# Information About EIGRP

Enhanced IGRP (EIGRP) is a Cisco proprietary enhanced version of the IGRP. EIGRP uses the same distance vector algorithm and distance information as IGRP; however, the convergence properties and the operating efficiency of EIGRP are significantly improved.

The convergence technology employs an algorithm referred to as the Diffusing Update Algorithm (DUAL), which guarantees loop-free operation at every instant throughout a route computation and allows all devices involved in a topology change to synchronize at the same time. Routers that are not affected by topology changes are not involved in recomputations.

IP EIGRP provides increased network width. With RIP, the largest possible width of your network is 15 hops. Because the EIGRP metric is large enough to support thousands of hops, the only barrier to expanding the network is the transport-layer hop counter. EIGRP increments the transport control field only when an IP packet has traversed 15 routers and the next hop to the destination was learned through EIGRP. When a RIP route is used as the next hop to the destination, the transport control field is incremented as usual.

## **EIGRP** Features

EIGRP offers these features:

- Fast convergence.
- Incremental updates when the state of a destination changes, instead of sending the entire contents of the routing table, minimizing the bandwidth required for EIGRP packets.
- Less CPU usage because full update packets need not be processed each time they are received.
- Protocol-independent neighbor discovery mechanism to learn about neighboring routers.
- Variable-length subnet masks (VLSMs).
- Arbitrary route summarization.

EIGRP scales to large networks.

## **EIGRP Components**

EIGRP has these four basic components:

- Neighbor discovery and recovery is the process that routers use to dynamically learn of other routers on their directly attached networks. Routers must also discover when their neighbors become unreachable or inoperative. Neighbor discovery and recovery is achieved with low overhead by periodically sending small hello packets. As long as hello packets are received, the Cisco IOS software can learn that a neighbor is alive and functioning. When this status is determined, the neighboring routers can exchange routing information.
- The reliable transport protocol is responsible for guaranteed, ordered delivery of EIGRP packets to all
  neighbors. It supports intermixed transmission of multicast and unicast packets. Some EIGRP packets
  must be sent reliably, and others need not be. For efficiency, reliability is provided only when necessary.
  For example, on a multiaccess network that has multicast capabilities (such as Ethernet), it is not necessary
  to send hellos reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello
  with an indication in the packet informing the receivers that the packet need not be acknowledged. Other
  types of packets (such as updates) require acknowledgment, which is shown in the packet. The reliable
  transport has a provision to send multicast packets quickly when there are unacknowledged packets
  pending. Doing so helps ensure that convergence time remains low in the presence of varying speed
  links.
- The DUAL finite state machine embodies the decision process for all route computations. It tracks all routes advertised by all neighbors. DUAL uses the distance information (known as a metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination that is guaranteed not to be part of a routing loop. When there are no feasible successors, but there are neighbors advertising the destination, a recomputation must occur. This is the process whereby a new successor is determined. The amount of time it takes to recompute the route affects the convergence time. Recomputation is processor-intensive; it is advantageous to avoid recomputation if it is not necessary. When a topology change occurs, DUAL tests for feasible successors. If there are feasible successors, it uses any it finds to avoid unnecessary recomputation.
- The protocol-dependent modules are responsible for network layer protocol-specific tasks. An example is the IP EIGRP module, which is responsible for sending and receiving EIGRP packets that are encapsulated in IP. It is also responsible for parsing EIGRP packets and informing DUAL of the new information received. EIGRP asks DUAL to make routing decisions, but the results are stored in the IP routing table. EIGRP is also responsible for redistributing routes learned by other IP routing protocols.

Note To enable EIGRP, the Device or active switch must be running the

### **EIGRP Nonstop Forwarding**

The Device stack supports two levels of EIGRP nonstop forwarding:

EIGRP NSF Awareness

• EIGRP NSF Capability

### **EIGRP NSF Awareness**

The supports EIGRP NSF Awareness for IPv4. When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade. This feature cannot be disabled.

### **EIGRP NSF Capability**

The supports EIGRP Cisco NSF routing to speed up convergence and to eliminate traffic loss after a stack's active switch changeover.

The also supports EIGRP NSF-capable routing for IPv4 for better convergence and lower traffic loss following an active switch changeover. When an EIGRP NSF-capable active switch restarts or a new active switch starts up and NSF restarts, the Device has no neighbors, and the topology table is empty. The Device must bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables without interrupting the traffic directed toward the Device stack. EIGRP peer routers maintain the routes learned from the new active switch and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the new active switch uses a new Restart (RS) bit in the EIGRP packet header to show the restart. When the neighbor receives this, it synchronizes the stack in its peer list and maintains the adjacency with the stack. The neighbor then sends its topology table to the active switch with the RS bit set to show that it is NSF-aware and is aiding the new active switch.

If at least one of the stack peer neighbors is NSF-aware, the active switch receives updates and rebuilds its database. Each NSF-aware neighbor sends an end of table (EOT) marker in the last update packet to mark the end of the table content. The active switch recognizes the convergence when it receives the EOT marker, and it then begins sending updates. When the active switch has received all EOT markers from its neighbors or when the NSF converge timer expires, EIGRP notifies the routing information database (RIB) of convergence and floods its topology table to all NSF-aware peers.

### **EIGRP Stub Routing**

The EIGRP stub routing feature reduces resource utilization by moving routed traffic closer to the end user.

**Note** The device uses EIGRP stub routing at the access layer to eliminate the need for other types of routing advertisements.

EIGRP stub routing is supported with the Network Essential slicense.

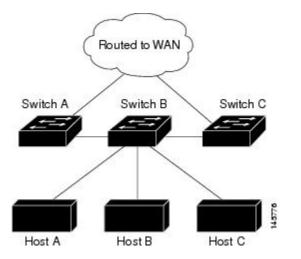

In a network using EIGRP stub routing, the only allowable route for IP traffic to the user is through a device that is configured with EIGRP stub routing. The device sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote routers to use EIGRP and to configure only the device as a stub. Only specified routes are propagated from the device. The device responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In the figure given below, device B is configured as an EIGRP stub router. Devicees A and C are connected to the rest of the WAN. Device B advertises connected, static, redistribution, and summary routes to Device A and C. Device B does not advertise any routes learned from Device A (and the reverse).

Figure 1: EIGRP Stub Router Configuration

## How to Configure EIGRP

To create an EIGRP routing process, you must enable EIGRP and associate networks. EIGRP sends updates to the interfaces in the specified networks. If you do not specify an interface network, it is not advertised in any EIGRP update.

Note

If you have routers on your network that are configured for IGRP, and you want to change to EIGRP, you must designate transition routers that have both IGRP and EIGRP configured. In these cases, perform Steps 1 through 3 in the next section and also see the "Configuring Split Horizon" section. You must use the same AS number for routes to be automatically redistributed.

### **Default EIGRP Configuration**

Table 1: Default EIGRP Configuration

| Feature             | Default Setting   |
|---------------------|---|
| Auto summary        | Disabled.   |
| Default-information | Exterior routes are accepted and default information is passed between processes when doing redistribution. |

| Feature                            | Default Setting   |
|------------------------------------|---|
| Default metric                     | Only connected routes and interface static routes can be redistribu default metric. The metric includes:  |
|                                    | • Bandwidth: 0 or greater kb/s.   |
|                                    | • Delay (tens of microseconds): 0 or any positive number that is 39.1 nanoseconds.  |
|                                    | • Reliability: any number between 0 and 255 (255 means 100 p reliability).  |
|                                    | • Loading: effective bandwidth as a number between 0 and 255 percent loading).  |
|                                    | • MTU: maximum transmission unit size of the route in bytes. 0 d integer.   |
| Distance                           | Internal distance: 90.  |
|                                    | External distance: 170.   |
| EIGRP log-neighbor changes         | Disabled. No adjacency changes logged.  |
| IP authentication key-chain        | No authentication provided.   |
| IP authentication mode             | No authentication provided.   |
| IP bandwidth-percent               | 50 percent.   |
| IP hello interval                  | For low-speed nonbroadcast multiaccess (NBMA) networks: 60 sec networks: 5 seconds.   |
| IP hold-time                       | For low-speed NBMA networks: 180 seconds; all other networks:   |
| IP split-horizon                   | Enabled.  |
| IP summary address                 | No summary aggregate addresses are predefined.  |
| Metric weights                     | tos: 0; k1 and k3: 1; k2, k4, and k5: 0   |
| Network                            | None specified.   |
| Nonstop Forwarding (NSF) Awareness | Enabled for IPv4 on switches running the Allows Layer 3 switche<br>forwarding packets from a neighboring NSF-capable router during<br>software changes. |
| NSF capability                     | Disabled.   |
|                                    | <b>Note</b> The Device supports EIGRP NSF-capable routing for IPv4  |
| Offset-list                        | Disabled.   |
| Router EIGRP                       | Disabled.   |
| Set metric                         | No metric set in the route map.   |

| Feature       | Default Setting   |  |
|---------------|---|--|
| Traffic-share | Distributed proportionately to the ratios of the metrics. |  |
| Variance      | 1 (equal-cost load-balancing).                            |  |

# **Configuring Basic EIGRP Parameters**

#### Procedure

|        | Command or Action   | Purpose   |  |
|--------|---|---|--|
| Step 1 | configure terminal  | Enters global configuration mode.   |  |
|        | Example:  |   |  |
|        | Device# configure terminal  |   |  |
| Step 2 | router eigrp autonomous-system  | Enables an EIGRP routing process, and enter router  |  |
|        | Example:  | configuration mode. The AS number identifies the routes to other EIGRP routers and is used to tag routing               |  |
|        | Device(config)# router eigrp 10   | information.  |  |
| Step 3 | nsf   | (Optional) Enables EIGRP NSF. Enter this command on   |  |
|        | Example:  | the active switch and on all of its peers.  |  |
|        | Device(config-router)# <b>nsf</b>   |   |  |
| Step 4 | network network-number  | Associate networks with an EIGRP routing process. EIGRP   |  |
|        | Example:  | sends updates to the interfaces in the specified networks   |  |
|        | Device(config-router)# <b>network 192.168.0.0</b>   |   |  |
| Step 5 | eigrp log-neighbor-changes  | (Optional) Enables logging of EIGRP neighbor changes to monitor routing system stability.                               |  |
|        | Example:  |   |  |
|        | Device(config-router)# eigrp log-neighbor-changes   |   |  |
| Step 6 | metric weights tos k1 k2 k3 k4 k5   | (Optional) Adjust the EIGRP metric. Although the defaults   |  |
|        | Example:  | have been carefully set to provide excellent operation<br>most networks, you can adjust them.                           |  |
|        | Device(config-router)# metric weights 0 2 0 2 0<br>0  | <b>Caution</b> Setting metrics is complex and is not recommended without guidance from an experienced network designer. |  |
| Step 7 | <b>offset-list</b> [access-list number   name] { <b>in</b>   <b>out</b> } offset<br>[type number] | (Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned        |  |

|         | Command or Action  | Purpose  |
|---------|--|--|
|         | Example:   | through EIGRP. You can limit the offset list with an acces |
|         |  | list or an interface.                                      |
|         | Device(config-router)# offset-list 21 out 10                                 |  |
| Step 8  | auto-summary   | (Optional) Enables automatic summarization of subnet       |
|         | Example:   | routes into network-level routes.                          |
|         | Device(config-router)# <b>auto-summary</b>                                   |  |
| Step 9  | interface interface-id   | Enters interface configuration mode, and specifies the     |
|         | Example:   | Layer 3 interface to configure.                            |
|         | Device(config-router)#interface gigabitethernet 1/0/1                        |  |
| Step 10 | <b>ip summary-address eigrp</b> <i>autonomous-system-number address mask</i> | (Optional) Configures a summary aggregate.                 |
|         | Example:   |  |
|         | Device(config-if)# ip summary-address eigrp 1<br>192.168.0.0 255.255.0.0     |  |
| Step 11 | end  | Returns to privileged EXEC mode.                           |
|         | Example:   |  |
|         | Device(config-if) # <b>end</b>   |  |
| Step 12 | show ip protocols  | Verifies your entries.                                     |
|         | Example:   | For NSF awareness, the output shows:                       |
|         | Device# show ip protocols  | *** IP Routing is NSF aware *** EIGRP NSF enabled          |
| Step 13 | copy running-config startup-config   | (Optional) Saves your entries in the configuration file.   |
|         | Example:   |  |
|         | Device# copy running-config startup-config                                   |  |
|         |  |  |

## **Configuring EIGRP Interfaces**

Other optional EIGRP parameters can be configured on an interface basis.

I

#### Procedure

|        | Command or Action  | Purpose   |  |
|--------|--|---|--|
| Step 1 | configure terminal   | Enters global configuration mode.   |  |
|        | Example:   |   |  |
|        | Device# configure terminal   |   |  |
| Step 2 | interface interface-id   | Enters interface configuration mode, and specifies the  |  |
|        | Example:   | Layer 3 interface to configure.   |  |
|        | Device(config)# interface gigabitethernet 1/0/1  |   |  |
| Step 3 | ip bandwidth-percent eigrp percent   | (Optional) Configures the percentage of bandwidth that  |  |
|        | Example:   | can be used by EIGRP on an interface. The default is 50 percent.  |  |
|        | Device(config-if)# ip bandwidth-percent eigrp 60                                       |   |  |
| Step 4 | <b>ip summary-address eigrp</b> <i>autonomous-system-number</i><br><i>address mask</i> | (Optional) Configures a summary aggregate address for a specified interface (not usually necessary if auto-summary                              |  |
|        | Example:   | is enabled).  |  |
|        | Device(config-if)# ip summary-address eigrp 109<br>192.161.0.0 255.255.0.0             |   |  |
| Step 5 | ip hello-interval eigrp autonomous-system-number                                       | (Optional) Change the hello time interval for an EIGRP  |  |
|        | seconds Example:   | routing process. The range is 1 to 65535 seconds. The default is 60 seconds for low-speed NBMA networks 5 seconds for all other networks.       |  |
|        | Device(config-if)# ip hello-interval eigrp 109 10                                      |   |  |
| Step 6 | ip hold-time eigrp autonomous-system-number seconds                                    | (Optional) Change the hold time interval for an EIGRP   |  |
|        | Example:   | routing process. The range is 1 to 65535 seconds. The default is 180 seconds for low-speed NBMA networks and 15 seconds for all other networks. |  |
|        | Device(config-if)# ip hold-time eigrp 109 40   | Caution Do not adjust the hold time without consulting<br>Cisco technical support.  |  |
| Step 7 | no ip split-horizon eigrp autonomous-system-number                                     | (Optional) Disables split horizon to allow route information  |  |
|        | Example:   | to be advertised by a router out any interface from which that information originated.  |  |
|        | Device(config-if)# no ip split-horizon eigrp 109                                       |   |  |
| Step 8 | end  | Returns to privileged EXEC mode.  |  |
|        | Example:   |   |  |

|         | Command or Action                          | Purpose  |
|---------|--|--|
|         | Device(config)# <b>end</b>                 |  |
| Step 9  | show ip eigrp interface<br>Example:        | Displays which interfaces EIGRP is active on and information about EIGRP relating to those interfaces. |
|         | Device# show ip eigrp interface            |  |
| Step 10 | copy running-config startup-config         | (Optional) Saves your entries in the configuration file.   |
|         | Example:                                   |  |
|         | Device# copy running-config startup-config |  |
|         |  |  |

## **Configuring EIGRP Route Authentication**

EIGRP route authentication provides MD5 authentication of routing updates from the EIGRP routing protocol to prevent the introduction of unauthorized or false routing messages from unapproved sources.

|        | Command or Action   | Purpose  |
|--------|---|--|
| Step 1 | configure terminal  | Enters global configuration mode.                      |
|        | Example:  |  |
|        | Device# configure terminal  |  |
| Step 2 | interface interface-id  | Enters interface configuration mode, and specifies the |
|        | Example:  | Layer 3 interface to configure.                        |
|        | Device(config)# interface gigabitethernet 1/0/1                             |  |
| Step 3 | ip authentication mode eigrp autonomous-system md5                          | Enables MD5 authentication in IP EIGRP packets.        |
|        | Example:  |  |
|        | Device(config-if)# ip authentication mode eigrp 104 md5                     |  |
| Step 4 | <b>ip authentication key-chain eigrp</b> <i>autonomous-system key-chain</i> | Enables authentication of IP EIGRP packets.            |
|        | Example:  |  |
|        | Device(config-if)# ip authentication key-chain<br>eigrp 105 chain1          |  |

#### Procedure

|         | Command or Action   | Purpose   |  |
|---------|---|---|--|
| Step 5  | exit  | Returns to global configuration mode.   |  |
|         | Example:  |   |  |
|         | Device(config-if) # exit  |   |  |
| Step 6  | key chain name-of-chain   | Identify a key chain and enter key-chain configuration  |  |
|         | Example:  | mode. Match the name configured in Step 4.  |  |
|         | Device(config)# key chain chain1  |   |  |
| Step 7  | key number  | In key-chain configuration mode, identify the key number.   |  |
|         | Example:  |   |  |
|         | Device(config-keychain)# key 1  |   |  |
| Step 8  | key-string <i>text</i>  | In key-chain key configuration mode, identify the key   |  |
|         | Example:  | string.   |  |
|         | Device(config-keychain-key)# key-string key1  |   |  |
| Step 9  | accept-lifetime <i>start-time</i> {infinite   <i>end-time</i>   duration <i>seconds</i> } | (Optional) Specifies the time period during which the ke can be received.   |  |
|         | Example:  | The <i>start-time</i> and <i>end-time</i> syntax can be either <i>hh:mm:s.</i>  |  |
|         | Device(config-keychain-key)# accept-lifetime<br>13:30:00 Jan 25 2011 duration 7200        | <i>Month date year</i> or <i>hh:mm:ss date Month year</i> . The default is forever with the default <i>start-time</i> and the earliest acceptable date as January 1, 1993. The default <i>end-time</i> and <b>duration</b> is <b>infinite</b> . |  |
| Step 10 | <pre>send-lifetime start-time {infinite   end-time   duration seconds}</pre>              | (Optional) Specifies the time period during which the key can be sent.  |  |
|         | Example:  | The start-time and end-time syntax can be either hh:mm:ss   |  |
|         | Device(config-keychain-key)# send-lifetime<br>14:00:00 Jan 25 2011 duration 3600          | <i>Month date year</i> or <i>hh:mm:ss date Month year</i> . The default is forever with the default <i>start-time</i> and the earliest acceptable date as January 1, 1993. The default <i>end-time</i> and <b>duration</b> is <b>infinite</b> . |  |
| Step 11 | end   | Returns to privileged EXEC mode.  |  |
|         | Example:  |   |  |
|         | Device(config)# end   |   |  |
| Step 12 | show key chain  | Displays authentication key information.  |  |
|         | Example:  |   |  |
|         | Device# show key chain  |   |  |

| Command or Action                          | Purpose  |
|--|--|
| copy running-config startup-config         | (Optional) Saves your entries in the configuration file. |
| Example:                                   |  |
| Device# copy running-config startup-config |  |

# **Monitoring and Maintaining EIGRP**

You can delete neighbors from the neighbor table. You can also display various EIGRP routing statistics. The table given below lists the privileged EXEC commands for deleting neighbors and displaying statistics.

Table 2: IP EIGRP Clear and Show Commands

|   | T T T                                     |
|---|---|
| clear ip eigrp neighbors [if-address   interface]                               | Deletes neighbors from the neigh          |
| show ip eigrp interface [interface] [as number]                                 | Displays information about inter          |
| show ip eigrp neighbors [type-number]   | Displays EIGRP discovered neig            |
| <b>show ip eigrp topology</b> [autonomous-system-number]   [[ip-address] mask]] | Displays the EIGRP topology tab           |
| show ip eigrp traffic [autonomous-system-number]                                | Displays the number of packets s process. |

# **Feature Information for EIGRP**

Table 3: Feature Information for EIGRP

| Feature Name          | Release                  | Feature Information          |
|-----------------------|--------------------------|------------------------------|
| EIGRP (Enhanced IGRP) | Cisco IOS XE Fuji 16.9.2 | This feature was introduced. |

I
