

# CHAPTER 3

## Configuring System-Level High Availability

---

This chapter describes the Cisco NX-OS high availability (HA) system and application restart operations.

This chapter includes the following sections:

- [Information About VSM Restarts and Switchovers, page 3-3](#)
- [Guidelines and Limitations, page 3-5](#)
- [Configuring System-Level High Availability, page 3-5](#)
- [Verifying the HA Status, page 3-18](#)
- [Additional References, page 3-22](#)

## Information About System-Level High Availability

This section includes the following topics:

- [Information About Single and Dual Supervisors, page 3-1](#)
- [Information About VSM Restarts and Switchovers, page 3-3](#)

## Information About Single and Dual Supervisors

The Cisco Nexus 1000V can be configured with a single virtual supervisor module (VSM) or dual VSMs. [Table 3-1](#) describes the HA supervisor roles for single and dual VSM operation.

**Table 3-1 HA Supervisor Roles**

Single VSM Operation	Dual VSM Operation
<ul style="list-style-type: none"> <li>Stateless—In case of failure, service restarts from the startup configuration.</li> <li>Stateful—In case of failure, service resumes from previous state.</li> </ul>	<ul style="list-style-type: none"> <li>Redundancy is provided by one active VSM and one standby VSM.</li> <li>The active VSM runs all the system applications and controls the system.</li> <li>On the standby VSM, the applications are started and initialized in standby mode. They are also synchronized and kept up to date with the active VSM in order to be ready to run.</li> <li>On a switchover, the standby VSM takes over for the active VSM.</li> </ul>

This section includes the following topics:

- [HA Supervisor Roles, page 3-2](#)
- [Dual Supervisor Active and Standby Redundancy States, page 3-2](#)
- [Dual Supervisor Synchronization, page 3-3](#)

## HA Supervisor Roles

The redundancy role indicates not only whether the VSM interacts with other VSMs, but also the module number it occupies. [Table 3-2](#) shows the available HA roles for VSMs.

**Table 3-2 HA Supervisor Roles**

Role	Module Number	Description
Standalone	1	<ul style="list-style-type: none"> <li>This role does not interact with other VSMs.</li> <li>You assign this role when there is only one VSM in the system.</li> <li>This role is the default.</li> </ul>
Primary	1	<ul style="list-style-type: none"> <li>This role coordinates the active/standby state with the secondary VSM.</li> <li>This role takes precedence during bootup when negotiating active/standby mode. That is, if the secondary VSM does not have the active role at bootup, the primary VSM takes the active role.</li> <li>You assign this role to the first VSM that you install in a dual VSM system.</li> </ul>
Secondary	2	<ul style="list-style-type: none"> <li>This role coordinates the active/standby state with the primary VSM.</li> <li>You assign this role to the second VSM that you install in a dual VSM system.</li> </ul>

## Dual Supervisor Active and Standby Redundancy States

Independent of its role, the redundancy state of a VSM can be one of those described in [Table 3-3](#).

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential****Table 3-3 HA Supervisor Redundancy States**

<b>Redundancy State</b>	<b>Description</b>
Active	Controls the system and is visible to the outside world.
Standby	Synchronizes its configuration with that of the active VSM so that it is continuously ready to take over in case of a failure or manual switchover.  You cannot use Telnet or Secure Shell (SSH) protocols to communicate with the standby VSM. Instead, you can use the <b>attach module</b> command from the active VSM to access the standby VSM console. Only a subset of the CLI commands are available from the standby VSM console.

**Dual Supervisor Synchronization**

The active and standby VSMs are in the operationally HA state and can automatically synchronize when the internal state of one supervisor module is Active with HA Standby and the internal state of the other supervisor module is HA Standby.

If the output of the **show system redundancy** command indicates that the operational redundancy mode of the active VSM is None, then the active and standby VSMs are not yet synchronized. The following example shows the VSM internal state of dual supervisors as observed in the output of the **show system redundancy status** command.

```
switch# show system redundancy status
Redundancy role
-----
      administrative: standalone
      operational: standalone

Redundancy mode
-----
      administrative: HA
      operational: None

This supervisor (sup-1)
-----
      Redundancy state: Active
      Supervisor state: Active
      Internal state: Active with no standby

Other supervisor (sup-2)
-----
      Redundancy state: Not present
switch#
```

**Information About VSM Restarts and Switchovers**

This section includes the following topics:

- [Restarts on Standalone VSMs, page 3-4](#)
- [Restarts on Dual VSMs, page 3-4](#)
- [Switchovers on Dual VSMs, page 3-4](#)

## Restarts on Standalone VSMs

In a system with only one supervisor, when all HA policies have been unsuccessful in restarting a service, the supervisor restarts. The supervisor and all services restart with no prior state information.

## Restarts on Dual VSMs

When a VSM fails in a system with dual supervisors, the system performs a switchover rather than a system restart in order to maintain a stateful operation. In some cases, however, a switchover may not be possible at the time of the failure. For example, if the standby VSM is not in a stable standby state, a restart rather than a switchover is performed.

## Switchovers on Dual VSMs

A dual VSM configuration allows uninterrupted traffic forwarding with stateful switchover (SSO) when a failure occurs in the VSM. The two VSMs operate in an active/standby capacity in which only one is active at any given time, while the other acts as a standby backup. The two VSMs constantly synchronize the state and configuration in order to provide a seamless and stateful switchover of most services if the active VSM fails.

This section includes the following topics:

- [Switchover Characteristics, page 3-4](#)
- [Automatic Switchovers, page 3-4](#)
- [Manual Switchovers, page 3-4](#)

### Switchover Characteristics

A switchover occurs when the active supervisor fails (for example, if repeated failures occur in an essential service or if the system hosting the VSM fails).

A user-triggered switchover could occur (for example, if you need to perform maintenance tasks on the system hosting the active VSM).

An HA switchover has the following characteristics:

- It is stateful (nondisruptive) because control traffic is not affected.
- It does not disrupt data traffic because the VEMs are not affected.

### Automatic Switchovers

When a stable standby VSM detects that the active VSM has failed, it initiates a switchover and transitions to active. When a switchover begins, another switchover cannot be started until a stable standby VSM is available.

If a standby VSM that is not stable detects that the active VSM has failed, then, instead of initiating a switchover, it tries to restart the system.

### Manual Switchovers

Before you can initiate a manual switchover from the active to the standby VSM, the standby VSM must be stable. To find out if it is, see the “[Verifying that a System is Ready for a Switchover](#)” section on [page 3-8](#).

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

Once you have verified that the standby VSM is stable, you can manually initiate a switchover (see the “Manually Switching the Active VSM to Standby” section on page 3-9).

Once a switchover process begins, another switchover process cannot be started until a stable standby VSM is available.

## Guidelines and Limitations

Follow these guidelines and limitations when configuring system-level high availability:

- Although primary and secondary VSMs can reside in the same host, to improve redundancy, install them in separate hosts and, if possible, connected to different upstream switches.
- The console for the standby VSM is available through the vSphere client or using the command, **module attach <x>**, but configuration is not allowed and many commands are restricted. The **module attach <x>** command would be run at the console of the active VSM.
- You cannot use Telnet or Secure Shell (SSH) protocols to communicate with the standby VSM because the management interface IP is unconfigured until the VSM becomes active.

## Configuring System-Level High Availability

This section includes the following topics:

- [Guidelines and Limitations, page 3-5](#)
- [Changing the VSM Role, page 3-5](#)
- [Configuring a Switchover, page 3-7](#)
- [Adding a Second VSM to a Standalone System, page 3-11](#)
- [Replacing the Standby in a Dual VSM System, page 3-15](#)
- [Replacing the Active in a Dual VSM System, page 3-16](#)
- [Changing the Domain ID in a Dual VSM System, page 3-16](#)

## Changing the VSM Role

Use this procedure to change the role of a VSM to one of the following after it is already in service:

- Standalone
- Primary
- Secondary

### BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

**Caution**

Changing the role of a VSM can result in a conflict between the VSM pair. If a primary and secondary VSM see each other as active at the same time, the system resolves this problem by resetting the primary VSM.

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

- If you are changing a standalone VSM to a secondary VSM, be sure to first isolate it from the other VSM in the pair to prevent any interaction with the primary VSM during the change. Power the VM off from the vSphere Client before reconnecting it as standby.

For an example of changing the port groups and port profiles assigned to the VSM interfaces in the vSphere Client, see the following document:

- *Cisco Nexus 1000V Software Installation Guide, Release 4.0(4)SV1(2)*

To change a standalone VSM to a secondary VSM, see the “[Adding a Second VSM to a Standalone System](#)” section on page 3-11.

- You are logged into the CLI in EXEC mode.

**Note** The Cisco Nexus 1000V VSM software installation provides an opportunity for you to designate the role for each VSM. You can use this procedure to change that initial configuration.

- The possible HA roles are standalone, primary, and secondary.  
For more information, see the “[HA Supervisor Roles](#)” section on page 3-2.
- The possible HA redundancy states are active and standby.  
For more information, see the “[Dual Supervisor Active and Standby Redundancy States](#)” section on page 3-2.
- To activate a change from primary to secondary VSM, you must reload the VSM by doing one of the following:
  - Issue the **reload** command.
  - Power the VM off and then on from the vSphere Client.
- A change from a standalone to a primary VSM takes effect immediately.

**SUMMARY STEPS**

1. **system redundancy role {standalone | primary | secondary}**
2. **show system redundancy status**
3. **copy running-config startup-config**

**DETAILED STEPS**

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<b>system redundancy role {standalone   primary   secondary}</b>  <b>Example:</b> <pre>n1000v# system redundancy role standalone n1000v#</pre>	Designates the HA role of the VSM.

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

	<b>Command</b>	<b>Purpose</b>
<b>Step 2</b>	<b>show system redundancy status</b>  <b>Example:</b> switch# show system redundancy status	(Optional) Displays the current redundancy status for the VSM(s).
<b>Step 3</b>	<b>copy running-config startup-config</b>  <b>Example:</b> n1000v(config)# copy running-config startup-config	Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.

**EXAMPLE**

This example shows how to display the system redundancy status of a standalone VSM:

```
switch# show system redundancy status
Redundancy role
-----
      administrative:    standalone
      operational:       standalone

Redundancy mode
-----
      administrative:   HA
      operational:      None

This supervisor (sup-1)
-----
      Redundancy state: Active
      Supervisor state: Active
      Internal state:Active with no standby

Other supervisor (sup-2)
-----
      Redundancy state: Not present
switch#
```

## Configuring a Switchover

This section includes the following procedures for configuring a switchover in a dual VSM system:

- [Guidelines and Limitations, page 3-7](#)
- [Verifying that a System is Ready for a Switchover, page 3-8](#)
- [Manually Switching the Active VSM to Standby, page 3-9](#)

## Guidelines and Limitations

Follow these guidelines when performing a switchover:

- When you manually initiate a switchover, system messages are generated that indicate the presence of two VSMs and identify which one is becoming active.
- A switchover can only be performed when both VSMs are functioning.

## Verifying that a System is Ready for a Switchover

Use this procedure to verify that both an active and standby VSM are in place and operational before proceeding with a switchover.

### BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You are logged into the CLI in EXEC mode.
- If the standby VSM is not in a stable state (the state must be **ha-standby**), then a manually initiated switchover cannot be performed.

### SUMMARY STEPS

1. **show system redundancy status**
2. **show module**

### DETAILED STEPS

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<pre>show system redundancy status</pre> <p><b>Example:</b> n1000v# show system redundancy status Redundancy role ----- administrative: primary operational: primary Redundancy mode ----- administrative: HA operational: HA This supervisor (sup-1) ----- Redundancy state: Active Supervisor state: Active Internal state: Active with HA standby Other supervisor (sup-2) ----- Redundancy state: Standby Supervisor state: HA standby Internal state: HA standby</p>	<p>Displays the current redundancy status for the VSM(s).</p> <p>If the output indicates the following, then you can proceed with a system switchover, if needed.</p> <ul style="list-style-type: none"> <li>• The presence of an active VSM</li> <li>• The presence of a standby VSM in the HA standby redundancy state</li> </ul>

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

Step 2	Command	Purpose
	<pre>show module</pre> <pre>n1000v# show module</pre>	<p>Displays information about all available VEMs and VSMs in the system.</p> <p>In the command output, the Status column should display OK for switching modules and an active or ha-standby status for supervisor modules.</p> <p>If the output indicates the following, then you can proceed with a system switchover, if needed:</p> <ul style="list-style-type: none"> <li>• The presence of an active VSM</li> <li>• The presence of a standby VSM in the HA standby redundancy state</li> </ul>

**EXAMPLE**

This example shows how to display information about all available VEMs and VSMs in the system:

```
n1000v# show module
Mod Ports Module-Type Model Status
--- --- -----
1 0 Virtual Supervisor Module Nexus1000V active *
2 0 Virtual Supervisor Module Nexus1000V ha-standby
3 248 Virtual Ethernet Module NA ok

Mod Sw Hw
--- -----
1 4.0(4)SV1(0.37) 0.0
2 4.0(4)SV1(0.37) 0.0
3 4.0(4)SV1(0.37) 0.4

Mod MAC-Address(es) Serial-Num
--- -----
1 00-19-07-6c-5a-a8 to 00-19-07-6c-62-a8 NA
2 00-19-07-6c-5a-a8 to 00-19-07-6c-62-a8 NA
3 02-00-0c-00-21-00 to 02-00-0c-00-21-80 NA

Mod Server-IP Server-UUID Server-Name
--- -----
1 192.168.48.66 NA NA
2 192.168.48.66 NA NA
3 192.168.48.45 b497bc96-1583-32f1-9062-de3b5d37709c strider.cisco.com
```

\* this terminal session

**Manually Switching the Active VSM to Standby**

Use this procedure to manually switch an active VSM to standby in a dual supervisor system.

**BEFORE YOU BEGIN**

Before beginning this procedure, you must know or do the following:

- You are logged in to the active VSM CLI in EXEC mode.
- You have completed the steps in the “[Verifying that a System is Ready for a Switchover](#)” section on [page 3-8](#), and have found the system to be ready for a switchover.

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

- A switchover can only be performed when two VSMs are functioning in the switch.
- If the standby VSM is not in a stable state (ha-standby), then you cannot initiate a manual switchover. You will see the following error message:  
Failed to switchover (standby not ready to takeover in vdc 1)
- Once you enter the **system switchover** command, you cannot start another switchover process on the same system until a stable standby VSM is available.
- If a switchover does not complete successfully within 28 seconds, the supervisors will reset.
- Any unsaved running configuration that was available at active VSM is still unsaved in the new active VSM. You can verify this unsaved running configuration using the **show running-config diff** command. Save that configuration, if needed, as you would do in the other VSM (by entering the **copy running-config startup-config** command).

**SUMMARY STEPS**

1. **system switchover**
2. **show running-config diff**
3. **copy running-config startup-config**

**DETAILED STEPS**

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<b>system switchover</b>  <b>Example:</b> n1000v# system switchover	On the active, VSM, initiates a manual switchover to the standby VSM.  <b>Note</b> Once you enter this command, you cannot start another switchover process on the same system until a stable standby VSM is available.  <b>Note</b> Before proceeding, wait until the switchover completes and the standby supervisor becomes active.
<b>Step 2</b>	<b>show running-config diff</b>  <b>Example:</b> n1000v# show running-config diff	(Optional) Verify the difference between the running and startup configurations.  Any unsaved running configuration in an active VSM is also unsaved in the VSM that becomes active after switchover. Save that configuration in the startup if needed.
<b>Step 3</b>	<b>copy running-config startup-config</b>  <b>Example:</b> n1000v(config)# copy running-config startup-config	(Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.

**EXAMPLES**

This example shows how to switch an active VSM to the standby VSM and displays the output that appears on the standby VSM as it becomes the active VSM.

```
n1000v# system switchover
```

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

```

2009 Mar 31 04:21:56 n1000v %% VDC-1 %% %SYSMGR-2-HASWITCHOVER_PRE_START:
This supervisor is becoming active (pre-start phase).
2009 Mar 31 04:21:56 n1000v %% VDC-1 %% %SYSMGR-2-HASWITCHOVER_START:
This supervisor is becoming active.
2009 Mar 31 04:21:57 n1000v %% VDC-1 %% %SYSMGR-2-SWITCHOVER_OVER: Switchover completed.
2009 Mar 31 04:22:03 n1000v %% VDC-1 %% %PLATFORM-2-MOD_REMOVE: Module 1 removed (Serial
number )

```

This example shows how to display the difference between the running and startup configurations:

```

n1000v# show running-config diff
*** Startup-config
--- Running-config
*****
*** 1,38 ****
version 4.0(4)SV1(1)
role feature-group name new
role name testrole
username admin password 5 $1$S7HvKc5G$aguYqHl0dPttBJAhEPwsy1 role network-admin
telnet server enable
ip domain-lookup

```

## Adding a Second VSM to a Standalone System

Use this section to change a standalone system into a dual supervisor system by adding a second VSM.

This section includes the following topics:

- [Adding a Second VSM to a Standalone System, page 3-11](#)
- [Changing the Standalone VSM to a Primary VSM, page 3-13](#)
- [Verifying the Change to a Dual VSM System, page 3-14](#)

### BEFORE YOU BEGIN

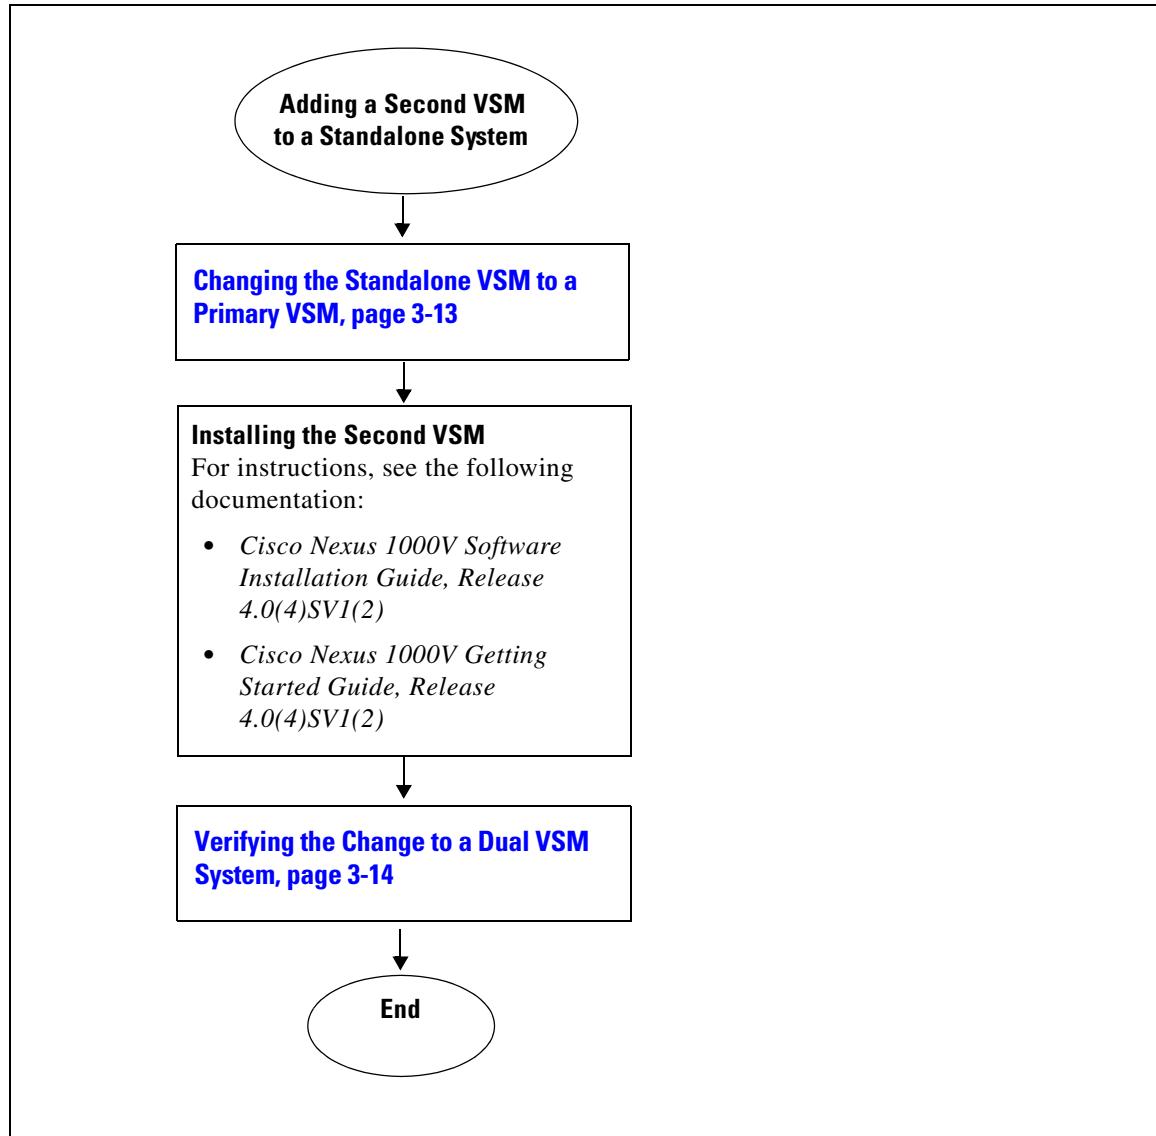

Before adding a second VSM to a standalone system, you must know or do the following:

- You are logged into the CLI in EXEC mode.
- You have the *Cisco Nexus 1000V Software Installation Guide, Release 4.0(4)SV1(2)* document available.
- Although primary and secondary VSMs can reside in the same host, to improve redundancy, install them in separate hosts and, if possible, connected to different upstream switches.
- When installing the second VSM, assign it with the secondary role.
- Set up the port groups for the dual VSM VMs with the same parameters in both hosts.
- After the secondary VSM is installed, the following occurs automatically:
  - The secondary VSM is reloaded and added to the system.
  - The secondary VSM negotiates with the primary VSM and becomes the standby VSM.
  - The standby VSM synchronizes the configuration and state with the primary VSM.

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential****Flow Chart: Adding a Second VSM to a Standalone System**

The following flow chart (see Figure 3-1) is designed to guide you through the process of adding a second VSM to a standalone system. After completing each procedure, return to the flow chart to make sure that you complete all required procedures in the correct sequence.

**Figure 3-1 Adding a Second VSM to a Standalone System**

## Changing the Standalone VSM to a Primary VSM

Use this procedure to change the role of a VSM from standalone in a single VSM system to primary in a dual VSM system.

### BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You are logged into the CLI in EXEC mode.
- A change from a standalone to a primary VSM takes effect immediately.

### SUMMARY STEPS

1. **system redundancy role primary**
2. **show system redundancy status**
3. **copy running-config startup-config**

### DETAILED STEPS

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<b>system redundancy role primary</b>  <b>Example:</b> n1000v# system redundancy role primary n1000v#	Changes the standalone VSM to a primary VSM.  The role change occurs immediately.
<b>Step 2</b>	<b>show system redundancy status</b>	Displays the current redundancy state for the VSM.
<b>Step 3</b>	<b>copy running-config startup-config</b>  <b>Example:</b> n1000v(config)# copy running-config startup-config	Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.

### EXAMPLE

This example shows how to display the current system redundancy status for the VSM:

```
n1000v# show system redundancy status
Redundancy role
-----
      administrative:  primary
      operational:    primary

Redundancy mode
-----
      administrative:  HA
      operational:     None

This supervisor (sup-1)
-----
      Redundancy state: Active
      Supervisor state: Active
```

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

```
Internal state: Active with no standby
```

```
Other supervisor (sup-2)
```

```
-----
```

```
Redundancy state: Not present
```

## Verifying the Change to a Dual VSM System

Use this procedure to verify a change from a single VSM to a dual VSM system.

### BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You are logged into the CLI in EXEC mode.
- You have already changed the single VSM role from standalone to primary (see the “[Changing the Standalone VSM to a Primary VSM](#)” section on page 3-13).
- You have already installed the second VSM using the *Cisco Nexus 1000V Software Installation Guide, Release 4.0(4)SV1(2)*.

### SUMMARY STEPS

1. **show system redundancy status**
2. **show module**

### DETAILED STEPS

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<b>show system redundancy status</b>	Displays the current redundancy status for VSMs in the system.  <b>Example:</b> n1000v# show system redundancy status
<b>Step 2</b>	<b>show module</b>	Displays information about all available VSMs and VEMs in the system.  <b>Example:</b> n1000v# show module

### EXAMPLES

This example shows how to display the current redundancy status for VSMs in the system. In this example, the primary and secondary VSMs are shown following a change from a single VSM system to a dual VSM system.

```
n1000v# show system redundancy status
  Redundancy role
  -----
  administrative: primary
  operational: primary
  Redundancy mode
  -----
  administrative: HA
  operational: HA
```

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

```
This supervisor (sup-1)
-----
Redundancy state: Active
Supervisor state: Active
Internal state: Active with HA standby
Other supervisor (sup-2)
-----
Redundancy state: Standby
Supervisor state: HA standby
Internal state: HA standby
```

This example shows how to display information about all available VSMs and VEMs in the system. In this example, the primary and secondary VSMs are shown following a change from a single VSM system to a dual VSM system. In addition, there is one VEM in module 3.

```
n1000v# show module
Mod Ports Module-Type Model Status
--- --- -----
1 0 Virtual Supervisor Module Nexus1000V active *
2 0 Virtual Supervisor Module Nexus1000V ha-standby
3 248 Virtual Ethernet Module NA ok

Mod Sw Hw
--- -----
1 4.0(4)SV1(0.37) 0.0
2 4.0(4)SV1(0.37) 0.0
3 4.0(4)SV1(0.37) 0.4

Mod MAC-Address(es) Serial-Num
--- -----
1 00-19-07-6c-5a-a8 to 00-19-07-6c-62-a8 NA
2 00-19-07-6c-5a-a8 to 00-19-07-6c-62-a8 NA
3 02-00-0c-00-21-00 to 02-00-0c-00-21-80 NA

Mod Server-IP Server-UUID Server-Name
--- -----
1 192.168.48.66 NA NA
2 192.168.48.66 NA NA
3 192.168.48.45 b497bc96-1583-32f1-9062-de3b5d37709c strider.cisco.com
* this terminal session
```

## Replacing the Standby in a Dual VSM System

Use this procedure to replace a standby/secondary VSM in a dual VSM system.

**Note**

**Equipment Outage**—This procedures requires that you power down and reinstall a VSM. During this time, your system will be operating with a single VSM.

**Step 1** Power off the standby VSM.

**Step 2** Install the new VSM as a standby, with the same domain ID as the existing VSM, using the procedure in the “Installing and Configuring the VSM VM” section in the *Cisco Nexus 1000V Software Installation Guide, Release 4.0(4)SV1(2)*.

Once the new VSM is added to the system, it will synchronize with the existing VSM.

## Replacing the Active in a Dual VSM System

Use this procedure to replace an active/primary VSM in a dual VSM system.

### BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You are logged into the CLI in EXEC mode.
- You must configure the port groups so that the new primary VSM cannot communicate with the secondary VSM or any of the VEMs during setup. VSMs with a primary or secondary redundancy role have built-in mechanisms for detecting and resolving the conflict between two VSMs in the active state. In order to avoid these mechanisms during the configuration of the new primary VSM, you must isolate the new primary VSM from the secondary VSM.

**Note** Equipment Outage—This procedures requires powering down and reinstalling a VSM. During this time, your system will be operating with a single VSM.

#### Step 1 Power off the active VSM.

The secondary VSM becomes active.

#### Step 2 On the vSphere Client, change the port group configuration for the new primary VSM to prevent communication with the secondary VSM and the VEMs during setup.

For an example of changing the port groups and port profiles assigned to the VSM interfaces in the vSphere Client, see the *Cisco Nexus 1000V Software Installation Guide, Release 4.0(4)SV1(2)*.

#### Step 3 Install the new VSM as a primary, with the same domain ID as the existing VSM, using “Installing and Configuring the VSM VM” section in the *Cisco Nexus 1000V Software Installation Guide, Release 4.0(4)SV1(2)*.

#### Step 4 Save the configuration.

#### Step 5 Power off the VM.

#### Step 6 On the vSphere Client, change the port group configuration for the new primary VSM to permit communication with the secondary VSM and the VEMs.

#### Step 7 Power up the new primary VSM.

The new primary VSM starts and automatically synchronizes all configuration data with the secondary, which is currently the active VSM. Because the existing VSM is active, the new primary VSM becomes the standby VSM and receives all configuration data from the existing active VSM.

## Changing the Domain ID in a Dual VSM System

Use this procedure to change the domain ID in a dual VSM system.

### BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You have access to the console of both the active and standby VSM.

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

- VSMs with a primary or secondary redundancy role have built-in mechanisms for detecting and resolving the conflict between two VSMs in the active state. In order to avoid these mechanisms while changing the domain ID, you must isolate the standby VSM from the active VSM. This procedure has a step for isolating the VSMs.

**Note**

Equipment Outage—This procedure requires powering down a VSM. During this time, your system will be operating with a single VSM.

**DETAILED STEPS**

- Step 1** On the vSphere Client for the standby VSM, do one of the following to isolate the VSMs and prevent their communication while completing this procedure:

- Change the port group configuration for the interfaces using port groups that prevent the VSMs from communicating with each other.
- Unmark the “Connected” option for the interfaces.

The standby VSM becomes active but cannot communicate with the other active VSM or the VEM.

- Step 2** At the console of the standby VSM, change the domain id and save the configuration.

**Example:**

```
n1000v# config t
n1000v(config)# svs-domain
n1000v(config-svs-domain)# domain id 100
n1000v(config-svs-domain)# copy running-config startup-config
```

The domain id is changed on the standby VSM and the VEM connected to it.

- Step 3** Power down the standby VSM.

- Step 4** At the console of the active VSM, change the domain id and save the configuration.

**Example:**

```
n1000v# config t
n1000v(config)# svs-domain
n1000v(config-svs-domain)# domain id 100
n1000v(config-svs-domain)# copy running-config startup-config
```

The domain id is changed on the active VSM and the VEM connected to it.

- Step 5** On the vSphere Client for the standby VSM, do one of the following to permit communication with the active VSM:

- Change the port group configuration for the interfaces.
- Make sure the “Connect at power on” option is marked for the interfaces.

Once powered up, the standby VSM will be able to communicate with the active VSM.

- Step 6** Power up the standby VSM.

Both VSMs are now using the new domain ID and will synchronize.

**Verifying the HA Status****Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

# Verifying the HA Status

Use this procedure to display and verify the HA status of the system.

**SUMMARY STEPS**

1. **show system redundancy status**
2. **show module**
3. **show processes**

**DETAILED STEPS**

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	<b>show system redundancy status</b>	Displays the HA status of the system.  <b>Example:</b> n1000v# show system redundancy status
<b>Step 2</b>	<b>show module</b>	Displays information about all available VSMs and VEMs in the system.  <b>Example:</b> n1000v# show module
<b>Step 3</b>	<b>show processes</b>	Displays the state of all processes and the start count of the process. <ul style="list-style-type: none"> <li>• State: R (runnable), S (sleeping), Z (defunct)</li> <li>• Type: U (unknown), O (non sysmgr), VL (vdc-local), VG (vdc-global), VU (vdc-unaware), NR (not running), ER (terminated etc)</li> </ul>

**EXAMPLES**

This example shows how to display the system redundancy status:

```
n1000v# show system redundancy status
Redundancy role
-----
administrative: primary
operational: primary
Redundancy mode
-----
administrative: HA
operational: HA
This supervisor (sup-1)
-----
Redundancy state: Active
Supervisor state: Active
Internal state: Active with HA standby
Other supervisor (sup-2)
-----
Redundancy state: Standby
Supervisor state: HA standby
Internal state: HA standby
```

This example shows how to display information about all available VSMs and VEMs in the system:

**Beta Release 4.0(4)SV1(2) Draft -- Cisco Confidential**

```
n1000v# show module
Mod Ports Module-Type Model Status
--- -----
1 0 Virtual Supervisor Module Nexus1000V active *
2 0 Virtual Supervisor Module Nexus1000V ha-standby
3 248 Virtual Ethernet Module NA ok

Mod Sw Hw
--- -----
