# aaa accounting

To enable authentication, authorization, and accounting (AAA) accounting of requested services for billing or security purposes when you use RADIUS or TACACS+, use the **aaa accounting** command in global configuration mode. To disable AAA accounting, use the **no** form of this command.

aaa accouting {auth-proxy | system | network | exec | connections | commands level} {default | list-name} {start-stop | stop-only | none} [broadcast] group group-name no aaa accouting {auth-proxy | system | network | exec | connections | commands level} {default | list-name} {start-stop | stop-only | none} [broadcast] group group-name

### **Syntax Description**

auth-proxy	Provides information about all authenticated-proxy user events.	
system	Performs accounting for all system-level events not associated with users, such as reloads.	
network	Runs accounting for all network-related service requests.	
exec	Runs accounting for EXEC shell session. This keyword might return user profile information such as what is generated by the <b>autocommand</b> command.	
connection	Provides information about all outbound connections made from the network access server.	
commands level	Runs accounting for all commands at the specified privilege level. Valid privilege level entries are integers from 0 through 15.	
default	Uses the listed accounting methods that follow this argument as the default list of methods for accounting services.	
list-name	Character string used to name the list of at least one of the accounting methods decribed in	
start-stop	Sends a "start" accounting notice at the beginning of a process and a "stop" accounting notice at the end of a process. The "start" accounting record is sent in the background. The requested user process begins regardless of whether the "start" accounting notice was received by the accounting server.	
stop-only	Sends a "stop" accounting notice at the end of the requested user process.	
none	Disables accounting services on this line or interface.	
broadcast	(Optional) Enables sending accounting records to multiple AAA servers. Simultaneously sends accounting records to the first server in each group. If the first server is unavailable, fail over occurs using the backup servers defined within that group.	
group groupname	At least one of the keywords described in Table 1: AAA accounting Methods, on page 5	

**Command Default** 

AAA accounting is disabled.

**Command Modes** 

Global configuration

Command	History
Cullillialia	HIISLUIY

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

Use the **aaa accounting** command to enable accounting and to create named method lists defining specific accounting methods on a per-line or per-interface basis.

Table 1: AAA accounting Methods

Keyword	Description
group radius	Uses the list of all RADIUS servers for authentication as defined by the <b>aaa group server radius</b> command.
group tacaes+	Uses the list of all TACACS+ servers for authentication as defined by the <b>aaa group server tacacs</b> + command.
group group-name	Uses a subset of RADIUS or TACACS+ servers for accounting as defined by the server group group-name.

In Table 1: AAA accounting Methods, on page 5, the group radius and group tacacs+ methods refer to a set of previously defined RADIUS or TACACS+ servers. Use the radius server and tacacs server commands to configure the host servers. Use the aaa group server radius and aaa group server tacacs+ commands to create a named group of servers.

Cisco IOS software supports the following two methods of accounting:

- RADIUS—The network access server reports user activity to the RADIUS security server in the form
  of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is
  stored on the security server.
- TACACS+—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server.

Method lists for accounting define the way accounting will be performed. Named accounting method lists enable you to designate a particular security protocol to be used on specific lines or interfaces for particular types of accounting services. Create a list by entering the *list-name* and the *method*, where *list-name* is any character string used to name this list (excluding the names of methods, such as radius or tacacs+) and *method* identifies the methods to be tried in sequence as given.

If the **aaa accounting** command for a particular accounting type is issued without a named method list specified, the default method list is automatically applied to all interfaces or lines (where this accounting type applies) except those that have a named method list explicitly defined. (A defined method list overrides the default method list.) If no default method list is defined, then no accounting takes place.

Note

System accounting does not use named accounting lists; you can only define the default list for system accounting.

For minimal accounting, include the **stop-only** keyword to send a stop record accounting notice at the end of the requested user process. For more accounting, you can include the **start-stop** keyword, so that RADIUS

or TACACS+ sends a start accounting notice at the beginning of the requested process and a stop accounting notice at the end of the process. Accounting is stored only on the RADIUS or TACACS+ server. The none keyword disables accounting services for the specified line or interface.

When AAA accounting is activated, the network access server monitors either RADIUS accounting attributes or TACACS+ AV pairs pertinent to the connection, depending on the security method you have implemented. The network access server reports these attributes as accounting records, which are then stored in an accounting log on the security server. For a list of supported RADIUS accounting attributes, refer to the appendix RADIUS Attributes in the *Cisco IOS Security Configuration Guide*. For a list of supported TACACS+ accounting AV pairs, refer to the appendix TACACS+ Attribute-Value Pairs in the *Cisco IOS Security Configuration Guide*.

Note

This command cannot be used with TACACS or extended TACACS.

This example defines a default commands accounting menthod list, where accounting services are provided by a TACACS+ security server, set for privilege level 15 commands with a stop-only restriction:

```
Device (config) # aaa accounting commands 15 default stop-only group TACACS+
```

This example defines a default auth-proxy accounting method list, where accounting services are provided by a TACACS+ security server with a stop-only restriction. The aaa accounting commands activates authentication proxy accounting.

```
Device(config) # aaa new model
Device(config) # aaa authentication login default group TACACS+
Device(config) # aaa authorization auth-proxy default group TACACS+
Device(config) # aaa accounting auth-proxy default start-stop group TACACS+
```

# aaa accounting dot1x

To enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions, use the **aaa** accounting dot1xcommand in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

```
aaa accounting dot1x \quad \{name \mid default \} \quad \{broadcast \ group \quad \{name \mid radius \mid tacacs+\} \quad [group \quad \{name \mid radius \mid tacacs+\} \quad [group \quad \{name \mid radius \mid tacacs+\} \quad [group \quad \{name \mid radius \mid tacacs+\} \quad ] \}
no aaa accounting dot1x \quad \{name \mid default \}
```

### **Syntax Description**

name	Name of a server group. This is optional when you enter it after the <b>broadcast group</b> and <b>group</b> keywords.
default	Specifies the accounting methods that follow as the default list for accounting services.
start-stop	Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested user process begins regardless of whether or not the start accounting notice was received by the accounting server.

**broadcast** Enables accounting records to be sent to multiple AAA servers and sends accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.

### group

Specifies the server group to be used for accounting services. These are valid server group names:

- name Name of a server group.
- radius Lists of all RADIUS hosts.
- tacacs+ Lists of all TACACS+ hosts.

The **group** keyword is optional when you enter it after the **broadcast group** and **group** keywords. You can enter more than optional **group** keyword.

radius	(Optional) Enables RADIUS accounting.
tacacs+	(Optional) Enables TACACS+ accounting.

### **Command Default**

AAA accounting is disabled.

### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

This command requires access to a RADIUS server.

We recommend that you enter the **dot1x reauthentication** interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

This example shows how to configure IEEE 802.1x accounting:

Device(config)# aaa new-model
Device(config)# aaa accounting dotlx default start-stop group radius

# aaa accounting identity

To enable authentication, authorization, and accounting (AAA) accounting for IEEE 802.1x, MAC authentication bypass (MAB), and web authentication sessions, use the aaa accounting identity command in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

```
aaa accounting identity {name | default } start-stop {broadcast group {name | radius | tacacs+}
[group {name | radius | tacacs+} ... ] | group {name | radius | tacacs+} [group
{ name | radius | tacacs+} . . . ] }
no aaa accounting identity { name | default }
```

### **Syntax Description**

name	Name of a server group. This is optional when you enter it after the <b>broadcast group</b> and <b>group</b>
	keywords.

#### default Uses the accounting methods that follow as the default list for accounting services.

### start-stop

Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server.

**broadcast** Enables accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.

### group

Specifies the server group to be used for accounting services. These are valid server group

- *name* Name of a server group.
- radius Lists of all RADIUS hosts.
- tacacs+ Lists of all TACACS+ hosts.

The **group** keyword is optional when you enter it after the **broadcast group** and **group** keywords. You can enter more than optional **group** keyword.

radius	(Optional) Enables RADIUS authorization.
tacacs+	(Optional) Enables TACACS+ accounting.

#### **Command Default**

AAA accounting is disabled.

### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

To enable AAA accounting identity, you need to enable policy mode. To enable policy mode, enter the authentication display new-style command in privileged EXEC mode.

This example shows how to configure IEEE 802.1x accounting identity:

### Device# authentication display new-style

Please note that while you can revert to legacy style configuration at any time unless you have explicitly entered new-style configuration, the following caveats should be carefully read and understood.

- (1) If you save the config in this mode, it will be written to NVRAM in NEW-style config, and if you subsequently reload the router without reverting to legacy config and saving that, you will no longer be able to revert.
- (2) In this and legacy mode, Webauth is not IPv6-capable. It will only become IPv6-capable once you have entered newstyle config manually, or have reloaded with config saved in 'authentication display new' mode.

Device# configure terminal
Device(config)# aaa accounting identity default start-stop group radius

## aaa authentication dot1x

To specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication, use the **aaa authentication dot1x** command in global configuration mode on the switch stack or on a standalone switch. To disable authentication, use the **no** form of this command.

aaa authentication dot $1x \{ default \}$  method1 no aaa authentication dot $1x \{ default \}$  method1

### **Syntax Description**

**default** The default method when a user logs in. Use the listed authentication method that follows this argument.

method1

Specifies the server authentication. Enter the **group radius** keywords to use the list of all RADIUS servers for authentication.

Note

Though other keywords are visible in the command-line help strings, only the **default** and **group radius** keywords are supported.

### **Command Default**

No authentication is performed.

### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

The **method** argument identifies the method that the authentication algorithm tries in the specified sequence to validate the password provided by the client. The only method that is IEEE 802.1x-compliant is the **group radius** method, in which the client data is validated against a RADIUS authentication server.

If you specify **group radius**, you must configure the RADIUS server by entering the **radius-server host** global configuration command.

Use the **show running-config** privileged EXEC command to display the configured lists of authentication methods.

This example shows how to enable AAA and how to create an IEEE 802.1x-compliant authentication list. This authentication first tries to contact a RADIUS server. If this action returns an error, the user is not allowed access to the network.

```
Device(config)# aaa new-model
Device(config)# aaa authentication dot1x default group radius
```

## aaa new-model

To enable the authentication, authorization, and accounting (AAA) access control model, issue the **aaa new-model** command in global configuration mode. To disable the AAA access control model, use the **no** form of this command.

aaa new-model no aaa new-model

### **Syntax Description**

This command has no arguments or keywords.

### **Command Default**

AAA is not enabled.

### **Command Modes**

Global configuration (config)

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

This command enables the AAA access control system.

If the **login local** command is configured for a virtual terminal line (VTY), and the **aaa new-model** command is removed, you must reload the switch to get the default configuration or the **login** command. If the switch is not reloaded, the switch defaults to the **login local** command under the VTY.

### Note

We do not recommend removing the aaa new-model command.

The following example shows this restriction:

```
Switch(config)# aaa new-model
Switch(config)# line vty 0 15
Switch(config-line)# login local
Switch(config-line)# exit
Switch(config)# no aaa new-model
Switch(config)# exit
Switch(switch# show running-config | b line vty
line vty 0 4
login local !<=== Login local instead of "login"
line vty 5 15
login local
!</pre>
```

### **Examples**

The following example initializes AAA:

```
Switch(config)# aaa new-model
Switch(config)#
```

Command	Description
aaa accounting	Enables AAA accounting of requested services for billing or security purposes.
aaa authentication arap	Enables an AAA authentication method for ARAP using TACACS+.
aaa authentication enable default	Enables AAA authentication to determine if a user can access the privileged command level.
aaa authentication login	Sets AAA authentication at login.
aaa authentication ppp	Specifies one or more AAA authentication method for use on serial interfaces running PPP.
aaa authorization	Sets parameters that restrict user access to a network.

# access-session template monitor

To set the access session template to monitor ports, use the **access-session template monitor** command in global configuration mode. To return to the default setting, use the **no** form of this command.

### access-session template monitor

no access-session template monitor

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

This command is not configured.

**Command Modes** 

Global configuration (config)

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

The access-session template monitor command enables session monitoring to create sessions on all ports where authentication configurations are not present, and MAC addresses are known. These sessions have open access ports for traffic, multi-auth host mode to control the number of hosts on a port, and port-control set to auto for sessions to undergo authentication and authorization. The access-session template monitor command is enabled by default if the device classifier or autoconf command is enabled. Session monitoring can be disabled on a per port basis.

This command is available on devices that has Identity-Based Networking Services (IBNS). The equivalent command for access-session template monitor command in IBNS new-style mode is access-session monitor. To switch from IBNS legacy mode to new style mode, use the authentication convert-to new-style command.

### **Examples**

The following example shows how to set the access session template to monitor ports:

Device(config) # access-session template monitor

Command	Description
device classifier	Creates a monitor session for all the MAC addresses learned in the system.
authentication convert-to new-style	Converts all the relevant authentication commands to their CPL control policy-equivalents.

### authentication host-mode

To set the authorization manager mode on a port, use the **authentication host-mode** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

authentication host-mode {multi-auth | multi-domain | multi-host | single-host} no authentication host-mode

### **Syntax Description**

multi-auth	Enables multiple-authorization mode (multi-auth mode) on the port.
multi-domain	Enables multiple-domain mode on the port.
multi-host	Enables multiple-host mode on the port.
single-host	Enables single-host mode on the port.

### **Command Default**

Single host mode is enabled.

### **Command Modes**

Interface configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

Single-host mode should be configured if only one data host is connected. Do not connect a voice device to authenticate on a single-host port. Voice device authorization fails if no voice VLAN is configured on the port.

Multi-domain mode should be configured if data host is connected through an IP phone to the port. Multi-domain mode should be configured if the voice device needs to be authenticated.

Multi-auth mode should be configured to allow devices behind a hub to obtain secured port access through individual authentication. Only one voice device can be authenticated in this mode if a voice VLAN is configured.

Multi-host mode also offers port access for multiple hosts behind a hub, but multi-host mode gives unrestricted port access to the devices after the first user gets authenticated.

This example shows how to enable multi-auth mode on a port:

Device(config-if)# authentication host-mode multi-auth

This example shows how to enable multi-domain mode on a port:

Device(config-if)# authentication host-mode multi-domain

This example shows how to enable multi-host mode on a port:

Device(config-if)# authentication host-mode multi-host

This example shows how to enable single-host mode on a port:

Device(config-if)# authentication host-mode single-host

You can verify your settings by entering the **show authentication sessions interface** *interface* **details** privileged EXEC command.

# authentication mac-move permit

To enable MAC move on a device, use the **authentication mac-move permit** command in global configuration mode. To disable MAC move, use the **no** form of this command.

authentication mac-move permit no authentication mac-move permit

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

MAC move is disabled.

**Command Modes** 

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

The command enables authenticated hosts to move between ports on a device. For example, if there is a device between an authenticated host and port, and that host moves to another port, the authentication session is deleted from the first port, and the host is reauthenticated on the new port.

If MAC move is disabled, and an authenticated host moves to another port, it is not reauthenticated, and a violation error occurs.

This example shows how to enable MAC move on a device:

Device(config) # authentication mac-move permit

# authentication priority

To add an authentication method to the port-priority list, use the **authentication priority** command in interface configuration mode. To return to the default, use the **no** form of this command.

authentication priority [dot1x | mab] {webauth}
no authentication priority [dot1x | mab] {webauth}

### **Syntax Description**

dot1x	(Optional) Adds 802.1x to the order of authentication methods.
mab	(Optional) Adds MAC authentication bypass (MAB) to the order of authentication methods.
webauth	Adds web authentication to the order of authentication methods.

#### **Command Default**

The default priority is 802.1x authentication, followed by MAC authentication bypass and web authentication.

### **Command Modes**

Interface configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

Ordering sets the order of methods that the switch attempts when trying to authenticate a new device is connected to a port.

When configuring multiple fallback methods on a port, set web authentication (webauth) last.

Assigning priorities to different authentication methods allows a higher-priority method to interrupt an in-progress authentication method with a lower priority.

Note

If a client is already authenticated, it might be reauthenticated if an interruption from a higher-priority method occurs.

The default priority of an authentication method is equivalent to its position in execution-list order: 802.1x authentication, MAC authentication bypass (MAB), and web authentication. Use the **dot1x**, **mab**, and **webauth** keywords to change this default order.

This example shows how to set 802.1x as the first authentication method and web authentication as the second authentication method:

Device(config-if)# authentication priority dotx webauth

This example shows how to set MAB as the first authentication method and web authentication as the second authentication method:

Device(config-if) # authentication priority mab webauth

Command	Description
authentication control-direction	Configures the port mode as unidirectional or bidirectional.
authentication event fail	Specifies how the Auth Manager handles authentication failures as a result of unrecognized user credentials.
authentication event no-response action	Specifies how the Auth Manager handles authentication failures as a result of a nonresponsive host.
authentication event server alive action reinitialize	Reinitializes an authorized Auth Manager session when a previously unreachable authentication, authorization, and accounting server becomes available.
authentication event server dead action authorize	Authorizes Auth Manager sessions when the authentication, authorization, and accounting server becomes unreachable.
authentication fallback	Enables a web authentication fallback method.
authentication host-mode	Allows hosts to gain access to a controlled port.
authentication open	Enables open access on a port.
authentication order	Specifies the order in which the Auth Manager attempts to authenticate a client on a port.
authentication periodic	Enables automatic reauthentication on a port.
authentication port-control	Configures the authorization state of a controlled port.
authentication timer inactivity	Configures the time after which an inactive Auth Manager session is terminated.
authentication timer reauthenticate	Specifies the period of time between which the Auth Manager attempts to reauthenticate authorized ports.
authentication timer restart	Specifies the period of time after which the Auth Manager attempts to authenticate an unauthorized port.
authentication violation	Specifies the action to be taken when a security violation occurs on a port.
mab	Enables MAC authentication bypass on a port.

Command	Description
show authentication registrations	Displays information about the authentication methods that are registered with the Auth Manager.
show authentication sessions	Displays information about current Auth Manager sessions.
show authentication sessions interface	Displays information about the Auth Manager for a given interface.

### authentication violation

To configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port, use the **authentication violation** command in interface configuration mode.

authentication violation{ protect | replace | restrict | shutdown }
no authentication violation{ protect | replace | restrict | shutdown }

### **Syntax Description**

protect	Drops unexpected incoming MAC addresses. No syslog errors are generated.
replace	Removes the current session and initiates authentication with the new host.
restrict	Generates a syslog error when a violation error occurs.
shutdown	Error-disables the port or the virtual port on which an unexpected MAC address occurs.

### **Command Default**

Authentication violation shutdown mode is enabled.

### Command Modes

Interface configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

Use the **authentication violation** command to specify the action to be taken when a security violation occurs on a port.

This example shows how to configure an IEEE 802.1x-enabled port as error-disabled and to shut down when a new device connects it:

Device(config-if) # authentication violation shutdown

This example shows how to configure an 802.1x-enabled port to generate a system error message and to change the port to restricted mode when a new device connects to it:

Device(config-if)# authentication violation restrict

This example shows how to configure an 802.1x-enabled port to ignore a new device when it connects to the port:

Device(config-if)# authentication violation protect

This example shows how to configure an 802.1x-enabled port to remove the current session and initiate authentication with a new device when it connects to the port:

Device(config-if)# authentication violation replace

You can verify your settings by entering the **show authentication** privileged EXEC command.

# cisp enable

To enable Client Information Signaling Protocol (CISP) on a switch so that it acts as an authenticator to a supplicant switch and a supplicant to an authenticator switch, use the **cisp enable** global configuration command.

cisp enable no cisp enable

### **Syntax Description**

This command has no arguments or keywords.

### **Command Default**

No default behavior or values.

### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.
	This command was reintroduced. This command was not supported in and

### **Usage Guidelines**

The link between the authenticator and supplicant switch is a trunk. When you enable VTP on both switches, the VTP domain name must be the same, and the VTP mode must be server.

To avoid the MD5 checksum mismatch error when you configure VTP mode, verify that:

- VLANs are not configured on two different switches, which can be caused by two VTP servers in the same domain.
- Both switches have different configuration revision numbers.

This example shows how to enable CISP:

Device(config) # cisp enable

Command	Description
dot1x credentialsprofile	Configures a profile on a supplicant switch.
dot1x supplicant force-multicast	Forces 802.1X supplicant to send multicast packets.
dot1x supplicant controlled transient	Configures controlled access by 802.1X supplicant.
show cisp	Displays CISP information for a specified interface.

### clear errdisable interface vlan

To reenable a VLAN that was error-disabled, use the **clear errdisable interface** command in privileged EXEC mode.

**clear errdisable interface** interface-id **vlan** [vlan-list]

### **Syntax Description**

interface-id	Specifies an interface.
vlan list	(Optional) Specifies a list of VLANs to be reenabled. If a VLAN list is not specified, then all VLANs are reenabled.

### **Command Default**

No default behavior or values.

### **Command Modes**

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

You can reenable a port by using the **shutdown** and **no shutdown** interface configuration commands, or you can clear error-disable for VLANs by using the **clear errdisable** interface command.

This example shows how to reenable all VLANs that were error-disabled on Gigabit Ethernet port 4/0/2:

Device# clear errdisable interface gigabitethernet4/0/2 vlan

Command	Description
errdisable detect cause	Enables error-disabled detection for a specific cause or all causes.
errdisable recovery	Configures the recovery mechanism variables.
show errdisable detect	Displays error-disabled detection status.
show errdisable recovery	Displays error-disabled recovery timer information.
show interfaces status err-disabled	Displays interface status of a list of interfaces in error-disabled state.

### clear mac address-table

To delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members, or all dynamic addresses on a particular VLAN, use the **clear mac address-table** command in privileged EXEC mode. This command also clears the MAC address notification global counters.

**clear mac address-table** {**dynamic** [**address** *mac-addr* | **interface** *interface-id* | **vlan** *vlan-id*] | **move update** | **notification**}

### **Syntax Description**

dynamic	Deletes all dynamic MAC addresses.
address mac-addr	(Optional) Deletes the specified dynamic MAC address.
interface interface-id	(Optional) Deletes all dynamic MAC addresses on the specified physical port or port channel.
vlan vlan-id	(Optional) Deletes all dynamic MAC addresses for the specified VLAN. The range is 1 to 4094.
move update	Clears the MAC address table move-update counters.
notification	Clears the notifications in the history table and reset the counters.

### **Command Default**

No default behavior or values.

### **Command Modes**

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

You can verify that the information was deleted by entering the **show mac address-table** privileged EXEC command.

This example shows how to remove a specific MAC address from the dynamic address table:

Device# clear mac address-table dynamic address 0008.0070.0007

Command	Description
mac address-table notification	Enables the MAC address notification feature.
mac address-table move update {receive   transmit}	Configures MAC address-table move update on the switch.

Command	Description
show mac address-table	Displays the MAC address table static and dynamic entries.
show mac address-table move update	Displays the MAC address-table move update information on the switch.
show mac address-table notification	Displays the MAC address notification settings for all interfaces or on the specified interface when the <b>interface</b> keyword is appended.
snmp trap mac-notification change	Enables the SNMP MAC address notification trap on a specific interface.

# confidentiality-offset

To enable MACsec Key Agreement protocol (MKA) to set the confidentiality offset for MACsec operations, use the **confidentiality-offset** command in MKA-policy configuration mode. To disable confidentiality offset, use the **no** form of this command.

confidentiality-offset no confidentiality-offset

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

Confidentiality offset is disabled.

Command Modes

MKA-policy configuration (config-mka-policy)

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Examples**

The following example shows how to enable the confidentiality offset:

Device> enable
Device# configure terminal
Device(config)# mka policy 2

Device(config-mka-policy)# confidentiality-offset

Command	Description
mka policy	Configures an MKA policy.
delay-protection	Configures MKA to use delay protection in sending MKPDU.
include-icv-indicator	Includes ICV indicator in MKPDU.
key-server	Configures MKA key-server options.
macsec-cipher-suite	Configures cipher suite for deriving SAK.

### cts manual

To manually enable an interface for Cisco TrustSec Security, use the **cts manual** command in interface configuration mode.

#### cts manual

### **Syntax Description**

This command has no arguments or keywords.

### **Command Default**

Disabled

#### **Command Modes**

Interface configuration (config-if)

### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was modified with additional options.
Cisco IOS XE 3.7E	This command was introduced.

### **Usage Guidelines**

Use the **cts manual** command to enter the TrustSec manual interface configuration in which policies and the Security Association Protocol (SAP) are configured on the link.

When **cts manual** command is configured, 802.1X authentication is not performed on the link. Use the **policy** subcommand to define and apply policies on the link. By default no policy is applied. To configure MACsec link-to-link encryption, the SAP negotiation parameters must be defined. By default SAP is not enabled. The same SAP PMK should be configured on both sides of the link (that is, a shared secret)

### **Examples**

The following example shows how to enter the Cisco TrustSec manual mode:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 0
Switch(config-if)# cts manual
Switch(config-if-cts-manual))#
```

The following example shows how to remove the Cisco TrustSec manual configuration from an interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 0
Switch(config-if)# no cts manual
```

Command	Description	
propagate sgt (cts manual)	Enables SGT propagation at Layer 2 on Cisco TrustSec Security interfaces.	
sap mode-list (cts manual)	Manually specifies the PMK and the SAP authentication and encryption modes to negotiate MACsec link encryption between two interfaces.	
show cts interface	Displays Cisco TrustSec interface configuration statistics.	

### cts role-based enforcement

To enable Cisco TrustSec role-based (security group) access control enforcement, use the **cts role-based enforcement** command in global configuration mode. To disable the configuration, use the **no** form of this command.

cts role-based enforcement [logging-interval interval | vlan-list all | vlan-ID [,] [-]] no cts role-based enforcement [logging-interval interval | vlan-list all | vlan-ID [,] [-]]

### **Syntax Description**

logging-interval interval	(Optional) Configures a logging interval for a security group access control list (SGACL). Valid values for the <i>interval</i> argument are from 5 to 86400 seconds. The default is 300 seconds
vlan-list	(Optional) Configures VLANs on which role-based ACLs are enforced.
all	(Optional) Specifies all VLANs.
vlan-ID	(Optional) VLAN ID. Valid values are from 1 to 4094.
,	(Optional) Specifies another VLAN separated by a comma.
-	(Optional) Specifies a range of VLANs separated by a hyphen.

### **Command Default**

Role-based access control is not enforced.

### **Command Modes**

Global configuration (config)

### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

### **Usage Guidelines**

Note

RBACL and SGACL are used interchangeably.

Use the **cts role-based enforcement** command to globally enable or disable SGACL enforcement for Cisco TrustSec-enabled interfaces in the system.

The default interval after which log for a given flow is printed is 300 seconds. Use the **logging-interval** keyword to change the default interval. Logging is only triggered when the Cisco ACE Application Control Engine has the **logging** keyword.

SGACL enforcement is not enabled by default on VLANs. Use the **cts role-based enforcement vlan-list** command to enable or disable SGACL enforcement for Layer 2 switched packets and for Layer 3 switched packets on an switched virtual interface (SVI).

The vlan-ID argument can be a single VLAN ID, a list of VLAN IDs, or VLAN ID ranges.

When a VLAN in which a SGACL is enforced has an active SVI, the SGACL is enforced for both Layer 2 and Layer 3 switched packets within that VLAN. Without an SVI, the SGACL is enforced only for Layer 2 switched packets, because no Layer 3 switching is possible within a VLAN without an SVI.

The following example shows configure an SGACL logging interval:

```
Switch(config)# cts role-based enforcement logging-interval 90
Switch(config)# logging rate-limit

May 27 10:19:21.509: %RBM-6-SGACLHIT:
ingress_interface='GigabitEthernet1/0/2' sgacl_name='sgacl2' action='Deny'
protocol='icmp' src-ip='16.16.1.3' src-port='8' dest-ip='17.17.1.2' dest-port='0'
sgt='101' dgt='202' logging_interval_hits='5'
```

Command	Description
logging rate-limit	Limits the rate of messages logged per second.
show cts role-based permissions	Displays the SGACL permission list.

### cts role-based I2-vrf

To select a virtual routing and forwarding (VRF) instance for Layer 2 VLANs, use the **cts role-based 12-vrf** command in global configuration mode. To remove the configuration, use the **no** form of this command.

cts role-based 12-vrf vrf-name vlan-list all vlan-ID [,] [-] no cts role-based 12-vrf vrf-name vlan-list all vlan-ID [,] [-]

### **Syntax Description**

vrf-name	Name of the VRF instance.
vlan-list	Specifies the list of VLANs to be assigned to a VRF instance.
all	Specifies all VLANs.
vlan-ID	VLAN ID. Valid values are from 1 to 4094.
,	(Optional) Specifies another VLAN separated by a comma.
-	(Optional) Specifies a range of VLANs separated by a hyphen.

### **Command Default**

VRF instances are not selected.

### **Command Modes**

Global configuration (config)

### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

### **Usage Guidelines**

The *vlan-list* argument can be a single VLAN ID, a list of comma-separated VLAN IDs, or hyphen-separated VLAN ID ranges.

The **all** keyword is equivalent to the full range of VLANs supported by the network device. The **all** keyword is not preserved in the nonvolatile generation (NVGEN) process.

If the **cts role-based 12-vrf** command is issued more than once for the same VRF, each successive command entered adds the VLAN IDs to the specified VRF.

The VRF assignments configured by the **cts role-based 12-vrf** command are active as long as a VLAN remains a Layer 2 VLAN. The IP–SGT bindings learned while a VRF assignment is active are also added to the Forwarding Information Base (FIB) table associated with the VRF and the IP protocol version. If an Switched Virtual Interface (SVI) becomes active for a VLAN, the VRF-to-VLAN assignment becomes inactive and all bindings learned on the VLAN are moved to the FIB table associated with the VRF of the SVI.

Use the **interface vlan** command to configure an SVI interface, and the **vrf forwarding** command to associate a VRF instance to the interface.

The VRF-to-VLAN assignment is retained even when the assignment becomes inactive. It is reactivated when the SVI is removed or when the SVI IP address is changed. When reactivated, the IP–SGT bindings are moved back from the FIB table associated with the VRF of the SVI to the FIB table associated with the VRF assigned by the **cts role-based 12-vrf** command.

The following example shows how to select a list of VLANS to be assigned to a VRF instance:

Switch(config) # cts role-based 12-vrf vrf1 vlan-list 20

The following example shows how to configure an SVI interface and associate a VRF instance:

Switch(config)# interface vlan 101
Switch(config-if)# vrf forwarding vrf1

Command	Description
interface vlan	Configures a VLAN interface.
vrf forwarding	Associates a VRF instance or a virtual network with an interface or subinterface.
show cts role-based permissions	Displays the SGACL permission list.

### cts role-based monitor

To enable role-based (security-group) access list monitoring, use the **cts role-based monitor** command in global configuration mode. To remove role-based access list monitoring, use the **no** form of this command.

cts role-based monitor all | permissions | default | from sgt | unknown to sgt | unknown [ipv4] no cts role-based monitor all | permissions | default | from sgt | unknown to sgt | unknown [ipv4]

### **Syntax Description**

all	Monitors permissions for all source tags to all destination tags.
permissions	Monitors permissions from a source tags to a destination tags.
default	Monitors the default permission list.
from	Specifies the source group tag for filtered traffic.
sgt	Security Group Tag (SGT). Valid values are from 2 to 65519.
unknown	Specifies an unknown source or destination group tag (DST).
ipv4	(Optional) Specifies the IPv4 protocol.

### **Command Default**

Role-based access control monitoring is not enabled.

### **Command Modes**

Global configuration (config)

### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

### **Usage Guidelines**

Use the **cts role-based monitor all** command to enable the global monitor mode. If the **cts role-based monitor all** command is configured, the output of the **show cts role-based permissions** command displays monitor mode for all configured policies as true.

The following examples shows how to configure SGACL monitor from a source tag to a destination tag:

Switch(config) # cts role-based monitor permissions from 10 to 11

Command	Description
show cts role-based permissions	Displays the SGACL permission list.

# cts role-based permissions

To enable permissions from a source group to a destination group, use the **cts role-based permissions** command in global configuration mode. To remove the permissions, use the **no** form of this command.

cts role-based permissions default ipv4 | from sgt | unknown to sgt | unknown ipv4 rbacl-name [rbacl-name....]

no cts role-based permissions default [ipv4] | from sgt | unknown to sgt | unknown [ipv4]

### **Syntax Description**

default	Specifies the default permissions list. Every cell (an SGT pair) for which, security group access control list (SGACL) permission is not configured statically or dynamically falls under the default category.
ipv4	Specifies the IPv4 protocol.
from	Specifies the source group tag of the filtered traffic.
sgt	Security Group Tag (SGT). Valid values are from 2 to 65519.
unknown	Specifies an unknown source or destination group tag.
rbacl-name	Role-based access control list (RBACL) or SGACL name. Up to 16 SGACLs can be specified in the configuration.

### **Command Default**

Permissions from a source group to a destination group is not enabled.

### **Command Modes**

Global configuration (config)

### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

### **Usage Guidelines**

Use the **cts role-based permissions** command to define, replace, or delete the list of SGACLs for a given source group tag (SGT), destination group tag (DGT) pair. This policy is in effect as long as there is no dynamic policy for the same DGT or SGT.

The **cts role-based permissions default** command defines, replaces, or deletes the list of SGACLs of the default policy as long as there is no dynamic policy for the same DGT.

The following example shows how to enable permissions for a destination group:

Switch(config)# cts role-based permissions from 6 to 6 mon\_2

Command	Description
show cts role-based permissions	Displays the SGACL permission list.

# delay-protection

To configure MKA to use delay protection in sending MACsec Key Agreement Protocol Data Units (MKPDUs), use the **delay-protection** command in MKA-policy configuration mode. To disable delay protection, use the **no** form of this command.

delay-protection no delay-protection

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

Delay protection for sending MKPDUs is disabled.

**Command Modes** 

MKA-policy configuration (config-mka-policy)

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Examples**

The following example shows how to configure MKA to use delay protection in sending MKPDUs:

Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# delay-protection

Command	Description
mka policy	Configures an MKA policy.
confidentiality-offset	Sets the confidentiality offset for MACsec operations.
include-icv-indicator	Includes ICV indicator in MKPDU.
key-server	Configures MKA key-server options.
macsec-cipher-suite	Configures cipher suite for deriving SAK.

# deny (MAC access-list configuration)

To prevent non-IP traffic from being forwarded if the conditions are matched, use the **deny** MAC access-list configuration command on the switch stack or on a standalone switch. To remove a deny condition from the named MAC access list, use the **no** form of this command.

### **Syntax Description**

any	Denies any source or destination MAC address.
host src-MAC-addr   src-MAC-addr mask	Defines a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
host dst-MAC-addr   dst-MAC-addr mask	Defines a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
type mask	(Optional) Specifies the EtherType number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
	The type is 0 to 65535, specified in hexadecimal.
	The mask is a mask of don't care bits applied to the EtherType before testing for a match.
aarp	(Optional) Specifies EtherType AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
amber	(Optional) Specifies EtherType DEC-Amber.
appletalk	(Optional) Specifies EtherType AppleTalk/EtherTalk.
dec-spanning	(Optional) Specifies EtherType Digital Equipment Corporation (DEC) spanning tree.
decnet-iv	(Optional) Specifies EtherType DECnet Phase IV protocol.
diagnostic	(Optional) Specifies EtherType DEC-Diagnostic.

(Optional) Specifies EtherType DEC-DSM.
(Optional) Specifies EtherType 0x6000.
(Optional) Specifies EtherType 0x8042.
(Optional) Specifies EtherType DEC-LAT.
(Optional) Specifies EtherType DEC-LAVC-SCA.
(Optional) Specifies the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.
<i>mask</i> is a mask of don't care bits applied to the LSAP number before testing for a match.
(Optional) Specifies EtherType DEC-MOP Remote Console.
(Optional) Specifies EtherType DEC-MOP Dump.
(Optional) Specifies EtherType DEC-MSDOS.
(Optional) Specifies EtherType DEC-MUMPS.
(Optional) Specifies EtherType DEC- Network Basic Input/Output System (NetBIOS).
(Optional) Specifies EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.
(Optional) Specifies EtherType VINES IP.
(Optional) Specifies EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary EtherType in decimal, hexadecimal, or octal.
(Optional) Specifies a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the <b>cos</b> option is configured.

## **Command Default**

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

## **Command Modes**

Mac-access list configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

You enter MAC-access list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **host** keyword, you must enter an address mask.

When an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in the table.

**Table 2: IPX Filtering Criteria** 

IPX Encapsulation Type		Filter Criterion
Cisco IOS Name	Novel Name	
arpa	Ethernet II	EtherType 0x8137
snap	Ethernet-snap	EtherType 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

This example shows how to define the named MAC extended access list to deny NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is denied.

Device(config-ext-macl) # deny any host 00c0.00a0.03fa netbios.

This example shows how to remove the deny condition from the named MAC extended access list:

Device (config-ext-macl) # no deny any 00c0.00a0.03fa 0000.0000.0000 netbios.

This example denies all packets with EtherType 0x4321:

Device(config-ext-macl) # deny any any 0x4321 0

You can verify your settings by entering the **show access-lists** privileged EXEC command.

Command	Description
mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.
permit	Permits from the MAC access-list configuration.  Permits non-IP traffic to be forwarded if conditions are matched.

Command	Description
show access-lists	Displays access control lists configured on a switch.

## device-role (IPv6 snooping)

To specify the role of the device attached to the port, use the **device-role** command in IPv6 snooping configuration mode.

device-role { node | switch }

## **Syntax Description**

**node** Sets the role of the attached device to node.

**switch** Sets the role of the attached device to switch.

#### **Command Default**

The device role is node.

#### **Command Modes**

IPv6 snooping configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

The **device-role** command specifies the role of the device attached to the port. By default, the device role is node.

The **switch** keyword indicates that the remote device is a switch and that the local switch is now operating in multiswitch mode; binding entries learned from the port will be marked with trunk\_port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk\_trusted\_port preference level.

This example shows how to define an IPv6 snooping policy name as policy1, place the device in IPv6 snooping configuration mode, and configure the device as the node:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# device-role node

# device-role (IPv6 nd inspection)

To specify the role of the device attached to the port, use the **device-role** command in neighbor discovery (ND) inspection policy configuration mode.

**device-role** { host | switch }

Syntax Description	host Sets the role of the attached device to host.	
	switch	Sets the role of the attached device to switch.
Command Default	The device role is host.	

## Command Modes

ND inspection policy configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

The **device-role** command specifies the role of the device attached to the port. By default, the device role is host, and therefore all the inbound router advertisement and redirect messages are blocked.

The **switch** keyword indicates that the remote device is a switch and that the local switch is now operating in multiswitch mode; binding entries learned from the port will be marked with trunk\_port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk trusted port preference level.

The following example defines a Neighbor Discovery Protocol (NDP) policy name as policy1, places the device in ND inspection policy configuration mode, and configures the device as the host:

Device(config) # ipv6 nd inspection policy policy1
Device(config-nd-inspection) # device-role host

## device-tracking policy

To configure a Switch Integrated Security Features (SISF)-based IP device tracking policy, use the **device-tracking** command in global configuration mode. To delete a device tracking policy, use the **no** form of this command.

device -tracking policy policy-name no device-tracking policy policy-name

#### **Syntax Description**

policy-name

User-defined name of the device tracking policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0).

#### **Command Default**

A device tracking policy is not configured.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
	This command was introduced.

#### **Usage Guidelines**

Use the SISF-based **device-tracking policy** command to create a device tracking policy. When the **device-tracking policy** command is enabled, the configuration mode changes to device-tracking configuration mode. In this mode, the administrator can configure the following first-hop security commands:

- (Optional) **device-role** {node] | switch}—Specifies the role of the device attached to the port. Default is node.
- (Optional) **limit address-count** value—Limits the number of addresses allowed per target.
- (Optional) **no**—Negates a command or sets it to defaults.
- (Optional) **destination-glean**{recovery| log-only}[dhcp]}—Enables binding table recovery by data traffic source address gleaning.
- (Optional) **data-glean**{recovery| log-only}[dhcp | ndp]}—Enables binding table recovery using source or data address gleaning.
- (Optional) **security-level**{**glean**|**guard**|**inspect**}—Specifies the level of security enforced by the feature. Default is **guard**.

**glean**—Gleans addresses from messages and populates the binding table without any verification. **guard**—Gleans addresses and inspects messages. In addition, it rejects RA and DHCP server messages. This is the default option.

**inspect**—Gleans addresses, validates messages for consistency and conformance, and enforces address ownership.

- (Optional) **tracking** {**disable** | **enable**}—Specifies a tracking option.
- (Optional) **trusted-port**—Sets up a trusted port. It disables the guard on applicable targets. Bindings learned through a trusted port have preference over bindings learned through any other port. A trusted port is given preference in case of a collision while making an entry in the table.

This example shows how to configure an a device-tracking policy:

Device(config)# device-tracking policy policy1
Device(config-device-tracking)# trusted-port

# dot1x critical (global configuration)

To configure the IEEE 802.1X critical authentication parameters, use the **dot1x critical** command in global configuration mode.

## dot1x critical eapol

## **Syntax Description**

**eapol** Specifies that the switch send an EAPOL-Success message when the switch successfully authenticates the critical port.

## **Command Default**

eapol is disabled

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This example shows how to specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port:

Device(config) # dot1x critical eapol

# dot1x pae

To set the Port Access Entity (PAE) type, use the **dot1x pae** command in interface configuration mode. To disable the PAE type that was set, use the **no** form of this command.

dot1x pae {supplicant | authenticator}
no dot1x pae {supplicant | authenticator}

## **Syntax Description**

supplicant	The interface acts only as a supplicant and will not respond to messages that are meant for an authenticator.
authenticator	The interface acts only as an authenticator and will not respond to any messages meant for a supplicant.

#### **Command Default**

PAE type is not set.

#### **Command Modes**

Interface configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.
	This command was reintroduced. This command was not supported in and

## **Usage Guidelines**

Use the **no dot1x pae** interface configuration command to disable IEEE 802.1x authentication on the port.

When you configure IEEE 802.1x authentication on a port, such as by entering the **dot1x port-control** interface configuration command, the switch automatically configures the port as an IEEE 802.1x authenticator. After the **no dot1x pae** interface configuration command is entered, the Authenticator PAE operation is disabled.

The following example shows that the interface has been set to act as a supplicant:

Device(config)# interface g1/0/3
Device(config-if)# dot1x pae supplicant

## dot1x supplicant controlled transient

To control access to an 802.1x supplicant port during authentication, use the **dot1x supplicant controlled transient** command in global configuration mode. To open the supplicant port during authentication, use the **no** form of this command

dot1x supplicant controlled transient no dot1x supplicant controlled transient

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

Access is allowed to 802.1x supplicant ports during authentication.

**Command Modes** 

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.
	This command was reintroduced. This command was not supported in and

#### **Usage Guidelines**

In the default state, when you connect a supplicant switch to an authenticator switch that has BPCU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the **dot1x supplicant controlled transient** global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the **no dot1x supplicant controlled transient** global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the **dot1x supplicant controlled transient** command on a supplicant switch when BPDU guard is enabled on the authenticator switch port with the **spanning-tree bpduguard enable** interface configuration command.

This example shows how to control access to 802.1x supplicant ports on a switch during authentication:

Device(config) # dot1x supplicant controlled transient

## dot1x supplicant force-multicast

To force a supplicant switch to send only multicast Extensible Authentication Protocol over LAN (EAPOL) packets whenever it receives multicast or unicast EAPOL packets, use the **dot1x supplicant force-multicast** command in global configuration mode. To return to the default setting, use the **no** form of this command.

## dot1x supplicant force-multicast no dot1x supplicant force-multicast

### **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

The supplicant switch sends unicast EAPOL packets when it receives unicast EAPOL packets. Similarly, it sends multicast EAPOL packets when it receives multicast EAPOL packets.

## **Command Modes**

Global configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.
	This command was reintroduced. This command was not supported in and

#### **Usage Guidelines**

Enable this command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

This example shows how force a supplicant switch to send multicast EAPOL packets to the authenticator switch:

Device(config) # dot1x supplicant force-multicast

Command	Description
cisp enable	Enable Client Information Signalling Protocol (CISP) on a switch so that it acts as an authenticator to a supplicant switch.
dot1x credentials	Configure the 802.1x supplicant credentials on the port.
dot1x pae supplicant	Configure an interface to act only as a supplicant.

## dot1x test eapol-capable

To monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x, use the **dot1x test eapol-capable** command in privileged EXEC mode on the switch stack or on a standalone switch.

dot1x test eapol-capable [interface interface-id]

## **Syntax Description**

interface interface-id

(Optional) Port to be queried.

#### **Command Default**

There is no default setting.

#### **Command Modes**

Privileged EXEC

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

Use this command to test the IEEE 802.1x capability of the devices connected to all ports or to specific ports on a switch.

There is not a no form of this command.

This example shows how to enable the IEEE 802.1x readiness check on a switch to query a port. It also shows the response received from the queried port verifying that the device connected to it is IEEE 802.1x-capable:

Device# dot1x test eapol-capable interface gigabitethernet1/0/13

 ${\tt DOT1X\_PORT\_EAPOL\_CAPABLE:DOT1X: MAC~00-01-02-4b-f1-a3~on~gigabite thernet 1/0/13~is~EAPOL~capable}$ 

Command	Description
dot1x test timeout timeout	Configures the timeout used to wait for EAPOL response to an IEEE 802.1x readiness query.

## dot1x test timeout

To configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness, use the **dot1x test timeout** command in global configuration mode on the switch stack or on a standalone switch.

dot1x test timeout timeout

## **Syntax Description**

*timeout* Time in seconds to wait for an EAPOL response. The range is from 1 to 65535 seconds.

#### **Command Default**

The default setting is 10 seconds.

#### **Command Modes**

Global configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

Use this command to configure the timeout used to wait for EAPOL response.

There is not a no form of this command.

This example shows how to configure the switch to wait 27 seconds for an EAPOL response:

Device# dot1x test timeout 27

You can verify the timeout configuration status by entering the **show run** privileged EXEC command.

Command	Description
dot1x test eapol-capable [interface interface-id]	Checks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports.

## dot1x timeout

To configure the value for retry timeouts, use the **dot1x timeout** command in global configuration or interface configuration mode. To return to the default value for retry timeouts, use the **no** form of this command.

dot1x timeout {auth-period seconds   held-period seconds   quiet-period seconds   ra	atelimit-period
seconds   server-timeout seconds   start-period seconds   supp-timeout seconds	tx-period
seconds}	

## **Syntax Description**

auth-period seconds	Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt).
	The range is from 1 to 65535. The default is 30.
held-period seconds	Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt).
	The range is from 1 to 65535. The default is 60
quiet-period seconds	Configures the time, in seconds, that the authenticator (server) remains quiet (in the HELD state) following a failed authentication exchange before trying to reauthenticate the client.
	The range is from 1 to 65535. The default is 60
ratelimit-period seconds	Throttles the EAP-START packets that are sent from misbehaving client PCs (for example, PCs that send EAP-START packets that result in the wasting of switch processing power).
	<ul> <li>The authenticator ignores EAPOL-Start packets from clients that have successfully authenticated for the rate-limit period duration.</li> </ul>
	• The range is from 1 to 65535. By default, rate limiting is disabled.
server-timeout seconds	Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted.
	• The range is from 1 to 65535. The default is 30.
	If the server does not send a response to an 802.1X packet within the specified period, the packet is sent again.
start-period seconds	Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted.
	The range is from 1 to 65535. The default is 30.
	In Cisco IOS Release 15.2(5)E, this command is only available in the supplicant mode. If the command is applied in any other mode, the command misses from the configuration.

supp-timeout seconds	Sets the authenticator-to-supplicant retransmission time for all EAP messages other than EAP Request ID.	
	The range is from 1 to 65535. The default is 30.	
tx-period seconds	Configures the number of seconds between retransmission of EAP request ID packets (assuming that no response is received) to the client.	
	• The range is from 1 to 65535. The default is 30.	
	• If an 802.1X packet is sent to the supplicant and the supplicant does not send a response after the retry period, the packet will be sent again.	

#### **Command Default**

Periodic reauthentication and periodic rate-limiting are done.

#### **Command Modes**

Interface configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

The **dot1x timeout reauth-period** interface configuration command affects the behavior of the switch only if you have enabled periodic re-authentication by using the **dot1x reauthentication** interface configuration command.

During the quiet period, the switch does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default.

When the **ratelimit-period** is set to 0 (the default), the switch does not ignore EAPOL packets from clients that have been successfully authenticated and forwards them to the RADIUS server.

The following example shows that various 802.1X retransmission and timeout periods have been set:

```
Device(config) # configure terminal
Device(config) # interface g1/0/3
Device(config-if) # dot1x port-control auto
Device(config-if) # dot1x timeout auth-period 2000
Device(config-if) # dot1x timeout held-period 2400
Device(config-if) # dot1x timeout quiet-period 600
Device(config-if) # dot1x timeout start-period 90
Device(config-if) # dot1x timeout supp-timeout 300
Device(config-if) # dot1x timeout tx-period 60
Device(config-if) # dot1x timeout server-timeout 60
```

## epm access-control open

To configure an open directive for ports that do not have an access control list (ACL) configured, use the **epm access-control open** command in global configuration mode. To disable the open directive, use the **no** form of this command.

epm access-control open no epm access-control open

## **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

The default directive applies.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

Use this command to configure an open directive that allows hosts without an authorization policy to access ports configured with a static ACL. If you do not configure this command, the port applies the policies of the configured ACL to the traffic. If no static ACL is configured on a port, both the default and open directives allow access to the port.

You can verify your settings by entering the **show running-config** privileged EXEC command.

This example shows how to configure an open directive.

Device(config)# epm access-control open

Command	Description
show running-config	Displays the contents of the current running configuration file.

## include-icv-indicator

To include the integrity check value (ICV) indicator in MKPDU, use the **include-icv-indicator** command in MKA-policy configuration mode. To disable the ICV indicator, use the **no** form of this command.

include-icv-indicator no include-icv-indicator

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

ICV indicator is included.

**Command Modes** 

MKA-policy configuration (config-mka-policy)

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Examples**

The following example shows how to include the ICV indicator in MKPDU:

Device> enable
Device# configure terminal
Device(config)# mka policy 2

Device(config-mka-policy)# include-icv-indicator

Command	Description
mka policy	Configures an MKA policy.
confidentiality-offset	Sets the confidentiality offset for MACsec operations.
delay-protection	Configures MKA to use delay protection in sending MKPDU.
key-server	Configures MKA key-server options.
macsec-cipher-suite	Configures cipher suite for deriving SAK.

# ip access-list role-based

To create a role-based (security group) access control list (RBACL) and enter role-based ACL configuration mode, use the **ip access-list role-based** command in global configuration mode. To remove the configuration, use the **no** form of this command.

ip access-list role-based access-list-name no ip access-list role-based access-list-name

## **Syntax Description**

access-list-name Name of the security group access control list (SGACL).

## **Command Default**

Role-based ACLs are not configured.

#### **Command Modes**

Global configuration (config)

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

## **Usage Guidelines**

For SGACL logging, you must configure the **permit ip log** command. Also, this command must be configured in Cisco IIdentity Services Engine (ISE) to enable logging for dynamic SGACLs.

The following example shows how to define an SGACL that can be applied to IPv4 traffic and enter role-based access list configuration mode:

Switch(config)# ip access-list role-based rbacl1
Switch(config-rb-acl)# permit ip log

Command	Description
permit ip log	Permits logging that matches the configured entry.
show ip access-list	Displays contents of all current IP access lists.

## ip admission

To enable web authentication, use the **ip admission** command in interface configuration mode. You can also use this command in fallback-profile configuration mode. To disable web authentication, use the **no** form of this command.

ip admission rule no ip admission rule

## **Syntax Description**

rule IP admission rule name.

#### **Command Default**

Web authentication is disabled.

#### **Command Modes**

Interface configuration

Fallback-profile configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

The **ip admission** command applies a web authentication rule to a switch port.

This example shows how to apply a web authentication rule to a switchport:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip admission rule1
```

This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.

```
Device# configure terminal
Device(config)# fallback profile profile1
Device(config-fallback-profile)# ip admission rule1
```

# ip admission name

To enable web authentication, use the **ip admission name** command in global configuration mode. To disable web authentication, use the **no** form of this command.

ip admission name name {consent | proxy http} [absolute timer minutes | inactivity-time minutes | list {acl | acl-name} | service-policy type tag service-policy-name]
no ip admission name name {consent | proxy http} [absolute timer minutes | inactivity-time minutes | list {acl | acl-name} | service-policy type tag service-policy-name]

## **Syntax Description**

name	Name of network admission control rule.
consent	Associates an authentication proxy consent web page with the IP admission rule specified using the <i>admission-name</i> argument.
proxy http	Configures web authentication custom page.
absolute-timer minutes	(Optional) Elapsed time, in minutes, before the external server times out.
inactivity-time minutes	(Optional) Elapsed time, in minutes, before the external file server is deemed unreachable.
list	(Optional) Associates the named rule with an access control list (ACL).
acl	Applies a standard, extended list to a named admission control rule. The value ranges from 1 through 199, or from 1300 through 2699 for expanded range.
acl-name	Applies a named access list to a named admission control rule.
service-policy type tag	(Optional) A control plane service policy is to be configured.
service-policy-name	Control plane tag service policy that is configured using the <b>policy-map type control tag</b> policyname command, keyword, and argument. This policy map is used to apply the actions on the host when a tag is received.

## **Command Default**

Web authentication is disabled.

## **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

The ip admission name command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the **ip access-group in** and **ip admission web-rule** interface configuration commands to enable web authentication on a specific interface.

#### **Examples**

This example shows how to configure only web authentication on a switch port:

```
Device# configure terminal
Device(config) ip admission name http-rule proxy http
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 101 in
Device(config-if)# ip admission rule
Device(config-if)# end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switch port:

```
Device# configure terminal

Device(config)# ip admission name rule2 proxy http

Device(config)# fallback profile profile1

Device(config)# ip access group 101 in

Device(config)# ip admission name rule2

Device(config)# interface gigabitethernet1/0/1

Device(config-if)# dot1x port-control auto

Device(config-if)# dot1x fallback profile1

Device(config-if)# end
```

Command	Description
dot1x fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
fallback profile	Creates a web authentication fallback profile.
ip admission	Enables web authentication on a port.
show authentication sessions interface interface detail	Displays information about the web authentication session status.
show ip admission	Displays information about NAC cached entries or the NAC configuration.

# ip dhcp snooping database

To configure the Dynamic Host Configuration Protocol (DHCP)-snooping database, use the **ip dhcp snooping database** command in global configuration mode. To disable the DHCP-snooping database, use the **no** form of this command.

no ip dhcp snooping database [ timeout | write-delay ]

## **Syntax Description**

flaghtuni	Chariffee the detahase LIDI for
flash:url	Specifies the database URL for
	storing entries using flash.
ftp:url	Specifies the database URL for
-	storing entries using FTP.
http:url	Specifies the database URL for
	storing entries using HTTP.
https:url	Specifies the database URL for
	storing entries using secure HTTP
	(https).
rcp:url	Specifies the database URL for
	storing entries using remote copy
	(rcp).
scp:url	Specifies the database URL for
	storing entries using Secure Copy
	(SCP).
tftp:url	Specifies the database URL for
	storing entries using TFTP.
timeout seconds	Specifies the timeout interval; valid
	values are from 0 to 86400 seconds.
write-delay seconds	Specifies the amount of time before
	writing the DHCP-snooping entries
	to an external server after a change
	is seen in the local DHCP-snooping
	database; valid values are from 15
	to 86400 seconds.

## **Command Default**

The DHCP-snooping database is not configured.

## **Command Modes**

Global configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

You must enable DHCP snooping on the interface before entering this command. Use the **ip dhcp snooping** command to enable DHCP snooping.

This example shows how to specify the database URL using TFTP:

Device(config) # ip dhcp snooping database tftp://10.90.90.90/snooping-rp2

This example shows how to specify the amount of time before writing DHCP snooping entries to an external server:

Device(config)# ip dhcp snooping database write-delay 15

## ip dhcp snooping information option format remote-id

To configure the option-82 remote-ID suboption, use the **ip dhcp snooping information option format remote-id** command in global configuration mode on the switch to configure the option-82 remote-ID suboption. To configure the default remote-ID suboption, use the **no** form of this command.

ip dhcp snooping information option format remote-id {hostname | string string} no ip dhcp snooping information option format remote-id {hostname | string string}

#### **Syntax Description**

hostname	Specify the switch hostname as the remote ID.
string string	Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).

#### **Command Default**

The switch MAC address is the remote ID.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

You must globally enable DHCP snooping by using the **ip dhcp snooping** global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled, the default remote-ID suboption is the switch MAC address. This command allows you to configure either the switch hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.

## Note

If the hostname exceeds 63 characters, it will be truncated to 63 characters in the remote-ID configuration.

This example shows how to configure the option- 82 remote-ID suboption:

Device (config) # ip dhcp snooping information option format remote-id hostname

## ip dhcp snooping verify no-relay-agent-address

To disable the DHCP snooping feature from verifying that the relay agent address (giaddr) in a DHCP client message matches the client hardware address on an untrusted port, use the **ip dhcp snooping verify no-relay-agent-address** command in global configuration mode. To enable verification, use the **no** form of this command.

ip dhcp snooping verify no-relay-agent-address no ip dhcp snooping verify no-relay-agent-address

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

The DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0.

## **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

By default, the DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0; the message is dropped if the giaddr field is not 0. Use the **ip dhcp snooping verify no-relay-agent-address** command to disable the verification. Use the **no ip dhcp snooping verify no-relay-agent-address** to reenable verification.

This example shows how to enable verification of the giaddr in a DHCP client message:

 ${\tt Device}\,({\tt config})\,\#\,\,\textbf{no}\,\,\textbf{ip}\,\,\textbf{dhcp}\,\,\textbf{snooping}\,\,\textbf{verify}\,\,\textbf{no-relay-agent-address}$ 

## ip http access-class

To specify the access list that should be used to restrict access to the HTTP server, use the **ip http access-class** command in global configuration mode. To remove a previously configured access list association, use the **no** form of this command.

Note

The existing **ip http access-class** access-list-number command is currently supported, but is going to be deprecated. Use the **ip http access-class ipv4** { access-list-number | access-list-name } and **ip http access-class ipv6** access-list-name instead.

```
ip http access-class { access-list-number | ipv4 { access-list-number | access-list-name } |
ipv6 access-list-name }
no ip http access-class { access-list-number | ipv4 { access-list-number | access-list-name }
| ipv6 access-list-name }
```

## **Syntax Description**

ipv4	Specifies the IPv4 access list to restrict access to the secure HTTP server.
ipv6	Specifies the IPv6 access list to restrict access to the secure HTTP server.
access-list-number	Standard IP access list number in the range 0 to 99, as configured by the <b>access-list</b> global configuration command.
access-list-name	Name of a standard IPv4 access list, as configured by the <b>ip access-list</b> command.

## **Command Default**

No access list is applied to the HTTP server.

## **Command Modes**

Global configuration (config)

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was modified. The <b>ipv4</b> and <b>ipv6</b> keyword were added.
Cisco IOS XE Release 3.3SE	This command was introduced.

#### **Usage Guidelines**

If this command is configured, the specified access list is assigned to the HTTP server. Before the HTTP server accepts a connection, it checks the access list. If the check fails, the HTTP server does not accept the request for a connection.

## **Examples**

The following example shows how to define an access list as 20 and assign it to the HTTP server:

```
Device(config) # ip access-list standard 20
Device(config-std-nacl) # permit 209.165.202.130 0.0.0.255
Device(config-std-nacl) # permit 209.165.201.1 0.0.255.255
```

```
Device(config-std-nacl)# permit 209.165.200.225 0.255.255.255
Device(config-std-nacl)# exit
Device(config)# ip http access-class 20
```

The following example shows how to define an IPv4 named access list as and assign it to the HTTP server.

```
Device(config) # ip access-list standard Internet_filter
Device(config-std-nacl) # permit 1.2.3.4
Device(config-std-nacl) # exit
Device(config) # ip http access-class ipv4 Internet_filter
```

Command	Description
ip access-list	Assigns an ID to an access list and enters access list configuration mode.
ip http server	Enables the HTTP 1.1 server, including the Cisco web browser user interface.

## ip radius source-interface

To force RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets, use the **ip** radius source-interface command in global configuration mode. To prevent RADIUS from using the IP address of a specified interface for all outgoing RADIUS packets, use the no form of this command.

ip radius source-interface interface-name [vrf vrf-name] no ip radius source-interface

#### **Syntax Description**

interface-name	Name of the interface that RADIUS uses for all of its outgoing packets.
vrf vrf-name	(Optional) Per virtual route forwarding (VRF) configuration.

#### **Command Default**

No default behavior or values.

#### **Command Modes**

Global configuration (config)

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

Use this command to set the IP address of an interface to be used as the source address for all outgoing RADIUS packets. The IP address is used as long as the interface is in the *up* state. The RADIUS server can use one IP address entry for every network access client instead of maintaining a list of IP addresses. Radius uses the IP address of the interface that it is associated to, regardless of whether the interface is in the *up* or *down* state.

The **ip radius source-interface** command is especially useful in cases where the router has many interfaces and you want to ensure that all RADIUS packets from a particular router have the same IP address.

The specified interface should have a valid IP address and should be in the *up* state for a valid configuration. If the specified interface does not have a valid IP address or is in the *down* state, RADIUS selects a local IP that corresponds to the best possible route to the AAA server. To avoid this, add a valid IP address to the interface or bring the interface to the *up* state.

Use the **vrf** *vrf*-name keyword and argument to configure this command per VRF, which allows multiple disjoined routing or forwarding tables, where the routes of one user have no correlation with the routes of another user.

#### **Examples**

The following example shows how to configure RADIUS to use the IP address of interface s2 for all outgoing RADIUS packets:

ip radius source-interface s2

The following example shows how to configure RADIUS to use the IP address of interface Ethernet0 for VRF definition:

ip radius source-interface Ethernet0 vrf vrf1

## ip source binding

To add a static IP source binding entry, use the **ip source binding** command. Use the **no** form of this command to delete a static IP source binding entry

ip source binding mac-address vlan vlan-id ip-address interface interface-id no ip source binding mac-address vlan vlan-id ip-address interface interface-id

## **Syntax Description**

mac-address	Binding MAC address.
vlan vlan-id	Specifies the Layer 2 VLAN identification; valid values are from 1 to 4094.
ip-address	Binding IP address.
interface interface-id	ID of the physical interface.

#### **Command Default**

No IP source bindings are configured.

#### **Command Modes**

Global configuration.

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

You can use this command to add a static IP source binding entry only.

The **no** format deletes the corresponding IP source binding entry. It requires the exact match of all required parameter in order for the deletion to be successful. Note that each static IP binding entry is keyed by a MAC address and a VLAN number. If the command contains the existing MAC address and VLAN number, the existing binding entry is updated with the new parameters instead of creating a separate binding entry.

This example shows how to add a static IP source binding entry:

Device# configure terminal

Deviceconfig) ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1

## ip verify source

To enable IP source guard on an interface, use the **ip verify source** command in interface configuration mode. To disable IP source guard, use the **no** form of this command.

ip verify source [mac-check][tracking]
no ip verify source

## **Syntax Description**

mac-check (Optional) Enables IP source guard with MAC address verification.

tracking (Optional) Enables IP port security to learn static IP address learning on a port.

## **Command Default**

IP source guard is disabled.

#### **Command Modes**

Interface configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

To enable IP source guard with source IP address filtering, use the **ip verify source** interface configuration command

To enable IP source guard with source IP address filtering and MAC address verification, use the **ip verify source mac-check** interface configuration command.

## **Examples**

This example shows how to enable IP source guard with source IP address filtering on an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip verify source
```

This example shows how to enable IP source guard with MAC address verification:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip verify source mac-check
```

You can verify your settings by entering the **show ip verify source** privileged EXEC command.

## ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6** access-list command in global configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list access-list-name | match-local-traffic | log-update threshold threshold-in-msgs | role-based list-name

noipv6 access-list access-list-name | client permit-control-packets| log-update threshold | role-based list-name

## **Syntax Description**

ipv6 access-list-name	Creates a named IPv6 ACL (up to 64 characters in length) and enters IPv6 ACL configuration mode.
	access-list-name - Name of the IPv6 access list. Names cannot contain a space or quotation mark, or begin with a numeric.
match-local-traffic	Enables matching for locally-generated traffic.
log-update threshold threshold-in-msgs	Determines how syslog messages are generated after the initial packet match.  threshold-in-msgs- Number of packets generated.
role-based list-name	Creates a role-based IPv6 ACL.

#### **Command Default**

No IPv6 access list is defined.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
	This command was reintroduced. This command was not supported in and

#### **Usage Guidelines**

IPv6 ACLs are defined by using the **ipv6 access-list**command in global configuration mode and their permit and deny conditions are set by using the **deny** and **permit**commands in IPv6 access list configuration mode. Configuring the **ipv6 access-list**command places the device in IPv6 access list configuration mode--the device prompt changes to Device(config-ipv6-acl)#. From IPv6 access list configuration mode, permit and deny conditions can be set for the defined IPv6 ACL.

Note

IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. (The former two match conditions allow for ICMPv6 neighbor

discovery.) An IPv6 ACL must contain at least one entry for the implicit **deny ipv6 any any** statement to take effect. The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. Use the **ipv6 access-class** line configuration command with the *access-list-name* argument to apply an IPv6 ACL to incoming and outgoing IPv6 virtual terminal connections to and from the device.

An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded, not originated, by the device.

#### **Examples**

The example configures the IPv6 ACL list named list1 and places the device in IPv6 access list configuration mode.

```
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)#
```

The following example configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all packets from the network FEC0:0:0:2::/64 (packets that have the site-local prefix FEC0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting out of Ethernet interface 0. The second entry in the ACL permits all other traffic to exit out of Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```
Device(config)# ipv6 access-list list2 deny FECO:0:0:2::/64 any
Device(config)# ipv6 access-list list2 permit any any
Device(config)# interface ethernet 0
Device(config-if)# ipv6 traffic-filter list2 out
```

## ipv6 snooping policy

Note

All existing IPv6 Snooping commands (prior to ) now have corresponding SISF-based device-tracking commands that allow you to apply your configuration to both IPv4 and IPv6 address families. For more information, seedevice-tracking policy

To configure an IPv6 snooping policy and enter IPv6 snooping configuration mode, use the **ipv6 snooping policy** command in global configuration mode. To delete an IPv6 snooping policy, use the **no** form of this command.

ipv6 snooping policy snooping-policy no ipv6 snooping policy snooping-policy

## **Syntax Description**

snooping-policy

User-defined name of the snooping policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0).

#### **Command Default**

An IPv6 snooping policy is not configured.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

Use the **ipv6 snooping policy** command to create an IPv6 snooping policy. When the **ipv6 snooping policy** command is enabled, the configuration mode changes to IPv6 snooping configuration mode. In this mode, the administrator can configure the following IPv6 first-hop security commands:

- The **device-role** command specifies the role of the device attached to the port.
- The **limit address-count** *maximum* command limits the number of IPv6 addresses allowed to be used on the port.
- The **protocol** command specifies that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP).
- The **security-level** command specifies the level of security enforced.
- The **tracking** command overrides the default tracking policy on a port.
- The **trusted-port** command configures a port to become a trusted port; that is, limited or no verification is performed when messages are received.

This example shows how to configure an IPv6 snooping policy:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)#

## key chain macsec

To configure a MACsec key chain name on a device interface to fetch a Pre Shared Key (PSK), use the **key chain macsec** command in global configuration mode. To disable it, use the **no** form of this command.

**key chain** *name* **macsec** { **description** | **key** | **exit**}

## **Syntax Description**

name	Name of a key chain to be used to get keys.
description	Provides description of the MACsec key chain.
key	Configure a MACsec key.
exit	Exits from the MACsec key-chain configuration mode.
no	Negates the command or sets the default values.

#### **Command Default**

key chain macsec is disabled.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

This example shows how to configure MACsec key chain to fetch a 128-bit Pre Shared Key (PSK):

```
Switch#configure terminal
Switch(config) #key chain kc1 macsec
Switch(config-keychain-macsec) #key 1000
Switch(config-keychain-macsec) #cryptographic-algorithm aes-128-cmac
Switch(config-keychain-macsec-key) # key-string fb63e0269e2768c49bab8ee9a5c2258f
Switch(config-keychain-macsec-key) #end
Switch#
```

This example shows how to configure MACsec key chain to fetch a 256-bit Pre Shared Key (PSK):

```
Switch#configure terminal
Switch(config) #key chain kc1 macsec
Switch(config-keychain-macsec) #key 2000
Switch(config-keychain-macsec) #cryptographic-algorithm aes-256-cmac
Switch(config-keychain-macsec-key) # key-string
c865632acb269022447c417504albf5db1c296449b52627ba01f2ba2574c2878
Switch(config-keychain-macsec-key) #end
Switch#
```

## key-server

To configure MKA key-server options, use the **key-server** command in MKA-policy configuration mode. To disable MKA key-server options, use the **no** form of this command.

key-server priority value no key-server priority

## **Syntax Description**

priority value

Specifies the priority value of the MKA key-server.

## **Command Default**

MKA key-server is disabled.

## **Command Modes**

MKA-policy configuration (config-mka-policy)

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Examples**

The following example shows how to configure the MKA key-server:

Device> enable

Device# configure terminal
Device(config)# mka policy 2

Device(config-mka-policy)# key-server priority 33

Command	Description
mka policy	Configures an MKA policy.
confidentiality-offset	Sets the confidentiality offset for MACsec operations.
delay-protection	Configures MKA to use delay protection in sending MKPDU.
include-icv-indicator	Includes ICV indicator in MKPDU.
macsec-cipher-suite	Configures cipher suite for deriving SAK)

## limit address-count

To limit the number of IPv6 addresses allowed to be used on the port, use the **limit address-count** command in Neighbor Discovery Protocol (NDP) inspection policy configuration mode or IPv6 snooping configuration mode. To return to the default, use the **no** form of this command.

limit address-count maximum no limit address-count

#### **Syntax Description**

maximum The number of addresses allowed on the port. The range is from 1 to 10000.

#### **Command Default**

The default is no limit.

#### **Command Modes**

ND inspection policy configuration

IPv6 snooping configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

The **limit address-count** command limits the number of IPv6 addresses allowed to be used on the port on which the policy is applied. Limiting the number of IPv6 addresses on a port helps limit the binding table size. The range is from 1 to 10000.

This example shows how to define an NDP policy name as policy1, place the switch in NDP inspection policy configuration mode, and limit the number of IPv6 addresses allowed on the port to 25:

```
Device(config) # ipv6 nd inspection policy policy1
Device(config-nd-inspection) # limit address-count 25
```

This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and limit the number of IPv6 addresses allowed on the port to 25:

Device(config) # ipv6 snooping policy policy1
Device(config-ipv6-snooping) # limit address-count 25

# mab request format attribute 32

To enable VLAN ID-based MAC authentication on a switch, use the **mab request format attribute 32 vlan access-vlan** command in global configuration mode. To return to the default setting, use the **no** form of this command.

mab request format attribute 32 vlan access-vlan no mab request format attribute 32 vlan access-vlan

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

VLAN-ID based MAC authentication is disabled.

**Command Modes** 

Global configuration

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

Use this command to allow a RADIUS server to authenticate a new user based on the host MAC address and VLAN.

Use this feature on networks with the Microsoft IAS RADIUS server. The Cisco ACS ignores this command.

This example shows how to enable VLAN-ID based MAC authentication on a switch:

Device(config) # mab request format attribute 32 vlan access-vlan

Command	Description
authentication event	Sets the action for specific authentication events.
authentication fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
authentication host-mode	Sets the authorization manager mode on a port.
authentication open	Enables or disables open access on a port.
authentication order	Sets the order of authentication methods used on a port.
authentication periodic	Enables or disables reauthentication on a port.
authentication port-control	Enables manual control of the port authorization state.
authentication priority	Adds an authentication method to the port-priority list.

Command	Description
authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.
authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port with the maximum number of devices already connected to that port.
mab	Enables MAC-based authentication on a port.
mab eap	Configures a port to use the Extensible Authentication Protocol (EAP).
show authentication	Displays information about authentication manager events on the switch.

# macsec-cipher-suite

To configure cipher suite for deriving Security Association Key (SAK), use the **macsec-cipher-suite** command in MKA-policy configuration mode. To disable cipher suite for SAK, use the **no** form of this command.

macsec-cipher-suite gcm-aes-128 | gcm-aes-256 no macsec-cipher-suite gcm-aes-128 | gcm-aes-256

#### **Syntax Description**

gcm-aes-128 Configures cipher suite for deriving SAK with 128-bit encryption.

**gcm-aes-256** Configures cipher suite for deriving SAK with 256-bit encryption.

#### **Command Default**

GCM-AES-128 encryption is enabled.

#### **Command Modes**

MKA-policy configuration (config-mka-policy)

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

If the device supports both GCM-AES-128 and GCM-AES-256 ciphers, it is highly recommended to define and use a user-defined MKA policy to include both or only 256 bits cipher, based on your requirements..

#### **Examples**

The following example shows how to configure MACsec cipher suite for deriving SAK with 256-bit encryption:

Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# macsec-cipher-suite gcm-aes-256

Command	Description	
mka policy	Configures an MKA policy.	
confidentiality-offset	Sets the confidentiality offset for MACsec operations.	
delay-protection	Configures MKA to use delay protection in sending MKPDU.	
include-icv-indicator	Includes ICV indicator in MKPDU.	
key-server	Configures MKA key-server options.	

This command was introduced.

# macsec network-link

To enable MKA MACsec configuration on the uplink interfaces, use the **macsec network-link** command on the interface. To disable it, use the **no** form of this command.

#### macsec network-link

Cisco IOS XE Denali 16.3.1

Syntax Description	macsec network-link	Enables MKA MACsec configuration on device interfaces using EAP-TLS
		authentication protocol.

## Command Default macsec network-link is disabled.

## **Command Modes** Interface configuration

## Command History Release Modification

This example shows how to configure MACsec MKA on an interface using the EAP-TLS authentication protocol:

Switch#configure terminal
Switch(config)# int G1/0/20
Switch(config-if)# macsec network-link
Switch(config-if)# end
Switch#

# match (access-map configuration)

To set the VLAN map to match packets against one or more access lists, use the **match** command in access-map configuration mode on the switch stack or on a standalone switch. To remove the match parameters, use the **no** form of this command.

match ip address namenumber [namenumber] [namenumber]...|ipv6 address namenumber [namenumber] [namenumber]...|mac address name [name] [name]...

no match ip address namenumber [namenumber] [namenumber]...|ipv6 address namenumber [namenumber] [namenumber] [namenumber]...|mac address name [name] [name]...

#### **Syntax Description**

ip address	address Sets the access map to match packets against an IP address access list.	
ipv6 address	Sets the access map to match packets against an IPv6 address access list.	
mac address	Sets the access map to match packets against a MAC address access list.	
пате	Name of the access list to match packets against.	
number	Number of the access list to match packets against. This option is not valid for MAC access lists.	

#### **Command Default**

The default action is to have no match parameters applied to a VLAN map.

#### **Command Modes**

Access-map configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

You enter access-map configuration mode by using the **vlan access-map** global configuration command.

You must enter one access list name or number; others are optional. You can match packets against one or more access lists. Matching any of the lists counts as a match of the entry.

In access-map configuration mode, use the **match** command to define the match conditions for a VLAN map applied to a VLAN. Use the **action** command to set the action that occurs when the packet matches the conditions.

Packets are matched only against access lists of the same protocol type; IP packets are matched against IP access lists, IPv6 packets are matched against IPv6 access lists, and all other packets are matched against MAC access lists.

IP, IPv6, and MAC addresses can be specified for the same map entry.

This example shows how to define and apply a VLAN access map vmap4 to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list al2:

```
Device(config) # vlan access-map vmap4
Device(config-access-map) # match ip address al2
Device(config-access-map) # action drop
```

```
Device(config-access-map) # exit
Device(config) # vlan filter vmap4 vlan-list 5-6
```

You can verify your settings by entering the **show vlan access-map** privileged EXEC command.

# mka pre-shared-key

To configure MKA MACsec on a device interface using a Pre Shared Key (PSK), use the **mka pre-shared-key key-chain** *key-chain name* command in global configuration mode. To disable it, use the **no** form of this command.

mka pre-shared-key key-chain key-chain-name

## **Syntax Description**

**mka pre-shared-key key-chain** Enables MACsec MKA configuration on device interfaces using a PSK.

## **Command Default**

mka pre-shared-key is disabled.

#### **Command Modes**

Interface configuration

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

This example shows how to configure MKA MACsec on an interface using a PSK:

Switch#
Switch(config) # int G1/0/20
Switch(config-if) # mka pre-shared-key key-chain kc1
Switch(config-if) # end
Switch#

# no authentication logging verbose

To filter detailed information from authentication system messages, use the **no authentication logging verbose** command in global configuration mode on the switch stack or on a standalone switch.

#### no authentication logging verbose

### **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

All details are not displayed in the system messages.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

This command filters details, such as anticipated success, from authentication system messages. Failure messages are not filtered.

To filter verbose authentication system messages:

Device(config) # no authentication logging verbose

You can verify your settings by entering the **show running-config** privileged EXEC command.

Command	Description
no authentication logging verbose	Filters details from authentication system messages.
no dot1x logging verbose	Filters details from 802.1x system messages.
no mab logging verbose	Filters details from MAC authentication bypass (MAB) system messages.

# no dot1x logging verbose

To filter detailed information from 802.1x system messages, use the **no dot1x logging verbose** command in global configuration mode on the switch stack or on a standalone switch.

#### no dot1x logging verbose

#### **Syntax Description**

This command has no arguments or keywords.

## **Command Default**

All details are not displayed in the system messages.

#### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

This command filters details, such as anticipated success, from 802.1x system messages. Failure messages are not filtered.

To filter verbose 802.1x system messages:

Device(config) # no dot1x logging verbose

You can verify your settings by entering the **show running-config** privileged EXEC command.

Command	Description
no authentication logging verbose	Filters details from authentication system messages.
no dot1x logging verbose	Filters details from 802.1x system messages.
no mab logging verbose	Filters details from MAC authentication bypass (MAB) system messages.

# no mab logging verbose

To filter detailed information from MAC authentication bypass (MAB) system messages, use the **no mab logging verbose** command in global configuration mode on the switch stack or on a standalone switch.

no mab logging verbose

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

All details are not displayed in the system messages.

**Command Modes** 

Global configuration

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

This command filters details, such as anticipated success, from MAC authentication bypass (MAB) system messages. Failure messages are not filtered.

To filter verbose MAB system messages:

Device(config) # no mab logging verbose

You can verify your settings by entering the **show running-config** privileged EXEC command.

Command	Description
no authentication logging verbose	Filters details from authentication system messages.
no dot1x logging verbose	Filters details from 802.1x system messages.
no mab logging verbose	Filters details from MAC authentication bypass (MAB) system messages.

# permit (MAC access-list configuration)

To allow non-IP traffic to be forwarded if the conditions are matched, use the **permit** MAC access-list configuration command on the switch stack or on a standalone switch. To remove a permit condition from the extended MAC access list, use the **no** form of this command.

### **Syntax Description**

any	Denies any source or destination MAC address.
host src-MAC-addr   src-MAC-addr mask	Specifies a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
host dst-MAC-addr   dst-MAC-addr mask	Specifies a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
type mask	(Optional) Specifies the EtherType number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
	• <i>type</i> is 0 to 65535, specified in hexadecimal.
	• <i>mask</i> is a mask of don't care bits applied to the EtherType before testing for a match.
aarp	(Optional) Specifies EtherType AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
amber	(Optional) Specifies EtherType DEC-Amber.
appletalk	(Optional) Specifies EtherType AppleTalk/EtherTalk.
dec-spanning	(Optional) Specifies EtherType Digital Equipment Corporation (DEC) spanning tree.
decnet-iv	(Optional) Specifies EtherType DECnet Phase IV protocol.
diagnostic	(Optional) Specifies EtherType DEC-Diagnostic.

dsm	(Optional) Specifies EtherType DEC-DSM.
etype-6000	(Optional) Specifies EtherType 0x6000.
etype-8042	(Optional) Specifies EtherType 0x8042.
lat	(Optional) Specifies EtherType DEC-LAT.
lavc-sca	(Optional) Specifies EtherType DEC-LAVC-SCA.
lsap lsap-number mask	(Optional) Specifies the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.
	The <i>mask</i> is a mask of don't care bits applied to the LSAP number before testing for a match.
mop-console	(Optional) Specifies EtherType DEC-MOP Remote Console.
mop-dump	(Optional) Specifies EtherType DEC-MOP Dump.
msdos	(Optional) Specifies EtherType DEC-MSDOS.
mumps	(Optional) Specifies EtherType DEC-MUMPS.
netbios	(Optional) Specifies EtherType DEC- Network Basic Input/Output System (NetBIOS).
vines-echo	(Optional) Specifies EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.
vines-ip	(Optional) Specifies EtherType VINES IP.
xns-idp	(Optional) Specifies EtherType Xerox Network Systems (XNS) protocol suite.
cos cos	(Optional) Specifies an arbitrary class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message appears if the <b>cos</b> option is configured.

## **Command Default**

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

## **Command Modes**

Mac-access list configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## Usage Guidelines

Though visible in the command-line help strings, appletalk is not supported as a matching condition.

You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in the following table.

**Table 3: IPX Filtering Criteria** 

IPX Encapsulation Type		Filter Criterion
Cisco IOS Name	Novell Name	
arpa	Ethernet II	EtherType 0x8137
snap	Ethernet-snap	EtherType 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

This example shows how to define the MAC-named extended access list to allow NetBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

Device(config-ext-macl) # permit any host 00c0.00a0.03fa netbios

This example shows how to remove the permit condition from the MAC-named extended access list:

Device(config-ext-macl) # no permit any 00c0.00a0.03fa 0000.0000.0000 netbios

This example permits all packets with EtherType 0x4321:

Device(config-ext-macl) # permit any any 0x4321 0

You can verify your settings by entering the **show access-lists** privileged EXEC command.

Command	Description
deny	Denies from the MAC access-list configuration.  Denies non-IP traffic to be forwarded if conditions are matched.
mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.

Command	Description
show access-lists	Displays access control lists configured on a switch.

# propagate sgt (cts manual)

To enable Security Group Tag (SGT) propagation at Layer 2 on Cisco TrustSec Security (CTS) interfaces, use the **propagate sgt** command in interface configuration mode. To disable SGT propagation, use the **no** form of this command.

#### propagate sgt

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

SGT processing propagation is enabled.

#### **Command Modes**

CTS manual interface configuration mode (config-if-cts-manual)

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

#### **Usage Guidelines**

SGT processing propagation allows a CTS-capable interface to accept and transmit a CTS Meta Data (CMD) based L2 SGT tag. The **no propagate sgt** command can be used to disable SGT propagation on an interface in situations where a peer device is not capable of receiving an SGT, and as a result, the SGT tag cannot be put in the L2 header.

#### **Examples**

The following example shows how to disable SGT propagation on a manually-configured TrustSec-capable interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 0
Switch(config-if)# cts manual
Switch(config-if-cts-manual)# no propagate sgt
```

The following example shows that SGT propagation is disabled on Gigabit Ethernet interface 0:

#### Switch#show cts interface brief

```
Global Dot1x feature is Disabled
Interface GigabitEthernet0:
    CTS is enabled, mode:
    IFC state:
                            OPEN
    Authentication Status:
                            NOT APPLICABLE
       Peer identity:
                            "unknown"
       Peer's advertised capabilities: ""
   Authorization Status: NOT APPLICABLE
    SAP Status:
                            NOT APPLICABLE
    Propagate SGT:
                            Disabled
    Cache Info:
        Cache applied to link : NONE
```

Command	Description
cts manual	Enables an interface for CTS.

Command	Description
show cts interface	Displays Cisco TrustSec states and statistics per interface.

# protocol (IPv6 snooping)

To specify that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP), or to associate the protocol with an IPv6 prefix list, use the **protocol** command. To disable address gleaning with DHCP or NDP, use the **no** form of the command.

protocol {dhcp | ndp}
no protocol {dhcp | ndp}

#### **Syntax Description**

**dhcp** Specifies that addresses should be gleaned in Dynamic Host Configuration Protocol (DHCP) packets.

**ndp** Specifies that addresses should be gleaned in Neighbor Discovery Protocol (NDP) packets.

#### **Command Default**

Snooping and recovery are attempted using both DHCP and NDP.

#### **Command Modes**

IPv6 snooping configuration mode

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

If an address does not match the prefix list associated with DHCP or NDP, then control packets will be dropped and recovery of the binding table entry will not be attempted with that protocol.

- Using the **no protocol** {**dhcp** | **ndp**} command indicates that a protocol will not be used for snooping or gleaning.
- If the **no protocol dhcp** command is used, DHCP can still be used for binding table recovery.
- Data glean can recover with DHCP and NDP, though destination guard will only recovery through DHCP.

This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure the port to use DHCP to glean addresses:

Device (config) # ipv6 snooping policy policy1
Device (config-ipv6-snooping) # protocol dhcp

## radius server

Note

Starting from Cisco IOS 15.2(5)E release, the **radius server** command replaces the **radius-server host** command, being used in releases prior to Cisco IOS Release 15.2(5)E. The old command has been deprecated.

Use the **radius server** configuration sub-mode command on the switch stack or on a standalone switch to configure the RADIUS server parameters, including the RADIUS accounting and authentication. Use the **no** form of this command to return to the default settings.

radius server name
address {ipv4 | ipv6} ip{address | hostname} auth-port udp-port acct-port udp-port
key string
automate tester name | retransmit value | timeout seconds
no radius server name

## **Syntax Description**

address {ipv4   ipv6} ip{address   hostname}	Specify the IP address of the RADIUS server.	
auth-port udp-port	(Optional) Specify the UDP port for the RADIUS authentication server. The range is from 0 to 65536.	
acct-port udp-port	(Optional) Specify the UDP port for the RADIUS accounting server. The range is from 0 to 65536.	
key string	(Optional) Specify the authentication and encryption key for all RADIUS communication between the switch and the RADIUS daemon.	
	Note The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.	
automate tester name	(Optional) Enable automatic server testing of the RADIUS server status, and specify the username to be used.	
retransmit value	(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting.	
timeout seconds	(Optional) Specifies the time interval that the Switch waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting.	
no radius server name	Returns to the default settings	

#### **Command Default**

- The UDP port for the RADIUS accounting server is 1646.
- The UDP port for the RADIUS authentication server is 1645.
- Automatic server testing is disabled.
- The timeout is 60 minutes (1 hour).
- When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.
- The authentication and encryption key (string) is not configured.

#### **Command Modes**

Radius server sub-mode configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced to replace the <b>radius-server host</b> command.

#### **Usage Guidelines**

- We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to non-default values.
- You can configure the authentication and encryption key by using the **key** *string* sub-mode configuration command. Always configure the key as the last item in this command.
- Use the **automate-tester** *name* keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

This example shows how to configure 1645 as the UDP port for the authentication server and 1646 as the UDP port for the accounting server, and configure a key string:

```
Device(config) # radius server ISE
Device(config-radius-server) # address ipv4 10.1.1 auth-port 1645 acct-port 1646
Device(config-radius-server) # key cisco123
```

# sap mode-list (cts manual)

To select the Security Association Protocol (SAP) authentication and encryption modes (prioritized from highest to lowest) used to negotiate link encryption between two interfaces, use the **sap mode-list** command in Cisco TrustSec dot1x interface configuration mode. To remove a mode-list and revert to the default, use the **no** form of this command.

Use the **sap mode-list** command to manually specify the PMK and the Security Association Protocol (SAP) authentication and encryption modes to negotiate MACsec link encryption between two interfaces. Use the **no** form of the command to disable the configuration.

 $sap\ pmk\ mode-list\ gcm-encrypt\ |\ gmac\ |\ no-encap\ |\ null\ [gcm-encrypt\ |\ gmac\ |\ no-encap\ |\ no-encap\ |\ null\ [gcm-encrypt\ |\ gmac\ |\ no-encap\ |\ null\ [gcm-encrypt\ |\ null\ [gcm-encrypt\ |\ gmac\ |\ no-encap\ |\ null\ [gcm-encrypt\ |\ null\$ 

## **Syntax Description**

pmk hex_value	Specifies the Hex-data PMK (without leading 0x; enter even number of hex characters, or else the last character is prefixed with 0.).
mode-list	Specifies the list of advertised modes (prioritized from highest to lowest).
gcm-encrypt	Specifies GMAC authentication, GCM encryption.
gmac	Specifies GMAC authentication only, no encryption.
no-encap	Specifies no encapsulation.
null	Specifies encapsulation present, no authentication, no encryption.

#### **Command Default**

The default encryption is **sap pmk mode-list gcm-encrypt null**. When the peer interface does not support 802.1AE MACsec or 802.REV layer-2 link encryption, the default encryption is **null**.

#### **Command Modes**

CTS manual interface configuration (config-if-cts-manual)

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

### **Usage Guidelines**

Use the **sap pmk mode-list** command to specify the authentication and encryption method.

The Security Association Protocol (SAP) is an encryption key derivation and exchange protocol based on a draft version of the 802.11i IEEE protocol. SAP is used to establish and maintain the 802.1AE link-to-link encryption (MACsec) between interfaces that support MACsec.

SAP and PMK can be manually configured between two interfaces with the **sap pmk mode-list** command. When using 802.1X authentication, both sides (supplicant and authenticator) receive the PMK and the MAC address of the peer's port from the Cisco Secure Access Control Server.

If a device is running Cisco TrustSec-aware software but the hardware is not Cisco TrustSec-capable, disallow encapsulation with the **sap mode-list no-encap** command.

## **Examples**

The following example shows how to configure SAP on a Gigabit Ethernet interface:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# cts manual
Switch(config-if-cts-manual)# sap pmk FFFEE mode-list gcm-encrypt
```

Command	Description
cts manual	Enables an interface for Cisco TrustSec.
propagate sgt (cts manual)	Enables SGT propagation at Layer 2 on Cisco TrustSec Security interfaces.
show cts interface	Displays Cisco TrustSec interface configuration statistics.

# security level (IPv6 snooping)

To specify the level of security enforced, use the **security-level** command in IPv6 snooping policy configuration mode.

security level   glean   guard   inspec	security level	{ glean	guard	inspect }
---	----------------	---------	-------	-----------

## **Syntax Description**

glean	Extracts addresses from the messages and installs them into the binding table without performing any verification.
guard	Performs both glean and inspect. Additionally, RA and DHCP server messages are rejected unless they are received on a trusted port or another policy authorizes them.
inspect	Validates messages for consistency and conformance; in particular, address ownership is enforced. Invalid messages are dropped.

#### **Command Default**

The default security level is guard.

#### **Command Modes**

IPv6 snooping configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This example shows how to define an IPv6 snooping policy name as policy1, place the device in IPv6 snooping configuration mode, and configure the security level as inspect:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# security-level inspect

# server-private (RADIUS)

To configure the IP address of the private RADIUS server for the group server, use the **server-private** command in RADIUS server-group configuration mode. To remove the associated private server from the authentication, authorization, and accounting (AAA) group server, use the **no** form of this command.

server-private ip-address [auth-port port-number | acct-port port-number] [non-standard] [timeout seconds] [retransmit retries] [key string]

**no server-private** ip-address [auth-port port-number | acct-port port-number] [non-standard] [timeout seconds] [retransmit retries] [key string]

#### **Syntax Description**

ip-address	IP address of the private RADIUS server host.
auth-port port-number	(Optional) User Datagram Protocol (UDP) destination port for authentication requests. The default value is 1645.
acct-port port-number	Optional) UDP destination port for accounting requests. The default value is 1646.
non-standard	(Optional) RADIUS server is using vendor-proprietary RADIUS attributes.
timeout seconds	(Optional) Time interval (in seconds) that the device waits for the RADIUS server to reply before retransmitting. This setting overrides the global value of the <b>radius-server timeout</b> command. If no timeout value is specified, the global value is used.
retransmit retries	(Optional) Number of times a RADIUS request is resent to a server, if that server is not responding or responding slowly. This setting overrides the global setting of the <b>radius-server retransmit</b> command.
key string	(Optional) Authentication and encryption key used between the device and the RADIUS daemon running on the RADIUS server. This key overrides the global setting of the <b>radius-server key</b> command. If no key string is specified, the global value is used.
	The <i>string</i> can be <b>0</b> (specifies that an unencrypted key follows), <b>6</b> (specifies that an advanced encryption scheme [AES] encrypted key follows), <b>7</b> (specifies that a hidden key follows), or a line specifying the unencrypted (clear-text) server key.

#### **Command Default**

If server-private parameters are not specified, global configurations will be used; if global configurations are not specified, default values will be used.

## **Command Modes**

RADIUS server-group configuration (config-sg-radius)

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

Use the **server-private** command to associate a particular private server with a defined server group. To prevent possible overlapping of private addresses between virtual route forwarding (VRF) instances, private

servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (default "radius" server group) can still be referred to by IP addresses and port numbers. Thus, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

#### Note

- If the **radius-server directed-request** command is configured, then a private RADIUS server cannot be used as the group server by configuring the **server-private** (RADIUS) command.
- Creating or updating AAA server statistics record for private RADIUS servers are not supported. If
  private RADIUS servers are used, then error messages and tracebacks will be encountered, but these
  error messages or tracebacks do not have any impact on the AAA RADIUS functionality. To avoid these
  error messages and tracebacks, configure public RADIUS server instead of private RADIUS server.

Use the **password encryption aes** command to configure type 6 AES encrypted keys.

### **Examples**

The following example shows how to define the sg\_water RADIUS group server and associate private servers with it:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa group server radius sg_water
Device(config-sg-radius)# server-private 10.1.1.1 timeout 5 retransmit 3 key xyz
Device(config-sg-radius)# server-private 10.2.2.2 timeout 5 retransmit 3 key xyz
Device(config-sg-radius)# end
```

Command	Description
aaa group server	Groups different server hosts into distinct lists and distinct methods.
aaa new-model	Enables the AAA access control model.
password encryption aes	Enables a type 6 encrypted preshared key.
radius-server host	Specifies a RADIUS server host.
radius-server directed-request	Allows users to log in to a Cisco NAS and select a RADIUS server for authentication.

## show aaa clients

To show AAA client statistics, use the **show aaa clients** command.

show aaa clients [detailed]

**Syntax Description** 

detailed (Optional) Shows detailed AAA client statistics.

**Command Modes** 

User EXEC

**Command History** 

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the **show aaa clients** command:

Device# show aaa clients

Dropped request packets: 0

## show aaa command handler

To show AAA command handler statistics, use the **show aaa command handler** command.

#### show aaa command handler

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Modes**

User EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the **show aaa command handler** command:

#### Device# show aaa command handler

```
AAA Command Handler Statistics:
account-logon: 0, account-logoff: 0
account-query: 0, pod: 0
service-logon: 0, service-logoff: 0
user-profile-push: 0, session-state-log: 0
reauthenticate: 0, bounce-host-port: 0
disable-host-port: 0, update-rbacl: 0
update-sgt: 0, update-cts-policies: 0
invalid commands: 0
async message not sent: 0
```

# show aaa local

To show AAA local method options, use the **show aaa local** command.

show aaa local {netuser {name | all } | statistics | user lockout}

## **Syntax Description**

netuser	Specifies the AAA local network or guest user database.
name	Network user name.
all	Specifies the network and guest user information.
statistics	Displays statistics for local authentication.
user lockout	Specifies the AAA local locked-out user.

## **Command Modes**

User EXEC

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the **show aaa local statistics** command:

Device# show aaa local statistics

Local EAP statistics

EAP Method	Success	Fail	
Unknown	0	0	
EAP-MD5	0	0	
EAP-GTC	0	0	
LEAP	0	0	
PEAP	0	0	
EAP-TLS	0	0	
EAP-MSCHAPV2	0	0	
EAP-FAST	0	0	
Requests received from AAA: Responses returned from EAP: Requests dropped (no EAP AVP): Requests dropped (other reasons): Authentication timeouts from EAP:			0 0 0 0
Credential request Requests sent to Requests failed ( Authorization res	backend: (unable to send	·):	0
Success: Fail:			0

## show aaa servers

To shows all AAA servers as seen by the AAA server MIB, use the **show aaa servers** command.

show aaa servers [ private | public | [detailed] ]

## Syntax Description

detailed	(Optional) Displays private AAA servers as seen by the AAA Server MIB.
public	(Optional) Displays public AAA servers as seen by the AAA Server MIB.
detailed	(Optional) Displays detailed AAA server statistics.

#### **Command Modes**

User EXEC

#### **Command History**

Release	Modification		
Cisco IOS XE Everest 16.6.1	This command was introduced.		

This is an example of output from the **show aaa servers** command:

```
Device# show aaa servers
```

```
RADIUS: id 1, priority 1, host 172.20.128.2, auth-port 1645, acct-port 1646
State: current UP, duration 9s, previous duration 0s

Estimated Throttled Accounting Transactions: 0
Maximum Throttled Transactions: access \mathbf{0}, accounting \mathbf{0}
```

## show aaa sessions

To show AAA sessions as seen by the AAA Session MIB, use the **show aaa sessions** command.

#### show aaa sessions

## **Syntax Description**

This command has no arguments or keywords.

#### **Command Modes**

User EXEC

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the show aaa sessions command:

```
Device# show aaa sessions
```

```
Total sessions since last reload: 7
Session Id: 4007
Unique Id: 4025
User Name: *not available*
IP Address: 0.0.0.0
Idle Time: 0
CT Call Handle: 0
```

## show authentication brief

To display brief information about authentication sessions for a given interface, use the **show authentication brief** command in either user EXEC or privileged EXEC mode.

show authentication brief[switch{switch-number|active|standby}{R0}]

## **Syntax Description**

switch-number	Valid values for the <i>switch-number</i> are from 1 to 9.
R0	Displays information about the Route Processor (RP) slot 0.
active	Specifies the active instance.
standby	Specifies the standby instance.

#### **Command Modes**

Privileged EXEC (#)

User EXEC (>)

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

The following is a sample output from the **show authentication brief** command:

Device# show authentication brief

Interface	MAC Address	AuthC	AuthZ	Fg	Uptime
Gi2/0/14	0002.0002.0001	m:NA d:OK	AZ: SA-	X	281s

Gi2/0/14	0002.0002.0016	m:NA d:OK	AZ: SA-	X	289s

The following is a sample output from the **show authentication brief** command for standby instances:

Device# show authentication brief switch standby R0

No sessions currently exist

The table below describes the significant fields shown in the displays.

Table 4: show authentication brief Field Descriptions

Field	Description
Interface	The type and number of the authentication interface.
MAC Address	The MAC address of the client.
AuthC	Indicates authentication status.
AuthZ	Indicates authorization status.

Field	Description	
Fg	Flag indicates the current status. The valid values are:	
	A—Applying policy (multi-line status for details)	
	D—Awaiting removal	
	• F—Final removal in progress	
	• I—Awaiting IIF ID allocation	
	• P—Pushed session	
	R—Removing user profile (multi-line status for details)	
	U—Applying user profile (multi-line status for details)	
	• X—Unknown blocker	
Uptime	Indicates the duration since which the session came up	

## show authentication sessions

To display information about current Auth Manager sessions, use the **show authentication sessions** command.

show authentication sessions [database] [handle handle-id [details]] [interface type number [details] [mac mac-address [interface type number] [method method-name [interface type number [details]] [session-id session-id [details]]

## **Syntax Description**

database	(Optional) Shows only data stored in session database.
handle handle-id	(Optional) Specifies the particular handle for which Auth Manager information is to be displayed.
details	(Optional) Shows detailed information.
interface type number	(Optional) Specifies a particular interface type and number for which Auth Manager information is to be displayed.
mac mac-address	(Optional) Specifies the particular MAC address for which you want to display information.
method method-name	(Optional) Specifies the particular authentication method for which Auth Manager information is to be displayed. If you specify a method ( <b>dot1x</b> , <b>mab</b> , or <b>webauth</b> ), you may also specify an interface.
session-id session-id	(Optional) Specifies the particular session for which Auth Manager information is to be displayed.

#### **Command Modes**

User EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

Use the **show authentication sessions** command to display information about all current Auth Manager sessions. To display information about specific Auth Manager sessions, use one or more of the keywords.

This table shows the possible operating states for the reported authentication sessions.

## **Table 5: Authentication Method States**

State	Description
Not run	The method has not run for this session.
Running	The method is running for this session.
Failed over	The method has failed and the next method is expected to provide a result.

State	Description
Success	The method has provided a successful authentication result for the session.
Authc Failed	The method has provided a failed authentication result for the session.

This table shows the possible authentication methods.

#### **Table 6: Authentication Method States**

State	Description
dot1x	802.1X
mab	MAC authentication bypass
webauth	web authentication

The following example shows how to display all authentication sessions on the switch:

Device# show	authentication	sessions			
Interface	MAC Address	Method	Domain	Status	Session ID
Gi1/0/48	0015.63b0.f676	dot1x	DATA	Authz Success	0A3462B1000000102983C05C
Gi1/0/5	000f.23c4.a401	mab	DATA	Authz Success	0A3462B10000000D24F80B58
Gi1/0/5	0014.bf5d.d26d	dot1x	DATA	Authz Success	0A3462B10000000E29811B94

The following example shows how to display all authentication sessions on an interface:

#### Device# show authentication sessions interface gigabitethernet2/0/47

```
Interface: GigabitEthernet2/0/47
          MAC Address: Unknown
           IP Address: Unknown
               Status: Authz Success
               Domain: DATA
     Oper host mode: multi-host Oper control dir: both
        Authorized By: Guest Vlan
         Vlan Policy: 20
      Session timeout: N/A
        Idle timeout: N/A
    Common Session ID:
                        0A3462C8000000000002763C
      Acct Session ID: 0x00000002

## show cts interface

To display Cisco TrustSec (CTS) configuration statistics for an interface, use the **show cts interface** command in EXEC or privileged EXEC mode.

show cts interface [type slot/port | brief | summary]

### **Syntax Description**

type slot/port	(Optional) Specifies an interface type and slot or port number. A verbose output for this interface is returned.
brief	(Optional) Displays abbreviated status for all CTS interfaces.
summary	(Optional) Displays a tabular summary of all CTS interfaces with 4 or 5 key status fields for each interface.

### **Command Default**

None

### **Command Modes**

EXEC (>)

Privileged EXEC (#)

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was modified with additional options.
Cisco IOS XE Denali 16.2.1	This command was introduced.

### **Usage Guidelines**

Use the **show cts interface** command without keywords to display verbose status for all CTS interfaces.

### **Examples**

The following example displays output without using a keyword (verbose status for all CTS interfaces):

#### Switch# show cts interface

```
Global Dot1x feature is Disabled
 Interface GigabitEthernet0/1/0:
    CTS is enabled, mode: MANUAL
     IFC state:
                             OPEN
     Interface Active for 00:00:18.232
     Authentication Status: NOT APPLICABLE
         Peer identity:
                             "unknown"
         Peer's advertised capabilities: ""
     Authorization Status:
                             NOT APPLICABLE
                             NOT APPLICABLE
         Configured pairwise ciphers:
             gcm-encrypt
            null
         Replay protection:
                                enabled
         Replay protection mode: STRICT
         Selected cipher:
```

```
Propagate SGT:
                       Enabled
Cache Info:
   Cache applied to link : NONE
Statistics:
   authc success:
   authc reject:

        Peer identity:
        Peer's advertised capabilities: ""
    Authorization Status: NOT APPLICABLE
                           NOT APPLICABLE
    SAP Status:
    Propagate SGT:
                           Enabled
    Cache Info:
        Cache applied to link : NONE
```

## **Related Commands**

Command	Description	
cts manual Enables an interface for CTS.		
propagate sgt (cts manual)	Enables Security Group Tag (SGT) propagation at Layer 2 on Cisco TrustSec Security (CTS) interfaces.	
sap mode-list (cts manual)	Manually specifies the PMK and the SAP authentication and encryption modes to negotiate MACsec link encryption between two interfaces.	

## show cts role-based permissions

To display the role-based (security group) access control permission list, use the **show cts role-based permissions** command in privileged EXEC mode.

show cts role-based permissions [default [details | ipv4 [details]] | from [sgt [ipv4 | to [sgt | unknown] | details | ipv4 [details]]] | unknown] | ipv4 | to [sgt | unknown] | [ipv4]]

### **Syntax Description**

default	(Optional) Displays information about the default permission list.	
details	(Optional) Displays attached access control list (ACL) details.	
ipv4	(Optional) Displays information about the IPv4 protocol.	
from	(Optional) Displays information about the source group.	
sgt	(Optional) Security Group Tag. Valid values are from 2 to 65519.	
to	(Optional) Displays information about the destination group.	
unknown	(Optional) Displays information about unknown source and destination groups.	

#### **Command Modes**

Privileged EXE (#)

#### **Command History**

Release	Modification
Cisco IOS XE Denali 16.3.1	This command was introduced.

### **Usage Guidelines**

This command displays the content of the SGACL permission matrix. You can specify the source security group tag (SGT) by using the **from** keyword and the destination SGT by using the **to** keyword. When both these keywords are specified RBACLs of a single cell are displayed. An entire column is displayed when only the **to** keyword is used. An entire row is displayed when the **from** keyword is used. The entire permission matrix is displayed when both the **from** and **to** keywords are omitted.

The command output is sorted by destination SGT as a primary key and the source SGT as a secondary key. SGACLs for each cell is displayed in the same order they are defined in the configuration or acquired from Cisco Identity Services Engine (ISE).

The **details** keyword is provided when a single cell is selected by specifying both **from** and **to** keywords. When the **details** keyword is specified the access control entries of SGACLs of a single cell are displayed.

The following is sample output from the **show role-based permissions** command:

Switch# show cts role-based permissions

```
IPv4 Role-based permissions default (monitored):
default_sgac1-02
Permit IP-00
IPv4 Role-based permissions from group 305:sgt to group 306:dgt (monitored):
test_reg_tcp_permit-02
RBACL Monitor All for Dynamic Policies : TRUE
RBACL Monitor All for Configured Policies : FALSE
```

```
IPv4 Role-based permissions from group 6:SGT_6 to group 6:SGT_6 (configured):
    mon_1
IPv4 Role-based permissions from group 10 to group 11 (configured):
    mon_2
RBACL Monitor All for Dynamic Policies : FALSE
RBACL Monitor All for Configured Policies : FALSE
```

## **Related Commands**

Command	Description
cts role-based permissions	Enables permissions from a source group to a destination group.
cts role-based monitor	Enables role-based access list monitoring.

## show cisp

To display CISP information for a specified interface, use the **show cisp** command in privileged EXEC mode.

Show Cisp   Chemis   interface thierface-ta     registrations   summa	show	cisp	{   clients	interface	interface-id]	registrations	summar
---	------	------	-------------	-----------	---------------	---------------	--------

### **Syntax Description**

clients	(Optional) Display CISP client details.	
interface interface-id	(Optional) Display CISP information about the specified interface. Valid interfaces include physical ports and port channels.	
registrations	Displays CISP registrations.	
summary	(Optional) Displays CISP summary.	

#### **Command Modes**

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.
	This command was reintroduced. This command was not supported in and

This example shows output from the **show cisp interface** command:

```
Device# show cisp interface fast 0 CISP not enabled on specified interface
```

This example shows output from the **show cisp registration** command:

### ${\tt Device\#} \ \ \textbf{show cisp registrations}$

```
Interface(s) with CISP registered user(s):

Auth Mgr (Authenticator) Gi3/0/3 Gi3/0/5 Gi3/0/23

## **Related Commands**

Command	Description	
cisp enable	Enable Client Information Signalling Protocol (CISP)	
dot1x credentials profile	Configure a profile on a supplicant switch	

## show dot1x

To display IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port, use the **show dot1x** command in user EXEC mode.

show dot1x [all [count | details | statistics | summary]] [interface type number [details | statistics]] [statistics]

### **Syntax Description**

all	(Optional) Displays the IEEE 802.1x information for all interfaces.		
count	(Optional) Displays total number of authorized and unauthorized clients.		
details	(Optional) Displays the IEEE 802.1x interface details.		
statistics	(Optional) Displays the IEEE 802.1x statistics for all interfaces.		
summary	(Optional) Displays the IEEE 802.1x summary for all interfaces.		
interface type number	(Optional) Displays the IEEE 802.1x status for the specified port.		

#### **Command Modes**

User EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the **show dot1x all** command:

```
Device# show dot1x all
```

Sysauthcontrol Enabled Dot1x Protocol Version 3

This is an example of output from the **show dot1x all count** command:

#### Device# show dot1x all count

Number of Dot1x sessions
-----Authorized Clients = 0
UnAuthorized Clients = 0
Total No of Client = 0

This is an example of output from the **show dot1x all statistics** command:

#### Device# show dot1x statistics

## show eap pac peer

To display stored Protected Access Credentials (PAC) for Extensible Authentication Protocol (EAP) Flexible Authentication via Secure Tunneling (FAST) peers, use the **show eap pac peer** command in privileged EXEC mode.

#### show eap pac peer

## **Syntax Description**

This command has no arguments or keywords.

## **Command Modes**

Privileged EXEC

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the **show eap pac peers** privileged EXEC command:

Device> show eap pac peers

No PACs stored

## **Related Commands**

Command	Description
_	Clears EAP session information for the switch or for the specified port.

# show ip dhcp snooping statistics

To display DHCP snooping statistics in summary or detail form, use the **show ip dhcp snooping statistics** command in user EXEC mode.

show ip dhcp snooping statistics [detail ]

### **Syntax Description**

detail (Optional) Displays detailed statistics information.

#### **Command Modes**

User EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

In a switch stack, all statistics are generated on the stack primary. If a new active switch is elected, the statistics counters reset.

This is an example of output from the **show ip dhcp snooping statistics** command:

Device> show ip dhcp snooping statistics

Packets	Forwarde	ed			=	=	0
Packets	Dropped				=	=	0
Packets	Dropped	From	untrusted	ports	=	=	0

This is an example of output from the **show ip dhcp snooping statistics detail** command:

### ${\tt Device} \gt{} \textbf{show ip dhcp snooping statistics detail}$

Packets Processed by DHCP Snooping	= 0
Packets Dropped Because	
IDB not known	= 0
Queue full	= 0
Interface is in errdisabled	= 0
Rate limit exceeded	= 0
Received on untrusted ports	= 0
Nonzero giaddr	= 0
Source mac not equal to chaddr	= 0
Binding mismatch	= 0
Insertion of opt82 fail	= 0
Interface Down	= 0
Unknown output interface	= 0
Reply output port equal to input port	= 0
Packet denied by platform	= 0

This table shows the DHCP snooping statistics and their descriptions:

**Table 7: DHCP Snooping Statistics** 

DHCP Snooping Statistic	Description
Packets Processed by DHCP Snooping	Total number of packets handled by DHCP snooping, including forwarded and dropped packets.
Packets Dropped Because IDB not known	Number of errors when the input interface of the packet cannot be determined.
Queue full	Number of errors when an internal queue used to process the packets is full. This might happen if DHCP packets are received at an excessively high rate and rate limiting is not enabled on the ingress ports.
Interface is in errdisabled	Number of times a packet was received on a port that has been marked as error disabled. This might happen if packets are in the processing queue when a port is put into the error-disabled state and those packets are subsequently processed.
Rate limit exceeded	Number of times the rate limit configured on the port was exceeded and the interface was put into the error-disabled state.
Received on untrusted ports	Number of times a DHCP server packet (OFFER, ACK, NAK, or LEASEQUERY) was received on an untrusted port and was dropped.
Nonzero giaddr	Number of times the relay agent address field (giaddr) in the DHCP packet received on an untrusted port was not zero, or the <b>no ip dhcp snooping information option allow-untrusted</b> global configuration command is not configured and a packet received on an untrusted port contained option-82 data.
Source mac not equal to chaddr	Number of times the client MAC address field of the DHCP packet (chaddr) does not match the packet source MAC address and the <b>ip dhcp snooping verify mac-address</b> global configuration command is configured.
Binding mismatch	Number of times a RELEASE or DECLINE packet was received on a port that is different than the port in the binding for that MAC address-VLAN pair. This indicates someone might be trying to spoof the real client, or it could mean that the client has moved to another port on the switch and issued a RELEASE or DECLINE. The MAC address is taken from the chaddr field of the DHCP packet, not the source MAC address in the Ethernet header.
Insertion of opt82 fail	Number of times the option-82 insertion into a packet failed. The insertion might fail if the packet with the option-82 data exceeds the size of a single physical packet on the internet.

DHCP Snooping Statistic	Description
Interface Down	Number of times the packet is a reply to the DHCP relay agent, but the SVI interface for the relay agent is down. This is an unlikely error that occurs if the SVI goes down between sending the client request to the DHCP server and receiving the response.
Unknown output interface	Number of times the output interface for a DHCP reply packet cannot be determined by either option-82 data or a lookup in the MAC address table. The packet is dropped. This can happen if option 82 is not used and the client MAC address has aged out. If IPSG is enabled with the port-security option and option 82 is not enabled, the MAC address of the client is not learned, and the reply packets will be dropped.
Reply output port equal to input port	Number of times the output port for a DHCP reply packet is the same as the input port, causing a possible loop. Indicates a possible network misconfiguration or misuse of trust settings on ports.
Packet denied by platform	Number of times the packet has been denied by a platform-specific registry.

## show radius server-group

To display properties for the RADIUS server group, use the **show radius server-group** command.

**show radius server-group** { name | all }

### **Syntax Description**

name Name of the server group. The character string used to name the group of servers must be defined using **the aaa group server radius** command.

**all** Displays properties for all of the server groups.

#### **Command Modes**

User EXEC

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

Use the **show radius server-group** command to display the server groups that you defined by using the **aaa group server radius** command.

This is an example of output from the **show radius server-group all** command:

```
Device# show radius server-group all
Server group radius
Sharecount = 1 sg_unconfigured = FALSE
Type = standard Memlocks = 1
```

This table describes the significant fields shown in the display.

#### Table 8: show radius server-group command Field Descriptions

Field	Description
Server group	Name of the server group.
Sharecount	Number of method lists that are sharing this server group. For example, if one method list uses a particular server group, the sharecount would be 1. If two method lists use the same server group, the sharecount would be 2.
sg_unconfigured	Server group has been unconfigured.
Туре	The type can be either standard or nonstandard. The type indicates whether the servers in the group accept nonstandard attributes. If all servers within the group are configured with the nonstandard option, the type will be shown as "nonstandard".

Field	Description
Memlocks	An internal reference count for the server-group structure that is in memory. The number represents how many internal data structure packets or transactions are holding references to this server group. Memlocks is used internally for memory management purposes.

# show vlan access-map

To display information about a particular VLAN access map or for all VLAN access maps, use the **show vlan** access-map command in privileged EXEC mode.

show vlan access-map [map-name]

**Syntax Description** 

map-name (Optional) Name of a specific VLAN access map.

**Command Default** 

None

**Command Modes** 

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the show vlan access-map command:

```
Device# show vlan access-map
Vlan access-map "vmap4" 10
Match clauses:
   ip address: al2
Action:
   forward
Vlan access-map "vmap4" 20
Match clauses:
   ip address: al2
Action:
   forward
```

## show vlan filter

To display information about all VLAN filters or about a particular VLAN or VLAN access map, use the **show vlan filter** command in privileged EXEC mode.

show vlan filter access-map name | vlan vlan-id

## **Syntax Description**

access-map name	(Optional) Displays filtering information for the specified VLAN access map.
vlan vlan-id	(Optional) Displays filtering information for the specified VLAN. The range is 1 to 4094.

### **Command Default**

None

#### **Command Modes**

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

This is an example of output from the **show vlan filter** command:

Device# **show vlan filter**VLAN Map map\_1 is filtering VLANs: 20-22

# show vlan group

To display the VLANs that are mapped to VLAN groups, use the **show vlan group** command in privileged EXEC mode.

show vlan group [group-name vlan-group-name [user\_count]]

Syntax Description	group-name vlan-group-name	(Optional) Displays the VLANs mapped to the specified VLAN group.
	user_count	(Optional) Displays the number of users in each VLAN mapped to a specified VLAN group.

### **Command Default**

None

#### **Command Modes**

Privileged EXEC

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

The **show vlan group** command displays the existing VLAN groups and lists the VLANs and VLAN ranges that are members of each VLAN group. If you enter the **group-name** keyword, only the members of the specified VLAN group are displayed.

This example shows how to display the members of a specified VLAN group:

## switchport port-security aging

To set the aging time and type for secure address entries or to change the aging behavior for secure addresses on a particular port, use the **switchport port-security aging** command in interface configuration mode. To disable port security aging or to set the parameters to their default states, use the **no** form of this command.

switchport port-security aging static | time | type absolute | inactivity no switchport port-security aging static | time | type

#### **Syntax Description**

static	c Enables aging for statically configured secure addresses on this port.	
time time	Specifies the aging time for this port. The range is 0 to 1440 minutes. If the time is 0, aging is disabled for this port.	
type	Sets the aging type.	
absolute	Sets absolute aging type. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.	
inactivity	Sets the inactivity aging type. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.	

#### **Command Default**

The port security aging feature is disabled. The default time is 0 minutes.

The default aging type is absolute.

The default static aging behavior is disabled.

#### **Command Modes**

Interface configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.

To allow limited time access to particular secure addresses, set the aging type as **absolute**. When the aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as **inactivity**. This removes the secure address when it become inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the **no switchport port-security aging static** interface configuration command.

This example sets the aging time as 2 hours for absolute aging for all the secure addresses on the port:

Device(config) # interface gigabitethernet1/0/1
Device(config-if) # switchport port-security aging time 120

This example sets the aging time as 2 minutes for inactivity aging type with aging enabled for configured secure addresses on the port:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport port-security aging time 2
Device(config-if)# switchport port-security aging type inactivity
Device(config-if)# switchport port-security aging static
```

This example shows how to disable aging for configured secure addresses:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport port-security aging static
```

## switchport port-security mac-address

To configure secure MAC addresses or sticky MAC address learning, use the **switchport port-security mac-address** interface configuration command. To return to the default setting, use the **no** form of this command.

switchport port-security mac-address mac-address [vlan vlan-id access | voice] | sticky [mac-address | vlan vlan-id access | voice]

no switchport port-security mac-address mac-address [vlan vlan-id access | voice] | sticky [mac-address | vlan vlan-id access | voice]

#### **Syntax Description**

mac-address A secure MAC address for the interface by entering a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value configured.

**vlan** *vlan-id* (Optional) On a trunk port only, specifies the VLAN ID and the MAC address. If no VLAN ID is specified, the native VLAN is used.

**vlan access** (Optional) On an access port only, specifies the VLAN as an access VLAN.

vlan voice (Optional) On an access port only, specifies the VLAN as a voice VLAN.

**Note** The **voice** keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.

sticky

Enables the interface for sticky learning. When sticky learning is enabled, the interface adds all secure MAC addresses that are dynamically learned to the running configuration and converts these addresses to sticky secure MAC addresses.

mac-address (Optional) A MAC address to specify a sticky secure MAC address.

#### **Command Default**

No secure MAC addresses are configured.

Sticky learning is disabled.

#### **Command Modes**

Interface configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.

- You cannot configure static secure or sticky secure MAC addresses in the voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.
- Voice VLAN is supported only on access ports and not on trunk ports.

Sticky secure MAC addresses have these characteristics:

- When you enable sticky learning on an interface by using the switchport port-security mac-address
   sticky interface configuration command, the interface converts all the dynamic secure MAC addresses,
   including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC
   addresses and adds all sticky secure MAC addresses to the running configuration.
- If you disable sticky learning by using the **no switchport port-security mac-address sticky** interface configuration command or the running configuration is removed, the sticky secure MAC addresses remain part of the running configuration but are removed from the address table. The addresses that were removed can be dynamically reconfigured and added to the address table as dynamic addresses.
- When you configure sticky secure MAC addresses by using the switchport port-security mac-address
   sticky mac-address interface configuration command, these addresses are added to the address table and
   the running configuration. If port security is disabled, the sticky secure MAC addresses remain in the
   running configuration.
- If you save the sticky secure MAC addresses in the configuration file, when the switch restarts or the
  interface shuts down, the interface does not need to relearn these addresses. If you do not save the sticky
  secure addresses, they are lost. If sticky learning is disabled, the sticky secure MAC addresses are
  converted to dynamic secure addresses and are removed from the running configuration.
- If you disable sticky learning and enter the **switchport port-security mac-address sticky** *mac-address* interface configuration command, an error message appears, and the sticky secure MAC address is not added to the running configuration.

You can verify your settings by using the **show port-security** privileged EXEC command.

This example shows how to configure a secure MAC address and a VLAN ID on a port:

```
Device(config) # interface gigabitethernet 2/0/2
Device(config-if) # switchport mode trunk
Device(config-if) # switchport port-security
Device(config-if) # switchport port-security mac-address 1000.2000.3000 vlan 3
```

This example shows how to enable sticky learning and to enter two sticky secure MAC addresses on a port:

```
Device(config) # interface gigabitethernet 2/0/2
Device(config-if) # switchport port-security mac-address sticky
Device(config-if) # switchport port-security mac-address sticky 0000.0000.4141
Device(config-if) # switchport port-security mac-address sticky 0000.0000.0006
```

## switchport port-security maximum

To configure the maximum number of secure MAC addresses, use the **switchport port-security maximum** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

switchport port-security maximum value [vlan [vlan-list | [access | voice]]] no switchport port-security maximum value [vlan [vlan-list | [access | voice]]]

### **Syntax Description**

value	Sets the maximum number of secure MAC addresses for the interface.
	The default setting is 1.

# **vlan** (Optional) For trunk ports, sets the maximum number of secure MAC addresses on a VLAN or range of VLANs. If the **vlan** keyword is not entered, the default value is used.

*vlan-list* (Optional) Range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.

**access** (Optional) On an access port only, specifies the VLAN as an access VLAN.

#### voice (Optional) On an access port only, specifies the VLAN as a voice VLAN.

The **voice** keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.

#### **Command Default**

When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.

#### **Command Modes**

Interface configuration

Note

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. See the **sdm prefer** command. This number represents the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.

• When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

Voice VLAN is supported only on access ports and not on trunk ports.

• When you enter a maximum secure address value for an interface, if the new value is greater than the previous value, the new value overrides the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

Setting a maximum number of addresses to one and configuring the MAC address of an attached device ensures that the device has the full bandwidth of the port.

When you enter a maximum secure address value for an interface, this occurs:

- If the new value is greater than the previous value, the new value overrides the previously configured value.
- If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

You can verify your settings by using the **show port-security** privileged EXEC command.

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 5
```

## switchport port-security violation

To configure secure MAC address violation mode or the action to be taken if port security is violated, use the **switchport port-security violation** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

 $switchport \hspace{0.2cm} port-security \hspace{0.2cm} violation \hspace{0.2cm} protect \hspace{0.2cm} |\hspace{0.2cm} restrict \hspace{0.2cm} |\hspace{0.2cm} shutdown \hspace{0.2cm} |\hspace{0.2cm} shutdown \hspace{0.2cm} vlan \\ no \hspace{0.2cm} switchport \hspace{0.2cm} port-security \hspace{0.2cm} violation \hspace{0.2cm} protect \hspace{0.2cm} |\hspace{0.2cm} restrict \hspace{0.2cm} |\hspace{0.2cm} shutdown \hspace{0.2cm} |\hspace{0.2cm} shutdown \hspace{0.2cm} vlan \\ \\ \end{array}$ 

#### **Syntax Description**

protect	Sets the security violation protect mode.
restrict	Sets the security violation restrict mode.
shutdown	Sets the security violation shutdown mode.
shutdown vlan	Sets the security violation mode to per-VLAN shutdown.

#### **Command Default**

The default violation mode is **shutdown**.

#### **Command Modes**

Interface configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

In the security violation protect mode, when the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

Note

We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

In the security violation restrict mode, when the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

In the security violation shutdown mode, the interface is error-disabled when a violation occurs and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments. When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command, or you can manually re-enable it by entering the **shutdown** and **no shutdown** interface configuration commands.

When the security violation mode is set to per-VLAN shutdown, only the VLAN on which the violation occurred is error-disabled.

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.

A security violation occurs when the maximum number of secure MAC addresses are in the address table and a station whose MAC address is not in the address table attempts to access the interface or when a station whose MAC address is configured as a secure MAC address on another secure port attempts to access the interface.

When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause** *psecure-violation* global configuration command. You can manually re-enable the port by entering the **shutdown** and **no shutdown** interface configuration commands or by using the **clear errdisable interface** privileged EXEC command.

You can verify your settings by using the **show port-security** privileged EXEC command.

This example show how to configure a port to shut down only the VLAN if a MAC security violation occurs:

```
Device(config) # interface gigabitethernet2/0/2
Device(config) # switchport port-security violation shutdown vlan
```

## tacacs server

To configure the TACACS+ server for IPv6 or IPv4 and enter TACACS+ server configuration mode, use the **tacacs server** command in global configuration mode. To remove the configuration, use the **no** form of this command.

tacacs server name no tacacs server

### **Syntax Description**

name Name of the private TACACS+ server host.

#### **Command Default**

No TACACS+ server is configured.

#### **Command Modes**

Global configuration (config)

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

The **tacacs server** command configures the TACACS server using the *name* argument and enters TACACS+ server configuration mode. The configuration is applied once you have finished configuration and exited TACACS+ server configuration mode.

### **Examples**

The following example shows how to configure the TACACS server using the name server1 and enter TACACS+ server configuration mode to perform further configuration:

Device(config) # tacacs server server1
Device(config-server-tacacs) #

#### **Related Commands**

Command	Description
address ipv6 (TACACS+)	Configures the IPv6 address of the TACACS+ server.
key (TACACS+)	Configures the per-server encryption key on the TACACS+ server.
port (TACACS+)	Specifies the TCP port to be used for TACACS+ connections.
send-nat-address (TACACS+)	Sends a client's post-NAT address to the TACACS+ server.
single-connection (TACACS+)	Enables all TACACS packets to be sent to the same server using a single TCP connection.
timeout (TACACS+)	Configures the time to wait for a reply from the specified TACACS server.

## tracking (IPv6 snooping)

To override the default tracking policy on a port, use the **tracking** command in IPv6 snooping policy configuration mode.

 $tracking \ \{enable \ [reachable-lifetime \ \{value \ | \ infinite\}\ ] \ | \ disable \ [stale-lifetime \ \{value \ | \ infinite\}\ ]$ 

### **Syntax Description**

enable	Enables tracking.
reachable-lifetime	(Optional) Specifies the maximum amount of time a reachable entry is considered to be directly or indirectly reachable without proof of reachability.
	<ul> <li>The reachable-lifetime keyword can be used only with the enable keyword.</li> </ul>
	<ul> <li>Use of the reachable-lifetime keyword overrides the global reachable lifetime configured by the ipv6 neighbor binding reachable-lifetime command.</li> </ul>
value	Lifetime value, in seconds. The range is from 1 to 86400, and the default is 300.
infinite	Keeps an entry in a reachable or stale state for an infinite amount of time.
disable	Disables tracking.
stale-lifetime	(Optional) Keeps the time entry in a stale state, which overwrites the global stale-lifetime configuration.
	• The stale lifetime is 86,400 seconds.
	<ul> <li>The stale-lifetime keyword can be used only with the disable keyword.</li> </ul>
	<ul> <li>Use of the stale-lifetime keyword overrides the global stale lifetime configured by the ipv6 neighbor binding stale-lifetime command.</li> </ul>

#### **Command Default**

The time entry is kept in a reachable state.

### **Command Modes**

IPv6 snooping configuration

## **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

## **Usage Guidelines**

The **tracking** command overrides the default tracking policy set by the **ipv6 neighbor tracking** command on the port on which this policy applies. This function is useful on trusted ports where, for example, you may not want to track entries but want an entry to stay in the binding table to prevent it from being stolen.

The **reachable-lifetime** keyword is the maximum time an entry will be considered reachable without proof of reachability, either directly through tracking or indirectly through IPv6 snooping. After the **reachable-lifetime** value is reached, the entry is moved to stale. Use of the **reachable-lifetime** keyword with the tracking command overrides the global reachable lifetime configured by the **ipv6 neighbor binding reachable-lifetime** command.

The **stale-lifetime** keyword is the maximum time an entry is kept in the table before it is deleted or the entry is proven to be reachable, either directly or indirectly. Use of the **reachable-lifetime** keyword with the **tracking** command overrides the global stale lifetime configured by the **ipv6 neighbor binding stale-lifetime** command.

This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure an entry to stay in the binding table for an infinite length of time on a trusted port:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# tracking disable stale-lifetime infinite

## trusted-port

To configure a port to become a trusted port, use the **trusted-port** command in IPv6 snooping policy mode or ND inspection policy configuration mode. To disable this function, use the **no** form of this command.

## trusted-port no trusted-port

### **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

No ports are trusted.

#### **Command Modes**

ND inspection policy configuration

IPv6 snooping configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

When the **trusted-port** command is enabled, limited or no verification is performed when messages are received on ports that have this policy. However, to protect against address spoofing, messages are analyzed so that the binding information that they carry can be used to maintain the binding table. Bindings discovered from these ports will be considered more trustworthy than bindings received from ports that are not configured to be trusted.

This example shows how to define an NDP policy name as policy1, place the switch in NDP inspection policy configuration mode, and configure the port to be trusted:

```
Device(config)# ipv6 nd inspection policy1
Device(config-nd-inspection)# trusted-port
```

This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure the port to be trusted:

Device(config) # ipv6 snooping policy policy1
Device(config-ipv6-snooping) # trusted-port

## vlan access-map

To create or modify a VLAN map entry for VLAN packet filtering, and change the mode to the VLAN access-map configuration, use the **vlan access-map** command in global configuration mode on the switch stack or on a standalone switch. To delete a VLAN map entry, use the **no** form of this command.

vlan access-map name [number]
no vlan access-map name [number]

Note

This command is not supported on switches running the LAN Base feature set.

### **Syntax Description**

*name* Name of the VLAN map.

number

(Optional) The sequence number of the map entry that you want to create or modify (0 to 65535). If you are creating a VLAN map and the sequence number is not specified, it is automatically assigned in increments of 10, starting from 10. This number is the sequence to insert to, or delete from, a VLAN access-map entry.

#### **Command Default**

There are no VLAN map entries and no VLAN maps applied to a VLAN.

#### **Command Modes**

Global configuration

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

In global configuration mode, use this command to create or modify a VLAN map. This entry changes the mode to VLAN access-map configuration, where you can use the **match** access-map configuration command to specify the access lists for IP or non-IP traffic to match and use the **action** command to set whether a match causes the packet to be forwarded or dropped.

In VLAN access-map configuration mode, these commands are available:

- action—Sets the action to be taken (forward or drop).
- default—Sets a command to its defaults.
- exit—Exits from VLAN access-map configuration mode.
- match—Sets the values to match (IP address or MAC address).
- no—Negates a command or set its defaults.

When you do not specify an entry number (sequence number), it is added to the end of the map.

There can be only one VLAN map per VLAN and it is applied as packets are received by a VLAN.

You can use the **no vlan access-map** *name* [*number*] command with a sequence number to delete a single entry.

Use the vlan filter interface configuration command to apply a VLAN map to one or more VLANs.

For more information about VLAN map entries, see the software configuration guide for this release.

This example shows how to create a VLAN map named vac1 and apply matching conditions and actions to it. If no other entries already exist in the map, this will be entry 10.

```
Device(config) # vlan access-map vac1
Device(config-access-map) # match ip address acl1
Device(config-access-map) # action forward
```

This example shows how to delete VLAN map vac1:

```
Device(config) # no vlan access-map vac1
```

## vlan dot10 tag native

To enable dot1q (IEEE 802.1Q) tagging for a native VLAN on a trunk port, use the **vlan dot1Q tag native** command in global configuration mode.

To disable this function, use the **no** form of this command.

vlan dot1Q tag native no vlan dot1Q tag native

**Syntax Description** 

This command has no arguments or keywords.

**Command Default** 

Disabled

**Command Modes** 

Global configuration (config)

#### **Command History**

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

#### **Usage Guidelines**

Typically, you configure 802.1Q trunks with a native VLAN ID which strips tagging from all packets on that VLAN.

To maintain the tagging on the native VLAN and drop untagged traffic, use the **vlan dot1q tag native** command. The device will tag the traffic received on the native VLAN and admit only 802.1Q-tagged frames, dropping any untagged traffic, including untagged traffic in the native VLAN.

Control traffic continues to be accepted as untagged on the native VLAN on a trunked port, even when the **vlan dot1q tag native** command is enabled.

Note

If the **dot1q tag vlan native** command is configured at global level, dot1x reauthentication will fail on trunk ports.

This example shows how to enable dot1q (IEEE 802.1Q) tagging for native VLANs on all trunk ports on a device:

```
Device(config)# vlan dot1q tag native
Device(config)#
```

#### **Related Commands**

Command	Description
show vlan dot1q tag native	Displays the status of tagging on the native VLAN.

## vlan filter

To apply a VLAN map to one or more VLANs, use the **vlan filter** command in global configuration mode on the switch stack or on a standalone switch. To remove the map, use the **no** form of this command.

vlan filter mapname vlan-list list | all no vlan filter mapname vlan-list list | all

Note

This command is not supported on switches running the LAN Base feature set.

#### **Syntax Description**

тарпате	Name of the VLAN map entry.
vlan-list	Specifies which VLANs to apply the map to.
list	The list of one or more VLANs in the form tt, uu-vv, xx, yy-zz, where spaces around commas and dashes are optional. The range is 1 to 4094.
all	Adds the map to all VLANs.

#### **Command Default**

There are no VLAN filters.

#### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

### **Usage Guidelines**

To avoid accidentally dropping too many packets and disabling connectivity in the middle of the configuration process, we recommend that you completely define the VLAN access map before applying it to a VLAN.

For more information about VLAN map entries, see the software configuration guide for this release.

This example applies VLAN map entry map1 to VLANs 20 and 30:

Device(config)# vlan filter map1 vlan-list 20, 30

This example shows how to delete VLAN map entry mac1 from VLAN 20:

Device(config) # no vlan filter map1 vlan-list 20

You can verify your settings by entering the **show vlan filter** privileged EXEC command.

## vlan group

To create or modify a VLAN group, use the **vlan group** command in global configuration mode. To remove a VLAN list from the VLAN group, use the **no** form of this command.

vlan group group-name vlan-list vlan-list no vlan group group-name vlan-list vlan-list

## **Syntax Description**

group-name	Name of the VLAN group. The group name may contain up to 32 characters and must begin with a letter.
vlan-list vlan-list	Specifies one or more VLANs to be added to the VLAN group. The <i>vlan-list</i> argument can be a single VLAN ID, a list of VLAN IDs, or VLAN ID range. Multiple entries are separated by a hyphen (-) or a comma (,).

#### **Command Default**

None

### **Command Modes**

Global configuration

### **Command History**

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

#### **Usage Guidelines**

If the named VLAN group does not exist, the **vlan group** command creates the group and maps the specified VLAN list to the group. If the named VLAN group exists, the specified VLAN list is mapped to the group.

The **no** form of the **vlan group** command removes the specified VLAN list from the VLAN group. When you remove the last VLAN from the VLAN group, the VLAN group is deleted.

A maximum of 100 VLAN groups can be configured, and a maximum of 4094 VLANs can be mapped to a VLAN group.

This example shows how to map VLANs 7 through 9 and 11 to a VLAN group:

Device(config) # vlan group group1 vlan-list 7-9,11

This example shows how to remove VLAN 7 from the VLAN group:

Device(config) # no vlan group group1 vlan-list 7
