

# **Configuring Autoconf**

Autoconf is a solution that can be used to manage port configurations for data or voice VLAN, quality of service (QoS) parameters, storm control, and MAC-based port security on end devices that are deployed in the access layer of a network.

- Prerequisites for Autoconf, on page 1
- Restrictions for Autoconf, on page 1
- Information About Autoconf, on page 2
- How to Configure Autoconf, on page 7
- Configuration Examples for Autoconf, on page 14
- Additional References for Autoconf, on page 15
- Feature History for Autoconf, on page 16

# **Prerequisites for Autoconf**

• Before enabling Autoconf, disable the Auto SmartPort (ASP) macro, device classifier, and then access the session monitor.

### **Restrictions for Autoconf**

- ASP macro and Autoconf are not supported on the same interface at the same time. Either Autoconf or ASP must be disabled on a per-interface level.
- Interface templates are not applicable for wireless sessions.
- When the Autoconf feature is enabled using the **autoconf enable** command, the default Autoconf service policy is applied to all the interfaces. No other service policy can be applied globally using the **service-policy** command. To apply a different service policy, you must disable Autoconf on that interface. When a service policy is applied globally, you must disable it before enabling the Autoconf feature.
- When both local (interface level) and global service policies exist, the local policy takes precedence. The global service policy comes into effect only when the local policy is removed.
- Service templates cannot be applied to interfaces, and interface templates cannot be applied to service instances.
- Only one service template can be nested inside an interface template.

• Autoconf does not support the switchover feature.

### **Information About Autoconf**

### **Benefits of Autoconf**

The Autoconf feature permits hardbinding between the end device and the interface. Autoconf falls under the umbrella of the Smart Operations solution. Smart Operations is a comprehensive set of capabilities that can simplify and improve LAN switch deployment. Smart Operations help organizations deliver operational excellence and scale services on the network.

The Autoconf feature automatically applies the needed configurations on the device ports to enable the efficient performance of each directly connected end device using a set of interface configurations that are configured inside an interface template.

- Autoconf efficiently applies commands to an interface because the parser does not need to parse each command each time.
- Configurations that are applied through the Autoconf feature can be reliably removed from a port without impacting previous or subsequent configurations on the port.
- The Autoconf feature provides built-in and user-defined configurations using interface and service templates. Configurations applied through templates can be centrally updated with a single operation.
- Using the Autoconf feature, a configuration can be applied to ports and access sessions.
- The Autoconf feature reduces ongoing maintenance for devices and attached end devices by making them intuitive and autoconfigurable. This reduces operation expenses (OPEX) and lowers the total cost of ownership (TCO).

### **Identity Session Management and Templates**

A key advantage of the Autoconf feature is that the core session management capability is decoupled from the application-specific logic; thus, allowing the same framework to be used regardless of the criteria for policy determination or the nature of the policies applied.

The identity session management infrastructure allows configurations and/or policies to be applied as templates.

Both service and interface templates are named containers of configuration and policy. Service templates may be applied only to access sessions, while interface templates may be applied only to ports. When a service template is applied to an access session, the contained configuration/policy is applied only to the target session and has no impact on other sessions that may be hosted on the same access port. Similarly, when an interface template is applied to an access port, it impacts all traffic exchanged on the port.

The Autoconf feature uses a set of built-in maps and built-in templates. The built-in templates are designed based on best practices for interface configurations. Built-in templates can be modified by the user to include customized configurations, limiting the need to create a new template.

The templates created by users are referred to as user-defined templates. User-defined templates can be defined on the device and can be mapped to any built-in or user-defined trigger.

Use the **show derived-config** command, to view the overall applied configurations applied by Autoconf template and manual configuration. The interface commands shown in the output of **show running-config interface** *type number* command are not necessarily the operational configuration. The Autoconf feature dynamically applies a template to the interface, and overrides any conflicting static configuration that is already applied.

## **Autoconf Operation**

Autoconf uses the Device Classifier to identify the end devices that are connected to a port.

The Autoconf feature uses the device classification information gleaned from Cisco Discovery Protocol, LLDP, DHCP, MAC addresses, and the Organizationally Unique Identifier (OUI) that is identified by the Device Classifier.

The Device Classifier provides improved device classification capabilities and accuracy, and increased device visibility for enhanced configuration management.

Device classification is enabled when you enable the Autoconf feature using **autoconf enable** command in global configuration mode .

The device detection acts as an event trigger, which in turn applies the appropriate automatic template to the interface.

The Autoconf feature is based on a three-tier hierarchy.

- A policy map identifies the trigger type for applying the Autoconf feature.
- A parameter map identifies the appropriate template that must be applied, based on the end device.
- The templates contain the configurations to be applied.

The Autoconf built-in templates and triggers perform the these three steps automatically.

The Autoconf feature provides the following built-in templates:

- AP INTERFACE TEMPLATE
- DMP INTERFACE TEMPLATE
- IP CAMERA INTERFACE TEMPLATE
- IP PHONE INTERFACE TEMPLATE
- LAP\_INTERFACE\_TEMPLATE
- MSP CAMERA INTERFACE TEMPLATE
- MSP VC INTERFACE TEMPLATE
- PRINTER INTERFACE TEMPLATE
- ROUTER\_INTERFACE\_TEMPLATE
- SWITCH INTERFACE TEMPLATE
- TP INTERFACE TEMPLATE

Note

By default built-in templates are not displayed under running configuration. The built-in templates show in the running configuration only if you edit them.

The template that is selected is based on parameter map information applied to an interface. This information can be based on the following criteria:

- End Device type
- · MAC address
- OUI
- User role
- Username

The Autoconf feature provides one built-in parameter map BUILTIN\_DEVICE\_TO\_TEMPLATE with the following configuration:

```
Parameter-map name: BUILTIN DEVICE TO TEMPLATE
Map: 10 map device-type regex "Cisco-IP-Phone"
   20 interface-template IP PHONE INTERFACE TEMPLATE
Map: 20 map device-type regex "Cisco-IP-Camera"
 Action(s):
  20 interface-template IP CAMERA INTERFACE TEMPLATE
Map: 30 map device-type regex "Cisco-DMP"
 Action(s):
   20 interface-template DMP INTERFACE TEMPLATE
Map: 40 map oui eq "00.0f.44"
 Action(s):
  20 interface-template DMP INTERFACE TEMPLATE
Map: 50 map oui eq "00.23.ac"
 Action(s):
   20 interface-template DMP INTERFACE TEMPLATE
Map: 60 map device-type regex "Cisco-AIR-AP"
 Action(s):
  20 interface-template AP INTERFACE TEMPLATE
Map: 70 map device-type regex "Cisco-AIR-LAP"
 Action(s):
   20 interface-template LAP INTERFACE TEMPLATE
Map: 80 map device-type regex "Cisco-TelePresence"
 Action(s):
   20 interface-template TP INTERFACE TEMPLATE
Map: 90 map device-type regex "Surveillance-Camera"
 Action(s):
   10 interface-template MSP CAMERA INTERFACE TEMPLATE
Map: 100 map device-type regex "Video-Conference"
 Action(s):
   10 interface-template MSP VC INTERFACE TEMPLATE
```

Note

Use the **show parameter-map type subscriber attribute-to-service All** command to view the configuration for the built-in parameter map.

The Autoconf feature provides one built-in policy map BUILTIN\_AUTOCONF\_POLICY with the following configuration:

```
BUILTIN_AUTOCONF_POLICY

event identity-update match-all

10 class always do-until-failure

10 map attribute-to-service table BUILTIN DEVICE TO TEMPLATE
```

Note

Use the **show policy-map type control subscriber BUILTIN\_AUTOCONF\_POLICY** command to view the configuration for the built-in policy map.

You can also manually create policy maps, parameter maps, and templates.

When a trigger is created that is based on specific user information, a local 802.1X Cisco Identity Services Engine (ISE) server authenticates it ensuring the security of the operation.

An interface template can be dynamically activated (on an interface) using any of the following methods:

- RADIUS CoA—While Change of Authorization (CoA) commands are targeted to one or more access sessions, any referenced template must be applied to the interface hosting the referenced session.
- RADIUS Access-Accept for client authentication or authorization—Any referenced interface template returned in an Access-Accept must be applied to the port that is hosting the authorized access session.
- Service template—If an interface template is referenced in a service template that is either locally defined
  or sourced from the AAA server, the interface template must be applied to the interface hosting any
  access-session on which the service template is applied (add a new command for interface template
  reference from within a locally defined service template).
- Subscriber control-policy action—A mapping action under the subscriber control policy activates service and/or interface template (as referenced in a parameter map) based on the type of filter, and removes any templates associated with a previous policy.
- Device-to-template parameter map—A subscriber parameter map that allows the filter type to service and/or interface template mappings to be specified in an efficient and readable manner.

### **Advantages of Using Templates**

Using templates for autoconfiguration has the following benefits:

- Templates are parsed once when they are being defined. This makes dynamic application of the templates very efficient.
- Templates can be applied to an Ethernet interface that is connected to an end device, based on the type
  of the end device.
- Service templates allow the activation of session-oriented features, whereas interface templates apply configurations to the interface that is hosting a session.
- Service templates are applied to access sessions and hence only impact the traffic exchanged with a single endpoint on a port.
- Startup and running configurations of the device are not modified by the dynamic application of the template.
- Policy application is synchronized with the access-session life cycle, which is tracked by the framework by using all available techniques, including just link-up/link-down.
- Templates can be updated with a single operation. All applied instances of the templates are updated.
- Constituent commands of the templates do not appear in the running configuration.

- Templates can be removed with no impact on previous or subsequent configurations.
- Template application is acknowledged, allowing for synchronization and performing remedial actions where failures occur.
- Data VLAN, quality of service (QoS) parameters, storm control, and MAC-based port security are configured automatically based on the end device that is connected to the switch.
- The switch port is cleaned up completely by removing configurations when the device is disconnected from a port.
- Human error is reduced in the installation and configuration process.

### **Autoconf Functionality**

The Autoconf feature is disabled by default in global configuration mode. When you enable the Autoconf i feature in global configuration mode, it is enabled by default at the interface level. The built-in template configurations are applied based on the end devices detected on all interfaces.

Use the **access-session inherit disable autoconf** command to manually disable Autoconf at the interface level, even when Autoconf is enabled at the global level.

If you disable Autoconf at the global level, all interface-level configurations are disabled.

Global	Interface Level	AutoConf Status
Disable	Disable	No automatic configurations are applied when an end device is connected.
Enable	Enabled by default	If Autoconf is enabled at the global level, it is enabled at the interface level by default. Built-in template configurations are applied based on the end devices that are detected on all interfaces.
Enable	Disable	Enabled at global level. Disabled at interface level. No automatic configurations are applied when an end device is connected to the interface on which Autoconf is disabled.

Autoconf allows you to retain the template even when the link to the end device is down or the end device is disconnected, by configuring the Autoconf sticky feature. Use the **access-session interface-template sticky** command to configure the Autoconf sticky feature in global configuration mode. The Autoconf sticky feature avoids the need for detecting the end device and applying the template every time the link flaps or device is removed and connected back.

The **access-session interface-template sticky** command is mandatory to apply an inbuilt template that contains **access-session** commands on an interface. Configure the **access-session interface-template sticky** command to apply interface template on a port using a service policy.

If you want to disable the Autoconf feature on a specific interface, use the **access-session inherit disable interface-template-sticky** command in interface configuration mode.

# **How to Configure Autoconf**

## **Applying a Built-in Template to an End Device**

The following task shows how to apply a built-in template on an interface that is connected to an end device, for example, a Cisco IP phone.

#### Before you begin

Make sure that the end device, for example, a Cisco IP phone, is connected to the switch port.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. autoconf enable
- **4**. end
- 5. (Optional) show device classifier attached interface interface-type interface-number
- **6. show template binding target** *interface-type interface-number*

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device(config)# configure terminal	
Step 3	autoconf enable	Enables the Autoconf feature.
	Example:	
	Device(config)# autoconf enable	
Step 4	end	Exits global configuration mode and enters privileged EXEC
	Example:	mode.
	Device(config)# end	
Step 5	(Optional) show device classifier attached interface	Displays whether the end device is classified by the device
	interface-type interface-number	classifier with correct attributes.
	Example:	
	Device# show device classifier attached interface Gi3/0/26	

	Command or Action	Purpose
Step 6	show template binding target interface-type interface-number	Displays the configuration applied through the template on the interface.
	Example:	
	Device# show template binding target gi3/0/26	

#### Verifying th device classification of an End Device

#### Verifying the Interface Template on an Interface

#### **Verifying the Interface Configuration**

#### **Verifying Global Configuration after Applying Autoconf**

The following example shows that an IP phone is classified by the Device Classifier with correct attributes:

Device# show device classifier attached interface GigabitEthernet 3/0/26

Summary:

MAC_Address	Port_Id	Profile Name	Device Name
=========		=======================================	=======================================
0026.0bd9.7bbb	Gi3/0/26	Cisco-IP-Phone-7962	Cisco TP Phone 7962

The following example shows that a built-in interface template is applied on the interface:

Device# show template binding target GigabitEthernet 3/0/26

```
Interface Templates
=============

Interface: Gi4/0/11
Method Source Template-Name
------
dynamic Built-in IP_PHONE_INTERFACE_TEMPLATE
```

The following example shows how to verify the interface configuration after the interface template is applied to the IP phone connected to the GigabitEthernet interface 3/0/26:

```
Device# show running-config interface GigabitEthernet 3/0/26
Building configuration...

Current configuration: 624 bytes!
interface GigabitEthernet3/0/26!
End

Device# show derived-config interface GigabitEthernet 3/0/26
Building configuration...

Derived configuration: 649 bytes!
interface GigabitEthernet3/0/26
switchport mode access
switchport block unicast
```

```
switchport port-security maximum 3
 switchport port-security maximum 2 vlan access
 switchport port-security violation restrict
 switchport port-security aging time 2
 switchport port-security aging type inactivity
 switchport port-security
 load-interval 30
 storm-control broadcast level pps 1k
storm-control multicast level pps 2k
 storm-control action trap
spanning-tree portfast
 spanning-tree bpduguard enable
 service-policy input AutoConf-4.0-CiscoPhone-Input-Policy
service-policy output AutoConf-4.0-Output-Policy

### **Applying a Modified Built-in Template to an End Device**

The following task shows how to modify a built-in template when multiple wireless access points and IP cameras are connected to a switch.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. template template-name
- 4. switchport access vlan vlan-id
- **5.** description description
- 6. exit
- 7. autoconf enable
- **8.** end
- 9. show template interface binding all

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device(config)# configure terminal	
Step 3	template template-name	Enters template configuration mode for the builtin template.
	Example:	
	Device(config)# template AP_INTERFACE_TEMPLATE	
Step 4	switchport access vlan vlan-id	Sets the VLAN when the interface is in access mode.
	Example:	
	Device(config-template)# switchport access vlan 20	
Step 5	description description	Modifies the description of the built-in template.
	Example:	
	Device(config-template)# description modifiedAP	
Step 6	exit	Exits template configuration mode and enters global
	Example:	configuration mode.
	Device(config-template)# exit	
Step 7	autoconf enable	Enables the Autoconf feature.
	Example:	
	Device(config)# autoconf enable	
Step 8	end	Exits global configuration mode and enters privileged EXEC
	Example:	mode.
	Device(config)# end	
Step 9	show template interface binding all	Displays whether the template is applied on the interface.
	Example:	
	Device# show template interface binding all	

### Verifying the Device classification of an End Device

### Verifying the Interface Template on an Interface

The following example shows that the IP camera and access points are classified by the Device Classifier with correct attributes:

```
{\tt Device\#\ show\ device\ classifier\ attached\ detail}
```

```
DC default profile file version supported = 1

Detail:
MAC_Address    Port_Id    Cert Parent Proto    ProfileType    Profile Name
Device_Name
```

		=====			=====			
001d.a1ef.23a8	Gi1/0/7	30	3	С	M	Default	Cisco-AIR-AP-1130	cisco
AIR-AP1131AG-A	-K9							
001e.7a26.eb05	Gi1/0/30	70	2	С	M	Default	Cisco-IP-Camera	Cisco
TD Camora								

The following example shows that a built-in interface template is applied on the interface:

Device# show template interface binding all

Template-Name	Source	Method	Interface
IP_CAMERA_INTERFACE_TEMPLATE	Built-in	dynamic	Gi1/0/30
AP INTERFACE TEMPLATE	Modified-Built-in	dvnamic	Gi1/0/7

## **Migrating from ASP to Autoconf**

### Before you begin

Verify that the AutoSmart Port (ASP) macro is running using the **show running-config** | **include macro auto global** command.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. no macro auto global processing
- 4. exit
- 5. clear macro auto configuration all
- 6. configure terminal
- 7. autoconf enable
- 8. end

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	no macro auto global processing	Disables ASP on a global level.
	Example:	
	Device(config)# no macro auto global processing	

Command or Action	Purpose	
exit	Exits global configuration mode and returns to privileged	
Example:	EXEC mode.	
Device(config)# exit		
clear macro auto configuration all	Clears macro configurations for all interfaces.	
Example:		
Device# clear macro auto configuration all		
configure terminal	Enters global configuration mode.	
Example:		
Device# configure terminal		
autoconf enable	Enables the Autoconf feature.	
Example:		
Device(config)# autoconf enable		
end	Exits global configuration mode and returns to privileged	
Example:	EXEC mode.	
Device(config)# end		
	exit  Example:  Device(config)# exit  clear macro auto configuration all  Example:  Device# clear macro auto configuration all  configure terminal  Example:  Device# configure terminal  autoconf enable  Example:  Device(config)# autoconf enable  end  Example:	

# **Configuration Examples for Autoconf**

## **Example: Applying a Built-in Template to an End Device**

The following example shows how to apply a built-in template to an end device connected to an interface.

```
Device> enable
Device(config)# configure terminal
Device(config)# autoconf enable
Device(config)# end
Device# show device classifier attached interface Gi3/0/26
Device# show template binding target GigabitEthernet 3/0/26
```

### **Example: Applying a Modified Built-in Template to an End Device**

The following example shows how to modified built-in template and verify the configuration:

```
Device> enable

Device(config)# configure terminal

Device(config)# template AP_INTERFACE_TEMPLATE

Device(config-template)# switchport access vlan 20

Device(config-template)# description modifiedAP

Device(config-template)# exit

Device(config)# autoconf enable
```

```
Device(config)# end
Device# show template interface binding all
```

## **Example: Migrating from ASP Macros to Autoconf**

The following example shows how to migrate from ASP to Autoconf:

```
Device> enable
Device# configure terminal
Device(config)# no macro auto global processing
Device(config)# exit
Device# clear macro auto configuration all
Device# configure terminal
Device(config)# autoconf enable
Device(config)# end
```

# **Feature History for Autoconf**

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1 Autoconf	Autoconf	The feature was introduced.
		The Autoconf feature permits hardbinding between an end device and an interface.
		The following commands were added or modified: <b>autoconf enable</b> , <b>map</b>
		attribute-to-service (autoconf), map device-type
		(service-template), parameter-map type subscriber (service-template),
		show parameter-map type subscriber attribute-to-service all, show template interface.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <a href="https://cfnng.cisco.com">https://cfnng.cisco.com</a>.
