CHAPTER 1

Configuring Advanced BGP

This chapter describes how to configure advanced features of the Border Gateway Protocol (BGP) on the Cisco NX-OS device.

This chapter includes the following sections:

- Information About Advanced BGP, page 11-1
- Licensing Requirements for Advanced BGP, page 11-11
- Prerequisites for Advanced BGP, page 11-12
- Guidelines and Limitations for Advanced BGP, page 11-12
- Configuring Advanced BGP, page 11-13
- Verifying Advanced BGP Configuration, page 11-42
- Displaying BGP Statistics, page 11-44
- Related Topics, page 11-44
- Default Settings, page 11-44
- Additional References, page 11-45
- Feature History for BGP, page 11-45

Information About Advanced BGP

BGP is an interdomain routing protocol that provides loop-free routing between organizations or autonomous systems. Cisco NX-OS supports BGP version 4. BGP version 4 includes multiprotocol extensions that allow BGP to carry routing information for IP multicast routes and multiple Layer 3 protocol address families. BGP uses TCP as a reliable transport protocol to create TCP sessions with other BGP-enabled devices called BGP peers. When connecting to an external organization, the router creates external BGP (eBGP) peering sessions. BGP peers within the same organization exchange routing information through internal BGP (iBGP) peering sessions.

This section includes the following topics:

- Peer Templates, page 11-2
- Authentication, page 11-2
- Route Policies and Resetting BGP Sessions, page 11-3
- eBGP, page 11-3
- iBGP, page 11-3

- Capabilities Negotiation, page 11-6
- Route Dampening, page 11-6
- Load Sharing and Multipath, page 11-7
- Route Aggregation, page 11-7
- BGP Conditional Advertisement, page 11-8
- BGP Next-Hop Address Tracking, page 11-8
- Route Redistribution, page 11-9
- Tuning BGP, page 11-9
- Multiprotocol BGP, page 11-9
- Graceful Restart and High Availability, page 11-10
- ISSU, page 11-11
- Virtualization Support, page 11-11

Peer Templates

BGP peer templates allow you to create blocks of common configuration that you can reuse across similar BGP peers. Each block allows you to define a set of attributes that a peer then inherits. You can choose to override some of the inherited attributes as well, making it a very flexible scheme for simplifying the repetitive nature of BGP configurations.

Cisco NX-OS implements three types of peer templates:

- The *peer-session* template defines BGP peer session attributes, such as the transport details, remote autonomous system number of the peer, and session timers. A peer-session template can also inherit attributes from another peer-session template (with locally defined attributes that override the attributes from an inherited peer-session).
- A *peer-policy* template defines the address-family dependent policy aspects for a peer including the inbound and outbound policy, filter-lists, and prefix-lists. A peer-policy template can inherit from a set of peer-policy templates. Cisco NX-OS evaluates these peer-policy templates in the order specified by the preference value in the inherit configuration. The lowest number is preferred over higher numbers.
- The *peer* template can inherit the peer-session and peer-policy templates to allow for simplified peer definitions. It is not mandatory to use a peer template but it can simplify the BGP configuration by providing reusable blocks of configuration.

Authentication

You can configure authentication for a BGP neighbor session. This authentication method adds an MD5 authentication digest to each TCP segment sent to the neighbor to protect BGP against unauthorized messages and TCP security attacks.

The MD5 password must be identical between BGP peers.

Route Policies and Resetting BGP Sessions

You can associate a route policy to a BGP peer. Route policies use route maps to control or modify the routes that BGP recognizes. You can configure a route policy for inbound or outbound route updates. The route policies can match on different criteria, such as a prefix or AS_path attribute, and selectively accept or deny the routes. Route policies can also modify the path attributes. See Chapter 17, "Configuring Policy-Based Routing" for more information on route polices.

When you change a route policy applied to a BGP peer, you must reset the BGP sessions for that peer. Cisco NX-OS supports the following three mechanisms to reset BGP peering sessions:

- Hard reset—A hard reset tears down the specified peering sessions, including the TCP connection, and deletes routes coming from the specified peer. This option interrupts packet flow through the BGP network. Hard reset is disabled by default.
- Soft reconfiguration inbound—A soft reconfiguration inbound triggers routing updates for the specified peer without resetting the session. You can use this option if you change an inbound route policy. Soft reconfiguration inbound saves a copy of all routes received from the peer before processing the routes through the inbound route policy. If you change the inbound route policy, Cisco NX-OS passes these stored routes through the modified inbound route policy to update the route table without tearing down existing peering sessions. Soft reconfiguration inbound can use significant memory resources to store the unfiltered BGP routes. Soft reconfiguration inbound is disabled by default.
- Route Refresh—A route refresh updates the inbound routing tables dynamically by sending route
 refresh requests to supporting peers when you change an inbound route policy. The remote BGP peer
 responds with a new copy of its routes that the local BGP speaker processes with the modified route
 policy. Cisco NX-OS automatically sends an outbound route refresh of prefixes to the peer.
- BGP peers advertise the route refresh capability as part of the BGP capability negotiation when establishing the BGP peer session. Route refresh is the preferred option and enabled by default.

BGP also uses route maps for route redistribution, route aggregation, route dampening, and other features. See Chapter 16, "Configuring Route Policy Manager," for more information on route maps.

eBGP

External BGP (eBGP) allows you to connect BGP peers from different autonomous systems to exchange routing updates. Connecting to external networks enables traffic from your network to be forwarded to other networks and across the Internet.

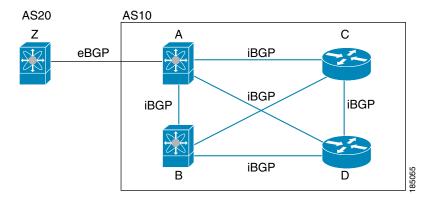

You should use loopback interfaces for establishing eBGP peering sessions because loopback interfaces are less susceptible to interface flapping. An interface *flap* occurs when the interface is administratively brought up or down because of a failure or maintenance issue. See the "Configuring eBGP" section on page 11-24 for information on multihop, fast external fallovers, and limiting the size of the AS-path attribute.

iBGP

Internal BGP (iBGP) allows you to connect BGP peers within the same autonomous system. You can use iBGP for multihomed BGP networks (networks that have more than one connection to the same external autonomous system).

Figure 11-1 shows an iBGP network within a larger BGP network.

Figure 11-1 iBGP Network

iBGP networks are fully meshed. Each iBGP peer has a direct connection to all other iBGP peers to prevent network loops.

You should configure a separate interior gateway protocol in the iBGP network.

This section includes the following topics:

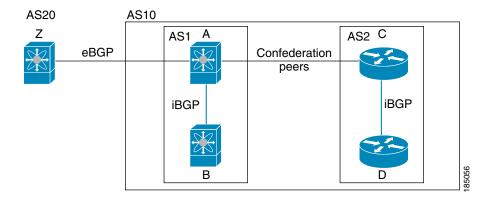

- AS Confederations, page 11-4
- Route Reflector, page 11-5

AS Confederations

A fully meshed iBGP network becomes complex as the number of iBGP peers grows. You can reduce the iBGP mesh by dividing the autonomous system into multiple subautonomous systems and grouping them into a single confederation. A confederation is a group of iBGP peers that use the same autonomous system number to communicate to external networks. Each subautonomous system is fully meshed within itself and has a few connections to other subautonomous systems in the same confederation.

Figure 11-2 shows the BGP network from Figure 11-1, split into two subautonomous systems and one confederation.

Figure 11-2 AS Confederation

In this example, AS10 is split into two subautonomous systems, AS1 and AS2. Each subautonomous system is fully meshed, but there is only one link between the subautonomous systems. By using AS confederations, you can reduce the number of links compared to the fully meshed autonomous system in Figure 11-1.

Route Reflector

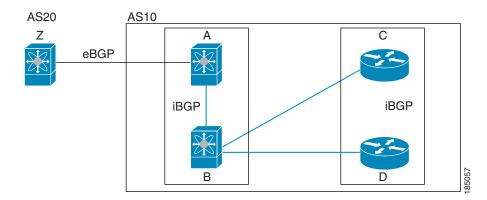

You can alternately reduce the iBGP mesh by using a route reflector configuration. route reflectors pass learned routes to neighbors so that all iBGP peers do not need to be fully meshed.

Figure 11-1 shows a simple iBGP configuration with four meshed iBGP speakers (router A, B, C, and D). Without route reflectors, when router A receives a route from an external neighbor, it advertises the route to all three iBGP neighbors.

When you configure an iBGP peer to be a route reflector, it becomes responsible for passing iBGP learned routes to a set of iBGP neighbors.

In Figure 11-3, router B is the route reflector. When the route reflector receives routes advertised from router A, it advertises (reflects) the routes to routers C and D. Router A no longer has to advertise to both routers C and D.

Figure 11-3 route reflector

The route reflector and its client peers form a cluster. You do not have to configure all iBGP peers to act as client peers of the route reflector. You must configure any nonclient peer as fully meshed to guarantee that complete BGP updates reach all peers.

Capabilities Negotiation

A BGP speaker can learn about BGP extensions supported by a peer by using the capabilities negotiation feature. Capabilities negotiation allows BGP to use only the set of features supported by both BGP peers on a link.

If a BGP peer does not support capabilities negotiation, Cisco NX-OS will attempt a new session to the peer without capabilities negotiation if you have configured the address family as IPv4. Any other multiprotocol configuration (such as IPv6) requires capabilities negotiation.

Route Dampening

Route dampening is a BGP feature that minimizes the propagation of flapping routes across an internetwork. A route flaps when it alternates between the available and unavailable states in rapid succession.

For example, consider a network with three BGP autonomous systems: AS1, AS2, and AS3. Suppose that a route in AS1 flaps (it becomes unavailable). Without route dampening, AS1 sends a withdraw message to AS2. AS2 propagates the withdrawal message to AS3. When the flapping route reappears, AS1 sends an advertisement message to AS2, which sends the advertisement to AS3. If the route repeatedly becomes unavailable, and then available, AS1 sends many withdrawal and advertisement messages that propagate through the other autonomous systems.

Route dampening can minimize flapping. Suppose that the route flaps. AS2 (in which route dampening is enabled) assigns the route a penalty of 1000. AS2 continues to advertise the status of the route to neighbors. Each time that the route flaps, AS2 adds to the penalty value. When the route flaps so often that the penalty exceeds a configurable suppression limit, AS2 stops advertising the route, regardless of how many times that it flaps. The route is now dampened.

The penalty placed on the route decays until the reuse limit is reached. At that time, AS2 advertises the route again. When the reuse limit is at 50 percent, AS2 removes the dampening information for the route.

The router does not apply a penalty to a resetting BGP peer when route dampening is enabled, even though the peer reset withdraws the route.

Load Sharing and Multipath

BGP can install multiple equal-cost eBGP or iBGP paths into the routing table to reach the same destination prefix. Traffic to the destination prefix is then shared across all the installed paths.

The BGP best-path algorithm considers the paths as equal-cost paths if the following attributes are identical:

- Weight
- Local preference
- AS_path
- Origin code
- Multi-exit discriminator (MED)
- IGP cost to the BGP next hop

BGP selects only one of these multiple paths as the best path and advertises the path to the BGP peers.

Paths received from different AS confederations are considered as equal-cost paths if the external AS_path values and the other attributes are identical.

When you configure a route reflector for iBGP multipath, and the route reflector advertises the selected best path to its peers, the next hop for the path is not modified.

Route Aggregation

You can configure aggregate addresses. Route aggregation simplifies route tables by replacing a number of more specific addresses with an address that represents all the specific addresses. For example, you can replace these three more specific addresses, 10.1.1.0/24, 10.1.2.0/24, and 10.1.3.0/24 with one aggregate address, 10.1.0.0/16.

Aggregate prefixes are present in the BGP route table so that fewer routs are advertised.

Cisco NX-OS does not support automatic route aggregation.

Route aggregation can lead to forwarding loops. To avoid this problem, when BGP generates an advertisement for an aggregate address, it automatically installs a summary discard route for that aggregate address in the local routing table. BGP sets the administrative distance of the summary discard to 220 and sets the route type to discard. BGP does not use discard routes for next-hop resolution.

BGP Conditional Advertisement

BGP conditional advertisement allows you to configure BGP to advertise or withdraw a route based on whether or not a prefix exists in the BGP table. This feature is useful, for example, in multihomed networks, in which you want BGP to advertise some prefixes to one of the providers only if information from the other provider is not present.

Consider an example network with three BGP autonomous systems: AS1, AS2, and AS3, where AS1 and AS3 connect to the Internet and to AS2. Without conditional advertisement, AS2 propagates all routes to both AS1 and AS3. With conditional advertisement, you can configure AS2 to advertise certain routes to AS3 only if routes from AS1 do not exist (if for example, the link to AS1 fails).

BGP conditional advertisement adds an exist or not-exist test to each route that matches the configured route map. See the "Configuring BGP Conditional Advertisement" section on page 11-30 for more information.

BGP Next-Hop Address Tracking

BGP monitors the next-hop address of installed routes to verify next-hop reachability and to select, install, and validate the BGP best path. BGP next-hop address tracking speeds up this next-hop reachability test by triggering the verification process when routes change in the RIB that may affect BGP next-hop reachability.

BGP receives notifications from the RIB when next-hop information changes (event-driven notifications). BGP is notified when any of the following events occurs:

- Next hop becomes unreachable.
- Next hop becomes reachable.
- Fully recursed IGP metric to the next hop changes.
- First hop IP address or first hop interface changes.
- Next hop becomes connected.
- Next hop becomes unconnected.
- Next hop becomes a local address.
- Next hop becomes a nonlocal address.

Reachability and recursed metric events trigger a best-path recalculation.

Event notifications from the RIB are classified as critical and noncritical. Notifications for critical and noncritical events are sent in separate batches. However, a noncritical event is sent with the critical events if the noncritical event is pending and there is a request to read the critical events.

- Critical events are related to next-hop reachability, such as the loss of next hops resulting in a switchover to a different path. A change in the IGP metric for a next hop resulting in a switchover to a different path can also be considered a critical event.
- Non-critical events are related to next hops being added without affecting the best path or changing the IGP metric to a single next hop.

See the "Configuring BGP Next-Hop Address Tracking" section on page 11-23 for more information.

Critical and non-critical events can be configured individually on a per address family basis.

Route Redistribution

You can configure BGP to redistribute static routes or routes from other protocols.. You must configure a route map with the redistribution to control which routes are passed into BGP. A route map allows you to filter routes based on attributes such as the destination, origination protocol, route type, route tag, and so on. See Chapter 16, "Configuring Route Policy Manager," for more information.

When you redistribute BGP to IGP, iBGP is redistributed as well. To override this behavior, you must insert an additional deny statement into the route map.

Tuning BGP

You can modify the default behavior of BGP through BGP timers and by adjusting the best-path algorithm.

This section includes the following topics:

- BGP Timers, page 11-9
- Tuning the Best-Path Algorithm, page 11-9

BGP Timers

BGP uses different types of timers for neighbor session and global protocol events. Each established session has a minimum of two timers for sending periodic keepalive messages and for timing out sessions when peer keepalives do not arrive within the expected time. In addition, there are other timers for handling specific features. Typically, you configure these timers in seconds. The timers include a random adjustment so that the same timers on different BGP peers trigger at different times.

Tuning the Best-Path Algorithm

You can modify the default behavior of the best-path algorithm through optional configuration parameters, including changing how the algorithm handles the MED attribute and the router ID.

Multiprotocol BGP

BGP on Cisco NX-OS supports multiple address families. Multiprotocol BGP (MP-BGP) carries different sets of routes depending on the address family. For example, BGP can carry one set of routes for IPv4 unicast routing, one set of routes for IPv4 multicast routing, and one set of routes for IPv6 multicast routing. You can use MP-BGP for reverse-path forwarding (RPF) checks in IP multicast networks.

Because Multicast BGP does not propagate multicast state information, you need a multicast protocol, such as Protocol Independent Multicast (PIM).

Use the router address-family and neighbor address-family configuration modes to support multiprotocol BGP configurations. MP-BGP maintains separate RIBs for each configured address family, such as a unicast RIB and a multicast RIB for BGP.

A multiprotocol BGP network is backward compatible but BGP peers that do not support multiprotocol extensions cannot forward routing information, such as address family identifier information, that the multiprotocol extensions carry.

Graceful Restart and High Availability

Cisco NX-OS supports nonstop forwarding and graceful restart for BGP.

You can use nonstop forwarding (NSF) for BGP to forward data packets along known routes in the Forward Information Base (FIB) while the BGP routing protocol information is being restored following a fallover. With NSF, BGP peers do not experience routing flaps. During a fallover, the data traffic is forwarded through intelligent modules while the standby supervisor becomes active.

If a Cisco NX-OS router experiences a cold reboot, the network does not forward traffic to the router and removes the router from the network topology. In this scenario, BGP experiences a nongraceful restart and removes all routes. When Cisco NX-OS applies the startup configuration, BGP reestablishes peering sessions and relearns the routes.

A Cisco NX-OS router that has dual supervisors can experience a stateful supervisor switchover. During the switchover, BGP uses nonstop forwarding to forward traffic based on the information in the FIB, and the system is not removed from the network topology. A router whose neighbor is restarting is referred to as a "helper." After the switchover, a graceful restart operation begins. When it is in progress, both routers reestablish their neighbor relationship and exchange their BGP routes. The helper continues to forward prefixes pointing to the restarting peer, and the restarting router continues to forward traffic to peers even though those neighbor relationships are restarting. When the restarting router has all route updates from all BGP peers that are graceful restart capable, the graceful restart is complete, and BGP informs the neighbors that it is operational again.

Low Memory Handling

BGP reacts to low memory for the following conditions:

- Minor alert—BGP does not establish any new eBGP peers. BGP continues to establish new iBGP peers and confederate peers. Established peers remain, but reset peers will not be re-established.
- Severe alert—BGP shuts down select established eBGP peers every two minutes until the memory alert becomes minor. For each eBGP peer, BGP calculates the ratio of total number of paths received to the number of paths selected as best paths. The peers with the highest ratio are selected to be shut down to reduce memory usage. You must clear a shutdown eBGP peer before you can bring the eBGP peer back up to avoid oscillation.

You can exempt important eBGP peers from this selection process.

• Critical alert—BGP gracefully shuts down all the established peers. You must clear a shutdown BGP peer before you can bring the BGP peer back up.

See the "Tuning BGP" section on page 11-36 for more information on how to exempt a BGP peer from shutdown due to a low memory condition.

ISSU

Cisco NX-OS supports in-service software upgrades (ISSU). ISSU allows you to upgrade software without impacting forwarding.

The following conditions are required to support ISSU:

- Graceful restart must be enabled (default)
- Keepalive and hold timers must not be smaller than their default values

If either of these requirements is not met, Cisco NX-OS issues a warning. You can proceed with the upgrade or downgrade, but service might be disrupted.

Cisco NX-OS cannot guarantee ISSU for non-default timer values if the negotiated hold time between BGP peers is less than the system switchover time.

In Cisco NX-OS Release 4.2(3) or later, if the negotiated hold time is less than the system switchover time, you can optionally proceed with an upgrade that may be distruptive. In earlier releases, you must reconfigure the hold timers on the BGP peers to be greater than the system switchover time and restart the BGP sessions before you can proceed with the ISSU.

Virtualization Support

Cisco NX-OS supports multiple instances of BGP that run on the same system. BGP supports Virtual Routing and Forwarding instances (VRFs) that exist within virtual device contexts (VDCs). You can configure one BGP instance in a VDC, but you can have multiple VDCs on the system.

By default, Cisco NX-OS places you in the default VDC and default VRF unless you specifically configure another VDC and VRF. See the *Cisco NX-OS Virtual Device Context Configuration Guide* and Chapter 14, "Configuring Layer 3 Virtualization."

Licensing Requirements for Advanced BGP

The following table shows the licensing requirements for this feature:

Product	License Requirement	
Cisco NX-OS	BGP requires an Enterprise Services license. For a complete explanation of the NX-OS licensing scheme	
	and how to obtain and apply licenses, see the Cisco NX-OS Licensing Guide	

Prerequisites for Advanced BGP

Advanced BGP has the following prerequisites:

- You must enable the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).
- You should have a valid router ID configured on the system.
- You must have an AS number, either assigned by a Regional Internet Registry (RIR) or locally administered.
- You must have reachability (such as an interior gateway protocol (IGP), a static route, or a direct connection) to the peer that you are trying to make a neighbor relationship with.
- You must explicitly configure an address family under a neighbor for the BGP session establishment.

Guidelines and Limitations for Advanced BGP

Advanced BGP has the following guidelines and limitations:

- The dynamic AS number prefix peer configuration overrides the individual AS number configuration inherited from a BGP template.
- If you configure a dynamic AS number for prefix peers in an AS confederation, BGP establishes sessions with only the AS numbers in the local confederation.
- BGP sessions created through a dynamic AS number prefix peer ignore any configured eBGP multihop time-to-live (TTL) value or a disabled check for directly connected peers.
- Configure a router ID for BGP to avoid automatic router ID changes and session flaps.
- Use the maximum-prefix configuration option per peer to restrict the number of routes received and system resources used.
- Configure the update-source to establish a session with eBGP multihop sessions.
- Specify a BGP route map if you configure redistribution.
- Configure the BGP router ID within a VRF.
- If you decrease the keepalive and hold timer values, the network might experience session flaps.
- If you configure VDCs, install the Advanced Services license and enter the desired VDC (see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.x).
- When you redistribute BGP to IGP, iBGP is redistributed as well. To override this behavior, you must insert an additional deny statement into the route map.
- The following guidelines and limitations apply to the **remove-private-as** command:
 - It applies only to eBGP peers.
 - It can be configured only in neighbor configuration mode and not in neighbor-address-family mode.

- If the AS-path includes both private and public AS numbers, the private AS numbers are not removed.
- If the AS-path contains the AS number of the eBGP neighbor, the private AS numbers are not removed.
- Private AS numbers are removed only if all AS numbers in that AS-path belong to a private AS number range. Private AS numbers are not removed if a peer's AS number or a non-private AS number is found in the AS-path segment.

Configuring Advanced BGP

This section describes how to configure advanced BGP and includes the following topics:

- Configuring BGP Session Templates, page 11-14
- Configuring BGP Peer-Policy Templates, page 11-16
- Configuring BGP Peer Templates, page 11-18
- Configuring Prefix Peering, page 11-21
- Configuring BGP Authentication, page 11-21
- Resetting a BGP Session, page 11-22
- Modifying the Next-Hop Address, page 11-22
- Configuring BGP Next-Hop Address Tracking, page 11-23
- Configuring Next-Hop Filtering, page 11-23
- Disabling Capabilities Negotiation, page 11-24
- Configuring eBGP, page 11-24
- Configuring AS Confederations, page 11-25
- Configuring Route Reflector, page 11-26
- Configuring Route Dampening, page 11-28
- Configuring Load Sharing and ECMP, page 11-29
- Configuring Maximum Prefixes, page 11-29
- Configuring Dynamic Capability, page 11-29
- Configuring Aggregate Addresses, page 11-30
- Configuring BGP Conditional Advertisement, page 11-30
- Configuring Route Redistribution, page 11-32
- Configuring Multiprotocol BGP, page 11-35
- Tuning BGP, page 11-36
- Configuring a Graceful Restart, page 11-39
- Configuring Virtualization, page 11-40

If you are familiar with the Cisco IOS CLI, be aware that the Cisco NX-OS commands for this feature might differ from the Cisco IOS commands that you would use.

Configuring BGP Session Templates

You can use BGP session templates to simplify BGP configuration for multiple BGP peers with similar configuration needs. BGP templates allow you to reuse common configuration blocks. You configure BGP templates first, and then apply these templates to BGP peers.

With BGP session templates, you can configure session attributes such as inheritance, passwords, timers, and security.

A peer-session template can inherit from one other peer-session template. You can configure the second template to inherit from a third template. The first template also inherits this third template. This indirect inheritance can continue for up to seven peer-session templates.

Any attributes configured for the neighbor take priority over any attributes inherited by that neighbor from a BGP template.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the switchto vdc command).

When editing a template, you can use the **no** form of a command at either the peer or template level to explicitly override a setting in a template. You must use the **default** form of the command to reset that attribute to the default state.

SUMMARY STEPS

- 1. config t
- 2. router bgp autonomous-system-number
- 3. template peer-session template-name
- **4.** Add appropriate attributes to the session template.
- **5**. Add appropriate attributes to the session template.
- 6. exit
- 7. **neighbor** *ip-address* **remote-as** *as-number*
- **8. inherit peer-session** *template-name*
- **9.** Add appropriate neighbor attributes.
- 10. show bgp peer-session template-name
- 11. copy running-config startup-config

DETAILED STEPS

Step 1

Command	Purpose
config t	Enters configuration mode.
Example:	
switch# config t	
switch(config)#	

	Command	Purpose
Step 2	router bgp autonomous-system-number	Enables BGP and assigns the autonomous system number to the local BGP speaker.
	<pre>Example: switch(config) # router bgp 65536 switch(config-router) #</pre>	and the second s
Step 3	template peer-session template-name	Enters peer-session template configuration mode.
	<pre>Example: switch(config-router)# template peer-session BaseSession switch(config-router-stmp)#</pre>	
Step 4	password number password	(Optional) Adds the clear text password <i>test</i> to the
	<pre>Example: switch(config-router-stmp)# password 0 test</pre>	neighbor. The password is stored and displayed in type 3 encrypted form (3DES).
Step 5	timers keepalive hold Example:	(Optional) Adds the BGP keepalive and holdtimer values to the peer-session template.
	switch(config-router-stmp)# timers 30 90	The default keepalive interval is 60. The default hold time is 180.
Step 6	exit	Exits peer-session template configuration mode.
	<pre>Example: switch(config-router-stmp)# exit switch(config-router)#</pre>	
Step 7	<pre>neighbor ip-address remote-as as-number Example: switch(config-router) # neighbor 192.168.1.2 remote-as 65536 switch(config-router-neighbor) #</pre>	Places the router in the neighbor configuration mode for BGP routing and configures the neighbor IP address.
Step 8	inherit peer-session template-name	Applies a peer-session template to the peer.
	<pre>Example: switch(config-router-neighbor)# inherit peer-session BaseSession switch(config-router-neighbor)</pre>	
Step 9	description text	(Optional) Adds a description for the neighbor.
	<pre>Example: switch(config-router-neighbor)# description Peer Router A switch(config-router-neighbor)</pre>	
Step 10	show bgp peer-session template-name	(Optional) Displays the peer-policy template.
	<pre>Example: switch(config-router-neighbor) # show bgp peer-session BaseSession</pre>	
Step 11	copy running-config startup-config	(Optional) Saves this configuration change.
	<pre>Example: switch(config-router-neighbor)# copy running-config startup-config</pre>	

Use the **show bgp neighbor** command to see the template applied. See the *Cisco Nexus 7000 Series NX-OS Unicast Routing Command Reference* for details on all commands available in the template.

This example shows how to configure a BGP peer-session template and apply it to a BGP peer:

```
switch# config t
switch(config)# router bgp 65536
switch(config-router)# template peer-session BaseSession
switch(config-router-stmp)# timers 30 90
switch(config-router-stmp)# exit
switch(config-router)# neighbor 192.168.1.2 remote-as 65536
switch(config-router-neighbor)# inherit peer-session BaseSession
switch(config-router-neighbor)# description Peer Router A
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor)# copy running-config startup-config
```

Configuring BGP Peer-Policy Templates

You can configure a peer-policy template to define attributes for a particular address family. You assign a preference to each peer-policy template and these templates are inherited in the order specified, for up to five peer-policy templates in a neighbor address family.

Cisco NX-OS evaluates multiple peer policies for an address family using the preference value. The lowest preference value is evaluated first. Any attributes configured for the neighbor take priority over any attributes inherited by that neighbor from a BGP template.

Peer-policy templates can configure address family-specific attributes such as AS-path filter lists, prefix lists, route reflection, and soft reconfiguration.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the switchto vdc command).

When editing a template, you can use the **no** form of a command at either the peer or template level to explicitly override a setting in a template. You must use the default form of the command to reset that attribute to the default state.

SUMMARY STEPS

- 1. config t
- 2. router bgp autonomous-system-number
- 3. template peer-policy template-name
- **4.** Add appropriate attributes to the policy template.
- 5. exit
- 6. **neighbor** ip-address **remote-as** as-number
- 7. address-family {ipv4 | ipv6} {multicast | unicast}
- 8. inherit peer-policy template-name preference
- 9. show bgp peer-policy template-name

10. copy running-config startup-config

DETAILED STEPS

	Command	Purpose
Step 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
Step 2	<pre>router bgp autonomous-system-number Example: switch(config) # router bgp 65536 switch(config-router) #</pre>	Enables BGP and assigns the autonomous system number to the local BGP speaker.
Step 3	template peer-policy template-name	Creates a peer-policy template.
	Example: switch(config-router) # template peer-policy BasePolicy switch(config-router-ptmp) #	
Step 4	advertise-active-only	(Optional) Advertises only active routes to the peer.
	<pre>Example: switch(config-router-ptmp)# advertise-active-only</pre>	
Step 5	maximum-prefix number	(Optional) Sets the maximum number of prefixes
	<pre>Example: switch(config-router-ptmp)# maximum-prefix 20</pre>	allowed from this peer.
Step 6	exit	Exits peer-policy template configuration mode.
	<pre>Example: switch(config-router-ptmp)# exit switch(config-router)#</pre>	
Step 7	<pre>neighbor ip-address remote-as as-number Example: switch(config-router) # neighbor 192.168.1.2 remote-as 65536 switch(config-router-neighbor) #</pre>	Places the router in neighbor configuration mode for BGP routing and configures the neighbor IP address.
Step 8	<pre>address-family {ipv4 ipv6}{multicast unicast}</pre>	Enters global address family configuration mode for the IPv4 address family.
	<pre>Example: switch(config-router-neighbor)# address-family ipv4 unicast switch(config-router-neighbor-af)#</pre>	
Step 9	<pre>inherit peer-policy template-name preference</pre>	Applies a peer-policy template to the peer address family configuration and assigns the preference value for this peer policy.
	Example: switch(config-router-neighbor-af)# inherit peer-policy BasePolicy 1	

	Command	Purpose
Step 10	show bgp peer-policy template-name	(Optional) Displays the peer-policy template.
	<pre>Example: switch(config-router-neighbor-af)# show bgp peer-policy BasePolicy</pre>	
Step 11	copy running-config startup-config	(Optional) Saves this configuration change.
	<pre>Example: switch(config-router-neighbor-af)# copy running-config startup-config</pre>	

Use the **show bgp neighbor** command to see the template applied. See the *Cisco Nexus 7000 Series NX-OS Unicast Routing Command Reference* for details on all commands available in the template.

This example shows how to configure a BGP peer-session template and apply it to a BGP peer:

This example shows how to configure a BGP peer-policy template and apply it to a BGP peer:

```
switch# config t
switch(config)# router bgp 65536
switch(config-router)# template peer-session BasePolicy
switch(config-router-ptmp)# maximum-prefix 20
switch(config-router-ptmp)# exit
switch(config-router)# neighbor 192.168.1.1 remote-as 65536
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# inherit peer-policy BasePolicy
switch(config-router-neighbor-af)# copy running-config startup-config
```

Configuring BGP Peer Templates

You can configure BGP peer templates to combine session and policy attributes in one reusable configuration block. Peer templates can also inherit peer-session or peer-policy templates. Any attributes configured for the neighbor take priority over any attributes inherited by that neighbor from a BGP template. You configure only one peer template for a neighbor, but that peer template can inherit peer-session and peer-policy templates.

Peer templates support session and address family attributes, such as eBGP multihop time-to-live, maximum prefix, next-hop self, and timers.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

When editing a template, you can use the **no** form of a command at either the peer or template level to explicitly override a setting in a template. You must use the default form of the command to reset that attribute to the default state.

SUMMARY STEPS

1. config t

- **2. router bgp** *autonomous-system-number*
- 3. template peer template-name
- 4. Add appropriate attributes to the peer template.
- 5. exit
- 6. **neighbor** *ip-address*
- 7. inherit peer template-name
- 8. exit
- **9.** Add appropriate neighbor attributes.
- 10. show bgp peer-template template-name
- 11. copy running-config startup-config

DETAILED STEPS

Command	Purpose
config t	Enters configuration mode.
Example: switch# config t switch(config)#	
router bgp autonomous-system-number Example:	Enters BGP mode and assigns the autonomous system number to the local BGP speaker.
switch(config)# router bgp 65536	
template peer template-name	Enters peer template configuration mode.
Example: switch(config-router)# template peer BasePeer switch(config-router-neighbor)#	
<pre>inherit peer-session template-name Example: switch(config-router-neighbor) # inherit peer-session BaseSession</pre>	(Optional) Inherits a peer-session template in the peetemplate.
address-family {ipv4 ipv6}{multicast unicast}	(Optional) Configures the global address family configuration mode for the IPv4 address family.
<pre>Example: switch(config-router-neighbor)# address-family ipv4 unicast switch(config-router-neighbor-af)#</pre>	
inherit peer template-name	(Optional) Applies a peer template to the neighbor
Example: switch(config-router-neighbor-af)# inherit peer BasePolicy	address family configuration.
exit	Exits BGP neighbor address family configuration
<pre>Example: switch(config-router-neighbor-af)# exit switch(config-router-neighbor)#</pre>	mode.

	Command	Purpose
Step 8	timers keepalive hold	(Optional) Adds the BGP timer values to the peer.
	<pre>Example: switch(config-router-neighbor)# timers 45 100</pre>	These values override the timer values in the peer-session template, BaseSession.
Step 9	exit	Exits BGP peer template configuration mode.
	<pre>Example: switch(config-router-neighbor)# exit switch(config-router)#</pre>	
Step 10	neighbor ip-address remote-as as-number	Places the router in neighbor configuration mode for
	<pre>Example: switch(config-router)# neighbor 192.168.1.2 remote-as 65536 switch(config-router-neighbor)#</pre>	BGP routing and configures the neighbor IP address.
Step 11	inherit peer template-name	Inherits the peer template.
	<pre>Example: switch(config-router-neighbor)# inherit peer BasePeer</pre>	
Step 12	timers keepalive hold	(Optional) Adds the BGP timer values to this neighbor.
	<pre>Example: switch(config-router-neighbor)# timers 60 120</pre>	These values override the timer values in the peer template and the peer-session template.
Step 13	show bgp peer-template template-name	(Optional) Displays the peer template.
	<pre>Example: switch(config-router-neighbor-af)# show bgp peer-template BasePeer</pre>	
Step 14	copy running-config startup-config	(Optional) Saves this configuration change.
	<pre>Example: switch(config-router-neighbor-af)# copy running-config startup-config</pre>	

Use the **show bgp neighbor** command to see the template applied. See the *Cisco Nexus 7000 Series NX-OS Unicast Routing Command Reference* for details on all commands available in the template.

This example shows how to configure a BGP peer template and apply it to a BGP peer:

```
switch# config t
switch(config)# router bgp 65536
switch(config-router)# template peer BasePeer
switch(config-router-neighbor)# inherit peer-session BaseSession
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# inherit peer-policy BasePolicy 1
switch(config-router-neighbor-af)# exit
switch(config-router-neighbor)# exit
switch(config-router)# neighbor 192.168.1.2 remote-as 65536
switch(config-router-neighbor)# inherit peer BasePeer
switch(config-router-neighbor)# copy running-config startup-config
```

Configuring Prefix Peering

BGP supports the definition of a set of peers using a prefix for both IPv4 and IPv6. This feature allows you to not have to add each neighbor to the configuration.

When defining a prefix peering, you must specify the remote AS number with the prefix. BGP accepts any peer that connects from that prefix and autonomous system if the prefix peering does not exceed the configured maximum peers allowed.

When a BGP peer that is part of a prefix peering disconnects, Cisco NX-OS holds its peer structures for a defined prefix peer timeout value. An established peer can reset and reconnect without danger of being blocked because other peers have consumed all slots for that prefix peering.

To configure the BGP prefix peering timeout value, use the following command in router configuration mode:

Command	Purpose
<pre>timers prefix-peer-timeout value Example: switch(config-router-neighbor)# timers prefix-peer-timeout 120</pre>	Configures the timeout value for prefix peering. The range is from 0 to 1200 seconds. The default value is 30.

To configure the maximum number of peers, use the following command in neighbor configuration mode:

Command	Purpose
	Configures the maximum number of peers for this prefix peering. The range is from 1 to 1000.
<pre>switch(config-router-neighbor)# maximum-peers 120</pre>	

This example shows how to configure a prefix peering that accepts up to 10 peers:

```
switch(config)# router bgp 65536
switch(config-router)# timers prefix-peer-timeout 120
switch(config-router)# neighbor 10.100.200.0/24 remote-as 65536
switch(config-router-neighbor)# maximum-peers 10
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)#
```

Use the **show ip bgp neighbor** command to show the details of the configuration for that prefix peering with a list of the currently accepted instances and the counts of active, maximum concurrent, and total accepted peers.

Configuring BGP Authentication

You can configure BGP to authenticate route updates from peers using MD5 digests.

To configure BGP to use MD5 authentication, use the following command in neighbor configuration mode:

Command	Purpose
password [0 3 7] string	Configures an MD5 password for BGP neighbor sessions.
<pre>Example: switch(config-router-neighbor)# password BGPpassword</pre>	

Resetting a BGP Session

If you modify a route policy for BGP, you must reset the associated BGP peer sessions. If the BGP peers do not support route refresh, you can configure a soft reconfiguration for inbound policy changes. Cisco NX-OS automatically attempts a soft reset for the session.

To configure soft reconfiguration inbound, use the following command in neighbor address-family configuration mode:

Command	Purpose
<pre>Example: switch(config-router-neighbor-af)#</pre>	Enables soft reconfiguration to store the inbound BGP route updates. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.

To reset a BGP neighbor session, use the following command in any mode:

Command	Purpose
clear bgp {ip ipv6} {unicast multicast} ip-address soft {in out}	Resets the BGP session without tearing down the TCP session.
<pre>Example: switch# clear bgp ip unicast 192.0.2.1 soft in</pre>	

Modifying the Next-Hop Address

You can modify the next-hop address used in a route advertisement in the following ways:

- Disable next-hop calculation and use the local BGP speaker address as the next-hop address.
- Set the next-hop address as a third-party address. Use this feature in situations where the original
 next-hop address is on the same subnet as the peer that the route is being sent to. Using this feature
 saves an extra hop during forwarding.

To modify the next-hop address, use the following parameters in commands address-family configuration mode:

Command	Purpose
next-hop-self	Uses the local BGP speaker address as the next-hop
<pre>Example: switch(config-router-neighbor-af)# next-hop-self</pre>	address in route updates. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.
next-hop-third-party Example:	Sets the next-hop address as a third-party address. Use this command for single-hop EBGP peers that
<pre>switch(config-router-neighbor-af)# next-hop-third-party</pre>	do not have next-hop-self configured

Configuring BGP Next-Hop Address Tracking

BGP next-hop address tracking is enabled by default and cannot be disabled.

You can modify the delay interval between RIB checks to increase the performance of BGP next-hop tracking.

To modify the BGP next-hop address tracking, use the following commands address-family configuration mode:

Command	Purpose
nexthop trigger-delay {critical non-critical} milliseconds	Specifies the next-hop address tracking delay timer for critical next-hop reachability routes and for
<pre>Example: switch(config-router-af)# nexthop trigger-delay critical 5000</pre>	noncritical routes. The range is from 1 to 4294967295 milliseconds. The critical timer default is 3000. The noncritical timer default is 10000.

Configuring Next-Hop Filtering

BGP next-hop filtering allows you to specify that when a next-hop address is checked with the RIB, the underlying route for that next-hop address is passed through the route map. If the route map rejects the route, the next-hop address is treated as unreachable.

BGP marks all next hops that are rejected by the route policy as invalid and does not calculate the best path for the routes that use the invalid next-hop address.

To configure BGP next-hop filtering, use the following command in address-family configuration mode:

Command	Purpose
nexthop route-map name	Specifies a route map to match the BGP next-hop route to. The name can be any case-sensitive
Example:	alphanumeric string up to 63 characters.
<pre>switch(config-router-af)# nexthop route-map nextHopLimits</pre>	aiphanumerie string up to 03 characters.

Disabling Capabilities Negotiation

You can disable capabilities negotiations to interoperate with older BGP peers that do not support capabilities negotiation.

To disable capabilities negotiation, use the following command in neighbor configuration mode:

Command	Purpose
<pre>dont-capability-negotiate Example: switch(config-router-neighbor) # dont-capability-negotiate</pre>	Disables capabilities negotiation. You must manually reset the BGP sessions after configuring this command.

Configuring eBGP

This section includes the following topics:

- Disabling eBGP Single-Hop Checking, page 11-24
- Configuring eBGP Multihop, page 11-25
- Disabling a Fast External Fallover, page 11-25
- Limiting the AS-path Attribute, page 11-25

Disabling eBGP Single-Hop Checking

You can configure eBGP to disable checking whether a single-hop eBGP peer is directly connected to the local router. Use this option for configuring a single-hop loopback eBGP session between directly connected switches.

To disable checking whether or not a single-hop eBGP peer is directly connected, use the following command in neighbor configuration mode:

Command	Purpose
Every 1 o	Disables checking whether or not a single-hop eBGP peer is directly connected. You must manually reset the BGP sessions after using this
	command.

Configuring eBGP Multihop

You can configure the eBGP time-to-live (TTL) value to support eBGP multihop. In some situations, an eBGP peer is not directly connected to another eBGP peer and requires multiple hops to reach the remote eBGP peer. You can configure the eBGP TTL value for a neighbor session to allow these multihop sessions.

To configure eBGP multihop, use the following command in neighbor configuration mode:

Command	Purpose
ebgp-multihop ttl-value	Configures the eBGP TTL value for eBGP
<pre>Example: switch(config-router-neighbor)# ebgp-multihop 5</pre>	multihop. The range is from 2 to 255. You must manually reset the BGP sessions after using this command.

Disabling a Fast External Fallover

By default, the Cisco Nexus 7000 Series device supports fast external fallover for neighbors in all VRFs and address-families (IPv4 or IPv6). Typically, when a BGP router loses connectivity to a directly connected eBGP peer, BGP triggers a fast external fallover by resetting the eBGP session to the peer. You can disable this fast external fallover to limit the instability caused by link flaps.

To disable fast external fallover, use the following command in router configuration mode:

Command	Purpose
	Disables a fast external fallover for eBGP peers. This command is enabled by default.
<pre>switch(config-router)# no fast-external-fallover</pre>	

Limiting the AS-path Attribute

You can configure eBGP to discard routes that have a high number of AS numbers in the AS-path attribute.

To discard routes that have a high number of AS numbers in the AS-path attribute, use the following command in router configuration mode:

Command	Purpose
maxas-limit number	Discards eBGP routes that have a number of
<pre>Example: switch(config-router)# maxas-limit 50</pre>	AS-path segments that exceed the specified limit. The range is from 1 to 2000.

Configuring AS Confederations

To configure an AS confederation, you must specify a confederation identifier. To the outside world, the group of autonomous systems within the AS confederation look like a single autonomous system with the confederation identifier as the autonomous system number.

To configure a BGP confederation identifier, use the following command in router configuration mode:

Command	Purpose
confederation identifier as-number	Configures a confederation identifier for an AS
<pre>Example: switch(config-router)# confederation identifier 4000</pre>	confederation. This command triggers an automatic notification and session reset for the BGP neighbor sessions.

To configure the autonomous systems that belong to the AS confederation, use the following command in router configuration mode:

Command	Purpose
	Specifies a list of autonomous systems that belong to the confederation. This command triggers an automatic notification and session reset for the BGP neighbor sessions.
<pre>Example: switch(config-router)# bgp confederation peers 5 33 44</pre>	

Configuring Route Reflector

You can configure iBGP peers as route reflector clients to the local BGP speaker, which acts as the route reflector. Together, a route reflector and its clients form a cluster. A cluster of clients usually has a single route reflector. In such instances, the cluster is identified by the router ID of the route reflector. To increase redundancy and avoid a single point of failure in the network, you can configure a cluster with more than one route reflector. You must configure all route reflectors in the cluster with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

SUMMARY STEPS

- 1. config t
- 2. router bgp as-number
- 3. cluster-id cluster-id
- 4. address-family {ipv4 | ipv6} {unicast | multicast}
- 5. client-to-client reflection
- 6. exit
- 7. **neighbor** *ip-address* **remote-as** *as-number*
- 8. address-family {ipv4 | ipv6} {unicast | multicast}
- 9. route-reflector-client

- 10. show bgp {ip | ipv6} {unicast | multicast} neighbors
- 11. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
Step 2	<pre>router bgp as-number Example: switch(config) # router bgp 65536 switch(config-router) #</pre>	Enters BGP mode and assigns the autonomous system number to the local BGP speaker.
Step 3	<pre>cluster-id cluster-id Example: switch(config-router)# cluster-id 192.0.2.1</pre>	Configures the local router as one of the route reflectors that serve the cluster. You specify a cluster ID to identify the cluster. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.
Step 4	<pre>address-family {ipv4 ipv6} {unicast</pre>	Enters router address family configuration mode for the specified address family.
Step 5	<pre>client-to-client reflection Example: switch(config-router-af)# client-to-client reflection</pre>	(Optional) Configures client-to-client route reflection. This feature is enabled by default. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.
Step 6	<pre>exit Example: switch(config-router-neighbor)# exit switch(config-router)#</pre>	Exits router address configuration mode.
Step 7	<pre>neighbor ip-address remote-as as-number Example: switch(config-router) # neighbor 192.0.2.10 remote-as 65536 switch(config-router-neighbor) #</pre>	Configures the IP address and AS number for a remote BGP peer.
Step 8	<pre>address-family {ipv4 ipv6}{unicast multicast} Example: switch(config-router-neighbor) # address-family ipv4 unicast switch(config-router-neighbor-af) #</pre>	Enters neighbor address family configuration mode for the unicast IPv4 address family.

	Command or Action	Purpose
Step 9	<pre>route-reflector-client Example: switch(config-router-neighbor-af) # route-reflector-client</pre>	Configures the device as a BGP route reflector and configures the neighbor as its client. This command triggers an automatic notification and session reset for the BGP neighbor sessions.
Step 10	<pre>show bgp {ip ipv6} {unicast multicast} neighbors Example: switch(config-router-neighbor-af)#</pre>	(Optional) Displays the BGP peers.
Step 11	<pre>copy running-config startup-config Example: switch(config-router-neighbor-af) # copy running-config startup-config</pre>	(Optional) Saves this configuration change.

This example shows how to configure the router as a route reflector and add one neighbor as a client:

```
switch(config) # router bgp 65536
switch(config-router) # neighbor 192.0.2.10 remote-as 65536
switch(config-router-neighbor) # address-family ip unicast
switch(config-router-neighbor-af) # route-reflector-client
switch(config-router-neighbor-af) # copy running-config startup-config
```

Configuring Route Dampening

You can configure route dampening to minimize route flaps propagating through your iBGP network.

To configure route dampening, use the following command in address-family or VRF address family configuration mode:

Command	Purpose
<pre>dampening [{half-life reuse-limit suppress-limit max-suppress-time route-map map-name}] Example: switch(config-router-af)# dampening route-map bgpDamp</pre>	Disables capabilities negotiation. The parameter values are as follows:
	• half-life—The range is from 1 to 45.
	• reuse-limit—The range is from 1 to 20000.
	• suppress-limit—The range is from 1 to 20000.
	• max-suppress-time—The range is from 1 to 255.

Configuring Load Sharing and ECMP

You can configure the maximum number of paths that BGP adds to the route table for equal-cost multipath load balancing.

To configure the maximum number of paths, use the following command in router address-family configuration mode:

Command	Purpose
	Configures the maximum number of equal-cost paths for load sharing. The range is from 1 to 16.
Frample:	The default is 1.

Configuring Maximum Prefixes

You can configure the maximum number of prefixes that BGP can receive from a BGP peer. If the number of prefixes exceeds this value, you can optionally configure BGP to generate a warning message or tear down the BGP session to the peer.

To configure the maximum allowed prefixes for a BGP peer, use the following command in neighbor address-family configuration mode:

Command	Purpose
maximum-prefix maximum [threshold] [restart time warming-only]	Configures the maximum number of prefixes from a peer. The parameter ranges are as follows:
<pre>Example: switch(config-router-neighbor-af)# maximum-prefix 12</pre>	• maximum—The range is from 1 to 300000.
	• <i>Threshold</i> —The range is from 1 to 100 percent. The default is 75 percent.
	• <i>time</i> —The range is from 1 to 65535 minutes.
	This command triggers an automatic notification and session reset for the BGP neighbor sessions if the prefix limit is exceeded.

Configuring Dynamic Capability

You can configure dynamic capability for a BGP peer.

To configure dynamic capability, use the following command in neighbor configuration mode:

Command	Purpose
dynamic-capability	Enables dynamic capability. This command
<pre>Example: switch(config-router-neighbor)#</pre>	triggers an automatic notification and session reset for the BGP neighbor sessions.
dynamic-capability	This command is disabled by default.

Configuring Aggregate Addresses

You can configure aggregate address entries in the BGP route table.

To configure an aggregate address, use the following command in router address-family configuration mode:

Command	Purpose
<pre>aggregate-address ip-prefix/length [as-set] [summary-only] [advertise-map map-name] [attribute-map map-name] [suppress-map map-name]</pre>	Creates an aggregate address. The path advertised for this route is an autonomous system set that consists of all elements contained in all paths that are being summarized:
<pre>Example: switch(config-router-af)# aggregate-address 192.0.2.0/8 as-set</pre>	• The as-set keyword generates autonomous system set path information and community information from contributing paths.
	• The summary-only keyword filters all more specific routes from updates.
	• The advertise-map keyword and argument specify the route map used to select attribute information from selected routes.
	• The attribute-map keyword and argument specify the route map used to select attribute information from the aggregate.
	• The suppress-map keyword and argument conditionally filters more specific routes.

Configuring BGP Conditional Advertisement

You can configure BGP conditional advertisement to limit the routes that BGP propagates. You define the following two route maps:

- Advertise map—Specifies the conditions that the route must match before BGP considers the conditional advertisement. This route map can contain any appropriate match statements.
- Exist map or nonexist map—Defines the prefix that must exist in the BGP table before BGP propagates a route that matches the advertise map. The nonexist map defines the prefix that must not exist in the BGP table before BGP propagates a route that matches the advertise map. BGP processes only the permit statements in the prefix list match statements in these route maps.

If the route does not pass the condition, BGP withdraws the route if it exists in the BGP table.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the switchto vdc command).

SUMMARY STEPS

1. config t

- 2. router bgp as-number
- 3. neighbor ipaddress remote-as as-number
- 4. address-family {ipv4 | ipv6} {unicast | multicast}
- **5.** advertise-map *adv-map* {exist-map | non-exist-map | nonexist-map}
- 6. show ip bgp neighbor
- 7. copy running-config startup-config

DETAILED STEPS

	Command	Purpose
Step 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
Step 2	<pre>router bgp as-number Example: switch(config) # router bgp 65536 switch(config-router) #</pre>	Enters BGP mode and assigns the autonomous system number to the local BGP speaker.
Step 3	<pre>neighbor ip-address remote-as as-number Example: switch(config-router) # neighbor 192.168.1.2 remote-as 65537 switch(config-router-neighbor) #</pre>	Places the router in neighbor configuration mode for BGP routing and configures the neighbor IP address.
Step 4	<pre>address-family {ipv4 ipv6} {unicast multicast} Example: switch(config-router-neighbor) # address-family ipv4 multicast switch(config-router-neighbor-af) #</pre>	Enters address family configuration mode.

Command	Purpose
<pre>advertise-map adv-map {exist-map exist-rmap non-exist-map nonexist-rmap}</pre>	Configures BGP to conditionally advertise routes based on the two configured route maps:
<pre>Example: switch(config-router-neighbor-af)# advertise-map advertise exist-map exist</pre>	• adv-map—Specifies a route map with match statements that the route must pass before BGP passes the route to the next route map. The adv-map is a case-sensitive alphanumeric string up to 63 characters.
	• exist-rmap—Specifies a route map with match statements for a prefix list. A prefix in the BGP table must match a prefix in the prefix list before BGP will advertise the route. The exist-rmap is a case-sensitive alphanumeric string up to 63 characters.
	• nonexist-rmap—Specifies a route map with match statements for a prefix list. A prefix in the BGP table must not match a prefix in the prefix list before BGP will advertise the route. The nonexist-rmap is a case-sensitive alphanumeric string up to 63 characters.
show ip bgp neighbor	(Optional) Displays information about BGP and the
<pre>Example: switch(config-router-neighbor-af)# sho ip bgp neighbor</pre>	configured conditional advertisement route maps.
copy running-config startup-config	(Optional) Saves this configuration change.
Example: switch(config-router-neighbor-af)# coprunning-config startup-config	yy .

This example shows how to configure BGP conditional advertisement:

```
switch# config t
switch(config)# router bgp 65536
switch(config-router)# neighbor 192.0.2.2 remote-as 65537
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# advertise-map advertise exist-map exist
switch(config-router-neighbor-af)# exit
switch(config-router-neighbor)# exit
switch(config-router)# exit
switch(config-router)# exit
switch(config-route-map)# match as-path pathList
switch(config-route-map)# exit
switch(config-route-map)# exit
switch(config-route-map)# match ip address prefix-list plist
switch(config-route-map)# exit
switch(config-route-map)# exit
switch(config-route-map)# exit
switch(config-route-map)# exit
switch(config-route-map)# exit
```

Configuring Route Redistribution

You can configure BGP to accept routing information from another routing protocol and redistribute that information through the BGP network. Optionally, you can assign a default route for redistributed routes.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the switchto vdc command).

SUMMARY STEPS

- 1. config t
- 2. router bgp as-number
- 3. address-family {ipv4 | ipv6} {unicast | multicast}
- 4. redistribute {direct | {eigrp | isis | ospf | ospfv3 | rip} instance-tag | static} route-map map-name
- 5. default-metric value
- 6. copy running-config startup-config

DETAILED STEPS

	Command	Purpose
Step 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
Step 2	router bgp as-number	Enters BGP mode and assigns the autonomous system number to the local BGP speaker.
	<pre>Example: switch(config)# router bgp 65536 switch(config-router)#</pre>	number to the focul Bot speaker.
Step 3	address-family {ipv4 ipv6} {unicast multicast}	Enters address family configuration mode.
	<pre>Example: switch(config-router)# address-family ipv4 unicast switch(config-router-af)#</pre>	
Step 4	redistribute {direct {eigrp isis ospf ospfv3 rip} instance-tag static} route-map map-name	Redistributes routes from other protocols into BGP. See the "Configuring Route Maps" section on page 16-11 for more information about route maps.
	<pre>Example: switch(config-router-af)# redistribute eigrp 201 route-map Eigrpmap</pre>	
Step 5	default-metric value	(Optional) Generates a default route into BGP.
	<pre>Example: switch(config-router-af)# default-metric 33</pre>	
Step 6	copy running-config startup-config	(Optional) Saves this configuration change.
	Example: switch(config-router-af)# copy running-config startup-config	

This example shows how to redistribute EIGRP into BGP:

```
switch# config t
switch(config)# router bgp 65536
switch(config-router)# address-family ipv4 unicast
switch(config-router-af)# redistribute eigrp 201 route-map Eigrpmap
switch(config-router-af)# copy running-config startup-config
```

Configuring Multiprotocol BGP

You can configure MP-BGP to support multiple address families, including IPv4 and IPv6 unicast and multicast routes.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

SUMMARY STEPS

- 1. config t
- 2. router bgp as-number
- 3. **neighbor** *ip-address* **remote-as** *as-numbe*r
- 4. address-family {ipv4 | ipv6} {unicast | multicast}
- 5. copy running-config startup-config

DETAILED STEPS

	Command	Purpose
Step 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
Step 2	router bgp as-number	Enters BGP mode and assigns the autonomous system
	<pre>Example: switch(config)# router bgp 65536 switch(config-router)#</pre>	number to the local BGP speaker.
Step 3	neighbor ip-address remote-as as-number	Places the router in neighbor configuration mode for
	<pre>Example: switch(config-router) # neighbor 192.168.1.2 remote-as 65537 switch(config-router-neighbor) #</pre>	BGP routing and configures the neighbor IP address.
Step 4	address-family {ipv4 ipv6} {unicast multicast}	Enters address family configuration mode.
	<pre>Example: switch(config-router-neighbor)# address-family ipv4 multicast switch(config-router-neighbor-af)#</pre>	
Step 5	copy running-config startup-config	(Optional) Saves this configuration change.
	<pre>Example: switch(config-router-neighbor-af)# copy running-config startup-config</pre>	

This example shows how to enable advertising and receiving IPv4 and IPv6 routes for multicast RPF for a neighbor.:

```
switch# config t
switch(config) # interface ethernet 2/1
switch(config-if) # ipv6 address 2001:0DB8::1
switch(config-if) # router bgp 65536
switch(config-router) # neighbor 192.168.1.2 remote-as 35537
switch(config-router-neighbor) # address-family ipv4 multicast
switch(config-router-neighbor-af) # exit
switch(config-router-neighbor) # address-family ipv6 multicast
switch(config-router-neighbor-af) # copy running-config startup-config
```

Tuning BGP

You can tune BGP characteristics through a series of optional parameters.

To tune BGB, use the following optional commands in router configuration mode:

Command	Purpose
bestpath [always-compare-med compare-routerid med {missing-as-worst non-deterministic}]	Modifies the best-path algorithm. The optional parameters are as follows:
Example: switch(config-router)# bestpath	• always-compare-med—Compares MED on paths from different autonomous systems.
always-compare-med	• compare-routerid —Compares the router IDs for identical eBGP paths.
	• med missing-as-worst—Treats a missing MED as the highest MED.
	• med non-deterministic—Does not always pick the best MED path from among the paths from the same autonomous system.
enforce-first-as	Enforces the neighbor autonomous system to be the first AS number listed in the AS_path attribute for
<pre>Example: switch(config-router)# enforce-first-as</pre>	eBGP.
log-neighbor-changes	Generates a system message when a neighbor
Example:	changes state.
switch(config-router)#	
log-neighbor-changes	

Command	Purpose
<pre>router-id id Example: switch(config-router)# router-id 209.165.20.1</pre>	Manually configures the router ID for this BGP speaker.
<pre>timers [bestpath-delay delay bgp keepalive holdtime prefix-peer-timeout timeout] Example: switch(config-router)# timers bgp 90 270</pre>	 Sets the BGP timer values. The optional parameters are as follows: delay—Initial best-path timeout value after a restart. The range is from 0 to 3600 seconds. The default value is 300. keepalive—BGP session keepalive time. The range is from 0 to 3600 seconds. The default value is 60. holdtime—BGP session hold time. The range is from 0 to 3600 seconds. The default value is 180. timeout—Prefix peer timeout value. The range is from 0 to 1200 seconds. The default value is 30. You must manually reset the BGP sessions after configuring this command.

To tune BGP, use the following optional command in router address-family configuration mode:

Command	Purpose
distance ebgp-distance ibgp distance local-distance	Sets the administrative distance for BGP. The range is from 1 to 255. The defaults are as follows:
<pre>Example: switch(config-router-af)# distance 20 100 200</pre>	eBGP distance—20.iBGP distance—200.
200	 local distance—220. Local-distance is the administrative distance used for aggregate discard routes when they are installed in the RIB.

To tune BGP, use the following optional commands in neighbor configuration mode:

Command	Purpose
description string Example:	Sets a descriptive string for this BGP peer. The string can be up to 80 alphanumeric characters.
switch(config-router-neighbor)# description main site	

Command	Purpose
low-memory exempt	Exempts this BGP neighbor from a possible shutdown due to a low memory condition.
<pre>Example: switch(config-router-neighbor)# low-memory exempt</pre>	
<pre>transport connection-mode passive Example: switch(config-router-neighbor)# transport connection-mode passive</pre>	Allows a passive connection setup only. This BGP speaker does not initiate a TCP connection to a BGP peer. You must manually reset the BGP sessions after configuring this command.
remove-private-as Example: switch(config-router-neighbor)# remove-private-as	Removes private AS numbers from outbound route updates to an eBGP peer. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.
	Note See the "Guidelines and Limitations for Advanced BGP" section for more information on this command.
<pre>update-source interface-type number Example: switch(config-router-neighbor)# update-source ethernet 2/1</pre>	Configures the BGP speaker to use the source IP address of the configured interface for BGP sessions to the peer. This command triggers an automatic notification and session reset for the BGP neighbor sessions.

To tune BGP, use the following optional commands in neighbor address-family configuration mode:

Command	Purpose
<pre>suppress-inactive Example: switch(config-router-neighbor-af)# suppress-inactive</pre>	Advertises the best (active) routes only to the BGP peer. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.
default-originate [route-map map-name]	Generates a default route to the BGP peer.
<pre>Example: switch(config-router-neighbor-af)# default-originate</pre>	
<pre>filter-list list-name {in out} Example: switch(config-router-neighbor-af)# filter-list BGPFilter in</pre>	Applies an AS_path filter list to this BGP peer for inbound or outbound route updates. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.
<pre>prefix-list list-name {in out} Example: switch(config-router-neighbor-af)# prefix-list PrefixFilter in</pre>	Applies a prefix list to this BGP peer for inbound or outbound route updates. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.

Command	Purpose
send-community	Sends the community attribute to this BGP peer. This command triggers an automatic soft clear or
<pre>Example: switch(config-router-neighbor-af)# send-community</pre>	refresh of BGP neighbor sessions.
send-extcommunity	Sends the extended community attribute to this
<pre>Example: switch(config-router-neighbor-af)# send-extcommunity</pre>	BGP peer. This command triggers an automatic soft clear or refresh of BGP neighbor sessions.

Configuring a Graceful Restart

You can configure a graceful restart and enable the graceful restart helper feature for BGP.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Create the VDCs and VRFs.

Ensure that you are in the correct VDC (or use the switchto vdc command).

SUMMARY STEPS

- 1. config t
- 2. router bgp as-number
- 3. graceful-restart
- 4. graceful-restart [restart-time time | stalepath-time time]
- 5. graceful-restart-helper
- 6. show running-config bgp
- 7. copy running-config startup-config

DETAILED STEPS

	Command	Purpose
Step 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
Step 2	router bgp as-number	Creates a new BGP process with the configured autonomous system number.
	<pre>Example: switch(config) # router bgp 65536 switch(config-router) #</pre>	autonomous system number.

	Command	Purpose
Step 3	<pre>graceful-restart Example: switch(config-router)# graceful-restart</pre>	Enables a graceful restart and the graceful restart helper functionality. This command is enabled by default.
		This command triggers an automatic notification and session reset for the BGP neighbor sessions.
Step 4	<pre>graceful-restart [restart-time time stalepath-time time]</pre>	Configures the graceful restart timers. The optional parameters are as follows:
	<pre>Example: switch(config-router)# graceful-restart restart-time 300</pre>	• restart-time—Maximum time for a restart sent to the BGP peer. The range is from 1 to 3600 seconds. The default is 120.
		• stalepath-time—Maximum time that BGP will keep the stale routes from the restarting BGP peer. The range is from 1 to 3600 seconds. The default is 300.
		This command triggers an automatic notification and session reset for the BGP neighbor sessions.
Step 5	<pre>graceful-restart-helper Example: switch(config-router)# graceful-restart-helper</pre>	Enables the graceful restart helper functionality. Use this command if you have disabled graceful restart but you still want to enable graceful restart helper functionality. This command triggers an automatic notification and session reset for the BGP neighbor sessions.
Step 6	show running-config bgp	(Optional) Displays the BGP configuration.
	<pre>Example: switch(config-router)# show running-config bgp</pre>	
Step 7	copy running-config startup-config	(Optional) Saves this configuration change.
	<pre>Example: switch(config-router)# copy running-config startup-config</pre>	

This example shows how to enable a graceful restart:

```
switch# config t
switch(config)# router bgp 65536
switch(config-router)# graceful-restart
switch(config-router)# copy running-config startup-config
```

Configuring Virtualization

You can configure one BGP process in each VDC. You can create multiple VRFs within each VDC and use the same BGP process in each VRF.

BEFORE YOU BEGIN

Ensure that you have enabled the BGP feature (see the "Enabling the BGP Feature" section on page 10-10).

Ensure that you are in the correct VDC (or use the switchto vdc command).

SUMMARY STEPS

- 1. config t
- 2. vrf context vrf-name
- 3. exit
- 4. router bgp as-number
- **5. vrf** *vrf*-name
- **6. neighbor** *ip-address* **remote-as** *as-number*
- 7. copy running-config startup-config

DETAILED STEPS

	Command	Purpose
ep 1	config t	Enters configuration mode.
	<pre>Example: switch# config t switch(config)#</pre>	
ep 2	<pre>vrf context vrf-name Example: switch(config) # vrf context RemoteOfficeVRF switch(config-vrf) #</pre>	Creates a new VRF and enters VRF configuration mode.
ep 3	<pre>exit Example: switch(config-vrf)# exit switch(config)#</pre>	Exits VRF configuration mode.
ep 4	<pre>router bgp as-number Example: switch(config) # router bgp 65536 switch(config-router) #</pre>	Creates a new BGP process with the configured autonomous system number.
5	<pre>vrf vrf-name Example: switch(config-router)# vrf RemoteOfficeVRF switch(config-router-vrf)#</pre>	Enters the router VRF configuration mode and associates this BGP instance with a VRF.

	Command	Purpose
Step 6	neighbor ip-address remote-as as-number	Configures the IP address and AS number for a remote BGP peer.
	Example:	Der peer.
	switch(config-router-vrf)# neighbor	
	209.165.201.1 remote-as 65536	
	switch(config-routervrf-neighbor)#	
Step 7	copy running-config startup-config	(Optional) Saves this configuration change.
	Example:	
	<pre>switch(config-router-vrf-neighbor)# copy running-config startup-config</pre>	

This example shows how to create a VRF and configure the router ID in the VRF:

```
switch# config t
switch(config)# vrf context NewVRF
switch(config-vrf)# exit
switch(config)# router bgp 65536
switch(config-router)# vrf NewVRF
switch(config-router-vrf)# neighbor 209.165.201.1 remote-as 65536
switch(config-router-vrf-neighbor)# copy running-config startup-config
```

Verifying Advanced BGP Configuration

To verify the BGP configuration, use the following commands:

Command	Purpose
show bgp all [summary] [vrf vrf-name]	Displays the BGP information for all address families.
show bgp convergence [vrf vrf-name]	Displays the BGP information for all address families.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] community {regexp expression [community] [no-advertise] [no-export] [no-export-subconfed]} [vrf vrf-name]	Displays the BGP routes that match a BGP community.
show bgp [vrf vrf-name] {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] community-list list-name [vrf vrf-name]	Displays the BGP routes that match a BGP community list.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] extcommunity {regexp expression generic [non-transitive transitive] aa4:nn [exact-match]} [vrf vrf-name]	Displays the BGP routes that match a BGP extended community.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] extcommunity-list list-name [exact-match]} [vrf vrf-name]	Displays the BGP routes that match a BGP extended community list.

Command	Purpose
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] {dampening dampened-paths [regexp expression]} [vrf vrf-name]	Displays the information for BGP route dampening. Use the clear bgp dampening command to clear the route flap dampening information.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] history-paths [regexp expression] [vrf vrf-name]	Displays the BGP route history paths.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] filter-list list-name [vrf vrf-name]	Displays the information for the BGP filter list.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] neighbors [ip-address ipv6-prefix] [vrf vrf-name]	Displays the information for BGP peers. Use the clear bgp neighbors command to clear these neighbors.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] {nexthop nexthop-database} [vrf vrf-name]	Displays the information for the BGP route next hop.
show bgp paths	Displays the BGP path information.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] policy name [vrf vrf-name]	Displays the BGP policy information. Use the clear bgp policy command to clear the policy information.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] prefix-list list-name [vrf vrf-name]	Displays the BGP routes that match the prefix list.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] received-paths [vrf vrf-name]	Displays the BGP paths stored for soft reconfiguration.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] regexp expression [vrf vrf-name]	Displays the BGP routes that match the AS_path regular expression.
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] route-map map-name [vrf vrf-name]	Displays the BGP routes that match the route map.
show bgp peer-policy name [vrf vrf-name]	Displays the information about BGP peer policies.
show bgp peer-session name [vrf vrf-name]	Displays the information about BGP peer sessions.
show bgp peer-template name [vrf vrf-name]	Displays the information about BGP peer templates. Use the clear bgp peer-template command to clear all neighbors in a peer template.
show bgp process	Displays the BGP process information.

Command	Purpose
show {ip ipv6} bgp options	Displays the BGP status and configuration information. This command has multiple options. See the <i>Cisco Nexus 7000 Series NX-OS Unicast Routing Command Reference</i> for more information.
show {ip ipv6} mbgp options	Displays the BGP status and configuration information. This command has multiple options. See the <i>Cisco Nexus 7000 Series NX-OS Unicast Routing Command Reference</i> for more information.
show running-configuration bgp	Displays the current running BGP configuration.

Displaying BGP Statistics

To display BGP statistics, use the following commands:

Command	Purpose
show bgp {ip ipv6} {unicast multicast} [ip-address ipv6-prefix] flap-statistics [vrf vrf-name]	Displays the BGP route flap statistics. Use the clear bgp flap-statistics command to clear these statistics.
show bgp sessions [vrf vrf-name]	Displays the BGP sessions for all peers. Use the clear bgp sessions command to clear these statistics.
show bgp sessions [vrf vrf-name]	Displays the BGP sessions for all peers. Use the clear bgp sessions command to clear these statistics.
show bgp statistics	Displays the BGP statistics.

Feature History for BGP

Table 11-2 lists the release history for this feature.

Table 11-2 Feature History for BGP

Feature Name	Releases	Feature Information
ISSU	4.2(3)	Lowered BGP minimum hold-time check to eight seconds.
Next-hop addressing	4.2(1)	Added support for BGP next-hop address tracking and filtering.
4-Byte AS numbers	4.2(1)	Added support for 4-byte AS numbers in plaintext notation.
Conditional advertisement	4.2(1)	Added support for conditionally advertising BGP routes based on the existence of other routes in the BGP table.
Dynamic AS number for prefix peers	4.1(2)	Added support for a range of AS numbers for BGP prefix peer configuration.
BGP	4.0(1)	This feature was introduced.
