

Configuring sFlow

This chapter describes how to configure sFlow on Cisco NX-OS devices.

This chapter includes the following sections:

- [About sFlow, on page 1](#)
- [Prerequisites for sFlow, on page 2](#)
- [Guidelines and Limitations for sFlow, on page 2](#)
- [Default Settings for sFlow, on page 3](#)
- [Configuring sFlow , on page 4](#)
- [Verifying the sFlow Configuration, on page 11](#)
- [Monitoring and Clearing sFlow Statistics, on page 11](#)
- [Configuration Examples for sFlow, on page 11](#)
- [Additional References, on page 12](#)

About sFlow

Sampled flow (sFlow) allows you to monitor real-time traffic in data networks that contain switches and routers. It uses the sampling mechanism in the sFlow agent software on switches and routers to monitor traffic and to forward the sample data to the central data collector.

For more information about sFlow, see [RFC 3176](#).

sFlow Agent

The sFlow agent, which is embedded in the Cisco NX-OS software, periodically samples or polls the interface counters that are associated with a data source of the sampled packets. The data source can be an Ethernet interface, an EtherChannel interface, or a range of Ethernet interfaces. The sFlow agent queries the Ethernet port manager for the respective EtherChannel membership information and also receives notifications from the Ethernet port manager for membership changes.

When you enable sFlow sampling, based on the sampling rate and the hardware internal random number, the ingress packets and egress packets are sent to the CPU as an sFlow-sampled packet. The sFlow agent processes the sampled packets and sends an sFlow datagram to the sFlow analyzer. In addition to the original sampled packet, an sFlow datagram includes information about the ingress port, the egress port, and the original packet length. An sFlow datagram can have multiple sFlow samples.

Prerequisites for sFlow

sFlow has the following prerequisites:

- For Cisco Nexus 9332PQ, 9372PX, 9372TX, and 93120TX switches and for Cisco Nexus 9396PX, 9396TX, and 93128TX switches with the N9K-M6PQ generic expansion module (GEM), you must configure the sFlow and SPAN ACL TCAM region sizes for any uplink ports that are to be configured as an sFlow data source. To do so, use the **hardware access-list tcam region sflow** and **hardware access-list tcam region span** commands. See [Configuring ACL TCAM Region Sizes](#) for more information.

Note By default, the sflow region size is zero, and the span region size is non-zero. You need to configure the sflow region to 256 and allocate enough entries to the span region in order to configure the port as an sFlow data source.

- Egress sFlow of multicast traffic requires **hardware multicast global-tx-span** configuration

Guidelines and Limitations for sFlow

Note For scale information, see the release-specific *Cisco Nexus 9000 Series NX-OS Verified Scalability Guide*.

sFlow has the following guidelines and limitations:

- If at least one sFlow data source is configured, the SPAN sessions cannot be brought up.
 - If at least one SPAN session is configured as **no shut**, sFlow data sources cannot be added.
 - The sampling mode that is used for sFlow is based on an algorithm that is known as LFSR. Due to the use of LFSR, it is not guaranteed that one in every few packets are sampled with the sampling rate of n. However, the number of packets that are sampled is equal to the total packets over a period of time.
- When sFlow and SPAN are configured on the same interface, and the hardware rate-limiter is configured for sFlow, the Rate-Limiter Drops counter in the output of the **show hardware rate-limiter** command displays more drops than expected.
- sFlow is a software-driven feature, hardware only sends copies of traffic from the sFlow source interfaces to the CPU for further processing. Elevated CPU usage is expected. sFlow traffic sent to the CPU by hardware is rate-limited to protect the CPU.
- When you enable sFlow for an interface, it is enabled for both ingress and egress. You cannot enable sFlow for only ingress or only egress.

For Cisco Nexus 9508 switches with Cisco Nexus 9636C-R and 9636Q-R line cards, sFlow can be enabled for an interface only in the ingress direction.
- The storm control feature does not work if you enable storm control on an interface where sFlow is also enabled.

- sFlow is not supported on the SVIs.
- Subinterfaces are not supported for sFlow.
- We recommend you configure the sampling rate that is based on the sFlow configuration and traffic in the system.
- The switch supports only one sFlow collector.
- sFlow and Network Address Translation (NAT) are not supported on the same port.
- sFlow does not support egress sampling for multicast, broadcast, or unknown unicast packets.
sFlow supports sampling IPv6 traffic but only on IPv4 collector address.
- sFlow counters increment even for control packets that ingress on the sFlow data-source interfaces. These packets may be sampled and send out as sFlow datagrams (similar to data plane traffic).
- The following Cisco Nexus switches support sFlow and SPAN together:
 - N9336C-FX2
 - N93240YC-FX2
 - N93360YC-FX2
- Beginning with Cisco NX-OS Release 9.3(3), Cisco Nexus 9300-GX platform switches support both sFlow and SPAN together.
- sFlow is not supported in Cisco Nexus 3132C-Z platform switches.
- In Cisco Nexus 9300-EX and 9300-FX platform switches, the FEX, HIF, and NIF ports cannot be configured as sFlow data-source interfaces.
- Nexus 9000-EX, FX, and GX family of switches only support sampling at the following values: 4096, 8192, 16384, 32768, 65536. Configuring values other than these results in the value being rounded off to the next supported value.

Default Settings for sFlow

The following table lists the default settings for sFlow parameters.

Table 1: Default sFlow Parameters

Parameters	Default
sFlow sampling rate	4096
sFlow sampling size	128
sFlow counter poll interval	20
sFlow maximum datagram size	1400
sFlow collector IP address	0.0.0.0

Parameters	Default
sFlow collector port	6343
sFlow agent IP address	0.0.0.0

Configuring sFlow

Enabling sFlow

You must enable the sFlow feature before you can configure sFlow settings on the switch.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	[no] feature sflow Example: <pre>switch(config)# feature sflow</pre>	Enables or disables sFlow.
Step 3	(Optional) show feature Example: <pre>switch(config)# show feature</pre>	Displays the enabled and disabled features.
Step 4	(Optional) copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

Configuring the Sampling Rate

You can configure the sampling rate for sFlow.

Before you begin

Make sure that you have enabled sFlow.

Nexus 9000-EX, FX, and GX family of switches only support sampling at the following values: 4096, 8192, 16384, 32768, 65536. Configuring values other than these will result in the value being rounded off to the next supported value.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	[no] sflow sampling-rate <i>sampling-rate</i> Example: switch(config)# sflow sampling-rate 50000	Configures the sFlow sampling rate for packets. The <i>sampling-rate</i> can be an integer between 4096 and 1000000000.
Step 3	(Optional) show sflow Example: switch(config)# show sflow	Displays the sFlow configuration.
Step 4	(Optional) copy running-config startup-config Example: switch(config)# copy running-config startup-config	Copies the running configuration to the startup configuration.

Configuring the Maximum Sampled Size

You can configure the maximum number of bytes that should be copied from a sampled packet.

Before you begin

Make sure that you have enabled sFlow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	[no] sflow max-sampled-size <i>sampling-size</i> Example: switch(config)# sflow max-sampled-size 200	Configures the sFlow maximum sampling size. The range for the <i>sampling-size</i> is from 64 to 256 bytes.
Step 3	(Optional) show sflow Example: switch(config)# show sflow	Displays the sFlow configuration.

	Command or Action	Purpose
Step 4	(Optional) copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

Configuring the Counter Poll Interval

You can configure the maximum number of seconds between successive samples of the counters that are associated with the data source. A sampling interval of 0 disables counter sampling.

Before you begin

Make sure that you have enabled sFlow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	[no] sflow counter-poll-interval <i>poll-interval</i> Example: <pre>switch(config)# sflow counter-poll-interval 100</pre>	Configures the sFlow poll interval for an interface. The range for the <i>poll-interval</i> is from 0 to 2147483647 seconds.
Step 3	(Optional) show sflow Example: <pre>switch(config)# show sflow</pre>	Displays the sFlow configuration.
Step 4	(Optional) copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

Configuring the Maximum Datagram Size

You can configure the maximum number of data bytes that can be sent in a single sample datagram.

Before you begin

Make sure that you have enabled sFlow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	[no] sflow max-datagram-size <i>datagram-size</i> Example: switch(config)# sflow max-datagram-size 2000	Configures the sFlow maximum datagram size. The range for the <i>datagram-size</i> is from 200 to 9000 bytes.
Step 3	(Optional) show sflow Example: switch(config)# show sflow	Displays the sFlow configuration.
Step 4	(Optional) copy running-config startup-config Example: switch(config)# copy running-config startup-config	Copies the running configuration to the startup configuration.

Configuring the sFlow Collector Address

You can configure the IPv4 address of the sFlow data collector that is connected to the management port.

Before you begin

Make sure that you have enabled sFlow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	[no] sflow collector-ip <i>ip-address</i> vrf <i>vrf</i> [source <i>ip-address</i>] Example: switch(config)# sflow collector-ip 192.0.2.5 vrf management	Configures the IPv4 address for the sFlow collector. If the IP address is set to 0.0.0.0, all samples will be dropped. The <i>vrf</i> can be one of the following: <ul style="list-style-type: none"> A user-defined VRF name—You can specify a maximum of 32 alphanumeric characters.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • vrf management—You must use this option if the sFlow data collector is on the network connected to the management port. • vrf default—You must use this option if the sFlow data collector is on the network connected to the front-panel ports. <p>The source ip-address option causes the sent sFlow datagram to use the source IP address as the IP packet source address. The source IP address has to be already configured on one of the switch local interfaces; otherwise, an error message appears. If the interface with the source IP address is changed or removed after this option is configured, the sFlow datagram will no longer be sent out, and an event history error and syslog error will be logged. When the source ip-address option is not configured, Cisco NX-OS picks the IP packet source address automatically for the sent sFlow datagram.</p>
Step 3	(Optional) show sflow Example: <pre>switch(config)# show sflow</pre>	Displays the sFlow configuration.
Step 4	(Optional) copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

Configuring the sFlow Collector Port

You can configure the destination port for sFlow datagrams.

Before you begin

Make sure that you have enabled sFlow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	switch# configure terminal switch(config)#	
Step 2	[no] sflow collector-port <i>collector-port</i> Example: switch(config)# sflow collector-port 7000	Configures the UDP port of the sFlow collector. The range for the <i>collector-port</i> is from 1 to 65535.
Step 3	(Optional) show sflow Example: switch(config)# show sflow	Displays the sFlow configuration.
Step 4	(Optional) copy running-config startup-config Example: switch(config)# copy running-config startup-config	Copies the running configuration to the startup configuration.

Configuring the sFlow Agent Address

You can configure the IPv4 address of the sFlow agent.

Before you begin

Make sure that you have enabled sFlow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	[no] sflow agent-ip <i>ip-address</i> Example: switch(config)# sflow agent-ip 192.0.2.3	Configures the IPv4 address of the sFlow agent. The default IP address is 0.0.0.0, which means that all samples will be dropped. You must specify a valid IP address to enable sFlow functionality. Note This IP address is not necessarily the source IP address for sending the sFlow datagram to the collector.
Step 3	(Optional) show sflow Example: switch(config)# show sflow	Displays the sFlow configuration.

	Command or Action	Purpose
Step 4	(Optional) copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

Configuring the sFlow Sampling Data Source

You can configure the source of the data for the sFlow sampler as an Ethernet port, a range of Ethernet ports, or a port channel.

Before you begin

Make sure that you have enabled sFlow.

If you want to use a port channel as the data source, make sure that you have already configured the port channel and you know the port channel number.

Make sure that the sFlow and SPAN ACL TCAM region sizes are configured for any uplink ports that are to be configured as an sFlow data source on the following devices: Cisco Nexus 9332PQ, 9372PX, 9372TX, and 93120TX switches and Cisco Nexus 9396PX, 9396TX, and 93128TX switches with the N9K-M6PQ or N9K-M12PQ generic expansion module (GEM).

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	[no] sflow data-source interface [ethernet slot/port[-port] port-channel channel-number] Example: <pre>switch(config)# sflow data-source interface ethernet 1/5-12</pre>	Configures the sFlow sampling data source. For an Ethernet data source, <i>slot</i> is the slot number, and <i>port</i> can be either a single port number or a range of ports designated as <i>port-port</i> .
Step 3	(Optional) show sflow Example: <pre>switch(config)# show sflow</pre>	Displays the sFlow configuration.
Step 4	(Optional) copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

Verifying the sFlow Configuration

Use these commands to display the sFlow configuration.

Table 2: sFlow Show Commands

Command	Purpose
show sflow	Displays all the data sources of the sFlow samplers and the sFlow agent configuration.
show process	Verifies whether the sFlow process is running.
show running-config sflow [all]	Displays the current sFlow running configuration.

Monitoring and Clearing sFlow Statistics

Use the **show sflow statistics** command to display the sFlow statistics.

Use the following commands to clear the sFlow statistics:

Command	Description
clear sflow statistics	Clears most of the sFlow statistics from the show sflow statistics command.
clear counters interface all	Clears the Total Packets field from the show sflow statistics command.
clear hardware rate-limiter sflow	Clears the Total Samples field from the show sflow statistics command.

Configuration Examples for sFlow

This example shows how to configure sFlow:

```
feature sflow
sflow sampling-rate 4096
sflow max-sampled-size 200
sflow counter-poll-interval 100
sflow max-datagram-size 2000
sflow collector-ip 192.0.2.5 vrf management
sflow collector-port 7000
sflow agent-ip 192.0.2.3
sflow data-source interface ethernet 1/5
```
