Access Mode

Thin Client mode, also called TCP port forwarding, assumes that the client application uses TCP to connect to a well-known server and port. In this mode, the remote user downloads a Java applet by clicking the link provided on the portal page. The Java applet acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The Java applet starts a new SSL connection for every client connection.

The Java applet initiates an HTTP request from the remote user client to the SSL VPN gateway. The name and port number of the internal email server is included in the HTTP request. The SSL VPN gateway creates a TCP connection to that internal email server and port.

Thin Client mode extends the capability of the cryptographic functions of the Web browser to enable remote access to TCP-based applications such as Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP), Internet Message Access protocol (IMAP), Telnet, and Secure Shell (SSH).

**Note**

The TCP port-forwarding proxy works only with Sun's Java Runtime Environment (JRE) version 1.4 or later. A Java applet is loaded through the browser that verifies the JRE version. The Java applet refuses to run if a compatible JRE version is not detected.

When using Thin Client mode, you should be aware of the following:

- The remote user must allow the Java applet to download and install.
- For TCP port-forwarding applications to work seamlessly, administrative privileges must be enabled for remote users.
- You cannot use Thin Client mode for applications such as FTP, where the ports are negotiated dynamically. That is, you can use TCP port forwarding only with static ports.

**Full Tunnel Client Access Mode**

Full Tunnel Client mode enables access to the corporate network completely over an SSL VPN tunnel, which is used to move data at the network (IP) layer. This mode supports most IP-based applications, such as Microsoft Outlook, Microsoft Exchange, Lotus Notes E-mail, and Telnet. Being part of the SSL VPN is completely transparent to the applications run on the client. A Java applet is downloaded to handle the tunneling between the client host and the SSL VPN gateway. The user can use any application as if the client host was in the internal network.

The tunnel connection is determined by the group policy configuration. The SSL VPN client (SVC) or AnyConnect client is downloaded and installed to the remote client, and the tunnel connection is established when the remote user logs in to the SSL VPN gateway. By default, the client software is removed from the remote client after the connection is closed, but you can keep it installed, if required.

**Note**

Full Tunnel SSL VPN access requires administrative privileges on the remote client.

## Understanding and Managing SSL VPN Support Files

SSL VPNs sometimes require supporting files that reside in the device's flash storage. This is especially true of SSL VPNs configured on ASA devices. Supporting files include Cisco Secure Desktop (CSD) packages, AnyConnect client images, and plug-in files. Security Manager includes many of these files for your use. However, some supporting files, such as graphic files used for portal pages, or client profiles used for AnyConnect clients are not provided by Security Manager.

Typically, you need to create a File Object to specify a supporting file, and you then select the File Object when you create a policy that refers to it. You can create the File Objects that you need when you create the policies, or you can create them before you start defining policies. For more information, see [Add and Edit File Object Dialog Boxes, page 34-37](#).

When you deploy policies to the devices, any supporting files referenced in your policies are copied to the device and placed in flash memory in the `\csm` folder. For the most part, you do not have to do any manual work to make this happen. The following are some situations where you might need to do some manual work:

- If you are trying to discover existing SSL VPN policies, or rediscover them, file references from the SSL VPN policies must be correct. For detailed information on how supporting files are handled during policy discovery, see [Discovering Remote Access VPN Policies, page 30-12](#).
- If you have configured the ASA device in an Active/Failover configuration, you must get the supporting files onto the failover device. The supporting files are not copied over to the failover device during a failover. You have these choices for getting the files onto the failover device:

- Manually copy the files from the \csm folder on the active unit to the failover unit.
- After deploying the policies to the active unit, force a failover and redeploy the policies to the now-active unit.
- If you are using a VPN cluster for load balancing, the same supporting files must be deployed to all devices in the cluster.

### Cisco Secure Desktop (CSD) Packages

These packages are for ASA SSL VPNs. You select a package in the Dynamic Access policy. The package you select must be compatible with the ASA operating system version running on the device. When you create a Dynamic Access policy for an ASA device, the version number that is compatible with the device's operating system is displayed in the Version field.

You can find the CSD packages in Program Files\CSCOpX\files\vms\repository\. The file names are in the form securedesktop-asa\_k9-version.pkg or csd\_version.pkg, where *version* is the CSD version number such as 3.5.1077.

Following is the CSD compatibility with ASA versions for the CSD packages shipped with Security Manager:

- csd\_3\_6\_181-3.6.181.pkg—ASA 8.4 or later.
- csd\_3\_5\_2008-3.5.2008.pkg—ASA 8.0(4) or later.
- csd\_3\_5\_2001-3.5.2001.pkg—ASA 8.0(4) or later.
- csd\_3\_5\_1077-3.5.1077.pkg—ASA 8.0(4) or later.
- csd\_3\_5\_841-3.5.841.pkg—ASA 8.0(4) or later.
- csd\_3\_4\_2048-3.4.2048.pkg—ASA 8.0(4) or later.
- csd\_3\_4\_1108-3.4.1108.pkg—ASA 8.0(4) or later.
- securedesktop\_asa\_k9-3.3.0.151.pkg—ASA 8.0(3.1) or later.
- securedesktop\_asa-k9-3.3.0.118.pkg—ASA 8.0(3.1) or later.
- securedesktop-asa-k9-3.2.1.126.pkg—ASA 8.0(3) or later.
- securedesktop-asa\_k9-3.2.0.136.pkg—ASA 8.0(2) or later.

For more information on CSD version compatibility with ASA versions, see the CSD release notes at [http://www.cisco.com/en/US/products/ps6742/prod\\_release\\_notes\\_list.html](http://www.cisco.com/en/US/products/ps6742/prod_release_notes_list.html) and [Supported VPN Platforms](#) on Cisco.com.

For more information on creating Dynamic Access policies to specify the CSD, see [Configuring Cisco Secure Desktop Policies on ASA Devices](#), page 32-9.

### AnyConnect Client Images

These images are for remote access SSL and IKEv2 IPsec VPNs hosted on an ASA. The AnyConnect client is downloaded to the user's PC and manages the client's VPN connection. Security Manager includes several AnyConnect images, which you can find in Program Files\CSCOpX\files\vms\repository\. The package names indicate the workstation operating system and the anyconnect release number in this general pattern:

anyconnect-client\_OS\_information-anyconnect\_release.pkg. For example, anyconnect-win-3.0.0610-k9-3.0.0610.pkg is the AnyConnect 3.0(0610) client for Windows workstations. The k9 indicates that the package includes encryption. In this example, the AnyConnect release number is repeated; in some file names, the release number appears once.

Packages are available for the following workstation operating systems (OS). For specific information on which OS versions that each client supports, see the documentation for the AnyConnect client on Cisco.com.

- Linux—Packages start with anyconnect-linux, or anyconnect-linux-64 for 64-bit versions.
- Mac OS—Packages start with anyconnect-macosx for Mac OS X on i386 workstations, and anyconnect-macosx-powerpc for Mac OS X on Power PC workstations.
- Windows—Packages start with anyconnect-win.

You can also download other AnyConnect client packages to the Security Manager server or your local Security Manager client and use them in remote access policies. However, Security Manager might not be able to configure newer parameters for those clients, although it might be possible to use FlexConfigs to configure newer parameters.

For more information on the AnyConnect client, its profiles, and how to configure policies to load the client onto the device, see the following topics:

- [Understanding SSL VPN AnyConnect Client Settings, page 31-62](#)
- [Configuring SSL VPN AnyConnect Client Settings \(ASA\), page 31-64](#)
- [Cisco AnyConnect Profile Editor, page 31-63](#)

#### Plug-in Files

These files are used as browser plug-ins. You can find plug-in files in Program Files\CSCOPx\files\vm\repository\. For complete information on the available files, see [Configuring SSL VPN Browser Plug-ins \(ASA\), page 31-60](#).

## Prerequisites for Configuring SSL VPNs

For a remote user to securely access resources on a private network behind an SSL VPN gateway, the following prerequisites must be met:

- A user account (login name and password).
- An SSL-enabled browser (such as Internet Explorer, Netscape, Mozilla, or Firefox).
- An email client (such as Eudora, Microsoft Outlook, or Netscape Mail).
- One of the following operating systems:
  - Microsoft Windows 2000 or Windows XP, with either JRE for Windows version 1.4 or later, or a browser that supports ActiveX controls.
  - Linux with JRE for Linux version 1.4 or later. To access Microsoft shared files from Linux in clientless remote access mode, Samba must also be installed.

- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\), page 30-32](#)

## SSL VPN Limitations

SSL VPN configurations in Security Manager are subject to the following limitations:

- SSL VPN license information cannot be imported into Security Manager. As a result, certain command parameters, such as **vpn sessiondb** and **max-webvpn-session-limit**, cannot be validated.
- You must configure DNS on each device in the topology in order to use clientless SSL VPN. Without DNS, the device cannot retrieve named URLs, but only URLs with IP addresses.
- If you share your Connection Profiles policy among multiple ASA devices, bear in mind that all devices share the same address pool unless you use device-level object overrides to replace the global definition with a unique address pool for each device. Unique address pools are required to avoid overlapping addresses in cases where the devices are not using NAT.
- If the device configuration contains an address pool for SSL VPN with a name that begins CSM\_ (the naming convention used by Cisco Security Manager), Cisco Security Manager cannot detect whether the addresses in that pool overlap with the pool configured in your SSL VPN policy. (This can occur, for example, when the pool was configured by a user on a different installation of Security Manager.) This can lead to errors during deployment. Therefore, we recommend that you configure the same IP address pool as a network/host object in Security Manager and define it as part of the SSL VPN policy. This enables the proper validation to take place.
- The same IP address and port number cannot be shared by multiple SSL VPN gateways on the same IOS device. As a result, deployment errors can occur if a duplicate gateway exists in the device configuration but was not redefined using the Security Manager interface. If such an error occurs, you must choose a different IP address and port number and redeploy.
- If you define AAA authentication or accounting as part of an SSL VPN policy, the **aaa new-model** command is deployed to enable AAA services. Bear in mind that this command is not removed if you later delete the SSL VPN policy, as there might be other parts of the device configuration that require the **aaa new-model** command for AAA services.

### Note

In addition, we recommend that you define at least one local user on the device with a privilege level of 15. This ensures that you will not be locked out of the device if the **aaa new-model** command is configured without an associated AAA server.

## Understanding Devices Supported by Each Remote Access VPN Technology

There are three types of remote access VPN: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. The devices on which you can configure these technologies differs, and broadly speaking, the configuration for each type of VPN differs for ASA/PIX 7.0+ compared to IOS/PIX 6.3 devices.

The following table describes the basic device support. When you select a device, the device type will determine which remote access policies are visible or configurable.

**Tip**

Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

**Table 30-1** *Devices Supported by Each Remote Access Technology*

| Technology          | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE version 1 IPsec | <ul style="list-style-type: none"> <li>ASA/PIX 7.0+—ASA 5500 series and PIX 515, 515E, 525, or 535 with PIX Software 7.0+ (including 8.0+), running in single context and router modes.</li> <li>IOS/PIX 6.3—Cisco IOS security routers (including Aggregation Service Routers, or ASRs), Catalyst 6500/7600, and PIX Firewalls running PIX Software 6.3 only.</li> </ul>                                                                                                                                                                                                                                  |
| IKE version 2 IPsec | ASA 5500 series only, running ASA Software 8.4(x) only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SSL                 | <ul style="list-style-type: none"> <li>ASA—ASA 5500 series devices running software version 8.0 and later, running in single-context and router modes.</li> <li>IOS—Cisco 870, 880, 890, 1800, 2800, 3700, 3800, 7200, and 7301 Series routers running software version 12.4(6)T and later, and on Cisco 1900, 2900, and 3900 Series routers running software version 15.0(1)M and later. For the 880 Series routers, the minimum software version is 12.4(15)XZ, which is mapped to 12.4(20)T in Security Manager.</li> </ul> <p><b>Tip</b> No version of PIX is supported for SSL VPN configuration.</p> |

## Overview of Remote Access VPN Policies

The following list summarizes the various policies used in remote access VPN configuration based on the technology used in the VPN. Possible remote access VPN types are: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. Where indicated, many of these policies apply to specific device types only. To see an edited version of this list per device type, see the following topics:

- [Overview of Remote Access VPN Policies for ASA and PIX 7.0+ Devices, page 31-2](#)
- [Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices, page 33-2](#)

**Note**

You cannot configure SSL VPNs on PIX devices; PIX devices support remote access IKEv1 IPsec VPNs only.

**Note**

You can create Unified ACL object on-the-fly in certain Remote Access VPN policies, such as Dynamic Access Policy. However, when you create Unified ACL object on-the-fly, Cisco Security Manager displays an error message. To overcome this issue, you must select the created ACL in the Selector window and save the policy.

- **Policies used with remote access IKEv1 and IKEv2 IPsec and SSL VPNs:**

- **ASA Cluster Load Balancing (ASA/PIX 7.0+)**—In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device. For more information, see [Understanding Cluster Load Balancing \(ASA\), page 31-5](#).
- **Connection Profiles (ASA/PIX 7.0+)**—A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. For more information, see [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 31-7](#).
- **Dynamic Access (ASA 8.0+)**—Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles that each user might inhabit within an organization, and logins from remote access sites with different configurations and levels of security. Dynamic access policies (DAP) let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. For more information, see [Chapter 32, “Managing Dynamic Access Policies for Remote Access VPNs \(ASA 8.0+ Devices\)”](#).
- **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations. For more information, see [Configuring VPN Global Settings, page 26-30](#).
- **Group Policies (ASA/PIX 7.0+)**—You can view the user group policies defined for your remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For more information, see [Configuring Group Policies for Remote Access VPNs, page 31-26](#).
- **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see [Understanding Public Key Infrastructure Policies, page 26-51](#) and [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#).

- **Policies used in remote access IPsec VPNs only:**
  - **Certificate To Connection Profile Maps, Policy and Rules** (IKEv1 IPsec only, ASA/PIX 7.0+ only.)—Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods. For more information, see [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 31-36.
  - **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see [Configuring an IKE Proposal](#), page 26-9.
  - **IPsec Proposal (ASA/PIX 7.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\)](#), page 31-40.
  - **IPsec Proposal (IOS/PIX 6.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 33-3.
  - **High Availability** (IOS/PIX 6.3)—High Availability (HA) is supported by the creation of an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see [Configuring High Availability in Remote Access VPNs \(IOS\)](#), page 33-11.
  - **User Groups (IOS/PIX 6.x)**—A user group policy specifies the attributes that determine user access to and use of the VPN. For more information, see [Configuring User Group Policies](#), page 33-13.
- **Policies used in remote access IKEv2 IPsec and SSL VPNs only:**
  - **Access** (ASA only.)—An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or AnyConnect Essentials Client. For more information, see [Understanding SSL VPN Access Policies \(ASA\)](#), page 31-44.
  - **Other Settings** (ASA only.)—The SSL VPN Other Settings policy defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, AnyConnect client images and profiles, Kerberos Constrained Delegation, and some other advanced settings. For more information, see [Configuring Other SSL VPN Settings \(ASA\)](#), page 31-51.
  - **Shared License** (ASA only.)—Use the SSL VPN Shared License page to configure your SSL VPN Shared License. For more information, see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\)](#), page 31-74.

- **SSL VPN (IOS devices only.)**—The SSL VPN policy table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. For more information, see [Configuring an SSL VPN Policy \(IOS\)](#), page 33-14.

## Discovering Remote Access VPN Policies

Security Manager allows you to import the configurations of remote access IPsec VPN policies during policy discovery. You can also discover SSL VPN policies on ASA devices, but not on IOS devices. To discover remote access VPN policies, select the **RA VPN Policies** option in the Discover Device settings when adding the device to the inventory or when discovering policies on a device already in the inventory. For more information on adding devices or discovering policies, see the following topics:

- [Adding Devices to the Device Inventory](#), page 3-7
- [Discovering Policies on Devices Already in Security Manager](#), page 5-15

You can discover configurations on devices that are already deployed in your remote access VPN network, so that Security Manager can manage them. These configurations are imported into Security Manager as remote access VPN policies. Remote access VPN policy discovery can be performed by importing the configuration of a live device or by importing a configuration file. However, SSL VPN policies that refer to files in flash storage cannot be discovered from configuration files, therefore, we recommend that you do not discover SSL VPNs from configuration files.

When you initiate policy discovery on a device in a remote access VPN, the system analyzes the configuration on the device and then translates this configuration into Security Manager policies so that the device can be managed. Warnings are displayed if the imported configuration completes only a partial policy definition. If additional settings are required, you must go to the relevant page in the Security Manager interface to complete the policy definition. You can also rediscover the configurations of devices that are already managed with Security Manager.

When discovering SSL VPN policies, files residing in flash storage that are referenced in SSL VPN policies are copied to the Security Manager server to be stored in the /csm directory on the target device when policies are deployed from Security Manager. If the flash storage contains files that you want to use, but they are not referenced by an SSL VPN policy, either configure commands that refer to them or manually copy them to the Security Manager server. Policy discovery fails if an SSL VPN policy on the device refers to a file that has been deleted from flash; in this case, either fix the configuration directly before discovering the device, or deselect the **RA VPN Policies** option when adding the device and create the desired SSL VPN configuration in Security Manager.

### Tips

- You should perform deployment immediately after you discover the policies on a device before you make any changes to policies or unassign policies from the device; otherwise, the changes that you configure in Security Manager might not be deployed to the device.
- For ASA and PIX 7.0+ devices, the default connection profiles and group policy are discovered and added to the Connection Profiles and Group Policies policy. You can modify these default profiles and group, but you cannot delete them:
  - **DefaultRAGroup**—The default connection profile for remote access IPsec VPNs.
  - **DefaultWEBVPNGroup**—The default connection profile for SSL VPNs. This connection profile is discovered only for ASA 8.0+ devices.

- DfltGrpPolicy—The default group policy, which is used by the default connection profiles. When discovered, Security Manager uses the name *<device\_display\_name>*DfltGrpPolicy. However, when you deploy configurations, the device display name is stripped off and DfltGrpPolicy is used.

This naming convention is necessary because group policies are modeled as shared policy objects, and you might have modified the default group policy differently on your devices. However, the naming convention does not prevent you from using shared policies that incorporate the default group policy; the device display name is stripped from the object name regardless of the device to which it is assigned. For example, if you use the object 10.100.10.1DfltGrpPolicy with device 10.200.11.1, Security Manager still uses “DfltGrpPolicy” in the configuration.

**Note** Although these default connection profiles use the DfltCustomization object for SSL VPN portal customization, Security Manager does not discover it. To modify DfltCustomization, you must do so directly on the device. However, you can simply create your own customization object and specify it in the default connection profile to use non-default settings.

## Using the Remote Access VPN Configuration Wizard

You can use the Remote Access VPN Configuration wizard to create the policies required to configure a basic IPsec or SSL VPN. The wizard provides simplified options to configure the basic settings. Thus, after using the wizard, you might need to configure additional settings in the individual remote access VPN policies.

#### Tip

The wizard never creates a valid IKEv2 IPsec VPN. You must always configure additional policies to complete an IKEv2 configuration.

#### Note

For Remote Access VPN Multi-Context Mode, only Remote Access SSL VPN is supported for ASA devices running the software version 9.5(2) or later.

Depending on the device type and VPN type (IPsec or SSL), the wizard takes you through the steps to configure a basic remote access VPN.

To access the Remote Access Configuration wizard:

1. In Device view, select the device to configure as your remote access server from the Device selector.
2. Select **Remote Access VPN > Configuration Wizard** from the Policy selector.
3. Select the radio button corresponding to the type of remote access VPN you want to create: **Remote Access SSL VPN** or **Remote Access IPsec VPN**.
4. Click **Remote Access Configuration Wizard** to open the appropriate wizard.

For detailed information on how to use each version of the wizard, see the following topics:

- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(ASA Devices\)](#), page 30-14
- [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 30-25
- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\)](#), page 30-32
- [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(IOS and PIX 6.3 Devices\)](#), page 30-36

## Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices)

This procedure describes how to create or edit SSL VPNs on ASA devices using the Remote Access SSL VPN Configuration Wizard.

### Related Topics

- [Understanding Remote Access SSL VPNs](#), page 30-2
- [Understanding Devices Supported by Each Remote Access VPN Technology](#), page 30-8

- 
- Step 1** In Device view, select the desired ASA device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access SSL VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The Access page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Access Page \(ASA\)](#), page 30-16.
- Step 5** Specify the interfaces on which you want to enable the SSL VPN connections. Click **Select** to select an interface or an interface role object that identifies the interfaces.
- Step 6** Specify the port number you want to use for the SSL VPN sessions. Enter the port number or the name of a port list object that defines the number, or click **Select** to select the object or to create a new object.

The default port is 443, for HTTPS traffic. The port number can be 443, or within the range of 1024-65535. If you change the port number, all current SSL VPN connections terminate, and current users must reconnect.

---

**Note** If HTTP port redirection is enabled, the default HTTP port number is 80.

---

- Step 7** To allow users to select a tunnel group from a list of tunnel group connection profiles configured on the device at login, select the **Allow Users to Select Connection Profile in Portal Page** option.
- Step 8** To allow users to use the AnyConnect VPN client to connect to the SSL VPN, select the **Enable AnyConnect Access** check box.
- Step 9** Click **Next**. The Connection Profile page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Connection Profile Page \(ASA\)](#), page 30-17.

**Step 10** In **Connection Profile Name**, enter the name of the connection profile. This is the name of the tunnel group, and will appear in the Remote Access VPN > Connection Profiles policy. For more information about the connection profile policy, see [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7.

**Step 11** On the Connection Profile page, configure these options that will later appear in the General tab of the connection profile (see [General Tab \(Connection Profiles\)](#), page 31-10):

- **Group Policy**—Enter the name of the ASA Group Policy policy object that will be the default group for the connection profile, or click **Select** to select the object. If the required object does not yet exist, click **Select**, then click the **Create (+)** button in the ASA User Groups Selector dialog box, which opens a wizard to guide you through the creation process as described in [Creating User Groups with the Create Group Policy Wizard](#), page 30-20.

For more information about ASA Group Policies objects, see [ASA Group Policies Dialog Box](#), page 34-1.

- **Group Policies**—This table lists all group policies currently used on the device, whether for SSL or IPsec VPNs. You can click **Edit** to add other group policies.
- **Global IP Address Pool**—Enter the address pools from which IP addresses are assigned. The server uses these address pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.

Specify the pools as address ranges or network/host objects that contain address ranges, in the format *Start\_Address-End\_Address*, for example, 10.100.10.2-10.100.10.254. Click **Select** to select network/host objects or to create new objects.

**Step 12** On the Connection Profile page, configure these options that will later appear in the SSL VPN tab of the connection profile (see [SSL Tab \(Connection Profiles\)](#), page 31-22):

- **Portal Page Customization**—The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. Click **Select** to select the object or to create a new object.

**Note**

You can set up different login windows for different groups by using a combination of customization profiles and tunnel groups. For example, assuming that you had created a customization profile called salesgui, you can create an SSL VPN tunnel group called sales that uses that customization profile.

- **Connection URL**—The URL of the connection profile. This URL provides users with direct access to the customized portal page. Select a protocol (**http** or **https**) from the list, and specify the URL including the name of the connection profile, in the field provided.

The URL is made up of the host name or IP address of the ASA device and port number, and the alias used to identify the SSL VPN connection profile.

**Note**

If you do not specify a URL, you can access the portal page by entering the portal page URL, and then selecting the connection profile alias from a list of configured connection profile aliases configured on the device. See [SSL VPN Configuration Wizard—Access Page \(ASA\)](#), page 30-16.

**Step 13** On the Connection Profile page, configure the AAA options for authentication, authorization, and accounting, and secondary authentication, which will later appear on the AAA and Secondary AAA tab of the connection profile (see [AAA Tab \(Connection Profiles\)](#), page 31-13 and [Secondary AAA Tab \(Connection Profiles\)](#), page 31-17).

**Step 14** Click **Finish** to save your changes.

## SSL VPN Configuration Wizard—Access Page (ASA)

Use the Access page of the SSL VPN Configuration Wizard to configure the security appliance interfaces for SSL VPN sessions. After you complete the wizard, you can later edit these settings in the SSL VPN Access policy; see [SSL VPN Access Policy Page, page 31-45](#).

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see [Using the Remote Access VPN Configuration Wizard, page 30-13](#)). The Access page is the first page that appears.

|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Policy              | <p>Default ASA user group associated with the device. Enter an ASA user group policy or click <b>Select</b> to select one from a list or to create a new one.</p> <p>If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server.</p> <p>Click <b>Select</b> to select an existing object or to create a new one. If you click the <b>Create (+)</b> button in the group policy selection dialog box, you are guided through the group creation process using a wizard, as explained in <a href="#">Creating User Groups with the Create Group Policy Wizard, page 30-20</a>.</p>                                                                                                                                                                                                                                                    |
| Full Tunnel               | A read-only field that indicates whether full tunnel access mode is configured for the object selected in the Group Policy field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Group Policies            | <p>The names of all ASA user group policies that are configured for the device, even those that are configured for IPsec VPN connections only. The contents of this table is identical to the contents of the Remote Access VPN &gt; Group Policies policy. The table shows whether full tunnel access mode is enabled or disabled for each group policy.</p> <p>You can change the list by clicking <b>Edit</b>. This opens a dialog box where you can select additional group policies, or deselect currently selected policies (do not deselect policies that are used by other connection profiles). You can also create new group policies (click the <b>Create (+)</b> button below the available group policies list) or edit the group policy object by selecting it and clicking the <b>Edit (pencil)</b> button below either list.</p> <p>If you create a new group policy, the Create Group Policy wizard is used to guide you through the process. See <a href="#">Creating User Groups with the Create Group Policy Wizard, page 30-20</a>.</p> |
| Portal Page Customization | The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. This profile defines the appearance of the portal page that allows the remote user access to all resources available on the SSL VPN. Click <b>Select</b> to select the object or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Connection URL            | <p>The URL of the connection profile. This URL provides users with direct access to the customized portal page.</p> <p>Select a protocol (<b>http</b> or <b>https</b>) from the list and specify the URL, including host name or IP address of the ASA device and port number and the alias used to identify the SSL VPN connection profile.</p> <p><b>Note</b> If you do not specify a URL, you can access the portal page by entering the portal page URL, and then selecting the connection profile alias from a list of configured connection profile aliases configured on the device. See <a href="#">SSL VPN Configuration Wizard—Access Page (ASA), page 30-16</a>.</p>                                                                                                                                                                                                                                                                                                                                                                              |

**Table 30-3** *SSL VPN Configuration Wizard, Connection Profile Page (ASA) (continued)*

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global IPv4 Address Pool        | <p>The address pools from which IPv4 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>                                                                                                                                                                              |
| Global IPv6 Address Pool        | <p>The address pools from which IPv6 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 2001:db8::1-2001:db8::2:1. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools. .</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>                                                                                                                                                                            |
| Authentication Server Group     | <p>The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Use LOCAL if Server Group Fails | <p>Whether to fall back to the local database for authentication if the selected authentication server group fails.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Authorization Server Group      | <p>The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Accounting Server Group         | <p>The name of the accounting server group. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Secondary Authentication        | <p>Whether to enable double authentication, which prompts the user for two sets of credentials (username and password) before completing the remote access VPN connection.</p> <ul style="list-style-type: none"> <li>• <b>Enable Secondary Authentication</b>—Select this option to require double authentication.</li> <li>• <b>Authentication Server Group</b>—The name of the authentication server group (LOCAL if the tunnel group is configured on the local device) to be used with the second set of credentials. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</li> <li>• <b>Use LOCAL if Server Group Fails</b>—Whether to fall back to the local database for authentication if the selected authentication server group fails.</li> </ul> |

## Creating User Groups with the Create Group Policy Wizard

When you are using the Remote Access SSL VPN Configuration wizard to create an SSL VPN on ASA or IOS devices, you can create new ASA group policy or IOS user group objects using a wizard. The wizard lets you configure select elements of the group, so you might need to edit the object after creating it to configure additional settings.

The Create Group Policy wizard is available only through the Remote Access SSL VPN Configuration wizard. For an explanation of how to start and use the wizard, see the following topics:

The following procedure assumes that you are already in the Remote Access SSL VPN Configuration wizard, as described in the following topics:

- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(ASA Devices\)](#), page 30-14
- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\)](#), page 30-32

### Related Topics

- [SSL VPN Access Modes](#), page 30-4

- 
- Step 1** When using the Remote Access VPN Configuration wizard for SSL VPNs, proceed to the page where you select group policies. On this page, you can open the selection page for user groups by doing the following:
- ASA devices—On the Connection Profile page of the wizard, click **Select** next to the Group Policy field, or click **Edit** next to the Group Policies table.
  - IOS devices—On the Gateway and Context page of the wizard, click **Edit** next to the Group Policies table.
- Step 2** In the Group Policy Selector dialog box, click the **Create (+)** button below the list of available group policies to start the Create Group Policy wizard. The wizard starts at the Group Policy page.
- You can also do the following on the Group Policy Selector:
- Select existing groups and click >> to use them in the SSL VPN. When selecting a group for the default group on an ASA (the Group Policy field), you select the object simply by clicking it in the list.
  - Select an existing group and click **Edit (pencil)** to change its properties.
- Step 3** On the Group Policy page, configure the following options:
- **Name**—The name of the user group. Enter up to 128 characters, including uppercase and lowercase characters and most alphanumeric or symbol characters.
  - **Access Method**—Select the required remote access method options, as follows:
    - **Full Tunnel**—To access to the corporate network completely over an SSL VPN tunnel. This is the recommended option.
    - **Clientless**—To access the internal or corporate network using a web browser on the client machine.
    - **Thin Client**—To download a Java applet that acts as a TCP proxy on the client machine.
- Step 4** Click **Next**. The page that opens next depends on which access methods you selected. This procedure assumes that you selected all methods, in which case the Full Client page opens.

- Step 5** On the Full Client page, select whether to restrict access to full tunnel only or to allow other methods of access if the full client download fails. Also, specify DNS and WINS server information, and configure split tunneling if you want to allow it. For an explanation of the options, see [Create Group Policy Wizard—Full Tunnel Page, page 30-21](#).
- Step 6** Click **Next**. The Clientless and Thin Client page opens.
- Step 7** On the Clientless and Thin Client page, configure these access modes. For an explanation of the options, see [Create Group Policy Wizard—Clientless and Thin Client Access Modes Page, page 30-24](#).
- Step 8** Click **Finish** to create the group policy object.
- Step 9** When you complete the wizard, the group policy is added to the available groups list, but it is not selected (unless you are configuring the default group for an ASA). To select it, highlight it in the available groups list and click >> to move it to the selected groups list.
-  **Note** To specify a user group as the default user group, select it and click **Set As Default**. This option is only available for IOS routers.
- Step 10** Click **OK** in the Group Policy Selector page to save your changes and return to the Remote Access SSL VPN Configuration wizard.
- 

## Create Group Policy Wizard—Full Tunnel Page

**Note** This page is available only if you selected the **Full Client** option in the Group Policy of the Create Group Policy wizard.

---

In this page, you can configure the mode used to access the corporate network.

### Navigation Path

For information on starting the Create Group Policy wizard, see [Creating User Groups with the Create Group Policy Wizard, page 30-20](#).

| Mode                                          | <p>The access modes to allow in the SSL VPN. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Use Other Access Modes if SSL VPN Client Download Fails</b>—To allow the remote client to use clientless or thin client access modes if the download of the VPN client fails.</li> <li>• <b>Full Tunnel Only</b>—Prohibit clientless or thin client access. The user must have the full client installed and functional to connect to the VPN.</li> </ul> <p>Ensure that you configure the full client images on the device. For ASA devices, use the Client Settings tab of the SSL VPN &gt; Other Settings policy; see <a href="#">Configuring SSL VPN AnyConnect Client Settings (ASA), page 31-64</a>. For IOS devices, the client is managed using a FlexConfig policy; see <a href="#">Predefined FlexConfig Policy Objects, page 7-19</a>.</p> |
| Client IP Address Pools<br>(IOS device only.) | <p>The IP address ranges of the address pool that full tunnel clients will draw from when they log on. The address pool must be in the same subnet as one of the device's interface IP addresses.</p> <p>Enter the address range separating the first and last IP address with a hyphen, for example, 10.100.10.2-10.100.10.255. If you enter a single address, the pool has just one address. Do not enter subnet designations.</p> <p>You can also enter the name of a network/host policy object that defines the range, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple ranges with commas.</p>                                                                                                                                                                                                                        |
| Primary IPv4 DNS Server                       | The IPv4 address of the primary DNS server for the group. Enter the IPv4 address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Secondary IPv4 DNS Server                     | The IPv4 address of the secondary DNS server for the group. Enter the IPv4 address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Primary IPv6 DNS Server                       | The IPv6 address of the primary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Secondary IPv6 DNS Server                     | The IPv6 address of the secondary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Default DNS Domain                            | The domain name of the DNS server to be used for Full Client SSL VPN connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Primary WINS Server                           | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Secondary WINS Server                         | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 30-4 Create User Group Wizard—Full Tunnel Page (continued)**

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Networks<br>(ASA device only.)     | <p>If you select Tunnel Specified Traffic or Exclude Specified traffic in the Split Tunnel Option, enter the name of the ACL object that defines the traffic to be tunneled or excluded. Click <b>Select</b> to select the object or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Destinations<br>(IOS device only.) | <p>If you select Tunnel Specified Traffic or Exclude Specified traffic in the Split Tunnel Option, specify the IP addresses that define the traffic to be tunneled or excluded.</p> <p>Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple addresses with commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 30-4** Create User Group Wizard—Full Tunnel Page (continued)

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exclude Local LANs<br>(IOS device only.) | Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the <b>Exclude Specified Traffic</b> split tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN.<br><br>When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client. |
| Split DNS Names                          | A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server.<br><br>Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.                                                                                                                                                                                                                              |

## Create Group Policy Wizard—Clientless and Thin Client Access Modes Page

In the Clientless and Thin Client page of the Create Group Policy wizard, you can configure the Clientless and Thin Client modes to be used for accessing the corporate network in your SSL VPN.

### Note

This page is only available if you selected the **Clientless** or **Thin Client** options in step 1 of the Create Group Policy wizard.

### Navigation Path

For information on starting the Create Group Policy wizard, see [Creating User Groups with the Create Group Policy Wizard, page 30-20](#).

### Related Topics

### Field Reference

**Table 30-5** Create User Group Wizard—Clientless and Thin Client Page

| Element                       | Description                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Clientless</b>             | Appears only if you selected <b>Clientless</b> in step 1 of the wizard.                                                                                                                                                                                                     |
| Portal Page Websites          | The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. |
| Allow Users to Enter Websites | Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                            |

**Table 30-5** Create User Group Wizard—Clientless and Thin Client Page (continued)

| Element                                           | Description                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Thin Client</b>                                | Appears only if you selected <b>Thin Client</b> in step 1 of the wizard.                                                                                                                                                                                                                                                |
| Port Forwarding List                              | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. |
| Port Forwarding Applet Name<br>(ASA device only.) | The application name or short description to display on the Port Forwarding Java applet screen on the portal, up to 64 characters. This is the name of the applet users will download to act as a TCP proxy on the client machine for the services configured on the SSL VPN gateway.                                   |
| Download Port Forwarding Applet on Client Login   | Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.                                                                                               |

## Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

This procedure describes how to create IPSec VPNs on ASA or PIX 7.0+ devices using the Remote Access VPN Configuration Wizard.

### Tip

The wizard allows you to select shared policies to use in the VPN on the Defaults page (the final step of the wizard). If you want to use this feature, you must first ensure that all required shared policies are configured and submitted to the database. For information on configuring shared policies and VPN policy defaults, see [Understanding and Configuring VPN Default Policies, page 25-12](#).

### Related Topics

- [Understanding Remote Access IPSec VPNs, page 30-2](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 30-8](#)

- 
- Step 1** In Device view, select the desired ASA or PIX 7.0+ device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access IPSec VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The Connection Profile page opens. For a description of the options that appear on this page, see [Remote Access VPN Configuration Wizard—IPSec VPN Connection Profile Page \(ASA\), page 30-28](#).
- Step 5** On the Connection Profile page, configure these basic options:

- **Connection Profile name**—Enter the name of the connection profile. This is the name of the tunnel group, and will appear in the Remote Access VPN > Connection Profiles policy. For more information about the connection profile policy, see [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7.
- **IKE Versions**—Select the IKE versions to use during IKE negotiations between the VPN server and the remote users, version 1, 2 or both. IKEv2 is supported on ASA Software release 8.4(1)+ only.

**Step 6** On the Connection Profile page, configure these options that will later appear in the General tab of the connection profile (see [General Tab \(Connection Profiles\)](#), page 31-10):

- **Group Policy**—Enter the name of the ASA Group Policy policy object that will be the default group for the connection profile, or click **Select** to select the object. If the required object does not yet exist, click **Select**, then click the **Create (+)** button in the ASA User Groups Selector dialog box to open the dialog boxes that are used to create these objects.

When creating a new group policy object, you must select the same IKE versions that you select in the Connection Profile page of the wizard. These options are on the Technology page of the Add ASA Group Policies dialog box: Easy VPN/IPSec IKEv1 and Easy VPN/IPSec IKEv2.

For more information about ASA Group Policies objects, see [ASA Group Policies Dialog Box](#), page 34-1.

- **Global IP Address Pool**—Enter the address pools from which IP addresses are assigned. The server uses these address pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.

Specify the pools as address ranges or network/host objects that contain address ranges, in the format *Start\_Address-End\_Address*, for example, 10.100.10.2-10.100.10.254. Click **Select** to select network/host objects or to create new objects.

**Step 7** On the Connection Profile page, configure the AAA options for authentication, authorization, and accounting, which will later appear on the AAA tab of the connection profile (see [AAA Tab \(Connection Profiles\)](#), page 31-13).

**Step 8** Click **Next** to move to the IPsec Settings page.

**Step 9** On the IPsec Settings page, configure the options for IPsec, which will later appear on the IPsec tab of the connection profile (see [IPsec Tab \(Connection Profiles\)](#), page 31-19). Note that some of these settings apply to IKEv1 only.

- **Preshared Key, Confirm**—Enter the IKEv1 preshared key for the tunnel group in each field. The maximum length of a preshared key is 127 characters.

You cannot configure a preshared key for remote access IKEv2 IPsec VPNs.

- **Trustpoint Name**—Enter the name of the PKI enrollment policy object that defines the trustpoint name, if any trustpoints are configured, for an IKEv1 connection. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the object from a list or to create a new object.

For IKEv2, the trustpoint name is not configured here, but on the IKEv2 Settings tab of the Global Settings policy. The configuration is explained later in this procedure.

- The other options (other than the client table) apply to both IKEv1 and IKEv2. Change the settings if you need non-default behavior. For an explanation of the options, including the client software update table, see [Remote Access VPN Configuration Wizard—IPsec Settings Page \(ASA\)](#), page 30-30.

**Step 10** Click **Next** to move to the VPN Defaults page.

- Step 11** On the Defaults page, select the additional shared policies that you want to assign to the VPN. Initially, the policies listed are those chosen on the Security Manager Administration VPN Defaults page.
- For more information about selecting these policies, see [Remote Access VPN Configuration Wizard—Defaults Page, page 30-31](#).
- Step 12** Click **Finish** to save your changes.
- Because the wizard does not configure all possible options, inspect the policies created and configure any additional options that you want to implement.
- The remaining steps are required if you selected IKE version 2 as a supported IKE version, or if you specified an IPsec trustpoint.
- Step 13** (IKEv2 Optional.) Configure group aliases and double authentication if required:
- Select the Connection Profiles policy.
  - Select the connection profile you configured in the wizard, and click the **Edit Row (pencil)** button to open the Connection Profiles dialog box.
    - If you want to configure double authentication, select the Secondary AAA tab and configure the required settings. For more information, see [Secondary AAA Tab \(Connection Profiles\), page 31-17](#).
    - If you want to configure aliases for the profile, which helps users select the correct profile during login, select the SSL tab and configure the alias table. For more information, see [SSL Tab \(Connection Profiles\), page 31-22](#).
    - There are several additional connection profile settings that are not configured in the wizard. Examine the tabs in the Connection Profile dialog box to determine if additional changes are required.
  - Click **OK** in the Connection Profiles dialog box to save your changes.
- Step 14** (IKEv2 Requirement.) Select the **Remote Access VPN > SSL VPN > Access** policy and configure at least the following. For detailed information about configuring an Access policy, see [Understanding SSL VPN Access Policies \(ASA\), page 31-44](#).
- Add the remote access VPN interface to the access interfaces table.
  - Select **Allow Users to Select Connection Profile in Portal Page**.
  - Select **Enable AnyConnect Access**.
- Step 15** (IKEv2 Requirement.) Select the **Remote Access VPN > SSL VPN > Other Settings** policy, and click the **Client Settings** tab.
- In the AnyConnect Client Image table, add an AnyConnect 3.0 or later client image, one that supports IKEv2 negotiations.
- For more information on configuring client images, see [Configuring SSL VPN AnyConnect Client Settings \(ASA\), page 31-64](#).
- Step 16** (IKEv2 Requirement.) Select the **Remote Access VPN > Global Settings** policy, and click the IKEv2 Settings tab.
- At minimum, configure the **RA Trustpoint** for remote access IKEv2 authentication. Enter the name of the PKI enrollment object that identifies the certificate authority (CA) server or click **Select** to select the object or to create a new one.
- For more information on configuring IKEv2 global settings, see [Configuring VPN Global IKEv2 Settings, page 26-37](#).
- Step 17** (IKEv1, IKEv2 Requirement.) Select the **Remote Access VPN > Public Key Infrastructure** policy and ensure that the following PKI enrollment objects are selected:

- (IKEv1) The object specified on the IPsec tab of the connection profile, if a trustpoint is configured.
- (IKEv2) The object specified on the IKEv2 Settings tab of the Global Settings policy.

**Note** In the wizard, you might have applied a shared Public Key Infrastructure policy that already specifies these objects.

**Step 18** (IKEv2 Optional.) IKEv2 connections require the use of the AnyConnect 3.0+ client. The AnyConnect client might need to download files, such as software upgrades, profiles, localization and customization files, CSD, SCEP, and so forth. The wizard does not enable these types of download.

To enable AnyConnect file downloads:

- Select **Remote Access VPN > IPsec VPN > IPsec Proposal**.
- Select the IPsec proposal created by the wizard, and click **Edit Row (pencil)** to open the IPsec Proposal Editor. For information about the various options, see [IPsec Proposal Editor \(ASA, PIX 7.0+ Devices\)](#), page 31-41.
- Select the **Enable Client Services** option, and enter a port number if you do not want to use the default port 443. (You can use the same port number used for SSL VPN or other SSL uses.)
- Click **OK** to save your changes.

## Remote Access VPN Configuration Wizard—IPsec VPN Connection Profile Page (ASA)

Use the Connection Profile page of the Remote Access VPN Configuration wizard to configure the connection profile policies on your security appliance for a remote access IPsec VPN. You can specify a name for the connection profile policy that you are adding, select the IKE versions to allow during IKE negotiations, select the user group policy, specify address pools for this policy, and specify authentication, authorization, and accounting server group settings.

For more information about using the wizard to configure remote access IPsec VPNs on ASA, see [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 30-25.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN on an ASA or PIX 7.0+ device (see [Using the Remote Access VPN Configuration Wizard](#), page 30-13). The IPsec Connection Profile page is the first page that appears.

### Field Reference

| IKE Versions                    | <p>The IKE versions to use during IKE negotiations between the VPN server and the remote users. IKEv2 is supported on ASA Software release 8.4(1)+ only; you cannot change the option selection on other types of device.</p> <p>Select <b>IKE Version 1</b>, <b>IKE Version 2</b>, or <b>Both</b> (to allow either version). IKEv2 connections are allowed using Anyconnect clients only.</p>                                                                                                                                                                                                                                                               |
| Group Policy                    | <p>If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server.</p> <p>Click <b>Select</b> to select an existing object or to create a new one.</p> <p><b>Tip</b> If you enable IKEv2 for this VPN, there are special considerations for the group policy you choose. For detailed information, see <a href="#">Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices)</a>, page 30-25.</p> |
| Global IP Address Pool          | <p>The address pools from which IP addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>             |
| Authentication Server Group     | <p>The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use LOCAL if Server Group Fails | <p>Whether to fall back to the local database for authentication if the selected authentication server group fails.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Authorization Server Group      | <p>The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Accounting Server Group         | <p>The name of the accounting server group. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Remote Access VPN Configuration Wizard—IPSec Settings Page (ASA)

Use the IPSec Settings page of the Remote Access VPN Configuration wizard to configure the IPSec settings on your security appliance for a remote access IPSec VPN. Some of these settings apply to IKE version 1 (IKEv1) only; if you are configuring an IKEv2-only VPN, these fields are greyed and unconfigurable.

For more information about using the wizard to configure remote access IPsec VPNs on ASA, see [Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 30-25.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN on an ASA or PIX 7.0+ device (see [Using the Remote Access VPN Configuration Wizard](#), page 30-13); then click **Next** until you reach this page.

### Field Reference

**Table 30-7 Remote Access VPN Configuration Wizard, IPSec VPN Wizard—IPSec Settings (ASA)**

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preshared Key<br>(IKEv1 only.)                    | The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field.<br><br><b>Tip</b> You cannot configure preshared keys for IKEv2 remote access VPNs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Trustpoint Name<br>(IKEv1 only.)                  | The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv1 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate.<br><br>Click <b>Select</b> to select the object from a list or to create a new object.<br><br><b>Tip</b> This trustpoint is used for IKEv1 negotiations only. To configure the global trustpoint for IKEv2 negotiations, use the IKEv2 Settings tab of the Global Settings policy; see <a href="#">Configuring VPN Global IKEv2 Settings</a> , page 26-37. |
| IKE Peer ID Validation                            | Select whether IKE peer ID validation is ignored (Do not check), required, or checked only if supported by a certificate. During IKE negotiations, peers must identify themselves to one another.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Sending Certificate Chain                  | Whether to enable the sending of the certificate chain for authorization. A certificate chain includes the root CA certificate, identity certificate, and key pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Password Update with RADIUS Authentication | When selected, enables passwords to be updated with the RADIUS authentication protocol.<br><br>Whether to enable passwords to be updated with the RADIUS authentication protocol. For more information, see <a href="#">Supported AAA Server Types</a> , page 6-28.                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 30-7 Remote Access VPN Configuration Wizard, IPsec VPN Wizard—IPsec Settings (ASA)**

| Element                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| ISAKMP Keepalive                           | <p>Whether to monitor ISAKMP keepalive. If you select the <b>Monitor Keepalive</b> option, you can configure IKE keepalive as the default failover and routing mechanism. Enter the following parameters:</p> <ul style="list-style-type: none"> <li>• <b>Confidence Interval</b>—The number of seconds that a device waits between sending IKE keepalive packets.</li> <li>• <b>Retry Interval</b>—The number of seconds a device waits between attempts to establish an IKE connection with the remote peer. The default is 2 seconds.</li> </ul> <p>For more information, see <a href="#">Configuring VPN Global ISAKMP/IPsec Settings, page 26-33</a>.</p> |
| Client Software Update table (IKEv1 only.) | <p>The VPN client revision level and URLs for client platforms. You can configure different revision levels for All Windows Platforms, Windows 95/98/ME, Windows NT4.0/2000/XP, or the VPN3002 Hardware Client.</p> <p>To configure the client for a platform, select it, click the <b>Edit Row</b> button, and fill in the <a href="#">IPsec Client Software Update Dialog Box, page 31-22</a>.</p>                                                                                                                                                                                                                                                           |

## Remote Access VPN Configuration Wizard—Defaults Page

Use the Defaults page of the Remote Access VPN Configuration wizard to select the shared policies to assign to the remote access IPsec VPN. Initially, the policies selected are those configured in the Security Manager Administration VPN Defaults for remote access VPNs. For information on how to configure these defaults, see [Understanding and Configuring VPN Default Policies, page 25-12](#).

Required policies must always have a policy selected. If “Factory Default” is shown, then the policy applied is not a shared policy but default policy settings supplied by Security Manager. If you can select the empty option, the policy is optional and you need to configure it only if you want the associated features.

When evaluating which policies to assign (if any), keep the following in mind:

- The drop-down lists for each policy type list the existing shared policies that you can select. You can select only shared policies that have been committed to the Security Manager database (and approved, if you are using Workflow mode with an approver). You cannot create a shared policy and use it before you submit it.
- To view the content of a policy, select it and click the **View Content** button. You are presented with a read-only view of the policy. Use this to help verify that you are selecting the desired policy.

### Note

If you try to select a default policy that is currently locked by another user, a message is displayed warning you of a lock problem. To bypass the lock, select a different policy or cancel the VPN creation until the lock is removed. For more information, see [Understanding Policy Locking, page 5-8](#).

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN (see [Using the Remote Access VPN Configuration Wizard, page 30-13](#)) and click **Next** until you reach this page.

**Field Reference****Table 30-8 Remote Access VPN Configuration Wizard, Defaults Page**

| Element                                      | Description                                                                                                                                                                                            |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASA Cluster Load Balance                     | Defines load balancing for an ASA device in your remote access VPN.                                                                                                                                    |
| High Availability                            | Defines a High Availability (HA) policy on a Cisco IOS router in a remote access VPN.                                                                                                                  |
| Certificate to Connection Profile Map Policy | (IKEv1 only.) Defines the certificate to connection profile map options for an ASA device in your remote access VPN.                                                                                   |
| IKE Proposal                                 | Defines the set of algorithms that two peers use to secure the IKE negotiation between them.                                                                                                           |
| IPsec Proposal                               | Defines the crypto maps required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. |
| Public Key Infrastructure                    | Defines the Public Key Infrastructure (PKI) policy used to generate PKI enrollment requests for PKI certificates and RSA keys.                                                                         |
| VPN Global Settings                          | Defines global settings for IKE, IPsec, IKEv2, NAT, and fragmentation that apply to devices in your remote access VPN.                                                                                 |

## Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices)

This procedure describes how to create or edit SSL VPNs on IOS devices using the Remote Access SSL VPN Configuration Wizard.

**Related Topics**

- [Understanding Remote Access SSL VPNs](#), page 30-2
- [Understanding Devices Supported by Each Remote Access VPN Technology](#), page 30-8

- 
- Step 1** In Device view, select the desired IOS device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access SSL VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The Gateway and Context page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Gateway and Context Page \(IOS\)](#), page 30-33.
- Step 5** Select the gateway to be used as a proxy for connections to the protected resources in your SSL VPN. Options are:

- **Use Existing Gateway**—Lets you use an existing gateway object. If you select this option, specify the name of the SSL VPN Gateway policy object that defines the gateway. Click **Select** to select the object or to create a new object.
- **Create Using IP Address**—Lets you configure a new gateway object using a reachable (public, static) IP address on the router. Enter the IP address.
- **Create Using Interface**—Lets you configure a new gateway using the public, static IP address of a router interface. Select the interface or interface role object.

If you elected to create a new gateway using an IP address or an interface:

- Specify a gateway name.
- Specify the number of the port that will carry the HTTPS traffic. The default is 443, unless HTTP port redirection is enabled, in which case the default HTTP port number is 80. If you want to use a different port, it must be between 1024 and 65535.

- Step 6** Enter the name of the context that defines the virtual configuration of the SSL VPN.
- Step 7** Select the user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client access is enabled for the group. Click **Edit** to select the desired groups, or to create new groups.
- Step 8** Configure the AAA options for authentication, authentication domain, and accounting. For detailed information, see [SSL VPN Configuration Wizard—Gateway and Context Page \(IOS\), page 30-33](#).
- Step 9** Click **Next**. The Portal Page Customization page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Portal Page Customization Page \(IOS\), page 30-35](#).
- Step 10** On the Portal Customization page, configure the following options. The bottom of the page is a preview of what the portal page will look like based on your selections; use the preview to fine-tune your selections.
- **Title**—The name of the portal page, which appears at the top of the page.
  - **Logo**—The graphic to show in the title area of the page: None, Default (the Cisco logo graphic), or Custom. If you select custom, click **Select** to select the graphic on the Security Manager server. You must copy the custom graphic to the server before you can use it in the portal customization.  
  
The source image file for the logo can be a GIF, JPG, or PNG file, with a file name of up to 255 characters, and up to 100 kilobytes in size.
  - **Login Message**—The text that should appear above the login prompt.
  - **Title and Text Colors**—The colors to use for the title and login area and the fonts.
- Step 11** Click **Finish** to save your changes.

## SSL VPN Configuration Wizard—Gateway and Context Page (IOS)

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

A gateway and context must be configured on a device before a remote user can access resources on a private network behind the SSL VPN. Use this step of the SSL VPN Configuration wizard to specify a gateway and context configuration, including information that will allow users to access a portal page.

**Navigation Path**

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an IOS device (see [Using the Remote Access VPN Configuration Wizard, page 30-13](#)). The Gateway and Context page is the first page that appears.

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gateway      | <p>The gateway to be used as a proxy for connections to the protected resources in your SSL VPN. Options are:</p> <ul style="list-style-type: none"> <li>• <b>Use Existing Gateway</b>—When selected, enables you to use an existing gateway for your SSL VPN.</li> <li>• <b>Create Using IP Address</b>—When selected, enables you to configure a new gateway using a reachable (public static) IP address on the router.</li> <li>• <b>Create Using Interface</b>—When selected, enables you to configure a new gateway using the public static IP address of the router interface.</li> </ul>                        |
| Gateway Name | <p>The name of the SSL VPN gateway policy object that defines the gateway:</p> <ul style="list-style-type: none"> <li>• If you selected Use Existing Gateway, click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> <p><b>Note</b> After selecting the gateway, the port number and digital certificate required to establish a secure connection are displayed in the relevant fields.</p> <ul style="list-style-type: none"> <li>• If you selected Create Using IP Address or Interface, enter the name of the object that you want to create (up to 128 characters).</li> </ul> |
| IP Address   | <p>Available if you selected to create a gateway using an IP address.</p> <p>The IP address on the router that should be used as the gateway address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Interface    | <p>Available if you selected to create a gateway using an interface.</p> <p>The name of the interface, or the interface role object that defines the interface, that should be used as the SSL VPN gateway. Click <b>Select</b> to select the interface or interface role, or to create a new interface role.</p>                                                                                                                                                                                                                                                                                                       |

**Table 30-9** *SSL VPN Configuration Wizard, Gateway and Context Page (continued)*

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                        | <p>The port number used for SSL VPN connections. The default is 443, unless HTTP port redirection is enabled, in which case the default HTTP port number is 80. If you enter a different number, it must be between 1024 and 65535.</p> <ul style="list-style-type: none"> <li>If you selected Use Existing Gateway, this is a read-only field that shows the port number configured in the selected object.</li> <li>If you selected Create Using IP Address or Interface, enter the port number or the name of a port list object that specifies the number, or click <b>Select</b> to select the port list object.</li> </ul> |
| Trustpoint                  | The digital certificate required to establish the secure connection. A self-signed certificate is generated when an SSL VPN gateway is activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Context Name                | <p>The name of the context that defines the virtual configuration of the SSL VPN.</p> <p><b>Note</b> To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| Portal Page URL             | The URL for the SSL VPN, which is filled in when you select (or define) a gateway object. Users connect to this URL to enter the VPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Group Policies              | The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client access is enabled for the group. Click <b>Edit</b> to select the desired groups, or to create new groups.                                                                                                                                                                                                                                                                                                                               |
| Authentication Server Group | <p>The authentication server groups. The list is in prioritized order. Authentication is attempted using the first group and proceeds through the list until the user is successfully authenticated or denied. Use the LOCAL group if the users are defined on the gateway itself.</p> <p>Enter the names of the AAA server groups; separate multiple entries with commas. You can click <b>Select</b> to select the groups or to create new ones.</p>                                                                                                                                                                           |
| Authentication Domain       | A list or method for SSL VPN remote user authentication. If you do not specify a list or method, the gateway uses global AAA parameters for remote-user authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Accounting Server Group     | The accounting server group. Enter the name of the AAA server group policy object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## SSL VPN Configuration Wizard—Portal Page Customization Page (IOS)

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use this step of the SSL VPN Configuration wizard to define the appearance of the portal page that remote users see when connecting to the SSL VPN. The portal page allows remote users access to all websites available on the SSL VPN networks.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see [Using the Remote Access VPN Configuration Wizard, page 30-13](#)); then click **Next** until you reach this page.

### Related Topics

- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\), page 30-32](#)

### Field Reference

**Table 30-10** *SSL VPN Configuration Wizard, Portal Page Customization Page*

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title         | The text displayed at the top of the page. Control the color using the Primary settings in the Title Color and Text Color fields.                                                                                                                                                                                                                                                      |
| Logo          | The graphic displayed next to the title. Select None, Default, or Custom. To configure a custom graphic, you must copy the desired graphic to the Security Manager server, then click <b>Browse</b> to select the file. Supported graphic types are GIF, JPG, and PNG, with a maximum size of 100 KB.                                                                                  |
| Login Message | The text displayed immediately above the login prompt. Control the color using the Secondary settings in the Title Color and Text Color fields.                                                                                                                                                                                                                                        |
| Title Color   | The colors used for the title and login area and the text: <ul style="list-style-type: none"> <li>• Primary—The Title, Login Box title, and the text in those areas.</li> <li>• Secondary—The Login Box username/password background and the text in that area.</li> </ul> Click <b>Select</b> to choose background colors. For text, select either Black or White from the text list. |
| Text Color    |                                                                                                                                                                                                                                                                                                                                                                                        |
| Preview       | A preview of how the portal page will appear based on your selections.                                                                                                                                                                                                                                                                                                                 |

## Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices)

### Note

From version 4.17, though Cisco Security Manager continues to support Cisco IOS, FWSM, IPS, and PIX features/functionality, it does not support any enhancements.

This procedure describes how to create or edit IPSec VPNs on IOS and PIX 6.3 devices using the Remote Access VPN Configuration Wizard.

**Tip**

The wizard allows you to select shared policies to use in the VPN on the Defaults page (the final step of the wizard). If you want to use this feature, you must first ensure that all required shared policies are configured and submitted to the database. For information on configuring shared policies and VPN policy defaults, see [Understanding and Configuring VPN Default Policies, page 25-12](#).

**Related Topics**

- [Understanding Remote Access IPSec VPNs, page 30-2](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 30-8](#)

- 
- Step 1** In Device view, select the desired IOS or PIX 6.3 device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access IPSec VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The User Group Policy page opens.
- Step 5** Select the required user groups from the Available User Groups list and click >>.
- If the required user group is not in the list, click **Create (+)** to open the Add User Groups dialog box, which enables you to create or edit a user group object. See [Add or Edit User Group Dialog Box, page 34-73](#).
  - You can edit an existing user group by selecting it in either list and clicking **Edit (pencil)**.
  - To deselect a user group, select it and click <<.
- Step 6** Click **Next**. The Defaults page opens.
- Step 7** Select the shared policies to assign to the VPN. Initially, the selected policies are those configured on the Security Manager Administration VPN Defaults page. You can use the defaults or select different policies, if any are available. For more information about these policy defaults, see [Remote Access VPN Configuration Wizard—Defaults Page, page 30-31](#).
- Step 8** Click **Finish** to save your changes.
- Inspect the policies created and configure any additional options that you want to implement.
-

# Managing Remote Access VPNs on ASA and PIX 7.0+ Devices

## Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

You can configure and manage remote access IPsec on devices running Cisco ASA Software or PIX 7.0+, and SSL VPNs on ASA 8.0+ devices (but not on PIX devices). Additionally, you can use IKE version 2 (IKEv2) negotiations in remote access IPsec VPNs on ASA 8.4(x) devices.

## Tip

No VPN configuration is supported on Cisco Catalyst 6500 Series ASA Service Modules and the ASA Software Release 8.5(x) used on the module.

The configuration of these remote access VPNs are the same for these device types. IOS and PIX 6.3+ devices use different configurations for remote access VPNs (as explained in [Chapter 33, “Managing Remote Access VPNs on IOS and PIX 6.3 Devices”](#)).

The topics in this chapter explain how to configure policies that are specific to ASA and PIX 7.0+ devices. Additionally, review the following topics for more information about remote access VPNs:

## Overview of Remote Access VPN Policies for ASA and PIX 7.0+ Devices

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

When you configure remote access VPNs on ASA or PIX 7.0+ devices, you use the following policies based on the type of VPN you are configuring. Possible remote access VPN types are: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. IKEv2 is supported on ASA devices running the software version 8.4(x) and later. [Table 31-1](#) explains the conditions under which these policies are required or optional.

### Note

You cannot configure SSL VPNs on PIX devices; PIX devices support remote access IKEv1 IPsec VPNs only.

- **Policies used with remote access IKEv1 and IKEv2 IPsec and SSL VPNs:**
  - **ASA Cluster Load Balancing**—In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device. For more information, see [Understanding Cluster Load Balancing \(ASA\)](#), page 31-5.
  - **Connection Profiles**—A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. For more information, see [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7.
  - **Dynamic Access**—Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles that each user might inhabit within an organization, and logins from remote access sites with different configurations and levels of security. Dynamic access policies (DAP) let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. For more information, see [Chapter 32, “Managing Dynamic Access Policies for Remote Access VPNs \(ASA 8.0+ Devices\)”](#).

### Note

For multi-context ASA devices, the Dynamic Access policy is supported by Security Manager version 4.12 and ASA version 9.6(2) onwards only.

- **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations. For more information, see [Configuring VPN Global Settings, page 26-30](#).
- **Group Policies**—You can view the user group policies defined for your remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For more information, see [Configuring Group Policies for Remote Access VPNs, page 31-26](#).
- **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see [Understanding Public Key Infrastructure Policies, page 26-51](#) and [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#).

---

**Note** For multi-context ASA devices, the Public Key Infrastructure policy is supported by Security Manager version 4.12 and ASA version 9.6(2) onwards only.

---

- **Username from Cert Scripts**—You can use this policy to define a script to use in mapping the username from the certificate. For more information, see [Add/Edit Scripts Dialog Box, page 31-34](#).

---

**Note** For multi-context ASA devices, the Username from Cert Scripts policy is supported by Security Manager version 4.12 and ASA version 9.6(2) onwards only.

---

- **Policies used in remote access IPsec VPNs only:**

- **Certificate To Connection Profile Maps, Policy and Rules (IKEv1 IPsec only.)**—Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods. For more information, see [Configuring Certificate to Connection Profile Map Policies \(ASA\), page 31-36](#).
- **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see [Configuring an IKE Proposal, page 26-9](#).
- **IPsec Proposal (ASA/PIX 7.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 31-40](#).

- **Policies used in remote access IKEv2 IPsec and SSL VPNs only:**
  - **Access**—An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or AnyConnect Essentials Client. For more information, see [Understanding SSL VPN Access Policies \(ASA\)](#), page 31-44.
  - **Other Settings**—The SSL VPN Other Settings policy defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, AnyConnect client images and profiles, Kerberos Constrained Delegation, and some other advanced settings. For more information, see [Configuring Other SSL VPN Settings \(ASA\)](#), page 31-51.
  - **Shared License**—Use the SSL VPN Shared License page to configure your SSL VPN Shared License. For more information, see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\)](#), page 31-74.

The following table explains whether a policy is required or optional for a particular type of VPN.

**Table 31-1 Remote Access VPN Policy Requirements for ASA Devices**

| Policy                                                   | Required, Optional                                                                                                                      |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| ASA Cluster Load Balancing                               | <b>Optional</b> for all VPN types.                                                                                                      |
| Connection Profiles                                      | <b>Required</b> for all VPN types.                                                                                                      |
| Dynamic Access                                           | <b>Optional</b> for all VPN types.                                                                                                      |
| Global Settings                                          | <b>Required:</b> IKEv2 IPsec.<br><b>Optional:</b> IKEv1 IPsec, SSL.                                                                     |
| Group Policies                                           | <b>Required</b> for all VPN types.                                                                                                      |
| Public Key Infrastructure                                | <b>Required:</b> IKEv2 IPsec.<br>Also required if you configure any trustpoints for IKEv1 IPsec or SSL VPNs. Otherwise, it is optional. |
| Certificate To Connection Profile Maps, Policy and Rules | <b>Optional:</b> IKEv1 IPsec.<br><b>Not used in:</b> IKEv2 IPsec, SSL.                                                                  |
| IKE Proposal                                             | <b>Required:</b> IKEv1 IPsec, IKEv2 IPsec.<br><b>Not used in:</b> SSL.                                                                  |
| IPsec Proposal (ASA/PIX 7.x)                             | <b>Required:</b> IKEv1 IPsec, IKEv2 IPsec.<br><b>Not used in:</b> SSL.                                                                  |
| Access                                                   | <b>Required:</b> IKEv2 IPsec, SSL.<br><b>Not used in:</b> IKEv1 IPsec.                                                                  |
| Other Settings                                           | <b>Required:</b> IKEv2 IPsec, SSL.<br><b>Not used in:</b> IKEv1 IPsec.                                                                  |
| Shared License                                           | <b>Optional:</b> IKEv2 IPsec, SSL.<br><b>Not used in:</b> IKEv1 IPsec.                                                                  |

## Understanding Cluster Load Balancing (ASA)

In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device.

To implement load balancing, you must group two or more devices on the same private LAN-to-LAN network into a virtual cluster. All devices in the virtual cluster carry session loads. One device in the virtual cluster, called the virtual director, directs incoming calls to the other devices, called secondary devices. The virtual director monitors all devices in the cluster, keeps track of how busy each is, and distributes the session load accordingly.

The virtual cluster appears to outside clients as a single virtual cluster IP address. This IP address is not tied to a specific physical device—it belongs to the current virtual director. A VPN client trying to establish a connection connects first to this virtual cluster IP address. The virtual director then sends back to the client the public IP address of the least-loaded available host in the cluster. In a second transaction (transparent to the user), the client connects directly to that host. In this way, the virtual director directs traffic evenly and efficiently across resources.

The role of virtual director is not tied to a physical device—it can shift among devices. If a machine in the cluster fails, the terminated sessions can immediately reconnect to the virtual cluster IP address. The virtual director then directs these connections to another active device in the cluster. Should the virtual director itself fail, a secondary device in the cluster immediately takes over as the new virtual session director. Even if several devices in the cluster fail, users can continue to connect to the cluster as long as any one device in the cluster is available.

### Understanding Redirection Using a Fully Qualified Domain Name (FQDN)

By default, the ASA sends only IP addresses in load-balancing redirection to a client. If certificates are in use that are based on DNS names, the certificates will be invalid when redirected to a secondary device. As a VPN director, this security appliance can send a fully qualified domain name (FQDN) of a cluster device (another security appliance in the cluster) when redirecting VPN client connections to that cluster device. The security appliance uses reverse DNS lookup to resolve the FQDN of the device to its outside IP address to redirect connections and perform VPN load balancing. All outside and inside network interfaces on the load-balancing devices in a cluster must be on the same IP network.

After you enable load balancing using FQDNs, add an entry for each of your ASA outside interfaces into your DNS server, if such entries are not already present. Each ASA outside IP address should have a DNS entry associated with it for lookups. These DNS entries must also be enabled for Reverse Lookup. Enable DNS lookups on your ASA and define your DNS server IP address on the ASA.

For the procedure to configure cluster load balancing, see [Configuring Cluster Load Balance Policies \(ASA\)](#), page 31-5.

## Configuring Cluster Load Balance Policies (ASA)

Use the ASA Cluster Load Balance page to enable load balancing for an ASA device in your remote access VPN. You must explicitly enable load balancing, as it is disabled by default. All devices that participate in a cluster must share the same cluster-specific values: IP address, encryption settings, encryption key, and port. For more information on cluster load balancing, see [Understanding Cluster Load Balancing \(ASA\)](#), page 31-5.

**Note**

Load balancing requires an active 3DES/AES license and an ASA Model 5510 with a Plus license or an ASA Model 5520 or later. The ASA device checks for the existence of this crypto license before enabling load balancing. If it does not detect an active 3DES or AES license, the device prevents load balancing, and also prevents internal configuration of 3DES by the load balancing system unless the license permits this usage.

**Step 1** Do one of the following:

- (Device View) Select an ASA device; then select **Remote Access VPN > ASA Cluster Load Balance** from the Policy selector.
- (Policy View) Select **Remote Access VPN > ASA Cluster Load Balance** from the Policy Type selector. Select an existing policy or create a new one.

The ASA Cluster Load Balance page opens.

**Step 2** Select **Participate in Load Balancing Cluster** to indicate that the device belongs to a load-balancing cluster.

**Step 3** Configure the VPN Cluster Configuration options:

- **Cluster IPv4/IPv6 Address**—Specify the single IP address that represents the entire virtual cluster. Choose an IP address that is in the same subnet as the external interface. Beginning with version 4.12, Security Manager supports IPv6 address for IPv6 cluster in addition to the IPv4 address. This is for ASA devices running the version 9.0 or later.
- **UDP Port**—Specify the UDP destination port for the virtual cluster to which the device belongs. The port is typically 9023, but if that port is in use by another application, enter the UDP destination port number that you want to use for load balancing.
- **Enable IPsec Encryption, IPsec Shared Secret**—If required, select **Enable IPsec Encryption** to ensure that all load-balancing information communicated between the devices is encrypted. If you select this option, also enter (and confirm) the shared secret password. This can be a case-sensitive value between 4 and 16 characters, without spaces. The security appliances in the virtual cluster communicate through LAN-to-LAN tunnels using IPsec. This password must match the passwords passed on by the client.

**Step 4** Configure the priority of the server in the cluster. Select one of the following options:

- **Accept default device value**—To accept the default priority value assigned to the device.
- **Configure same priority on all devices in the cluster**—To configure the same priority value to all the devices in the cluster. Then enter the priority number (1-10) to indicate the likelihood of the device becoming the virtual director, either at startup or when the existing director fails.

**Step 5** Specify the public and private interfaces to be used on the server:

- **Public Interfaces**—The public interfaces to be used on the server. Enter the name of an interface or interface role object, or click **Select** to select the interface or role or to create a new role.
- **Private Interfaces**—The private interfaces to be used on the server. Enter the name of an interface or interface role object, or click **Select** to select the interface or role or to create a new role.

**Step 6** If required, select **Send FQDN to client instead of an IP address when redirecting** to enable redirection using fully-qualified domain names. This option is available only for ASA devices running 8.0(2) or later. For more information, see [Understanding Cluster Load Balancing \(ASA\), page 31-5](#).

# Configuring Connection Profiles (ASA, PIX 7.0+)

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. If you do not assign a group policy to a user, the default connection profile for the connection applies. You can create one or more connection profiles specific to your environment. You can configure connection profiles on the local remote access VPN server or on external AAA servers.

When you discover remote access VPN policies on a device, Security Manager adds the default connection profiles to the policy. You can edit these profiles, and the associated DfltGrpPolicy (renamed in Security Manager as *<device\_display\_name>DfltGrpPolicy*), but you cannot delete them. The following default connection profiles are supported in Security Manager:

- **DefaultRAGroup**—The default connection profile for remote access IPsec VPNs.
- **DefaultWEBVPNGroup**—The default connection profile for SSL VPNs. This connection profile is discovered only for ASA 8.0+ devices.

If you are configuring a connection profile on an ASA device, you have the option of configuring double authentication. The double authentication feature implements two-factor authentication for remote access to the network, in accordance with the Payment Card Industry Standards Council Data Security Standard. This feature requires that the user enter two separate sets of login credentials at the login page. For example, the primary authentication might be a one-time password, and the secondary authentication might be a domain (Active Directory) credential. If the primary credential authentication fails, the security appliance does not attempt to validate the secondary credentials. If either authentication fails, the connection is denied. Both the AnyConnect VPN client (SSL VPN or IKEv2 IPsec VPN) and Clientless SSL VPN support double authentication. The AnyConnect client supports double authentication on Windows computers (including supported Windows Mobile devices and Start Before Login), Mac computers, and Linux computers.

This procedure describes how to create or edit connection profiles on your remote access VPN server using the Connection Profile policy.

**Note**

You can also create connection profiles from the Remote Access VPN Configuration wizard; see [Using the Remote Access VPN Configuration Wizard, page 30-13](#). For information on connection profiles in Easy VPN site-to-site topologies, see [Configuring a Connection Profile Policy for Easy VPN, page 28-13](#).

**Related Topics**

- [Discovering Remote Access VPN Policies, page 30-12](#)

**Step 1**

Do one of the following:

- (Device view) With an ASA or PIX 7.0+ device selected, select **Remote Access VPN > Connection Profiles** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Connection Profiles (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Connection Profiles page opens. The policy lists all connection profiles and shows the group policy used in the profile. For more information, see [Connection Profiles Page, page 31-8](#).

- Step 2** Click **Add Row (+)** beneath the table, or select a profile and click **Edit Row (pencil)**. The Connection Profiles dialog box opens.
- Step 3** (All remote access VPN types.) On the General tab, specify the connection profile name and group policies and select which method (or methods) of address assignment to use. For a detailed explanation of the configuration, see [General Tab \(Connection Profiles\), page 31-10](#).
- Step 4** (All remote access VPN types.) Click the **AAA** tab to specify the AAA authentication parameters for the connection profile. For a detailed explanation of the configuration, see [AAA Tab \(Connection Profiles\), page 31-13](#).
- Step 5** (Remote access IKEv2 IPsec and SSL VPN only.) If you are setting up a connection profile on an ASA device, you can configure secondary authentication. To do so, click the **Secondary AAA** tab. For a detailed explanation of the configuration, see [Secondary AAA Tab \(Connection Profiles\), page 31-17](#).
- Step 6** (Remote access IPsec VPN only.) Click the **IPsec** tab to specify IPsec and IKE parameters for the connection profile. Some of these settings apply to IKEv1 but not to IKEv2 connections. For a detailed explanation of the configuration, see [IPSec Tab \(Connection Profiles\), page 31-19](#).

---

**Note** To configure IKEv2 settings, use the IKEv2 Settings tab of the Global Settings policy; see [Configuring VPN Global IKEv2 Settings, page 26-37](#).

---

- Step 7** (Remote access SSL VPN only.) Click the **SSL** tab to specify the WINS servers for the connection profile policy, select a customized look and feel for the SSL VPN end-user logon web page, specify DHCP servers to be used for client address assignment, and establish an association between an interface and client IP address pools. For a detailed explanation of the configuration, see [SSL Tab \(Connection Profiles\), page 31-22](#).
- Step 8** Click **OK**.
- 

## Connection Profiles Page

Use the Connection Profiles page to manage connection profile policies for remote access VPN or Easy VPN topologies. The Connection Profiles page lists the connection profiles that are configured, shows the group policy associated with those connection profiles, and indicates whether a connection profile is the default connection profile to use for Citrix clients when no specific tunnel group is identified during tunnel negotiation.

Use of this policy differs depending on the type of VPN you are configuring:

- Remote access SSL VPN—The policy is used only for ASA devices. You can create multiple profiles, and configure settings on all tabs of the Connection Profiles dialog box.
- Remote access IPsec VPN—The policy is used for ASA devices and PIX Firewalls running PIX 7.0+ software. You can create multiple profiles, but only the General, AAA, and IPsec tabs on the Connection Profiles dialog box apply to this configuration (in some cases, you will see only these tabs).
- Easy VPN topologies—The policy is used for Easy VPN servers (hubs) that are ASA devices or PIX Firewalls running PIX 7.0+ software. You can create a single profile, so the policy page actually imbeds the Connection Profiles dialog box, so that you have direct access to the tabs that define the profile. Only the General, AAA, and IPsec tabs apply.

For remote access IPsec and SSL VPNs:

- To add a profile, click the **Add Row** button and fill in the Connection Profiles dialog box.
- To edit an existing profile, select it and click the **Edit Row** button.
- To delete a profile, select it and click the **Delete Row** button.

The connection profile consists of the following tabs. Configure them as appropriate for the type of VPN you are configuring.

- [General Tab \(Connection Profiles\)](#), page 31-10
- [AAA Tab \(Connection Profiles\)](#), page 31-13
- [Secondary AAA Tab \(Connection Profiles\)](#), page 31-17 (SSL VPN and IKEv2 IPsec VPN only.)
- [IPSec Tab \(Connection Profiles\)](#), page 31-19 (Some of these settings apply to IKEv1 but not to IKEv2 connections.)
- [SSL Tab \(Connection Profiles\)](#), page 31-22 (SSL VPN only)

#### Navigation Path

Remote access VPNs:

- (Device View) Select an ASA or PIX 7+ device and select **Remote Access VPN > Connection Profiles** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Connection Profiles (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Easy VPN:

- From the [Site-to-Site VPN Manager Window](#), page 25-18, select the Easy VPN topology and then select **Connection Profiles (PIX7.0/ASA)**.
- (Device view) Select a device that participates in the Easy VPN topology and select **Site to Site VPN** from the Policy selector. Select the Easy VPN topology and click **Edit VPN Policies** to open the [Site-to-Site VPN Manager Window](#), page 25-18, where you can select the policy.
- (Policy view) Select **Site-to-Site VPN > Connection Profiles (PIX7.0/ASA)**. Select an existing policy or create a new one.

This section contains the following topics:

- [General Tab \(Connection Profiles\)](#), page 31-10
- [AAA Tab \(Connection Profiles\)](#), page 31-13
- [Secondary AAA Tab \(Connection Profiles\)](#), page 31-17
- [IPSec Tab \(Connection Profiles\)](#), page 31-19
- [SSL Tab \(Connection Profiles\)](#), page 31-22

## Supported CLIs in Remote Access VPN Multi-Context Mode - Connection Profiles

The following CLIs are supported for ASA 9.5(2) for Connection Profiles for remote access VPN in multiple context mode. These CLIs are supported in Admin and User Context for Tunnel-Group.

DefaultWEBVPNGroup is the default Connection Profile. DefaultRAGroup is not supported in ASA 9.5(2) remote access VPN Multiple Context mode.

**Note**

For the configurations that are not supported, Security Manager displays a warning message that you can ignore. No delta will be generated.

- Type remote-access
- General-attributes
  - Accounting-server-group
  - Address-pool
  - Annotation
  - Authenticated-session-username
  - Authentication-attr-from-server
  - Authentication-server-group
  - Authorization-required
  - Authorization-server-group
  - Default-group-policy
  - Dhcp-server
  - Exit
  - Ipv6-address-pool
  - Nat-assigned-to-public-ip

  - Authentication
  - Exit
  - Group-alias
  - Group-url
  - No
  - Radius-reject-message

## General Tab (Connection Profiles)

Use the General tab of the Connection Profiles dialog box to configure the basic properties for a VPN Connection Profile policy. These properties are used in remote access IPsec and SSL VPNs and site-to-site Easy VPN topologies.

The General Tab is supported in ASA 9.5(2) Remote Access VPN in Multiple Context mode.

### Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see [Connection Profiles Page, page 31-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **General** tab if necessary.

- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see [Connection Profiles Page](#), page 31-8). Click the **General** tab if necessary.

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Profile Name          | The name of the connection profile (tunnel group).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Group Policy                     | If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server.<br><br>Click <b>Select</b> to select an existing object or to create a new one.                                                                                                                                                                                                                                                                        |
| <b>Client Address Assignment</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DHCP Servers                     | The DHCP servers to be used for client address assignments. The servers are used in the order listed.<br><br>Enter the IP addresses of the DHCP servers or the names of network/host policy objects that define the DHCP server addresses. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.                                                                                                                                                                                                                                                                        |
| Global IPv4 Address Pool         | The address pools from which IPv4 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.<br><br>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas. |

**Table 31-2 Connection Profile General Tab (continued)**

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global IPv6 Address Pool               | <p>The address pools from which IPv6 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running version 9.0 or later. Address pools are entered as a range of addresses, for example, fe80::60/5 4, where fe80::60/5 is the IPv6 address and prefix length, and 4 is the count (number of addresses). The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>                                    |
| Interface-Specific Address Pools table | <p>If you want to configure separate IP address pools for specific interfaces, so that clients connecting through that interface use a pool different from the global pool, add the interface to this table and configure the separate pool. Any interface not listed here uses the global pool. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running version 9.0 or later. Therefore, you see an additional column for IPv6 address pool.</p> <ul style="list-style-type: none"> <li>To add an interface-specific address pool, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Interface Specific Client Address Pools Dialog Box, page 31-12</a></li> <li>To edit an interface pool, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface, select it and click the <b>Delete Row</b> button.</li> </ul> |

### Add/Edit Interface Specific Client Address Pools Dialog Box

Use the Add/Edit Interface Specific Client Address Pools dialog box to configure interface-specific client address pools for your connection profile policy.

#### Navigation Path

Open the General tab in the Connection Profiles dialog box (see [General Tab \(Connection Profiles\), page 31-10](#)), then click **Add Row** below the Interface-Specific Address Pools table, or select a row in the table and click **Edit Row**.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface         | The interface to which you are assigning an address pool. Enter the interface name or the name of an interface role object, or click <b>Select</b> to select an interface or object or to create a new object.                                                                                                                                                                                                                                                                                  |
| IPv4 Address Pool | The IPv4 address pool to assign to the interface. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the version 9.0 or later. Address pools are specified using the starting and ending IP addresses of the pool, for example, 10.100.10.2-10.100.10.254. You can either type in the IP address range, or use a network/host object that specifies an address range. Click <b>Select</b> to select a network/host object or to create a new object. |
| IPv6 Address Pool | The IPv6 address pool to assign to the interface. IPv6 address pools are specified using the IPv6 address along with the prefix length and followed by the count, where count refer to the number of addresses in the pool. You can either type in the IP address range, or use a network/host object that specifies an address range. Click <b>Select</b> to select a network/host object or to create a new object.                                                                           |

**AAA Tab (Connection Profiles)**

Use the AAA tab of the Connection Profile dialog box to configure the AAA authentication parameters for a connection profile policy.

For AAA, the Distinguished Name Authorization Settings policy is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

However, beginning with Security Manager version 4.12, this policy is supported for ASA 9.6(2) Remote Access VPN in Multi-context mode. The supported CLIs for the Admin and User context are:

- Tunnel-group General-attributes
  - Secondary-username-from-certificate
  - Username-from-certificate

**Navigation Path**

- Remote Access VPNs—From the Connection Profiles page (see [Connection Profiles Page, page 31-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **AAA** tab.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see [Connection Profiles Page, page 31-8](#)). Click the **AAA** tab.

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Method                                     | <p>Whether to authenticate connections using AAA, certificates, or both, Multiple Certificate, AAA and Multiple Certificate, and SAML. If you select Certificate, many of the options on the dialog box are disabled as the required details are obtained from the certificate.</p> <p>Beginning with version 4.10, Security Manager enables you to select SAML Identity Provider as an authentication method. This is to enable SAML Service Provider for the current tunnel group. SAML Identity Provider will not be used until they are applied in a tunnel group. The SAML authentication is a mutual exclusion authentication method. See <a href="#">Configuring SAML Identity Provider, page 6-98</a> for more information.</p> <p>Beginning with version 4.13, Security Manager enables you to select Multiple Certificate, or AAA &amp; Multiple Certificate as an authentication method. This method is enabled to support the Multiple certificate authentication feature of ASA 9.7.1 devices. If you select this method for a ASA device earlier to 9.7.1 release, validation error message appears. For more information, see <a href="#">Multiple Certificate Authentication Support, page 9-4</a>.</p> |
| Authentication Server Group                               | <p>The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>If you want to use different authentication server groups based on the interface to which the client connects, configure the server groups in the Interface-Specific Authentication Server Groups table at the bottom of this tab (described below).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Use LOCAL if Server Group Fails                           | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Authorization Server Group                                | The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Users must exist in the authorization database to connect | Whether to require that the username of the client must exist in the authorization database to allow a successful connection. If the username does not exist in the authorization database, then the connection is denied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Accounting Server Group                                   | The name of the accounting server group. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Strip Realm from Username<br>Strip Group from Username    | <p>Whether to remove the realm or group name from the username before passing the username on to the AAA server. A realm is an administrative domain. Enabling these options allows the authentication to be based on the username alone.</p> <p>You can enable any combination of these options. However, you must select both check boxes if your server cannot parse delimiters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Interface-Specific Authentication Server Groups table | <p>If you want to configure separate authentication server groups for specific interfaces, so that clients connecting through that interface use a server group different from the global group, add the interface to this table and configure the separate group. Any interface not listed here uses the global authentication server group. The table shows the server group and whether you are falling back to local authentication if the server group is not available.</p> <ul style="list-style-type: none"> <li>To add an interface-specific authentication group to the list, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Interface Specific Authentication Server Groups Dialog Box</a>, page 31-16.</li> <li>To edit an interface setting, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

### Add/Edit Interface Specific Authentication Server Groups Dialog Box

Use the Add/Edit Interface Specific Authentication Server Groups dialog boxes to configure interface-specific authentication for your connection profile policy. This setting overrides the global authentication server group settings if the client connects to the specified interface.

If you are configuring the secondary AAA server for an SSL VPN on an ASA device, the settings are specifically used for the secondary set of credentials that the user enters; this is reflected in the name of the dialog box.

#### Navigation Path

Open the AAA or Secondary AAA tabs in the Connection Profiles dialog box (see [AAA Tab \(Connection Profiles\)](#), page 31-13 or [Secondary AAA Tab \(Connection Profiles\)](#), page 31-17), then click **Add Row** below the Interface-Specific Address Pools table, or select a row in the table and click **Edit Row**.

| Server Group                                                                                                    | The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.<br><br>When you are configuring secondary AAA, this group is used specifically for the second credentials. You can specify different server groups for primary and secondary credentials. |
| Use LOCAL if Server Group Fails                                                                                 | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                                                                                                                                                                                                            |
| Use Primary Username<br>(Secondary authentication only; remote access SSL or IKEv2 IPsec VPN on ASA 8.2+ only.) | Whether to use the same username for the secondary credentials that was used for the primary credentials. If you select this option, after users authenticate with their primary credentials, they are prompted for the secondary password only. If you do not select this option, the secondary prompt requires both a username and password.                                                                              |

## Secondary AAA Tab (Connection Profiles)

Use the Secondary AAA tab to configure the secondary AAA authentication parameters for a remote access SSL VPN connection profile policy for use with ASA 8.2+ devices, or a remote access IKEv2 IPsec VPN connection profile policy for use with an ASA 8.4(1)+ device. These settings do not apply to remote access IKEv1 IPsec VPNs or Easy VPN topologies or to other device types.

### Navigation Path

Remote Access VPNs only—From the Connection Profiles page (see [Connection Profiles Page, page 31-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **Secondary AAA** tab.

|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use LOCAL if Server Group Fails                         | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Use Primary Username for Secondary Authentication       | Whether to use the same username for the secondary credentials that was used for the primary credentials. If you select this option, after users authenticate with their primary credentials, they are prompted for the secondary password only. If you do not select this option, the secondary prompt requires both a username and password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Username for Session                                    | The username that the software will use for the user session, either the primary or secondary name. If you prompt for the primary name only, select primary.<br><br><b>Note</b> By default, if there is more than one username, AnyConnect remembers both usernames between sessions. In addition, the head-end device might offer a feature to allow for administrative control over whether the client remembers both or neither usernames.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authorization Authentication Server                     | The server to use for authorization, either the primary authentication server (defined on the AAA tab) or the secondary authentication server configured on this tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Distinguished Name (DN) Secondary Authorization Setting | How you want to use the distinguished name for authorization. A distinguished name (DN) is a unique identification, made up of individual fields, that can be used as the identifier when matching users to a tunnel group. DN rules are used for enhanced certificate authentication. Select from the following options to determine how the DN is used during authorization: <ul style="list-style-type: none"> <li>• <b>Use Entire DN as the Username</b>—Use the entire DN; do not focus on any one field.</li> <li>• <b>Specify Individual DN fields as the Username</b>—Focus on specific fields. Select a primary field, and optionally, a secondary field. The default is to use only the user identification (UID) field.</li> <li>• <b>Use Script to Select Username</b>—Beginning with version 4.7, Security Manager enables you to define a script to use in mapping the username from the certificate. Select the script that you have defined from the drop-down list. For more information, see <a href="#">Add/Edit Scripts Dialog Box, page 31-34</a>.</li> </ul> <b>Note</b> The Distinguished Name (DN) Secondary Authorization Settings policy is supported from Security Manager version 4.12 for ASA devices running version 9.6(2) in Multi-context mode. The supported CLIs for the Admin and User context are: <ul style="list-style-type: none"> <li>• Tunnel-group General-attributes <ul style="list-style-type: none"> <li>• Secondary-username-from-certificate</li> <li>• Username-from-certificate</li> </ul> </li> </ul> |

| Secondary Interface-Specific Authentication Server Groups table | <p>If you want to configure separate secondary authentication server groups for specific interfaces, so that clients connecting through that interface use a server group different from the global group, add the interface to this table and configure the separate group. Any interface not listed here uses the global authentication server group. The table shows the server group and whether you are falling back to local authentication if the server group is not available.</p> <ul style="list-style-type: none"> <li>To add a secondary interface-specific authentication group to the list, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Interface Specific Authentication Server Groups Dialog Box</a>, page 31-16.</li> <li>To edit an interface setting, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

## IPSec Tab (Connection Profiles)

Use the IPSec tab of the Connection Profiles page to specify IPSec and IKE parameters for the connection policy.

Beginning with version 4.8, Security Manager supports VPN connectivity via standards-based, third-party, IKEv2 remote-access clients (in addition to AnyConnect). Authentication support includes preshared keys, certificates, and user authentication via the Extensible Authentication Protocol (EAP).

IPSec is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. Beginning with Cisco Security Manager version 4.17, IPSec is supported from ASA 9.9(2) or later multi-context devices. However, the following attributes under **Connection Profile > IPSec** tab is not supported for ASA 9.9(2) or later multi-context devices:

- Enable IKEv2 Mobike RRC
- Client Software Update Table

### Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see [Connection Profiles Page](#), page 31-8), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **IPSec** tab.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see [Connection Profiles Page](#), page 31-8). Click the **IPSec** tab.

| Trustpoint Name                                   | <p>The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv2 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate.</p> <p>Click <b>Select</b> to select the object from a list or to create a new object.</p> <p><b>Note</b> Local authentication must be using certificate if you select EAP for remote authentication.</p>                                                                                                   |
| Enable IKEv2 Mobike RRC                           | <p>Select to enable Return Routability checking for dynamic IP address changes in IKE/IPSEC security associations on which mobike is enabled. By default, Mobike RRC is disabled.</p> <p><b>Note</b> You can enable Return Routability Checking for dynamic IP address changes, only for ASA 9.8.1 and later.</p> <p><b>Note</b> This option is not supported for ASA 9.9(2) or later multi-context devices.</p>                                                                                                                                                                                                                                               |
| Enable IKEv2 RSA Signature SHA-1                  | <p>Select to enable RSA signature SHA-1 for IKEv2 authentication. By default, RSA Signature SHA-1 is disabled.</p> <p><b>Note</b> This option is supported from Cisco Security Manager 4.19 and ASA 9.12(1) or later devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IKE Peer ID Validation                            | <p>Select whether IKE peer ID validation is ignored (Do not check), required, or checked only if supported by a certificate. During IKE negotiations, peers must identify themselves to one another.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Sending Certificate Chain                  | <p>Whether to enable the sending of the certificate chain for authorization. A certificate chain includes the root CA certificate, identity certificate, and key pair.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Password Update with RADIUS Authentication | <p>Whether to enable passwords to be updated with the RADIUS authentication protocol. For more information, see <a href="#">Supported AAA Server Types, page 6-28</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ISAKMP Keepalive                                  | <p>Whether to monitor ISAKMP keepalive. If you select the <b>Monitor Keepalive</b> option, you can configure IKE keepalive as the default failover and routing mechanism. Enter the following parameters:</p> <ul style="list-style-type: none"> <li>• <b>Confidence Interval</b>—The number of seconds that a device waits between sending IKE keepalive packets.</li> <li>• <b>Retry Interval</b>—The number of seconds a device waits between attempts to establish an IKE connection with the remote peer. The default is 2 seconds.</li> </ul> <p>For more information, see <a href="#">Configuring VPN Global ISAKMP/IPsec Settings, page 26-33</a>.</p> |

**Table 31-7** Connection Profiles IPsec Tab (continued)

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client Software Update table | <p>The VPN client revision level and URLs for client platforms. You can configure different revision levels for All Windows Platforms, Windows 95/98/ME, Windows NT4.0/2000/XP, or the VPN3002 Hardware Client.</p> <p>To configure the client for a platform, select it, click the <b>Edit Row</b> button, and fill in the <a href="#">IPsec Client Software Update Dialog Box, page 31-22</a>.</p> <p><b>Note</b> This option is not supported for ASA 9.9(2) or later multi-context devices.</p> |

### IPsec Client Software Update Dialog Box

Use the IPsec Client Software Update dialog box to configure the specific revision level and image URL of a VPN client.

#### Navigation Path

Open the IPsec tab in the Connection Profiles dialog box (see [IPsec Tab \(Connection Profiles\), page 31-19](#)), select a client type from the Client Software Update table, then click **Edit Row**.

#### Field Reference

**Table 31-8** IPsec Client Software Update Dialog Box

| Element          | Description                       |
|------------------|-----------------------------------|
| Client Type      | Type of client being modified.    |
| Client Revisions | Revision level of the client.     |
| Image URL        | URL of the client software image. |

### SSL Tab (Connection Profiles)

Use the SSL tab of the Connection Profile dialog box to configure the WINS servers for the connection profile policy, select a customized look and feel for the SSL VPN end-user logon web page, DHCP servers to be used for client address assignment, and to establish an association between an interface and client IP address pools. Some items, such as connection profile aliases, apply to remote access IKEv2 IPsec VPNs, but otherwise these settings do not apply to remote access IKEv1 IPsec VPNs or Easy VPN topologies.

The following profiles are supported for the SSL tab in ASA 9.5(2) Remote Access VPN in Multi-context mode.

- Radius-Reject-Message
- Connection alias
- Group-url
- Group-alias

**Navigation Path**

Remote Access VPNs only—From the Connection Profiles page (see [Connection Profiles Page, page 31-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **SSL** tab.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WINS Servers List | <p>The name of the WINS (Windows Internet Naming Server) servers list to use for CIFS name resolution. Click <b>Select</b> to select the WINS servers list policy object or to create a new object.</p> <p>SSL VPN uses the CIFS protocol to access or share files on remote systems. When you attempt a file-sharing connection to a Windows computer by using its computer name, the file server you specify corresponds to a specific WINS server name that identifies a resource on the network.</p> <p>A WINS servers list defines a list of WINS servers, which are used to translate Windows file server names to IP addresses. The security appliance queries the WINS servers to map WINS names to IP addresses. You must configure at least one, and up to three WINS servers for redundancy. The security appliance uses the first server on the list for WINS/CIFS name resolution. If the query fails, it uses the next server.</p> |
| DNS Group         | <p>The DNS group to use for the SSL VPN tunnel group. The DNS group resolves the hostname to the appropriate DNS server for the tunnel group. Select the desired group from the list; the DefaultDNS group is the default group that is always available on the device.</p> <p><b>Tip</b> The DNS groups are defined in the <b>Platform &gt; Device Admin &gt; Server Access &gt; DNS</b> policy. Use the DNS policy to change the servers defined in a group or to add or remove groups. See <a href="#">DNS Page, page 52-14</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 31-9 Connection Profile SSL Tab (continued)

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Portal Page Customization                   | <p>The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. This profile defines the appearance of the portal page that allows the remote user access to all resources available on the SSL VPN. Click <b>Select</b> to select the object or to create a new object.</p> <p><b>Note</b> You can set up different login windows for different groups by using a combination of customization profiles and groups. For example, assuming that you had created a customization profile called salesgui, you can create an SSL VPN group called sales that uses that customization profile. You would then specify the SSL VPN customization object in the group policy object on the SSL VPN &gt; Settings tab; see <a href="#">ASA Group Policies SSL VPN Settings, page 34-25</a>.</p>                                                                                                                                                                                 |
| SAML Identity Provider                      | Select the SAML Identity Provider. SAML Identity Provider will not be used until it is applied in a tunnel group. See <a href="#">Configuring SAML Identity Provider, page 6-98</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Override SVC Download<br>(ASA 8.0(2)+ only) | Whether you want clientless users logging in under specific tunnel groups to not have to wait for the download prompt to expire before being presented with the clientless SSL VPN home page. Instead, these users are immediately presented with the clientless SSL VPN home page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Reject Radius Message<br>(ASA 8.0(2)+ only) | Whether you want to display to remote users a RADIUS message about their authentication failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Connection Aliases table                    | <p>A list of alternate names by which the tunnel group can be referred to. The status indicates whether the name is enabled for use or disabled (cannot be used).</p> <p>A group alias creates one or more alternate names by which a user can refer to a tunnel group. This feature is useful when the same group is known by several common names (such as “Devtest” and “QA”). If you want the actual name of the tunnel group to appear on this list, you must specify it as an alias. The group alias that you specify here appears on the login page. Each tunnel group can have multiple aliases or no alias.</p> <ul style="list-style-type: none"> <li>To add an alias, click the <b>Add Row (+)</b> button beneath the table and fill in the <a href="#">Add/Edit Connection Alias Dialog Box, page 31-25</a>.</li> <li>To edit an alias, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>To delete an alias, select it and click the <b>Delete Row (trash can)</b> button.</li> </ul> |

**Table 31-9 Connection Profile SSL Tab (continued)**

| Element                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group URLs table                                                                          | <p>A list of URLs associated with the tunnel group connection profile. The status indicates whether the URL is enabled for use. When enabled, the user can use the URL, which eliminates the need to select a group during login.</p> <p>You can configure multiple URLs (or no URLs) for a tunnel group. Each URL can be enabled or disabled individually. You must use a separate specification for each URL, specifying the entire URL using either the HTTP or HTTPS protocol.</p> <ul style="list-style-type: none"> <li>To add a URL, click the <b>Add Row (+)</b> button beneath the table and fill in the <a href="#">Add/Edit Connection URL Dialog Box</a>, page 31-26.</li> <li>To edit a URL, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>To delete a URL, select it and click the <b>Delete Row (trash can)</b> button.</li> </ul> |
| Default Citrix Client Profile<br>(ASA 9.1(4)+ only)                                       | <p>Whether this connection profile should be the default connection profile to use for Citrix clients when no specific tunnel group is identified during tunnel negotiation.</p> <p><b>Note</b> Only one connection profile can be configured as the Default Citrix Client Profile. If you try to configure a connection profile as the Default Citrix Client Profile when another profile is already configured as such, you will receive a warning message. If you continue with the operation, the selected connection profile will be made the Default Citrix Client Profile and the other connection profile will be deselected as the Default Citrix Client Profile.</p>                                                                                                                                                                                        |
| Disable CSD<br>(ASA 8.2(0)+ only)<br>Both Clientless and<br>AnyConnect<br>AnyConnect only | <p>Whether to disable Cisco Secure Desktop (CSD) for this connection profile. Security Manager supports this feature on all devices that are running ASA software version 8.2(0) and later.</p> <p><b>Note</b> If you choose to disable CSD, by default Security Manager selects the option for both SSL Clientless VPN and AnyConnect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Add/Edit Connection Alias Dialog Box

Use the Add/Edit Connection Alias dialog box to create or edit a connection alias for an SSL or IKEv2 IPsec VPN connection profile. Specifying the connection alias creates one or more alternate names by which the user can refer to a tunnel group.

#### Navigation Path

Open the SSL tab in the Connection Profiles dialog box (see [SSL Tab \(Connection Profiles\)](#), page 31-22), and click **Add Row** beneath the Connection Alias table, or select an alias from the table and click **Edit Row**.

**Field Reference****Table 31-10 Add/Edit Connection Alias Dialog Box**

| Element          | Description                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled          | Whether to enable the connection alias. You must enable the alias for users to use it.                                                     |
| Connection Alias | The alternative name for the connection profile.<br>The connection alias that you specify here appears in a list on the user's login page. |

**Add/Edit Connection URL Dialog Box**

Use this dialog box to specify incoming URLs for the tunnel group. If a connection URL is enabled in a tunnel group, when the user connects using that URL, the security appliance selects the associated tunnel group and presents the user with only the username and password fields in the login window.

**Tips**

- You can configure multiple URLs or addresses (or none) for a group. Each URL or address can be enabled or disabled individually.
- You cannot associate the same URL or address with multiple groups. The security appliance verifies the uniqueness of the URL or address before accepting the URL or address for a tunnel group.

**Navigation Path**

Open the SSL tab in the Connection Profiles dialog box (see [SSL Tab \(Connection Profiles\)](#), page 31-22), and click **Add Row** beneath the Group URLs table, or select a URL from the table and click **Edit Row**.

**Field Reference****Table 31-11 Add/Edit Connection URL Dialog Box**

| Element        | Description                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| Enabled        | Whether to enable the connection alias. You must enable the alias for users to use it.                            |
| Connection URL | Select a protocol ( <b>http</b> or <b>https</b> ) from the list, and specify the incoming URL for the connection. |

## Configuring Group Policies for Remote Access VPNs

In the Group Policies page, you can view the user group policies defined for your ASA remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For information on creating connection profiles, see [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7.

For more information about group policies, see [Understanding Group Policies \(ASA\)](#), page 31-27.

**Tip**

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

Each row in the table represents an ASA group policy object, displaying the name of the policy object assigned to the remote access VPN connection profile, whether it is stored on the ASA device itself (Internal) or on a AAA server (External), and whether the group is for IKEv1 (IPsec), IKEv2 (IPsec), SSL, or all types of VPN. For external groups, the protocol is unknown and listed as N/A.

- To add an ASA group policy object, click the **Add Row** button. This opens an object selector, from which you can select an existing policy object or click the **Create** button to create a new object. For more information about creating group policies, see [Creating Group Policies \(ASA, PIX 7.0+\)](#), page 31-28.

**Note**

You cannot create more than one group policy that includes DfltGrpPolicy in its name. DfltGrpPolicy is the default policy defined on the device; if Security Manager discovers the group during remote access policy discovery, the group appears in the list under the name *<device\_display\_name>DfltGrpPolicy*. When you deploy the configuration to the device, the display name prefix is removed so that DfltGrpPolicy is updated correctly. For more information, see [Discovering Remote Access VPN Policies](#), page 30-12.

- To edit an object, select it and click the **Edit Row** button to open the [ASA Group Policies Dialog Box](#), page 34-1.
- To delete an object from the policy, select it and click the **Delete Row** button. The associated policy objects are not deleted, they are only removed from this policy.

**Note**

You cannot delete the default group policy.

#### Navigation Path

- (Device view) Select an ASA device, then select **Remote Access VPN > Group Policies** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Group Policies (ASA)** from the Policy selector. Select an existing policy or create a new one.

## Understanding Group Policies (ASA)

When you configure a remote access IPsec or SSL VPN connection, you must create user groups to which remote clients will belong. A user group policy is a set of user-oriented attribute/value pairs for remote access VPN connections that are stored either internally (locally) on the device or externally on an AAA server. The connection profile uses a user group policy that sets terms for user connections after the connection is established. Group policies let you apply whole sets of attributes to a user or a group of users, rather than having to specify each attribute individually for each user.

**Tip**

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

An ASA user group comprises the following attributes:

- Group policy source—Identifies whether the user group’s attributes and values are stored internally (locally) on the security appliance or externally on an AAA server. If the user group is an external type, no other settings need to be configured for it. For more information, see [ASA Group Policies Dialog Box, page 34-1](#).
- Client Configuration settings, which specify the Cisco client parameters for the user group in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies Client Configuration Settings, page 34-6](#).
- Client Firewall Attributes, which configure the firewall settings for VPN clients in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies Client Firewall Attributes, page 34-7](#).
- Hardware Client Attributes, which configure the VPN 3002 Hardware Client settings in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies Hardware Client Attributes, page 34-9](#).
- IPsec settings, which specify tunneling protocols, filters, connection settings, and servers for the user group in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies IPsec Settings, page 34-10](#).
- Clientless settings, which configure the Clientless mode of access to the corporate network in an SSL VPN, for the ASA user group. For more information, see [ASA Group Policies SSL VPN Clientless Settings, page 34-12](#).
- Full Client settings, which configure the Full Client mode of access to the corporate network in an SSL VPN, for the ASA user group. For more information, see [ASA Group Policies SSL VPN Full Client Settings, page 34-19](#).
- General settings that are required for Clientless/Port Forwarding in an SSL VPN. For more information, see [ASA Group Policies SSL VPN Settings, page 34-25](#).
- DNS/WINS settings that define the DNS and WINS servers and the domain name that should be pushed to remote clients associated with the ASA user group. For more information, see [ASA Group Policies DNS/WINS Settings, page 34-30](#).
- Split tunneling that lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. For more information, see [ASA Group Policies Split Tunneling Settings, page 34-31](#).
- Remote access or SSL VPN session connection settings for the ASA user group. For more information, see [ASA Group Policies Connection Settings, page 34-33](#).

## Creating Group Policies (ASA, PIX 7.0+)

#### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Group Policies page to create group policies for ASA or PIX 7.0+ devices used in remote access IPsec VPNs, or ASA devices used in remote access SSL VPNs. For information about group policies, see:

- [Understanding Group Policies \(ASA\), page 31-27](#)
- [Configuring Group Policies for Remote Access VPNs, page 31-26](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA or PIX 7.0+ device selected, select **Remote Access VPN > Group Policies** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Group Policies (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- The Group Policies page opens. The table lists the existing group policies, whether they are defined internally on the device or externally on a AAA server, and the protocol for the group: IKEv1 (IPsec), IKEv2 (IPsec), or SSL.
- Step 2** Click **Add Row (+)** to open a dialog box from which you can select a user group from a list of predefined ASA user group objects, or create new ones if necessary. To create a new group, click the **Create (+)** button in the dialog box.
- Step 3** Select the required ASA user group from the list and click **OK**. If the required group already exists, you are finished.
- If the required ASA user group does not exist, create it by clicking **Create (+)**. The Add ASA User Group dialog box appears, displaying a list of settings that you can configure for the ASA user group object. For a description of the elements on this dialog box, see [ASA Group Policies Dialog Box, page 34-1](#).
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Select whether to store the ASA user group's attributes and values locally on the device, or on an external server.

---

**Note** If you selected to store the ASA user group's attributes on an external server, you do not need to configure any Technology settings. After you specify the AAA server group that will be used for authentication and a password to the AAA server, click **OK** and then select the group in the object selector and click **OK** to add it to the policy.

---

- Step 6** If you selected to store the ASA user group's attributes locally on the device, select the type of VPN for which you are creating the ASA user group from the **Technology** list:
- Easy VPN/IPSec IKEv1—For remote access IPsec VPNs that use IKE version 1 negotiations.
  - Easy VPN/IPSec IKEv2—(ASA only.) For remote access IPsec VPNs that use IKE version 2 negotiations.
  - SSL Clientless—(ASA only.) For SSL VPNs, all access modes (not just clientless).
- Step 7** To configure the user group for Easy VPN/IPSec IKEv1 and Easy VPN/IPSec IKEv2, from the Easy VPN/IPSec VPN folder in the Settings pane:
- Select **Client Configuration** to configure the Cisco client parameters. For a description of these settings, see [ASA Group Policies Client Configuration Settings, page 34-6](#).
  - Select **Client Firewall Attributes** to configure the firewall settings for VPN clients. For a description of these settings, see [ASA Group Policies Client Firewall Attributes, page 34-7](#).
  - Select **Hardware Client Attributes** to configure the VPN 3002 Hardware Client settings. For a description of these settings, see [ASA Group Policies Hardware Client Attributes, page 34-9](#).
  - Select **IPsec** to specify tunneling protocols, filters, connection settings, and servers. For a description of these settings, see [ASA Group Policies IPsec Settings, page 34-10](#).

- Step 8** To configure the user group for an SSL VPN, from the SSL VPN folder in the Settings pane:
- Select **Clientless** to configure the Clientless mode of access to the corporate network in an SSL VPN. For a description of these settings, see [ASA Group Policies SSL VPN Clientless Settings, page 34-12](#).
  - Select **Full Client** to configure the Full Client mode of access to the corporate network in an SSL VPN. For a description of these settings, see [ASA Group Policies SSL VPN Full Client Settings, page 34-19](#).
  - Select **Settings** to configure the general settings that are required for clientless and thin client (port forwarding) access modes in an SSL VPN. For a description of these settings, see [ASA Group Policies SSL VPN Settings, page 34-25](#).
- Step 9** Specify the following settings for an ASA user group in an Easy VPN/IPSec IKEv1 or IKEv2 VPN and SSL VPN configuration, in the Settings pane:
- Select **DNS/WINS** to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the ASA user group. For a description of these settings, see [ASA Group Policies DNS/WINS Settings, page 34-30](#).
  - Select **Split Tunneling** to allow a remote client to conditionally direct encrypted packets through a secure tunnel to the central site and simultaneously allow clear text tunnels to the Internet through a network interface. For a description of these settings, see [ASA Group Policies Split Tunneling Settings, page 34-31](#).
  - Select **Connection Settings** to configure the SSL VPN connection settings for the ASA user group, such as the session and idle timeouts, including the banner text. For a description of these settings, see [ASA Group Policies Connection Settings, page 34-33](#).
- Step 10** Click **OK**.
- Step 11** Select the ASA user group from the list and click **OK**.
- 

## Understanding SSL VPN Server Verification (ASA)

When connecting to a remote SSL-enabled server through clientless SSL VPN, it is important to know that you can trust the remote server, and that it is in fact the server you are trying to connect to. ASA 9.0 introduces support for SSL server certificate verification against a list of trusted certificate authority (CA) certificates for clientless SSL VPN.

When you connect to a remote server via a web browser using the HTTPS protocol, the server will provide a digital certificate signed by a CA to identify itself. Web browsers ship with a collection of CA certificates which are used to verify the validity of the server certificate. This is a form of public key infrastructure (PKI).

Just as browsers provide certificate management facilities, so does the ASA in the form of trusted certificate pool management facility: trustpools. This can be thought of as a special case of trustpoint representing multiple known CA certificates. The ASA includes a default bundle of certificates, similar to that provided with web browsers, but it is inactive until activated by the administrator.

### Note

If you are already familiar with trustpools from Cisco IOS then you should be aware that the ASA version is similar, but not identical.

For more information on managing trusted certificates, see the following topics:

- [Configuring SSL VPN Server Verification \(ASA\)](#), page 31-74
- [Configuring Trusted Pool Settings \(ASA\)](#), page 31-31
- [Using the Trustpool Manager](#), page 31-32

## Configuring Trusted Pool Settings (ASA)

Use the Trusted Pool Settings page to configure options for certificate revocation. You can also launch the Trustpool Manager.

### Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > Trusted Pool** from the Policy selector.

### Related Topics

- [Configuring SSL VPN Server Verification \(ASA\)](#), page 31-74
- [Using the Trustpool Manager](#), page 31-324

The default value is 60 minutes.</li> <li>• <b>Enforce next CRL update</b>—Whether the ASA should enforce the next CRL update.</li> </ul>                                                                                                                                                                                                                                  |

Table 31-12 Trusted Pool Page (continued)

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate Expiration Alerts | <p>Beginning with version 4.9, Security Manager enables checking all CA and ID certificates in the trust points for expiration once every 24 hours. If a certificate is nearing expiration, a syslog will be issued as an alert. You can configure the reminder and recurrence intervals. This feature is supported only in devices running ASA software version 9.4(1) or later.</p> <p><b>Begin</b>—Enter the number of days before the expiration in which the first alert will be sent. The range is 1 to 90 days. By default, reminders will start at 60 days prior to expiration.</p> <p><b>Repeat</b>—Enter the frequency, in number of days, at which the alert will be repeated if the certificate is not renewed. The range is 1 to 14 days. By default reminders will be sent every 7 days.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Automatic Import              | <p>Beginning with version 4.10, Security Manager enables automatic import of Trustpool certificate bundle. When you enable automatic import, you can configure the URL that the ASA will use to download and import the Trustpool certificate bundle. This feature is supported only in devices running ASA software version 9.5(2) or later.</p> <p>Beginning with version 4.13, Security Manager provides source interface option that ASA can use to identify the destination URL. This feature is not supported for ASA versions lower to 9.7.1.</p> <p><b>Interface</b>—Click the <b>Select</b> button and choose the interface. If the interface configured is management-only, the destination URL is routed through management VRF. For non-management interface, the URL is routed through data VRF. If interface is not specified, both the routing table of the management and data VRF are polled to identify the route to reach the URL.</p> <p><b>Import from a URL</b>—Enter the URL from which the ASA has to download the Trustpool certificate bundle.</p> <p><b>Download Time</b>—Enter the time at which the ASA will download the certificate bundle. The import takes place daily at the time specified here.</p> <p><b>Note</b> The default value of the URL is <a href="http://www.cisco.com/security/pki/trs/ios_core.p7b">http://www.cisco.com/security/pki/trs/ios_core.p7b</a> and the default value of the download time is 22:00:00.</p> |
| Launch Trustpool Manager      | <p>Launches the Trustpool Manager, which is used to manage Trustpool certificates. You can use the Trustpool Manager to perform the following:</p> <p>For more information, see <a href="#">Using the Trustpool Manager, page 31-32</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Using the Trustpool Manager

Use the Trustpool Manager to manage the certificates that are included in the trustpool. The Trustpool Manager provides the following functions:

- Updating the trustpool

- Importing a certificate bundle
- Exporting a certificate bundle
- Removing certificates from the trustpool

### Navigation Path

(Device View only) Select an ASA device, select **Remote Access VPN > Trusted Pool** from the Policy selector, and then click **Launch Trustpool Manager**.

### Updating the Trustpool

The trustpool should be updated if either of the following conditions exists:

- Any certificate in the trustpool is due to expire or has been re-issued.
- The published CA certificate bundle contains additional certificates that are required by a specific application.

To update the certificates in the trustpool, click **Refresh Certificates**.

### Importing a Certificate Bundle

You can import individual certificates or bundles of certificates from a variety of locations in one of the following formats:

- x509 certificates in DER format wrapped in a pkcs7 structure
- a file of concatenated x509 certificates in PEM format (complete with PEM header)

To import a certificate or bundle:

1. Click **Import Bundle**.
2. Select the location of the bundle:
  - **Import from Cisco published signed root file distribution**—Select this option to import from the published distribution site.
  - **Import from a URL**—If the bundle is hosted on a server, select this option, select the protocol from the list, and enter the URL in the box.
  - **Bundle file on device**—If the bundle is stored on the ASA flash file system, select this option and then enter the path to the bundle.
  - **Select bundle file**—If the bundle is stored on your machine, click Import from a file, then click Browse Local Files and navigate to the bundle.
3. Specify the following import options:
  - **Clear all certificates before import**—Whether to clear the trustpool before importing the bundle.
  - **Continue to import the bundle if signature validation fails or can't be performed**—Whether to continue import if the signature can not be validated.
4. Click **Import**.

### Exporting a Certificate Bundle

When you have correctly configured the Trustpool you should export the pool. This will enable you to restore the Trustpool to this point, for example if you wish to remove a certificate that was added to the trustpool after the export. You can export the pool to the Security Manager server file system or your local file system.

To export the certificate bundle:

1. Click **Export Bundle**.
2. Click **Browse**.
3. Select the tab that corresponds to the file system you want to export to (local machine or Security Manager server).
4. Navigate to the folder where you want to save the trustpool.
5. Enter a unique memorable name for the trustpool in the File name box.
6. Click **Save**.

### Removing Certificates from the Trustpool

You can remove certificates from the trustpool using the following methods:

- To remove an individual certificate, select the certificate and click **Delete**.
- To remove all certificates that are not part of the default bundle, click **Clear Trustpool**.

#### Note

Before clearing the trustpool you should export the current trustpool so that you can restore your current settings if needed.

## Add/Edit Scripts Dialog Box

Use the Add/Edit Scripts dialog box to define a script to use in mapping the username from the certificate.

### Navigation Path

- (Device view) Select an ASA device, then select **Remote Access VPN > Username from Cert Scripts** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Username from Cert Scripts (ASA)** from the Policy selector. Select an existing policy or create a new one.

### Field Reference

**Table 31-13** Add/Edit Scripts Dialog Box

| Element                  | Description                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Script Name              | Specify the name of the script and use the script in the tunnel group AAA authentication and authorization. The script name may be different for authentication and authorization. You define the script here, and CLI uses the same script to perform this function. |
| Select Script Parameters | Specify the attributes and content of the script.                                                                                                                                                                                                                     |
| Value for Username       | Select an attribute from the drop-down list of standard DN attributes to use as the username (Subject DN).                                                                                                                                                            |

**Table 31-13 Add/Edit Scripts Dialog Box (continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No Filtering                    | Specify that you want to use the entire specified DN name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Filter by Substring             | Specify the Starting Index (the position in the string of the first character to match) and Ending Index (number of characters to search). If you choose this option, the starting index cannot be blank. If you leave the ending index blank, it defaults to -1, indicating that the entire string is searched for a match.                                                                                                                                                                                                                                                                                                        |
| Filter by Regular Expression    | Enter a regular expression to apply to the search in the Regular Expression field. Standard regular expression operators apply.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use Custom Script in LUA format | <p>Specify a custom script written in the LUA programming language to parse the search fields. Selecting this option makes available a field in which you can enter your custom LUA script.</p> <p>The following are examples of custom scripts in LUA format:</p> <ul style="list-style-type: none"> <li>"return findpattern(cert.subject.cn,"%a+")"</li> <li>local a,b,c;<br/>a,b,c = string.find( cert.subject.fulldn, 'cn=(.+),cn=Users');<br/>return c;</li> </ul> <p><b>Note</b> LUA is case-sensitive.</p> <p>The following table provides the attribute names and their descriptions that you can use in an LUA script.</p> |

**Table 31-14 Attributes in an LUA script**

| Attribute         | Description            |
|-------------------|------------------------|
| cert.subject.c    | Country                |
| cert.subject.cn   | Common Name            |
| cert.subject.dnq  | DN qualifier           |
| cert.subject.ea   | E-mail Address         |
| cert.subject.genq | Generational qualified |
| cert.subject.gn   | Given Name             |
| cert.subject.i    | Initials               |
| cert.subject.l    | Locality               |
| cert.subject.n    | Name                   |
| cert.subject.o    | Organization           |
| cert.subject.ou   | Organization Unit      |
| cert.subject.ser  | Subject Serial Number  |
| cert.subject.sn   | Surname                |
| cert.subject.sp   | State/Province         |
| cert.subject.t    | Title                  |

**Table 31-14** Attributes in an LUA script (continued)

| Attribute               | Description               |
|-------------------------|---------------------------|
| cert.subject.uid        | User ID                   |
| cert.issuer.c           | Country                   |
| cert.issuer.cn          | Common Name               |
| cert.issuer.dnq         | DN qualifier              |
| cert.issuer.ea          | E-mail Address            |
| cert.issuer.genq        | Generational qualified    |
| cert.issuer.gn          | Given Name                |
| cert.issuer.i           | Initials                  |
| cert.issuer.l           | Locality                  |
| cert.issuer.n           | Name                      |
| cert.issuer.o           | Organization              |
| cert.issuer.ou          | Organization Unit         |
| cert.issuer.ser         | Issuer Serial Number      |
| cert.issuer.sn          | Surname                   |
| cert.issuer.sp          | State/Province            |
| cert.issuer.t           | Title                     |
| cert.issuer.uid         | User ID                   |
| cert.serialnumber       | Certificate Serial Number |
| cert.subjectaltname.upn | User Principal Name       |

## Working with IPsec VPN Policies

Certain policies need to be configured for IPsec VPNs. The topics listed below explain these remote access IPsec VPN policies, with the exception of the IKE Proposal policy, which is explained in [Configuring an IKE Proposal, page 26-9](#).

This section contains the following topics:

- [Configuring Certificate to Connection Profile Map Policies \(ASA\), page 31-36](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 31-40](#)

## Configuring Certificate to Connection Profile Map Policies (ASA)

Certificate to connection profile map policies are used for enhanced certificate authentication on ASA devices in remote access IKEv1 IPsec VPNs. They are not used in remote access IKEv2 IPsec or SSL VPNs.

Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods.

To match user permission groups based on DN fields of the certificate, you define rules that specify the fields to match for a group and then enable each rule for that selected group. A connection profile must already exist in the configuration before you can create a rule for it.

This procedure describes how to configure a Certificate to Connection Profile Map policy for a remote client trying to connect to an ASA server device.

---

**Step 1** Do one of the following:

- (Device View) Select an ASA device; then select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Policies** from the Policy selector.
- (Policy View) Select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Policies** from the Policy Type selector. Select an existing policy or create a new one.

The Certificate to Connection Profile Map Policies page opens.

**Step 2** Select any, or all, of the following options to establish authentication and to determine to which connection profile (tunnel group) to map the client:

- **Use Configured Rules to Match a Certificate to a Group**—To use the rules defined in the Certificate to Connection Profile Maps > Rules policy. For information on configuring the rules, see [Configuring Certificate to Connection Profile Map Rules \(ASA\)](#), page 31-37.
  - **Use Certificate Organization Unit (OU) Field to Determine the Group**—To use the organizational unit (OU) field of the client certificate.
  - **Use IKE Identify to Determine the Group**—To use the IKE identity.
  - **Use Peer IP address to Determine the Group**—To use the peer's IP address.
  - **Use Group URL if Group URL and Certificate Map match different Connection profiles** is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- 

## Configuring Certificate to Connection Profile Map Rules (ASA)

If you configure certificate to connection profile maps, and select the option to **Use Configured Rules to Match a Certificate to a Group** (as explained in [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 31-36), you need to configure the rules required to match a user to a connection profile based on the user certificate.

To match user permission groups based on fields of the certificate, you define rules that specify the fields to match for a group and then enable each rule for that selected group. You must first define a connection profile (tunnel group) before you can create and map a rule to it.

This procedure describes how to configure the Certificate to Connection Profile Map rules and parameters for any remote client trying to connect to an ASA server device.

**Tip**

---

Certificate to connection profile map policies apply to remote access IKEv1 IPsec VPNs only. They do not apply to IKEv2 or SSL VPNs.

---

**Before You Begin**

- Make sure the connection profiles for which you are creating mapping rules has been configured on the device. See [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7.
- Make sure that you select **Use Configured Rules to Match a Certificate to a Group** in the Certificate to Connection Profile Maps Policies policy. See [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 31-36.

**Step 1** (Device view only) With an ASA device selected, select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector.

The Certificate to Connection Profile Map Rules page is displayed. The policy has two tables:

- **Maps table (upper table)**—The upper table lists all connection profiles for which you are defining certificate to connection map rules. Each row is a profile map, which includes the name of the connection profile that is being mapped, the priority of the map (lower numbers have higher priority), and the map name. You can configure more than one map for the same connection profile.
  - To configure rules for a map, select it and then use the rules table to create, edit, and delete the rules.
  - To add a map, click the **Add Row** button and fill in the [Map Rule Dialog Box \(Upper Table\)](#), page 31-39.
  - To edit map properties (not rules), select it and click the **Edit Row** button.
  - To delete an entire map, select it and click the **Delete Row** button.
- **Rules table (lower table)**—The rules for the map selected in the upper table. You must ensure that the map is actually selected in the upper table: the group title above the rules table should say “**Details for (Connection Profile Name)**.”

When you select a map, the table shows all rules configured for the map, including the field (subject or issuer), certificate component, matching operator, and the value that the rule is looking for. The remote user must match all configured rules in a map for the device to use the mapped connection profile.

- To add a rule, click the **Add Row** button and fill in the [Map Rule Dialog Box \(Lower Table\)](#), page 31-40.
- To edit a rule, select it and click the **Edit Row** button.
- To delete a rule, select it and click the **Delete Row** button.

**Step 2** To add a rule to a map:

- a. Select the map in the upper table.

If the map does not already exist, create it by clicking the **Add Row (+)** button beneath the upper table and fill in the Map Rule dialog box for creating maps. In the dialog box, you must select the connection profile for the map, assign a relative priority between 1 and 65535 (lower numbers have higher priority), and a unique map name.

- b. Ensure that the map is actually selected. Highlighting the map in the table is not sufficient. The heading above the lower table should be “**Details for (Connection Profile Name)**,” and unless the map is new, the table should show some rules.
- c. To add a new certificate to connection profile matching rule that must be satisfied in order for a remote client to connect to the device using the profile in this map, click the **Add Row (+)** button beneath the lower table. This opens the Map Rule dialog box with different fields.

**Note** If you get the error message “Missing Settings, A value ID required for Mapping field, Please select a Mapping,” it means that you have not successfully selected a map in the upper table. Click on the desired map again.

- d. From the **Field** list, select whether the rule should examine the Subject or Issuer field of the client certificate.
  - e. From the **Component** list, select the component of the client certificate to use for the matching rule.
  - f. From the **Operator** field, select how the component should be compared to the Value field: Equals (exact match is required), Contains (the entire value must appear), Does Not Equal, Does Not Contain.
  - g. In the **Value** field, specify the value to match, then click **OK** to save the rule.
  - h. Add additional rules to the map as desired.
- Step 3** In the **Default Connection Profile** field, select the connection profile that should be used for users who do not meet any of the map rules.

## Map Rule Dialog Box (Upper Table)

Use the Map Rule dialog box, when opened for the maps table in the upper part of the Certificate to Connection Profile Maps > Rules policy, to configure maps for which you can then configure rules in the lower table of the Rules policy. For a detailed explanation of configuring these maps and their associated rules, see [Configuring Certificate to Connection Profile Map Rules \(ASA\)](#), page 31-37.

### Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector. Click the **Add Row** button beneath the upper table, or select a map in the upper table and click **Edit Row**.

### Field Reference

**Table 31-15** Map Rule Dialog Box (Upper Table)

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Map Name           | The name of the connection profile map.                                                                                                                                                                                                                                                                                                                                                                 |
| Priority           | The priority number of the matching rule, between 1 and 65535. A lower number has a higher priority. For example, a matching rule with a priority number of 2, has a higher priority than a matching rule with a priority number of 5.<br><br>If you create multiple maps, they are processed in priority order, and the first matching rule determines to which profile the user is mapped.            |
| Connection Profile | Select the connection profile for IPsec and for SSL for which you are creating matching rules. You must select either or both connection profiles. Clients attempting to connect to the connection profiles must satisfy the associated matching rule conditions to connect to the device.<br><br>Connection Profile for IPsec is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. |

## Map Rule Dialog Box (Lower Table)

Use the Map Rule dialog box, when opened for the rules table in the lower part of the Certificate to Connection Profile Maps > Rules policy, to configure rules for the map selected in the maps table (upper table of the Rules policy). For a detailed explanation of configuring these rules, see [Configuring Certificate to Connection Profile Map Rules \(ASA\)](#), page 31-37.

### Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector. Click the **Add Row** button beneath the lower table, or select a rule in the lower table and click **Edit Row**.

| Field                      | Select the field for the matching rule according to the <b>Subject</b> or the <b>Issuer</b> of the client certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Component                  | Select the component of the client certificate to use for the matching rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Operator                   | Select the operator for the matching rule as follows: <ul style="list-style-type: none"> <li>• Equals—The certificate component must match the entered value. If they do not match exactly, the connection is denied.</li> <li>• Contains—The certificate component must contain the entered value. If the component does not contain the value, the connection is denied.</li> <li>• Does Not Equal—The certificate component <i>cannot</i> equal the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client county value equals US, then the connection is denied.</li> <li>• Does Not Contain—The certificate component <i>cannot</i> contain the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client county value contains US, the connection is denied.</li> </ul> |
| Value                      | The value of the matching rule. The value entered is associated with the selected component and operator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Default Connection Profile | This option is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices)

### Note

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

This procedure describes how to create or edit an IPsec proposal for your remote access VPN server when the server is an ASA or PIX 7.0+ device.

**Note**

Beginning with Cisco Security Manager version 4.17, you can configure and deploy IPsec Proposal policy on ASA multi-context devices running the software version 9.9(2) or later.

If you are configuring an IPsec proposal for IOS or PIX 6.3 devices, including Catalyst 6500/7600 devices, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 33-3.

An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.

When configuring an IPsec proposal, you must define the external interface through which the remote access clients connect to the server, the IKE version to use during IKE negotiation, and the encryption and authentication algorithms that protect the data in the VPN tunnel. You can also enable reverse route injection and NAT traversal.

For more information on IPsec tunnel concepts, see [Understanding IPsec Proposals](#), page 26-19.

**Related Topics**

- [Table Columns and Column Heading Features](#), page 1-49

**Step 1**

Do one of the following:

- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy Type selector. Select an existing policy or create a new one.

The IPsec Proposal page opens and lists the configured proposals, including the VPN endpoint, IPsec transform set, and whether reverse route injection is configured for the proposal.

**Step 2**

Do any of the following:

- To add a new IPsec proposal, click the **Add Row (+)** button and fill in the IPsec Proposal Editor dialog box. For detailed information on the available options, see [IPsec Proposal Editor \(ASA, PIX 7.0+ Devices\)](#), page 31-41.
- To edit an existing proposal, select it and click the **Edit Row (pencil)** button.
- To delete a proposal, select it and click the **Delete Row (trash can)** button.

## IPsec Proposal Editor (ASA, PIX 7.0+ Devices)

**Note**

From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the IPsec Proposal Editor to create or edit an IPsec proposal for an ASA or PIX 7.0+ device.

The elements in this dialog box differ according to the selected device. The table below describes the elements on the General tab in the IPsec Proposal Editor dialog box when an ASA or PIX 7.0+ device is selected.

**Note**

For a description of the elements in the dialog box when a PIX 7.0+ or ASA device is selected, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\)](#), page 33-4.

**Navigation Path**

- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy selector. Click the Add Row (+) or Edit Row (pencil) buttons.
- (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy Type selector. Select an existing policy or create a new one. Click the Add Row (+) or Edit Row (pencil) buttons.

Traffic Flow Confidentiality is not available when IKEv1 is enabled.</p> <p>Use the Burst, Payload Size, and Timeout parameters to generate random length packets at random intervals across the specified SA.</p> |

## Working with SSL and IKEv2 IPsec VPN Policies

Certain policies need to be configured for SSL VPNs. These policies are also used with remote access IKEv2 IPsec VPNs. The topics listed below explain these remote access VPN policies.

This section contains the following topics:

- [Understanding SSL VPN Access Policies \(ASA\), page 31-44](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)
- [Configuring SSL VPN Shared Licenses \(ASA 8.2+\), page 31-74](#)

## Understanding SSL VPN Access Policies (ASA)

An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or AnyConnect Essentials Client.

For more information about the Anyconnect VPN Client, see [Understanding SSL VPN AnyConnect Client Settings, page 31-62](#). The remainder of this topic explains DTLS and AnyConnect Essentials in more detail.

### Datagram Transport Layer Security (DTLS)

Enabling Datagram Transport Layer Security (DTLS) allows the AnyConnect client establishing an SSL VPN connection to use two simultaneous tunnels—an SSL tunnel and a DTLS tunnel. Using DTLS avoids latency and bandwidth problems associated with SSL connections and improves the performance of real-time applications that are sensitive to packet delays. By default, DTLS is enabled when SSL VPN access is enabled on an interface. If you disable DTLS, SSL VPN connections connect with an SSL VPN tunnel only.

#### Note

In order for DTLS to fall back to a TLS connection, you must specify a fallback trustpoint. If you do not specify a fallback trustpoint and the DTLS connection experiences a problem, the connection terminates instead of falling back to the specified trustpoint.

### AnyConnect Essentials VPN Client

AnyConnect Essentials is a separately licensed VPN client for SSL or IKEv2 IPsec, entirely configured on the adaptive security appliance, that provides the full AnyConnect capability, with the following exceptions:

- No CSD (including HostScan/Vault/Cache Cleaner)
- No clientless SSL VPN
- Optional Windows Mobile Support

The AnyConnect Essentials client provides remote end users running Microsoft Windows Vista, Windows Mobile, Windows XP or Windows 2000, Linux, or Macintosh OS X, with the benefits of a Cisco VPN client. If this feature is disabled, the full AnyConnect VPN client is used. This feature is disabled by default.

#### Note

---

This license cannot be used at the same time as the shared license for SSL VPN.

This section contains the following topics:

- [SSL VPN Access Policy Page, page 31-45](#)
- [Configuring an Access Policy, page 31-50](#)

## SSL VPN Access Policy Page

Use the SSL VPN Access Policy page to configure access parameters for your remote access SSL or IKEv2 IPsec VPN. For more information about configuring an Access policy, see [Configuring an Access Policy, page 31-50](#).

#### Tip

---

Any trustpoints that you specify in this policy must also be selected in the **Public Key Infrastructure** policy. For more information, see [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 26-56](#).

---

#### Navigation Path

- (Device View) Select **Remote Access VPN > SSL VPN > Access** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Table 31-18 SSL VPN Access Policy Page

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Interface Table       | <p>The Access Interface table lists the interfaces that are configured for remote access SSL or IKEv2 IPsec VPN connections. The table displays the access settings for each interface: whether the interface is enabled to allow VPN access, whether DTLS is enabled, whether client certificates are required, and the trustpoints used by the interface.</p> <ul style="list-style-type: none"> <li>To configure access on an interface, click the <b>Add row (+)</b> button (see <a href="#">Access Interface Configuration Dialog Box</a>, page 31-48).</li> <li>To edit access settings for an interface, select the interface and click the <b>Edit Row (pencil)</b> button (see <a href="#">Access Interface Configuration Dialog Box</a>, page 31-48).</li> <li>To delete access settings for an interface, select the interface and click the <b>Delete Row (trash can)</b> button.</li> </ul> |
| Server Name Indication Table | <p>The Server Name Indication table lists the Server Name Indication mappings that have been defined.</p> <ul style="list-style-type: none"> <li>To define a Server Name Indication mapping, click the <b>Add row (+)</b> button (see <a href="#">Server Name Indication Dialog Box</a>, page 31-49).</li> <li>To edit an existing mapping, select the mapping and click the <b>Edit Row (pencil)</b> button (see <a href="#">Server Name Indication Dialog Box</a>, page 31-49).</li> <li>To delete a Server Name Indication mapping, select the mapping and click the <b>Delete Row (trash can)</b> button.</li> </ul> <p>This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p>                                                                                                                                                                                            |
| Port Number                  | <p>The port to use for VPN sessions. The default port is 443, for HTTPS traffic. If HTTP port redirection is enabled, the default HTTP port number is 80. To specify a non-default port, the range is 1024 through 65535.</p> <p>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p> <p>Enter the port number or the name of a port list object, or click <b>Select</b> to select a port list object or to create a new object.</p> <p><b>Note</b> If you change the port number, all current SSL VPN connections terminate (upon configuration deployment), and current users must reconnect.</p>                                                                                                                                                                                                                                                                             |
| DTLS Port Number             | <p>The UDP port to use for DTLS connections. The default port is 443. For details about DTLS, see <a href="#">Understanding SSL VPN Access Policies (ASA)</a>, page 31-44.</p> <p>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p> <p>Enter the port number or the name of a port list object, or click <b>Select</b> to select a port list object or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 31-18** *SSL VPN Access Policy Page (continued)*

| <b>Element</b>                                                    | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fallback Trustpoint                                               | <p>The trustpoint (Certificate Authority, or CA server) to use for interfaces that do not have an assigned trustpoint. Enter the name of a PKI enrollment object, or click <b>Select</b> to select the object from a list or to create a new object.</p> <p>This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Default Idle Timeout                                              | <p>The amount of time, in seconds, that an SSL or IKEv2 IPsec VPN session can be idle before the security appliance terminates it.</p> <p>This value applies only if the Idle Timeout value in the group policy for the user is set to zero (0), which means there is no timeout value; otherwise the group policy Idle Timeout value takes precedence over the timeout you configure here. The minimum value you can enter is 60 seconds (1 minute). The default is 30 minutes (1800 seconds). The maximum is 24 hours (86400 seconds).</p> <p>We recommend that you set this attribute to a short time period. This is because a browser set to disable cookies (or one that prompts for cookies and then denies them) can result in a user not connecting but nevertheless appearing in the sessions database. If the Simultaneous Logins attribute for the group policy is set to one, the user cannot log back in because the database indicates that the maximum number of connections already exists. Setting a low idle timeout removes such phantom sessions quickly, and lets a user log in again.</p> <p>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p> |
| Max Session Limit                                                 | <p>The maximum number of SSL or IKEv2 IPsec VPN sessions allowed. Be aware that the different ASA models have different maximum session limits:</p> <ul style="list-style-type: none"> <li>• ASA 5505—25.</li> <li>• ASA 5510—250.</li> <li>• ASA 5520—750.</li> <li>• ASA 5540—2500.</li> <li>• ASA 5550, 5585-X with SSP-10—5000.</li> <li>• ASA 5580, 5585-X (other models)—10,000.</li> </ul> <p>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Certificate Authentication Timeout<br>(ASA 8.4(5) or ASA 9.1(2)+) | <p>The amount of time, in minutes, to wait before timing out certificate authentication. Valid values are from 1 to 120 minutes.</p> <p>This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 31-18** SSL VPN Access Policy Page (continued)

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Access Interface Configuration Dialog Box

Use the Access Interface Configuration dialog box to configure an interface on an ASA device for remote access SSL or IKEv2 IPsec VPN connections.

#### Navigation Path

Open the SSL VPN Access policy (see [SSL VPN Access Policy Page](#), page 31-45), then click **Add Row** below the interface table, or select a row in the table and click **Edit Row**.

#### Related Topics

- [Configuring an Access Policy](#), page 31-50
- [Understanding Interface Role Objects](#), page 6-73

**Field Reference****Table 31-19 Access Interface Configuration Dialog Box**

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Interface                        | The interface or interface role object on which you want to configure SSL or IKEv2 IPsec VPN access. Enter the name of the interface or interface role, or click <b>Select</b> to select one from a list or to create new interface role objects.<br><br>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.                                                                                                     |
| Trustpoint<br>Load Balancing Trustpoint | The trustpoint (Certificate Authority, or CA server) to use for authenticating users on the interface. Enter the name of a PKI enrollment object, or click <b>Select</b> to select one or to create a new object.<br><br>If load balancing is configured, you can also select a separate PKI enrollment object for the load balancing trustpoint.<br><br>This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. |
| Allow Access                            | Select this option to enable VPN access via this interface. If the option is not selected, access is configured on the interface, but it is disabled.<br><br>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.                                                                                                                                                                                                 |
| Enable DTLS                             | When selected, enables Datagram Transport Layer Security (DTLS) on the interface and allows an AnyConnect VPN Client to establish an SSL VPN connection using two simultaneous tunnels—an SSL tunnel and a DTLS tunnel.<br><br>This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.                                                                                                                               |

**Server Name Indication Dialog Box**

Beginning from version 4.8, Security Manager enables you to configure Server Name Indication mappings used by the enabled VPN interface for authentication. This capability includes the mapping of domain names to trustpoints.

Use the Server Name Indication dialog box to define or modify a domain and trustpoint for each interface.

**NOTES:**

- You can configure a unique domain name to a trustpoint. However, you can map a trustpoint to multiple domain names. You can configure a maximum of 16 unique trustpoints.
- Server Name Indication mapping of domain names to trustpoints is supported for devices that are running the ASA software version 9.3(2) or later.

**Navigation Path**

Open the SSL VPN Access policy (see [SSL VPN Access Policy Page, page 31-45](#)), then click **Add Row** below the ServerNameIndication table, or select a row in the table and click **Edit Row**.

**Field Reference****Table 31-20 Server Name Indication Dialog Box**

| Element     | Description                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain Mask | Enter the domain name that the trustpoint will be configured with. This domain will not be associated with any particular interface. A certificate with an associated domain may be used by any interface.        |
| Trustpoint  | The trustpoint (Certificate Authority, or CA server) to use for authenticating users on the interface. Enter the name of a PKI enrollment object, or click <b>Select</b> to select one or to create a new object. |

**Configuring an Access Policy**

This procedure describes how to configure an Access policy on an ASA device. Access policies are required for remote access SSL and IKEv2 IPsec VPN connections. For more information about access policies, see [Understanding SSL VPN Access Policies \(ASA\)](#), page 31-44.

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Access page opens. For a description of the elements on this page, see [SSL VPN Access Policy Page](#), page 31-45.

**Step 2** In the interface table at the top of the policy, configure all of the interfaces on which you will allow remote access SSL or IKEv2 IPsec VPN connections:

- To add an interface, click the **Add Row (+)** button beneath the table and fill in the Add Access Interface Configuration dialog box. You must specify the interface name (or an interface role object that identifies the desired interfaces) and whether to allow access on the interface.

You can also specify the PKI enrollment object that identifies the Certificate Authority (CA) server trustpoint for the interface (and a load balancing trustpoint if you use load balancing), whether to enable DTLS connections, and whether to require that the client have a valid certificate to complete a connection. For details about the options, see [Access Interface Configuration Dialog Box](#), page 31-48.

- To edit the settings for an interface, select it and click the **Edit Row (pencil)** button.
- To delete an interface, select it and click the **Delete Row** button. Keep in mind that you can edit the interface settings to disable access, so you should delete an interface only if you want to permanently remove it from VPN use.

**Step 3** Configure the remaining settings. The settings are described in detail in [SSL VPN Access Policy Page](#), page 31-45. The following are the settings that are of particular interest:

- **Fallback Trustpoint**—The Certificate Authority (CA) server trustpoint to use if an interface does not have a trustpoint configured in the table. Enter the name of a PKI enrollment object, or click **Select** to select one or to create a new object.
- **Allow Users to Select Connection Profile in Portal Page**—If you have multiple tunnel groups, selecting this option allows the user to select the correct tunnel group during login. You must select this option for IKEv2 IPsec VPNs.

- **Enable AnyConnect Access**—The AnyConnect VPN client is a full client; you must enable AnyConnect access if you want to allow full client access to the VPN. You must select this option for IKEv2 IPsec VPNs.

For more information about AnyConnect, including AnyConnect Essentials, see [Understanding SSL VPN AnyConnect Client Settings](#), page 31-62.

- **Enable AnyConnect Essentials**—Select this option if you are using AnyConnect Essentials clients, which you can use with remote access SSL or IKEv2 IPsec VPNs.

**Step 4** Any trustpoints that you specify in this policy must also be selected in the **Public Key Infrastructure** policy. For more information, see [Configuring Public Key Infrastructure Policies for Remote Access VPNs](#), page 26-56.

## Configuring Other SSL VPN Settings (ASA)

The SSL VPN Other Settings policy for ASA devices defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, AnyConnect client images and profiles, Kerberos Constrained Delegation, and some other advanced settings.

To configure the Other Settings policy, do one of the following:

- (Device View) Select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

You can then configure the settings on the following tabs:

- **Performance tab**—To configure caching to improve SSL VPN performance. See [Configuring SSL VPN Performance Settings \(ASA\)](#), page 31-52. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- **Content Rewrite tab**—To create rules that permit users to browse certain sites and applications without going through the security appliance itself. See [Configuring SSL VPN Content Rewrite Rules \(ASA\)](#), page 31-53. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- **Encoding tab**—To configure non-default encoding for web pages delivered from CIFS servers. Encoding is normally determined by the remote user's browser. See [Configuring SSL VPN Encoding Rules \(ASA\)](#), page 31-55. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- **Proxy tab**—To define HTTP or HTTPS proxy servers, if your network requires them, and proxy bypass rules. See [Configuring SSL VPN Proxies and Proxy Bypass \(ASA\)](#), page 31-57. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- **Plug In tab**—To define browser plug-ins, which are separate programs that a web browser invokes to perform a dedicated function. See [Configuring SSL VPN Browser Plug-ins \(ASA\)](#), page 31-60. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- **Client Settings tab**—To configure AnyConnect client images and profiles for downloading to clients. See the following topics:
  - [Understanding SSL VPN AnyConnect Client Settings](#), page 31-62
  - [Configuring SSL VPN AnyConnect Client Settings \(ASA\)](#), page 31-64

This is partially supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. Only the AnyConnect Client Image is supported in ASA 9.5(2) Multiple Context Mode. Beginning with version 4.12, Security Manager provides support for multi-context ASA 9.6(2) and later devices for Admin and User contexts. The CLIs supported are:

- Anyconnect image
- Anyconnect profile

During discovery, the AnyConnect Image is not discovered for ASA 9.5(2) remote access VPN Multiple Context mode. After discovery if you want to remove the AnyConnect Image configuration you must use FlexConfig.

- Microsoft KCD Server—To configure Kerberos Constrained Delegation (KCD) for use with clientless SSL VPN connections. See the following topics:
  - [Understanding Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\), page 31-67](#)
  - [Configuring Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\), page 31-69](#)

This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

- AnyConnect Custom Attributes tab—To configure AnyConnect custom attributes. See [Configuring AnyConnect Custom Attributes \(ASA\), page 31-70](#). AnyConnect Custom Attributes tab is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Advanced tab—To configure the memory, on-screen keyboard, and internal password features. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

---

**Note** Beginning with 4.15, Cisco Security Manager supports HTTP Strict Transport Security (HSTS). HTTPS is a web security policy mechanism which helps to protect websites against protocol downgrade attacks and hijack of cookies.

---

You can enable or disable HSTS and also provide the timeout values in the Advanced tab. See [Configuring SSL VPN Advanced Settings \(ASA\), page 31-72](#).

- SSL Server Verification tab—To enable HTTPS server verification for clientless SSL VPN users. See [Configuring SSL VPN Server Verification \(ASA\), page 31-74](#). This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

**Tip**

---

You must also configure a connection profile policy on the device. See [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 31-7](#).

---

## Configuring SSL VPN Performance Settings (ASA)

Caching enhances SSL VPN performance. It stores frequently reused objects in the system cache, which reduces the need to perform repeated rewriting and compressing of content. It reduces traffic between SSL VPN and both the remote servers and end-user browsers, with the result that many applications run much more efficiently.

This procedure describes how to enable caching on your ASA security appliance.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

---

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector. Click the **Performance** tab if it is not already selected.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one. Click the **Performance** tab if it is not already selected.

**Step 2** Select **Enable** to enable caching on the security appliance.

If you deselect this option, the cache settings configured on the security appliance do not take effect.

**Step 3** Configure the following options:

- **Minimum Object Size**—The minimum size of an HTTP object that can be stored in the cache on the security appliance, in kilobytes. The range is 0-10,000 KB. The default is 0 KB.
- **Maximum Object Size**—The maximum size of an HTTP object that can be stored in the cache on the security appliance, in kilobytes. The range is 0-10,000 KB. The default is 1000 KB. The maximum size must be larger than the minimum size.
- **Last Modified Factor**—An integer to set a revalidation policy for caching objects that have only the last-modified timestamp, and no other server-set expiration values. The range is 1-100. The default is 20.

The Expires response from the origin web server to the security appliance request, which indicates the time that the response expires, also affects caching. This response header indicates the time that the response becomes stale and should not be sent to the client without an up-to-date check (using a conditional GET operation).

The security appliance can also calculate an expiration time for each web object before it is written to disk. The algorithm to calculate an object's cache expiration date is as follows:

Expiration date = (Today's date - Object's last modified date) \* Freshness factor

After the expiration date has passed, the object is considered stale and subsequent requests causes a fresh retrieval of the content by the security appliance. Setting the last modified factor to zero is equivalent to forcing an immediate revalidation, while setting it to 100 results in the longest allowable time until revalidation.

- **Expiration Time**—The amount of time (in minutes) that the security appliance caches objects without revalidating them. The range is 0-900 minutes. The default is one minute.  
Revalidation consists of rejecting the objects from the origin server before serving the requested content to the client browser when the age of the cached object has exceeded its freshness lifetime. The age of a cached object is the time that the object has been stored in the security appliance's cache without the security appliance explicitly contacting the origin server to check if the object is still fresh.
- **Cache Static Content**—Whether to cache static content on the security appliance. Each web page can include static and dynamic objects. The security appliance caches individual static objects, such as image files (\*.gif, \*.jpeg), java applets (.js), and cascading style sheets (\*.css).

## Configuring SSL VPN Content Rewrite Rules (ASA)

SSL VPN processes application traffic through a content transformation/rewriting engine that includes advanced elements (such as, JavaScript, VBScript, Java, and multi-byte characters) to proxy HTTP traffic depending on whether the user is using an application within or independently of an SSL VPN device.

If you do not want some applications and web resources, such as public web sites, to go through the security appliance, you can create rewrite rules that permit users to browse certain sites and applications without going through the security appliance itself. This is similar to split tunneling in an IPsec VPN connection.

In the Content Rewrite tab of the SSL VPN Other Settings page, you can configure multiple content rewrite rules. The Content Rewrite tab lists all applications for which content rewrite is enabled or disabled.

**Tip**

The security appliance searches rewrite rules by order number, starting with the lowest, and applies the first rule that matches.

This procedure shows you how to create or edit content rewrite rules.

**Related Topics**

- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Content Rewrite** tab. The Content Rewrite tab displays all applications for which content rewrite is enabled or disabled.
- The security appliance searches rewrite rules by order number, starting with the lowest, and applies the first rule that matches. The resource mask defines the application string to which the rule is matched. If a rule does not have a number, it is evaluated after all of the numbered rules.
- Step 3** Do any of the following:
- To add a rule, click the **Add Row** button beneath the table and fill in the Add Content Rewrite dialog box. The options are described in detail in [Add/Edit Content Rewrite Dialog Box, page 31-54](#).
  - To edit a rule, select it, click the **Edit Row** button, and make your changes in the Edit Content Rewrite dialog box.
  - To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.
- 

**Add/Edit Content Rewrite Dialog Box**

Use the Add or Edit Content Rewrite dialog box to configure the rewriting engine that includes advanced elements such as JavaScript, VBScript, Java, and multi-byte characters to proxy HTTP traffic over a SSL VPN connection. For more information about content rewrite rules, see [Configuring SSL VPN Content Rewrite Rules \(ASA\), page 31-53](#).

**Navigation Path**

From the Content Rewrite tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button, or select a rule and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN Content Rewrite Rules \(ASA\), page 31-53](#).

**Field Reference****Table 31-21 Add or Edit Content Rewrite Dialog Box**

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable        | <p>When selected, enables content rewriting on the security appliance for the rewrite rule.</p> <p>Some applications do not require this processing, such as external public web sites. For these applications, you might choose to turn off content rewriting.</p>                                                                                                                                                                                                                     |
| Rule Number   | <p>The number for this rule. This number specifies the position of the rule in the list. Rules without a number are at the end of the list. The range is from 1 to 65534.</p> <p>Rules are processed from the lowest to the highest number, and the first match is applied to the traffic.</p>                                                                                                                                                                                          |
| Rule Name     | An alphanumeric string that describes the content rewrite rule. The maximum length is 128 characters.                                                                                                                                                                                                                                                                                                                                                                                   |
| Resource Mask | <p>The name of the application or resource to which the rule applies. The maximum length is 300 characters.</p> <p>You can use the following wildcards:</p> <ul style="list-style-type: none"> <li>• *—Matches everything. You cannot use this wildcard by itself. It must accompany an alphanumeric string.</li> <li>• ?—Matches any single character.</li> <li>• [!x-y]—Matches any character not in the sequence.</li> <li>• [x-y]—Matches any character in the sequence.</li> </ul> |

**Configuring SSL VPN Encoding Rules (ASA)**

Use the Encoding tab of the SSL VPN Other Settings page to specify the character set to encode in SSL VPN portal pages to be delivered to remote users. By default, the encoding type set on the remote browser determines the character set for SSL VPN portal pages, so you need to set the character encoding only if it is necessary to ensure proper encoding on the browser.

Character encoding is the pairing of raw data (such as 0's and 1's) with characters to represent the data. The language determines the character encoding method to use. Some languages use the same method, while others do not. Usually, the geographic region determines the default encoding method used by the browser, but the remote user can change this. The browser can also detect the encoding specified on the page, and render the document accordingly.

The encoding attribute lets you specify the value of the character encoding method in the SSL VPN portal page to ensure that the browser renders it properly, regardless of the region in which the user is using the browser, or any changes made to the browser.

The character encoding attribute is a global setting that, by default, all SSL VPN portal pages inherit. However, you can override the file-encoding attribute for Common Internet File System (CIFS) servers that use character encoding that differs from the value of the character-encoding attribute. You can use different file-encoding values for CIFS servers that require different character encodings.

The SSL VPN portal pages downloaded from the CIFS server to the SSL VPN user encode the value of the SSL VPN file-encoding attribute identifying the server, or if one does not, they inherit the value of the character encoding attribute. The remote user's browser maps this value to an entry in its character encoding set to determine the proper character set to use. The SSL VPN portal pages do not specify a value if SSL VPN configuration does not specify a file encoding entry for the CIFS server and the character encoding attribute is not set. The remote browser uses its own default encoding if the SSL VPN portal page does not specify the character encoding, or if it specifies a character encoding value that the browser does not support.

In the Encoding tab of the SSL VPN Global Settings page, you can view the currently configured character sets associated with the CIFS server to be encoded in the portal pages. From this tab, you can create or edit the character sets, as described in the following procedure.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Encoding** tab. The Encoding tab displays the default encoding and a list of CIFS servers for which encoding rules are configured.
- Step 3** From the **Global SSL VPN Encoding Type** list, select the attribute that determines the character encoding that all SSL VPN portal pages inherit, except for those from the CIFS servers listed in the table.

---

**Note** If you choose **none** or specify a value that the browser on the SSL VPN client does not support, the browser uses its own default encoding. The default global encoding is none.

---

You can select from the following encoding types:

- big5
- gb2312
- ibm-850
- iso-8859-1
- shift\_jis

---

**Note** If you are using Japanese Shift\_jis Character encoding, click **Do not specify** in the Font Family area of the associated Select Page Font pane to remove the font family.

---

- unicode
- windows-1252
- none

- Step 4** Do any of the following:
- To add a rule, click the **Add Row** button beneath the table and configure the following settings in the Add File Encoding dialog box:

- **CIFS Server IP, CIFS Server Host**—Select one of these options to specify the CIFS server either by IP address or hostname. If you select IP address, you can either enter the IP address or the name of a network/host object that specifies one or more individual IP addresses.  
If you specify a hostname, the security appliance retains the case you specify, although it ignores the case when matching the name to a server.
- **Encoding Type**—Select the encoding type. The options are the same as for the global setting described above.
- To edit a rule, select it, click the **Edit Row** button, and make your changes in the Edit File Encoding dialog box.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

## Configuring SSL VPN Proxies and Proxy Bypass (ASA)

Use the Proxy tab of the SSL VPN Other Settings page to configure the security appliance to terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers. On this tab, you can also configure the security appliance to perform minimal content rewriting and to specify the types of content to rewrite—external links, XML, or neither.

The security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers. These servers act as intermediaries between users and the Internet. Requiring all Internet access through a server you control provides another opportunity for filtering to assure secure Internet access and administrative control.

### Note

The HTTP/HTTPS proxy does not support connections to personal digital assistants.

You can specify a proxy auto-configuration (PAC) file to download from an HTTP proxy server; however, you cannot use proxy authentication when specifying the PAC file.

You can configure the security appliance to use proxy bypass when applications and web resources work better with the content rewriting this feature provides. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

You can configure multiple proxy bypass entries. The order in which you configure them is unimportant. The interface and path mask or interface and port uniquely identify a proxy bypass rule.

If you configure proxy bypass using ports rather than path masks, depending on your network configuration, you might need to change your firewall configuration to allow these ports access to the security appliance. Use path masks to avoid this restriction. Be aware, however, that path masks can change, so you might need to use multiple path mask statements to exhaust the possibilities.

This procedure shows you how to define proxies and proxy bypass rules for your SSL VPN.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.

- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Proxy** tab. The Proxy tab displays any currently defined proxies and proxy rules.
- Step 3** From the **Proxy Type** field, select the type of external proxy server to use for SSL VPN connections:
- **HTTP/HTTPS Proxy Server**—To specify proxy servers to handle HTTP or HTTPS requests.
  - **Proxy Using PAC**—To specify a proxy auto-configuration (PAC) file to download from an HTTP proxy server to the user's browser. Once downloaded, the PAC file uses a JavaScript function to identify a proxy for each URL.
- If you select this option, enter the URL for the PAC file in the **Specify Proxy Auto Config file URL** field. The URL must begin with **http://** or the security appliance will not use the PAC file.
- Step 4** If you select HTTP/HTTPS Proxy Server for the proxy type, configure the settings for the HTTP and HTTPS proxy servers. There are separate settings for the HTTP and HTTPS server, allowing you to use different servers, or to specify only one type of proxy. Configure the following options:
- **Enable HTTP Proxy Server, Enable HTTPS Proxy Server**—Select either or both of these options to configure the proxy server.
  - **HTTP Proxy Server (IPv4/IPv6), HTTPS Proxy Server (IPv4/IPv6)**—Enter the IP address, or the name of a network/host object that contains the single proxy server's IP address, for each type of proxy server you are configuring. You can click **Select** to select the object from a list or to create a new object.
- The default ports are 80 for HTTP and 443 for HTTPS.
- Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA 9.0(1) or later devices. If the IPv6 address you entered is invalid, Security Manager would throw an error. Security Manager displays a warning message if the object is not available when you select the proxy server from the list.
- **HTTP Proxy Port, HTTPS Proxy Port**—Enter the port on the proxy server to which HTTP or HTTPS requests will be forwarded. You can also enter the name of a port list object that defines the port, or click **Select** to select an object or to create a new one.
  - **Exception Address List**—A URL or a comma-delimited list of several URLs to exclude from those that should be sent to the HTTP or HTTPS proxy servers. The string does not have a character limit, but the entire command cannot exceed 512 characters. You can specify literal URLs or use the following wildcards:
    - \* to match any string, including slashes (/) and periods (.). You must accompany this wildcard with an alphanumeric string.
    - ? to match any single character, including slashes and periods.
    - [x-y] to match any single character in the range of x and y, where x represents one character and y represents another character in the ANSI character set.
    - [!x-y] to match any single character that is not in the range.
  - **Authentication User Name, Authentication Password, Confirm**—If the proxy server requires user authentication, enter a valid user name and password.
- Step 5** If necessary, configure proxy bypass rules in the Proxy Bypass table at the bottom of the tab. Proxy bypass rules specify the ASA interface, port, and target URL configured for proxy bypass. Do any of the following:

- To create a proxy bypass rule, click the **Add Row** button and fill in the Add Proxy Bypass dialog box. For specific information on the attributes of a proxy bypass rule, see [Add or Edit Proxy Bypass Dialog Box, page 31-59](#).
- To edit a proxy bypass rule, select the rule and click the **Edit Row** button.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

**Tip** If you configure proxy bypass rules, you must also configure the SSL VPN Access policy. For more information, see [Configuring an Access Policy, page 31-50](#).

### Add or Edit Proxy Bypass Dialog Box

Use the Add or Edit Proxy Bypass dialog box to set proxy bypass rules when the security appliance should perform little or no content rewriting.

#### Navigation Path

From the Proxy tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button, or select a rule and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN Encoding Rules \(ASA\), page 31-55](#).

|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | The interface on the security appliance that is used for proxy bypass. Enter the name of the interface or the interface role object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                         |
| Bypass On Port | Select this option to use a port number for proxy bypass. Valid port numbers are 20000-21000. Enter the ports or the name of a port list object, or click <b>Select</b> to select an object or to create a new one.<br><br><b>Note</b> If you configure proxy bypass using ports rather than path masks, depending on your network configuration, you might need to change your firewall configuration to allow these ports access to the security appliance. Use path masks to avoid this restriction. |

**Table 31-22 Add or Edit Proxy Bypass Dialog Box (continued)**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bypass Matching Specific Pattern | <p>Select this option to use a URL path mask to match for proxy bypass. A path is the text in a URL that follows the domain name. For example, in the URL <code>www.mycompany.com/hrbenefits</code>, <code>hrbenefits</code> is the path.</p> <p>You can use the following wildcards:</p> <ul style="list-style-type: none"> <li>• <code>*</code>—Matches everything. You cannot use this wildcard by itself. It must accompany an alphanumeric string.</li> <li>• <code>?</code>—Matches any single character.</li> <li>• <code>[x-y]</code>—Matches any character in the sequence.</li> <li>• <code>[!x-y]</code>—Matches any character not in the sequence.</li> </ul> <p>The maximum is 128 bytes.</p> <p><b>Note</b> Path masks can change, so you might need to use multiple path mask statements to exhaust the possibilities.</p> |
| URL                              | <p>Select the <b>http</b> or <b>https</b> protocol, then enter a URL to which you want to apply proxy bypass.</p> <p>URLs used for proxy bypass allow a maximum of 128 bytes. The port for HTTP is 80 and for HTTPS it is 443, unless you specify another port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Rewrite XML                      | Whether to rewrite XML sites and applications to be bypassed by the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rewrite Hostname                 | Whether to rewrite external links to be bypassed by the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring SSL VPN Browser Plug-ins (ASA)

A browser plug-in is a separate program that a web browser invokes to perform a dedicated function, such as connect a client to a server within the browser window. The security appliance lets you import plug-ins for download to remote browsers in clientless SSL VPN sessions.

Cisco redistributes the following open-source, Java-based components to be accessed as plug-ins for web browsers in Clientless SSL VPN sessions. Cisco tests the plug-ins it redistributes, and in some cases, tests the connectivity of plug-ins we cannot redistribute. These files are available in the `\files\vm\repository` folder in the product installation folder (usually `C:\Program Files\CSCOpX`) on the Security Manager server. The actual file names include release numbers:

- `rdp-plugin.jar`—The Remote Desktop Protocol plug-in lets the remote user connect to a computer running Microsoft Terminal Services. The web site containing the source of the redistributed plug-in is <http://properjavardp.sourceforge.net/>.
- `ssh-plugin.jar`—The Secure Shell-Telnet plug-in lets the remote user establish a Secure Shell or Telnet connection to a remote computer. The web site containing the source of the redistributed plug-in is <http://javassh.org/>.

**Note** The `ssh-plugin.jar` provides support for both SSH and Telnet protocols. The SSH client supports SSH Version 1.0.

- `vnc-plugin.jar`—The Virtual Network Computing plug-in lets the remote user use a monitor, keyboard, and mouse to view and control a computer with remote desktop sharing turned on. The web site containing the source of the redistributed plug-in is <http://www.tightvnc.com>.

**Note**

Per the GNU General Public License (GPL), Cisco redistributes plug-ins without having made any changes to them. Per the GPL, Cisco cannot directly enhance these plug-ins.

The security appliance does the following when you install a plug-in onto the flash device:

- (Cisco-distributed plug-ins only) Unpacks the jar file specified in the URL.
- Writes the file to the `cisco-config/97/plugin` directory on the security appliance file system.
- Enables the plug-in for all future clientless SSL VPN sessions, and adds a main menu option and an option to the drop-down menu next to the Address field of the portal page.

When the user in a clientless SSL VPN session clicks the associated menu option on the portal page, the portal page displays a window to the interface and displays a help pane. The user can select the protocol displayed in the drop-down menu and enter the URL in the Address field to establish a connection.

**Note**

Some Java plug-ins might report a status of connected or online even when a session to the destination service is not set up. The open-source plug-in reports the status, not the security appliance.

In the Plug-in tab of the SSL VPN Global Settings page, you can view the currently configured browser plug-ins for clientless SSL VPN browser access. From this tab, you can create or edit the plug-in files, as described in the following procedure.

**Plug-in Requirements and Restrictions**

Clientless SSL VPN must be enabled on the security appliance to provide remote access to the plug-ins. The minimum access rights required for remote use belong to the guest privilege mode. The plug-ins automatically install or update the Java version required on the remote computer. A stateful failover does not retain sessions established using plug-ins. Users must reconnect following a failover.

Before installing a plug-in, prepare the security appliance as follows:

- Make sure clientless SSL VPN is enabled on an interface on the security appliance.
- Install an SSL certificate onto the security appliance interface to which remote users use a fully-qualified domain name (FQDN) to connect.

**Note**

Do not specify an IP address as the common name (CN) for the SSL certificate. The remote user attempts to use the FQDN to communicate with the security appliance. The remote PC must be able to use DNS or an entry in the `System32\drivers\etc\hosts` file to resolve the FQDN.

**Related Topics**

- [Understanding and Managing SSL VPN Support Files, page 30-5](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.

- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Plug-in** tab. The Plug-in tab lists all configured plug-ins, including the type of plug-in and the name of the File policy object that defines the actual plug-in file.
- Step 3** Do any of the following:
- To add a plug-in, click the **Add Row** button beneath the table and fill in the Add Plug-In Entry dialog box as follows:
    - **Plug-in**—Select the type of plug-in that you are adding:
      - Remote Desktop (RDP) or RDP2—For Remote Desktop Protocol services.
      - Secure Shell (SSH), Telnet—For Secure Shell and Telnet services.
      - VNC—For Virtual Network Computing services.
      - Citrix (ICA)—For Citrix MetaFrame services.
      - Post—For post services.
    - **Plug-in File**—The name of the File policy object that defines the plug-in file. Enter the name of the File object or click **Select** to select an object or to create a new one. For more information on creating File Objects, see [Add and Edit File Object Dialog Boxes, page 34-37](#).
  - To edit a plug-in, select it, click the **Edit Row** button, and make your changes in the Edit Plug-In Entry dialog box.
  - To delete a plug-in, select it and click the **Delete Row** button. You are asked to confirm the deletion.

## Understanding SSL VPN AnyConnect Client Settings

The Cisco AnyConnect VPN Client provides secure SSL and IKEv2 IPsec connections to the security appliance for remote users. The client gives remote users the benefits of an SSL or IKEv2 IPsec VPN client without the need for network administrators to install and configure clients on remote computers.

**Tip**

---

IKEv2 IPsec connections require AnyConnect 3.0 or later clients.

---

Without a previously installed client, remote users enter the IP address in their browser of an interface configured to accept SSL or IKEv2 IPsec VPN connections. Unless the security appliance is configured to redirect http:// requests to https://, users must enter the URL in the form https://<address>.

After the user enters the URL, the browser connects to that interface and displays the login screen. If the user satisfies the login authentication, and the security appliance identifies the user as requiring the client, it downloads the client that matches the operating system of the remote computer. After downloading, the client installs and configures itself, establishes a secure connection and either remains or uninstalls itself (depending on the security appliance configuration) when the connection terminates.

In the case of a previously installed client, when the user authenticates, the security appliance examines the revision of the client and upgrades the client as necessary.

When the client negotiates a connection with the security appliance, it connects using Transport Layer Security (TLS), and optionally, Datagram Transport Layer Security (DTLS). DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.

The AnyConnect client can be downloaded from the security appliance, or it can be installed manually on the remote workstation by the system administrator. For more information about installing the client manually, see the *Cisco AnyConnect Secure Mobility Client Administrator Guide*. AnyConnect documentation is available at

[http://www.cisco.com/en/US/products/ps10884/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps10884/tsd_products_support_series_home.html). You can find general information about AnyConnect at <http://www.cisco.com/go/anyconnect>.

The security appliance downloads the client based on the group policy or username attributes of the user establishing the connection. You can configure the security appliance to automatically download the client, or you can configure it to prompt the remote user about whether to download the client. In the latter case, if the user does not respond, you can configure the security appliance to either download the client after a timeout period or present the login page.

### AnyConnect Client Profiles

An AnyConnect client profile is a group of configuration parameters, stored in an XML file, that the client uses to configure the connection entries that appear in the client user interface. These parameters (XML tags) include the names and addresses of host computers and settings to enable additional client features.

The AnyConnect client installation includes a profile template, named *AnyConnectProfile.tmpl*, that you can edit with a text editor and use as a basis to create other profile files. You can also set advanced parameters that are not available through the user interface. The installation also includes a complete XML schema file, named *AnyConnectProfile.xsd*.

You can add the profile to the Client Settings tab in the Other Settings policy to have it loaded onto the security appliance and subsequently downloaded to the client workstations based on group policies and username attributes.

## Cisco AnyConnect Profile Editor

You can configure a profile using the AnyConnect profile editor, a convenient GUI-based configuration tool launched from Cisco Security Manager. The AnyConnect software package for Windows, version 2.5 and later, includes the editor, which activates when you launch the editor from the Add/Edit AnyConnect Client Profile dialog box as long as you have added an appropriate AnyConnect package to the AnyConnect Client Image list.

#### Note

The Cisco AnyConnect Profile Editor is an independent program. For information about configuring AnyConnect profiles, and what AnyConnect Profile Editor can do for you, see the materials available online at

[http://www.cisco.com/en/US/products/ps10884/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps10884/products_installation_and_configuration_guides_list.html).

#### Note

Beginning with version 4.7, Security Manager provides support for AnyConnect version 3.2.

**Navigation Path**

Open the [Add/Edit AnyConnect Client Profile dialog box](#), then click **Launch Editor** (you must first add an appropriate AnyConnect package to the AnyConnect Client Image list before accessing the Add/Edit AnyConnect Client Profile dialog box). The AnyConnect Profile Editor is displayed.

**Configuring SSL VPN AnyConnect Client Settings (ASA)**

This procedure shows you how to define SSL and IKEv2 IPsec VPN client images and profiles. For a detailed explanation of AnyConnect images and profiles, see [Understanding SSL VPN AnyConnect Client Settings, page 31-62](#).

**Tip**

Ensure that you add AnyConnect images of the required releases. For example, if you are configuring an IKEv2 IPsec VPN, you must include an AnyConnect 3.0 or later image. In general, the image versions must support the features you are deploying in the remote access VPN.

**Related Topics**

- [Understanding SSL VPN AnyConnect Client Settings, page 31-62](#)
- [Cisco AnyConnect Profile Editor, page 31-63](#)
- [Understanding and Managing SSL VPN Support Files, page 30-5](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

**Step 1**

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

On the Other Settings page, click the **Client Settings** tab. The tab has two tables listing the configured AnyConnect clients and profiles separately.

The AnyConnect images include an order number. The security appliance downloads portions of the AnyConnect images to the remote computer until it achieves a match with the operating system, starting with the highest order number. Therefore, you should give the highest number to the image used by the most commonly-encountered operating system.

Because mobile users have slower connection speeds, you should load the AnyConnect image for Windows Mobile at the top of the list. Alternatively, you can decrease the connection time by specifying the regular expression **Windows CE** to match the user agent on Windows Mobile devices. When the browser on the mobile device connects to the ASA, it includes the User-Agent string in the HTTP header. The ASA, receiving the string, immediately downloads AnyConnect for Windows Mobile without ascertaining whether the other AnyConnect images are appropriate.

**Step 3**

To add an AnyConnect client image or make changes to the existing list, do any of the following:

- To add an AnyConnect image, click the **Add Row** button beneath the table and fill in the Add AnyConnect Client Image dialog box. You need to specify the name of the File object that defines the image and the priority order of the image. You can also specify a regular expression for the connecting client to speed up the download. For detailed information about the options, see [Add/Edit AnyConnect Client Image Dialog Box, page 31-66](#).
- To edit an image, select it, click the **Edit Row** button, and make your modifications in the Edit AnyConnect Client Image dialog box.
- To delete an image, select it and click the **Delete Row** button. You are asked to confirm the deletion.

**Step 4** To add an AnyConnect profile or make changes to the existing list, do any of the following:

- To add an AnyConnect profile, click the **Add Row** button beneath the table and configure these options in the Add AnyConnect Client Profile dialog box:
  - **AnyConnect Profile Name**—The name of the profile.  
To use this profile, ensure that you specify the profile name in an ASA Group Policy object assigned to the security appliance (in the Full Client settings page as described in [ASA Group Policies SSL VPN Full Client Settings, page 34-19](#)). Configure the ASA Group Policy object through the remote access Connection Profiles policy for the device as described in [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 31-7](#).
  - **AnyConnect Profile Type**—Select the type of AnyConnect Profile you are adding or editing: VPN, Network Access Manager, Telemetry, Web Security, ISE Posture, or Customer Experience Feedback.
  - **AnyConnect Profile File**—The name of the File object that identifies the Anyconnect client profile XML file. Click **Select** to select the object or to create a new one. For more information about File objects, see [Add and Edit File Object Dialog Boxes, page 34-37](#).

---

**Note** Beginning with version 4.7, Security Manager provides support for AnyConnect version 3.2. If you select ISE Posture as the AnyConnect Profile Type, the AnyConnect Profile File will have a filename extension of .isp.

---

---

**Note** If you are going to create a new profile using the AnyConnect Profile Editor, do not specify an AnyConnect Profile File.

---

- **Enable Storage URL**—Beginning with version 4.12, Security Manager enables you to select either Private or Shared option for ASA 9.6(2) or later Multi-Context devices.
- **Launch Editor**—Click **Launch Editor** to use the AnyConnect Profile Editor to edit the profile specified in AnyConnect Profile File or to create a new profile if no profile file is specified. For more information about File objects, see [Cisco AnyConnect Profile Editor, page 31-63](#).
- To edit a profile, select it, click the **Edit Row** button, and make your modifications in the Edit AnyConnect Client Profile dialog box.
- To delete a profile, select it and click the **Delete Row** button. You are asked to confirm the deletion.

## Add/Edit AnyConnect Client Image Dialog Box

Use the Add or Edit AnyConnect Client Image dialog box to create or edit a package file as the client image, and establish the order that the security appliance downloads the image to the remote workstation.

### Navigation Path

From the Client Settings tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the AnyConnect Client Image table, or select an image and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN AnyConnect Client Settings \(ASA\)](#), page 31-64.

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AnyConnect Client Image                                                    | The name of the File object that identifies the Anyconnect client. Click <b>Select</b> to select an object or to create a new one. For more information about File objects, see <a href="#">Add and Edit File Object Dialog Boxes</a> , page 34-37.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Image Order                                                                | The order in which the security appliance downloads the client images to the remote workstation. It downloads the image in priority order. Therefore, you should enter a lower value for the image used by the most commonly-encountered operating system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Regular Expression                                                         | A regular expression to match the user agent. Enter a name of an existing regular expression policy object or click <b>Select</b> to select an entry from the Regular Expressions Selector dialog box. To add a new regular expression, click the <b>Add (+)</b> button on the Regular Expressions Selector dialog box. For more information see <a href="#">Add/Edit Regular Expressions</a> , page 17-109.<br><br>If you are adding an AnyConnect package for Windows Mobile, specify the regular expression <b>Windows CE</b> to match the user agent on Windows Mobile devices. This decreases the connection time of the mobile device. When the browser on the mobile device connects to the adaptive security appliance, it includes the User-Agent string in the HTTP header. The adaptive security appliance, receiving the string, immediately downloads AnyConnect for Windows Mobile without ascertaining whether the other AnyConnect images are appropriate. |
| Enable Storage URL<br>(Only for ASA 9.6(2) or later Multi-Context devices) | Beginning with version 4.12, Security Manager enables you to select either Private or Shared option for ASA 9.6(2) or later Multi-Context devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Understanding Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)

There are many ways to protect network resources through the use of authentication. Many organizations want to use Kerberos to protect certain web applications while using other authentication techniques, such as username and password, digital certificates, RSA SecureID, or SmartCards, to control access to an SSL VPN. However, a restriction in the Kerberos protocol prevents Kerberos authentication if the user has already used another technique to authenticate to the VPN.

Microsoft overcomes this limitation in Kerberos starting with Windows Server 2003. Using protocol transition and constrained delegation, the ASA can authenticate to the Kerberos Key Distribution Center (KDC) on the Windows domain controller and obtain impersonate tickets for users who have authenticated to the ASA using non-Kerberos protocols. The ASA can use the impersonate ticket to obtain other Kerberos service tickets for remote users.

To configure the domain controller so that Kerberos constrained delegation works, you must do the following:

- Each instance of a service that uses Kerberos authentication must have a service principal name (SPN) defined so that clients can identify it on the network. Register the SPN in the Active Directory **Service-Principal-Name** attribute of the Windows account under which the instance of the service is running. When a service needs to authenticate to another service running on a specific computer, it uses that service's SPN to differentiate it from other services running on that computer.

The SPN syntax is *service\_class/host\_name:port*, where:

- *service\_class* identifies the service. It can be a built-in service, such as http, or a user defined service.
  - *host\_name* identifies the fully-qualified domain name or NetBIOS name of the server that hosts the service, but it cannot be an IP address.
  - *port* identifies the port on which the service runs. You can omit the port if you use the default service port.
- Create a service account username and password that the ASA can use. Configure the account to allow Kerberos constrained delegation to any authentication protocol. In addition, the user account must not be marked as a sensitive account that cannot be delegated.

To configure the ASA to allow KCD, once the ASA joins the domain, an entry should appear under the Users and Computers list on the domain controller for the ASA. In the Properties dialog box, on the Delegation tab, select **Trust this computer for delegation to specified services only**, and then select **Use any authentication protocol**. In the table of authorized services, add all services for which the ASA is delegated for authentication on behalf of users.

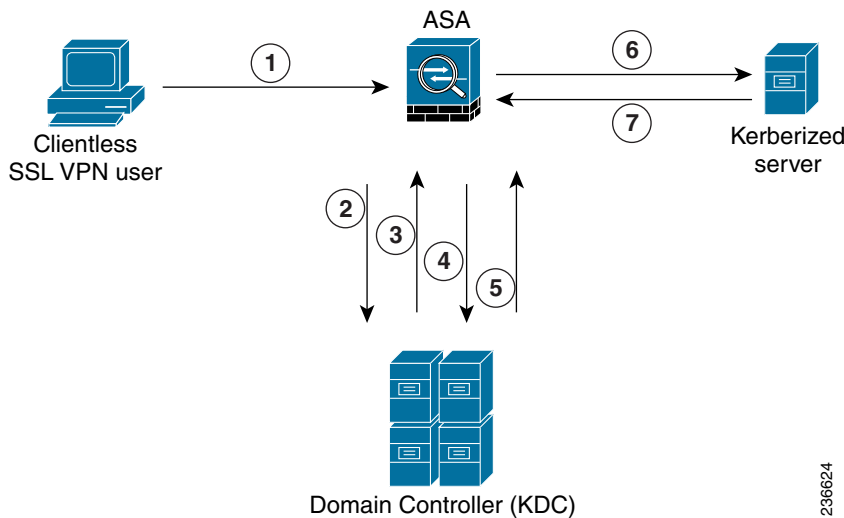

### Tip

For definitive information on configuring this feature on the Windows domain controller, refer to the Microsoft documentation.

For the ASA to use Kerberos constrained delegation, you must configure the ASA as described in [Configuring Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\)](#), page 31-69. The feature is available on ASA Software release 8.4 and later only.

Following is an example that explains how Kerberos constrained delegation works with a clientless SSL VPN hosted on an ASA.

**Figure 31-1 Kerberos Constrained Delegation Example**

After verifying the identity of an SSL VPN user with the configured authentication mechanism, the ASA uses protocol transition to switch to the Kerberos protocol for authentication on behalf of the user and then sends a Kerberos service ticket instead of the user's credentials to a published Web server that accepts Kerberos for authentication. Following are the steps:

1. An SSL VPN user session is authenticated by the ASA using the authentication mechanism configured for the user. For example, in case of Smartcard credentials, the ASA extracts the required information (the user's principle name) from the digital certificate and performs LDAP authorization against Windows Active Directory.
2. After successful authentication, the user logs into the ASA SSL VPN portal page. The VPN user accesses a web service by entering a URL in the portal page or by clicking on a bookmark. If the access requires authentication, the server challenges the ASA for credentials and along with the challenge sends a list of authentication mechanisms supported by the server. Based on the HTTP headers in the challenge, the ASA deduces whether the server requires Kerberos authentication. If connecting to a backend server requires Kerberos authentication, then the ASA requests an impersonate ticket, for itself on behalf the user, from the KDC.
3. The KDC returns the requested tickets to the ASA. Even though these tickets are passed to the ASA, they contain the user's authorization data.

**Note** These first steps comprise protocol transition; after these steps, a user who authenticated to the ASA using a non-Kerberos authentication protocol is transparently authenticated to the KDC using Kerberos.

4. The ASA now requests a service ticket from the KDC for the specific service that the user wants to access. The service ticket request contains the SPN (the unique identifier) of the service.
5. The KDC returns a service ticket for the specific service to the ASA.
6. The ASA uses the service ticket to request access to the web service, in the above scenario this is sent to the web server in a HTTP GET request.
7. The web server authenticates the Kerberos service ticket and grants access to the service. An authentication failure will display an appropriate error message after acknowledgment of which the portal will be displayed.

## Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)

Use the Microsoft KCD Server tab of the SSL VPN Other Settings page to configure Kerberos Constrained Delegation (KCD) for clientless SSL VPNs hosted on an ASA.

KCD addresses a limitation of Kerberos. If a user authenticates to the SSL VPN using a method other than Kerberos, the user cannot access Kerberos-protected resources. This prevents a remote access device, such as ASA, from authenticating users using non-Kerberos methods and still provide single sign-on access to Kerberos-authenticated web applications in the enterprise.

If this limitation applies to your network, you can configure KCD to get around the limitation. KCD offloads the Kerberos authentication to the ASA. Users log into the corporate network using the SSL VPN portal, and from then on, access Kerberos-protected services in a transparent fashion.

### Tips

- KCD requires ASA release 8.4+. If you configure KCD for other releases, the configuration is ignored.
- The feature is used with clientless SSL VPN access only.
- Microsoft Windows Server (2003 or 2008), configured as domain controllers, are required for KCD.
- If you use SSL VPN Bookmark policy objects to define bookmarks to include on the SSL VPN portal page, you might need to add explicit service principle name (SPN) parameters to bookmarks if a service uses a non-default port. For services that use Kerberos authentication, an SPN must be defined in the Service-Principle-Name attribute of the account under which the service runs.

Bookmarks need to reflect this configuration. The SPN is a parameter on the URL:

`http://<url>?SPN=<spn>` or `http://<url>?SPN=<spn>`. For example,

**`http://owa.example.com?SPN=http/owa:444`**. For more details about the SPN syntax, see [Understanding Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\), page 31-67](#).

- To configure this feature, you must also configure the Hostname, DNS, and NTP policies. Configure both hostname and domain name in the Hostname policy.
- Kerberos authentication requires that the clock between the hosts to be synchronized with a maximum drift of 5 minutes (this is the default setting). This restriction is applicable to the clocks on the ASA, the domain controller, and the application servers. Configuring the same NTP server for all servers should address the requirement.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)
- [Understanding AAA Server and Server Group Objects, page 6-27](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Microsoft KCD Server** tab.
- Step 3** Select **Configure KCD** and configure the following options:

- **KCD Server**—The AAA server group object that identifies the Microsoft KCD server (the domain controller) to use for Kerberos Constrained Delegation. Enter the name of the object or click **Select** to select it from a list or to create a new object. The object must use a Kerberos AAA server policy object to identify the domain controller.
- **Username, Password, Confirm**—A user account that the ASA can use to join the Active Directory domain.

For the ASA to use Kerberos protocol transition and constrained delegation, and obtain service tickets on behalf of the remote access users, the account used by the ASA to authenticate with the domain controller must be configured in Active Directory and configured to allow Kerberos constrained delegation to any authentication protocol. In addition, the user account must not be marked as a sensitive account that cannot be delegated. For more information about Active Directory configuration requirements, see [Understanding Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\)](#), page 31-67.

## Configuring AnyConnect Custom Attributes (ASA)

AnyConnect custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade.

In the AnyConnect Custom Attribute tab of the SSL VPN Other Settings page, you can view configured AnyConnect custom attributes, add new attributes, and modify or delete existing attributes.

### Related Topics

- [Understanding and Managing SSL VPN Support Files](#), page 30-5
- [Configuring Other SSL VPN Settings \(ASA\)](#), page 31-51

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **AnyConnect Custom Attribute** tab. The AnyConnect Custom Attribute tab lists all defined custom attributes.
- Step 3** Do any of the following:
- To add a custom attribute, click the **Add Row** button beneath the table and fill in the Add AnyConnect Custom Attribute dialog box. The options are described in detail in [Add/Edit AnyConnect Custom Attribute Dialog Box](#), page 31-71.
  - To edit a custom attribute, select it, click the **Edit Row** button, and make your changes in the Edit Plug-In Entry dialog box.
  - To delete a custom attribute, select it and click the **Delete Row** button. You are asked to confirm the deletion.
-

## Add/Edit AnyConnect Custom Attribute Dialog Box

Use the Add or Edit AnyConnect Custom Attribute dialog box to add or modify an AnyConnect custom attribute. AnyConnect custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade.

Beginning with version 4.7, Security Manager enables to add Custom Attribute Data to an existing Custom Attribute Type for ASA devices running the software version 9.3(1) or later. Use the Add or Edit AnyConnect Custom Attribute Data dialog box to add or modify the attribute name and attribute value for an existing AnyConnect custom attribute type. For more information see [Add/Edit AnyConnect Custom Attribute Data Dialog Box, page 31-71](#).

### Navigation Path

From the AnyConnect Custom Attribute tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the AnyConnect Custom Attributes table, or select an attribute and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring AnyConnect Custom Attributes \(ASA\), page 31-70](#).

### Related Topics

### Field Reference

**Table 31-24 Add or Edit AnyConnect Custom Attributes Dialog Box**

| Element     | Description                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type        | The type of the AnyConnect custom attribute. This is used when referencing the attribute in Security Manager and in the aggregate auth protocol messages sent to the AnyConnect client. The maximum length is 32 characters. |
| Description | A free form description of attribute usage. This text will appear in the command help when the custom attribute is referenced from the group-policy attribute configuration mode. The maximum length is 128 characters.      |

## Add/Edit AnyConnect Custom Attribute Data Dialog Box

Beginning with Security Manager version 4.7, you can use the Add or Edit AnyConnect Custom Attribute Data dialog box to add or modify the attribute name and attribute value for an existing AnyConnect custom attribute type.

### Navigation Path

Click the AnyConnect Custom Attribute tab of the SSL VPN Other Settings policy for ASA devices. On the Custom Attribute table, select an attribute type and then click the **Add Row** button for the Custom Attribute Data table. Or on the Custom Attribute Data table select an existing Custom Attribute Data and click the **Edit Row** button.

For each attribute type, you can define multiple attribute names with corresponding values.

For information on adding or modifying an attribute type, see [Understanding SSL VPN AnyConnect Client Settings, page 31-62](#).

#### Field Reference

**Table 31-25 Add or Edit AnyConnect Custom Attribute Data Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attribute Name  | The name of an AnyConnect custom attribute. The name is used when referencing the attribute in group-policy and dynamic-access-policy-record config mode. The maximum length is 32 characters.                                                                                                              |
| Attribute Value | A free form string containing the attribute value. The attribute value is associated with the attribute name and it is passed to the client during the configuration of the connection. The maximum length of the string can be 420 characters.<br><br>The attribute value can contain multiple text lines. |

## Configuring SSL VPN Advanced Settings (ASA)

Use the Advanced tab of the SSL VPN Other Settings page to configure the memory, on-screen keyboard, and internal password features on ASA devices. Beginning with Cisco Security Manager 4.15, you can also enable the HSTS support and specify the timeout values. All of these settings are optional.

#### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 31-51](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** On the Other Settings page, click the **Advanced** Tab.

**Step 3** In the **Memory Size** field, specify the amount of memory you want to allocate to SSL VPN sessions. The default is 50%.

To change the setting, select one of the following options and enter the desired number:

- **% of Total Physical Memory**—As a percentage of total memory. Default is 50%.
- **Kilobytes**—In kilobytes. 20KB is the minimum setting allowed. Cisco recommends that you do not specify memory in terms of KB because different ASA models have different total amounts of memory, for example:

---

**Note** When you change the memory size, the new setting takes effect only after the system reboots.

---

- Step 4** In the **Enable On-Screen Keyboard** field, select one of the following options:
- **Disabled**—The on-screen keyboard is not displayed. Users must input their credentials using the standard keyboard. This is the default.
  - **On All Pages**—Allows a user to input credentials using an on-screen keyboard, which is displayed whenever logon credentials are required.
  - **On Logon Page Only**—Allows a user to input credentials using an on-screen keyboard, which is displayed on the logon page but not on any other pages that require credentials.

- Step 5** Select **Allow Users to Enter Internal Password** to require an additional password when accessing internal sites. This feature is useful if you require that the internal password be different from the SSL VPN password. For example, you can use a one-time password for authentication to ASA and another password for internal sites.

---

**Note** The HSTS option is available for ASA 9.8.2 and later devices only.

---

- Step 6** In the HTTP Strict Transport Security (HSTS) area, do the following:
- To enable HSTS support, select the **Enable HSTS Header** check box. HSTS feature can be enabled by sending header to clients. To disable the support, clear this check box.
  - If you have selected the **Enable HSTS Header** check box, in **HSTS Header Timeout** enter the timeout value. If you leave this field blank, Cisco Security Manager will use the default Timeout value of 10886400.
  - If you want to include sub domains directive to the header, select the **Include Sub Domains** check box.
  - If you want to include payload directive to the header, select the **Payload** check box.

---

**Note**

- If you select the **Payload** check box, the **Include Sub Domains** is also selected by default.
- If you choose payload, ensure that the HSTS Header Timeout value is 31536000 or greater.

---

---

**Note** Beginning with ASA 9.13(1), the existing CLI structure (**Enable HSTS Header, HSTS Header Timeout, Include Sub Domains & Preload**) is moved under HSTS server command, with the addition of four new CLI options: **Enable HSTS-Client, Enable X-Content-Type-Options, Enable X-XSS-Protection, and Content-Security-Policy**. Although Cisco Security Manager 4.20 will continue to support the existing CLI, the four newly added CLI options will not be supported.

---

## Configuring SSL VPN Server Verification (ASA)

When connecting to a remote SSL-enabled server through clientless SSL VPN, it is important to know that you can trust the remote server, and that it is in fact the server you are trying to connect to. ASA 9.0 introduces support for SSL server certificate verification against a list of trusted certificate authority (CA) certificates for clientless SSL VPN.

When you connect to a remote server via a web browser using the HTTPS protocol, the server will provide a digital certificate signed by a CA to identify itself. Web browsers ship with a collection of CA certificates which are used to verify the validity of the server certificate. This is a form of public key infrastructure (PKI).

Just as browsers provide certificate management facilities, so does the ASA in the form of trusted certificate pool management facility: trustpools. This can be thought of as a special case of trustpoint representing multiple known CA certificates. The ASA includes a default bundle of certificates, similar to that provided with web browsers, but it is inactive until activated by the administrator.

**Note**

If you are already familiar with trustpools from Cisco IOS then you should be aware that the ASA version is similar, but not identical.

This procedure describes how to enable HTTPS server verification for clientless SSL VPN users.

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector. Click the **SSL Server Verification** tab.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one. Click the **SSL Server Verification** tab.
- Step 2** Select **Enable** to enable HTTPS Server Verification for Clientless SSL VPN users.
- Step 3** Specify the action you want to be taken if server certificate verification fails:
- **Disconnect user from Https page** – Disconnect if the server could not be verified.
  - **Allow user to continue to Https page** – Allow the user to continue the connection, even if the check failed.
- 

## Configuring SSL VPN Shared Licenses (ASA 8.2+)

Use the SSL VPN Shared License page to configure your SSL VPN Shared License.

You can purchase a shared license with a large number of SSL or remote access IKEv2 IPsec VPN sessions and share the sessions as needed among a group of ASA devices by configuring one of the ASA devices as a shared license server, and the rest as clients. For the server license, you can share 500-50,000 licenses in increments of 500 and 50,000-1,040,000 licenses in increments of 1000.

A license is consumed by each remote access user that makes an SSL or IKEv2 IPsec connection.

**Note**

The shared license cannot be used at the same time as the AnyConnect Essentials license.

The following topics explain the procedure for configuring shared licenses:

- [Configuring an ASA Device as a Shared License Client, page 31-76](#)
- [Configuring an ASA Device as a Shared License Server, page 31-77](#)

**Navigation Path**

- (Device View) Select an ASA device using version 8.2 or later, and select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

**Field Reference**

|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh Interval                               | The refresh interval, between 10-300 seconds. The default is 30 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interfaces                                     | A comma-separated list of interfaces used for communicating shared licenses to clients. Enter the names of interfaces or interface role objects, or click <b>Select</b> to select interfaces or objects or to create new objects.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Configure Backup shared SSL VPN License Server | Whether to configure a backup server for the shared license server. If you select this option, configure the following: <ul style="list-style-type: none"> <li>• <b>Backup License Server</b>—The IP address, or network/host object that contains the address, of the server to act as a backup license server if the current one is unavailable. Click <b>Select</b> to select an object or to create a new one.</li> <li>• <b>Backup Server Serial Number</b>—The serial number of the backup license server.</li> <li>• <b>HA Peer Serial Number</b>—(Optional) The serial number of the backup server of a failover pair.</li> </ul> |

This section contains the following topics:

- [Configuring an ASA Device as a Shared License Client, page 31-76](#)
- [Configuring an ASA Device as a Shared License Server, page 31-77](#)

## Configuring an ASA Device as a Shared License Client

This procedure describes how to configure an ASA device as a shared license client.

### Tip

You must ensure that the SSL VPN Shared License Client activation key is present on the device.

### Step 1

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN Shared License page appears (see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\), page 31-74](#)).

### Step 2

Select **Shared License Client** as the role of the device.

### Step 3

In the Shared Secret field, enter and confirm a case-sensitive string (4-128 characters) used for communicating with the shared license server.

### Step 4

In the License Server field, enter the IP address or the name of a network/host object that identifies the ASA device configured as the license server.

### Step 5

In the License Server Port field, enter the number of the TCP port on which the license server communicates.

- Step 6** Select the role of the client:
- **Client Only**—When selected, the client acts only as the client. In this case, you can specify another device as a backup server.
  - **Backup Server**—When selected, the client also acts as the backup server. In this case, you must also specify the interfaces to be used for this purpose.
- 

## Configuring an ASA Device as a Shared License Server

This procedure describes how to configure an ASA device as a shared license server.

**Tip**

You must ensure that the SSL VPN Shared License Server activation key is present on the device.

---

- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.
- The SSL VPN Shared License page appears (see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\)](#), page 31-74).
- Step 2** Select **Shared License Server** as the role of the device.
- Step 3** In the Shared Secret field, enter and confirm a case-sensitive string (4-128 characters) used for communicating with the shared license server.
- Step 4** In the License Server Port field, enter the number of the TCP port on which the license server communicates.
- Step 5** In the Refresh Interval field, enter a value between 10-300 seconds to be used as the refresh interval. Default is 30 seconds.
- Step 6** In the Interfaces field, enter or select the interfaces to be used for communicating with clients.
- Step 7** (Optional.) Select **Configure Backup shared SSL VPN License Server** to configure a backup server for the shared license server, then configure the following:
- **Backup License Server**—The IP address, or network/host object that contains the address, of the server to act as a backup license server if the current one is unavailable.
  - **Backup Server Serial Number**—The serial number of the backup license server.
  - **HA Peer Serial Number**—(Optional) The serial number of the backup server of a failover pair.
- 

## Customizing Clientless SSL VPN Portals

You can customize the web site and its contents that you use for the portal page for a browser-based clientless SSL VPN. ASA devices allow much more customization than IOS devices. You can create several policy objects that define the look of the web pages the user sees when logging into or out of the VPN and the home page for the portal, as well as the bookmarks and smart tunnels available to the user.

This section contains the following topics:

- [Configuring ASA Portal Appearance Using SSL VPN Customization Objects](#), page 31-78
- [Localizing SSL VPN Web Pages for ASA Devices](#), page 31-80
- [Creating Your Own SSL VPN Logon Page for ASA Devices](#), page 31-82
- [Configuring SSL VPN Bookmark Lists for ASA and IOS Devices](#), page 31-83
- [Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks](#), page 31-84
- [Configuring SSL VPN Smart Tunnels for ASA Devices](#), page 31-85
- [Configuring WINS/NetBIOS Name Service \(NBNS\) Servers To Enable File System Access in SSL VPNs](#), page 31-88

## Configuring ASA Portal Appearance Using SSL VPN Customization Objects

An SSL VPN Customization object describes the appearance of browser-based clientless SSL VPN web pages displayed to users. This includes the Logon page displayed when they connect to the ASA security appliance, the Home page displayed after authentication, and the Logout page displayed when users log out of the SSL VPN service.

You use SSL VPN Customization objects when defining ASA group objects or Remote Access VPN Connection policies for ASA devices. You can create several customization objects and define multiple ASA group or connection profiles so that each user group sees web pages designed specifically for their use. Customization can include localizing the web pages in the languages appropriate for each group. For more information about localization, see [Localizing SSL VPN Web Pages for ASA Devices](#), page 31-80.

Initially, when a user first connects, the default customization object identified in the connection profile determines how the logon screen appears. If the user selects a different group from the connection profile list on the logon page, and that group has its own customization, the screen changes to reflect the customization object for the selected group. After the remote user is authenticated, the screen appearance is determined by the customization object that has been assigned to the group policy.

After you create the SSL VPN customization object as described in this procedure, you can use the object to specify the portal characteristics in these policies:

- On the **SSL VPN > Settings** page in an ASA group policy object (see [ASA Group Policies SSL VPN Settings](#), page 34-25), which you then select in one of these policies:
  - **Remote Access VPN > Group Policies**
  - **Remote Access VPN > Connection Profiles** on the **General** tab
- In the **Remote Access VPN > Connection Profiles** policy, you can also specify the SSL VPN customization object on the **SSL** tab (see [SSL Tab \(Connection Profiles\)](#), page 31-22).

### Related Topics

- [Localizing SSL VPN Web Pages for ASA Devices](#), page 31-80
- [Creating Policy Objects](#), page 6-9
- [Add and Edit SSL VPN Customization Dialog Boxes](#), page 34-51

---

**Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#), page 6-4).

**Tip**

You can also create SSL VPN Customization objects when defining policies or objects that use this object type. For more information, see [Selecting Objects for Policies, page 6-2](#).

- Step 2** Select **SSL VPN Customization** from the Object Type selector. The SSL VPN Customization page opens, displaying a list of the existing SSL VPN Customization objects.
- Step 3** Right-click in the work area and select **New Object**.  
The Add SSL VPN Customization dialog box appears (see [Add and Edit SSL VPN Customization Dialog Boxes, page 34-51](#)).
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Before you configure settings for the various pages, use the Preview button to view the default settings. Clicking **Preview** opens a browser window to display the current settings for the Logon page, Portal page, or Logout page, whichever one is selected in the table of contents (selecting a page within one of these folders is the same as selecting the parent folder).

**Tip**

Click **Preview** after making any changes to settings to verify that the changes are what you desire.

- Step 6** Configure the settings for the Logon page. This web page is the one users see first when connecting to the SSL VPN portal. It is used for logging into the VPN. Select the following items in the Logon Page folder in the table of contents on the left of the dialog box to view and change the settings:
- **Logon Page**—Specify the title of the web page, which is displayed in the browser's title bar.
  - **Title Panel**—Determine whether the Logon page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic. For more information about the settings, see [SSL VPN Customization Dialog Box—Title Panel, page 34-53](#).
  - **Language**—If you want to configure translation tables for other languages on the ASA device and use them, you can configure the supported languages and allow users to choose their language. For information about translation tables and localization support, see [Localizing SSL VPN Web Pages for ASA Devices, page 31-80](#). For more information about the settings, see [SSL VPN Customization Dialog Box—Language, page 34-54](#).
  - **Logon Form**—Configure the labels and colors used in the form that accepts user logon information. For more information about the settings, see [SSL VPN Customization Dialog Box—Logon Form, page 34-56](#).
  - **Informational Panel**—If you want to provide extra information to the user, you can enable an informational panel and add text and a logo graphic. For more information about the settings, see [SSL VPN Customization Dialog Box—Informational Panel, page 34-57](#).
  - **Copyright Panel**—If you want to include copyright information on the logon page, you can enable the copyright panel and enter your copyright statement. For more information about the settings, see [SSL VPN Customization Dialog Box—Copyright Panel, page 34-58](#).
  - **Full Customization**—If you do not want to use the security appliance's built-in logon page, even customized, you can instead enable full customization and supply your own web page. For information on creating the required file, see [Creating Your Own SSL VPN Logon Page for ASA Devices, page 31-82](#). For more information about the settings, see [SSL VPN Customization Dialog Box—Full Customization, page 34-59](#).

- Step 7** Configure the settings for the Portal page. This is the home page for the SSL VPN portal, and is displayed after the users log in. Select the following items in the Portal Page folder in the table of contents on the left of the dialog box to view and change the settings:
- **Portal Page**—Specify the title of the web page, which is displayed in the browser’s title bar.
  - **Title Panel**—Determine whether the Portal page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic. For more information about the settings, see [SSL VPN Customization Dialog Box—Title Panel, page 34-53](#).
  - **Toolbar**—Determine whether the Portal page will have a toolbar, which contains a field for entering a URL to browse. For more information about the settings, see [SSL VPN Customization Dialog Box—Toolbar, page 34-59](#).
  - **Applications**—Determine which application buttons will appear on the page. For more information about the settings, see [SSL VPN Customization Dialog Box—Applications, page 34-60](#).
  - **Custom Panes**—Determine how you want to organize the body of the Portal page. The default is a single column with no internal panes. You can create a multiple-column layout, create internal panes that display text or references to URLs, and determine in which column and row to place the panes. For more information about the settings, see [SSL VPN Customization Dialog Box—Custom Panes, page 34-61](#).
  - **Home Page**—Determine how and whether to display URL lists on the home page, and whether to use your own web page for the main body of the Portal page. For more information about the settings, see [SSL VPN Customization Dialog Box—Home Page, page 34-62](#).
- Step 8** Select **Logout Page** to configure the settings of the page displayed when a user logs out of the SSL VPN. You can configure the title, message text, fonts, and colors. For more information about the settings, see [SSL VPN Customization Dialog Box—Logout Page, page 34-63](#).
- Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-13](#).
- Step 10** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).
- Step 11** Click **OK** to save the object.
- 

## Localizing SSL VPN Web Pages for ASA Devices

Localization is the process of providing text in a language that is appropriate for the target users. When you create an SSL VPN Customization object for defining the look of browser-based clientless SSL VPN web pages hosted on an ASA device, you can configure the pages to use the desired language.

To see localized web pages correctly, users must configure their browsers to use UTF-8 encoding (for example, in Internet Explorer, select **View > Encoding > Unicode (UTF-8)**). They also must install the required fonts or language support files for their language using the Regional and Language Options control panel. On the Languages tab, click Details to install the desired languages, and select the appropriate supplemental language settings for East Asian, complex scripting, and right-left languages. On the Advanced tab, select the desired code page conversion tables. If users do not configure the browser correctly, they might see boxes instead of characters.

There are two techniques you can use to localize SSL VPN web pages that are hosted on an ASA device. These techniques are not mutually exclusive; you can use both of them. These are the techniques:

- **Configure the SSL VPN Customization object using the desired language**—When you create the SSL VPN Customization object, you can enter text for labels and messages in non-English, non-ASCII languages in UTF-8 encoding. To enter non-ASCII languages in UTF-8 encoding, you must configure Windows with the correct locale setting and have the required fonts installed. Use the Regional and Language Options control panel to configure your system and install files required for complex script or East Asian languages. If you want to type in text directly, you also need to install an appropriate keyboard; otherwise, you can use a text editor that supports the language's characters and copy and paste text from a document that contains the text you want to use.

You can also enter non-ASCII languages into SSL VPN Bookmarks objects.

- **Configure translation tables on the ASA device to support the languages you want to make available**—To enable the security appliance to provide language translation for the portal and screens displayed to users, you must define the necessary languages in a translation table and import the table into the security appliance. The software image package for the security appliance includes a translation table template. Every language you list in an SSL VPN Customization object must have a corresponding translation table on the device. Conversely, translation tables for languages that are not listed in the SSL VPN Customization object are ignored.

If you use this technique, you must use the ASA CLI or ASDM to configure and upload the translation tables. You cannot manage the translation tables with Security Manager. However, the SSL VPN Customization object includes settings that allow you to configure automatic browser language selection and to enable users to select their desired language. Thus, if you install translation tables for ten languages, the pages defined in the SSL VPN Customization object will be available to users in all of those languages. For more information on these settings, see [SSL VPN Customization Dialog Box—Language, page 34-54](#).

Although both of the following features require translation tables, they are separate and complementary:

- **Automatic Browser Language Selection**—Automatic browser language selection attempts to select the appropriate language based on the user's browser settings. This technique does not ask for user input. In the SSL VPN Customization object, you create a list of languages that will be used in the negotiation with the browser. During a connection, the security appliance receives a list of languages (and their priorities) from the browser, and looks through your list of languages top to bottom until a match is found. If there is no match, then the language you defined in the list as the default language is used. If you do not specify a default language, English is used.

The languages on the security appliance are labels for the translation tables. The languages must mirror those of the browser, and can consist of groups of up to 8 alphanumeric characters (starting from alpha characters), separated by hyphens. For example, fr-FR-paris-univ8. However, when you add a language to the list in Security Manager, only the first two characters are available.

When looking for a match, the security appliance starts with the longest language name, and if it does not match, it discards the rightmost group of the name. For example, if the preferred language on the browser is fr-FR-paris-univ8, and the security appliance supports fr-FR-paris-univ8, fr-FR-paris, fr-FR, and fr, it matches fr-FR-paris-univ8 and uses the translated strings from that translation table. If fr is the only language on the security appliance, the security appliance considers it a match also, and uses that translation table.

For more information about setting up translation tables, see the user documentation for the ASA device and operating system or the ASDM online help.

- **Language Selector**—By enabling the language selector, you provide the user with the ability to actively select the desired language from a list of languages that you support. This technique does not rely on the browser language settings being configured correctly. The language selector is displayed on the logon page.

## Creating Your Own SSL VPN Logon Page for ASA Devices

You can create your own custom SSL VPN Logon page rather than use the page provided by the security appliance for browser-based clientless SSL VPNs. This is called full customization, and replaces the settings you can configure in the SSL VPN Customization policy object.

To provide your own Logon page, you must create the page, copy it to the Security Manager server, and identify the page on the Full Customization page of the SSL VPN Customization object dialog box. For information on creating SSL VPN Customization objects, see [Configuring ASA Portal Appearance Using SSL VPN Customization Objects, page 31-78](#).

When you enable full customization, all other settings for the Logon page configured in the policy object are ignored. When you deploy your configuration to the ASA device, Security Manager copies your custom page to the device.

The Logon page you create must include all of the HTML code required to present the page correctly, and include special Cisco HTML code that provides the functions for the login form and the Language Selector drop-down list. Keep the following in mind when you create the HTML file:

- The file extension must be **.inc**.
- All images in the custom Logon page must be present on the security appliance. Replace the file path with the keyword **/+CSCOU+/,** which is an internal directory on the ASA device. When you upload an image to the device, it is saved in this directory.
- Use the **cscs\_ShowLoginForm('lform')** Javascript function to add the login form to the page. This form prompts for the username, passwords, and group information. You must include this function somewhere on the page.
- Use the **cscs\_ShowLanguageSelector('selector')** Javascript function to add the Language Selector drop-down list to the page. You do not have to use this function if you are not supporting the use of more than one language.

**Related Topics**

## Configuring SSL VPN Bookmark Lists for ASA and IOS Devices

When you configure a browser-based clientless SSL VPN, you can define a list of bookmarks, or URLs, to include on the SSL VPN portal page. Use SSL VPN bookmarks policy objects to define bookmark lists.

You can create SSL VPN bookmark objects for SSL VPNs hosted on IOS devices or ASA devices. However, these device types allow different bookmark configurations, the ASA device allowing more configuration options than IOS devices. Besides allowing more configuration options, you can also create bookmarks for ASA devices in non-English, non-ASCII languages. For more information on localizing the bookmarks and portal for ASA devices, see [Localizing SSL VPN Web Pages for ASA Devices](#), page 31-80.

After you create the SSL VPN bookmark object as described in this procedure, you can use the object to specify the bookmark object in the **Portal Web Pages** or **Bookmarks** fields in these policies:

- ASA devices—On the **SSL VPN > Clientless** page in an ASA group policy object (see [ASA Group Policies SSL VPN Clientless Settings](#), page 34-12), which you then select in one of these policies:
  - **Remote Access VPN > Group Policies**
  - **Remote Access VPN > Connection Profiles** on the **General** tab
- ASA devices—In the **Remote Access VPN > Dynamic Access** policy, you can specify the SSL VPN bookmark object on the **Main > Bookmarks** tab (see [Main Tab](#), page 32-14).
- IOS devices—On the **Clientless** page in a user group policy object configured for SSL VPN (see [User Group Dialog Box—Clientless Settings](#), page 34-83), which you then select in the **Remote Access VPN > SSL VPN** policy on the **General** tab.

### Related Topics

- [Creating Group Policies \(ASA, PIX 7.0+\)](#), page 31-28
- [Configuring Dynamic Access Policies](#), page 32-2
- [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7
- [Configuring an SSL VPN Policy \(IOS\)](#), page 33-14
- [Creating Policy Objects](#), page 6-9
- [Policy Object Manager](#), page 6-4

---

**Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#), page 6-4).

**Tip** You can also create SSL VPN bookmark objects when you define policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#), page 6-2.

---

**Step 2** Select **SSL VPN Bookmarks** from the Object Type selector. The SSL VPN Bookmarks page opens, displaying a list of the existing SSL VPN bookmark objects.

**Step 3** Right-click in the work area, then select **New Object**.

The Add SSL VPN Bookmark dialog box appears (see [Add or Edit Bookmarks Dialog Boxes](#), page 34-44).

**Step 4** Enter a name for the object and optionally a description of the object.

- Step 5** If you are creating the object for an SSL VPN hosted on an IOS device, you can enter a name for the heading that is displayed above the bookmarks list in the **Bookmarks Heading (IOS)** field.
- Step 6** The Bookmarks table displays any URLs that are defined for the object. To add a bookmark, click the **Add Row** button below the table; to edit an existing bookmark, select it and click the **Edit Row** button. The Add/Edit SSL VPN Bookmark Entry dialog box opens. For more information about the fields on this dialog box, see [Add or Edit Bookmark Entry Dialog Boxes, page 34-45](#).
- In the **Bookmark Option** field, select whether you are defining a bookmark (**Enter Bookmark**) or adding bookmarks from another SSL VPN bookmark object (**Include Existing Bookmarks**). If you are including an existing object, enter the object's name or click **Select** to select it from a list of existing objects.
  - If you are creating the object for use on an IOS device, enter the title of the bookmark, which is displayed to users, and the URL. Be careful to select the correct protocol for the URL. Click **OK** to add the bookmark to the table of bookmarks.
  - If you are creating the object for use on an ASA device, you have many more options. Besides the title and the URL, you can define a subtitle and image icon for the bookmark plus other options.

**Tip** If you choose the protocols RDP, SSH, Telnet, VNC, or ICA, you must configure the plug-in for the protocol in the **Remote Access VPN > SSL VPN > Other Settings** policy (see [Configuring SSL VPN Browser Plug-ins \(ASA\), page 31-60](#)).

You can also configure the bookmark to use the Post method rather than the Get method. If you use Post, you must configure the post parameters by clicking **Add Row** beneath the Post Parameters table. For more information on Post parameters, see these topics:

- [Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks, page 31-84](#)
- [Add and Edit Post Parameter Dialog Boxes, page 34-48](#)

Click **OK** to add the bookmark to the table of bookmarks.

- Step 7** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-13](#).
- Step 8** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).
- Step 9** Click **OK** to save the object.

## Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks

One of the options you have for configuring bookmarks on an SSL VPN hosted on an ASA device is the method used by a URL, either Get or Post. The Get method is the standard method; a user clicks the URL and is taken to the web page. The Post method is useful when processing the data might involve changes to it, for example, storing or updating data, ordering a product, or sending e-mail.

If you choose the Post URL method, you must configure Post parameters for bookmark entries. Because these are often personalized resources that contain the user ID and password or other input parameters, you might need to define clientless SSL VPN macro substitutions.

Clientless SSL VPN macro substitutions let you configure users for access to personalized resources that contain the user ID and password or other input parameters. Examples of such resources include bookmark entries, URL lists, and file shares.

**Note**

For security reasons, password substitutions are disabled for file access URLs (cifs://). Also for security reasons, use caution when introducing password substitutions for web links, especially for non-SSL instances.

You can use the following macro substitutions:

- **Logon Information Substitutions**— The security appliance obtains values for these substitutions from the SSL VPN Logon page. It recognizes these strings in user requests, and replaces them with the value specific to the user before it passes the request on to a remote server.

These are the available macro substitutions:

- **CSCO\_WEBVPN\_USERNAME**  
The username used to log into the SSL VPN.
- **CSCO\_WEBVPN\_PASSWORD**  
The password used to log into the SSL VPN.
- **CSCO\_WEBVPN\_INTERNAL\_PASSWORD**  
The internal resource password entered when logging into the SSL VPN.
- **CSCO\_WEBVPN\_CONNECTION\_PROFILE**  
The connection profile associated with the user group selected when logging into the SSL VPN.

For example, if a URL list contains the link `http://someserver/homepage/CSCO_WEBVPN_USERNAME.html`, the security appliance translates it to the following unique links:

- For USER1 the link becomes `http://someserver/homepage/USER1.html`
- For USER2 the link is `http://someserver/homepage/USER2.html`

In the following example, `cifs://server/users/CSCO_WEBVPN_USERNAME` lets the security appliance map a file drive to specific users:

- For USER1 the link becomes `cifs://server/users/USER1`
  - For USER2 the link is `cifs://server/users/USER2`
- **RADIUS/LDAP Vendor-Specific Attributes (VSAs)**—These substitutions let you set substitutions configured on either a RADIUS or an LDAP server. These are the available macro substitutions:
    - **CSCO\_WEBVPN\_MACRO1**
    - **CSCO\_WEBVPN\_MACRO2**

For information on configuring bookmarks, see [Configuring SSL VPN Bookmark Lists for ASA and IOS Devices](#), page 31-83.

## Configuring SSL VPN Smart Tunnels for ASA Devices

A smart tunnel is a connection between an application running on a user's workstation and a private site. The connection uses a clientless (browser-based) SSL VPN session with the security appliance as the pathway and proxy server. Smart tunnels do not require the user to connect the application to the local

port, so the application can gain access to the network without giving the user administrative privileges, as is required for full tunnel support. If you do not otherwise configure the network to allow access to an application, you can create a smart tunnel for those applications that you want to support.

You can configure smart tunnel access to an application under the following conditions:

- The application is a Winsock 2, TCP-based application and there is a browser plug-in for the application. Cisco distributes plug-ins for some applications for use in clientless SSL VPN, including SSH (for both SSH and Telnet sessions), RDP, and VNC. You must supply or obtain plug-ins for any other applications. Configure plug-ins in the **Remote Access VPN > SSL VPN > Other Settings** policy on the Plug-Ins tab.
- The user's workstation is a supported platform. See the Cisco ASA 5500 Series Adaptive Security Appliances documentation that corresponds with your ASA version for supported platforms, [http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html).

Users of Microsoft Windows Vista who use smart tunnels (or port forwarding) must add the URL of the ASA device to the Trusted Site zone. Configure the Trusted Site zone in Internet Explorer (**Tools > Internet Options, Security** tab).

- The user's browser must be enabled with Java, Microsoft ActiveX, or both.
- If the user's workstation requires a proxy server to reach the security appliance, the URL of the terminating end of the connection must be in the list of URLs excluded from proxy services. In this configuration, smart tunnels support only basic authentication.

**Tip**

A stateful failover does not retain smart tunnel connections. Users must reconnect following a failover.

You configure smart tunnel access for an application by creating an SSL VPN smart tunnel list policy object and including that object in an ASA group policy object. You then assign the ASA group policy object to a device in the **Remote Access VPN > Group Policies** policy.

#### Related Topics

- [Understanding Group Policies \(ASA\), page 31-27](#)
- [Creating Policy Objects, page 6-9](#)
- [Policy Object Manager, page 6-4](#)

**Step 1** Create an SSL VPN smart tunnel list policy object:

- Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)), and select **SSL VPN Smart Tunnel Lists** from the table of contents.

**Tip**

You can also create SSL VPN smart tunnel list objects when you create or edit the ASA group policy object. For more information, see [Selecting Objects for Policies, page 6-2](#).

- Click the **Add Object** button to open the [Add and Edit Smart Tunnel List Dialog Boxes, page 34-66](#).
- Enter a name for the object, up to 64 characters.
- To the table of applications, add those applications for which you are granting smart tunnel access (click the **Add Row** button to open the [Add and Edit A Smart Tunnel Entry Dialog Boxes, page 34-67](#)). Consider the following:

- Enter an application name that is easy to understand and include version numbers if you support more than one version. For example, Microsoft Outlook.
- For the application path, entering only the filename, for example, outlook.exe, is the simplest and most maintainable option. This allows the user to install the application in any folder. Enter the full path if you want to enforce a specific installation structure.
- Hash values are optional, but you can use them to prevent spoofing. Without hash values, a user can rename an application to a supported filename; the security appliance checks only the filename and path (if specified). However, if you enter hash values, you must maintain them as users apply patches or application upgrades. For specific information on determining hash values, see [Add and Edit A Smart Tunnel Entry Dialog Boxes](#), page 34-67.

Click **OK** to save the entry.

- e. You can also incorporate other SSL VPN smart list objects into the object. This allows you to create a core set of smart list objects that you can use repeatedly in other objects.
- f. Click **OK** to save the object.

**Step 2** (Optional) Create an SSL VPN smart tunnel auto sign-on list policy object:

- a. Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#), page 6-4), and select **SSL VPN Smart Tunnel Auto Signon Lists** from the table of contents.

**Tip**

You can also create SSL VPN smart tunnel auto sign-on list objects when you create or edit the ASA group policy object. For more information, see [Selecting Objects for Policies](#), page 6-2.

- b. Click the **Add Object** button to open the [Add and Edit Smart Tunnel Auto Signon List Dialog Boxes](#), page 34-71.
- c. Enter a name for the object, up to 64 characters.
- d. To the table of smart tunnel auto sign-on entries, add the servers for which to automate the submission of login credentials during smart tunnel setup (click the **Add Row** button to open the [Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes](#), page 34-72).
- e. You can also incorporate other SSL VPN smart tunnel auto sign-on list objects into the object. This allows you to create a core set of smart tunnel auto sign-on list objects that you can use repeatedly in other objects.
- f. Click **OK** to save the object.

**Step 3** Configure the ASA group policy object to use the SSL VPN smart tunnel list object:

- a. Edit (or create) the ASA group policy object either from the [Policy Object Manager](#), page 6-4 or the **Remote Access VPN > Group Policies** policy. The object must be configured to support SSL VPNs. (You can also edit these objects from the **Remote Access VPN > Connection Profiles** policy from an individual profile.)
- b. Select the **SSL VPN > Clientless** folder from the table of contents to open [ASA Group Policies SSL VPN Clientless Settings](#), page 34-12.
- c. Enter the name of the SSL VPN smart tunnel list object in the **Smart Tunnel** field.
- d. Select **Auto Start Smart Tunnel** to automatically start smart tunnels for the applications when the user connects to the SSL VPN portal.

If you do not select this option, users must start smart tunnel access using the **Application Access > Start Smart Tunnels** button on the clientless SSL VPN portal page.

- e. Enter the name of the SSL VPN smart tunnel auto sign-on list object in the **Smart Tunnel Auto Signon Server List** field.
- f. If the universal naming convention (domain\username) is required for authentication, specify the Windows domain to add it to the username during auto sign-on in the **Domain Name** field. For example, enter CISCO to specify CISCO\qa\_team when authenticating for the username qa\_team. You must also check the Use Domain option when configuring associated entries in the auto sign-on server list.

## Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs

### Note

From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Clientless SSL VPN uses WINS and the Common Internet File System (CIFS) protocol to access or share files, printers, and other machine resources on remote systems. The ASA or IOS device uses a proxy CIFS client to provide this access transparently; users appear to have direct access to the file systems (subject to individual file and user permissions).

When users attempt a file-sharing connection to a Windows computer by using its computer name, the file server they specify corresponds to a specific WINS name that identifies a resource on the network. The security appliance queries WINS or NetBIOS name servers to map WINS names to IP addresses. SSL VPN requires NetBIOS to access or share files on remote systems.

You use WINS server list policy objects to configure the list of WINS servers that are used to resolve these Microsoft file-directory share names. The WINS server list objects define the NetBIOS Name Service (NBNS) server list on the device (using the **nbns-list** and **nbns-server** commands) for Common Internet File System (CIFS) name resolution.

After creating the WINS server list policy object, you can configure it in the following policies and policy objects, and also select the file access services that you want to allow:

- ASA devices—In the **Remote Access VPN > Connection Profiles** policy, specify the WINS server list object on the **SSL** tab (see [SSL Tab \(Connection Profiles\)](#), page 31-22).

Select the file access options on the **SSL VPN > Clientless** page in an ASA group policy object (see [ASA Group Policies SSL VPN Clientless Settings](#), page 34-12), which you then select in one of these policies:

- **Remote Access VPN > Group Policies**
- **Remote Access VPN > Connection Profiles** on the **General** tab
- IOS devices—On the **Clientless** page in a user group policy object configured for SSL VPN (see [User Group Dialog Box—Clientless Settings](#), page 34-83), which you then select in the **Remote Access VPN > SSL VPN** policy on the **General** tab.

### Related Topics

- [Creating Policy Objects](#), page 6-9

**Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#), page 6-4.

**Tip**

You can also create WINS server list objects when defining policies or objects that use this object type. For more information, see [Selecting Objects for Policies, page 6-2](#).

---

**Step 2** Select **WINS Server Lists** from the Object Type selector.

The WINS Server List page opens, displaying the currently defined WINS server list objects.

**Step 3** Right-click in the work area and select **New Object** to open the [Add or Edit WINS Server List Dialog Box, page 34-89](#).

**Step 4** Enter a name for the object and optionally a description of the object.

**Step 5** Click the **Add Row** button below the table, or select a server in the table and click **Edit Row**, to configure the WINS servers defined in the object. Configure these settings:

- **Server**—The IP address of the WINS server. You can select a network/host object or enter the address directly.
- **Set as Master Browser**—Select this option if the server is a primary browser, which maintains the list of computers and shared resources.

Other fields are optional; change them if you want non-default values. For more information, see [Add or Edit WINS Server Dialog Box, page 34-90](#).

Click **OK** to save your changes.

**Step 6** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-13](#).

**Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).

**Step 8** Click **OK** to save the object.

---

## Managing Dynamic Access Policies for Remote Access VPNs (ASA 8.0+ Devices)

---

This chapter explains Dynamic Access Policies (DAP) for assigning remote access users to connection profiles (tunnel groups). You can configure these policies for remote access IKEv1 IPsec on ASA 8.0+ devices, IKEv2 IPsec on ASA 8.4(x) devices, and SSL VPNs on ASA 8.0+ (except 8.5) devices.

For information on configuring other remote access policies for ASA and PIX 7.0+ devices, see [Chapter 31, “Managing Remote Access VPNs on ASA and PIX 7.0+ Devices”](#).

This chapter contains the following topics:

- [Understanding Dynamic Access Policies, page 32-1](#)
- [Configuring Dynamic Access Policies, page 32-2](#)
- [Dynamic Access Page \(ASA\), page 32-11](#)

### Understanding Dynamic Access Policies

Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles each user may inhabit within an organization, and logins from remote access sites with different configurations and levels of security. The task of authorizing users is much more complicated in a VPN environment than it is in a network with a static configuration.

Dynamic access policies (DAP) on a security appliance let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. These attributes address issues of multiple group membership and endpoint security. That is, the security appliance grants access to a particular user for a particular session based on the policies you define. It generates a DAP at the time the user connects by selecting and/or aggregating attributes from one or more DAP records. It selects these DAP records based on the endpoint security information of the remote device and the AAA authorization information for the authenticated user. It then applies the DAP record to the user tunnel or session. The DAP system includes the following components that require your attention:

- **DAP Selection Configuration File**—A text file containing criteria that the security appliance uses for selecting and applying DAP records during session establishment. It is stored on the security appliance. You can use Security Manager to modify it and upload it to the security appliance in XML data format. DAP selection configuration files include all of the attributes that you configure. These can include AAA attributes, endpoint attributes, and access policies as configured in network and web-type ACL filter, port forwarding, and URL lists.

- **DfltAccess Policy**—Always the last entry in the DAP summary table, always with a priority of 0. You can configure Access Policy attributes for the default access policy, but it does not contain—and you cannot configure—AAA or endpoint attributes. You cannot delete the DfltAccessPolicy, and it must be the last entry in the summary table.

**Tip**

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

**Integration of Cisco Secure Desktop with DAP**

The security appliance integrates the Cisco Secure Desktop (CSD) features into dynamic access policies (DAPs). Depending on the configuration, the security appliance uses one or more endpoint attribute values in combination with optional, AAA attribute values as conditions for assigning a DAP. The Cisco Secure Desktop features supported by the endpoint attributes of DAPs include OS detection, prelogin policies, Basic Host Scan results, and Endpoint Assessment.

As an administrator, you can specify a single attribute or combine attributes that together form the conditions required to assign a DAP to a session. The DAP provides network access at the level that is appropriate for the endpoint AAA attribute value. The security appliance applies a DAP when all of its configured endpoint criteria are satisfied.

**Note**

Cisco Security Manager supports only Host Scan version 4.3.

**Related Topics**

- [Configuring Dynamic Access Policies, page 32-2](#)
- [Configuring DAP Attributes, page 32-7](#)

## Configuring Dynamic Access Policies

This procedure describes how to create or edit a dynamic access policy.

**Related Topics**

- [Understanding Dynamic Access Policies, page 32-1](#)
- [Understanding DAP Attributes, page 32-4](#)
- [Configuring Cisco Secure Desktop Policies on ASA Devices, page 32-9](#)

**Step 1**

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Dynamic Access page opens. For a description of the elements on this page, see [Dynamic Access Page \(ASA\), page 32-11](#).

**Step 2**

Click **Create** or select a policy in the table and click **Edit**.

The Add/Edit Dynamic Access Policy dialog box opens, with the Main tab open by default. For a description of the elements in this dialog box, see [Table 32-4 on page 32-13](#).

- Step 3** Enter the name of the DAP record (up to 128 characters).
- Step 4** Specify a priority for the DAP record. The security appliance applies access policies in the order you set here, highest number having the highest priority.
- Step 5** Enter a description for the DAP record.
- Step 6** In the **Main** tab, configure the DAP attributes and the type of remote access method supported by the DAP system on your security appliance. For a detailed description of the elements on this tab, see [Table 32-5 on page 32-14](#).
- Click **Create** below the table, or select a DAP entry in the table and click **Edit**. The Add/Edit DAP Entry dialog box opens. For a description of the elements on this dialog box, see [Add/Edit DAP Entry Dialog Box, page 32-21](#).  
  
For a full description of the procedure to define the DAP attributes, see [Configuring DAP Attributes, page 32-7](#).
  - Select the type of remote access permitted by the DAP system.
  - Select the **Network ACL** tab to select and configure network ACLs to apply to this DAP record. Beginning with Security Manager version 4.10, you can select Unified ACL entries in addition to Extended entries.  
  
This tab is available only if you selected an access method other than Web Portal.
  - Select the **WebType ACL** tab to select and configure Web-type ACLs to apply to this DAP record.  
  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Functions** tab to configure file server entry and browsing, HTTP proxy, and URL entry for the DAP record.  
  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Port Forwarding** tab to select and configure port forwarding lists for user sessions.  
  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Bookmark** tab to select and configure URL lists for user sessions.  
  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Action** tab to configure the type of remote access permitted.  
  
This tab is available for all types of access methods.
  - Select the **AnyConnect** tab to choose if the setting for Always-On VPN on the AnyConnect service profile remains unchanged, is disabled, or the AnyConnect Profile Setting must be used. Always-On VPN enables AnyConnect to automatically establish a VPN session after you log onto the system.
  - Select the **Custom Attributes** tab to add AnyConnect Custom Attributes.  
  
This tab is available only if you selected the access method as Unchanged, AnyConnect Client, Both Default Web Portal, or Both Default Anyconnect Client. For information about how to add AnyConnect Custom Attributes, see [Add/Edit AnyConnect Custom Attribute Dialog Box, page 31-71](#).
- Step 7** Select the **Logical Operations** tab to create multiple instances of each type of endpoint attribute. For a description of the elements on this tab, see [Table 32-22 on page 32-43](#).
- Step 8** Select the **Advanced Expressions** tab to set additional attributes for the DAP using free-form LUA. For a description of the elements on this tab, see [Table 32-23 on page 32-45](#).
- Step 9** Click **OK**.
-

## Understanding DAP Attributes

DAP records include all of the attributes that you configure. These can include AAA attributes, endpoint attributes, and access policies as configured in network and web-type ACL filter, port forwarding and URL lists.

### DAP and AAA Attributes

DAP complements AAA services. It provides a limited set of authorization attributes that can override those AAA provides. The security appliance selects DAP records based on the AAA authorization information for the user and posture assessment information for the session. The security appliance can select multiple DAP records depending on this information, which it then aggregates to create DAP authorization attributes.

You can specify AAA attributes from the Cisco AAA attribute hierarchy, or from the full set of response attributes that the security appliance receives from a RADIUS or LDAP server.

### AAA Attribute Definitions

[Table 32-1 on page 32-4](#) defines the AAA selection attribute names that are available for DAP use. The Attribute Name field shows you how to enter each attribute name in a LUA logical expression, which you might do on the Advanced tab of the Add/Edit Dynamic Access Policy dialog box.

**Table 32-1 AAA Attribute Definitions**

| Attribute Type | Attribute Name        | Source | Value  | Max String Length | Description                 |
|----------------|-----------------------|--------|--------|-------------------|-----------------------------|
| Cisco          | aaa.cisco.memberof    | AAA    | string | 128               | memberof value              |
|                | aaa.cisco.username    | AAA    | string | 64                | username value              |
|                | aaa.cisco.class       | AAA    | string | 64                | class attribute value       |
|                | aaa.cisco.ipaddress   | AAA    | number | –                 | framed-ip address value     |
|                | aaa.cisco.tunnelgroup | AAA    | string | 64                | tunnel-group name           |
| LDAP           | aaa.ldap.<label>      | LDAP   | string | 128               | LDAP attribute value pair   |
| RADIUS         | aaa.radius.<number>   | RADIUS | string | 128               | Radius attribute value pair |

### DAP and Endpoint Security

The security appliance obtains endpoint security attributes by using posture assessment methods that you configure. These include Cisco Secure Desktop and NAC. You can use a match of a prelogin policy, Basic Host Scan entry, Host Scan Extension, or any combination of these and any other policy attributes to assign access rights and restrictions. At minimum, configure DAPs to assign to each prelogin policy and Basic Host Scan entry.

Endpoint Assessment, a Host Scan extension, examines the remote computer for a large collection of antivirus and antispymware applications, associated definitions updates, and firewalls. You can use this feature to combine endpoint criteria to satisfy your requirements before the security appliance assigns a specific DAP to the session.

### DAP and Anti-Virus, Anti-Spyware, and Personal Firewall Programs

The security appliance uses a DAP policy when the user attributes matches the configured AAA and endpoint attributes. The Prelogin Assessment and Host Scan modules of Cisco Secure Desktop return information to the security appliance about the configured endpoint attributes, and the DAP subsystem uses that information to select a DAP record that matches the values of those attributes. Most, but not all, anti-virus, anti-spyware, and personal firewall programs support active scan, which means that the programs are memory-resident, and therefore always running. Host Scan checks to see if an endpoint has a program installed, and if it is memory-resident as follows:

- If the installed program does not support active scan, Host Scan reports the presence of the software. The DAP system selects DAP records that specify the program.
- If the installed program does support active scan, and active scan is enabled for the program, Host Scan reports the presence of the software. Again the security appliance selects DAP records that specify the program.
- If the installed program does support active scan and active scan is disabled for the program, Host Scan ignores the presence of the software. The security appliance does not select DAP records that specify the program. Further, the output of the **debug trace** command, which includes a lot of information about DAP, does not indicate the program presence, even though it is installed.

### Endpoint Attribute Definitions

Table 32-2 on page 32-5 defines the endpoint selection attribute names that are available for DAP use. The Attribute Name field shows you how to enter each attribute name in a LUA logical expression, which you might do on the Advanced tab of the Add/Edit Dynamic Access Policy dialog box. The *label* variable identifies the application, filename, process, or registry entry.

**Table 32-2** Endpoint Attribute Definitions

| Attribute Type                                       | Attribute Name                | Source       | Value   | Max String Length | Description                                     |
|------------------------------------------------------|-------------------------------|--------------|---------|-------------------|-------------------------------------------------|
| Antispyware<br>(Requires<br>Cisco Secure<br>Desktop) | endpoint.as.label.exists      | Host<br>Scan | true    | –                 | Antispyware program exists                      |
|                                                      | endpoint.as.label.version     |              | string  | 32                | Antispyware description                         |
|                                                      | endpoint.as.label.description |              | string  | 128               | class attribute value                           |
|                                                      | endpoint.as.label.lastupdate  |              | integer | –                 | Seconds since update of antispyware definitions |
| Antivirus<br>(Requires<br>Cisco Secure<br>Desktop)   | endpoint.av.label.exists      | Host<br>Scan | true    | –                 | Antivirus program exists                        |
|                                                      | endpoint.av.label.version     |              | string  | 32                | Antivirus description                           |
|                                                      | endpoint.av.label.description |              | string  | 128               | class attribute value                           |
|                                                      | endpoint.av.label.lastupdate  |              | integer | –                 | Seconds since update of antivirus definitions   |

**Table 32-2 Endpoint Attribute Definitions (continued)**

|                                             |                                  |                |                 |     |                                                                                            |
|---------------------------------------------|----------------------------------|----------------|-----------------|-----|--------------------------------------------------------------------------------------------|
| Application                                 | endpoint.application.clienttype  | Application    | string          | –   | Client type:<br>CLIENTLESS<br>ANYCONNECT<br>IPSEC<br>L2TP                                  |
| File                                        | endpoint.file.label.exists       | Secure Desktop | true            | –   | The files exists                                                                           |
|                                             | endpoint.file.label.lastmodified |                | integer         | –   | Seconds since file was last modified                                                       |
|                                             | endpoint.file.label.crc32        |                | integer         | –   | CRC32 hash of the file                                                                     |
| NAC                                         | endpoint.nac.status              | NAC            | string          | -   | User defined status string                                                                 |

|                                             | endpoint.registry.label.value    |                | string          | 255 | Value of the registry entry                                                                |
| VLAN                                        | endpoint.vlan.type               | CNA            | string          | –   | VLAN type:<br>ACCESS<br>AUTH<br>ERROR<br>GUEST<br>QUARANTINE<br>ERROR<br>STATIC<br>TIMEOUT |

**About Advanced Expressions for AAA or Endpoint Attributes**

In the text box you enter free-form LUA text that represents AAA and/or endpoint selection logical operations. ASDM does not validate text that you enter here; it just copies this text to the DAP policy file, and the security appliance processes it, discarding any expressions it cannot parse.

This option is useful for adding selection criteria other than what is possible in the AAA and endpoint attribute areas above. For example, while you can configure the security appliance to use AAA attributes that satisfy any, all, or none of the specified criteria, endpoint attributes are cumulative, and must all be satisfied. To let the security appliance employ one endpoint attribute or another, you need to create appropriate logical expressions in LUA and enter them here.

### Examples of DAP Logical Expressions

Study these examples for help in creating logical expressions in LUA.

- This AAA LUA expression tests for a match on usernames that begin with "b". It uses the string library and a regular expression:

```
not(string.find(aaa.cisco.username, "^b") == nil)
```

- This endpoint expression tests for a match on CLIENTLESS OR CVC client types:

```
endpoint.application.clienttype=="CLIENTLESS" or endpoint.application.clienttype=="CVC"
```

- This endpoint expression tests for Norton Antivirus versions 10.x but excludes 10.5.x:

```
(endpoint.av.NortonAV.version > "10" and endpoint.av.NortonAV.version < "10.5") or
endpoint.av.NortonAV.version > "10.6"
```

### DAP Connection Sequence

The following sequence outlines a typical remote access connection establishment.

1. A remote client attempts a VPN connection.
2. The security appliance performs posture assessment, using configured NAC and Cisco Secure Desktop Host Scan values.
3. The security appliance authenticates the user via AAA. The AAA server also returns authorization attributes for the user.
4. The security appliance applies AAA authorization attributes to the session, and establishes the VPN tunnel.
5. The security appliance selects DAP records based on the user AAA authorization information and the session posture assessment information.
6. The security appliance aggregates DAP attributes from the selected DAP records, and they become the DAP policy.
7. The security appliance applies the DAP policy to the session.

## Configuring DAP Attributes

The attributes you must define for a DAP policy include specifying the authorization attributes and endpoint attributes. You can also configure network and webtype ACLs, file browsing, file server entry, HTTP proxy, URL entry, port forwarding lists and URL lists.

This procedure describes how to create or edit the AAA and endpoint attributes required for a DAP policy.

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- The Dynamic Access page opens. For a description of the elements on this page, see [Dynamic Access Page \(ASA\), page 32-11](#).
- Step 2** Click **Create** on the Dynamic Access policy page, or select the row of a policy in the table on the page, and click **Edit**.
- The Add/Edit Dynamic Access Policy dialog box opens, displaying the Main tab. For a description of the elements on the Main tab, see [Main Tab, page 32-14](#).
- Step 3** Click **Create** below the table, or select a DAP entry in the table and click **Edit**. The Add/Edit DAP Entry dialog box opens. For a description of the elements on this dialog box, see [Add/Edit DAP Entry Dialog Box, page 32-21](#).
- Step 4** Select the attribute type from the Criterion list, then enter the appropriate values. The dialog box values vary based on your selection. Options are:
- AAA Attributes Cisco; see [Table 32-6 on page 32-23](#).
  - AAA Attributes LDAP; see [Table 32-7 on page 32-25](#).
  - AAA Attributes RADIUS; see [Table 32-8 on page 32-26](#).
  - Anti-Spyware; see [Table 32-9 on page 32-27](#).
  - Anti-Virus; see [Table 32-10 on page 32-28](#).
  - AnyConnect Identity; see [Table 32-11 on page 32-29](#).
  - Application; see [Table 32-12 on page 32-30](#).
  - Device; see [Table 32-13 on page 32-31](#).
  - File; see [Table 32-14 on page 32-32](#).
  - NAC; see [Table 32-15 on page 32-33](#).
  - Operating System; see [Table 32-16 on page 32-34](#).
  - Personal Firewall; see [Table 32-17 on page 32-35](#).
  - Policy; see [Table 32-18 on page 32-36](#).
  - Process; see [Table 32-19 on page 32-36](#).
  - Registry; see [Table 32-20 on page 32-38](#).
  - Multiple Certificate Authentication; see [Table 32-21 on page 32-39](#)

**Step 5** Click **OK**.

---

## Configuring Cisco Secure Desktop Policies on ASA Devices

Cisco Secure Desktop (CSD) provides a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system. CSD provides a session-based interface where sensitive data is shared only for the duration of an SSL VPN session. All session information is encrypted, and all traces of the session data are removed from the remote client when the session is terminated, even if the connection terminates abruptly. This ensures that cookies, browser history, temporary files, and downloaded content do not remain on a system.

When the session closes, CSD overwrites and removes all data using a U.S. Department of Defense (DoD) sanitation algorithm to provide endpoint security protection.

### Note

A complete explanation of the capabilities and configuration of the Cisco Secure Desktop program is beyond the scope of this document. For information about configuring CSD, and what CSD can do for you, see the materials available online at [http://www.cisco.com/en/US/products/ps6742/tsd\\_products\\_support\\_configure.html](http://www.cisco.com/en/US/products/ps6742/tsd_products_support_configure.html). Select the configuration guide for the CSD version you are configuring.

---

This procedure describes how to configure the Cisco Secure Desktop feature on an ASA device.

### Before You Begin

- Make sure a connection profile policy has been configured on the device. See [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 31-7.

### Related Topics

- [Understanding and Managing SSL VPN Support Files](#), page 30-5

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Dynamic Access page opens. For a description of the elements on this page, see [Dynamic Access Page \(ASA\)](#), page 32-11.

**Step 2** In the Cisco Secure Desktop section, select **Enable CSD** to enable CSD on the ASA device.

### Note

The Enable CSD option is available for devices running ASA version less than ASA 9.5(2). Beginning with Security Manager 4.10, a new check box is available to configure Hostscan (to disable CSD) only for devices running the ASA version 9.5(2) or later.

---

**Step 3** In the **CSD Package** field, specify the name of the File Object that identifies the Cisco Secure Desktop package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see [Add and Edit File Object Dialog Boxes](#), page 34-37.

**Note** The package version must be compatible with the ASA operating system version. When you create a local policy in Device view, the **Version** field indicates the CSD package version you should select. (The version is included in the package file name. For example, `securedesktop-asa_k9-3.3.0.118.pkg` is CSD version 3.3.0.118.) When you create a shared policy in Policy view, the **Version** field indicates the version of the CSD file you selected. For more information on version compatibility, see [Understanding and Managing SSL VPN Support Files, page 30-5](#).

**Step 4** (Optional) In the **Hostscan Package** field, specify the name of the File Object that identifies the Host Scan package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see [Add and Edit File Object Dialog Boxes, page 34-37](#).

**Step 5** Click **Configure** to open the Cisco Secure Desktop Manager (CSDM) Policy Editor that lets you configure CSD on the security appliance. This application is independent of Security Manager; read the CSD documentation cited above for an explanation of how to use the policy editor.

The editor contains these main items (select them in the table of contents):

- **Prelogin Policies**—This is a decision tree. When a user attempts a connection, the user's system is evaluated against your rules and the first rule that matches is applied. Typically, you create policies for secure locations, home locations, and insecure public locations. You can make your checks based on registry information, the presence of specific files or certificates, the workstation's operating system, or IP address.

All editing is done through the right-click menu. Right click on boxes or + signs to activate related settings, if any.

For end nodes, you can select these options:

- **Access Denied**—Workstations that match your criteria are prevented from accessing the network.
- **Policy**—You want to define a specific admission policy at this point. After naming the policy, it is added to the table of contents. Select each item in the policy and configure its settings.
- **Subsequence**—You want to perform additional checks. Enter the name of the next decision tree that you want to evaluate for this workstation.
- **Host scan**—You can specify a set of registry entries, file names, and process names, which form a part of the basic host scan. The host scan occurs after the prelogin assessment but before the assignment of a dynamic access policy. Following the basic host scan, the security appliance uses the login credentials, the host scan results, prelogin policy, and other criteria you configure to assign a dynamic access policy. You can also enable:
  - **Endpoint Assessment**—The remote workstation scans for a large collection of antivirus, antispyware, and personal firewall applications, and associated updates.
  - **Advanced Endpoint Assessment**—Includes all of the Endpoint Assessment features, and lets you configure an attempt to update noncompliant workstations to meet the version requirements you specify. You must purchase and install a license for this feature before you can configure it.

# Dynamic Access Page (ASA)

Use the Dynamic Access page to view the dynamic access policies (DAP) defined on the security appliance. From this page, you can create, edit, or delete DAPs.

Use the Cisco Secure Desktop section to enable and download the Cisco Secure Desktop (CSD) software on the selected ASA device. Cisco Secure Desktop provides a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session.

## Note

The CSD client software must be installed and activated on a device in order for an SSL VPN policy to work properly.

## Tip

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

## Navigation Path

- (Device View) Select an ASA device; then select **Remote Access VPN > Dynamic Access (ASA)** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

See <a href="#">Add/Edit Dynamic Access Policy Dialog Box, page 32-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Delete button        | Click this button to delete the selected dynamic access policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Cisco Secure Desktop | For the procedure to configure CSD on an ASA device, see <a href="#">Configuring Cisco Secure Desktop Policies on ASA Devices, page 32-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable CSD           | When selected, enables the CSD on the device. Enabling CSD loads the specified Cisco Secure Desktop package. If you transfer or replace the CSD package file, disable and then enable CSD to load the file.                                                                                                                                                                                                                                                                                                                                                                                           |
| CSD Package          | Specify the name of the File Object that identifies the Cisco Secure Desktop package you want to upload to the device.<br><br>Click <b>Select</b> to select an existing File Object or to create a new one. For more information, see <a href="#">Add and Edit File Object Dialog Boxes, page 34-37</a> .                                                                                                                                                                                                                                                                                             |
| Hostscan Package     | Specify the name of the File Object that identifies the Hostscan package you want to upload to the device.<br><br>Click <b>Select</b> to select an existing File Object or to create a new one. For more information, see <a href="#">Add and Edit File Object Dialog Boxes, page 34-37</a> .                                                                                                                                                                                                                                                                                                         |
| Version              | The package version must be compatible with the ASA operating system version. When you create a local policy in Device view, the Version field indicates the CSD package version you should select. (The version is included in the package file name. For example, <code>securedesktop-asa_k9-3.3.0.118.pkg</code> is CSD version 3.3.0.118.) When you create a shared policy in Policy view, the Version field indicates the version of the CSD file you selected. For more information on version compatibility, see <a href="#">Understanding and Managing SSL VPN Support Files, page 30-5</a> . |
| Configure            | Click <b>Configure</b> to open the Cisco Secure Desktop Manager (CSDM) Policy Editor that lets you configure CSD on the security appliance. For a description of the elements in this dialog box, see <a href="#">Cisco Secure Desktop Manager Policy Editor Dialog Box, page 32-46</a> .                                                                                                                                                                                                                                                                                                             |

## Add/Edit Dynamic Access Policy Dialog Box

Use the Add/Edit Dynamic Access Policy dialog box to configure the dynamic access policies (DAP) on your security appliance. You can specify a name for the dynamic access policy that you are adding, select the priority, specify attributes in a LUA expression, and set attributes for network and webtype ACL filters, file access, HTTP proxy, URL entry and lists, port forwarding, and clientless SSL VPN access methods.

### Note

For detailed information about dynamic access policy attributes, see [Understanding DAP Attributes, page 32-4](#)

These tabs are available in the Add/Edit Dynamic Access Policy dialog box:

- [Main Tab, page 32-14](#)
- [Logical Operations Tab, page 32-42](#)
- [Advanced Expressions Tab, page 32-44](#)

#### Navigation Path

Open the [Dynamic Access Page \(ASA\), page 32-11](#), then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit Dynamic Access Policy dialog box is displayed.

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                     | The name of the dynamic access policy record (up to 128 characters).                                                                                                                                                                                                                                                                                                                                                                          |
| Priority                 | A priority for the dynamic access policy record. The security appliance applies access policies in the order you set here, highest number having the highest priority. In the case of dynamic access policy records with the same priority setting and conflicting ACL rules, the most restrictive rule applies.<br><br>Priority is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices. |
| Description              | Additional information about the dynamic access policy record (up to 1024 characters).<br><br>Description is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices.                                                                                                                                                                                                                        |
| Main tab                 | Enables you to add a dynamic access policy entry and set attributes for the access policy depending on the type of remote access that you configure.<br><br>For a description of the elements on this tab, see <a href="#">Main Tab, page 32-14</a> .                                                                                                                                                                                         |
| Logical Operations tab   | Enables you to create multiple instances of each type of endpoint attribute.<br><br>For a description of the elements on this tab, see <a href="#">Logical Operations Tab, page 32-42</a> .                                                                                                                                                                                                                                                   |
| Advanced Expressions tab | Enables you to configure one or more logical expressions to set AAA or endpoint attributes other than what is possible in the AAA and Endpoint areas.<br><br>For a description of the elements on this tab, see <a href="#">Advanced Expressions Tab, page 32-44</a> .                                                                                                                                                                        |

## Main Tab

Use the Main tab of the Add/Edit Dynamic Access Policy dialog box to configure the dynamic access policy attributes and the type of remote access method supported your security appliance. You can set attributes for network and webtype ACL filters, file access, HTTP proxy, URL entry and lists, port forwarding, and clientless SSL VPN access methods.

### Navigation Path

The Main tab appears when you open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 32-12.

**Table 32-5** Add/Edit Dynamic Access Policy Dialog Box > Main Tab

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria ID   | The AAA and endpoint selection attribute names that are available for dynamic access policy use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Content       | Values of the AAA and endpoint attributes criteria that the security appliance uses for selecting and applying a dynamic access policy record during session establishment. Attribute values that you configure here override authorization values in the AAA system, including those in existing group policy, tunnel group, and default group records.                                                                                                                                                                                                                              |
| Create button | Click this button to configure AAA and endpoint attributes as selection criteria for the DAP record. See <a href="#">Add/Edit DAP Entry Dialog Box</a> , page 32-21.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Edit button   | Click this button to edit the selected dynamic access policy. See <a href="#">Add/Edit DAP Entry Dialog Box</a> , page 32-21.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Delete button | Click this button to delete the selected dynamic access policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Access Method | Specify the type of remote access permitted: <ul style="list-style-type: none"> <li>• <b>Unchanged</b>—Continue with the current remote access method.</li> <li>• <b>AnyConnect Client</b>—Connect using the Cisco AnyConnect VPN Client.</li> <li>• <b>Web Portal</b>—Connect with clientless VPN.</li> <li>• <b>Both default Web Portal</b>—Connect via either clientless or the AnyConnect client, with a default of clientless.</li> <li>• <b>Both default AnyConnect Client</b>—Connect via either clientless or the AnyConnect client, with a default of AnyConnect.</li> </ul> |

Network ACL tab—Lets you select and configure network ACLs to apply to this dynamic access policy. An ACL for a dynamic access policy can contain permit or deny rules, but not both. If an ACL contains both permit and deny rules, the security appliance rejects it.

**Table 32-5 Add/Edit Dynamic Access Policy Dialog Box > Main Tab (continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network ACL           | <p>Lists the Access Control Lists (ACLs) that will be used to restrict user access to the SSL+VPN.</p> <p>Beginning with Security Manager version 4.10, Network ACL supports IPv6 entries. Also IPv6 is supported for devices running the software version ASA 9.0 or later. This is applicable for both Network ACL and Web Type ACL.</p> <p>Click the <b>Select</b> button to open the Access Control Lists Selector from which you can make your selection. The ACL contains conditions that describe a traffic stream of packets, and actions that describe what should occur based on those conditions. Only ACLs having all permit or all deny rules are eligible.</p> <p>Network ACL is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices.</p> |
| AnyConnect tab        | <p>Lets you choose if the setting for Always-On VPN on the AnyConnect service profile remains unchanged, is disabled, or the AnyConnect Profile Setting must be used. Always-On VPN enables AnyConnect to automatically establish a VPN session after you log onto the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Custom Attributes tab | <p>Lists the AnyConnect Custom Attribute Type and Custom Attribute Name. AnyConnect custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade. Beginning with version 4.7, Security Manager enables to add Custom Attribute Data to an existing Custom Attribute Type. This feature is supported for devices that are running the ASA software version 9.3(1) or later.</p>                                                                                                                                                                                                                                                      |
| Attribute Type        | <p>Select the Attribute Type that you configured in <a href="#">Add/Edit AnyConnect Custom Attribute Dialog Box, page 31-71</a> page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Attribute Name        | <p>Select the Attribute Name that you configured in <a href="#">Add/Edit AnyConnect Custom Attribute Data Dialog Box, page 31-71</a> page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WebType ACL tab       | <p>Lets you select and configure web-type ACLs to apply to this dynamic access policy. An ACL for a dynamic access policy can contain only permit or deny rules. If an ACL contains both permit and deny rules, the security appliance rejects it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Web Type ACL          | <p>Specifies the WebType access control list that will be used to restrict user access to the SSL+VPN.</p> <p>Click the <b>Select</b> button to open the Access Control Lists Selector from which you can make your selection. Only ACLs having all permit or all deny rules are eligible. Beginning with version 4.10, you can enter IPv6 values for the Web Type ACL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Functions tab         | <p>Lets you configure file server entry and browsing, HTTP proxy, and URL entry for the dynamic access policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP Proxy | <p>Specify how you want to configure the security appliance to terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers:</p> <ul style="list-style-type: none"> <li>• <b>Unchanged</b>—Uses values from the group policy that applies to this session.</li> <li>• <b>Enable</b>—Allows the forwarding of an HTTP applet proxy to the client.<br/><br/>The proxy is useful for technologies that interfere with proper content transformation, such as Java, ActiveX, and Flash. It bypasses mangling while ensuring the continued use of the security appliance. The forwarded proxy modifies the browser's old proxy configuration and redirects all HTTP and HTTPS requests to the new proxy configuration. It supports virtually all client side technologies, including HTML, CSS, JavaScript, VBScript, ActiveX, and Java. The only browser it supports is Microsoft Internet Explorer.</li> <li>• <b>Disable</b>—Disables the forwarding of an HTTP applet proxy to the client.</li> <li>• <b>Auto-start</b>—Enables HTTP proxy and to have the DAP record automatically start the applets associated with these features.</li> </ul> |

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URL Entry | <p>Using SSL VPN does not ensure that communication with every site is secure. SSL VPN ensures the security of data transmission between the remote user's PC or workstation and the security appliance on the corporate network. If a user then accesses a non-HTTPS web resource (located on the Internet or on the internal network), the communication from the corporate security appliance to the destination web server is not secured.</p> <p>In a clientless VPN connection, the security appliance acts as a proxy between the end user web browser and target web servers. When a user connects to an SSL-enabled web server, the security appliance establishes a secure connection and validates the server SSL certificate. The end user browser never receives the presented certificate, so therefore cannot examine and validate the certificate. The current implementation of SSL VPN does not permit communication with sites that present expired certificates. Neither does the security appliance perform trusted CA certificate validation. Therefore, users cannot analyze the certificate an SSL-enabled web-server presents before communicating with it.</p> <p>Specify how the URL entry setting must be configured on the portal page:</p> <ul style="list-style-type: none"> <li>• <b>Unchanged</b>—Uses values from the group policy that applies to this session.</li> <li>• <b>Enable</b>—Allows a user from entering HTTP/HTTPS URLs on the portal page. If this feature is enabled, users can enter web addresses in the URL entry box, and use clientless SSL VPN to access those websites.</li> <li>• <b>Disable</b>—Disables a user from entering HTTP/HTTPS URLs on the portal page.</li> </ul> <p><b>Note</b> To limit Internet access for users, select <b>Disable</b> for the URL Entry field. This prevents SSL VPN users from surfing the Web during a clientless VPN connection.</p> |

Port Forwarding tab—Lets you select and configure port forwarding lists for user sessions.

**Note** Port Forwarding does not work with some SSL/TLS versions.

**Caution** Make sure Sun Microsystems Java Runtime Environment (JRE) 1.4+ is installed on the remote computers to support port forwarding (application access) and digital certificates.

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Forwarding                                                                                                                                                                                                                                                                                                       | <p>Select an option for the port forwarding lists that apply to this DAP record:</p> <ul style="list-style-type: none"> <li>• <b>Unchanged</b>—Removes the attributes from the running configuration.</li> <li>• <b>Enable</b>—Enables port forwarding on the device.</li> <li>• <b>Disable</b>—Disables port forwarding on the device.</li> <li>• <b>Auto-start</b>—Enables port forwarding, and to have the DAP record automatically start the port forwarding applets associated with its port forwarding lists.</li> </ul> |
| Port Forwarding List                                                                                                                                                                                                                                                                                                  | <p>The Port Forwarding List, that defines the mapping of the port number on the client machine to the application's IP address and port behind the SSL VPN gateway.</p> <p>You can click <b>Select</b> to open the Port Forwarding List Selector from which you can select the required Port Forwarding List from a list of Port Forwarding List objects. A Port Forwarding List object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.</p>     |
| <p>Bookmark tab—Lets you enable and configure SSL VPN bookmarks. When enabled, users who successfully log into the SSL VPN are presented with the portal page containing the list of defined bookmarks. These bookmarks enable users to access resources available on SSL VPN websites in Clientless access mode.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable Bookmarks                                                                                                                                                                                                                                                                                                      | <p>Specify the file server browsing setting to be configured on the portal page:</p> <ul style="list-style-type: none"> <li>• <b>Unchanged</b>—Uses values from the group policy that applies to this session.</li> <li>• <b>Enable</b>—Enables bookmarks on the SSL VPN portal page.</li> <li>• <b>Disable</b>—Disables bookmarks on the SSL VPN portal page.</li> </ul>                                                                                                                                                      |
| Bookmarks                                                                                                                                                                                                                                                                                                             | <p>A list of websites that will be displayed on the portal page as a bookmark to enable users to access the resources available on the SSL VPN websites.</p> <p>You can click <b>Select</b> to open the Bookmarks Selector from which you can select the required bookmark from a list or create a new bookmark, as desired.</p>                                                                                                                                                                                               |
| <p>Action tab—Specifies special processing to apply to a specific connection or session.</p> <p>Action Tab is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices.</p> <p>Select one of the following options from the drop-down list:</p>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Continue                                                                                                                                                                                                                                                                                                              | (Default) When selected, continues the session. By default, the access policy attributes are applied to the session and it is running.                                                                                                                                                                                                                                                                                                                                                                                         |

Table 32-5 Add/Edit Dynamic Access Policy Dialog Box &gt; Main Tab (continued)

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Quarantine   | <p>When selected, quarantines the session.</p> <p>By selecting quarantine, you can restrict a particular client who already has an established tunnel through a VPN. Restricted ACLs are applied to a session to form a restricted group, based on the selected DAP record. When an endpoint is not compliant with an administratively defined policy, the user can still access services for remediation (such as updating the antivirus and so on), but restrictions are placed upon the user. After the remediation occurs, the user can reconnect, which invokes a new posture assessment. If this assessment passes, the user connects.</p> <p><b>Note</b> This parameter requires an AnyConnect release that supports AnyConnect Secure Mobility features.</p>                                                               |
| Terminate    | <p>When selected, terminates the session. By default, the access policy attributes are applied to the session and it is running.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| User Message | <p>Enter a text message to display on the portal page when this DAP record is selected. Maximum 128 characters. A user message displays as a yellow orb. When a user logs on it blinks three times to attract attention, and then it is still. If several DAP records are selected, and each of them has a user message, all user messages display.</p> <p><b>Note</b> You can include in such messages URLs or other embedded text, which require that you use the correct HTML tags.</p> <p>For example: All contractors please read &lt;a href='http://wwwin.abc.com/procedure.html'&gt;Instructions&lt;/a&gt; for the procedure to upgrade your antivirus software.</p> <p><b>Note</b> User Message is supported from Security Manager version 4.12 for ASA devices running version 9.6(2) or later in Multi-context mode.</p> |

The supported Dynamic Access Policy CLIs in Security Manager version 4.12 onwards for Multi-Context ASA 9.6(2) devices are as follows:

- Dynamic-access-policy-record action
- description
- exit
- help
- network-acl
- no
- priority
- quit
- user-message

## Add/Edit DAP Entry Dialog Box

Use the Add/Edit DAP Entry dialog box to specify the authorization attributes and endpoint attributes for a dynamic access policy. The security appliance selects the dynamic access policy based on the endpoint security information of the remote device and the AAA authorization information for the authenticated user. It then applies the dynamic access policy to the user tunnel or session.

For detailed information about dynamic access policy attributes, see [Understanding DAP Attributes, page 32-4](#).

The content of the dialog box differs based on the criterion that you select. The criterion is the authorization or endpoint attribute that serves as the selection criterion that the security appliance uses for selecting and applying dynamic access policies during session establishment. You can select from the following criteria:

- **AAA Attributes Cisco**—Refers to user authorization attributes that are stored in the AAA hierarchical model. See [Add/Edit DAP Entry Dialog Box > AAA Attributes Cisco, page 32-22](#)
- **AAA Attributes LDAP**—Sets the LDAP client stores all native LDAP response attribute value pairs in a database associated with the AAA session for the user. See [Add/Edit DAP Entry Dialog Box > AAA Attributes LDAP, page 32-24](#).
- **AAA Attributes RADIUS**—Sets the RADIUS client stores all native RADIUS response attribute value pairs in a database associated with the AAA session for the user. See [Add/Edit DAP Entry Dialog Box > AAA Attributes RADIUS, page 32-25](#).
- **Anti-Spyware**—Creates an endpoint attribute of type Anti-Spyware. You can use the Host Scan modules of Cisco Secure Desktop to scan for antispyware applications and updates that are running on the remote computer. See [Add/Edit DAP Entry Dialog Box > Anti-Spyware, page 32-26](#).
- **Anti-Virus**—Creates an endpoint attribute of type Anti-Virus. You can use the Host Scan modules of Cisco Secure Desktop to scan for antivirus applications and updates that are running on the remote computer. See [Add/Edit DAP Entry Dialog Box > Anti-Virus, page 32-27](#).
- **AnyConnect Identity**—Creates an endpoint attribute of type AnyConnect Identity. See [Add/Edit DAP Entry Dialog Box > AnyConnect Identity, page 32-28](#).
- **Application**—Indicates the type of remote access connection. See [Add/Edit DAP Entry Dialog Box > Application, page 32-29](#).
- **Device**—Creates an endpoint attribute of type Device. The Device Criterion lets you provide specific device information for use during the associated prelogin policy checking. See [Add/Edit DAP Entry Dialog Box > Device, page 32-30](#).
- **File**—Creates an endpoint attribute of type File. Filename checking to be performed by Basic Host Scan must be explicitly configured using Cisco Secure Desktop Manager. See [Add/Edit DAP Entry Dialog Box > File, page 32-31](#).
- **NAC**—Creates an endpoint attribute of type NAC. NAC protects the enterprise network from intrusion and infection from worms, viruses, and rogue applications by performing endpoint compliancy. We refer to these checks as posture†validation. See [Add/Edit DAP Entry Dialog Box > NAC, page 32-32](#).
- **Operating System**—Creates an endpoint attribute of type Operating System. The prelogin assessment module of the CSD can check the remote device for the OS version, IP address, and Microsoft Windows registry keys. See [Add/Edit DAP Entry Dialog Box > Operating System, page 32-33](#).

- Personal Firewall—Creates an endpoint attribute of type Personal Firewall. You can use the Host Scan modules of Cisco Secure Desktop to scan for personal firewall applications and updates that are running on the remote computer. For a description of the elements in the dialog box, see [Add/Edit DAP Entry Dialog Box > Personal Firewall, page 32-34](#).
- Policy—Creates an endpoint attribute of type Policy. See [Add/Edit DAP Entry Dialog Box > Policy, page 32-35](#).
- Process—Process name checking to be performed by Basic Host Scan must be explicitly configured using Cisco Secure Desktop Manager. See [Add/Edit DAP Entry Dialog Box > Process, page 32-36](#).
- Registry—Creates an endpoint attribute of type Registry. Registry key scans apply only to computers running Windows Microsoft Windows operating systems. See [Add/Edit DAP Entry Dialog Box > Registry, page 32-37](#).
- Multiple Certificate Authentication—Creates an endpoint attribute of type Multiple Certificate Authentication. You can specify the attributes for the multiple certificate authentication of remote VPN users. See [Add/Edit DAP Entry Dialog Box > Multiple Certificate Authentication, page 32-38](#).

**Note**

---

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

---

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed.

**Add/Edit DAP Entry Dialog Box > AAA Attributes Cisco**

To configure AAA attributes as selection criteria for dynamic access policies, in the Add/Edit DAP Entry dialog box, set AAA Attributes Cisco as the selection criterion to be used to select and apply the dynamic access policies during session establishment. You can set these attributes either to match or not match the value you enter. There is no limit for the number of AAA attributes for each dynamic access policy.

**Note**

---

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

---

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes Cisco** as the Criterion.

| Group Policy                                                                          | <p>Select the check box, select the matching criteria (for example, <i>is</i>) from the drop-down list, and enter the name of the AAA server group associated with the user. The maximum length is 64 characters.</p> <p>AAA server groups represent collections of authentication servers focused on enforcing specific aspects of your overall network security policy.</p>                                                                                                                                                                                                                                                                     |
| IPv4 Address                                                                          | <p>Select the check box, select the matching criteria (for example, <i>is</i>) from the drop-down list, and enter the assigned IP address.</p> <p>Addresses are predefined network objects. You can also click <b>Select</b> to open a dialog box that lists all available network hosts, and in which you can create or edit network host objects.</p> <p><b>Tip</b> If you select this option and later look at the rule in ASDM, the IP Address attribute is called Assigned IP Address.</p>                                                                                                                                                   |
| IPv6 Address<br>(Security Manager version 4.12 or later and ASA version 9.0 or later) | <p>Select the check box, select the matching criteria (for example, <i>is</i>) from the drop-down list, and enter the assigned IP address.</p> <p>Addresses are predefined network objects. You can also click <b>Select</b> to open a dialog box that lists all available network hosts, and in which you can create or edit network host objects.</p> <p><b>Tip</b> If you select this option and later look at the rule in ASDM, the IP Address attribute is called Assigned IP Address.</p>                                                                                                                                                   |
| Member-of                                                                             | <p>Select the check box, select the matching criteria (for example, <i>is</i>) from the drop-down list, and enter a comma-separated string of group policy names that apply to the user. This attribute lets you indicate multiple group membership. The maximum length is 128 characters.</p> <p><b>Tip</b> If you select this option, and later look at the rule in ASDM, this option will not appear. In general, this option is not used because it can be confused with the memberof LDAP attribute. Because this rule applies to Local authentication, you might want to use the Username attribute instead of the Member-of attribute.</p> |
| Username                                                                              | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the username of the authenticated user. A maximum of 64 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Username 2                                                                            | Select the check box, select the matching criteria ( <i>is</i> or <i>isn't</i> ) from the drop-down list, and enter the secondary username of the authenticated user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Profiles | <p>Select the check box, select the matching criteria (for example, <i>is</i>) from the drop-down list, and select the connection profile from a list of all the SSL VPN Connection Profile policies defined on the security appliance.</p> <p>An SSL VPN connection profile comprises a set of records that contain VPN tunnel connection profile policies, including the attributes that pertain to creating the tunnel itself.</p> <p><b>Note</b> For a description of the procedure to configure an SSL VPN Connection Profiles policy, see <a href="#">Configuring Connection Profiles (ASA, PIX 7.0+)</a>, page 31-7.</p> |
| SCEP Required       | Select the check box, select the matching criteria ( <i>is</i> or <i>isn't</i> ) from the drop-down list, and select <i>True</i> or <i>False</i> . This attribute enables to match whether or not the connection fails the certificate authentication.                                                                                                                                                                                                                                                                                                                                                                          |

### Add/Edit DAP Entry Dialog Box > AAA Attributes LDAP

The LDAP client stores all native LDAP response attribute value pairs in a database associated with the AAA session for the user. The LDAP client writes the response attributes to the database in the order in which it receives them. It discards all subsequent attributes with that name. This scenario might occur when a user record and a group record are both read from the LDAP server. The user record attributes are read first, and always have priority over group record attributes.

To support Active Directory group membership, the AAA LDAP client provides special handling of the LDAP memberOf response attribute. The AD memberOf attribute specifies the DN string of a group record in AD. The name of the group is the first CN value in the DN string. The LDAP client extracts the group name from the DN string and stores it as the AAA memberOf attribute, and in the response attribute database as the LDAP memberOf attribute. If there are additional memberOf attributes in the LDAP response message, then the group name is extracted from those attributes and is combined with the earlier AAA memberOf attribute to form a comma separated string of group names, also updated in the response attribute database.

#### Note

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

#### Navigation Path

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 32-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes LDAP** as the Criterion.

| Criterion    | Shows AAA Attributes LDAP as the selection criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Attribute ID | Specify the name of the LDAP attribute map in the dynamic access policy. LDAP attribute maps take the attribute names that you define and map them to Cisco-defined attributes. A maximum of 64 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Value        | <p>Select the matching criteria (for example, <i>is</i>) from the drop-down list, and enter the custom map value that maps to a Cisco Map Value or enter the Cisco map value that maps to the Custom Map Value. To enter multiple values, separate each value with ; as the delimiter.</p> <p>The attribute map is populated with value mappings that apply customer, user-defined attribute values to the customer attribute name and to the matching Cisco attribute name and value.</p> <p>Alternatively, click the <b>Fetch AD Groups</b> button to open the Fetch AD Groups dialog box. The table in the dialog box lists the UserGroup ID and UserGroup Name of the available LDAP servers that you can choose from. Select one or more rows and click the <b>Select</b> button.</p> <p>To search for a particular UserGroup in the list you can enter text in the Filter text box and click <b>Search</b>. The UserGroup name meeting the criteria appears in the list.</p> <p><b>Note</b> To be able to view the list of available LDAP servers you must first configure the mapping of Domain to AD Server Group. To perform this task, go to <b>Tools &gt; Security Manager Administration</b> and select <b>Identity Settings</b> from the table of contents. For more information, see <a href="#">Identity Settings Page, page 11-38</a>.</p> |

**Add/Edit DAP Entry Dialog Box > AAA Attributes RADIUS**

The RADIUS client stores all native RADIUS response attribute value pairs in a database associated with the AAA session for the user. The RADIUS client writes the response attributes to the database in the order in which it receives them. It discards all subsequent attributes with that name. This scenario might occur when a user record and a group record are both read from the RADIUS server. The user record attributes are read first, and always have priority over group record attributes.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes RADIUS** as the Criterion.

|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion    | Shows AAA Attributes RADIUS as the selection criterion.                                                                                                                                                                                                                                                                                                                                                                                            |
| Attribute ID | Specify the name of the RADIUS attribute name or number in the dynamic access policy. A maximum of 64 characters is allowed.<br><br>RADIUS attribute names do not contain the cVPN3000 prefix to better reflect support for all three security appliances (VPN 3000, PIX, and the ASA). The appliances enforce the RADIUS attributes based on attribute numeric ID, not attribute name. LDAP attributes are enforced by their name, not by the ID. |
| Value        | Select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the attribute value.                                                                                                                                                                                                                                                                                                                                     |

**Add/Edit DAP Entry Dialog Box > Anti-Spyware**

You can use the Host Scan feature of the Cisco Secure Desktop feature to enable Endpoint Assessment, a scan for antivirus, personal firewall, and antispyware applications and updates that are running on the remote computer. Following the configuration of the prelogin policies and host scan options, you can configure a match of any one or any combination of the Host Scan results to assign a dynamic access policy following the user login.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 32-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Spyware** as the Criterion.

| Version             | Available only if you selected <b>Matches</b> as the Type.<br>Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Last Update         | Available only if you selected <b>Matches</b> as the Type.<br>Specify the number of days since the last update. You might want to indicate that an update should occur in less than or greater than the number of days you enter here.                                                                                                                                                                                                                                                                                                                                                                                                    |

**Add/Edit DAP Entry Dialog Box > Anti-Virus**

You can configure a scan for antivirus applications and updates as a condition for the completion of a Cisco AnyConnect or clientless SSL VPN connection. Following the prelogin assessment, Cisco Secure Desktop loads Endpoint Assessment checks and reports the results back to the security appliance for use in assigning a dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 32-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Virus** as the Criterion.
