bluetooth pin

To configure a new Bluetooth pin, use the **bluetooth pin** command in interface configuration or global configuration mode.

bluetooth pin *pin*

Syntax Description	<i>pin</i>	Pairing pin for the Bluetooth interface. The pin is a 4-digit number.
---------------------------	------------	--

Command Modes	Interface configuration (config-if) Global configuration (config)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.

Usage Guidelines	The bluetooth pin command can be configured either in the interface configuration or global configuration mode. Cisco recommends using the global configuration mode to configure the Bluetooth pin.
-------------------------	---

Examples	This example shows how to configure a new Bluetooth pin using the bluetooth pin command.
-----------------	---

```
Device> enable
Device# configure terminal
Device(config)# bluetooth pin 1111
Device(config)#+
```

Related Commands	Command	Description
	show platform hardware bluetooth	Displays information about the Bluetooth interface

debug ilpower

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug ilpower {cdp | event | ha | port | powerman | registries | scp | sense}
no debug ilpower {cdp | event | ha | port | powerman | registries | scp | sense}
```

Syntax Description

cdp	Displays PoE Cisco Discovery Protocol (CDP) debug messages.
event	Displays PoE event debug messages.
ha	Displays PoE high-availability messages.
port	Displays PoE port manager debug messages.
powerman	Displays PoE power management debug messages.
registries	Displays PoE registries debug messages.
scp	Displays PoE SCP debug messages.
sense	Displays PoE sense debug messages.

Command Default

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines

This command is supported only on PoE-capable switches.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the **session switch-number** EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** EXEC command on the active switch to enable debugging on a member switch without first starting a session.

debug interface

debug interface

To enable debugging of interface-related activities, use the **debug interface** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug interface {interface-id | counters {exceptions | protocol memory} | null interface-number | port-channel port-channel-number | states | vlan vlan-id}
no debug interface {interface-id | counters {exceptions | protocol memory} | null interface-number | port-channel port-channel-number | states | vlan vlan-id}
```

Syntax Description	<p>interface-id ID of the physical interface. Displays debug messages for the specified physical port, identified by type switch number/module number/port, for example, gigabitethernet 1/0/2.</p> <p>null interface-number Displays debug messages for null interfaces. The interface number is always 0.</p> <p>port-channel port-channel-number Displays debug messages for the specified EtherChannel port-channel interface. The <i>port-channel-number</i> range is 1 to 48.</p> <p>vlan vlan-id Displays debug messages for the specified VLAN. The <i>vlan</i> range is 1 to 4094.</p> <p>counters Displays counters debugging information.</p> <p>exceptions Displays debug messages when a recoverable exceptional condition occurs during the computation of the interface packet and data rate statistics.</p> <p>protocol memory Displays debug messages for memory operations of protocol counters.</p> <p>states Displays intermediary debug messages when an interface's state transitions.</p>
Command Default	Debugging is disabled.
Command Modes	Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines	<p>If you do not specify a keyword, all debug messages appear.</p> <p>The undebug interface command is the same as the no debug interface command.</p> <p>When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the session switch-number EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command stack-member-number LINE EXEC command on the active switch to enable debugging on a member switch without first starting a session.</p>
-------------------------	--

debug lldp packets

To enable debugging of Link Layer Discovery Protocol (LLDP) packets, use the **debug lldp packets** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug lldp packets
no debug lldp packets

Syntax Description This command has no arguments or keywords.

Command Default Debugging is disabled.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines The **undebbug lldp packets** command is the same as the **no debug lldp packets** command.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the **session switch-number** EXEC command.

debug platform poe

debug platform poe

To enable debugging of a Power over Ethernet (PoE) port, use the **debug platform poe** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug platform poe [{error | info}] [switch switch-number]
no debug platform poe [{error | info}] [switch switch-number]
```

Syntax Description	error (Optional) Displays PoE-related error debug messages. info (Optional) Displays PoE-related information debug messages. switch switch-number (Optional) Specifies the stack member. This keyword is supported only on stacking-capable switches.				
Command Default	Debugging is disabled.				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				
Usage Guidelines	The undebbug platform poe command is the same as the no debug platform poe command.				

debug platform software fed active punt packet-capture start

To enable debugging of packets during high CPU utilization, for a switch, use the **debug platform software fed active punt packet-capture start** command in privileged EXEC mode. To disable debugging of packets during high CPU utilization, for a switch, use the **debug platform software fed active punt packet-capture stop** command in privileged EXEC mode.

```
debug platform software fed active punt packet-capture start
debug platform software fed active punt packet-capture stop
```

Syntax Description	active	Displays information about the active switch.
	punt	Specifies the punt information.
	packet-capture	Specifies information about the captured packet.
	start	Enables debugging of the active switch.
	stop	Disables debugging of the active switch.

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines	The debug platform software fed active punt packet-capture start command starts the debugging of packets during high CPU utilization. The packet capture is stopped when the 4k buffer size is exceeded.
-------------------------	---

Examples	The following is a sample output from the debug platform software fed active punt packet-capture start command:
-----------------	--

```
Device# debug platform software fed active packet-capture start
Punt packet capturing started.
```

The following is a sample output from the **debug platform software fed active punt packet-capture stop** command:

```
Device# debug platform software fed active packet-capture stop
Punt packet capturing stopped. Captured 101 packet(s)
```

duplex

To specify the duplex mode of operation for a port, use the **duplex** command in interface configuration mode. To return to the default value, use the **no** form of this command.

```
duplex {auto | full | half}
no duplex {auto | full | half}
```

Syntax Description

auto	Enables automatic duplex configuration. The port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.
full	Enables full-duplex mode.
half	Enables half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 Mb/s, 10,000 Mb/s, 2.5Gb/s, or 5Gb/s.

Command Default

The default is **auto** for Gigabit Ethernet ports.

Duplex options are not supported on the 1000BASE-x or 10GBASE-x (where -x is -BX, -CWDM, -LX, -SX, or -ZX) small form-factor pluggable (SFP) modules.

Command Modes

Interface configuration

Command History

Release	Modification
---------	--------------

Cisco IOS XE Everest 16.6.1 This command was introduced.

Usage Guidelines

For Gigabit Ethernet ports, setting the port to **auto** has the same effect as specifying **full** if the attached device does not autonegotiate the duplex parameter.

Note Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is **auto** and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duplex mode.

Certain ports can be configured to be either full duplex or half duplex. How this command is applied depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces, and use the **auto** setting on the supported side.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to **auto**.

Caution Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

You can verify your setting by entering the **show interfaces** privileged EXEC command.

Examples

This example shows how to configure an interface for full-duplex operation:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# duplex full
```

errdisable detect cause

errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the **errdisable detect cause** command in global configuration mode. To disable the error-disable detection feature, use the **no** form of this command.

```
errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}
no errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}
```

Syntax Description		
all	Enables error detection for all error-disabled causes.	
arp-inspection	Enables error detection for dynamic Address Resolution Protocol (ARP) inspection.	
bpduguard shutdown vlan	Enables per-VLAN error-disable for BPDU guard.	
dhcp-rate-limit	Enables error detection for DHCP snooping.	
dtp-flap	Enables error detection for the Dynamic Trunking Protocol (DTP) flapping.	
gbic-invalid	Enables error detection for an invalid Gigabit Interface Converter (GBIC) module.	Note This error refers to an invalid small form-factor pluggable (SFP) module.
inline-power	Enables error detection for the Power over Ethernet (PoE) error-disabled cause.	Note This keyword is supported only on switches with PoE ports.
link-flap	Enables error detection for link-state flapping.	
loopback	Enables error detection for detected loopbacks.	
pagp-flap	Enables error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.	
pppoe-ia-rate-limit	Enables error detection for the PPPoE Intermediate Agent rate-limit error-disabled cause.	
psp shutdown vlan	Enables error detection for protocol storm protection (PSP).	
security-violation shutdown vlan	Enables voice aware 802.1x security.	
sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.	

Command Default	Detection is enabled for all causes. All causes, except per-VLAN error disabling, are configured to shut down the entire port.
------------------------	--

Command Modes	Global configuration
----------------------	----------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines	A cause (such as a link-flap or dhcp-rate-limit) is the reason for the error-disabled state. When a cause is detected on an interface, the interface is placed in an error-disabled state, an operational state that is similar to a link-down state.
-------------------------	---

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the bridge protocol data unit (BPDU) guard, voice-aware 802.1x security, and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the **errdisable recovery** global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

For protocol storm protection, excess packets are dropped for a maximum of two virtual ports. Virtual port error disabling using the **psp** keyword is not supported for EtherChannel and Flexlink interfaces.

To verify your settings, enter the **show errdisable detect** privileged EXEC command.

This example shows how to enable error-disabled detection for the link-flap error-disabled cause:

```
Device(config)# errdisable detect cause link-flap
```

This command shows how to globally configure BPDU guard for a per-VLAN error-disabled state:

```
Device(config)# errdisable detect cause bpduguard shutdown vlan
```

This command shows how to globally configure voice-aware 802.1x security for a per-VLAN error-disabled state:

```
Device(config)# errdisable detect cause security-violation shutdown vlan
```

You can verify your setting by entering the **show errdisable detect** privileged EXEC command.

errdisable recovery cause

errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

```
errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit |
dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure |
pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control |
udld}
no errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit |
dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure |
pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control |
udld}
```

Syntax Description		
	all	Enables the timer to recover from all error-disabled causes.
	arp-inspection	Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.
	bpduguard	Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.
	channel-misconfig	Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.
	dhcp-rate-limit	Enables the timer to recover from the DHCP snooping error-disabled state.
	dtp-flap	Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.
	gbic-invalid	Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.
	Note	This error refers to an invalid small form-factor pluggable (SFP) error-disabled state.
	inline-power	Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state. This keyword is supported only on switches with PoE ports.
	link-flap	Enables the timer to recover from the link-flap error-disabled state.
	loopback	Enables the timer to recover from a loopback error-disabled state.
	mac-limit	Enables the timer to recover from the mac limit error-disabled state.
	pagp-flap	Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.

port-mode-failure	Enables the timer to recover from the port mode change failure error-disabled state.
pppoe-ia-rate-limit	Enables the timer to recover from the PPPoE IA rate limit error-disabled state.
psecure-violation	Enables the timer to recover from a port security violation disable state.
psp	Enables the timer to recover from the protocol storm protection (PSP) error-disabled state.
security-violation	Enables the timer to recover from an IEEE 802.1x-violation disabled state.
sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.
storm-control	Enables the timer to recover from a storm control error.
udld	Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.

Command Default Recovery is disabled for all causes.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines A cause (such as all or BPDU guard) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the interface stays in the error-disabled state until you enter the **shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

Examples This example shows how to enable the recovery timer for the BPDU guard error-disabled cause:

```
Device# Device#configure terminal
Device(config)# errdisable recovery cause bpduguard
```

errdisable recovery cause

errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

```
errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit |
dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure |
pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control |
udld}
no errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit |
dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure |
pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control |
udld}
```

Syntax Description		
	all	Enables the timer to recover from all error-disabled causes.
	arp-inspection	Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.
	bpduguard	Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.
	channel-misconfig	Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.
	dhcp-rate-limit	Enables the timer to recover from the DHCP snooping error-disabled state.
	dtp-flap	Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.
	gbic-invalid	Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.
	Note	This error refers to an invalid small form-factor pluggable (SFP) error-disabled state.
	inline-power	Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state. This keyword is supported only on switches with PoE ports.
	link-flap	Enables the timer to recover from the link-flap error-disabled state.
	loopback	Enables the timer to recover from a loopback error-disabled state.
	mac-limit	Enables the timer to recover from the mac limit error-disabled state.
	pagp-flap	Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.

port-mode-failure	Enables the timer to recover from the port mode change failure error-disabled state.
pppoe-ia-rate-limit	Enables the timer to recover from the PPPoE IA rate limit error-disabled state.
psecure-violation	Enables the timer to recover from a port security violation disable state.
psp	Enables the timer to recover from the protocol storm protection (PSP) error-disabled state.
security-violation	Enables the timer to recover from an IEEE 802.1x-violation disabled state.
sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.
storm-control	Enables the timer to recover from a storm control error.
udld	Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.

Command Default Recovery is disabled for all causes.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines A cause (such as all or BPDU guard) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the interface stays in the error-disabled state until you enter the **shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

Examples This example shows how to enable the recovery timer for the BPDU guard error-disabled cause:

```
Device# Device#configure terminal
Device(config)# errdisable recovery cause bpduguard
```

hw-module beacon

To control the beacon LED on a device, use the **hw-module beacon** command in the privileged EXEC mode.

```
hw-module beacon { rp { active | standby } | fan-tray | power-supply ps-slot-number | slot slot-number } { on | off | status }
```

Syntax Description	rp {active standby} fan-tray power-supply ps-slot-number slot slot-number on off status	Specifies the active or the standby Supervisor to be controlled. Specifies the fan tray beacon to be controlled. Specifies the power supply beacon to be controlled. Specifies the slot to be controlled. Turns the beacon on. Turns the beacon off. Displays the status of the beacon.
Command Default	This command has no default settings.	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.
Usage Guidelines	<p>Use the hw-module beacon command to turn on or off the beacon LEDs. You can monitor the power-supply, fan-tray, line card slots, and supervisor units by turning on the respective beacon LEDs. You can also find the status of these units with the hw-module beacon status command. Turning on the respective beacon LED helps in identifying the unit on the chassis for administrative purposes.</p> <p>Use the hw-module beacon slot slot-number command to enable or disable the module slot LED and also check its status. Blue indicates the slot LED is on and black indicates that it is off.</p> <p>Use the hw-module beacon rp active {on off} command to enable or disable the active supervisor LED. Similarly the standby supervisor LED can be turned on or off with the hw-module beacon rp standby {on off} command. You can check the status of the supervisor LED using the hw-module beacon rp {active standby} status command. Blue indicates the supervisor LED is on and black indicates the supervisor LED is off.</p> <p>Use the hw-module beacon fan-tray {on off status} command to enable or disable the fan tray LED or to check the status of the fan tray LED. Blue indicates the fan tray LED is on and black indicates that it is off.</p> <p>Use the hw-module beacon power-supply ps-slot-number {on off status} command to enable or disable the particular power supply LED, or to check its status. Blue indicates the power supply LED is on and black indicates the power supply LED is off.</p>	

Note If the switch is operating in SVL mode, then select either the active or standby switch. For example: **hw-module beacon switch {active | standby}**.

The following example shows how to switch on the LED beacon of the active supervisor:

```
Device> enable  
Device# hw-module beacon rp active on
```

hw-module slot upoe-plus

hw-module slot upoe-plus

To enable the 802.3bt mode on the device, use the **hw-module slot upoe-plus** command in the Global Configuration mode. To unconfigure the 802.3bt mode, use the **no** form of the command.

hw-module slot *slot-number* upoe-plus
no hw-module slot *slot-number* upoe-plus

Command Default	The device is in 802.3at mode.	
Command Modes	Global Configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.
Usage Guidelines	When a line card boots up, it is in 802.3at-compliant mode by default. Use the hw-module slot <i>slot-number</i> upoe-plus command to enable 802.3bt mode that makes the device 802.3bt compliant. This command causes the line card to be power-cycled to enable 802.3bt compliance.	

The following command enables 802.3bt mode on the line card located in slot numbered 4 of the device.

```
Device> enable
Device# configure terminal
Device(config)# hw-module slot 4 upoe-plus
Performing oir to update poe fw on chassis 1 slot 4
Device#
*Mar 21 05:39:36.215: %IOSXE_OIR-6-REMSPA: SPA removed from subslot 4/0, interfaces disabled
```

hw-module subslot mode

To control the subscriber line interface (SLI) traffic rate of a device, use the **hw-module subslot mode** command in global configuration mode. To return to the default mode, use the **no** form of this command.

Cisco IOS XE Gibraltar 16.10.x and Earlier Releases

```
hw-module subslot slot/subslot mode [{dynamic | performance}]
no hw-module subslot slot/subslot mode
```

Cisco IOS XE Gibraltar 16.11.1 and Later Releases

```
hw-module subslot slot/subslot mode [{dynamic | performance | static}]
no hw-module subslot slot/subslot mode
```

Syntax Description	<p>slot Slot number. The range is from 0 to 10.</p> <p>subslot Subslot number. The range is from 0 to 0.</p> <p>dynamic (Optional) Sets the line card operation modes to dynamic mode.</p> <p>performance (Optional) Sets the line card operation modes to performance mode.</p> <p>static (Optional) Sets the line card operation modes to static mode.</p>
--------------------	---

Command Default	<ul style="list-style-type: none"> • Until Cisco IOS XE Gibraltar 16.10.x release, the default mode is static. • Starting in Cisco IOS XE Gibraltar 16.11.1 release, the default mode is dynamic.
------------------------	---

Command Modes	Global Configuration (config)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines	<ul style="list-style-type: none"> • Performance mode: Allows limited number of front panel interfaces to operate at full 64-byte 10G rate, while keeping the other interfaces in disabled state. <p>For 7 slot chassis, 8 10G/MGig line card front panel interfaces get activated and provides full 64-byte 10G rate. For 10 slot chassis, 5 front panel interfaces get activated at full 64-byte 10G rate. The other line card interfaces are disabled and do not link up. Disabled front panel interfaces has amber LED on and the show interfaces command displays hardware in disabled state.</p> <ul style="list-style-type: none"> • Dynamic mode: Monitors the system software on how many SLI links are active based on the front panel port link status, and dynamically configures SLI link 64-byte packet max traffic bandwidth. <p>For 7 slot chassis, when the number of active SLI links exceed 8, system software limits SLI 64-byte packet traffic rate down to 7.5G for all 12 SLIs. For 10 slot chassis, when the number of active SLI links exceed 5, SLI 64-byte packet traffic rate is limited to 6.25G for all 8 SLIs. Otherwise, system software allows full 10G traffic with 64-byte packets on the active SLIs.</p>
-------------------------	--

hw-module subslot mode

- **Static mode:** SLI traffic rate is fixed to 7.5G for both 7 slot chassis and 10 slot chassis.

Examples

The following example shows how to set the line card mode to performance:

```
Device> enable
Device# configure terminal
Device(config)# hw-module subslot 1/0 mode performance
```

Related Commands	Command	Description
	show hw-module subslot mode	Displays the line card mode of the platform.
	show platform hardware iomd portgroups	Displays the port grouping information of the platform.
	show platform hardware iomd lc-portmap brief	Displays the line card port map information of the platform.

interface

To configure an interface, use the **interface** command.

```
interface {Auto-Template interface-number | FortyGigabitEthernet
switch-number/slot-number/port-number | GigabitEthernet switch-number/slot-number/port-number |
Group VI Group VI interface number | Internal Interface Internal Interface number | Loopback
interface-number Null interface-number Port-channel interface-number TenGigabitEthernet
switch-number/slot-number/port-number Tunnel interface-number Vlan interface-number }
```

Syntax Description		
	Auto-Template <i>interface-number</i>	Enables you to configure a auto-template interface. The range is from 1 to 999.
	FortyGigabitEthernet <i>switch-number/slot-number/port-number</i>	Enables you to configure a 40-Gigabit Ethernet interface. <ul style="list-style-type: none"> • <i>switch-number</i> — Switch ID. The range is from 1 to 8. • <i>slot-number</i> — Slot number. Value is 1. • <i>port-number</i> — Port number. The range is from 1 to 2.
	GigabitEthernet <i>switch-number/slot-number/port-number</i>	Enables you to configure a Gigabit Ethernet IEEE 802.3z interface. <ul style="list-style-type: none"> • <i>switch-number</i> — Switch ID. The range is from 1 to 8. • <i>slot-number</i> — Slot number. The range is from 0 to 1. • <i>port-number</i> — Port number. The range is from 1 to 48.
	Group VI <i>Group VI interface number</i>	Enables you to configure a Group VI interface. The range is from 0 to 9.
	Internal Interface <i>Internal Interface</i>	Enables you to configure an internal interface.
	Loopback <i>interface-number</i>	Enables you to configure a loopback interface. The range is from 0 to 2147483647.
	Null <i>interface-number</i>	Enables you to configure a null interface. The default value is 0.
	Port-channel <i>interface-number</i>	Enables you to configure a port-channel interface. The range is from 1 to 128.
	TenGigabitEthernet <i>switch-number/slot-number/port-number</i>	Enables you to configure a 10-Gigabit Ethernet interface. <ul style="list-style-type: none"> • <i>switch-number</i> — Switch ID. The range is from 1 to 8. • <i>slot-number</i> — Slot number. The range is from 0 to 1. • <i>port-number</i> — Port number. The range is from 1 to 24 and 37 to 48

Tunnel *interface-number* Enables you to configure a tunnel interface. The range is from 0 to 2147483647.

Vlan *interface-number* Enables you to configure a switch VLAN. The range is from 1 to 4094.

Command Default None

Command Modes Global configuration (config)

Command History **Release** **Modification**

Cisco IOS XE Everest 16.6.1 This command was introduced.

Usage Guidelines You can not use the "no" form of this command.

The following example shows how to configure a tunnel interface:

```
Device# interface Tunnel 15
```

interface range

To configure an interface range, use the **interface range** command.

```
interface range {Auto-Template interface-number | FortyGigabitEthernet
switch-number/slot-number/port-number | GigabitEthernet switch-number/slot-number/port-number |
Group VI Group VI interface number | Internal Interface Internal Interface number | Loopback
interface-number Null interface-number Port-channel interface-number TenGigabitEthernet
switch-number/slot-number/port-number Tunnel interface-number Vlan interface-number }
```

Syntax Description		
	Auto-Template <i>interface-number</i>	Enables you to configure a auto-template interface. The range is from 1 to 999.
	FortyGigabitEthernet <i>switch-number/slot-number/port-number</i>	Enables you to configure a 40-Gigabit Ethernet interface. <ul style="list-style-type: none"> • <i>switch-number</i> — Switch ID. The range is from 1 to 8. • <i>slot-number</i> — Slot number. Value is 1. • <i>port-number</i> — Port number. The range is from 1 to 2.
	GigabitEthernet <i>switch-number/slot-number/port-number</i>	Enables you to configure a Gigabit Ethernet IEEE 802.3z interface. <ul style="list-style-type: none"> • <i>switch-number</i> — Switch ID. The range is from 1 to 8. • <i>slot-number</i> — Slot number. The range is from 0 to 1. • <i>port-number</i> — Port number. The range is from 1 to 48.
	Group VI <i>Group VI interface number</i>	Enables you to configure a Group VI interface. The range is from 0 to 9.
	Internal Interface <i>Internal Interface</i>	Enables you to configure an internal interface.
	Loopback <i>interface-number</i>	Enables you to configure a loopback interface. The range is from 0 to 2147483647.
	Null <i>interface-number</i>	Enables you to configure a null interface. The default value is 0.
	Port-channel <i>interface-number</i>	Enables you to configure a port-channel interface. The range is from 1 to 128.

interface range

TenGigabitEthernet <i>switch-number/slot-number/port-number</i>	<ul style="list-style-type: none"> • <i>switch-number</i> — Switch ID. The range is from 1 to 8. • <i>slot-number</i> — Slot number. The range is from 0 to 1. • <i>port-number</i> — Port number. The range is from 1 to 24 and 37 to 48. <p>Enables you to configure a 10-Gigabit Ethernet interface.</p>				
Tunnel <i>interface-number</i>	Enables you to configure a tunnel interface. The range is from 0 to 2147483647.				
Vlan <i>interface-number</i>	Enables you to configure a switch VLAN. The range is from 1 to 4094.				
Command Default	None				
Command Modes	Global configuration				
Command History	<p><i>Table 1:</i></p> <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Examples

This example shows how you can select a set of VLAN interfaces to be configured :

```
Device(config)# interface range vlan 1-100
```

lldp (interface configuration)

To enable Link Layer Discovery Protocol (LLDP) on an interface, use the **lldp** command in interface configuration mode. To disable LLDP on an interface, use the **no** form of this command.

```
lldp {med-tlv-select tlv | receive | tlv-select power-management | transmit}
no lldp {med-tlv-select tlv | receive | tlv-select power-management | transmit}
```

Syntax Description	med-tlv-select Selects an LLDP Media Endpoint Discovery (MED) time-length-value (TLV) element to send. tlv String that identifies the TLV element. Valid values are the following: <ul style="list-style-type: none"> • inventory-management— LLDP MED Inventory Management TLV. • location— LLDP MED Location TLV. • network-policy— LLDP MED Network Policy TLV. • power-management— LLDP MED Power Management TLV. 				
receive	Enables the interface to receive LLDP transmissions.				
tlv-select	Selects the LLDP TLVs to send.				
power-management	Sends the LLDP Power Management TLV.				
transmit	Enables LLDP transmission on the interface.				
Command Default	LLDP is disabled.				
Command Modes	Interface configuration (config-if)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines This command is supported on 802.1 media types.

If the interface is configured as a tunnel port, LLDP is automatically disabled.

The following example shows how to disable LLDP transmission on an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no lldp transmit
```

The following example shows how to enable LLDP transmission on an interface:

```
Device(config)# interface gigabitethernet1/0/1
```

lldp (interface configuration)

```
Device(config-if)# lldp transmit
```

logging event power-inline-status

To enable the logging of Power over Ethernet (PoE) events, use the **logging event power-inline-status** command in interface configuration mode. To disable the logging of PoE status events, use the **no** form of this command.

```
logging event power-inline-status
no logging event power-inline-status
```

Syntax Description This command has no arguments or keywords.

Command Default Logging of PoE events is enabled.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines The **no** form of this command does not disable PoE error events.

Examples This example shows how to enable logging of PoE events on a port:

```
Device(config-if)# interface gigabitethernet1/0/1
Device(config-if)# logging event power-inline-status
Device(config-if)#
```

mode (power-stack configuration)

To configure power stack mode for the power stack, use the **mode** command in power-stack configuration mode. To return to the default settings, use the **no** form of the command.

```
mode {power-shared | redundant} [strict]
no mode
```

Syntax Description	power-shared Sets the power stack to operate in power-shared mode. This is the default. redundant Sets the power stack to operate in redundant mode. The largest power supply is removed from the power pool to be used as backup power in case one of the other power supplies fails. strict (Optional) Configures the power stack mode to run a strict power budget. The stack power needs cannot exceed the available power.				
Command Default	The default modes are power-shared and nonstrict.				
Command Modes	Power-stack configuration (config-stackpower)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines	<p>This command is available only on switch stacks running the IP Base or IP Services feature set.</p> <p>To access power-stack configuration mode, enter the stack-power stack power stack name global configuration command.</p> <p>Entering the no mode command sets the switch to the defaults of power-shared and non-strict mode.</p>
-------------------------	--

Note For stack power, available power is the total power available for PoE from all power supplies in the power stack, available power is the power allocated to all powered devices connected to PoE ports in the stack, and consumed power is the actual power consumed by the powered devices.

In **power-shared** mode, all of the input power can be used for loads, and the total available power appears as one large power supply. The power budget includes all power from all supplies. No power is set aside for power supply failures. If a power supply fails, load shedding (shutting down of powered devices or switches) might occur.

In **redundant** mode, the largest power supply is removed from the power pool to use as backup power in case one of the other power supplies fails. The available power budget is the total power minus the largest power supply. This reduces the available power in the pool for switches and powered devices, but in case of a failure or an extreme power load, there is less chance of having to shut down switches or powered devices.

In **strict** mode, when a power supply fails and the available power drops below the budgeted power, the system balances the budget through load shedding of powered devices, even if the actual power is less than the available power. In nonstrict mode, the power stack can run in an over-allocated state and is stable as long as

the actual power does not exceed the available power. In this mode, a powered device drawing more than normal power could cause the power stack to start shedding loads. This is normally not a problem because most devices do not run at full power. The chances of multiple powered devices in the stack requiring maximum power at the same time is small.

In both strict and nonstrict modes, power is denied when there is no power available in the power budget.

This is an example of setting the power stack mode for the stack named power1 to power-shared with strict power budgeting. All power in the stack is shared, but when the total available power is allotted, no more devices are allowed power.

```
Device(config)# stack-power stack power1
Device(config-stackpower)# mode power-shared strict
Device(config-stackpower)# exit
```

This is an example of setting the power stack mode for the stack named power2 to redundant. The largest power supply in the stack is removed from the power pool to provide redundancy in case one of the other supplies fails.

```
Device(config)# stack-power stack power2
Device(config-stackpower)# mode redundant
Device(config-stackpower)# exit
```

monitoring

To enable monitoring of all optical transceivers and to specify the time period for monitoring the transceivers, use the **monitoring** command in transceiver type configuration mode. To disable the monitoring, use the **no** form of this command.

monitoring [interval seconds]
no monitoring [interval]

Syntax Description	interval <i>seconds</i>	(Optional) Specifies the time interval for monitoring optical transceivers. The range is from 300 to 3600 seconds, and the default interval time is 600 seconds.
---------------------------	-----------------------------------	---

Command Default The interval time is 600 seconds.

Command Modes Transceiver type configuration (config-xcvr-type)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines You need digital optical monitoring (DOM) feature and transceiver module compatibility information to configure the **monitoring** command. Refer to the [compatibility matrix](#) to get the lists of Cisco platforms and minimum required software versions to support Gigabit Ethernet transceiver modules.

Gigabit Ethernet Transceivers transmit and receive Ethernet frames at a rate of a gigabit per second, as defined by the IEEE 802.3-2008 standard. Cisco's Gigabit Ethernet Transceiver modules support Ethernet applications across all Cisco switching and routing platforms. These pluggable transceivers offer a convenient and cost effective solution for the adoption in data center, campus, metropolitan area access and ring networks, and storage area networks.

The **interval** keyword enables you to change the default polling interval. For example, if you set the interval as 1500 seconds, polling happens at every 1500th second. During the polling period entSensorStatus of optical transceivers is set to *Unavailable*, and once the polling finishes entSensorStatus shows the actual status.

Examples

This example shows how to enable monitoring of optical transceivers and set the interval time for monitoring to 1500 seconds:

```
Device# configure terminal
Device(config)# transceiver type all
Device(config-xcvr-type)# monitoring interval 1500
```

This example shows how to disable monitoring for all transceiver types:

```
Device(config-xcvr-type)# no monitoring
```

Related Commands	Command	Description
	transceiver type all	Enables monitoring on all transceivers.

network-policy

To apply a network-policy profile to an interface, use the **network-policy** command in interface configuration mode. To remove the policy, use the **no** form of this command.

```
network-policy profile-number
no network-policy
```

Syntax Description	<i>profile-number</i> The network-policy profile number to apply to the interface.
---------------------------	--

Command Default	No network-policy profiles are applied.
------------------------	---

Command Modes	Interface configuration (config-if)
----------------------	-------------------------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines	Use the network-policy <i>profile number</i> interface configuration command to apply a profile to an interface.
-------------------------	---

You cannot apply the **switchport voice vlan** command on an interface if you first configure a network-policy profile on it. However, if **switchport voice vlan *vlan-id*** is already configured on the interface, you can apply a network-policy profile on the interface. The interface then has the voice or voice-signaling VLAN network-policy profile applied.

This example shows how to apply network-policy profile 60 to an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# network-policy 60
```

network-policy profile (global configuration)

To create a network-policy profile and to enter network-policy configuration mode, use the **network-policy profile** command in global configuration mode. To delete the policy and to return to global configuration mode, use the **no** form of this command.

network-policy profile *profile-number*
no network-policy profile *profile-number*

Syntax Description	<i>profile-number</i> Network-policy profile number. The range is 1 to 4294967295.	
Command Default	No network-policy profiles are defined.	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.
Usage Guidelines	<p>Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.</p> <p>To return to privileged EXEC mode from the network-policy profile configuration mode, enter the exit command.</p> <p>When you are in network-policy profile configuration mode, you can create the profile for voice and voice signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.</p> <p>These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).</p>	

This example shows how to create network-policy profile 60:

```
Device(config)# network-policy profile 60
Device(config-network-policy) #
```

power efficient-ethernet auto

To enable Energy Efficient Ethernet (EEE) for an interface, use the **power efficient-ethernet auto** command in interface configuration mode. To disable EEE on an interface, use the **no** form of this command.

power efficient-ethernet auto
no power efficient-ethernet auto

Syntax Description This command has no arguments or keywords.

Command Default EEE is disabled.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines You can enable EEE on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

The **power efficient-ethernet auto** command is available only if the interface is EEE capable. To check if an interface is EEE capable, use the **show eee capabilities** EXEC command.

When EEE is enabled, the device advertises and autonegotiates EEE to its link partner. To view the current EEE status for an interface, use the **show eee status** EXEC command.

This command does not require a license.

This example shows how to enable EEE for an interface:

```
Device(config-if)# power efficient-ethernet auto
Device(config-if) #
```

This example shows how to disable EEE for an interface:

```
Device(config-if)# no power efficient-ethernet auto
Device(config-if) #
```

power-priority

power-priority

To configure Cisco StackPower power-priority values for a switch in a power stack and for its high-priority and low-priority PoE ports, use the **power-priority** command in switch stack-power configuration mode. To return to the default setting, use the **no** form of the command.

```
power-priority {high value | low value | switch value}
no power-priority {high | low | switch}
```

Syntax Description	<p>high value Sets the power priority for the ports configured as high-priority ports. The range is 1 to 27, with 1 as the highest priority. The high value must be lower than the value set for the low-priority ports and higher than the value set for the switch.</p> <p>low value Sets the power priority for the ports configured as low-priority ports. The range is 1 to 27. The low value must be higher than the value set for the high-priority ports and the value set for the switch.</p> <p>switch value Sets the power priority for the switch. The range is 1 to 27. The switch value must be lower than the values set for the low and high-priority ports.</p>
---------------------------	--

Command Default	If no values are configured, the power stack randomly determines a default priority. The default ranges are 1 to 9 for switches, 10 to 18 for high-priority ports, 19 to 27 for low-priority ports. On non-PoE switches, the high and low values (for port priority) have no effect.
------------------------	--

Command Modes	Switch stack-power configuration (config-stack)
----------------------	---

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines	<p>To access switch stack-power configuration mode, enter the stack-power switch switch-number global configuration command.</p> <p>Cisco StackPower power-priority values determine the order for shutting down switches and ports when power is lost and load shedding must occur. Priority values are from 1 to 27; the highest numbers are shut down first.</p> <p>We recommend that you configure different priority values for each switch and for its high priority ports and low priority ports to limit the number of devices shut down at one time during a loss of power. If you try to configure the same priority value on different switches in a power stack, the configuration is allowed, but you receive a warning message.</p>
-------------------------	--

Note This command is available only on switch stacks running the IP Base or IP Services feature set.

Examples	This is an example of setting the power priority for switch 1 in power stack a to 7, for the high-priority ports to 11, and for the low-priority ports to 20.
-----------------	---

```
Device(config)# stack-power switch 1
Device(config-switch-stackpower)# stack-id power_stack_a
Device(config-switch-stackpower)# power-priority high 11
Device(config-switch-stackpower)# power-priority low 20
Device(config-switch-stackpower)# power-priority switch 7
Device(config-switch-stackpower)# exit
```

power inline

power inline

To configure the power management mode on PoE ports, use the **power inline** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

```
power inline {auto [max max-wattage] | consumption max-wattage | never | port {1-event | 2-event | priority value} | static [max max-wattage]}
no power inline {auto | consumption | never | port {1-event | 2-event | priority} | static}
```

Syntax Description		
	auto	Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. Allocation is on the first-come, first-serve basis.
	max max-wattage	(Optional) Limits the power allowed on a port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.
	never	Disables device detection, and disables power to the port.
	port	Configures the power priority of the port.
	1-event	Enables 1-event classification. This is applicable only when the port is in Universal Power over Ethernet-plus (UPOE) mode.
	2-event	Enables 2-event classification.
	priority value	Sets the power priority of the port. In case of a power supply failure, ports configured as lowest priority (7) are turned off first and ports configured as highest priority (0) are turned off last. The range is 0 to 7.
	static	Enables powered-device detection. Pre-allocates (reserves) power for a port before the switch discovers the powered device. This action guarantees that the device connected to the interface receives enough power.

Command Default	The default is auto (enabled). The maximum wattage is 30,000 mW. The default PoE port priority is 0 .						
Command Default	Interface configuration (config-if)						
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> <tr> <td>Cisco IOS XE Amsterdam 17.3.1</td><td>The port priority value was introduced to configure power priority on PoE ports.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.	Cisco IOS XE Amsterdam 17.3.1	The port priority value was introduced to configure power priority on PoE ports.
Release	Modification						
Cisco IOS XE Everest 16.6.1	This command was introduced.						
Cisco IOS XE Amsterdam 17.3.1	The port priority value was introduced to configure power priority on PoE ports.						

Usage Guidelines This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, the following error message appears:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# power inline auto
^
% Invalid input detected at '^' marker.
```

In a switch stack, this command is supported on all ports in the stack that support PoE.

Use the **max max-wattage** option to disallow higher-power powered devices. With this configuration, when the powered device sends Cisco Discovery Protocol messages requesting more power than the maximum wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.

Note The switch never powers any class 0 or class 3 device if the **power inline max max-wattage** command is configured for less than 30 W.

If the switch denies power to a powered device (the powered device requests more power through Cisco Discovery Protocol messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** command output shows *power-deny*.

Use the **power inline static max** command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by Cisco Discovery Protocol messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through Cisco Discovery Protocol messages that the powered device needs more than the maximum wattage, the powered device is shut down.

power inline

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears:

```
Command rejected: power inline static: pwr not available.
```

The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco-powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur, placing the port in an error-disabled state.

Use the **power inline port priority** command to configure the power priority of a PoE port. Powered devices connected to ports with low port priority are shut down first in case of a power shortage.

You can verify your settings by entering the **show power inline** command.

Examples

This example shows how to enable detection of a powered device and to automatically power a PoE port on a switch:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto
```

This example shows how to configure a PoE port on a switch to allow a class 1 or a class 2 powered device:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port on a switch:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline never
```

This example shows how to set the priority of a PoE port to the highest, so that it will be one of the last ports to be shut down in case of power supply failure:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
```

```
Device(config-if)# power inline port priority 0
```

Related Commands	Command	Description
	power inline max	Specifies the maximum amount of power, in milliwatts, that a device connected to a port can consume.
	power inline static	Allocates power from the system power pool to a switch port.
	power inline auto	Turns on the device discovery protocol and applies power to the device.
	power inline never	Sets the inline power to the off mode on a switch port.
	power inline port priority	Configures port priorities on PoE ports.
	show power inline	Displays the power status for the specified port or for all ports.

power inline auto-shutdown

power inline auto-shutdown

To enable automatic shutdown control on Power over Ethernet (PoE) ports during power shortage, use the **power inline auto-shutdown** command in global configuration mode. To disable the automatic shutdown control on PoE ports, use the **no** form of this command.

power inline auto-shutdown
no power inline auto-shutdown

Syntax Description This command has no arguments or keywords.

Command Default Automatic shutdown control on PoE ports is disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.

Usage Guidelines This command must be configured for the **power inline port priority** command to work. The **power inline port priority** command configures port priorities on PoE ports.

Examples This example shows how to enable the automatic shutdown control on PoE ports:

```
Device> enable
Device# configure terminal
Device(config)# power inline auto-shutdown
```

Related Commands	Command	Description
	power inline port priority	Configures port priorities on PoE ports.

power inline police

To enable policing of real-time power consumption on a powered device, use the **power inline police** command in interface configuration mode. To disable this feature, use the **no** form of this command

```
power inline police [action {errdisable | log}]
no power inline police
```

Syntax Description	action (Optional) Configures the device to turn off power to the port if the real-time power consumption exceeds the maximum power allocation on the port. This is the default action. errdisable action log (Optional) Configures the device to generate a syslog message while still providing power to a connected device if the real-time power consumption exceeds the maximum power allocation on the port.				
Command Default	Policing of the real-time power consumption of the powered device is disabled.				
Command Modes	Interface configuration (config-if)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines This command is supported only on Power over Ethernet (PoE)-capable ports. If you enter this command on a device or port that does not support PoE, an error message appears.

In a switch stack, this command is supported on all switches or ports in the stack that support PoE and real-time power-consumption monitoring.

When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the allocated maximum amount.

When PoE is enabled, the device senses the real-time power consumption of the powered device. This feature is called *power monitoring* or *power sensing*. The device also polices the power usage with the *power policing* feature.

When power policing is enabled, the device uses one of the these values as the cutoff power on the PoE port in this order:

1. The user-defined power level that limits the power allowed on the port when you enter the **power inline auto max max-wattage** or the **power inline static max max-wattage** interface configuration command
2. The device automatically sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLDP power negotiation.

If you do not manually configure the cutoff-power value, the device automatically determines it by using CDP power negotiation or the device IEEE classification and LLDP power negotiation. If CDP or LLDP are not enabled, the default value of 30 W is applied. However without CDP or LLDP, the device does not allow devices to consume more than 15.4 W of power because values from 15400 to 30000 mW are only allocated based on CDP or LLDP requests. If a powered device consumes more than 15.4 W without CDP or LLDP negotiation, the device might be in violation of the maximum current *I_{max}* limitation and might experience

power inline police

an *Icut* fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated on the PoE port. If the device uses more than the maximum power allocation (or *cutoff power*) on the port, the device either turns power off to the port, or the device generates a syslog message and updates the LEDs (the port LEDs are blinking amber) while still providing power to the device.

- To configure the device to turn off power to the port and put the port in the error-disabled state, use the **power inline police** interface configuration command.
- To configure the device to generate a syslog message while still providing power to the device, use the **power inline police action log** command.

If you do not enter the **action log** keywords, the default action is to shut down the port, turn off power to it, and put the port in the PoE error-disabled state. To configure the PoE port to automatically recover from the error-disabled state, use the **errdisable detect cause inline-power** global configuration command to enable error-disabled detection for the PoE cause and the **errdisable recovery cause inline-power interval** *interval* global configuration command to enable the recovery timer for the PoE error-disabled cause.

Caution If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the port, which could adversely affect the device.

You can verify your settings by entering the **show power inline police** privileged EXEC command.

Examples

This example shows how to enable policing of the power consumption and configuring the device to generate a syslog message on the PoE port on a device:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline police action log
```

power supply

To configure and manage the internal power supplies on a switch, use the **power supply** command in privileged EXEC mode.

power supply stack-member-number slot {A | B} {off | on}

Syntax Description	<i>stack-member-number</i>	Stack member number for which to configure the internal power supplies. The range is 1 to 9, depending on the number of switches in the stack.
		This parameter is available only on stacking-capable switches.
	slot	Selects the switch power supply to set.
	A	Selects the power supply in slot A.
	B	Selects the power supply in slot B.
		Note Power supply slot B is the closest slot to the outer edge of the switch.
	off	Sets the switch power supply to off.
	on	Sets the switch power supply to on.

Command Default The switch power supply is on.

Command Modes Privileged EXEC

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines The **power supply** command applies to a switch or to a switch stack where all switches are the same platform.

In a switch stack with the same platform switches, you must specify the stack member before entering the **slot {A | B} off** or **on** keywords.

To return to the default setting, use the **power supply stack-member-number on** command.

You can verify your settings by entering the **show env power** privileged EXEC command.

Examples This example shows how to set the power supply in slot A to off:

```
Device> power supply 2 slot A off
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
Continue? (yes/[no]): yes
Device
Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
```

power supply

This example shows how to set the power supply in slot A to on:

```
Device> power supply 1 slot B on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the show env power command:

```
Device> show env power
SW  PID          Serial#      Status        Sys Pwr  PoE Pwr  Watts
--  -----  -----  -----
1A  PWR-1RUC2-640WAC  DCB1705B05B  OK       Good    Good   250/390
1B  Not Present
```

power supply autoLC shutdown

To enable automatic shutdown control on linecards, use the **power supply autoLC shutdown** command in global configuration mode. This command is enabled by default and cannot be disabled. The AutoLC shutdown cannot be disabled message will be displayed if you try to disable it.

power supply autoLC shutdown
no power supply autoLC shutdown

Syntax Description This command has no arguments or keywords.

Command Default Automatic shutdown control on linecards is enabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Examples This example shows how to enable automatic shutdown on linecards:

```
Device> enable
Device# configure terminal
Device(config)# power supply autoLC shutdown
```

shell trigger

To create an event trigger, use the **shell trigger** command in global configuration mode. Use the **no** form of this command to delete the trigger.

shell trigger identifier description

no shell trigger identifier description

Syntax Description	<table border="0"> <tr> <td><i>identifier</i></td><td>Specifies the event trigger identifier. The identifier should have no spaces or hyphens between words.</td></tr> <tr> <td><i>description</i></td><td>Specifies the event trigger description text.</td></tr> </table>	<i>identifier</i>	Specifies the event trigger identifier. The identifier should have no spaces or hyphens between words.	<i>description</i>	Specifies the event trigger description text.
<i>identifier</i>	Specifies the event trigger identifier. The identifier should have no spaces or hyphens between words.				
<i>description</i>	Specifies the event trigger description text.				

Command Default System-defined event triggers:

- CISCO_DMP_EVENT
- CISCO_IPVSC_AUTO_EVENT
- CISCO_PHONE_EVENT
- CISCO_SWITCH_EVENT
- CISCO_ROUTER_EVENT
- CISCO_WIRELESS_AP_EVENT
- CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines Use this command to create user-defined event triggers for use with the **macro auto device** and the **macro auto execute** commands.

To support dynamic device discovery when using IEEE 802.1x authentication, you need to configure the RADIUS authentication server to support the Cisco attribute-value pair: **auto-smart-port=event trigger**.

Example

This example shows how to create a user-defined event trigger called RADIUS_MAB_EVENT:

```
Device(config)# shell trigger RADIUS_MAB_EVENT MAC_AuthBypass Event
Device(config)# end
```

show beacon all

To display the status of beacon LED on the device, use the **show beacon all** command in privileged EXEC mode.

```
show beacon { rp { active | standby } | fan-tray | power-supply ps-slot-number | slot slot-number } | all
```

Syntax Description	rp { active standby }	Specifies the active or the standby Supervisor whose beacon LED status is to be displayed.
	slot slot-num	Specifies the slot whose beacon LED status is to be displayed.
	fan-tray	Specifies that the status of fan tray beacon is to be displayed.
	power-supply ps-slot-number	Specifies the power supply whose beacon LED status is to be displayed.
	all	Displays the status of all beacon LEDs.

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.1	This command was introduced.
Command Default	This command has no default settings.	
Command Modes	Privileged EXEC (#)	
Usage Guidelines	Use the command show beacon all to know the status of all beacon LEDs.	

Sample output of **show beacon all** command on a 7-slot device.

```
Device#show beacon all
Slot#      Beacon Status
-----
1          OFF
2          OFF
3          OFF
*4         OFF
5          OFF
6          OFF
7          OFF
-----
Power-Supply#   Beacon Status
-----
4          OFF
8          OFF
-----
FANTRAY BEACON:    OFF
Switch#
```

show beacon all

Following is a sample output of *show beacon rp* command on a 7-slot device

```
Device#show beacon rp active
Slot#    Beacon Status
-----
3                  ON

Switch#show beacon rp standby
Slot#    Beacon Status
-----
4                  OFF
```

The following example displays the status of fantray:

```
Device#show beacon fantray
-----
FANTRAY BEACON: ON
Switch#
```

show eee

To display Energy Efficient Ethernet (EEE) information for an interface, use the **show eee** command in EXEC mode.

show eee {capabilities| counters| status}interface*interface-id*

Syntax Description	capabilities	Displays EEE capabilities for the specified interface.
	counters	Displays EEE counters for the specified interface.
	status	Displays EEE status information for the specified interface.
	interface <i>interface-id</i>	Specifies the interface for which to display EEE capabilities or status information.
Command Default	None	
Command Modes	User EXEC Privileged EXEC	
Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines You can enable EEE on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low power utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

To check if an interface is EEE capable, use the **show eee capabilities** command. You can enable EEE on an interface that is EEE capable by using the **power efficient-ethernet auto** interface configuration command.

To view the EEE status, LPI status, and wake error count information for an interface, use the **show eee status** command.

To view the EEE counters for an interface, use the **show eee counters** command.

Note Starting from Cisco IOS XE Gibraltar 16.12.1, the **show eee counters interface *interface-id*** command is not supported on line cards with Multigigabit (mGig) Ethernet ports.

This is an example of output from the **show eee capabilities** command on an interface where EEE is enabled:

```
Device# show eee capabilities interface gigabitethernet1/0/1
Gi1/0/1
      EEE (efficient-ethernet): yes (100-Tx and 1000T auto)
```

show eee

```
Link Partner : yes (100-Tx and 1000T auto)
```

This is an example of output from the **show eee capabilities** command on an interface where EEE is not enabled:

```
Device# show eee capabilities interface gigabitethernet2/0/1
Gi2/0/1
    EEE (efficient-ethernet) : not enabled
    Link Partner : not enabled
```

This is an example of output from the **show eee status** command on an interface where EEE is enabled and operational. The table that follows describes the fields in the display.

```
Device# show eee status interface gigabitethernet1/0/4
Gi1/0/4 is up
    EEE (efficient-ethernet) : Operational
    Rx LPI Status : Received
    Tx LPI Status : Received
```

This is an example of output from the **show eee status** command on an interface where EEE is operational and the ports are in low power save mode:

```
Device# show eee status interface gigabitethernet1/0/3
Gi1/0/3 is up
    EEE (efficient-ethernet) : Operational
    Rx LPI Status : Low Power
    Tx LPI Status : Low Power
    Wake Error Count : 0
```

This is an example of output from the **show eee status** command on an interface where EEE is not enabled because a remote link partner is incompatible with EEE:

```
Device# show eee status interface gigabitethernet1/0/3
Gi1/0/3 is down
    EEE (efficient-ethernet) : Disagreed
    Rx LPI Status : None
    Tx LPI Status : None
    Wake Error Count : 0
```

This is an example of output from the **show eee counters** command:

```
Device# show eee counters interface gigabitEthernet 2/0/1
LP Active Tx Time (10us) : 66649648
LP Transitioning Tx : 462
LP Active Rx Time (10us) : 64911682
LP Transitioning Rx : 153
```

Table 2: show eee status Field Descriptions

Field	Description
EEE (efficient-ethernet)	<p>The EEE status for the interface. This field can have any of the following values:</p> <ul style="list-style-type: none"> • N/A—The port is not capable of EEE. • Disabled—The port EEE is disabled. • Disagreed—The port EEE is not set because a remote link partner might be incompatible with EEE; either it is not EEE capable, or its EEE setting is incompatible. • Operational—The port EEE is enabled and operating. <p>If the interface speed is configured as 10 Mbps, EEE is disabled internally. When the interface speed moves back to auto, 100 Mbps or 1000 Mbps, EEE becomes active again.</p>
Rx/Tx LPI Status	<p>The Low Power Idle (LPI) status for the link partner. These fields can have any of the following values:</p> <ul style="list-style-type: none"> • N/A—The port is not capable of EEE. • Interrupted—The link partner is in the process of moving to low power mode. • Low Power—The link partner is in low power mode. • None—EEE is disabled or not capable at the link partner side. • Received—The link partner is in low power mode and there is traffic activity. <p>If an interface is configured as half-duplex, the LPI status is None, which means the interface cannot be in low power mode until it is configured as full-duplex.</p>
Wake Error Count	<p>The number of PHY wake-up faults that have occurred. A wake-up fault can occur when EEE is enabled and the connection to the link partner is broken.</p> <p>This information is useful for PHY debugging.</p>

show environment

show environment

To display information about the sensors, and status of fan and power supply, use the **show environment** command in EXEC mode.

show environment { all | counters | history | location | sensor | status | summary | table }

Syntax Description	all (Optional) Displays the list of sensors. counters (Optional) Displays the operational counters of the sensors. history (Optional) Displays history of the sensor state changes. location (Optional) Displays the sensors by location. sensor (Optional) Displays sensor summary. status (Optional) Displays the power supply and fan tray status of the switch. summary (Optional) Displays a summary of all the environment monitoring sensors. table (Optional) Displays sensor state table.				
Command Default	None				
Command Modes	User EXEC (>) Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines	Use the show environment EXEC command to display the information for the switch being accessed—a standalone switch or the active switch.
-------------------------	---

Examples	This example shows a sample output of the show environment all command:
-----------------	--

```
Device> show environment all

Sensor List: Environmental Monitoring
Sensor          Location       State        Reading
Temp: UADP_0_0   R1           Normal      52 Celsius
Temp: UADP_0_1   R1           Normal      50 Celsius
Temp: UADP_0_2   R1           Normal      50 Celsius
Temp: UADP_0_3   R1           Normal      52 Celsius
Temp: UADP_0_4   R1           Normal      51 Celsius
Temp: UADP_0_5   R1           Normal      52 Celsius
Temp: UADP_0_6   R1           Normal      63 Celsius
Temp: UADP_0_7   R1           Normal      54 Celsius
..
<output truncated>
```

This example shows a sample output of the **show environment status** command:

```
Device> show environment status
```

Power Supply	Model No	Type	Capacity	Status	Fan 1	Fan 2
PS1	C9600-PWR-2KWAC	ac	2000 W	active	good	good
PS4	C9600-PWR-2KWAC	ac	2000 W	active	good	good

```
PS Current Configuration Mode : Combined  
PS Current Operating State : none
```

```
Power supplies currently active : 2  
Power supplies currently available : 2
```

```
Fantray : good  
Power consumed by Fantray : 300 Watts  
Fantray airflow direction : side-to-side  
Fantray beacon LED: off  
Fantray status LED: green
```

show errdisable detect

show errdisable detect

To display error-disabled detection status, use the **show errdisable detect** command in EXEC mode.

show errdisable detect

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes User EXEC (>)

Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines A gbic-invalid error reason refers to an invalid small form-factor pluggable (SFP) module.

The error-disable reasons in the command output are listed in alphabetical order. The mode column shows how error-disable is configured for each feature.

You can configure error-disabled detection in these modes:

- port mode—The entire physical port is error-disabled if a violation occurs.
- vlan mode—The VLAN is error-disabled if a violation occurs.
- port/vlan mode—The entire physical port is error-disabled on some ports and is per-VLAN error-disabled on other ports.

This is an example of output from the **show errdisable detect** command:

```
Device> show errdisable detect
ErrDisable Reason      Detection     Mode
-----  -----  -----
arp-inspection        Enabled       port
bpduguard             Enabled       vlan
channel-misconfig     Enabled       port
community-limit       Enabled       port
dhcp-rate-limit      Enabled       port
dtp-flap              Enabled       port
gbic-invalid          Enabled       port
inline-power          Enabled       port
invalid-policy        Enabled       port
l2ptguard             Enabled       port
link-flap              Enabled       port
loopback               Enabled       port
lsgroup                Enabled       port
pagp-flap              Enabled       port
psecure-violation     Enabled       port/vlan
security-violatio     Enabled       port
sfp-config-mismat    Enabled       port
storm-control          Enabled       port
```

udld	Enabled	port
vmps	Enabled	port

show errdisable recovery

show errdisable recovery

To display the error-disabled recovery timer information, use the **show errdisable recovery** command in EXEC mode.

show errdisable recovery

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes User EXEC (>)

Privileged EXEC (#)

Command History

Release

Modification

Cisco IOS XE Everest 16.6.1

This command was introduced.

Usage Guidelines

A gbic-invalid error-disable reason refers to an invalid small form-factor pluggable (SFP) module interface.

Note Though visible in the output, the unicast-flood field is not valid.

show hardware led

To display the status of hardware components on the device, use the **show hardware led** command in privileged EXEC mode.

```
show hardware led [port [FortyGigabitEthernet interface-number | TenGigabitEthernet interface-number | GigabitEthernet interface-number | status] ]
```

Syntax Description		
	FortyGigabitEthernet <i>interface-number</i>	Specifies the FortyGigabit interface whose LED status is to be displayed
	TenGigabitEthernet <i>interface-number</i>	Specifies the Tengigabit interface whose LED status is to be displayed.
	GigabitEthernet <i>interface-number</i>	Specifies the One Gigabit interface whose LED status is to be displayed.
	status	Displays the status of the ports on the device.

Command History	Release	Modification
	Cisco IOS XE Fuji 16.8.1a	This command was introduced.

Command Default This command has no default settings.

Command Modes Privileged EXEC (#)

Usage Guidelines The **show hardware led** command displays the status of ports on the Line Cards and Supervisors, status of PowerSupply and Fan tray modules, and the status of RJ45 console.

On a Supervisor there are four PORT SET ENABLED LEDs, each representing a group of ports. Port numbers 1 to 4 form Group 1 (G1), Port numbers 5 to 8 form Group 2 (G2), Port number 9 is Group 3 (G3) and Port number 10 is Group 4 (G4). Status of each group for an active or standby supervisor is displayed.

The command displays the following colors to indicate status of the PORT LEDs:

- GREEN—Indicates the interface is up.
- BLACK—Indicates the interface is down.
- AMBER—Indicates the interface ADMIN is down.

The command displays the following colors to indicate the status of Line Cards (LC):

- AMBER—Indicates the LC is booting up.
- GREEN—Indicates the LC is up and running.
- RED—Indicates the LC has a problem or is disabled.

Status of BEACON LED for fantray, power-supply, line cards and supervisor modules are indicated by the following colours:

show hardware led

- BLUE—Indicates the Beacon LED is On.
- BLACK—Indicates the Beacon LED is Off.

Status of SYSTEM LED is indicated by the following colors:

- GREEN—Indicates all components are up and running.
- RED—Indicates that temperature exceeds either the critical temperature or the shutdown threshold; or fantray is either removed or has failed.
- ORANGE—Indicates that temperature exceeds the warning threshold; or fantray experiences partial fails; or active power supply failed.

For more information on LEDs refer [Cisco Catalyst 9400 Series Switches Hardware Installation Guide](#).

Sample output of *show hardware led* command

```
Device#show hardware led

show hw-module subslot mode

show hw-module subslot mode

To display the line card mode of the platform, use the **show hw-module subslot mode** command in privileged EXEC mode.

show hw-module subslot *slot/subslot* mode

Syntax Description	<p><i>slot</i> Slot number. The range is from 0 to 10.</p> <p><i>subslot</i> Subslot number. The range is from 0 to 0.</p>				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Examples

The following is sample output from the **show hw-module subslot mode** command:

```
Device# show hw-module subslot 1/0 mode
subslot [1/0] mode: dynamic
```

show idprom fan-tray

To display the serial number for the fan-tray component and the chassis, use the **show idprom fan-tray** command in privileged EXEC mode.

```
show idprom fan-tray
```

Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.
	Cisco IOS XE Fuji 16.8.1a	The output of the command was enhanced to include Chassis Serial Number in the command output.

The following is sample output from the **show idprom fan-tray** command:

```
Device#show idprom fan tray
Fan Tray Idprom:
Controller Type      : 3196
Hardware Revision    : 0.1

show ip interface

show ip interface

To display the usability status of interfaces configured for IP, use the **show ip interface** command in privileged EXEC mode.

show ip interface [type number] [brief]

Syntax Description	<i>type</i> (Optional) Interface type. <i>number</i> (Optional) Interface number. brief (Optional) Displays a summary of the usability status information for each interface.					
Command Default	The full usability status is displayed for all interfaces configured for IP.					
Command Modes	Privileged EXEC (#)					
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>		Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification					
Cisco IOS XE Everest 16.6.1	This command was introduced.					
Usage Guidelines	<p>The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable (which means that it can send and receive packets). If an interface is not usable, the directly connected routing entry is removed from the routing table. Removing the entry lets the software use dynamic routing protocols to determine backup routes to the network, if any.</p> <p>If the interface can provide two-way communication, the line protocol is marked "up." If the interface hardware is usable, the interface is marked "up."</p> <p>If you specify an optional interface type, information for that specific interface is displayed. If you specify no optional arguments, information on all the interfaces is displayed.</p> <p>When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. A show ip interface command on an asynchronous interface encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.</p> <p>You can use the show ip interface brief command to display a summary of the device interfaces. This command displays the IP address, the interface status, and other information.</p> <p>The show ip interface brief command does not display any information related to Unicast RPF.</p>					

Examples

The following example shows interface information on Gigabit Ethernet interface 1/0/1:

```
Device# show ip interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 is up, line protocol is up
  Internet address is 10.1.1.1/16
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 1500 bytes
  Helper address is not set
  Directed broadcast forwarding is disabled
```

```

Outgoing access list is not set
Inbound access list is not set
Proxy ARP is enabled
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachables are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Feature Fast switching turbo vector
IP VPN Flow CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Policy routing is enabled, using route map PBR
Network address translation is disabled
BGP Policy Mapping is disabled
IP Multi-Processor Forwarding is enabled
  IP Input features, "PBR",
    are not supported by MPF and are IGNORED
  IP Output features, "NetFlow",
    are not supported by MPF and are IGNORED

```

The following example shows how to display the usability status for a specific VLAN:

```

Device# show ip interface vlan 1

Vlan1 is up, line protocol is up
  Internet address is 10.0.0.4/24
  Broadcast address is 255.255.255.255
Address determined by non-volatile memory
  MTU is 1500 bytes
  Helper address is not set
  Directed broadcast forwarding is disabled
  Outgoing access list is not set
  Inbound access list is not set
  Proxy ARP is enabled
  Local Proxy ARP is disabled
  Security level is default
  Split horizon is enabled
  ICMP redirects are always sent
  ICMP unreachables are always sent
  ICMP mask replies are never sent
  IP fast switching is enabled
  IP fast switching on the same interface is disabled
  IP Flow switching is disabled
  IP CEF switching is enabled
  IP Fast switching turbo vector
  IP Normal CEF switching turbo vector
  IP multicast fast switching is enabled
  IP multicast distributed fast switching is disabled
  IP route-cache flags are Fast, CEF
  Router Discovery is disabled
  IP output packet accounting is disabled

```

show ip interface

```

IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled

```

The table below describes the significant fields shown in the display.

Table 3: show ip interface Field Descriptions

Field	Description
Broadcast address is	Broadcast address.
Peer address is	Peer address.
MTU is	MTU value set on the interface, in bytes.
Helper address	Helper address, if one is set.
Directed broadcast forwarding	Shows whether directed broadcast forwarding is enabled.
Outgoing access list	Shows whether the interface has an outgoing access list set.
Inbound access list	Shows whether the interface has an incoming access list set.
Proxy ARP	Shows whether Proxy Address Resolution Protocol (ARP) is enabled for the interface.
Security level	IP Security Option (IPSO) security level set for this interface.
Split horizon	Shows whether split horizon is enabled.
ICMP redirects	Shows whether redirect messages will be sent on this interface.
ICMP unreachables	Shows whether unreachable messages will be sent on this interface.
ICMP mask replies	Shows whether mask replies will be sent on this interface.
IP fast switching	Shows whether fast switching is enabled for this interface. It is generally enabled on serial interfaces, such as this one.
IP Flow switching	Shows whether Flow switching is enabled for this interface.
IP CEF switching	Shows whether Cisco Express Forwarding switching is enabled for the interface.
IP multicast fast switching	Shows whether multicast fast switching is enabled for the interface.

Field	Description
IP route-cache flags are Fast	Shows whether NetFlow is enabled on an interface. Displays "Flow init" to specify that NetFlow is enabled on the interface. Displays "Ingress Flow" to specify that NetFlow is enabled on a subinterface using the ip flow ingress command. Shows "Flow" to specify that NetFlow is enabled on a main interface using the ip route-cache flow command.
Router Discovery	Shows whether the discovery process is enabled for this interface. It is generally disabled on serial interfaces.
IP output packet accounting	Shows whether IP accounting is enabled for this interface and what the threshold (maximum number of entries) is.
TCP/IP header compression	Shows whether compression is enabled.
WCCP Redirect outbound is disabled	Shows the status of whether packets received on an interface are redirected to a cache engine. Displays "enabled" or "disabled."
WCCP Redirect exclude is disabled	Shows the status of whether packets targeted for an interface will be excluded from being redirected to a cache engine. Displays "enabled" or "disabled."
Netflow Data Export (hardware) is enabled	NetFlow Data Export (NDE) hardware flow status on the interface.

The following example shows how to display a summary of the usability status information for each interface:

```
Device# show ip interface brief
```

Interface	IP-Address	OK?	Method	Status	Protocol
Vlan1	unassigned	YES	NVRAM	administratively down	down
GigabitEthernet0/0	unassigned	YES	NVRAM	down	down
GigabitEthernet1/0/1	unassigned	YES	NVRAM	down	down
GigabitEthernet1/0/2	unassigned	YES	unset	down	down
GigabitEthernet1/0/3	unassigned	YES	unset	down	down
GigabitEthernet1/0/4	unassigned	YES	unset	down	down
GigabitEthernet1/0/5	unassigned	YES	unset	down	down
GigabitEthernet1/0/6	unassigned	YES	unset	down	down
GigabitEthernet1/0/7	unassigned	YES	unset	down	down

<output truncated>

Table 4: show ip interface brief Field Descriptions

Field	Description
Interface	Type of interface.
IP-Address	IP address assigned to the interface.
OK?	"Yes" means that the IP Address is valid. "No" means that the IP Address is not valid.

show ip interface

Field	Description
Method	The Method field has the following possible values: <ul style="list-style-type: none"> • RARP or SLARP: Reverse Address Resolution Protocol (RARP) or Serial Line Address Resolution Protocol (SLARP) request. • BOOTP: Bootstrap protocol. • TFTP: Configuration file obtained from the TFTP server. • manual: Manually changed by the command-line interface. • NVRAM: Configuration file in NVRAM. • IPCP: ip address negotiated command. • DHCP: ip address dhcp command. • unset: Unset. • other: Unknown.
Status	Shows the status of the interface. Valid values and their meanings are: <ul style="list-style-type: none"> • up: Interface is up. • down: Interface is down. • administratively down: Interface is administratively down.
Protocol	Shows the operational status of the routing protocol on this interface.

Related Commands

Command	Description
ip interface	Configures a virtual gateway IP interface on a Secure Socket Layer Virtual Private Network (SSL VPN) gateway
show interface status	Displays the status of the interface.

show interfaces

To display the administrative and operational status of all interfaces or for a specified interface, use the **show interfaces** command in the EXEC mode.

```
show interfaces [{ interface-id | vlan vlan-id }] [{ accounting | capabilities [ module number ] | description | etherchannel | flowcontrol | link [ module number ] | pruning | stats | status [{ err-disabled }] | trunk | [{ platform }] }]
```

Syntax Description		
	interface-id	(Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 252.
	vlan <i>vlan-id</i>	(Optional) VLAN identification. The range is 1 to 4094.
	accounting	(Optional) Displays accounting information on the interface, including active protocols and input and output packets and octets. Note The display shows only packets processed in software; hardware-switched packets do not appear.
	capabilities	(Optional) Displays the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.
	module <i>number</i>	(Optional) Displays capabilities of all interfaces on the switch or specified stack member. This option is not available if you entered a specific interface ID.
	description	(Optional) Displays the administrative status and description set for interfaces.
	etherchannel	(Optional) Displays interface EtherChannel information.
	flowcontrol	(Optional) Displays interface flow control information.
	link [<i>modulenumber</i>]	(Optional) Displays the up time and down time of the interface.
	pruning	(Optional) Displays trunk VTP pruning information for the interface.
	stats	(Optional) Displays the input and output packets by switching the path for the interface.
	status	(Optional) Displays the status of the interface. A status of unsupported in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot.
	err-disabled	(Optional) Displays interfaces in an error-disabled state.

show interfaces

trunk (Optional) Displays interface trunk information. If you do not specify an interface, only information for active trunking ports appears.

platform (Optional) Displays interface status, controller status, and platform information.

Note Though visible in the command-line help strings, the **crb**, **fair-queue**, **irb**, **mac-accounting**, **precedence**, **random-detect**, **rate-limit**, and **shape** keywords are not supported.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
Cisco IOS XE Everest 16.6.1		This command was introduced.
Cisco IOS XE Gibraltar 16.12.1		The link keyword was introduced.
Cisco IOS XE Amsterdam 17.2.1		The platform keyword was introduced.

Usage Guidelines The **show interfaces capabilities** command with different keywords has these results:

- Use the **show interface capabilities module** *number* command to display the capabilities of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.
- Use the **show interfaces** *interface-id* **capabilities** to display the capabilities of the specified interface.
- Use the **show interfaces capabilities** (with no module number or interface ID) to display the capabilities of all interfaces in the stack.

Note The field **Last Input** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully received by an interface and processed by the CPU on the device. This information can be used to know when a dead interface failed.

Last Input is not updated by fast-switched traffic.

The field **output** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully transmitted by the interface. The information provided by this field can be useful for knowing when a dead interface failed.

The **show interfaces link** command with different keywords has these results:

- Use the **show interface link module** *number* command to display the up time and down time of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.

Note On a standalone switch, the **module number** refers to the slot number.

- Use the **show interfaces interface-id link** to display the up time and down time of the specified interface.
- Use the **show interfaces link** (with no module number or interface ID) to display the up time and down time of all interfaces in the stack.
- If the interface is up, the up time displays the time (hours, minutes, and seconds) and the down time displays 00:00:00.
- If the interface is down, only the down time displays the time (hours, minutes, and seconds).

Examples

This is an example of output from the **show interfaces interface description** command when the interface has been described as *Connects to Marketing* by using the **description** interface configuration command:

```
Device# show interfaces gigabitethernet1/0/2 description
```

Interface	Status	Protocol	Description
Gi1/0/2	up	down	Connects to Marketing

This is an example of output from the **show interfaces interface-id pruning** command when pruning is enabled in the VTP domain:

```
Device# show interfaces gigabitethernet1/0/2 pruning
```

Port	Vlans pruned for lack of request by neighbor
Gi1/0/2	3,4

Port	Vlans traffic requested of neighbor
Gi1/0/2	1-3

This is an example of output from the **show interfaces stats** command for a specified VLAN interface:

```
Device# show interfaces vlan 1 stats
```

Switching path	Pkts In	Chars In	Pkts Out	Chars Out
Processor	1165354	136205310	570800	91731594
Route cache	0	0	0	0
Total	1165354	136205310	570800	91731594

This is an example of output from the **show interfaces status err-disabled** command. It displays the status of interfaces in the error-disabled state:

```
Device# show interfaces status err-disabled
```

Port	Name	Status	Reason
Gi1/0/2		err-disabled	gbic-invalid
Gi2/0/3		err-disabled	dtp-flap

This is an example of output from the **show interfaces interface-id pruning** command:

```
Device# show interfaces gigabitethernet1/0/2 pruning
```

show interfaces

```

Port Vlans pruned for lack of request by neighbor

Device# show interfaces gigabitethernet1/0/1 trunk

Port      Mode          Encapsulation  Status        Native vlan
Gi1/0/1   on           802.1q         other        10

Port      Vlans allowed on trunk
Gi1/0/1   none

Port      Vlans allowed and active in management domain
Gi1/0/1   none

Port      Vlans in spanning tree forwarding state and not pruned
Gi1/0/1   none

```

This is a sample output of the **show interfaces interface-id capabilities** command on a Cisco Catalyst 9400 Series Switch:

```

Device# show interface fi2/0/1 capabilities
FiveGigabitEthernet2/0/1
  Model:                  C9400-LC-48HN
  Type:                   100/1000/2.5G/5GBaseTX
  Speed:                  100,1000,2500,5000,auto
  Duplex:                 full,auto
  Trunk encap. type:      802.1Q
  Trunk mode:              on,off,desirable,nonegotiate
  Channel:                yes
  Broadcast suppression: percentage(0-100)
  Unicast suppression:   percentage(0-100)

Gi1/0/21	6w0d

show interfaces counters

To display various counters for the switch or for a specific interface, use the **show interfaces counters** command in privileged EXEC mode.

show interfaces [interface-id] counters [{errors | etherchannel | module member-number | protocol status | trunk}]

Syntax Description	
interface-id	(Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.
errors	(Optional) Displays error counters.
etherchannel	(Optional) Displays EtherChannel counters, including octets, broadcast packets, multicast packets, and unicast packets received and sent.
module member-number	(Optional) Displays counters for the specified member.
protocol status	(Optional) Displays the status of protocols enabled on interfaces.
trunk	(Optional) Displays trunk counters.

Note Though visible in the command-line help string, the **vlan vlan-id** keyword is not supported.

Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="0"> <tr> <td>Release</td> <td>Modification</td> </tr> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines If you do not enter any keywords, all counters for all interfaces are included.

This is an example of partial output from the **show interfaces counters** command. It displays all counters for the switch.

```
Device# show interfaces counters
Port          InOctets    InUcastPkts     InMcastPkts   InBcastPkts
Gi1/0/1        0           0               0             0
Gi1/0/2        0           0               0             0
Gi1/0/3      95285341    43115          1178430       1950
Gi1/0/4        0           0               0             0

<output truncated>
```

This is an example of partial output from the **show interfaces counters module** command for module 2. It displays all counters for the specified switch in the module.

show interfaces counters

```
Device# show interfaces counters module 2
Port          InOctets   InUcastPkts   InMcastPkts   InBcastPkts
Gi1/0/1        520         2             0             0
Gi1/0/2        520         2             0             0
Gi1/0/3        520         2             0             0
Gi1/0/4        520         2             0             0

<output truncated>
```

This is an example of partial output from the **show interfaces counters protocol status** command for all interfaces:

```
Device# show interfaces counters protocol status
Protocols allocated:
Vlan1: Other, IP
Vlan20: Other, IP, ARP
Vlan30: Other, IP, ARP
Vlan40: Other, IP, ARP
Vlan50: Other, IP, ARP
Vlan60: Other, IP, ARP
Vlan70: Other, IP, ARP
Vlan80: Other, IP, ARP
Vlan90: Other, IP, ARP
Vlan900: Other, IP, ARP
Vlan3000: Other, IP
Vlan3500: Other, IP
GigabitEthernet1/0/1: Other, IP, ARP, CDP
GigabitEthernet1/0/2: Other, IP
GigabitEthernet1/0/3: Other, IP
GigabitEthernet1/0/4: Other, IP
GigabitEthernet1/0/5: Other, IP
GigabitEthernet1/0/6: Other, IP
GigabitEthernet1/0/7: Other, IP
GigabitEthernet1/0/8: Other, IP
GigabitEthernet1/0/9: Other, IP
GigabitEthernet1/0/10: Other, IP, CDP

<output truncated>
```

This is an example of output from the **show interfaces counters trunk** command. It displays trunk counters for all interfaces.

```
Device# show interfaces counters trunk
Port      TrunkFramesTx  TrunkFramesRx  WrongEncap
Gi1/0/1       0            0            0
Gi1/0/2       0            0            0
Gi1/0/3     80678         0            0
Gi1/0/4     82320         0            0
Gi1/0/5       0            0            0

<output truncated>
```

show interfaces downshift

To display downshift status details of the specified interfaces and modules, use the **show interfaces downshift** command in privileged EXEC mode.

show interfaces *interface-id* downshift [module *module-number*]

Syntax Description	<i>interface-id</i> (Optional) ID of the physical interface, including type and port number.
---------------------------	--

module *module-number* (Optional) Displays the downshift status details of the specified slot number.

Command Default	None
------------------------	------

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.2.1	This command was introduced.

Usage Guidelines	The show interfaces downshift command with different keywords has these results:
-------------------------	---

Note This command is currently supported only on standalone devices.

- Use the **show interface downshift module *number*** command to display the downshift status details on the specified slot on the switch
- Use the **show interfaces *interface-id* downshift** to display the downshift status details of the specified interface.
- Use the **show interfaces downshift** (with no module number or interface ID) to display the downshift status details of all interfaces on the switch.

Examples

The following is a sample output from the **show interfaces *interface-id* downshift** command.

```
Device# show interfaces Te2/7/0/25 downshift
Port      Enabled     Active     AdminSpeed     OperSpeed
Te2/7/0/25    yes       yes        auto        2500
```

The following is a sample output from the **show interfaces downshift** command.

```
Device# show interfaces downshift
Port      Enabled     Active     AdminSpeed     OperSpeed
Te1/0/25    yes       no         auto        auto
Te1/0/26    yes       no         auto        auto
Te1/0/27    yes       no         auto        auto
Te1/0/28    yes       no         auto        auto
Te1/0/29    yes       no         auto       10G
Te1/0/30    yes       no         auto        auto
Te1/0/31    yes       no         auto       10G
Te1/0/32    yes       no         auto       10G
```

show interfaces switchport

show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings, use the **show interfaces switchport** command in privileged EXEC mode.

show interfaces [interface-id] switchport [{module number}]

Syntax Description	<p>interface-id (Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 48.</p> <p>module number (Optional) Displays switchport configuration of all interfaces on the switch or specified stack member.</p> <p>This option is not available if you entered a specific interface ID.</p>				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines Use the **show interface switchport module number** command to display the switch port characteristics of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.

This is an example of output from the **show interfaces switchport** command for a port. The table that follows describes the fields in the display.

```
Device# show interfaces gigabitethernet1/0/1 switchport
Name: Gi1/0/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: down
Administrative Trunking Encapsulation: dot1q
Negotiation of Trunking: On

Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: 11-20
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
```

Capture VLANs Allowed: ALL

Protected: false
 Unknown unicast blocked: disabled
 Unknown multicast blocked: disabled
 Appliance trust: none

Field	Description
Name	Displays the port name.
Switchport	Displays the administrative and operational status of the port. In this display, the port is in switchport mode.
Administrative Mode Operational Mode	Displays the administrative and operational modes.
Administrative Trunking Encapsulation Operational Trunking Encapsulation Negotiation of Trunking	Displays the administrative and operational encapsulation method and whether trunking negotiation is enabled.
Access Mode VLAN	Displays the VLAN ID to which the port is configured.
Trunking Native Mode VLAN Trunking VLANs Enabled Trunking VLANs Active	Lists the VLAN ID of the trunk that is in native mode. Lists the allowed VLANs on the trunk. Lists the active VLANs on the trunk.
Pruning VLANs Enabled	Lists the VLANs that are pruning-eligible.
Protected	Displays whether or not protected port is enabled (True) or disabled (False) on the interface.
Unknown unicast blocked Unknown multicast blocked	Displays whether or not unknown multicast and unknown unicast traffic is blocked on the interface.
Voice VLAN	Displays the VLAN ID on which voice VLAN is enabled.
Appliance trust	Displays the class of service (CoS) setting of the data packets of the IP phone.

show interfaces transceiver

show interfaces transceiver

To display the physical properties of a small form-factor pluggable (SFP) module interface, use the **show interfaces transceiver** command in EXEC mode.

```
show interfaces [interface-id] transceiver [{detail | module number | properties | supported-list | threshold-table}]
```

Syntax Description

interface-id	(Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.
detail	(Optional) Displays calibration properties, including high and low numbers and any alarm information for any Digital Optical Monitoring (DoM)-capable transceiver if one is installed in the switch.
module number	(Optional) Limits display to interfaces on module on the switch. This option is not available if you entered a specific interface ID.
properties	(Optional) Displays speed, duplex, and inline power settings on an interface.
supported-list	(Optional) Lists all supported transceivers.
threshold-table	(Optional) Displays alarm and warning threshold table.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
---------	--------------

Cisco IOS XE Everest 16.6.1

This command was introduced.

Examples

This is an example of output from the **show interfaces interface-id transceiver properties** command:

```
Device# show interfaces transceiver
```

```
If device is externally calibrated, only calibrated values are printed.
++ : high alarm, + : high warning, - : low warning, -- : low alarm.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
```

Port	Temperature (Celsius)	Voltage (Volts)	Current (mA)	Optical Tx Power (dBm)	Optical Rx Power (dBm)
Gi5/1/2	42.9	3.28	22.1	-5.4	-8.1
Te5/1/3	32.0	3.28	19.8	2.4	-4.2

```
Device# show interfaces gigabitethernet1/1/1 transceiver properties
Name : Gi1/1/1
Administrative Speed: auto
```

```

Operational Speed: auto
Administrative Duplex: auto
Administrative Power Inline: enable
Operational Duplex: auto
Administrative Auto-MDIx: off
Operational Auto-MDIx: off

```

This is an example of output from the **show interfaces interface-id transceiver detail** command:

```

Device# show interfaces gigabitethernet1/1/1 transceiver detail
ITU Channel not available (Wavelength not available),
Transceiver is internally calibrated.
mA:milliamperes, dBm:decibels (milliwatts), N/A:not applicable.
++:high alarm, +:high warning, -:low warning, -- :low alarm.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are uncalibrated.

```

		High Alarm Threshold (Celsius)	High Warn Threshold (Celsius)	Low Warn Threshold (Celsius)	Low Alarm Threshold (Celsius)
Port	Temperature (Celsius)	74.0	70.0	0.0	-4.0
Gi1/1/1		High Alarm Threshold (Celsius)	High Warn Threshold (Celsius)	Low Warn Threshold (Celsius)	Low Alarm Threshold (Celsius)
Port	Voltage (Volts)				
Gi1/1/1	3.28	3.60	3.50	3.10	3.00
Port	Optical Transmit Power (dBm)	High Alarm Threshold (dBm)	High Warn Threshold (dBm)	Low Warn Threshold (dBm)	Low Alarm Threshold (dBm)
Gi1/1/1	1.8	7.9	3.9	0.0	-4.0
Port	Optical Receive Power (dBm)	High Alarm Threshold (dBm)	High Warn Threshold (dBm)	Low Warn Threshold (dBm)	Low Alarm Threshold (dBm)
Gi1/1/1	-23.5	-5.0	-9.0	-28.2	-32.2

Related Commands

Command	Description
transceiver type all	Enters the transceiver type configuration mode.
monitoring	Enables digital optical monitoring.

show inventory

show inventory

To display the product inventory listing of all Cisco products installed in the networking device, use the **show inventory** command in user EXEC or privileged EXEC mode.

show inventory {fru | oid | raw} [entity]

fru	(Optional) Retrieves information about all Field Replaceable Units (FRUs) installed in the Cisco networking device.
oid	(Optional) Retrieves information about the vendor specific hardware registration identifier referred to as object identifier (OID). The OID identifies the MIB object's location in the MIB hierarchy, and provides a means of accessing the MIB object in a network of managed devices
raw	(Optional) Retrieves information about all Cisco products referred to as entities installed in the Cisco networking device, even if the entities do not have a product ID (PID) value, a unique device identifier (UDI), or other physical identification.
<i>entity</i>	(Optional) Name of a Cisco entity (for example, chassis, backplane, module, or slot). A quoted string may be used to display very specific UDI information; for example “sfslot 1” will display the UDI information for slot 1 of an entity named sfslot.

Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

Usage Guidelines	<p>The show inventory command retrieves and displays inventory information about each Cisco product in the form of a UDI. The UDI is a combination of three separate data elements: a product identifier (PID), a version identifier (VID), and the serial number (SN).</p> <p>The PID is the name by which the product can be ordered; it has been historically called the “Product Name” or “Part Number.” This is the identifier that one would use to order an exact replacement part.</p> <p>The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. The VID is incremented according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.</p> <p>The SN is the vendor-unique serialization of the product. Each manufactured product will carry a unique serial number assigned at the factory, which cannot be changed in the field. This is the means by which to identify an individual, specific instance of a product.</p> <p>The UDI refers to each product as an entity. Some entities, such as a chassis, will have subentities like slots. Each entity will display on a separate line in a logically ordered presentation that is arranged hierarchically by Cisco entities.</p> <p>Use the show inventory command without options to display a list of Cisco entities installed in the networking device that are assigned a PID.</p>
-------------------------	---

The following is sample output from the **show inventory** command:

```

Device# show inventory
NAME: "Chassis", DESC: "Cisco Catalyst 9400 Series 7 Slot Chassis"

```

Table 5: show inventory Field Descriptions

Field	Description
NAME	Physical name (text string) assigned to the Cisco entity. For example, console or a simple component number (port or module number), such as "1," depending on the physical component naming syntax of the device.
DESCR	Physical description of the Cisco entity that characterizes the object. The physical description includes the hardware serial number and the hardware revision.
PID	Entity product identifier. Equivalent to the entPhysicalModelName MIB variable in RFC 2737.
VID	Entity version identifier. Equivalent to the entPhysicalHardwareRev MIB variable in RFC 2737.
SN	Entity serial number. Equivalent to the entPhysicalSerialNum MIB variable in RFC 2737.

For diagnostic purposes, the **show inventory** command can be used with the **raw** keyword to display every RFC 2737 entity including those without a PID, UDI, or other physical identification.

Note The **raw** keyword option is primarily intended for troubleshooting problems with the **show inventory** command itself.

Enter the **show inventory** command with an *entity* argument value to display the UDI information for a specific type of Cisco entity installed in the networking device. In this example, a list of Cisco

show inventory

entities that match the `sfslot` argument string is displayed. You can request even more specific UDI information with the *entity* argument value enclosed in quotation marks.

```
9407R#show inv "Slot 2 Linecard"
NAME: "Slot 2 Linecard", DESCRIPTOR: "Cisco Catalyst 9400 Series 48-Port UPOE 10/100/1000 (RJ-45) "
PID: C9400-LC-48U      , VID: V01    , SN: JAE213102KS
```

show logg onboard slot

To display the status of a line card use the **show logg onboard slot *slot-num state*** command in the global configuration mode.

show logg onboard slot *slot-num state*

Syntax Description	<i>slot-num</i>	Specifies the line card.
	state	Displays the status of the line card.
Command Default	This command has no default settings.	
Command Modes	Privileged EXEC (#)	
Command History	Release Cisco IOS XE Fuji 16.8.1a	
	Modification This command was introduced.	
Usage Guidelines	Use this command to monitor the state of a line card. The status is AMBER during the boot-up of the line card; RED when the linecard is disabled or has a problem; GREEN when the linecard is up and running.	

show memory platform

show memory platform

To display memory statistics of a platform, use the **show memory platform** command in privileged EXEC mode.

show memory platform [{compressed-swap | information | page-merging}]

Syntax Description

compressed-swap	(Optional) Displays platform memory compressed-swap information.
information	(Optional) Displays general information about the platform.
page-merging	(Optional) Displays platform memory page-merging information.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines

Free memory is accurately computed and displayed in the Free Memory field of the command output.

show mgmt-infra trace messages ilpower

To display inline power messages within a trace buffer, use the **show mgmt-infra trace messages ilpower** command in privileged EXEC mode.

show mgmt-infra trace messages ilpower [switch stack-member-number]

Syntax Description	switch stack-member-number (Optional) Specifies the stack member number for which to display inline power messages within a trace buffer.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

This is an output example from the **show mgmt-infra trace messages ilpower** command:

```
Device# show mgmt-infra trace messages ilpower

```

show mgmt-infra trace messages ilpower-ha

To display inline power high availability messages within a trace buffer, use the **show mgmt-infra trace messages ilpower-ha** command in privileged EXEC mode.

show mgmt-infra trace messages ilpower-ha [switch *stack-member-number*]

Syntax Description	switch <i>stack-member-number</i> (Optional) Specifies the stack member number for which to display inline power messages within a trace buffer.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

This is an output example from the **show mgmt-infra trace messages ilpower-ha** command:

```
Device# show mgmt-infra trace messages ilpower-ha
[10/23/12 14:04:48.087 UTC 1 3] NG3K_ILPOWER_HA: Created NGWC ILP CF client successfully.
```

show mgmt-infra trace messages platform-mgr-poe

show mgmt-infra trace messages platform-mgr-poe

To display platform manager Power over Ethernet (PoE) messages within a trace buffer, use the **show mgmt-infra trace messages platform-mgr-poe** privileged EXEC command.

show mgmt-infra trace messages platform-mgr-poe [switch stack-member-number]

Syntax Description	switch stack-member-number (Optional) Specifies the stack member number for which to display messages within a trace buffer.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

This is an example of partial output from the **show mgmt-infra trace messages platform-mgr-poe** command:

```
Device# show mgmt-infra trace messages platform-mgr-poe
[10/23/12 14:04:06.431 UTC 1 5495] PoE Info: get power controller param sent:

show network-policy profile

To display the network-policy profiles, use the **show network policy profile** command in privileged EXEC mode.

show network-policy profile [profile-number] [detail]

Syntax Description	<i>profile-number</i> (Optional) Displays the network-policy profile number. If no profile is entered, all network-policy profiles appear.				
detail	(Optional) Displays detailed status and statistics information.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	This command was introduced.				

This is an example of output from the **show network-policy profile** command:

```
Device# show network-policy profile
Network Policy Profile 10
    voice vlan 17 cos 4
    Interface:
        none
Network Policy Profile 30

Network Policy Profile 36
    voice vlan 4 cos 3
    Interface:
        Interface_id
```

show platform hardware bluetooth

show platform hardware bluetooth

To display information about Bluetooth interface, use the **show platform hardware bluetooth** command in privileged EXEC mode.

show platform hardware bluetooth

Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Gibraltar 16.12.1</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.
Release	Modification				
Cisco IOS XE Gibraltar 16.12.1	This command was introduced.				
Usage Guidelines	The show platform hardware bluetooth command is to be used when an external USB Bluetooth dongle is connected on the device.				
Examples	<p>This example shows how to display the information of the Bluetooth interface using the show platform hardware bluetooth command.</p> <pre>Device> enable Device# show platform hardware bluetooth Controller: 0:1a:7d:da:71:13 Type: Primary Bus: USB State: DOWN Name: HCI Version:</pre>				

show platform hardware fed active forward

To display device-specific hardware information, use the **show platform hardware fed active** command.

This topic elaborates only the forwarding-specific options, that is, the options available with the **show platform hardware fed {active | standby} forward** command.

The output of the **show platform hardware fed active forward** displays all the details about the forwarding decision taken for the packet.

show platform hardware fed {active | standby} forward

Syntax Description	{ active standby } The switch for which you want to display information. You have the following options :
---------------------------	---

- **active**—Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

forward	Displays packet forwarding information.
----------------	---

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines	Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.
-------------------------	---

Fields displayed in the command output are explained below.

- Station Index : The Station Index is the result of the layer 2 lookup and points to a station descriptor which provides the following:
 - Destination Index : Determines the egress port(s) to which the packets should be sent to. Global Port Number(GPN) can be used as the destination index. A destination index with 15 down to 12 bits set indicates the GPN to be used. For example, destination index - 0xF04E corresponds to GPN - 78 (0x4e).
 - Rewrite Index : Determines what needs to be done with the packets. For layer 2 switching, this is typically a bridging action
 - Flexible Lookup Pipeline Stages(FPS) : Indicates the forwarding decision that was taken for the packet - routing or bridging
 - Replication Bit Map : Determines if the packets should be sent to CPU or stack
 - Local Data Copy = 1
 - Remote Data copy = 0
 - Local CPU Copy = 0

show platform hardware fed active forward

- Remote CPU Copy = 0

show platform hardware fed forward interface

To debug forwarding information and to trace the packet path in the hardware forwarding plane, use the **show platform hardware fed forward interface** command. This command simulates a user-defined packet and retrieves the forwarding information from the hardware forwarding plane. A packet is generated on the ingress port based on the packet parameters that you have specified in this command. You can also provide a complete packet from the captured packets stored in a PCAP file.

This topic elaborates only the interface forwarding-specific options, that is, the options available with the **show platform hardware fed {active | standby} forward interface** command.

show platform hardware fed {active | standby} forward interface *interface-type interface-number source-mac-address destination-mac-address {protocol-number | arp | cos | ipv4 | ipv6 | mpls}*

show platform hardware fed {active | standby} forward interface *interface-type interface-number pcap *pcap-file-name number packet-number data**

show platform hardware fed {active | standby} forward interface *interface-type interface-number vlan *vlan-id source-mac-address destination-mac-address {protocol-number | arp | cos | ipv4 | ipv6 | mpls}**

Syntax Description

{active standby }	The switch on which packet tracing has to be scheduled. The input port should be available on this switch. You have the following options :
• active —indicates the active switch on which the the ingress port is present.	
• standby —indicates the standby switch on which the ingress port is present.	

Note This keyword is not supported.

interface <i>interface-type interface-number</i>	The input interface on which packet trace is simulated.
source-mac-address	The source MAC address of the packet you want to simulate.
destination-mac-address	The MAC address of the destination interface in hexadecimal format.
protocol-number	The number assigned to any L3 protocol.
arp	The Address Resolution Protocol (ARP) parameters.
ipv4	The IPv4 packet parameters.
ipv6	The IPv6 packet parameters.
mpls	The Multiprotocol Label Switching (MPLS) label parameters.
cos	The class of service (CoS) number from 0 to 7 to set priority.

show platform hardware fed forward interface

pcap <i>pcap-file-name</i>	Name of the pcap file in internal flash (flash:). Ensure that the file already exists in flash:.
number <i>packet-number</i>	Specifies the packet number in the pcap file.
vlan <i>vlan-id</i>	VLAN id of the dot1q header in the simulated packet. The range is 1 to 4096.

Command Modes Privileged EXEC

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.
	Cisco IOS XE Fuji 16.9.1	The command was enhanced to support MPLS/ARP/VxLAN packet parameters and trace packets captured in a PCAP file.
	Cisco IOS XE Gibraltar 16.10.1	The command was enhanced to support data capture across a stack.

Usage Guidelines Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

This command supports the following packet types:

- Non-IP packets with any L3 protocol
- ARP packets
- IPv4 packets with any L4 protocol
- IPv4 packets with TCP/UDP/IGMP/ICMP/SCTP payload
- VxLAN packets
- MPLS packets with up to 3 Labels and meta data
- MPLS packets with IPv4/IPv6 payload
- IPv6 packets with TCP/UDP/IGMP/ICMP/SCTP payload

In a stack environment, you can trace packets across the stack irrespective of the number of stack members and topology. The **show platform hardware fed forward interface** *interface-type interface-number* command consolidates packet-forwarding information of all the stack members on the ingress switch. To achieve this, ensure that the *interface-number* argument is of the input switch.

To trace any particular packet from the captured packets stored in a PCAP file, use the **show platform hardware fed forward interface** *interface-type interface-number pcap* *pcap-file-name number packet-number* **data** command.

Example

This is an example of output from the **show platform hardware fed { active | standby } forward interface** command.

```
Device#show platform hardware fed active forward interface gigabitEthernet 1/0/35
0000.0022.0055 0000.0055.0066 ipv4 44.44.0.2 55.55.0.2 udp 1222 3333
```

Show forward is running in the background. After completion, syslog will be generated.

```
*Sep 24 05:57:36.614: %SHFWD-6-PACKET_TRACE_DONE: Switch 1 R0/0: fed: Packet Trace Complete:
  Execute (show platform hardware fed <> forward last summary|detail)
*Sep 24 05:57:36.614: %SHFWD-6-PACKET_FLOW_ID: Switch 1 R0/0: fed: Packet Trace Flow
  id is 150323855361
```

Related Commands

Command	Description
monitor capture interface	Configures monitor capture points specifying an attachment point and the packet flow direction.
monitor capture start	Starts the capture of packet data at a traffic trace point into a buffer.
monitor capture stop	Stops the capture of packet data at a traffic trace point.
monitor capture export	Saves the captured packets in the buffer. Use this command to export the monitor capture buffer to a pcap file in flash: that you can use as an input in the show forward with pcap .

show platform hardware fed forward last summary

show platform hardware fed forward last summary

To display a summary of packet tracing data from a switch or switches in a stack, use the **show platform hardware fed forward last summary** command.

The output of the **show platform hardware fed forward last summary** command displays all the details about the forwarding decision taken for the packet from the last time the **show forward** command was run.

show platform hardware fed {active | standby} forward last summary

Syntax Description	active standby	The switch on which you want to schedule a packet capture for a port. You have the following options : <ul style="list-style-type: none">• active—indicates the active switch on which the ingress port is present.• standby—indicates the standby switch on which the ingress port is present.
		Note This keyword is not supported.
	forward last summary	Displays packet forwarding information.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.
	Cisco IOS XE Everest 16.6.1 and later releases	Support for the keyword summary was discontinued.
	Cisco IOS XE Fuji 16.9.1	Support for keywords last and summary is introduced.
	Cisco IOS XE Gibraltar 16.10.1	The output of the command was enhanced to display the details about all the copies of the packets and the corresponding outgoing ports.

Usage Guidelines Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

With Cisco IOS XE Gibraltar 16.10.1, **show platform hardware fed forward last summary** command is enhanced to:

- Inject the debug packets from the CPU to simulate the incoming port and packets
- Use the debug packets to trace the packet in hardware data-path to provide forwarding details such as lookup, adjacency, rewrite information, drop decision, outgoing port and so on
- Drop the original packets at egress so as not to transmit the packet to the outgoing port

- Send a copy of all the packets to the CPU and display the details in the packet tracing output

Example

This is an example of output from the **show platform hardware fed {active | standby } forward last summary** command.

```
Device#show platform hardware fed active forward last summary

```

show platform hardware fed switch fwd-asic counters tla

To display the register information of a counter from the forwarding ASIC, use the **show platform hardware fed switch fwd-asic counters tla** command in the Privileged EXEC mode.

```
show platform hardware fed switch {switch_num | active | standby} fwd-asic counters tla  
tla_counter{detail | drop | statistics} [asic asic_num] output location:filename
```

Syntax Description

switch {switch_num | active | standby} The switch for which you want to display information. You have the following options :
• *switch_num*: ID of the switch.
• **active**: Displays information relating to the active switch.
• **standby**: Displays information relating to the standby switch, if available.

```
show platform hardware fed switch fwd-asic counters tla
```

tlatla_counter	<i>tla_counter</i> can be any of the following Three Letter Acronym (TLA) counters:
	<ul style="list-style-type: none"> • AQM Active Queue Management • ASE ACL Search Engine • DPP DopplerE Point to Point • EGR Egress Global Resolution • EPF Egress Port FIFO • ESM Egress Scheduler Module • EQC Egress Queue Controller • FPE Flexible Parser • FPS Flexible Pipe Stage • FSE Fib Search Engine • IGR Ingress Global Resolution • IPF Ingress Port FIFO • IQS Ingress Queues and Scheduler • MSC Macsec Engine • NFL Netflow • NIF Network Interface • PBC Packet Buffer Complex • PIM Protocol Independent Multicast • PLC Policer • RMU Recirculation Multiplexer Unit • RRE Reassembly Engine • RWE Rewrite Engine • SEC Security Engine • SIF Stack Interface • SPQ Supervisor Packet Queuing Engine • SQS Stack Queues And Scheduler • SUP Supervisor Interface

detail	Displays the contents of the registers of all non-zero counters.
drop	Displays the contents of the registers of all non-zero drop counters.
statistics	Displays the contents of the registers of all non-zero statistical counters.

asic asic_num	(Optional) Specifies the ASIC.
output location:filename	Specifies an output file to which the contents of the counters registers are to be dumped.

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
Cisco IOS XE Everest 16.6.1		This command was introduced.
Cisco IOS XE Amsterdam 17.3.1		The command output was modified to be presented in a readable tabular format. The size of the output file was also reduced by not printing fields that had zero values. The change keyword was deprecated.

Usage Guidelines	Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.
-------------------------	---

Note Some TLAs may not have any registers to display as part of **drop** or **statistics** options because of the lack of these drop or statistics registers for them. In such a case, a message, **No <detail|drop|statistics> counters to display for tla <TLA_NAME>** is displayed and no output file is generated.

Example

This is an example output from the **show platform hardware fed active fwd-asic counters tla aqm** command.

```
Device#show platform hardware fed active fwd-asic counters tla aqm detail output flash:aqm
command to get counters for tla AQM succeeded
Device#
Device# more flash:aqm

show platform hardware fed active fwd-asic resource tcam utilization

show platform hardware fed active fwd-asic resource tcam utilization

To display hardware information about the Ternary Content Addressable Memory (TCAM) usage, use the **show platform hardware fed active fwd-asic resource tcam utilization** command in privileged EXEC mode.

show platform hardware fed active fwd-asic resource tcam utilization[{asic-number }]

Syntax Description	<i>asic-number</i>	ASIC number. Valid values are from 0 to 7.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.2.1	This command was introduced in a release prior to Cisco IOS XE Amsterdam 17.2.1 .

Usage Guidelines On stackable switches, this command has the **switch** keyword, **show platform hardware fed switch active fwd-asic resource tcam utilization**. On non-stackable switches, the **switch** keyword is not available.

Example

The following is sample output from the **show platform hardware fed active fwd-asic resource tcam utilization** command:

```
Device# show platform hardware fed active fwd-asic resource tcam utilization
Codes: EM - Exact_Match, I - Input, O - Output, IO - Input & Output, NA - Not Applicable

CAM Utilization for ASIC [0]

show platform resources

show platform resources

To display platform resource information, use the **show platform resources** command in privileged EXEC mode.

show platform resources

This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines The output of this command displays the used memory, which is total memory minus the accurate free memory.

Example

The following is sample output from the **show platform resources** command:

```
Switch# show platform resources

**State Acronym: H - Healthy, W - Warning, C - Critical

Resource          Usage        Max      Warning     Critical
State

-----
Control Processor    7.20%     100%      90%       95%
H
DRAM              2701MB (69%) 3883MB    90%       95%
H
```

show platform software audit

To display the SE Linux Audit logs, use the **show platform software audit** command in privileged EXEC mode.

```
show platform software audit {all | summary | [switch {switch-number | active | standby} ] {0 | F0 | R0 | {FP | RP} {active}}}}
```

Syntax Description

all	Shows the audit log from all the slots.
summary	Shows the audit log summary count from all the slots.
switch	Shows the audit logs for a slot on a specific switch.
<i>switch-number</i>	Selects the switch with the specified switch number.
switch active	Selects the active instance of the switch.
standby	Selects the standby instance of the switch.
0	Shows the audit log for the SPA-Inter-Processor slot 0.
F0	Shows the audit log for the Embedded-Service-Processor slot 0.
R0	Shows the audit log for the Route-Processor slot 0.
FP active	Shows the audit log for the active Embedded-Service-Processor slot.
RP active	Shows the audit log for the active Route-Processor slot.

Command Modes

Privileged EXEC (#)

Command History

Release

Modification

Cisco IOS XE Gibraltar 16.10.1

This command was introduced.

Usage Guidelines

This command was introduced in the Cisco IOS XE Gibraltar 16.10.1 as a part of the SELinux Permissive Mode feature. The **show platform software audit** command displays the system logs containing the access violation events.

In Cisco IOS XE Gibraltar 16.10.1, operation in a permissive mode is available - with the intent of confining specific components (process or application) of the IOS-XE platform. In the permissive mode, access violation events are detected and system logs are generated, but the event or operation itself is not blocked. The solution operates mainly in an access violation detection mode.

The following is a sample output of the **show software platform software audit summary** command:

show platform software audit

```
Device# show platform software audit summary
=====
AUDIT LOG ON switch 1
-----
AVC Denial count: 58
=====
```

The following is a sample output of the **show software platform software audit all** command:

```
Device# show platform software audit all
=====
AUDIT LOG ON switch 1
-----
===== START =====

show platform software fed active punt cpuq rates

To display the rate at which packets are punted, including the drops in the punted path, use the **show platform software fed active punt cpuq rates** command in privileged EXEC mode.

show platform software fed {active | standby } punt cpuq rates

Syntax Description

active | standby

Displays information about the switch. You have the following options:

- **active**—Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

Note This keyword is not supported.

punt

Specifies the punt information.

cpuq

Specifies information about CPU receive queue.

rates

Specifies the rate at which the packets are punted.

Command Modes

Privileged EXEC (#)

Command History

Release

Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

Modification

Usage Guidelines

The output of this command displays the rate in packets per second at intervals of 10 seconds, 1 minute and 5 minutes.

Example

The following is sample output from the **show platform software fed active punt cpuq rates** command.

```
Device#show platform software fed active punt cpuq rates
```

Punt Rate CPU Q Statistics

Packets per second averaged over 10 seconds, 1 min and 5 mins

Q no	Queue Name	Rx 10s	Rx 1min	Rx 5min	Drop 10s	Drop 1min	Drop 5min
0	CPU_Q_DOT1X_AUTH	0	0	0	0	0	0
1	CPU_Q_L2_CONTROL	0	0	0	0	0	0
2	CPU_Q_FORUS_TRAFFIC	336	266	320	0	0	0
3	CPU_Q_ICMP_GEN	0	0	0	0	0	0
4	CPU_Q_ROUTING_CONTROL	0	0	0	0	0	0

show platform software fed active punt cpuq rates

5	CPU_Q_FORUS_ADDR_RESOLUTION	0	0	0	0	0	0
6	CPU_Q_ICMP_REDIRECT	0	0	0	0	0	0
7	CPU_Q_INTER_FED_TRAFFIC	0	0	0	0	0	0
8	CPU_Q_L2LVX_CONTROL_PKT	0	0	0	0	0	0
9	CPU_Q_EWLC_CONTROL	0	0	0	0	0	0

29	CPU_Q_FSS	0	0	0	0	0	0
30	CPU_Q_MCAST_DATA	0	0	0	0	0	0
31	CPU_Q_GOLD_PKT	0	0	0	0	0	0

The table below describes the significant fields shown in the display.

Table 7: show platform software fed active punt cpuq rates Field Descriptions

Field	Description
Queue Name	Name of the queue.
Rx	The per second rate at which the packets are received in 10s, 1 minute and 5 minutes.
Drop	The per second rate at which the packets are dropped in 10s, 1 minute and 5 minutes.

show platform software fed punt packet-capture display

To display packet capture information during high CPU utilization, use the **show platform software fed active punt packet-capture display** command in privileged EXEC mode.

show platform software fed active punt packet-capture display { detailed | hexdump}

Syntax Description	{active standby}	Displays information about a switch. You have the following options: <ul style="list-style-type: none"> • active—Displays information relating to the active switch. • standby—Displays information relating to the standby switch, if available. Note The standby keyword is not supported.
	punt	Specifies punt information.
	packet-capture display	Specifies information about the captured packet.
	detailed	Specifies detailed information about the captured packet.
	hex-dump	Specifies information about the captured packet, in hex format.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.
Usage Guidelines	The output of this command displays the periodic and persistent logs of CPU-bound packets, inband CPU traffic rates, and running CPU processes when the CPU passes a high CPU utilization threshold.	
Examples	The following is a sample output from the show platform software fed active punt packet-capture display detailed command:	
	<pre>Device# show platform software fed active punt packet-capture display detailed Punt packet capturing: disabled. Buffer wrapping: disabled Total captured so far: 101 packets. Capture capacity : 4096 packets ----- Packet Number: 1, Timestamp: 2018/09/04 23:22:10.179 ----- interface : GigabitEthernet2/0/2 [if-id: 0x00000032] (physical) ether hdr : dest mac: 0100.0ccc.ccc, src mac: 2c36.f8fc.4884 ether hdr : ethertype: 0x0032 Doppler Frame Descriptor :</pre>

show platform software ilpower

To display the inline power details of all the PoE ports on the device, use the **show platform software ilpower** command in privileged EXEC mode.

```
show platform software ilpower {details | port {GigabitEthernet interface-number } | system slot-number }
```

Syntax Description	details Displays inline power details for all the interfaces. port Displays inline power port configuration. GigabitEthernet interface-number The GigabitEthernet interface number. Values range from 0 to 9. system slot-number Displays inline power system configuration.				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>The command was introduced.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	The command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.6.1	The command was introduced.				

Examples The following is sample output from the **show platform software ilpower details** command:

```
Device# show platform software ilpower details

show platform software memory

To display memory information for a specified switch, use the **show platform software memory** command in privileged EXEC mode.

show platform software memory [{chunk | database | messaging}] process slot

Syntax Description

Syntax Description

chunk	(Optional) Displays chunk memory information for the specified process.
database	(Optional) Displays database memory information for the specified process.
messaging	(Optional) Displays messaging memory information for the specified process. The information displayed is for internal debugging purposes only.

show platform software memory

process

Level that is being set. Options include:

- **bt-logger**—The Binary-Tracing Logger process.
- **btrace-manager**—The Btrace Manager process.
- **chassis-manager**—The Chassis Manager process.
- **cli-agent**—The CLI Agent process.
- **cmm**—The CMM process.
- **dbm**—The Database Manager process.
- **dmiauthd**—The DMI Authentication Daemon process.
- **emd**—The Environmental Monitoring process.
- **fed**—The Forwarding Engine Driver process.
- **forwarding-manager**—The Forwarding Manager process.
- **geo**—The Geo Manager process.
- **gnmi**—The GNMI process.
- **host-manager**—The Host Manager process.
- **interface-manager**—The Interface Manager process.
- **iomd**—The Input/Output Module daemon (IOMd) process.
- **ios**—The IOS process.
- **iox-manager**—The IOx Manager process.
- **license-manager**—The License Manager process.
- **logger**—The Logging Manager process.
- **mdt-pubd**—The Model Defined Telemetry Publisher process.
- **ndbman**—The Netconf DataBase Manager process.
- **nesd**—The Network Element Synchronizer Daemon process.
- **nginx**—The Nginx Webserver process.
- **nif_mgr**—The NIF Manager process.
- **platform-mgr**—The Platform Manager process.
- **pluggable-services**—The Pluggable Services process.
- **replication-mgr**—The Replication Manager process.
- **shell-manager**—The Shell Manager process.
- **sif**—The Stack Interface (SIF) Manager process.
- **smd**—The Session Manager process.
- **stack-mgr**—The Stack Manager process.

show platform software memory

- **syncfd**—The SyncmDaemon process.
- **table-manager**—The Table Manager Server.
- **thread-test**—The Multithread Manager process.
- **virt-manager**—The Virtualization Manager process.

<i>slot</i>	<p>Hardware slot where the process for which the level is set, is running. Options include:</p> <ul style="list-style-type: none"> • <i>number</i>—Number of the SIP slot of the hardware module where the level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2. • <i>SIP-slot / SPA-bay</i>—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2. • F0—The Embedded Service Processor slot 0. • FP active—The active Embedded Service Processor. • FP standby—The standby Embedded Service Processor. • R0—The route processor in slot 0. • RP active—The active route processor. • RP standby—The standby route processor. • switch active—The active switch. • switch standby—The standby switch. • <i>number</i>—Number of the SIP slot of the hardware module where the level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2. • <i>SIP-slot / SPA-bay</i>—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2. • F0—The Embedded Service Processor in slot 0. • FP active—The active Embedded Service Processor. • R0—The route processor in slot 0. • RP active—The active route processor.

show platform software memory**Table 8: show platform software memory brief Field Descriptions**

Field	Description
module	Name of submodule.
allocated	Memory, allocated in bytes.
requested	Number of bytes requested by application.
allocs	Number of discrete allocation event attempts.
frees	Number of free events.

show platform software process list

To display the list of running processes on a platform, use the **show platform software process list** command in privileged EXEC mode.

```
show platform software process list switch {switch-number | active | standby} {0 | F0 | R0}
[ {name process-name | process-id process-ID | sort memory | summary}]
```

Syntax Description

switch <i>switch-number</i>	Displays information about the switch. Valid values for <i>switch-number</i> argument are from 0 to 9.
active	Displays information about the active instance of the switch.
standby	Displays information about the standby instance of the switch.
0	Displays information about the shared port adapters (SPA) Interface Processor slot 0.
F0	Displays information about the Embedded Service Processor (ESP) slot 0.
R0	Displays information about the Route Processor (RP) slot 0.
name <i>process-name</i>	(Optional) Displays information about the specified process. Enter the process name.
process-id <i>process-ID</i>	(Optional) Displays information about the specified process ID. Enter the process ID.
sort	(Optional) Displays information sorted according to processes.
memory	(Optional) Displays information sorted according to memory.
summary	(Optional) Displays a summary of the process memory of the host device.

Command Modes

Privileged EXE (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	The Size column in the output was modified to display Resident Set Size (RSS) in KB.
Cisco IOS XE Everest 16.6.1	The command was introduced.

Examples

The following is sample output from the **show platform software process list switch active R0** command:

```
Switch# show platform software process list switch active R0 summary

Total number of processes: 278
  Running      : 2
  Sleeping    : 276
  Disk sleeping : 0
  Zombies     : 0
```

show platform software process list

The table below describes the significant fields shown in the displays.

Table 9: show platform software process list Field Descriptions

Field	Description
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.
Pid	Displays the process ID that is used by the operating system to identify and keep track of the processes.
PPid	Displays process ID of the parent process.
Group Id	Displays the group ID

show platform software process list

Field	Description
Status	Displays the process status in human readable form.
Priority	Displays the negated scheduling priority.
Size	Prior to Cisco IOS XE Gibraltar 16.10.1: Displays Virtual Memory size. From Cisco IOS XE Gibraltar 16.10.1 onwards: Displays the Resident Set Size (RSS) that shows how much memory is allocated to that process in the RAM.

show platform software process memory

To display the amount of memory used by each system process, use the **show platform software process memory** command in privileged EXEC mode.

show platform process memory

```
switch {switch-number | active | standby} {0 | F0 | FP | R0} {all [sorted | virtual [sorted] ] | name process-name {maps | smaps [summary] } | process-id process-id{maps | smaps [summary] } }
```

Syntax Description		
	switch <i>switch-number</i>	Displays information about the switch. Enter the switch number.
	active	Specifies the active instance of the device.
	standby	Specifies the standby instance of the device.
	0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
	F0	Specifies the Embedded Service Processor (ESP) slot 0.
	FP	Specifies the Embedded Service Processor (ESP).
	R0	Specifies the Route Processor (RP) slot 0.
	all	Lists all processes.
	sorted	(Optional) Sorts the output based on Resident Set Size (RSS).
	virtual	(Optional) Specifies virtual memory.
	name <i>process-name</i>	Specifies a process name.
	maps	Specifies the memory maps of a process.
	smaps summary	Specifies the smaps summary of a process.
	process-id <i>process-id</i>	Specifies a process identifier.
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Command Modes Privileged EXEC(#)

Examples:

The following is a sample output from the **show platform software process memory active R0 all** command:

show platform software process memory

```
Device# show platform software process memory switch active R0 all
```

The table below describes the significant fields shown in the displays.

Table 10: show platform software process memory Field Descriptions

Field	Description
PID	Displays the process ID that is used by the operating system to identify and keep track of the processes.
RSS	Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.
PSS	Displays the Proportional Set Size of a process. This is the count of pages it has in memory, where each page is divided by the number of processes sharing it.
Heap	Displays where all user-allocated memory is located.
Shared	Shared clean + Shared dirty
Private	Private clean + Private dirty
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.

show platform software process slot switch

show platform software process slot switch

To display platform software process switch information, use the **show platform software process slot switch** command in privileged EXEC mode.

```
show platform software process slot switch {switch-number | active | standby} {0 | F0 | R0}
monitor [{cycles no-of-times [{interval delay [{lines number}]}]}]
```

Syntax Description

<i>switch-number</i>	Switch number.
active	Specifies the active instance.
standby	Specifies the standby instance.
0	Specifies the shared port adapter (SPA) interface processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
R0	Specifies the Route Processor (RP) slot 0.
monitor	Monitors the running processes.
cycles no-of-times	(Optional) Sets the number of times to run monitor command. Valid values are from 1 to 4294967295. The default is 5.
interval delay	(Optional) Sets a delay after each . Valid values are from 0 to 300. The default is 3.
lines number	(Optional) Sets the number of lines of output displayed. Valid values are from 0 to 512. The default is 0.

Command Modes

Privileged EXEC (#)

Command History

Release Modification

This command was introduced.

Usage Guidelines

The output of the **show platform software process slot switch** and **show processes cpu platform monitor location** commands display the output of the Linux **top** command. The output of these commands display Free memory and Used memory as displayed by the Linux **top** command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.

Examples

The following is sample output from the **show platform software process slot monitor** command:

```
Switch# show platform software process slot switch active R0 monitor
```

```
top - 00:01:52 up 1 day, 11:20, 0 users, load average: 0.50, 0.68, 0.83

show platform software thread list

To display the list of threads on a platform, use the **show platform software thread list** command in privileged EXEC mode.

```
show platform software thread list switch {switch-number | active | standby} {0 | F0 | FP
active | R0} pname {cdman | vidman | all} tname {main | pktio | rt | all}
```

Syntax Description		
switch <i>switch-number</i>		Displays information about the switch. Enter the switch number.
active		Specifies the active instance of the device.
standby		Specifies standby instance of the device.
0		Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
F0		Specifies the Embedded Service Processor (ESP) slot 0.
FP active		Specifies the active instance of Embedded Service Processor (ESP).
R0		Specifies the Route Processor (RP) slot 0.
pname		Specifies a process name. The possible values are cdman , vidman , and all .
tname		Specifies a thread name. The possible values are main , pktio , rt , and all .
Command History	Release	Modification
Cisco IOS XE Gibraltar 16.10.1		This command was introduced.
Command Modes	Privileged EXEC(#)	

Examples:

The following is sample output from the **show platform software thread list switch active R0 pname cdman tname all** command:

```
Device# show platform software thread list switch active R0 pname cdman tname all
```

Name TIME+	Tid	PPid	Group	Id	Core	Vcswch	Nvcswch	Status	Priority
cdman 12309	8407	7295		8407	1	0	0	S	20

The table below describes the significant fields shown in the displays.

show platform software thread list

Table 11: show platform software thread list Field Descriptions

Field	Description
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.
Tid	Displays the process ID.
PPid	Displays the process ID of the parent process.
Group Id	Displays the group ID.
Core	Displays processor information.
Vcswch	Displays the number of voluntary context switches.
Nvcswch	Displays the number of non-voluntary context switches.
Status	Displays the process status in human readable form.
Priority	Displays the negated scheduling priority.
TIME+	Displays the time since the start of the process.
Size	Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.

show processes cpu platform

To display information about the CPU utilization of the IOS-XE processes, use the **show processes cpu platform** command in privileged EXEC mode.

```
show processes cpu platform [ [ sorted [1min | 5min | 5sec] ] location
switch {switch-number | active | standby} {F0 | FP active | R0 | RP active} }
```

Syntax Description	sorted	(Optional) Displays output sorted based on percentage of CPU usage on a platform.
	1min	(Optional) Sorts based on 1 minute intervals.
	5min	(Optional) Sorts based on 5 minute intervals.
	5sec	(Optional) Sorts based on 5 second intervals.
	location	Specifies the Field Replaceable Unit (FRU) location.
	switch <i>switch-number</i>	Displays information about the switch. Enter the switch number.
	active	Specifies the active instance of the device.
	standby	Specifies the standby instance of the device.
	F0	Specifies the Embedded Service Processor (ESP) slot 0.
	FP active	Specifies active instances on the Embedded Service Processor (ESP).
	R0	Specifies the Route Processor (RP) slot 0.
	RP active	Specifies active instances on the Route Processor (RP).

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

show processes cpu platform history

show processes cpu platform history

To display information about the CPU usage history of a system, use the **show processes cpu platform history** command.

**show processes cpu platform history [1min | 5min | 5sec | 60min] location
switch {switch-number | active | standby} {0 | F0 | FP active | R0}**

1min	(Optional) Displays CPU utilization history with 1 minute intervals.
5min	(Optional) Displays CPU utilization history with 5 minute intervals.
5sec	(Optional) Displays CPU utilization history with 5 second intervals.
60min	(Optional) Displays CPU utilization history with 60 minute intervals.
location	Specifies the Field Replaceable Unit (FRU) location.
switch switch-number	Displays information about the switch. Enter the switch number.
active	Specifies the active instance of the device.
standby	Specifies the standby instance of the device.
0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
FP active	Specifies active instances on the Embedded Service Processor (ESP).
R0	Specifies the Route Processor (RP) slot 0.

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

show processes cpu platform monitor location switch {switch-number | active | standby} {0 | F0 | R0}
```

Syntax Description	location Displays information about the Field Replaceable Unit (FRU) location. switch Specifies the switch. switch-number Switch number. active Specifies the active instance. standby Specifies the standby instance. 0 Specifies the shared port adapter (SPA) interface processor slot 0. F0 Specifies the Embedded Service Processor (ESP) slot 0. R0 Specifies the Route Processor (RP) slot 0.
---------------------------	---

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines	The output of the show platform software process slot switch and show processes cpu platform monitor location commands display the output of the Linux top command. The output of these commands display Free memory and Used memory as displayed by the Linux top command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.
-------------------------	---

Examples	The following is sample output from the show processes cpu monitor location switch active R0 command:
-----------------	--

```
Switch# show processes cpu platform monitor location switch active R0

top - 00:04:21 up 1 day, 11:22,  0 users,  load average: 0.42, 0.60, 0.78

Related Commands

Command	Description
show platform software process slot switch	Displays platform software process switch information.

show processes memory

To display the amount of memory used by each system process, use the **show processes memory** command in privileged EXEC mode.

```
show processes memory [{process-id | sorted [{allocated | getbufs | holding}]}]
```

Syntax Description

process-id	(Optional) Process ID (PID) of a specific process. When you specify a process ID, only details for the specified process will be shown.
sorted	(Optional) Displays memory data sorted by the Allocated, Get Buffers, or Holding column. If the sorted keyword is used by itself, data is sorted by the Holding column by default.
allocated	(Optional) Displays memory data sorted by the Allocated column.
getbufs	(Optional) Displays memory data sorted by the Getbufs (Get Buffers) column.
holding	(Optional) Displays memory data sorted by the Holding column. This keyword is the default.

Command Modes

Privileged EXEC (#)

Command History

Release Modification

Cisco IOS XE Everest 16.6.1 This command was introduced.

Usage Guidelines

The **show processes memory** command and the **show processes memory sorted** command displays a summary of total, used, and free memory, followed by a list of processes and their memory impact.

If the standard **show processes memory process-id** command is used, processes are sorted by their PID. If the **show processes memory sorted** command is used, the default sorting is by the Holding value.

Note Holding memory of a particular process can be allocated by other processes also, and so it can be greater than the allocated memory.

The following is sample output from the **show processes memory** command:

```
Device# show processes memory
```

Processor	Pool	Total:	Used:	Free:	Process		
PID	TTY	Allocated	Freed	Holding	Getbufs	Retbufs	
0	0	8629528	689900	6751716	0	0	*Init*
0	0	24048	12928	24048	0	0	*Sched*
0	0	260	328	68	350080	0	*Dead*
1	0	0	0	12928	0	0	Chunk Manager
2	0	192	192	6928	0	0	Load Meter
3	0	214664	304	227288	0	0	Exec
4	0	0	0	12928	0	0	Check heaps
5	0	0	0	12928	0	0	Pool Manager
6	0	192	192	12928	0	0	Timers
7	0	192	192	12928	0	0	Serial Backgroun

show processes memory

```

    8   0      192      192     12928      0      0 AAA high-capacit
    9   0       0       0     24928      0      0 Policy Manager
   10   0       0       0     12928      0      0 ARP Input
   11   0      192      192     12928      0      0 DDR Timers
   12   0       0       0     12928      0      0 Entity MIB API
   13   0       0       0     12928      0      0 MPLS HC Counter
   14   0       0       0     12928      0      0 SERIAL A'detect

.
.

    78   0       0       0     12992      0      0 DHCPD Timer
   79   0      160      0     13088      0      0 DHCPD Database
               8329440 Total

```

The table below describes the significant fields shown in the display.

Table 12: show processes memory Field Descriptions

Field	Description
Processor Pool Total	Total amount of memory, in kilobytes (KB), held for the Processor memory pool.
Used	Total amount of used memory, in KB, in the Processor memory pool.
Free	Total amount of free memory, in KB, in the Processor memory pool.
PID	Process ID.
TTY	Terminal that controls the process.
Allocated	Bytes of memory allocated by the process.
Freed	Bytes of memory freed by the process, regardless of who originally allocated it.
Holding	Amount of memory, in KB, currently allocated to the process. This includes memory allocated by the process and assigned to the process.
Getbufs	Number of times the process has requested a packet buffer.
Retbufs	Number of times the process has relinquished a packet buffer.
Process	Process name.
Init	System initialization process.
Sched	The scheduler process.
Dead	Processes as a group that are now dead.
<value> Total	Total amount of memory, in KB, held by all processes (sum of the “Holding” column).

The following is sample output from the **show processes memory** command when the **sorted** keyword is used. In this case, the output is sorted by the Holding column, from largest to smallest.

```

Device# show processes memory sorted

Processor Pool Total: 25954228 Used: 8371280 Free: 17582948
 PID TTY Allocated Freed Holding Getbufs Retbufs Process
   0   0     8629528   689900   6751716      0      0 *Init*

--More--

```

The following is sample output from the **show processes memory** command when a process ID (*process-id*) is specified:

```
Device# show processes memory 1
```

```

Process ID: 1
Process Name: Chunk Manager
Total Memory Held: 8428 bytes
Processor memory holding = 8428 bytes
pc = 0x60790654, size =      6044, count =      1
pc = 0x607A5084, size =      1544, count =      1
pc = 0x6076DBC4, size =       652, count =      1
pc = 0x6076FF18, size =       188, count =      1
I/O memory holding = 0 bytes

```

```
Device# show processes memory 2
```

```

Process ID: 2
Process Name: Load Meter
Total Memory Held: 3884 bytes
Processor memory holding = 3884 bytes
pc = 0x60790654, size =      3044, count =      1
pc = 0x6076DBC4, size =       652, count =      1
pc = 0x6076FF18, size =       188, count =      1
I/O memory holding = 0 bytes

```

Related Commands

Command	Description
show memory	Displays statistics about memory, including memory-free pool statistics.
show processes	Displays information about the active processes.

show processes memory platform

show processes memory platform

To display memory usage for each Cisco IOS XE process, use the **show processes memory platform** command in privileged EXEC mode.

```
show processes memory platform [ [ detailed { name process-name | process-id process-ID } [ location | maps [ location ] | smaps [ location ] ] | location | sorted [ location ] ] { active | standby } { 0 | F0 | R0 } | accounting ]
```

Syntax Description	accounting	(Optional) Displays the top memory allocators for each Cisco IOS XE process.
	detailed	(Optional) Displays detailed memory information for a specified Cisco IOS XE process.
	name <i>process-name</i>	(Optional) Displays the Cisco IOS XE process name. Enter the process name.
	process-id <i>process-ID</i>	(Optional) Displays the Cisco IOS XE process ID. Enter the process ID.
	location	(Optional) Displays information about the Field Replaceable Unit (FRU) location.
	maps	(Optional) Displays memory maps of a process.
	smaps	(Optional) Displays static memory maps of a process.
	sorted	(Optional) Displays the sorted output based on the Resident Set Size (RSS) memory used by Cisco IOS XE process.
	active	Displays information about the active instance of the device.
	standby	Displays information about the standby instance of the device.
	0	Displays information about Shared Port Adapter (SPA)-Inter-Processor slot 0.
	F0	Displays information about Embedded Service Processor (ESP) slot 0.
	R0	Displays information about Route Processor (RP) slot 0.
Command Modes	Privileged EXEC (#)	
Command History	Release Cisco IOS XE Everest 16.6.1	Modification This command was introduced.

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was modified. The keyword accounting was added. The Total column was deleted from the output.

show processes platform

show processes platform

To display information about the IOS-XE processes running on a platform, use the **show processes platform** command in privileged EXEC mode.

**show processes platform [detailed name *process-name*] [location
switch { *switch-number* | active | standby } { 0 | F0 | FP active | R0 }]**

detailed	(Optional) Displays detailed information of the specified IOS-XE process.
name <i>process-name</i>	(Optional) Specifies the process name.
location	(Optional) Specifies the Field Replaceable Unit (FRU) location.
switch <i>switch-number</i>	(Optional) Displays information about the switch.
active	(Optional) Specifies the active instance of the device.
standby	(Optional) Specifies standby instance of the device.
0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
FP active	Specifies the active instance in the Embedded Service Processor (ESP).
R0	Specifies the Route Processor (RP) slot 0.

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Command Modes	Privileged EXEC(#)
---------------	--------------------

Examples:

The following is sample output from the **show processes platform** command:

```
Device# show processes platform

CPU utilization for five seconds: 1%, one minute: 2%, five minutes: 1%
      Pid      PPid  Status       Size  Name
-----+
      1        0    S          4876  systemd
      2        0    S            0  kthreadd
      3        2    S            0  ksoftirqd/0

The table below describes the significant fields shown in the displays.

Table 13: show processes platform Field Descriptions

Field	Description
Pid	Displays the process ID.

show processes platform

Field	Description
PPid	Displays the process ID of the parent process.
Status	Displays the process status in human readable form.
Size	Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.

show power

To display information of the power supplies and the cumulative power allocation of various port priorities configured on a device, use the **show power** command in privileged EXEC mode.

show power [{detail | inline | | module}]

Syntax Description	detail (Optional) Displays detailed information of the cumulative power allocation and Power over Ethernet (PoE) port priorities configured on a device. inline (Optional) Displays the inline power status. module (Optional) Displays the status of the power supply modules.						
Command Modes	Privileged EXEC (#)						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> <tr> <td>Cisco IOS XE Amsterdam 17.3.1</td> <td>The command output was enhanced to display information of the power allocated to the PoE port priorities.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.	Cisco IOS XE Amsterdam 17.3.1	The command output was enhanced to display information of the power allocated to the PoE port priorities.
Release	Modification						
Cisco IOS XE Everest 16.6.1	This command was introduced.						
Cisco IOS XE Amsterdam 17.3.1	The command output was enhanced to display information of the power allocated to the PoE port priorities.						

Examples

The following shows a sample output of the **show power** command:

```
Device# show power

Power
Supply Model No          Type Capacity Status   Fan States
----- -----
PS1    C9400-PWR-3200AC ac    1570 W  active  good  good
PS2    C9400-PWR-3200AC ac    1570 W  active  good  good
PS3    C9400-PWR-3200AC ac    1570 W  active  good  good
PS4    C9400-PWR-3200AC ac    1570 W  active  good  good

Power Summary           Maximum
(in Watts)      Used     Available
-----
System Power    3070      3070
Inline Power    480       3210
-----
Total          3550      6280

PoE             PoE Shutdown
Priority       Allocation(Watts) Threshold(Watts)
----- -----
Priority-0    240        1545
Priority-1    30         1575
Priority-2    0          1575
Priority-3    0          1575
Priority-4    0          1575
```

show power

Priority-5	0	1575
Priority-6	0	1575
Priority-7	0	1575

Table 14: show power Significant Field Descriptions

Field	Description
PoE Shutdown Allocation(Watts)	Power allocated to the PoE port priorities.
Threshold(Watts)	<p>Minimum power required for the PoE ports to be up.</p> <ul style="list-style-type: none"> • Priority-7: Minimum power required for priority 7 to priority 0 ports to be up • Priority-6: Minimum power required for priority 6 to priority 0 ports to be up • Priority-5: Minimum power required for priority 5 to priority 0 ports to be up • Priority-4: Minimum power required for priority 4 to priority 0 ports to be up • Priority-3: Minimum power required for priority 3 to priority 0 ports to be up • Priority-2: Minimum power required for priority 2 to priority 0 ports to be up • Priority-1: Minimum power required for priority 1 to priority 0 ports to be up • Priority-0: Minimum power required for priority 0 ports to be up

PoE auto shutdown cutoff power is an addition of the current system power (not maximum) and power allocated to different PoE ports. For example:

- Priority 0 cutoff power = system power + minimum power required for priority 0 ports to be up, which is, $3070 + 60 = 3130$.

The hardware registers are programmed using scaling factor as 15, and so the closest multiple of 15 is taken. As the closest multiple of 15 for 3130 is 3135, 3135 is programmed as the cutoff power for priority 0 ports.

- Priority 1 cutoff power = system power + minimum power required for priority 0 ports to be up + minimum power required for priority 1 ports to be up, which is, $3070 + 60 + 60 = 3190$.

As the closest multiple of 15 for 3190 is 3195, 3195 is programmed as the cutoff power for priority 1 ports.

- Priority 7 cutoff power = system power + minimum power required for priority 0 ports to be up + minimum power required for priority 1 ports to be up + minimum power required for priority 2 ports to be up + minimum power required for priority 3 ports to be up + minimum power required for priority 4 ports to be up + minimum power required for priority 5 ports to

be up + minimum power required for priority 6 ports to be up + minimum power required for priority 7 ports to be up, which is, $3070 + 60 + 60 + 60 + 60 + 60 + 60 + 60 + 60 = 3550$.

As the closest multiple of 15 for 3550 is 3555, 3555 is programmed as the cutoff power for priority 7 ports.

If a power supply is removed, the hardware identifies which ports to shutdown based on the power requirements.

show power inline priority

show power inline priority

To display the Power over Ethernet (PoE) port states and priorities of the administration and operating modes configured on an interface, use the **show power inline priority** command in privileged EXEC mode.

show power inline priority *interface-id*

Syntax Description	<i>interface-id</i> (Optional) Specifies the ID of the physical interface.						
Command Modes	Privileged EXEC (#)						
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> <tr> <td>Cisco IOS XE Amsterdam 17.3.1</td><td>The command output was enhanced to display information of the power allocated to the PoE port priorities.</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.	Cisco IOS XE Amsterdam 17.3.1	The command output was enhanced to display information of the power allocated to the PoE port priorities.
Release	Modification						
Cisco IOS XE Everest 16.6.1	This command was introduced.						
Cisco IOS XE Amsterdam 17.3.1	The command output was enhanced to display information of the power allocated to the PoE port priorities.						
Examples	The following is a sample output of the show power inline priority command. The table that follows describes the output fields.						

```
Device> show power inline priority gigabitEthernet 1/0/1

Power inline auto shutdown: Enabled
Interface Admin Oper Admin Oper
          State State Priority Priority
----- -----
GigabitEthernet1/0/1 static on      5       0

Priority Power Per
          Priority(Watts)
----- -----
0        0
1        1440
2        1440
3        2880
4        0
5        2880
6        0
7        0
```

Table 15: show power inline priority Field Descriptions

Field	Description
Admin State	Administration mode: auto, off, static.

Field	Description
Oper State	Operating mode: <ul style="list-style-type: none"> on: The powered device is detected, and power is applied. off: No PoE is applied. faulty: Device detection or a powered device is in a faulty state. power-deny: A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.
Admin Priority	Administration priority level: 0 to 7.
Oper Priority	Operating priority level: 0 to 7.
Power Per Priority(Watts)	Power allocated to the PoE port priorities.

In the above example, Gi1/0/1 has administration state configured as static with priority as 5. The internal priority programmed in the hardware is 0.

show power inline detail

show power inline detail

To display a detailed information on the Power over Ethernet (PoE) status for the specified interface, use the **show power inline *interface-id* detail** command in privileged EXEC mode.

show power inline [interface-id] detail

Syntax Description	<i>interface-id</i> (Optional) ID of the physical interface.						
Command Modes	Privileged EXEC (#)						
Command History	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> <tr> <td>Cisco IOS XE Gibraltar 16.11.1</td><td>This command was modified. The command output was enhanced to display information on the signal and spare pairs and also the physical class assigned by the power sourcing equipment (PSE) to the powered devices (PD).</td></tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.6.1	This command was introduced.	Cisco IOS XE Gibraltar 16.11.1	This command was modified. The command output was enhanced to display information on the signal and spare pairs and also the physical class assigned by the power sourcing equipment (PSE) to the powered devices (PD).
Release	Modification						
Cisco IOS XE Everest 16.6.1	This command was introduced.						
Cisco IOS XE Gibraltar 16.11.1	This command was modified. The command output was enhanced to display information on the signal and spare pairs and also the physical class assigned by the power sourcing equipment (PSE) to the powered devices (PD).						
Examples	This following is a sample output from the show power inline detail command on a Single Signature device:						

```
Device# show power inline gigabitethernet 1/0/29 detail

Interface: Gi1/0/29

          State          Alt-A,B     Allocated Utilized Alt-A,B
-----
Gi1/0/16  auto  SS   on, on        60.0       10.5      8       Ieee PD
Gi1/0/21  auto  DS   on, on        60.0       10.5      5,5    Ieee PD
```

This is an example of an output from the **show power inline upoe-plus interface-id** command on a switch port:

```
Device> show power inline upoe-plus gigabitEthernet 1/0/23

Codes: DS - Dual Signature device, SS - Single Signature device
      SP - Single Pairset device

Interface Admin Type Oper-State      Power(Watts)    Class   Device Name
          State          Alt-A,B     Allocated Utilized Alt-A,B
-----
Gi1/0/4   auto  SP   on            4.0        3.8       1       Ieee PD
Gi1/0/15  auto  SS   on, on        60.0       10.5      6       Ieee PD
Gi1/0/23  auto  DS   on, on        45.4       26.9      3,4    Ieee PD
```

Table 16: show power inline upoe-plus Field Descriptions

Field	Description
Type	Type of powered device: Single Pairset device or Single Signature device or Dual Signature device
Oper-State	The state of each signal and spare pair on the port.

```
show power inline upoe-plus
```

Field	Description
Power Allocated	Power allocated to the port, in Watts
Power Utilized	Power consumed by the powered device on the port.
Class Alt-A, B	Signal, Spare-pair respectively
Device Name	Name of the powered device as advertised by CDP.

show system mtu

To display the global maximum transmission unit (MTU) or maximum packet size set for the switch, use the **show system mtu** command in privileged EXEC mode.

show system mtu

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines For information about the MTU values and the stack configurations that affect the MTU values, see the **system mtu** command.

Examples This is an example of output from the **show system mtu** command:

```
Device# show system mtu
Global Ethernet MTU is 1500 bytes.
```

show tech-support

show tech-support

To automatically run **show** commands that display system information, use the **show tech-support** command in the privilege EXEC mode.

show tech-support

[**cef** | **cft** | **eigrp** | **evc** | **fnf** | **ipc** | **ipmulticast** | **ipsec** | **mfib** | **nat** | **nbar** | **onep** | **ospf** | **page** | **password** | **rsvp** | **subscriber** | **vrrp** | **wccp**]

Syntax Description

cef	(Optional) Displays CEF related information.
cft	(Optional) Displays CFT related information.
eigrp	(Optional) Displays EIGRP related information.
evc	(Optional) Displays EVC related information.
fnf	(Optional) Displays flexible netflow related information.
ipc	(Optional) Displays IPC related information.
ipmulticast	(Optional) Displays IP multicast related information.
ipsec	(Optional) Displays IPSEC related information.
mfib	(Optional) Displays MFIB related information.
nat	(Optional) Displays NAT related information.
nbar	(Optional) Displays NBAR related information.
onep	(Optional) Displays ONEP related information.
ospf	(Optional) Displays OSPF related information.
page	(Optional) Displays the command output on a single page at a time. Use the Return key to display the next line of output or use the space bar to display the next page of information. If not used, the output scrolls (that is, it does not stop for page breaks). Press the Ctrl-C keys to stop the command output.
password	(Optional) Leaves passwords and other security information in the output. If not used, passwords and other security-sensitive information in the output are replaced with the label "<removed>".
rsvp	(Optional) Displays IP RSVP related information.
subscriber	(Optional) Displays subscriber related information.
vrrp	(Optional) Displays VRRP related information.
wccp	(Optional) Displays WCCP related information.

Command Modes

Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was implemented.

Usage Guidelines	The output from the show tech-support command is very long. To better manage this output, you can redirect the output to a file (for example, show tech-support > filename) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.
------------------	--

You can use one of the following redirection methods:

- **> filename** - Redirects the output to a file.
- **>> filename** - Redirects the output to a file in append mode.

show tech-support bgp

show tech-support bgp

To automatically run show commands that display BGP related system information, use the **show tech-support bgp** command in the privileged EXEC mode.

```
show tech-support bgp [address-family {all | ipv4 [flowspec | multicast | unicast | [mdt | mvpn] {all | vrf vrf-instance-name} ] | ipv6 [flowspec | multicast | mvpn {all | vrf vrf-instance-name} | unicast] | l2vpn [evpn | vpls] | link-state [link-state] | [nsap | rtfilter] [unicast] | [vpnv4 | vpvn6] [flowspec | multicast | unicast] {all | vrf vrf-instance-name} } ] [detail]
```

Syntax Description		
address-family		(Optional) Displays the output for a specified address family.
address-family all		(Optional) Displays the output for all address families.
ipv4		(Optional) Displays the output for IPv4 address family.
ipv6		(Optional) Displays the output for IPv6 address family.
l2vpn		(Optional) Displays the output for L2VPN address family.
link-state		(Optional) Displays the output for Link State address family.
nsap		(Optional) Displays the output for NSAP address family.
rtfilter		(Optional) Displays the output for RT Filter address family.
vpnv4		(Optional) Displays the output for VPNV4 address family.
vpnv6		(Optional) Displays the output for VPKN6 address family.
flowspec		(Optional) Displays the flowspec related information for an address family.
multicast		(Optional) Displays the multicast related information for an address family.
unicast		(Optional) Displays the unicast related information for an address family.
mdt		(Optional) Displays the Multicast Distribution Tree (MDT) related information for an address family.

mvpn	(Optional) Displays the Multicast VPN (MVPN) related information for an address family.
vrf	Displays the information for a VPN Routing/Forwarding instance.
evpn	(Optional) Displays the Ethernet VPN (EVPN) related information for an address family.
vpls	(Optional) Displays the Virtual Private LAN Services (VPLS) related information for an address family.
<i>vrf-instance-name</i>	Specifies the name of the VPN Routing/Forwarding instance.
all	Displays the information about all VPN NLRIs.
detail	(Optional) Displays the detailed routes information.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History**Release** **Modification**

Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

Usage Guidelines

The **show tech-support bgp** command is used to display the outputs of various BGP show commands and log them to the show-tech file. The output from the **show tech-support bgp** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support > filename**) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

You can use one of the following redirection methods:

- > filename - Redirects the output to a file.
- >> filename - Redirects the output to a file in append mode.

The following **show** commands run automatically when the **show tech-support bgp** command is used:

- **show clock**
- **show version**
- **show running-config**
- **show process cpu sorted**
- **show process cpu history**
- **show process memory sorted**

The following **show** commands for a specific address family run automatically when the **show tech-support bgp address-family address-family-name address-family-modifier** command is used:

show tech-support bgp

- **show bgp address-family-name address-family-modifier summary**
- **show bgp address-family-name address-family-modifier detail**
- **show bgp address-family-name address-family-modifier internal**
- **show bgp address-family-name address-family-modifier neighbors**
- **show bgp address-family-name address-family-modifier update-group**
- **show bgp address-family-name address-family-modifier replication**
- **show bgp address-family-name address-family-modifier community**
- **show bgp address-family-name address-family-modifier dampening dampened-paths**
- **show bgp address-family-name address-family-modifier dampening flap-statistics**
- **show bgp address-family-name address-family-modifier dampening parameters**
- **show bgp address-family-name address-family-modifier injected-paths**
- **show bgp address-family-name address-family-modifier cluster-ids**
- **show bgp address-family-name address-family-modifier cluster-ids internal**
- **show bgp address-family-name address-family-modifier peer-group**
- **show bgp address-family-name address-family-modifier pending-prefixes**
- **show bgp address-family-name address-family-modifier rib-failure**

In addition to the above commands, the following segment routing specific **show** commands also run when the **show tech-support bgp** command is used:

- **show bgp all binding-sid**
- **show segment-routing client**
- **show segment-routing mpls state**
- **show segment-routing mpls gb**
- **show segment-routing mpls connected-prefix-sid-map protocol ipv4**
- **show segment-routing mpls connected-prefix-sid-map protocol backup ipv4**
- **show mpls traffic-eng tunnel auto-tunnel client bgp**

show tech-support diagnostic

To display diagnostic information for technical support, use the **show tech-support diagnostic** command in privileged EXEC mode.

show tech-support diagnostic

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines	The output of this command is very long. To better manage this output, you can redirect the output to a file (for example, show tech-support diagnostic > flash:filename) in the local writable storage file system or remote file system.
-------------------------	---

Note	For devices that support stacking, this command is executed on every switch that is up. For devices that do not support stacking, this command is executed only on the active switch.
-------------	---

The output of this command displays the output of the following commands:

Catalyst 9400 switches:

- **show clock**
- **show version**
- **show running-config**
- **show inventory**
- **show post**
- **show diagnostic bootup level**
- **show diagnostic status**
- **show diagnostic content module all**
- **show diagnostic result module all detail**
- **show diagnostic schedule module all**

TestGoldPktLoopback :

The GOLD packet Loopback test verifies the MAC level loopback functionality. In this test, a GOLD packet, for which doppler provides the support in hardware, is sent. The packet loops back at MAC level and is matched against the stored packet. It is a non-disruptive test.

TestPhyLoopback :

The PHY Loopback test verifies the PHY level loopback functionality. In this test, a packet is sent which loops back at PHY level and is matched against the stored packet. It is a disruptive test and cannot be run as a health monitoring test.

TestThermal :

This test verifies the temperature reading from the sensor is below the yellow temperature threshold. It is a non-disruptive test and can be run as a health monitoring test.

TestScratchRegister :

The Scratch Register test monitors the health of application-specific integrated circuits (ASICs) by writing values into registers and reading back the values from these registers. It is a non-disruptive test and can be run as a health monitoring

```
show tech-support diagnostic
```

test.

TestUnusedPortLoopback :

This test verifies the PHY level loopback functionality for admin-down ports. In this test, a packet is sent which loops back at PHY level and is matched against the stored packet. It is a non-disruptive test and can be run as a health monitoring test.

TestPortTxMonitoring :

This test monitors the TX counters of a connected interface.

This test verifies if the connected port is able to send the packets or not. It is a non-disruptive test and can be run as a health monitoring test.

.

speed

To specify the speed of a port, use the **speed** command in interface configuration mode. To return to the default value, use the **no** form of this command.

Note Available configuration options depend on the switch model and transceiver module installed. Options include 10, 100, 1000, 2500, 5000, 10000, 25000, 40000, 100000

speed {10 | 100 | 1000 | 2500 | 5000 | auto [{10 | 100 | 1000 | 2500 | 5000}] | nonegotiate}
no speed

Syntax Description

10	Specifies that the port runs at 10 Mbps.
100	Specifies that the port runs at 100 Mbps.
1000	Specifies that the port runs at 1000 Mbps. This option is valid and visible only on 10/100/1000 Mb/s ports.
2500	Specifies that the port runs at 2500 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.
5000	Specifies that the port runs at 5000 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.
auto	Detects the speed at which the port should run, automatically, based on the port at the other end of the link. If you use the 10 , 100 , 1000 , 2500 , or 5000 keyword with the auto keyword, the port autonegotiates only at the specified speeds.
nonegotiate	Disables autonegotiation, and the port runs at 1000 Mbps.

Command Default

The default is **auto**.

Command Modes

Interface configuration (config-if)

Command History

Release	Modification
---------	--------------

Cisco IOS XE Everest 16.6.1

This command was introduced.

Usage Guidelines

You cannot configure speed on 10-Gigabit Ethernet ports.

Except for the 1000BASE-T small form-factor pluggable (SFP) modules, you can configure the speed to not negotiate (**nonegotiate**) when an SFP module port is connected to a device that does not support autonegotiation.

The keywords, **2500** and **5000** are visible only on multi-Gigabit (m-Gig) Ethernet supporting devices.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting, and then forces the speed setting to the negotiated value. The duplex setting remains configured on each end of the link, which might result in a duplex setting mismatch.

speed

If both ends of the line support autonegotiation, we highly recommend the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, use the auto setting on the supported side, but set the duplex and speed on the other side.

Caution Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the “Configuring Interface Characteristics” chapter in the software configuration guide for this release.

Verify your settings using the **show interfaces** privileged EXEC command.

Examples

The following example shows how to set speed on a port to 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed 100
```

The following example shows how to set a port to autonegotiate at only 10 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10
```

The following example shows how to set a port to autonegotiate at only 10 or 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10 100
```

switchport block

To prevent unknown multicast or unicast packets from being forwarded, use the **switchport block** command in interface configuration mode. To allow forwarding unknown multicast or unicast packets, use the **no** form of this command.

```
switchport block {multicast | unicast}
no switchport block {multicast | unicast}
```

Syntax Description

multicast Specifies that unknown multicast traffic should be blocked.

Note Only pure Layer 2 multicast traffic is blocked. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

unicast Specifies that unknown unicast traffic should be blocked.

Command Default

Unknown multicast and unicast traffic is not blocked.

Command Modes

Interface configuration (config-if)

Command History

Release

Modification

Cisco IOS XE Everest 16.6.1

This command was introduced.

Usage Guidelines

By default, all traffic with unknown MAC addresses is sent to all ports. You can block unknown multicast or unicast traffic on protected or nonprotected ports. If unknown multicast or unicast traffic is not blocked on a protected port, there could be security issues.

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.

For more information about blocking packets, see the software configuration guide for this release.

This example shows how to block unknown unicast traffic on an interface:

```
Device(config-if)# switchport block unicast
```

You can verify your setting by entering the **show interfaces interface-id switchport** privileged EXEC command.

system mtu

To set the global maximum packet size or MTU size for switched packets on Gigabit Ethernet and 10-Gigabit Ethernet ports, use the **system mtu** command in global configuration mode. To restore the global MTU value to its default value, use the **no** form of this command.

```
system mtu bytes
no system mtu
```

Syntax Description

bytes The global MTU size in bytes. The range is 1500 to 9216 bytes; the default is 1500 bytes.

Command Default

The default MTU size for all ports is 1500 bytes.

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

Examples

This example shows how to set the global system MTU size to 6000 bytes:

```
Device(config)# system mtu 6000
Global Ethernet MTU is set to 6000 bytes.
Note: this is the Ethernet payload size, not the total
Ethernet frame size, which includes the Ethernet
header/trailer and possibly other tags, such as ISL or
802.1q tags.
```

voice-signaling vlan (network-policy configuration)

To create a network-policy profile for the voice-signaling application type, use the **voice-signaling vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

```
voice-signaling vlan {vlan-id [{cos cos-value | dscp dscp-value}] | dot1p [{cos l2-priority | dscp dscp}] | none | untagged}
```

Syntax Description	<p>vlan-id (Optional) The VLAN for voice traffic. The range is 1 to 4094.</p> <p>cos cos-value (Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</p> <p>dscp dscp-value (Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</p> <p>dot1p (Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).</p> <p>none (Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.</p> <p>untagged (Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.</p>
---------------------------	---

Command Default No network-policy profiles for the voice-signaling application type are defined.

The default CoS value is 5.

The default DSCP value is 46.

The default tagging mode is untagged.

Command Modes Network-policy profile configuration

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines Use the **network-policy profile** global configuration command to create a profile and to enter network-policy profile configuration mode.

The voice-signaling application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all of the same network policies apply as those advertised in the voice policy TLV.

When you are in network-policy profile configuration mode, you can create the profile for voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

voice-signaling vlan (network-policy configuration)

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure voice-signaling for VLAN 200 with a priority 2 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 200 cos 2
```

This example shows how to configure voice-signaling for VLAN 400 with a DSCP value of 45:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 400 dscp 45
```

This example shows how to configure voice-signaling for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice-signaling vlan dot1p cos 4
```

voice vlan (network-policy configuration)

To create a network-policy profile for the voice application type, use the **voice vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

```
voice vlan {vlan-id [{cos cos-value | dscp dscp-value}] | dot1p [{cos l2-priority | dscp dscp}] | none | untagged}
```

Syntax Description

vlan-id	(Optional) The VLAN for voice traffic. The range is 1 to 4094.
cos cos-value	(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.
dscp dscp-value	(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.
dot1p	(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).
none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.
untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.

Command Default

No network-policy profiles for the voice application type are defined.

The default CoS value is 5.

The default DSCP value is 46.

The default tagging mode is untagged.

Command Modes

Network-policy profile configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.

Usage Guidelines

Use the **network-policy profile** global configuration command to create a profile and to enter network-policy profile configuration mode.

The voice application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.

When you are in network-policy profile configuration mode, you can create the profile for voice by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

voice vlan (network-policy configuration)

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice vlan dot1p cos 4
```
