### channel-group

To assign an Ethernet port to an EtherChannel group, or to enable an EtherChannel mode, or both, use the **channel-group** command in interface configuration mode. To remove an Ethernet port from an EtherChannel group, use the **no** form of this command.

channel-group *channel-group-number* mode {active | auto [non-silent] | desirable [non-silent] | on | passive} no channel-group

| Syntax Description | channel-group-number            | Channel group number.   |
|--------------------|---------------------------------|---|
|                    |                                 | The range is 1 to 252.  |
|                    | mode                            | Specifies the EtherChannel mode.  |
|                    | active                          | Unconditionally enables Link<br>Aggregation Control Protocol<br>(LACP).   |
|                    | auto                            | Enables the Port Aggregation<br>Protocol (PAgP) only if a PAgP<br>device is detected.   |
|                    | non-silent                      | (Optional) Configures the interface<br>for nonsilent operation when<br>connected to a partner that is<br>PAgP-capable. Use in PAgP mode<br>with the <b>auto</b> or <b>desirable</b> keyword<br>when traffic is expected from the<br>other device. |
|                    | desirable                       | Unconditionally enables PAgP.   |
|                    | on                              | Enables the on mode.  |
|                    | passive                         | Enables LACP only if a LACP device is detected.   |
| Command Default    | No channel groups are assigned. |   |
|                    | No mode is configured.          |   |
| Command Modes      | Interface configuration         |   |
| Command History    | Release                         | Modification  |
|                    | Cisco IOS XE Everest 16.6.1     | This command was introduced.  |
| Usage Guidelines   |                                 | mand automatically creates the port-channel interface<br>1 do not have to use the <b>interface port-channel</b> command   |

in global configuration mode to manually create a port-channel interface. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

Although it is not necessary to disable the IP address that is assigned to a physical port that is part of a channel group, we strongly recommend that you do so.

You create Layer 3 port channels by using the **interface port-channel** command followed by the **no switchport** interface configuration command. Manually configure the port-channel logical interface before putting the interface into the channel group.

After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk.

Active mode places a port into a negotiating state in which the port initiates negotiations with other ports by sending LACP packets. A channel is formed with another port group in either the active or passive mode.

Auto mode places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. A channel is formed only with another port group in desirable mode. When auto is enabled, silent operation is the default.

Desirable mode places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets. An EtherChannel is formed with another port group that is in the desirable or auto mode. When desirable is enabled, silent operation is the default.

If you do not specify non-silent with the auto or desirable mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and rarely, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent.

In on mode, a usable EtherChannel exists only when both connected port groups are in the on mode.

Caution

**n** Use care when using the on mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack (but not in a cross-stack configuration). Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the **channel-group** interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Do not configure a secure port as part of an EtherChannel or configure an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Æ

Caution

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode desirable:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/1 - 2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode desirable
Device(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode active:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/1 - 2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode active
Device(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel in a switch stack. It uses LACP passive mode and assigns two ports on stack member 2 and one port on stack member 3 as static-access ports in VLAN 10 to channel 5:

```
Device# configure terminal

Device(config)# interface range GigabitEthernet 2/0/4 - 5

Device(config-if-range)# switchport mode access

Device(config-if-range)# switchport access vlan 10

Device(config-if-range)# channel-group 5 mode passive

Device(config)# interface GigabitEthernet 3/0/3

Device(config-if)# switchport mode access

Device(config-if)# switchport access vlan 10

Device(config-if)# switchport access vlan 10

Device(config-if)# switchport access vlan 10

Device(config-if)# channel-group 5 mode passive

Device(config-if)# channel-group 5 mode passive

Device(config-if)# exit
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

## channel-protocol

To restrict the protocol used on a port to manage channeling, use the **channel-protocol** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

 $\begin{array}{l} \mbox{channel-protocol} & \{lacp \mid pagp\} \\ \mbox{no channel-protocol} \end{array}$ 

| Syntax Description | lacp       Configures an EtherChannel with the Link Aggregation Control Protocol (LACP).         pagp       Configures an EtherChannel with the Port Aggregation Protocol (PAgP).         No protocol is assigned to the EtherChannel.         Interface configuration |   |  |
|--------------------|--|---|--|
|                    |  |   |  |
| Command Default    |  |   |  |
| Command Modes      |  |   |  |
| Command History    | Release  | Modification  |  |
|                    | Cisco IOS XE Everest 16.6.1  | This command was introduced.  |  |
| Usage Guidelines   | Use the <b>channel-protocol</b> command only to restrict<br>using the <b>channel-protocol</b> command, the setting is<br>interface configuration mode.   | a channel to LACP or PAgP. If you set the protocol by not overridden by the <b>channel-group</b> command in |  |
|                    | You must use the <b>channel-group</b> command in interface configuration mode to configure the EtherChannel parameters. The <b>channel-group</b> command also can set the mode for the EtherChannel.   |   |  |
|                    | You cannot enable both the PAgP and LACP modes on an EtherChannel group.   |   |  |
|                    | PAgP and LACP are not compatible; both ends of a channel must use the same protocol.   |   |  |
|                    | You cannot configure PAgP on cross-stack configurations.   |   |  |
|                    | This example shows how to specify LACP as the protocol that manages the EtherChannel:  |   |  |
|                    | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface gigabitethernet2/0</b><br>Device(config-if)# <b>channel-protocol lacp</b>   | 0/1   |  |
|                    | You can verify your settings by entering the <b>show ethe</b> command in privileged EXEC mode.   | erchannel [channel-group-number] protocol   |  |

## clear l2protocol-tunnel counters

To clear the protocol counters in protocol tunnel ports, use the **clear l2protocol-tunnel counters** command in privileged EXEC mode.

clear l2protocol-tunnel counters [interface-id]

| Syntax Description | interface-id                 |  | (Optional) The interface (physical interface or port cha counters are to be cleared. |
|--------------------|------------------------------|--|--|
| Command Default    | None                         |  |  |
| Command Modes      | Privileged EXEC              |  |  |
| Command History    | Release                      | Modification                             |  |
|                    | Cisco IOS XE Gibraltar 1     | 6.12.1 This command was introduced.      |  |
| Usage Guidelines   | Use this command to clea     | ar protocol tunnel counters on the switc | h or on the specified interface.   |
|                    | This example shows how       | to clear Layer 2 protocol tunnel counter | ers on an interface:   |
|                    | Device# <b>clear l2proto</b> | let1/0/3                                 |  |

## clear lacp

To clear Link Aggregation Control Protocol (LACP) channel-group counters, use the **clear lacp** command in privileged EXEC mode.

clear lacp [channel-group-number] counters

| Syntax Description | channel-group-number   | (Optional) Channel group number.  |  |
|--------------------|--|---|--|
|                    |  | The range is 1 to 252.  |  |
|                    | counters   | Clears traffic counters.  |  |
| Command Modes      | Privileged EXEC  |   |  |
| Command History    | Release  |   | Modification   |
|                    | Cisco IOS XE Everest 1   | (())  | This command was introduced.   |
| Usaga Guidalinas   |  |   |  |
| Usage Guidelines   | You can clear all counter<br>the specified channel gro   | s by using the <b>clear lacp counters</b> commany<br>bup by using the <b>clear lacp</b> <i>channel-group</i><br>to clear all channel-group information:   | and, or you can clear only the counters for  |
| Usage Guidelines   | You can clear all counter<br>the specified channel gro   | s by using the <b>clear lacp counters</b> comma<br>pup by using the <b>clear lacp</b> <i>channel-group</i><br>y to clear all channel-group information:   | and, or you can clear only the counters for  |

| Usage Guidelines   | You can clear all counters<br>the specified channel gro<br>This example shows how<br>Device> enable<br>Device# clear lacp co | s by using the <b>clear lacp counters</b> comma<br>oup by using the <b>clear lacp</b> <i>channel-group</i><br><i>y</i> to clear all channel-group information:<br><b>punters</b><br><i>y</i> to clear LACP traffic counters for group | and, or you can clear only the counters for <i>p-number</i> <b>counters</b> command. |

# clear pagp

To clear the Port Aggregation Protocol (PAgP) channel-group information, use the **clear pagp** command in privileged EXEC mode.

clear pagp [channel-group-number] counters

| Syntax Description | channel-group-number  | (Optional) Channel group number.   |                              |
|--------------------|---|--|------------------------------|
|                    |   | The range is 1 to 252.   |                              |
|                    | counters  | Clears traffic counters.   |                              |
| Command Modes      | Privileged EXEC   |  |                              |
| Command History    | Release   |  | Modification                 |
|                    | Cisco IOS XE Everest 1  | 6.6.1  | This command was introduced. |
| Usage Guidelines   | for the specified channel   | s by using the <b>clear pagp counters</b> comm<br>group by using the <b>clear pagp</b> <i>channel-s</i><br>to clear all channel-group information: |                              |
|                    | Device# clear pagp counters                                       |  |                              |
|                    |   |  |                              |
|                    | This example shows how  | to clear PAgP traffic counters for group   | 10:                          |
|                    | This example shows how<br>Device> enable<br>Device# clear pagp 10 |  | 10:                          |

## clear spanning-tree counters

To clear the spanning-tree counters, use the **clear spanning-tree counters** command in privileged EXEC mode.

clear spanning-tree counters [interface interface-id]

| interface interface-id  | (Optional) Clears all spanning-tree counters on the specified include physical ports, VLANs, and port channels.  |
|---|--|
|   | The VLAN range is 1 to 4094.   |
|   | The port channel range is 1 to 252.  |
| Privileged EXEC   |  |
| Release   | Modification   |
| Cisco IOS XE Everest 16.6.1   | This command was introduced.   |
| If the <i>interface-id</i> value is not specified, s                | panning-tree counters are cleared for all interfaces.  |
| This example shows how to clear spanning                            | g-tree counters for all interfaces:  |
| Device> <b>enable</b><br>Device# <b>clear spanning-tree counter</b> | ŝ  |
| -   | <ul> <li>Privileged EXEC</li> <li>Release</li> <li>Cisco IOS XE Everest 16.6.1</li> <li>If the <i>interface-id</i> value is not specified, s</li> <li>This example shows how to clear spannin Device&gt; enable</li> </ul> |

## clear spanning-tree detected-protocols

To restart the protocol migration process and force renegotiation with neighboring devices on the interface, use the **clear spanning-tree detected-protocols** command in privileged EXEC mode.

clear spanning-tree detected-protocols [interface interface-id]

| interface interface-id   | (Optional) Restarts the protocol migration process on the specified ir channels.   |  |  |
|--|--|--|--|
|  | The VLAN range is 1 to 4094.   |  |  |
|  | The port-channel range is 1 to 252.  |  |  |
| Privileged EXEC  |  |  |  |
| Release  | Modification   |  |  |
| Cisco IOS XE Everest 16.6.1  | This command was introduced.   |  |  |
| A device running the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol or the Multiple Spanning<br>Tree Protocol (MSTP) supports a built-in protocol migration method that enables it to interoperate with legacy<br>IEEE 802.1D devices. If a rapid-PVST+ or an MSTP device receives a legacy IEEE 802.1D configuration<br>bridge protocol data unit (BPDU) with the protocol version set to 0, the device sends only IEEE 802.1D<br>BPDUs on that port. A multiple spanning-tree (MST) device can also detect that a port is at the boundary of<br>a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or<br>a rapid spanning-tree (RST) BPDU (Version 2). |  |  |  |
| The device does not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot learn whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. Use the <b>clear spanning-tree detected-protocols</b> command in this situation.   |  |  |  |
| This example shows how to restart the  | protocol migration process on a port:  |  |  |
| Device> <b>enable</b><br>Device# <b>clear spanning-tree detec</b>  | eted-protocols interface gigabitethernet2/0/1  |  |  |
|  | <ul> <li>Privileged EXEC</li> <li>Release</li> <li>Cisco IOS XE Everest 16.6.1</li> <li>A device running the rapid per-VLAN stree Protocol (MSTP) supports a built-in IEEE 802.1D devices. If a rapid-PVST-bridge protocol data unit (BPDU) with BPDUs on that port. ### debug etherchannel

To enable debugging of EtherChannels, use the **debug etherchannel** command in privileged EXEC mode. To disable debugging, use the **no** form of the command.

```
debug etherchannel [{all | detail | error | event | idb }]
no debug etherchannel [{all | detail | error | event | idb }]
```

| Syntax Description | all   | (Optional) Displays all EtherChannel debug messages.               |                              |  |  |
|--------------------|---|--|------------------------------|--|--|
|                    | detail  | (Optional) Displays detailed EtherChannel debug messages.          |                              |  |  |
|                    | error   | (Optional) Displays EtherChannel error debug messages.             |                              |  |  |
|                    | event   | (Optional) Displays EtherChannel event messages.                   |                              |  |  |
|                    | idb   | (Optional) Displays PAgP interface descriptor block debug m        | nessages.                    |  |  |
| Command Default    | Debugg  | ging is disabled.  |                              |  |  |
| Command Modes      | Privileg  | ged EXEC   |                              |  |  |

|                    | Cisco I   | IOS XE Everest 16.6.1  | This command was introduced. |  |  |
| Usage Guidelines   | The un  | debug etherchannel command is the same as the no debug et          | herchannel command.          |  |  |
|                    |   |  |                              |  |  |
|                    | Note Although the <b>linecard</b> keyword is displayed in the command-line help, it is not supported. |  |                              |  |  |
|                    | This ex   | This example shows how to display all EtherChannel debug messages: |                              |  |  |
|                    |   | Device> <b>enable</b><br>Device# <b>debug etherchannel all</b>     |                              |  |  |
|                    | This ex   | ample shows how to display debug messages related to EtherC        | Channel events:              |  |  |
|                    |   | > enable<br># debug etherchannel event                             |                              |  |  |

### debug lacp

To enable debugging of Link Aggregation Control Protocol (LACP) activity, use the **debug lacp** command in privileged EXEC mode. To disable LACP debugging, use the **no** form of this command.

debug lacp [{all | event | fsm | misc | packet}] no debug lacp [{all | event | fsm | misc | packet}]

| Syntax Description | all   | (Optional) Displays all LACP debug r  | nessages.  |             |  |
|--------------------|---|---------------------------------------|--|-------------|--|
|                    | event (Optional) Displays LACP event debug messages.                            |                                       |  |             |  |
|                    | fsm   | (Optional) Displays messages about cl | nanges within the LACP finite state machine.     |             |  |
|                    | misc  | (Optional) Displays miscellaneous LA  | CP debug messages.                               |             |  |
|                    | packet (Optional) Displays the receiving and transmitting LACP control packets. |                                       |  |             |  |
| Command Default    | Debugg  | ging is disabled.                     |  |             |  |
| command Modes      | Privileged EXEC   |                                       |  |             |  |
| command History    | Releas  | ;e                                    | Modification                                     |             |  |
|                    | Cisco I   | IOS XE Everest 16.6.1                 | This command was                                 | introduced. |  |
| Isage Guidelines   | The un  | debug etherchannel command is the sa  | ame as the <b>no debug etherchannel</b> command. |             |  |
|                    | This example shows how to display all LACP debug messages:                      |                                       |  |             |  |
|                    |   | > enable<br># debug LACP all          |  |             |  |
|                    | This ex   | ample shows how to display debug mes  | sages related to LACP events:                    |             |  |
|                    |   |                                       |  |             |  |

### debug pagp

To enable debugging of Port Aggregation Protocol (PAgP) activity, use the **debug pagp** command in privileged EXEC mode. To disable PAgP debugging, use the **no** form of this command.

debug pagp [{all | dual-active | event | fsm | misc | packet}] no debug pagp [{all | dual-active | event | fsm | misc | packet}]

| Syntax Description | all  | (Optional) Displays all PAgP debug messages.                                     |  |
|--------------------|--|--|--|
|                    | dual-active  | (Optional) Displays dual-active detection messages.                              |  |
|                    | event  | (Optional) Displays PAgP event debug messages.                                   |  |
|                    | fsm  | (Optional) Displays messages about changes within the PAgP finite state machine. |  |
|                    | misc   | (Optional) Displays miscellaneous PAgP debug messages.                           |  |
|                    | packet   | (Optional) Displays the receiving and transmitting PAgP control packets.         |  |
| Command Default    | Debugging is disabled.                                   |  |  |
| Command Modes      | Privileged EXEC  |  |  |
| Command History    | Release  | Modification   |  |
|                    | Cisco IOS XE Everest 16.6.1                              | This command was introduced.   |  |
| Jsage Guidelines   | The <b>undebug pagp</b> command is the sar               | me as the <b>no debug pagp</b> command.  |  |
|                    | This example shows how to display all                    | PAgP debug messages:   |  |
|                    | Device> <b>enable</b><br>Device# <b>debug pagp all</b>   |  |  |
|                    | This example shows how to display deb                    | bug messages related to PAgP events:   |  |
|                    | Device> <b>enable</b><br>Device# <b>debug pagp event</b> |  |  |
|                    |  |  |  |

### debug platform pm

To enable debugging of the platform-dependent port manager software module, use the **debug platform pm** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform pm {all | counters | errdisable | fec | if-numbers | l2-control | link-status | platform | pm-vectors [detail] | ses | vlans} no debug platform pm {all | counters | errdisable | fec | if-numbers | l2-control | link-status | platform | pm-vectors [detail] | ses | vlans}

| Syntax Description | all   | Displays all port manager debug messages.   |  |  |
|--------------------|---|---|--|--|
|                    | counters  | Displays counters for remote procedure call (RPC) debug messages.                   |  |  |
|                    | errdisable  | Displays error-disabled-related events debug messages.                              |  |  |
|                    | fec   | Displays forwarding equivalence class (FEC) platform-related events debug messages. |  |  |
|                    | if-numbers  | Displays interface-number translation event debug messages.                         |  |  |
|                    | 12-control  | Displays Layer 2 control infra debug messages.                                      |  |  |
|                    | link-status   | Displays interface link-detection event debug messages.                             |  |  |
|                    | platform  | Displays port manager function event debug messages.                                |  |  |
|                    | pm-vectors  | Displays port manager vector-related event debug messages.                          |  |  |
|                    | detail(Optional) Displays vector-function details.sesDisplays service expansion shelf (SES) related event debug message |   |  |  |
|                    |   |   |  |  |
|                    | vlans Displays VLAN creation and deletion event debug messages.   |   |  |  |
| Command Default    | Debugging is disabled.  |   |  |  |
| Command Modes      | Privileged EXEC   |   |  |  |
| Command History    | Release   | Modification  |  |  |
|                    | Cisco IOS XE Everest 16.6.1   | This command was introduced.  |  |  |
| Usage Guidelines   | The undebug platform pm comm  | nand is the same as the <b>no debug platform pm</b> command.                        |  |  |
|                    | This example shows how to displa  | y debug messages related to the creation and deletion of VLANs:                     |  |  |
|                    | Device> <b>enable</b><br>Device# <b>debug platform pm vl</b> a  | ans   |  |  |

### debug platform udld

To enable debugging of the platform-dependent UniDirectional Link Detection (UDLD) software, use the **debug platform udld** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

in privileged EXEC mode. Then enter the **debug** command at the command-line prompt of the stack member.

debug platform udld [{error | event}] [switch switch-number] no debug platform udld [{error | event}] [switch switch-number]

| Syntax Description | error                          | (Optional) Displays error conditi   | on debug messages.   |
|--------------------|--------------------------------|-------------------------------------|--|
|                    | event                          | (Optional) Displays UDLD-relat      | ed platform event debug messages.  |
|                    | <b>switch</b><br>switch-number | (Optional) Displays UDLD debu       | g messages for the specified stack member.   |
| Command Default    | Debugging is disab             | oled.                               |  |
| Command Modes      | Privileged EXEC                |                                     |  |
| Command History    | Release                        |                                     | Modification   |
|                    | Cisco IOS XE Eve               | erest 16.6.1                        | This command was introduced.   |
| Usage Guidelines   | The undebug plat               | form udld command is the same as th | e no debug platform udld command.  |
|                    | -                              | 66 6                                | led only on the active switch. To enable debugging switch by using the <b>session</b> <i>switch-number</i> command |

### debug spanning-tree

To enable debugging of spanning-tree activities, use the **debug spanning-tree** command in EXEC mode. To disable debugging, use the **no** form of this command.

debug spanning-tree {all | backbonefast | bpdu | bpdu-opt | config | etherchannel | events | exceptions | general | ha | mstp | pvst+ | root | snmp | synchronization | switch | uplinkfast} no debug spanning-tree {all | backbonefast | bpdu | bpdu-opt | config | etherchannel | events | exceptions | general | mstp | pvst+ | root | snmp | synchronization | switch | uplinkfast}

| Syntax Description | all             | Displays all spanning-tree debug messages.   |
|--------------------|-----------------|--|
|                    | backbonefast    | Displays BackboneFast-event debug messages.  |
|                    | bpdu            | Displays spanning-tree bridge protocol data unit (BPDU) debug messages.  |
|                    | bpdu-opt        | Displays optimized BPDU handling debug messages.   |
|                    | config          | Displays spanning-tree configuration change debug messages.  |
|                    | etherchannel    | Displays EtherChannel-support debug messages.  |
|                    | events          | Displays spanning-tree topology event debug messages.  |
|                    | exceptions      | Displays spanning-tree exception debug messages.   |
|                    | general         | Displays general spanning-tree activity debug messages.  |
|                    | ha              | Displays high-availability spanning-tree debug messages.   |
|                    | mstp            | Debugs Multiple Spanning Tree Protocol (MSTP) events.  |
|                    | pvst+           | Displays per-VLAN spanning-tree plus (PVST+) event debug messages.   |
|                    | root            | Displays spanning-tree root-event debug messages.  |
|                    | snmp            | Displays spanning-tree Simple Network Management<br>Protocol (SNMP) handling debug messages.   |
|                    | switch          | Displays switch shim command debug messages. This<br>shim is the software module that is the interface between<br>the generic Spanning Tree Protocol (STP) code and the<br>platform-specific code of various device platforms. |
|                    | synchronization | Displays the spanning-tree synchronization event debug messages.   |
|                    | uplinkfast      | Displays UplinkFast-event debug messages.  |
|                    |                 |  |

| Command Default  | Debugging is disabled.  |                              |  |
|------------------|---|------------------------------|--|
| Command Modes    | Privileged EXEC   |                              |  |
| Command History  | Release   | Modification                 |  |
|                  | Cisco IOS XE Everest 16.6.1   | This command was introduced. |  |
| Usage Guidelines | The <b>undebug spanning-tree</b> command is the same as the <b>no debug spanning-tree</b> command.  |                              |  |
|                  | When you enable debugging on a stack, it is enabled only on the active switch. To enable debugging on the standby switch, start a session from the active switch by using the <b>session</b> <i>switch-number</i> command in privileged EXEC mode. Enter the <b>debug</b> command at the command-line prompt of the standby switch. |                              |  |
|                  | To enable debugging on the standby switch without first starting a session on the active switch, use the <b>remote command</b> <i>switch-number LINE</i> command in privileged EXEC mode.   |                              |  |
|                  | This example shows how to display all spanning-tree debug messages:   |                              |  |
|                  | Device> <b>enable</b><br>Device# <b>debug spanning-tree all</b>   |                              |  |

# instance (VLAN)

To map a VLAN or a group of VLANs to a multiple spanning tree (MST) instance, use the **instance** command in MST configuration mode. To return the VLANs to the default internal spanning tree (CIST) instance, use the **no** form of this command.

**instance** *instance-id* **vlans** *vlan-range* **no instance** *instance-id* 

| Syntax Description | instance-id   | Instance to which the specified VLANs are r | napped. The range is from 0 to 4094. |
|--------------------|---|---|--------------------------------------|
|                    | vlans vlan-range  | -   |                                      |
| Command Default    | No VLANs are mapped to any MST instance (all VLANs are mapped to the CIST instance).  |   |                                      |
| Command Modes      | MST configuration   | n mode (config-mst)                         |                                      |
| Command History    | Release   |   | Modification                         |
|                    | Cisco IOS XE Eve  | erest 16.6.1                                | This command was introduced.         |
| Usage Guidelines   | The <b>vlans</b> <i>vlan-range</i> is entered as a single value or a range.   |   |                                      |
|                    | The mapping is incremental, not absolute. When you enter a range of VLANs, this range is added or removed to the existing instances.  |   |                                      |
|                    | Any unmapped VLAN is mapped to the CIST instance.   |   |                                      |
| Examples           | The following exar  | mple shows how to map a range of VLANs to   | instance 2:                          |
|                    | Device(config)# <b>spanning-tree mst configuration</b><br>Device(config-mst)# <b>instance 2 vlans 1-100</b><br>Device(config-mst)#    |   |                                      |
|                    | The following example shows how to map a VLAN to instance 5:  |   |                                      |
|                    | Device(config)# <b>spanning-tree mst configuration</b><br>Device(config-mst)# <b>instance 5 vlans 1100</b><br>Device(config-mst)#     |   |                                      |
|                    | The following example shows how to move a range of VLANs from instance 2 to the CIST instance:  |   |                                      |
|                    | Device(config)# <b>spanning-tree mst configuration</b><br>Device(config-mst)# <b>no instance 2 vlans 40-60</b><br>Device(config-mst)# |   |                                      |
|                    | The following example shows how to move all the VLANs that are mapped to instance 2 back to the CIST instance:                        |   |                                      |
|                    | Device(config)# <b>spanning-tree mst configuration</b><br>Device(config-mst)# <b>no instance 2</b><br>Device(config-mst)#             |   |                                      |

#### **Related Commands**

| Command                         | Description   |
|---------------------------------|---|
| name (MST configuration mode)   | Sets the name of an MST region.                     |
| revision                        | Sets the revision number for the MST configuration. |
| show spanning-tree mst          | Displays the information about the MST protocol.    |
| spanning-tree mst configuration | Enters MST configuration mode.                      |

## interface port-channel

To access or create a port channel, use the **interface port-channel** command in global configuration mode. Use the **no** form of this command to remove the port channel.

interface port-channel *port-channel-number* no interface port-channel

| Syntax Description | port-channel-num  | ber Channel group number.  |   |
|--------------------|---|--|---|
|                    |   | The range is 1 to 252.   |   |
| Command Default    | No port channel lo  | gical interfaces are defined.  |   |
| Command Modes      | Global configuration  | on   |   |
| Command History    | Release   |  | Modification  |
|                    | Cisco IOS XE Eve  | erest 16.6.1   | This command was introduced.  |
| Usage Guidelines   | to a channel group.<br>automatically creat<br>create the port-char<br>or you can use a ne<br>new port channel.<br>You create Layer 3<br>command in interfa                            | Instead, you can use the <b>channel-gro</b><br>tes the port-channel interface when the<br>nucl interface first, the <i>channel-group</i><br>we number. If you use a new number,<br>port channels by using the <b>interface p</b> | port-channel interface before assigning physical ports<br><b>pup</b> command in interface configuration mode, which<br>the channel group obtains its first physical port. If you<br><i>-number</i> can be the same as the <i>port-channel-number</i> ,<br>the <b>channel-group</b> command dynamically creates a<br><b>port-channel</b> command followed by the <b>no switchport</b><br>manually configure the port-channel logical interface |
|                    | 1 2   | interface into the channel group.  |   |
|                    |   | net in a channel group is anowed.  |   |
| Ca                 | -   | port-channel interface as a routed point to the channel group.   | ort, do not assign Layer 3 addresses on the physical ports  |
|                    | $\wedge$  |  |   |
| Ca                 | <b>Caution</b> Do not assign bridge groups on the physical ports in a channel group used as a Layer 3 port channel int because it creates loops. You must also disable spanning tree. |  |   |
|                    | Follow these guide  | lines when you use the interface po  | rt-channel command:   |
|                    |   | use the Cisco Discovery Protocol (C<br>t channel interface.  | CDP), you must configure it on the physical port and  |
|                    | -   | -  | f an EtherChannel as an IEEE 802.1x port. If IEEE herChannel, the port does not join the EtherChannel.  |
|                    |   |  |   |

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

This example shows how to create a port channel interface with a port channel number of 5:

Device> enable Device# configure terminal Device(config)# interface port-channel 5

You can verify your setting by entering either the **show running-config** in privileged EXEC mode or the **show etherchannel** *channel-group-number* **detail** command in privileged EXEC mode.

### l2protocol-tunnel

To enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel, use the **l2protocol-tunnel** command in interface configuration mode on the switch stack or on a standalone switch. Use the **no** form of this command to disable tunneling on the interface.

l2protocol-tunnel [{drop-threshold | shutdown-threshold}] [value] [{cdp | stp | vtp }] [lldp]
[{point-to-point | [{pagp | lacp | udld}]}]
no l2protocol-tunnel [{drop-threshold | shutdown-threshold}] [value] [{cdp | stp | vtp }] [lldp]
[{point-to-point | [{pagp | lacp | udld}]}]

| Syntax Description | drop-threshold   | (Optional) Sets a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.  |  |
|--------------------|--|---|--|
|                    | shutdown-threshold   | (Optional) Sets a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.   |  |
|                    | value  | A threshold in packets per second to be received for encapsulation before the interface shuts down, or the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold. |  |
|                    | cdp  | (Optional) Enables tunneling of CDP, specifies a shutdown threshold for CDP, or specifies a drop threshold for CDP.   |  |
|                    | stp  | (Optional) Enables tunneling of STP, specifies a shutdown threshold for STP, or specifies a drop threshold for STP.   |  |
|                    | vtp  | (Optional) Enables tunneling or VTP, specifies a shutdown threshold for VTP, or specifies a drop threshold for VTP.   |  |
|                    | lldp   | (Optional) Enables tunneling of LLDP packets.   |  |
|                    | point-to-point   | (Optional) Enables point-to point tunneling of PAgP, LACP, and UDLD packets.  |  |
|                    | pagp   | (Optional) Enables point-to-point tunneling of PAgP, specifies a shutdown threshold for PAgP, or specifies a drop threshold for PAgP.   |  |
|                    | lacp   | (Optional) Enables point-to-point tunneling of LACP, specifies a shutdown threshold for LACP, or specifis a drop threshold for LACP.  |  |
|                    | udld   | (Optional) Enables point-to-point tunneling of UDLD, specifies a shutdown threshold for UDLD, or specifies a drop threshold for UDLD.   |  |
| Command Default    | The default is that no   | Layer 2 protocol packets are tunneled.  |  |
|                    | The default is no shutdown threshold for the number of Layer 2 protocol packets. |   |  |
|                    | The default is no drop threshold for the number of Layer 2 protocol packets.     |   |  |
| Command Modes      | Interface configuration  | on  |  |

| Command History  | Release  | Modification  | -   |  |  |  |
|------------------|--|---|---|--|--|--|
|                  | Cisco IOS XE Gibralt   | ar 16.12.1 This command was introduced.   | -   |  |  |  |
| Usage Guidelines | Trunking Protocol (V)  | You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN<br>Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol<br>(PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets.   |   |  |  |  |
|                  | You must enter this co   | ommand, with or without protocol types, a   | to tunnel Layer 2 packets.  |  |  |  |
|                  | If you enter this comn   | nand for a port channel, all ports in the ch  | nannel must have the same configuration.  |  |  |  |
|                  | across the network to<br>encapsulated with a we                                    | all customer locations. When protocol tu<br>ell-known Cisco multicast address for trans   | nsures that Layer 2 information is propagated<br>nneling is enabled, protocol packets are<br>smission across the network. When the packets<br>ed by the Layer 2 protocol MAC address. |  |  |  |
|                  | You can enable Layer   | 2 protocol tunneling for CDP, STP, and V  | VTP individually or for all three protocols.  |  |  |  |
|                  | by emulating a point-t<br>switch for PAgP or LA                                    | In a service-provider network, you can use Layer 2 protocol tunneling to enhance the creation of EtherChannels by emulating a point-to-point network topology. When protocol tunneling is enabled on the service-provider switch for PAgP or LACP, remote customer switches receive the protocol data units (PDUs) and can negotiate automatic creation of EtherChannels. |   |  |  |  |
|                  | To decrease the link-d   | To enable tunneling of PAgP, LACP, and UDLD packets, you must have a point-to-point network topology. To decrease the link-down detection time, you should also enable UDLD on the interface when you enable tunneling of PAgP or LACP packets.   |   |  |  |  |
|                  | You can enable point-<br>protocols.  | to-point protocol tunneling for PAgP, LA  | CP, and UDLD individually or for all three  |  |  |  |
|                  | $\triangle$  |   |   |  |  |  |
| -                | <b>-</b>   | d UDLD tunneling is only intended to em<br>at sends tunneled packets to many ports co   | ulate a point-to-point topology. An erroneous ould lead to a network failure.   |  |  |  |
|                  | on an interface before applied to each of the                                      | it shuts down. When no protocol option i  | f protocol packets per second that are received<br>is specified with the keyword, the threshold is<br>lso set a drop threshold on the interface, the<br>drop-threshold value.         |  |  |  |
|                  | entering the <b>errdisabl</b><br>out of the error-disabl<br>the error recovery fun | ed state and allowed to retry the operation   | iguration command, the interface is brought<br>n again when all the causes have timed out. If<br>terface stays in the error-disabled state until                                      |  |  |  |

Enter the **drop-threshold** keyword to control the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.

**Examples** 

This example shows how to enable protocol tunneling for CDP packets and to configure the shutdown threshold as 50 packets per second:

```
Device(config-if)# 12protocol-tunnel cdp
Device(config-if)# 12protocol-tunnel shutdown-threshold cdp 50
```

This example shows how to enable protocol tunneling for STP packets and to configure the drop threshold as 400 packets per second:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/11
Device(config-if)# 12protocol-tunnel stp
Device(config-if)# 12protocol-tunnel drop-threshold stp 400
```

This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and to configure the PAgP drop threshold as 1000 packets per second:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport access vlan 19
Device(config-if)# switchport mode dot1q-tunnel
Device(config-if)# 12protocol-tunnel point-to-point pagp
Device(config-if)# 12protocol-tunnel point-to-point udld
Device(config-if)# 12protocol-tunnel drop-threshold point-to-point pagp 1000
```

### lacp fast-switchover

To enable Link Aggregation Control Protocol (LACP) 1:1 link redundancy, use the **lacp fast-switchover** command in interface configuration mode. To disable LACP 1:1 link redundancy, use the **no** form of this command.

lacp fast-switchover [dampening time]
no lacp fast-switchover [dampening time]

**Syntax Description** dampening *time* Enables LACP 1:1 hot-standby dampening. The range is 30 to 180 seconds.

**Command Default** LACP 1:1 link redundancy is disabled by default.

**Command Modes** Interface configuration (config-if)

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines Prior to entering the lacp fast-switchover command, you must ensure the following:

- The port channel protocol type is LACP.
- The **lacp max-bundle 1** command has been entered on the port channel. The **lacp fast-switchover** command will not affect the **lacp max-bundle** command.

Prior to entering the lacp fast-switchover dampening command, you must ensure the following:

- The port channel protocol type is LACP.
- The lacp max-bundle 1 and lacp fast-switchover commands have been entered on the port channel.

When you enable LACP 1:1 link redundancy, based on the system priority and port priority, the port with the higher system priority chooses the link as the active link and the other link as the standby link (lower the LACP port priority, higher the preference, and lower the LACP system priority, higher the preference). In the case of LACP 1:1 redundancy feature, when the active link fails, the standby link is selected as the new active link without taking down the port channel. When the original active link recovers, it reverts to its active link status. During this change-over, the port channel is also up.

In the case of LACP 1:1 hot standby dampening feature, it configures a timer that delays switchover back to the higher priority port after it becomes active.

Note

- We recommend that you configure two ports only (one active and one hot-standby) in the bundle for optimum performance.
  - LACP 1:1 redundancy must be enabled at both ends of the LACP EtherChannel.
  - LACP 1:1 redundancy and dampening works only on LACP port-channels.

#### **Examples** This example shows how to enable LACP 1:1 link redundancy:

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 40
Device(config-if)# lacp fast-switchover
Device(config-if)# lacp max-bundle 1
```

This example shows how to enable LACP 1:1 hot standby dampening:

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 40
Device(config-if)# lacp fast-switchover
Device(config-if)# lacp max-bundle 1
Device(config-if)# lacp fast-switchover dampening 70
```

| Related Commands | Co |
|------------------|----|
|                  |    |

| Command           | Description  |
|-------------------|--|
| lacp max-bundle   | Assigns and configures an EtherChannel interface to an EtherChannel group. |
| show etherchannel | Displays the EtherChannel information for a channel.                       |
| show lacp         | Displays the LACP channel-group information.                               |

## lacp max-bundle

To define the maximum number of active LACP ports allowed in a port channel, use the **lacp max-bundle** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

lacp max-bundle max\_bundle\_number
no lacp max-bundle

| Syntax Description | <i>max_bundle_number</i> The maximum number of active LACP ports in the port channel. The range is 1 to 8. The default is 8.   |                        |                              |
|--------------------|--|------------------------|------------------------------|
| Command Modes      | Interface configuration  | n                      |                              |
| Command History    | Release  |                        | Modification                 |
|                    | Cisco IOS XE Everes  | st 16.6.1              | This command was introduced. |
| Usage Guidelines   | An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in hot-standby mode. When there are more than eight ports in an LACP channel group, the device on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. |                        |                              |
|                    | The <b>lacp max-bundle</b> command must specify a number greater than the number specified by the <b>port-channel min-links</b> command.   |                        |                              |
|                    | Use the <b>show etherchannel summary</b> command in privileged EXEC mode to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).   |                        |                              |
|                    | This example shows how to specify a maximum of five active LACP ports in port channel 2:   |                        |                              |
|                    | Device> <b>enable</b><br>Device# <b>configure t</b><br>Device(config)# <b>int</b><br>Device(config-if)#  | terface port-channel 2 |                              |

### lacp port-priority

To configure the port priority for the Link Aggregation Control Protocol (LACP), use the **lacp port-priority** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

lacp port-priority *priority* no lacp port-priority

| Syntax Description | <i>priority</i> Port priority for LACP. The range is 1 to 65535.  |   |  |
|--------------------|---|---|--|
| Command Default    | The default is 32768.   |   |  |
| Command Modes      | Interface configuration   |   |  |
| Command History    | Release   | Modification  |  |
|                    | Cisco IOS XE Everest 16.6.1   | This command was introduced.  |  |
| Usage Guidelines   |   | configuration mode determines which ports are bundled and there are more than eight ports in an LACP channel group. |  |
|                    | An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.   |   |  |
|                    | In port-priority comparisons, a numerically lower value has a higher priority: When there are more than eight ports in an LACP channel group, the eight ports with the numerically lowest values (highest priority values) for LACP port priority are bundled into the channel group, and the lower-priority ports are put in hot-standby mode. If two or more ports have the same LACP port priority (for example, they are configured with the default setting of 65535), then an internal value for the port number determines the priority. |   |  |
|                    | <b>Note</b> The LACP port priorities are only effective if the ports are on the device that controls the LACP link. See the <b>lacp system-priority</b> command in global configuration mode for determining which device controls the link   |   |  |
|                    | Use the <b>show lacp internal</b> command in privileged EXEC mode to display LACP port priorities and internal port number values.  |   |  |
|                    | For information about configuring LACP on physical ports, see the configuration guide for this release.   |   |  |

This example shows how to configure the LACP port priority on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# lacp port-priority 1000
```

You can verify your settings by entering the **show lacp** [*channel-group-number*] **internal** command in privileged EXEC mode.

### lacp rate

To set the rate at which Link Aggregation Control Protocol (LACP) control packets are ingressed to an LACP-supported interface, use the **lacp rate** command in interface configuration mode. To return to the default settings, use the **no** form of this command

lacp rate {normal | fast}
no lacp rate

| Syntax Description | <b>normal</b> Specifies that LACP control packets are ingressed at the normal rate, every 30 seconds after the link is bundled.  |   |  |  |
|--------------------|--|---|--|--|
|                    | fast Specifies that LACP con   | trol packets are ingressed at the fast rate, once every 1 second. |  |  |
| Command Default    | The default ingress rate for control packets is 30 seconds after the link is bundled.  |   |  |  |
| Command Modes      | Interface configuration  |   |  |  |
| Command History    | Release  | Modification  |  |  |
|                    | Cisco IOS XE Everest 16.6.1  | This command was introduced.                                      |  |  |
| Usage Guidelines   | Use this command to modify the duration of LACP timeout. The LACP timeout value on Cisco switch is three times the LACP rate that is configured on the interface. Using the <b>lacp rate</b> command, you can select the LACP timeout value for a switch to be either 90 seconds or 3 seconds. |   |  |  |
|                    | This command is supported only on LACP-enabled interfaces.   |   |  |  |
|                    | This example shows how to specify the fast (1 second) ingress rate on interface GigabitEthernet 0/0:   |   |  |  |
|                    | Device> enable   |   |  |  |

Device# configure terminall
Device(config)# interface gigabitEthernet 0/0
Device(config-if)# lacp rate fast

## lacp system-priority

To configure the system priority for the Link Aggregation Control Protocol (LACP), use the **lacp** system-priority command in global configuration mode on the device. To return to the default setting, use the **no** form of this command.

lacp system-priority priority no lacp system-priority

| Syntax Description | <i>priority</i> System priority for LACP. The range is 1 to 65535.   |  |  |
|--------------------|--|--|--|
| Command Default    | The default is 32768.  |  |  |
| Command Modes      | Global configuration   |  |  |
| Command History    | Release  | Modification                                     |  |
|                    | Cisco IOS XE Everest 16.6.1  | This command was introduced.                     |  |
| Usage Guidelines   | The <b>lacp system-priority</b> command determines which device in an LACP link controls port priorities.  |  |  |
|                    | An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel group, the device on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. |  |  |
|                    | In priority comparisons, numerically lower values have a higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the device MAC address) determines which device is in control.   |  |  |
|                    | The lacp system-priority command applies to all LACP EtherChannels on the device.  |  |  |
|                    | Use the <b>show etherchannel summary</b> command in privileged EXEC mode to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).   |  |  |
|                    | This example shows how to set the LACP system pri  | ority:   |  |
|                    | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>lacp system-priority 20000</b>  |  |  |
|                    | You can verify your settings by entering the show lac  | <b>p sys-id</b> command in privileged EXEC mode. |  |

## loopdetect

To detect network loops, use the **loopdetect** command in interface configuration mode. To disable loop-detection guard use the **no** form of this command.

loopdetect [ time | action syslog | source-port ]
no loopdetect [ time | action syslog | source-port ]

| Syntax Description   |   | (Outlined) Time internel of othick 1   | latest German and in second la Demos 0.4.10             |
|--|---|--|---|
| Syntax Description   | time  | Default: 5.  | oop-detect frames are sent, in seconds. Range: 0 to 10. |
|  | action syslog   | (Optional) Displays a system messa   | age when a loop is detected.                            |
|  | source-port   | (Optional) Error-disables the source   | e port.   |
| Command Default  | - Loop-detection  | guard is not enabled.  |   |
| Command Modes  | Interface configuration (config-if)   |  |   |
| Command History  | Release   |  | Modification  |
|  | Cisco IOS XE  | Amsterdam 17.2.1   | This command was introduced.                            |
| Usage Guidelines   | <b>loopdetect</b> com<br>destination port   | You can error-disable either the source port or the destination port depending on your requirement. When the <b>loopdetect</b> command is configured without any of the keywords or variables, the feature is enabled and the destination port is error-disabled when a loop is detected. We recommend that you error-disable the source port to better control traffic flow to and from your network. |   |
| The <b>loopdetect action syslog</b> command displays only a system message and does not error-<br>configured port. The <b>no loopdetect action syslog</b> command reverts the system to the last com |   |  |   |
| Examples   | The following example shows how to enable loop-detection guard. In this example, the destination port is error-disabled by default and loop-detect frames are sent at the default time interval of five seconds:        |  |   |
|  | Device# <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface tengigabitethernet 1/0/18</b><br>Device(config-if)# <b>loopdetect</b>  |  |   |
|  | The following example shows how to configure the time interval to send loop-detect frames. In this example, loop-detect frames are sent every 7 seconds and destination port is error-disabled when a loop is detected: |  |   |
|  | 1   |  |   |

The following example shows how to enable the feature and only display a system message. There is no action taken on either the destination port or the source port:

```
Device# enable
Device# configure terminal
Device(config)# interface tengigabitethernet 1/0/18
Device(config-if)# loopdetect action syslog
```

The following example shows how to enable the feature and error-disable the source port:

```
Device# enable
Device# configure terminal
Device(config)# interface tengigabitethernet 1/0/18
Device(config-if)# loopdetect source-port
```

The following example shows how the **no loopdetect action syslog** command works. In the first part of the example, the feature has been configured to error disable the source port (**loopdetect source-port**). The feature is then reconfigured to display a system message and not error-disable a port (**loopdetect action syslog**). In the last part of the example, the **no** form of the **loopdetect action syslog** command is configured, which causes the system to revert to the last configured option, that is, to error disable the source port.

Part 1: Error-disabling the source port:

```
Device# enable
Device# configure terminal
Device(config)# interface twentyfivegigabitethernet 1/0/20
Device(config-if)# loopdetect source-port
```

Part 2: Reconfiguring to display a system message and not error-disable a port:

Device(config-if) # loopdetect action syslog

Part 3: Using the **no** form of **loopdetect action syslog** (see Twe1/0/20):

Device(config-if)# no loopdetect action syslog
Device(config-if)# end

Device# show loopdetect

| Interface  | Interva | al Elapsed-Time | e Port-to-Er: | rdisbale    | ACTION     |
|------------|---------|-----------------|---------------|-------------|------------|
|            |         |                 |               |             |            |
| Twe1/0/1   | 5       | 3               | errdisable    | Source Port | SYSLOG     |
| Twe1/0/20  | 5       | 0               | errdisable    | Source Port | ERRDISABLE |
| Twe2/0/3   | 5       | 2               | errdisable    | Dest Port   | ERRDISABLE |
| Loopdetect | is ENA  | ABLED           |               |             |            |

#### **Related Commands**

| Command         | Description   |  |

### pagp learn-method

To learn the source address of incoming packets received from an EtherChannel port, use the **pagp learn-method** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

```
pagp learn-method {aggregation-port | physical-port}
                      no pagp learn-method
Syntax Description
                       aggregation-port
                                           Specifies address learning on the logical port channel. The device sends packets to the
                                           source using any port in the EtherChannel. This setting is the default. With
                                           aggregation-port learning, it is not important on which physical port the packet arrives.
                       physical-port
                                           Specifies address learning on the physical port within the EtherChannel. The device
                                           sends packets to the source using the same port in the EtherChannel from which it
                                           learned the source address. The other end of the channel uses the same port in the channel
                                           for a particular destination MAC or IP address.
                      The default is aggregation-port (logical port channel).

                      Interface configuration
Command Modes
Command History
                                                                                             Modification
                       Release
                       Cisco IOS XE Everest 16.6.1
                                                                                             This command was introduced.
Usage Guidelines
                      The learn method must be configured the same at both ends of the link.
                      The device supports address learning only on aggregate ports even though the physical-port keyword is
                      provided in the command-line interface (CLI). The pagp learn-method and the pagp port-priority commands
                      in interface configuration mode have no effect on the device hardware, but they are required for PAgP
                      interoperability with devices that only support address learning by physical ports.
                      When the link partner to the device is a physical learner, we recommend that you configure the device as a
                      physical-port learner by using the pagp learn-method physical-port command in interface configuration
                      mode. We also recommend that you set the load-distribution method based on the source MAC address by
                      using the port-channel load-balance src-mac command in global configuration mode. Use the pagp
                      learn-method command in interface configuration mode only in this situation.
                      This example shows how to set the learning method to learn the address on the physical port within
                      the EtherChannel:
                      Device> enable
                      Device# configure terminal
                      Device (config) # interface port-channel 2
                      Device (config-if) # pagp learn-method physical-port
                      This example shows how to set the learning method to learn the address on the port channel within
                      the EtherChannel:
                      Device> enable
                      Device# configure terminal
```

Device(config) # interface port-channel 2
Device(config-if) # pagp learn-method aggregation-port

You can verify your settings by entering either the **show running-config** command in privileged EXEC mode or the **show pagp** *channel-group-number* **internal** command in privileged EXEC mode.

#### pagp port-priority

To select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent, use the **pagp port-priority** command in interface configuration mode. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. To return to the default setting, use the **no** form of this command.

pagp port-priority *priority* no pagp port-priority

| Syntax Description | <i>priority</i> Priority number. The range is from (   | ) to 255.   |  |
|--------------------|--|---|--|
| Command Default    | The default is 128.  |   |  |
| Command Modes      | Interface configuration  |   |  |
| Command History    | Release  | Modification  |  |
|                    | Cisco IOS XE Everest 16.6.1  | This command was introduced.  |  |
| Usage Guidelines   | The physical port with the highest priority tha is the one selected for PAgP transmission.   | t is operational and has membership in the same EtherChannel  |  |
|                    | Is the one selected for PAgP transmission.<br>The device supports address learning only on aggregate ports even though the <b>physical-port</b> keyword is<br>provided in the command-line interface (CLI). The <b>pagp learn-method</b> and the <b>pagp port-priority</b> commands<br>in interface configuration mode have no effect on the device hardware, but they are required for PAgP<br>interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900<br>switch. |   |  |
|                    | physical-port learner by using the <b>pagp learn</b><br>mode. We also recommend that you set the los   | cal learner, we recommend that you configure the device as a <b>-method physical-port</b> command in interface configuration ad-distribution method based on the source MAC address by c command in global configuration mode. Use the <b>pagp</b> ation mode only in this situation. |  |
|                    | This example shows how to set the port priority to 200:  |   |  |
|                    | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface gigabitether</b><br>Device(config-if)# <b>pagp port-priority</b> #  |   |  |

You can verify your setting by entering the **show running-config** command in privileged EXEC mode or the **show pagp** *channel-group-number* **internal** command in privileged EXEC mode.

### port-channel

To convert the auto created EtherChannel into a manual channel and adding configuration on the EtherChannel, use the **port-channel** command in privileged EXEC mode.

port-channel {channel-group-number persistent | persistent }

| Syntax Description | channel-group-number  | Channel group number.   |  |
|--------------------|---|---|--|
|                    |   | The range is 1 to 252.  |  |
|                    | persistent  | Converts the auto created EtherChannel into a manual channel and allows you to add configuration on the EtherChannel. |  |
| Command Modes      | Privileged EXEC   |   |  |
| Command History    | Release   | Modification  |  |
|                    | Cisco IOS XE Everest 1  | 6.6.1This command was introduced.   |  |
| Usage Guidelines   | You can use the <b>show etherchannel summary</b> command in privileged EXEC mode to display the EtherChannel information.                     |   |  |
| Examples           | This example shows how to convert the auto created EtherChannel into a manual channel:<br>Device> enable<br>Device# port-channel 1 persistent |   |  |

### port-channel auto

To enable the auto-LAG feature on a switch globally, use the **port-channel auto** command in global configuration mode. To disable the auto-LAG feature on the switch globally, use **no** form of this command.

port-channel auto no port-channel auto

**Command Default** By default, the auto-LAG feature is disabled globally and is enabled on all port interfaces.

**Command Modes** Global configuration

| <b>Command History</b> | Release   | Modification  |
|------------------------|---|---|
|                        | Cisco IOS XE Everest 16.6.1   | This command was introduced.                            |
| Usage Guidelines       | You can use the <b>show etherchannel auto</b> commar was created automatically. | d in privileged EXEC mode to verify if the EtherChannel |

**Examples** This example shows how to enable the auto-LAG feature on the switch:

Device> enable Device# configure terminal Device(config)# port-channel auto

### port-channel load-balance

To set the load-distribution method among the ports in the EtherChannel, use the **port-channel load-balance** command in global configuration mode. To reset the load-balancing mechanism to the default setting, use the **no** form of this command.

port-channel load-balance {dst-ip | dst-mac | dst-mixed-ip-port | dst-port | extended | src-dst-ip | src-dst-mac | src-dst-mixed-ip-port | src-dst-port | src-ip | src-mac | src-mixed-ip-port | src-port}

#### no port-channel load-balance

| Syntax Description   | dst-ip  | Specifies load distribution based on the destination host IP address.   |  |  |
|--|---|---|--|--|
|  | dst-mac   | Specifies load distribution based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent on different ports in the channel. |  |  |
|  | dst-mixed-ip-port   | Specifies load distribution based on the destination IPv4 or IPv6 address and the TCP/UDP (Layer 4) port number.  |  |  |
|  | dst-port  | Specifies load distribution based on the destination TCP/UDP (Layer 4) port number for both IPv4 and IPv6.  |  |  |
|  | extended  | Sets extended load balance methods among the ports in the EtherChannel.   |  |  |
|  | src-dst-ip  | Specifies load distribution based on the source and destination host IP address.  |  |  |
|  | src-dst-mac   | Specifies load distribution based on the source and destination host MAC address.   |  |  |
|  | src-dst-mixed-ip-port   | Specifies load distribution based on the source and destination host IP address and TCP/UDP (layer 4) port number.  |  |  |
|  | src-dst-port  | Specifies load distribution based on the source and destination TCP/UDP (Layer 4) port number.  |  |  |
|  | src-ip  | Specifies load distribution based on the source host IP address.  |  |  |
|  | src-mac   | Specifies load distribution based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.                                     |  |  |
|  | src-mixed-ip-port   | Specifies load distribution based on the source host IP address and TCP/UDP (Layer 4) port number.  |  |  |
|  | <b>src-port</b> Specifies load distribution based on the TCP/UDP (Layer 4) port number. |   |  |  |
| <b>Command Default</b> The default value is <b>src-mac</b> . |   |   |  |  |
| Command Modes  | Global configuration (  | config)   |  |  |

| Command History  | Release   | Modification  |  |
|------------------|---|---|--|
|                  | Cisco IOS XE Everest 16.6.1   | This command was introduced.                            |  |
| Usage Guidelines | You can verify your setting by entering either the <b>show running-config</b> command in privileged EXEC mode or the <b>show etherchannel load-balance</b> command in privileged EXEC mode. |   |  |
| Examples         | The following example shows how to set the load-distribution method to dst-mac:   |   |  |
|                  | Device> <b>enable</b><br>Device <b># configure terminal</b><br>Device(config) <b># port-channel</b> :   | load-balance dst-mac                                    |  |
| Related Commands | Command   | Description   |  |
|                  | show etherchannel load-balance  | Displays information about EtherChannel load balancing. |  |

Displays the running configuration.

show running-config

### port-channel load-balance extended

To set combinations of load-distribution methods among the ports in the EtherChannel, use the **port-channel load-balance extended** command in global configuration mode. To reset the extended load-balancing mechanism to the default setting, use the **no** form of this command.

port-channel load-balance extended {dst-ip | dst-mac | dst-port | ipv6-label | l3-proto | src-ip | src-mac | src-port}

no port-channel load-balance extended

| Syntax Description | dst-ip   | dst-ip Specifies load distribution based on the destination host IP address.   |  |  |
|--------------------|--|--|--|--|
|                    | dst-mac  | <b>c</b> Specifies load distribution based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent on different ports in the channel. |  |  |
|                    | <b>dst-port</b> Specifies load distribution based on the destination TCP/UDP (Layer 4) port number for both IPv4 and IPv6.   |  |  |  |
|                    | ipv6-label   | belSpecifies load distribution based on the source MAC address and IPv6 flow label.toSpecifies load distribution based on the source MAC address and Layer 3 protocols.  |  |  |
|                    | 13-proto   |  |  |  |
|                    | src-ip   | Specifies load distribution based on the source host IP ad   | dress.   |  |
|                    | src-mac  | Specifies load distribution based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.  |  |  |
|                    | <b>src-port</b> Specifies load distribution based on the TCP/UDP (Layer 4) port number.  |  |  |  |
| Command Default    | The defau  | t is <b>src-mac</b> .  |  |  |
| Command Modes      | Global con   | figuration   |  |  |
| Command History    | Release  |  | Modification   |  |
|                    | Cisco IOS XE Everest 16.6.1  |  | This command was introduced.   |  |
|                    | have to mandatorily configure  |  | atleast one of the keywords for the <b>port-channel load-balance</b> |  |
| Usage Guidelines   | You can verify your setting by entering either the <b>show running-config</b> command in privileged EX or the <b>show etherchannel load-balance</b> command in privileged EXEC mode. |  | · · ·  |  |
| Examples           | This example shows how to set the extended load-distribution method:   |  |  |  |

Device> enable Device# configure terminal Device(config)# port-channel load-balance extended dst-ip dst-mac src-ip

# port-channel min-links

To define the minimum number of LACP ports that must be bundled in the link-up state and bundled in the EtherChannel in order that a port channel becomes active, use the **port-channel min-links** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

port-channel min-links min\_links\_number
no port-channel min-links

| Syntax Description | min_links_number  | The minimum number of active LAC  | P ports in the port channel.  |
|--------------------|---|---|---|
|                    |   | The range is 2 to 8 if the port channel if the port channel number is 129 or g  | I number is 128 or lesser and the range is 2 to 4 greater.  |
|                    |   | The default is 1.   |   |
| Command Modes      | Interface configurati   | ion   |   |
| Command History    | Release   |   | Modification  |
|                    | Cisco IOS XE Ever   | rest 16.6.1   | This command was introduced.  |
| Usage Guidelines   | <ul> <li>An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in hot-standby mode. When there are more than eight ports in an LACP channel group, the device on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored.</li> <li>The port-channel min-links command must specify a number a less than the number specified by the lacp</li> </ul> |   |   |
| Usage Guidelines   | and up to eight ports<br>group, the device on<br>into the channel and<br>noncontrolling end of<br>The <b>port-channel m</b>   | s can be in hot-standby mode. # rep admin vlan

To configure a Resilient Ethernet Protocol (REP) administrative VLAN for the REP to transmit hardware flood layer (HFL) messages, use the **rep admin vlan** command in global configuration mode. To return to the default configuration with VLAN 1 as the administrative VLAN, use the **no** form of this command.

rep admin vlan vlan-id segment segment-id no rep admin vlan vlan-id segment segment-id

| Syntax Description               | vlan-id   | 48-bit static MAC address.                         |
|----------------------------------|---|--|
|                                  | segment   | configures administrative VLAN for an REP segment. |
|                                  | segment-id specifies the segment for which the VLAN has been assigned. Segme ranges from 1-1024 |  |
| Command Default<br>Command Modes | – Global configuration  |  |
| Command History                  | Release   | Modification                                       |
|                                  | Cisco IOS XE Everest 16.6.1   | This command was introduced.                       |
|                                  | Cisco IOS XE Amsterdam 17.2.1   | The <b>segment</b> keyword was introduced.         |

#### rep block port

To configure Resilient Ethernet Protocol (REP) VLAN load balancing on a REP primary edge port, use the **rep block port** command in interface configuration mode. To return to the default configuration with VLAN 1 as the administrative VLAN, use the **no** form of this command.

**rep block port {id** *port-id* | *neighbor-offset* | **preferred**} **vlan {***vlan-list* | **all**} **no rep block port {id** *port-id* | *neighbor-offset* | **preferred**}

| Syntax Description | id port-id   | Specifies the VLAN blocking alternate port by entering the unique port ID, which is automatically generated when REP is enabled. The REP port ID is a 16-character hexadecimal value.  |  |  |
|--------------------|--|--|--|--|
|                    | neighbor-offset  | neighbor-offsetVLAN blocking alternate port by entering the offset number of a neighbor. The range is<br>from -256 to +256. A value of 0 is invalid.preferredSelects the regular segment port previously identified as the preferred alternate port for<br>VLAN load balancing.  |  |  |
|                    | preferred  |  |  |  |
|                    | vlan Identifies the VLANs to be blocked.   |  |  |  |
|                    | vlan-list  | VLAN ID or range of VLAN IDs to be displayed. Enter a VLAN ID from 1 to 4094, or a range or sequence of VLANs (such as 1-3, 22, and 41-44) to be blocked.  |  |  |
|                    | all  | Blocks all the VLANs.  |  |  |
| Command Default    |  | navior after you enter the <b>rep preempt segment</b> command in privileged EXEC (for manual to block all the VLANs at the primary edge port. This behavior remains until you configure <b>port</b> command.   |  |  |
|                    |  | edge port cannot determine which port is to be the alternate port, the default action is no<br>I no VLAN load balancing.   |  |  |
| Command Modes      | Interface config   | guration   |  |  |
| Command History    | Release  | Modification   |  |  |
|                    | Cisco IOS XE   | Everest 16.6.1 This command was introduced.  |  |  |
| Usage Guidelines   | port of an edge<br>downstream net  | et an alternate port by entering an offset number, this number identifies the downstream neighbor<br>port. The primary edge port has an offset number of 1; positive numbers above 1 identify<br>ighbors of the primary edge port. Negative numbers identify the secondary edge port (offset<br>lits downstream neighbors. |  |  |
|                    |  |  |  |  |
|                    | <b>Note</b> Do not enter an offset value of 1 because that is the offset number of the primary edge port itself. |  |  |  |
|                    | If you have cont   | foured a preempt delay time by entering the <b>rep preempt delay seconds</b> command in interface  |  |  |

If you have configured a preempt delay time by entering the **rep preempt delay seconds** command in interface configuration mode and a link failure and recovery occurs, VLAN load balancing begins after the configured

preemption time period elapses without another link failure. The alternate port specified in the load-balancing<br/>configuration blocks the configured VLANs and unblocks all the other segment ports. If the primary edge<br/>port cannot determine the alternate port for VLAN balancing, the default action is no preemption.Each port in a segment has a unique port ID. To determine the port ID of a port, enter the show interfaces<br/>interface-id rep detail command in privileged EXEC mode.ExamplesThe following example shows how to configure REP VLAN load balancing:<br/>Device> enable<br/>Device (config) # interface TenGigabitEthernet 4/1<br/>Device (config-if) # rep block port id 0009001818D68700 vlan 1-100Related CommandsCommandDescription

| Related Commands | Command | Description  |  |
|------------------|---------|--|--|
|                  | •       | Displays detailed REP configuration and status for all the interfaces or the specified interface, including the administrative VLAN. |  |

### rep Isl-age-timer

To configure the Resilient Ethernet Protocol (REP) link status layer (LSL) age-out timer value, use the **rep lsl-age-timer** command in interface configuration mode. To restore the default age-out timer value, use the **no** form of this command.

rep lsl-age-timer milliseconds no rep lsl-age-timer milliseconds

rep segment

| Syntax Description | <i>milliseconds</i> REP LSL age-out timer value, in milliseconds (ms). The range is from 120 to 10000 in multiples of 40.  |  |  |
|--------------------|--|--|--|
| Command Default    | The default LSL age-out timer value is 5   | ms.  |  |
| Command Modes      | Interface configuration  |  |  |
| Command History    | Release  | Modification   |  |
|                    | Cisco IOS XE Everest 16.6.1  | This command was introduced.                                     |  |
| Usage Guidelines   | While configuring REP configurable timers, we recommend that you configure the REP LSL number o first and then configure the REP LSL age-out timer value.                                      |  |  |
| Examples           | The following example shows how to configure a REP LSL age-out timer value:  |  |  |
|                    | Device> enable<br>Device# configure terminal<br>Device(config)# interface TenGigabitEthernet 4/1<br>Device(config-if)# rep segment 1 edge primary<br>Device(config-if)# rep lsl-age-timer 2000 |  |  |
| Related Commands   | Command  | Description  |  |
|                    | interface interface-type interface-name  | Specifies a physical interface or port channel to receive STCNs. |  |

Enables REP on an interface and assigns a segment ID.

### rep Isl-retries

To configure the REP link status layer (LSL) number of retries, use the **rep lsl-retries** command in interface configuration mode. To restore the default number of retries, use the **no** form of this command.

**rep lsl-retries** *number-of-retries* **no rep lsl-retries** *number-of-retries* 

| Syntax Description | number-of-retries       Number of LSL retries. The range of retries is from 3 to 10.         The default number of LSL retries is 5.                                |   |  |  |
|--------------------|---|---|--|--|
| Command Default    |   |   |  |  |
| Command Modes      | Interface configuration   |   |  |  |
| Command History    | Release   | Modification  |  |  |
|                    | Cisco IOS XE Everest 16.6.1   | This command was introduced   |  |  |
| Usage Guidelines   | -   | ne number of retries before the REP link is disabled. While<br>nd that you configure the REP LSL number of retries first<br>ue. |  |  |
|                    | The following example shows how to configure REP LSL retries.   |   |  |  |
|                    | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface TenGigabitEther</b><br>Device(config-if)# <b>rep segment 2 edge prim</b> |   |  |  |

# rep preempt delay

To configure a waiting period after a segment port failure and recovery before Resilient Ethernet Protocol (REP) VLAN load balancing is triggered, use the **rep preempt delay** command in interface configuration mode. To remove the configured delay, use the **no** form of this command.

rep preempt delay seconds no rep preempt delay

| Syntax Description | <i>seconds</i> Number of seconds to delay REP preemption. The range is from 15 to 300 seconds. The default is manual preemption without delay.   |   |                              |  |  |  |  |
|--------------------|--|---|------------------------------|--|--|--|--|
| Command Default    | REP preemption delay is not set. The default is manual preemption without delay.   |   |                              |  |  |  |  |
| Command Modes      | Interface configuration  |   |                              |  |  |  |  |
| Command History    | Release  |   | Modification                 |  |  |  |  |
|                    | Cisco IOS XE Everest 16.   | 6.1   | This command was introduced. |  |  |  |  |
| Usage Guidelines   | Enter this command on the  | REP primary edge port.  |                              |  |  |  |  |
| -                  | Enter this command and configure a preempt time delay for VLAN load balancing to be automatically triggered after a link failure and recovery.   |   |                              |  |  |  |  |
|                    | If VLAN load balancing is configured after a segment port failure and recovery, the REP primary edge port starts a delay timer before VLAN load balancing occurs. Note that the timer restarts after each link failure. When the timer expires, the REP primary edge port alerts the alternate port to perform VLAN load balancing (configured by using the <b>rep block port</b> command in interface configuration mode) and prepares the segment for the new topology. The configured VLAN list is blocked at the alternate port, and all other VLANs are blocked at the primary edge port. |   |                              |  |  |  |  |
|                    | You can verify your settings by entering the show interfaces rep command.  |   |                              |  |  |  |  |
| Examples           | The following example sho primary edge port:   | The following example shows how to configure a REP preemption time delay of 100 seconds on the primary edge port: |                              |  |  |  |  |
|                    | Device> <b>enable</b><br>Device# <b>configure term</b><br>Device(config)# <b>interf</b><br>Device(config-if)# <b>rep</b>   | ace TenGigabitEthernet 4/1  |                              |  |  |  |  |
| Related Commands   | Command  | Description   |                              |  |  |  |  |

| Commanu                       | Description  |
|-------------------------------|--|
| rep block port                | Configures VLAN load balancing.  |
| show interfaces rep<br>detail | Displays detailed REP configuration and status for all the interfaces or the specified interface, including the administrative VLAN. |

### rep preempt segment

To manually start Resilient Ethernet Protocol (REP) VLAN load balancing on a segment, use the **rep preempt** segment command in privileged EXEC mode.

rep preempt segment segment-id

| Syntax Description | segment-id ID                                | of the REP segment. The range is from 1 to 1024.  |   |
|--------------------|--|---|---|
| Command Default    | Manual preemp                                | ption is the default behavior.  |   |
| Command Modes      | Privileged EXE                               | EC .  |   |
| Command History    | Release                                      |   | Modification                            |
|                    | Cisco IOS XE                                 | Everest 16.6.1  | This command was introduced.            |
| Usage Guidelines   | Enter this com                               | nand on the segment, which has the primary edge p   | port on the device.                     |
|                    | balancing. Whe                               | the other segment configuratios are completed beforent you enter the <b>rep preempt segment</b> segment-id command is executed because preemption for VLAN lo | command, a confirmation message appears |

#### rep segment

To enable Resilient Ethernet Protocol (REP) on an interface and to assign a segment ID to the interface, use the **rep segment** command in interface configuration mode. To disable REP on the interface, use the **no** form of this command.

rep segment segment-id [edge [no-neighbor] [primary]] [preferred]
no rep segment

| Syntax Description | segment-id                      | Segment f<br>1 to 1024.  | for which REP is enabled. Assign a segment ID to the interface. The range is from .  |  |  |  |
|--------------------|---------------------------------|--------------------------|--|--|--|--|
|                    | edge                            | (Optional)               | ) Configures the port as an edge port. Each segment has only two edge ports.   |  |  |  |
|                    | no-neighbor                     | (Optional)               | ) Specifies the segment edge as one with no external REP neighbor.   |  |  |  |
|                    | primary                         |                          | ) Specifies that the port is the primary edge port where you can configure VLAN ncing. A segment has only one primary edge port.   |  |  |  |
|                    | preferred                       | (Optional)<br>load balar | ) Specifies that the port is the preferred alternate port or the preferred port for VLAN ncing.  |  |  |  |
|                    |                                 | Note                     | Configuring a port as a preferred port does not guarantee that it becomes the alternate port; it merely gives it a slight edge among equal contenders. The alternate port is usually a previously failed port. |  |  |  |
| Command Default    | REP is disabl                   | ed on the in             | nterface.  |  |  |  |
| Command Modes      | Interface con                   | figuration               |  |  |  |  |
| Command History    | Release                         |                          | Modification   |  |  |  |
|                    | Cisco IOS X                     | E Everest                | 16.6.1This command was introduced.   |  |  |  |
| Usage Guidelines   |                                 |                          | yer 2 IEEE 802.1Q port or a 802.1AD port. You must configure two edge ports on imary edge port and a secondary edge port.  |  |  |  |
|                    | If REP is enal<br>REP ports fol |                          | o ports on a device, both the ports must be either regular segment ports or edge ports. rules:   |  |  |  |
|                    | • If only o                     | ne port on               | a device is configured in a segment, that port should be an edge port.   |  |  |  |
|                    | • If two po                     | orts on a de             | evice belong to the same segment, both the ports must be regular segment ports.  |  |  |  |
|                    |                                 |                          | evice belong to the same segment, and one is configured as an edge port and one as a ort (a misconfiguration), the edge port is treated as a regular segment port.   |  |  |  |
|                    | $\triangle$                     |                          |  |  |  |  |
|                    |                                 |                          |  |  |  |  |

When REP is enabled on an interface, the default is for that port to be a regular segment port.

**Examples** 

The following example shows how to enable REP on a regular (nonedge) segment port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100
```

The following example shows how to enable REP on a port and identify the port as the REP primary edge port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100 edge primary
```

The following example shows how to enable REP on a port and identify the port as the REP secondary edge port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100 edge
```

The following example shows how to enable REP as an edge no-neighbor port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 1 edge no-neighbor primary
```

# rep stcn

I

|                    | To configure a Resilient Ethernet Protocol (REP) edge port to send segment topology change notifications (STCNs) to another interface or to other segments, use the <b>rep stcn</b> command in interface configuration mode. To disable the task of sending STCNs to the interface or to the segment, use the <b>no</b> form of this command. |  |   |  |  |
|--------------------|---|--|---|--|--|
|                    | rep stcn {interface in<br>no rep stcn {interface  | nterface-id   segment se<br>e   segment} | gment-id-list }   |  |  |
| Syntax Description | interface interface-id  | Specifies a physical inter               | face or port channel to receive STCNs.  |  |  |
|                    | segment segment-id-list   |  | ent or a list of REP segments to receive STCNs. The to 1024. You can also configure a sequence of segments, 00. |  |  |
| Command Default    | Transmission of STCNs   | to other interfaces or segm              | ents is disabled.   |  |  |

#### show interfaces rep detail

rep admin

vlan

To display detailed Resilient Ethernet Protocol (REP) configuration and status for all interfaces or a specified interface, including the administrative VLAN, use the **show interfaces rep detail** command in privileged EXEC mode.

show interfaces [interface-id] rep detail

Syntax Description interface-id (Optional) Physical interface used to display the port ID. Privileged EXEC **Command Modes Command History** Release Modification Cisco IOS XE Everest 16.6.1 This command was introduced. Enter this command on a segment edge port to send STCNs to one or more segments or to an interface. **Usage Guidelines** You can verify your settings by entering the **show interfaces rep detail** command in privileged EXEC mode. **Examples** The following example shows how to display the REP configuration and status for a specified interface; Device> enable Device# show interfaces TenGigabitEthernet4/1 rep detail TenGigabitEthernet4/1 REP enabled Segment-id: 3 (Primary Edge) PortID: 03010015FA66FF80 Preferred flag: No Operational Link Status: TWO WAY Current Key: 02040015FA66FF804050 Port Role: Open Blocked VLAN: <empty> Admin-vlan: 1 Preempt Delay Timer: disabled Configured Load-balancing Block Port: none Configured Load-balancing Block VLAN: none STCN Propagate to: none LSL PDU rx: 999, tx: 652 HFL PDU rx: 0, tx: 0 BPA TLV rx: 500, tx: 4 BPA (STCN, LSL) TLV rx: 0, tx: 0 BPA (STCN, HFL) TLV rx: 0, tx: 0 EPA-ELECTION TLV rx: 6, tx: 5 EPA-COMMAND TLV rx: 0, tx: 0 EPA-INFO TLV rx: 135, tx: 136 **Related Commands** Command Description

Configures a REP administrative VLAN for the REP to transmit HFL messages.

The following table describes the fields in the display:

#### Table 2: show lacp internal Field Descriptions

| Field              | Description   |
|--------------------|---|
| State              | State of the specific port. These are the allowed values:   |
|                    | • – —Port is in an unknown state.   |
|                    | • <b>bndl</b> —Port is attached to an aggregator and bundled with other ports.  |
|                    | • <b>susp</b> —Port is in a suspended state; it is not attached to any aggregator.  |
|                    | • <b>hot-sby</b> —Port is in a hot-standby state.   |
|                    | • <b>indiv</b> —Port is incapable of bundling with any other port.  |
|                    | • <b>indep</b> —Port is in an independent state (not<br>bundled but able to handle data traffic. In this<br>case, LACP is not running on the partner port).                       |
|                    | • <b>down</b> —Port is down.  |
| LACP Port Priority | Port priority setting. LACP uses the port priority to<br>put ports in standby mode when there is a hardware<br>limitation that prevents all compatible ports from<br>aggregating. |

| Field       | Description  |
|-------------|--|
| Admin Key   | Administrative key assigned to this port. LACP<br>automatically generates an administrative key value<br>as a hexadecimal number. The administrative key<br>defines the ability of a port to aggregate with other<br>ports. A port's ability to aggregate with other ports is<br>determined by the port physical characteristics (for<br>example, data rate and duplex capability) and<br>configuration restrictions that you establish. |
| Oper Key    | Runtime operational key that is being used by this port. LACP automatically generates this value as a hexadecimal number.  |
| Port Number | Port number.   |
| Port State  | State variables for the port, encoded as individual bits within a single octet with these meanings:         • bit0: LACP_Activity         • bit1: LACP_Timeout         • bit2: Aggregation         • bit3: Synchronization         • bit5: Distributing         • bit6: Defaulted         • bit7: Expired  |
|             | <b>Note</b> In the list above, bit7 is the MSB and bit0 is the LSB.  |

#### This is an example of output from the show lacp neighbor command:

Device> show lacp neighbor Flags: S - Device is sending Slow LACPDUS F - Device is sending Fast LACPDUS A - Device is in Active mode P - Device is in Passive mode Channel group 3 neighbors Partner's information: Partner Partner Partner Partner Port System ID Port Number Age Flags Gi2/0/1 32768,0007.eb49.5e80 0xC 19s SP LACP Partner Partner Partner Port Priority Oper Key Port State 32768 0x3 0x3C

| Field              | Description  |
|--------------------|--|
| Interface          | Displays the interfaces that have loop-detection guard enabled.                    |
| Interval           | Displays the time interval set to send the loop-detect frames in seconds.          |
| Elapsed-Time       | Displays the time elapsed within the set time interval to send loop-detect frames. |
| Port-to-Errdisbale | Displays the port that is configured to be error-disabled.                         |
| Action             | Displays the action the system will take when it detects a network loop.           |

# show pagp

To display Port Aggregation Protocol (PAgP) channel-group information, use the **show pagp** command in EXEC mode.

show pagp [channel-group-number] {counters | dual-active | internal | neighbor}

| Syntax Description          | channel-group-numbe   | er (Optional) Channel group num   | per.  |  |
|-----------------------------|---|---|---|--|
|                             |   | The range is 1 to 252.  |   |  |
|                             | counters  | Displays traffic information.   |   |  |
|                             | dual-active   | Displays the dual-active status   |   |  |
|                             | internal  | Displays internal information.  |   |  |
|                             | neighbor  | Displays neighbor information   |   |  |
| ommand Modes                | User EXEC   |   |   |  |

## show platform etherchannel

To display platform-dependent EtherChannel information, use the **show platform etherchannel** command in privileged EXEC mode.

**show platform etherchannel** channel-group-number {**group-mask** | **load-balance mac** src-mac dst-mac [**ip** src-ip dst-ip [**port** src-port dst-port]]} [**switch** switch-number]

| Syntax Description | channel-group-number   | Channel group number.                              |   |  |  |  |  |  |
|--------------------|--|--|---|--|--|--|--|--|
|                    |  | The range is 1 to 252.                             |   |  |  |  |  |  |
|                    | group-maskDisplays EtherChannel group mask.load-balanceTests EtherChannel load-balance hash algorithm. |  |   |  |  |  |  |  |
|                    |  |  |   |  |  |  |  |  |
|                    | macsrc-macSpecifies the source and destination MAC addresses.dst-mac                                   |  |   |  |  |  |  |  |
|                    | ip src-ip dst-ip   | (Optional) Specifies the source and destination    | IP addresses.                           |  |  |  |  |  |
|                    | <b>port</b> src-port<br>dst-port   | (Optional) Specifies the source and destination    | ree and destination layer port numbers. |  |  |  |  |  |
|                    | <b>switch</b><br>switch-number   | (Optional) Specifies the stack member.             |   |  |  |  |  |  |
| Command Modes      | Privileged EXEC  |  |   |  |  |  |  |  |
| Command History    | Release  |  | Modification                            |  |  |  |  |  |
|                    | Cisco IOS XE Everest   | 16.6.1   | This command was introduced.            |  |  |  |  |  |
| Usage Guidelines   | Use this command only troubleshooting a probl  | when you are working directly with a technical em. | support representative while            |  |  |  |  |  |
|                    | Do not use this command unless a technical support representative asks you to do so.                   |  |   |  |  |  |  |  |

I

### show platform pm

To display platform-dependent port manager information, use the **show platform pm** command in privileged EXEC mode.

**show platform pm** {**etherchannel** *channel-group-number* **group-mask** | **interface-numbers** | **port-data** *interface-id* | **port-state**}

| Syntax Description | etherchannel channel-group-number<br>group-mask                  | Displays the EtherChannel group-mask table for the specifi channel group. |  |  |  |  |  |
|--------------------|--|---|--|--|--|--|--|
|                    |  | The range is 1 to 252.  |  |  |  |  |  |
|                    | interface-numbers  | Displays interface numbers information.                                   |  |  |  |  |  |
|                    | port-data interface-id   | Displays port data information for the specified interface.               |  |  |  |  |  |
|                    | port-state   | Displays port state information.  |  |  |  |  |  |
| Command Modes      | Privileged EXEC  |   |  |  |  |  |  |
| Command History    | Release  | Modification  |  |  |  |  |  |
|                    | Cisco IOS XE Everest 16.6.1                                      | This command was introduced.  |  |  |  |  |  |
| Usage Guidelines   | Use this command only when you are wo troubleshooting a problem. | orking directly with your technical support representative while          |  |  |  |  |  |
|                    |  | 1 * 1 / / / 1 / 1   |  |  |  |  |  |

Do not use this command unless your technical support representative asks you to do so.

## show platform software fed (ifm mappings)

To display the number of VLAN mappings on each ASIC, use the **show platform software fed** command in privileged EXEC mode.

This topic provides information about only the number of VLAN mappings configured on each ASIC with the **show platform software fed** command.

show platform software fed { active | standby } ifm mappings [etherchannel | gpn | l3if-le | lpn | port-le]

| Syntax Description | { active   standby }   | Selects the state of the switch for which you following options:     | want to display information. You have the |  |  |  |  |  |
|--------------------|--|--|---|--|--|--|--|--|
|                    |  | • active—Displays information related to                             | the active switch.                        |  |  |  |  |  |
|                    |  | • standby—Displays information relating                              | g to standby switch, if available.        |  |  |  |  |  |
|                    | ifm  | Displays port information for a given interface ID.                  |   |  |  |  |  |  |
|                    | mappings   | Displays brief summary of all the interfaces.                        |   |  |  |  |  |  |
|                    | etherchannel   | Displays EtherChannel mapping information                            |   |  |  |  |  |  |
|                    | <b>gpn</b> Displays global port number mapping information.  |  |   |  |  |  |  |  |
|                    | <b>13if-le</b> Displays Layer 3 interface logical entity mapping information.  |  |   |  |  |  |  |  |
|                    | tion.  |  |   |  |  |  |  |  |
|                    | port-le  | Displays physical interface logical entity map                       | pping information.                        |  |  |  |  |  |
| Command Modes      | User EXEC (>)  |  |   |  |  |  |  |  |
|                    | Privileged EXEC  | (#)  |   |  |  |  |  |  |
| Command History    | Release  | Modification   | -   |  |  |  |  |  |
|                    | Cisco IOS XE An  | nsterdam 17.2.1 This command was introduced.                         | -   |  |  |  |  |  |
| Usage Guidelines   | The number of VLAN mappings configured on each ASIC can be derived by summing up the total number of interfaces on each ASIC. The output of the <b>show platform software fed active ifm mappings</b> command displays the ASIC number and the interface that is configured in separate columns. |  |   |  |  |  |  |  |
| Examples           | The following is sample output from the <b>show platform software fed active ifm mappings</b> command.<br>Here, a total of 20 VLAN mappings have been configured. The number of VLAN mappings in ASIC 0, ASIC 1, ASIC 2 are 8, 8 and 4 respectively:   |  |   |  |  |  |  |  |
|                    | Device> <b>enable</b><br>Device# <b>show pl</b><br>Interface<br>Active   | atform software fed active ifm mappings<br>IF_ID Inst Asic Core Port | SubPort Mac Cntx LPN GPN Type             |  |  |  |  |  |

# show rep topology

To display Resilient Ethernet Protocol (REP) topology information for a segment or for all the segments, including the primary and secondary edge ports in the segment, use the **show rep topology** command in privileged EXEC mode.

show rep topology [segment segment-id] [archive] [detail]

| Syntax Description | segment segmen   | ıt-id  | <ul><li>(Optional) Specifies the segment for which to display the REP topology information. The <i>segment-id</i> range is from 1 to 1024.</li><li>(Optional) Displays the previous topology of the segment. This keyword is useful for troubleshooting a link failure.</li></ul> |   |                 |                              |  |  |
|--------------------|--|--|---|---|-----------------|------------------------------|--|--|
|                    | archive  |  |   |   |                 |                              |  |  |
|                    | detail   |  | (Optio  | onal) Displays det                          | tailed REP top  | ology information.           |  |  |
| Command Modes      | Privileged EXEC  |  |   |   |                 |                              |  |  |

### show spanning-tree

To display spanning-tree information for the specified spanning-tree instances, use the **show spanning-tree** command in privileged EXEC mode.

show spanning-tree [bridge-group] [{ active | backbonefast | blockedports | bridge [id] | detail | inconsistentports | instances | interface interface-type interface-number | mst [{ list | configuration [digest] }] | pathcost method | root | summary [totals] | uplinkfast | vlan vlan-id }]

| Syntax Description | bridge-group  | (Optional) Specifies the bridge group number. The range is 1 to 255.   |
|--------------------|---|--|
|                    | active  | (Optional) Displays spanning-tree information on active interfaces only.   |
|                    | backbonefast  | (Optional) Displays spanning-tree BackboneFast status.   |
|                    | blockedports  | (Optional) Displays blocked port information.  |
|                    | bridge  | (Optional) Displays status and configuration of this switch.   |
|                    | detail  | (Optional) Shows status and configuration details.   |
|                    | inconsistentports   | (Optional) Displays information about inconsistent ports.  |
|                    | instances   | (Optional) Displays information about maximum STP instances.   |
|                    | <b>interface</b> <i>interface-type</i><br><i>interface-number</i> | (Optional) Specifies the type and number of the interface. Enter each interface designator, using a space to separate it from the one before and the one after. Ranges are not supported. Valid interfaces include physical ports and virtual LANs (VLANs). See the "Usage Guidelines" for valid values. |
|                    | mst   | (Optional) Specifies multiple spanning-tree.   |
|                    | list  | (Optional) Specifies a multiple spanning-tree instance list.   |
|                    | configuration digest  | (Optional) Displays the multiple spanning-tree current region configuration.   |
|                    | pathcost method   | (Optional) Displays the default path-cost calculation method that is used.<br>See the "Usage Guidelines" section for the valid values.   |
|                    | root  | (Optional) Displays root-switch status and configuration.  |
|                    | summary   | (Optional) Specifies a summary of port states.   |
|                    | totals  | (Optional) Displays the total lines of the spanning-tree state section.  |
|                    | uplinkfast  | (Optional) Displays spanning-tree UplinkFast status.   |
|                    | vlan vlan-id  | (Optional) Specifies the VLAN ID. The range is 1 to 4094.  |
|                    |   | If the <i>vlan-id</i> value is omitted, the command applies to the spanning-tree instance for all VLANs.   |
|                    | id  | (Optional) Identifies the spanning tree bridge.  |

I

|                  | port-channel number   | (Optional) Identifies the Ethernet ch  | annel associated with the interfaces. |  |  |  |  |  |
|------------------|---|--|---------------------------------------|--|--|--|--|--|
| Command Modes    | Privileged EXEC (#)   |  |                                       |  |  |  |  |  |
| Command History  | Release   |  | Modification                          |  |  |  |  |  |
|                  | Cisco IOS XE Everest 16.6   | 5.1  | This command was introduced.          |  |  |  |  |  |
| Usage Guidelines | , e   | its that are available with the <b>show spanni</b><br>and the network modules that are installed   |                                       |  |  |  |  |  |
|                  | The <b>port-channel</b> <i>number</i> values from 257 to 282 are supported on the Content Switching Module (CSM) and the Firewal Services Module (FWSM) only.   |  |                                       |  |  |  |  |  |
|                  | The <i>interface-number</i> argument designates the module and port number. Valid values for <i>interface-number</i> depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 2 to 13 and valid values for the port number are from 1 to 48. |  |                                       |  |  |  |  |  |
|                  | When checking spanning tree-active states and you have a large number of VLANs, you can enter the <b>show spanning-tree summary total</b> command. You can display the total number of VLANs without having to scroll through the list of VLANs.  |  |                                       |  |  |  |  |  |
|                  | The valid values for keyword <b>pathcoast</b> method are:   |  |                                       |  |  |  |  |  |
|                  | • append: Appends the redirected output to a URL (supporting the append operation).   |  |                                       |  |  |  |  |  |
|                  | • <b>begin</b> : Begins with the matching line.   |  |                                       |  |  |  |  |  |
|                  | • exclude: Excludes matching lines.   |  |                                       |  |  |  |  |  |
|                  | • include: Includes matching lines.   |  |                                       |  |  |  |  |  |
|                  | • redirect: Redirects output to a URL.  |  |                                       |  |  |  |  |  |
|                  | • tee: Copies output to a URL.  |  |                                       |  |  |  |  |  |
|                  | When you run the <b>show spanning-tree</b> command for a VLAN or an interface the switch router will display<br>the different port states for the VLAN or interface. The valid spanning-tree port states are listening, learning,<br>forwarding, blocking, disabled, and loopback.  |  |                                       |  |  |  |  |  |
|                  | -   | <pre>protocol rstp<br/>32769<br/>5c71.0dfe.8380<br/>e is the root<br/>2 sec Max Age 20 sec Forward D<br/>32769 (priority 32768 sys-id-ext<br/>5c71.0dfe.8380</pre> | -                                     |  |  |  |  |  |

| Te1/0/45  | Desg FWD 20000 | 128.45 P2p    |
| Te1/0/48  | Desg FWD 20000 | 128.48 P2p    |

See the table below for definitions of the port states:

#### Table 4: show spanning-tree vlan Command Port States

| Field | Definition  |
|-------|---|
| BLK   | Blocked is when the port is still sending and listening to BPDU packets but is not forwarding traffic.    |
| DIS   | Disabled is when the port is not sending or listening to BPDU packets and is not forwarding traffic.      |
| FWD   | Forwarding is when the port is sending and listening to BPDU packets and forwarding traffic.              |
| LBK   | Loopback is when the port recieves its own BPDU packet back.  |
| LIS   | Listening is when the port spanning tree initially starts to listen for BPDU packets for the root bridge. |
| LRN   | Learning is when the port sets the proposal bit on the BPDU packets it sends out                          |

This example shows how to display a summary of interface information:

| Hu6/0/30  | Back BLK | 200 | 128.870 | P2p |

The table below describes the fields that are shown in the example.

Table 5: show spanning-tree Command Output Fields

| Field            | Definition                   |
|------------------|------------------------------|
| Port ID Prio.Nbr | Port ID and priority number. |
| Cost             | Port cost.                   |
| Sts              | Status information.          |

This example shows how to display information about the spanning tree for this bridge only:

Device# show spanning-tree bridge

|          |       |         |     |                | Hello | Max | Fwd |          |
|----------|-------|---------|-----|----------------|-------|-----|-----|----------|
| Vlan     |       | Bri     | dge | ID             | Time  | Age | Dly | Protocol |
|          |       |         |     |                |       |     |     |          |
| VLAN0001 | 32769 | (32768, | 1)  | 5c71.0dfe.8380 | 2     | 20  | 15  | rstp     |

This example shows how to display detailed information about the interface:

```
Device#
show spanning-tree detail
VLAN0001 is executing the rstp compatible Spanning Tree protocol
 Bridge Identifier has priority 32768, sysid 1, address 5c71.0dfe.8380
  Configured hello time 2, max age 20, forward delay 15, transmit hold-count 6
  We are the root of the spanning tree
  Topology change flag not set, detected flag not set
  Number of topology changes 27 last change occurred 4d19h ago
         from TenGigabitEthernet1/0/48
  Times: hold 1, topology change 35, notification 2
         hello 2, max age 20, forward delay 15
  Timers: hello 0, topology change 0, notification 0, aging 300
 Port 1 (GigabitEthernet1/0/1) of VLAN0001 is designated forwarding
   Port path cost 20000, Port priority 128, Port Identifier 128.1.
  Designated root has priority 32769, address 5c71.0dfe.8380
  Designated bridge has priority 32769, address 5c71.0dfe.8380
   Designated port id is 128.1, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  Link type is point-to-point by default
  BPDU: sent 208695, received 1
 Port 18 (GigabitEthernet1/0/18) of VLAN0001 is designated forwarding
1
<<output truncated>>
```

This example shows how to display a summary of port states:

Device#

<<output truncated>>

The table below describes the fields that are shown in the example.

#### Table 6: show spanning-tree vlan Command Output Fields

| Field    | Definition   |  |
|----------|--|--|
| Role     | Current 802.1w role; valid values are Boun (boundary), Desg (designated), Root, Altn (alternate), and Back (backup).   |  |
| Sts      | Spanning-tree states; valid values are BKN* (broken) <sup>1</sup> , BLK (blocking), DWN (down), LTN (listening), LBK (loopback), LRN (learning), and FWD (forwarding).   |  |
| Cost     | Port cost.   |  |
| Prio.Nbr | Port ID that consists of the port priority and the port number.  |  |
| Status   | Status information; valid values are as follows:   |  |
|          | • P2p/Shr: The interface is considered as a point-to-point (resp. shared) interface by the spanning tree.  |  |
|          | • Edge: PortFast has been configured (either globally using the <b>default</b> command or directly on the interface) and no BPDU has been received.  |  |
|          | • *ROOT_Inc, *LOOP_Inc, *PVID_Inc and *TYPE_Inc: The port is in a broken state (BKN*) for an inconsistency. The port would be (respectively) Root inconsistent, Loopguard inconsistent, PVID inconsistent, or Type inconsistent. |  |
|          | • Bound(type): When in MST mode, identifies the boundary ports and specifies the type of the neighbor (STP, RSTP, or PVST).  |  |
|          | • Peer(STP): When in PVRST rapid-pvst mode, identifies the port connected to a previous version of the 802.1D bridge.  |  |
|          |  |  |

 $^{1}$  For information on the \*, see the definition for the Status field.

## show spanning-tree mst

To display the information about the Multiple Spanning Tree (MST) protocol, use the **show spanning-tree mst** command in privileged EXEC mode.

show spanning-tree mst [{ configuration [digest] | instance-id-number }] [ interface interface ] [
detail ] [ service instance ]

| Syntax Description | instance-id-number  | (Optional) Instance identification number. The range is from 0 to 4094.   |  |
|--------------------|---|---|--|
|                    | detail  | (Optional) Displays detailed information about the MST protocol.  |  |
|                    | interface   | (Optional) Displays the information about the interfaces. See the "Usage Guidelines' section for valid number values.   |  |
|                    | configuration   | (Optional) Displays information about the region configuration.   |  |
|                    | digest  | (Optional) Displays information about the message digest 5 (MD5) algorithm included<br>in the current MST configuration identifier (MSTCI).   |  |
|                    | interface   | (Optional) Displays information about the interface type.   |  |
| Command Modes      | Privileged EXEC (#)   |   |  |
| Command History    | Release   | Modification  |  |
|                    | Cisco IOS XE Evere  | st 16.6.1 This command was introduced.  |  |
| Usage Guidelines   | The valid values for the <i>interface</i> argument depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 2 to 13 and valid values for the port number are from 1 to 48.   |   |  |
|                    | The number of valid values for <b>port-channel</b> <i>number</i> are a maximum of 64 values ranging from 1 to<br>The <b>port-channel</b> <i>number</i> values from 257 to 282 are supported on the Content Switching Module (C<br>and the Firewall Services Module (FWSM) only.<br>The number of valid values for <b>vlan</b> are from 1 to 4094.<br>In the output display of the <b>show spanning-tree mst configuration</b> command, a warning message m<br>displayed. This message appears if you do not map secondary VLANs to the same instance as the asso<br>primary VLAN. The display includes a list of the secondary VLANs that are not mapped to the same in<br>as the associated primary VLAN. The warning message is as follows: |   |  |
|                    |   |   |  |
|                    |   |   |  |
|                    | These secondary vl<br>-> 3  | ans are not mapped to the same instance as their primary:   |  |
|                    |   | of the <b>show spanning-tree mst configuration digest</b> command, if the output applied restandard bridges at the same time on a per-port basis, two different digests are displayed |  |
|                    |   |   |  |

If you configure a port to transmit prestandard PortFast bridge protocol data units (BPDUs) only, the prestandard flag displays in the **show spanning-tree** commands. The variations of the prestandard flag are as follows:

- Pre-STD (or pre-standard in long format): This flag is displayed if the port is configured to transmit prestandard BPDUs and if a prestandard neighbor bridge has been detected on this interface.
- Pre-STD-Cf (or pre-standard (config) in long format): This flag is displayed if the port is configured to transmit prestandard BPDUs but a prestandard BPDU has not been received on the port, the autodetection mechanism has failed, or a misconfiguration, if there is no prestandard neighbor, has occurred.
- Pre-STD-Rx (or prestandard (rcvd) in long format): This flag is displayed when a prestandard BPDU
  has been received on the port, but it has not been configured to send prestandard BPDUs. The port will
  send prestandard BPDUs, but Cisco recommends that you change the port configuration so that the
  interaction with the prestandard neighbor does not rely only on the autodetection mechanism.

If the configuration is not prestandard compliant (for example, a single MST instance has an ID that is greater than or equal to 16,) the prestandard digest is not computed and the following output is displayed:

Device# show spanning-tree mst configuration digest

Name [region1] Revision 2 Instances configured 3 Digest 0x3C60DBF24B03EBF09C5922F456D18A03 Pre-std Digest N/A, configuration not pre-standard compatible

MST BPDUs include an MSTCI that consists of the region name, region revision, and an MD5 digest of the VLAN-to-instance mapping of the MST configuration.

See the **show spanning-tree mst** command field description table for output descriptions.

#### **Examples**

The following example shows how to display information about the region configuration:

Device# show spanning-tree mst configuration

```
      Name
      [train]

      Revision
      2702

      Instance
      Vlans mapped

      0
      1-9,11-19,21-29,31-39,41-4094

      1
      10,20,30,40
```

The following example shows how to display additional MST-protocol values:

Device# show spanning-tree mst 3 detail

```
###### MST03 vlans mapped: 3,3000-3999
Bridge address 0002.172c.f400 priority 32771 (32768 sysid 3)
Root this switch for MST03
GigabitEthernet1/1 of MST03 is boundary forwarding
Port info port id 128.1 priority 128
cost 20000
Designated root address 0002.172c.f400 priority 32771
cost 0

128.193
Timers: message expires in 2 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 3, received 252

The following example shows how to display the MD5 digest included in the current MSTCI:

Device# show spanning-tree mst configuration digest

Name[mst-config]Revision10Instances configured 25Digest0x40D5ECA178C657835C83BBCB16723192Pre-std Digest0x27BF112A75B72781ED928D9EC5BB4251

#### Related Commands

| Command                        | Description  |
|--------------------------------|--|
| spanning-tree mst              | Sets the path cost and port-priority parameters for any MST instance.                  |
| spanning-tree mst forward-time | Sets the forward-delay timer for all the instances on the Cisco 7600 series router.    |
| spanning-tree mst hello-time   | Sets the hello-time delay timer for all the instances on the Cisco 7600 series router. |
| spanning-tree mst max-hops     | Specifies the number of possible hops in the region before a BPDU is discarded.        |

### show udld

To display UniDirectional Link Detection (UDLD) administrative and operational status for all ports or the specified port, use the **show udld** command in user EXEC mode.

show udld [Auto-Template | Capwap | GigabitEthernet | GroupVI | InternalInterface | Loopback | Null | Port-channel | TenGigabitEthernet | Tunnel | Vlan] interface\_number show udld neighbors

| Syntax Description | Auto-Template      | (Optional) Displays UDLD operational status of the auto-template interface. The range is from 1 to 999.            |
|--------------------|--------------------|--|
|                    | Сарwар             | (Optional) Displays UDLD operational status of the CAPWAP interface. The range is from 0 to 2147483647.            |
|                    | GigabitEthernet    | (Optional) Displays UDLD operational status of the GigabitEthernet interface. The range is from 0 to 9.            |
|                    | GroupVI            | (Optional) Displays UDLD operational status of the group virtual interface. The range is from 1 to 255.            |
|                    | InternalInterface  | (Optional) Displays UDLD operational status of the internal interface. The range is from 0 to 9.                   |
|                    | Loopback           | (Optional) Displays UDLD operational status of the loopback interface. The range is from 0 to 2147483647.          |
|                    | Null               | (Optional) Displays UDLD operational status of the null interface.   |
|                    | Port-channel       | (Optional) Displays UDLD operational status of the Ethernet channel interfaces.                                    |
|                    |                    | The range is 1 to 252.   |
|                    | TenGigabitEthernet | (Optional) Displays UDLD operational status of the Ten Gigabit Ethernet interface. The range is from 0 to 9.       |
|                    | Tunnel             | (Optional) Displays UDLD operational status of the tunnel interface. The range is from 0 to 2147483647.            |
|                    | Vlan               | (Optional) Displays UDLD operational status of the VLAN interface. The range is from 1 to 4095.                    |
|                    | interface-id       | (Optional) ID of the interface and port number. Valid interfaces include physical ports, VLANs, and port channels. |
|                    | neighbors          | (Optional) Displays neighbor information only.   |

**Command Modes** 

User EXEC

|                  | Message interval: 5<br>CDP Device name: Switch-A  |  |  |  |

| Field  | Description   |
|--|---|
| Interface  | The interface on the local device configured for UDLD.  |
| Port enable administrative configuration setting | How UDLD is configured on the port. If UDLD is<br>enabled or disabled, the port enable configuration<br>setting is the same as the operational enable state.<br>Otherwise, the enable operational setting depends on<br>the global enable setting.                                      |
| Port enable operational state                    | Operational state that shows whether UDLD is actually running on this port.   |
| Current bidirectional state                      | The bidirectional state of the link. An unknown state<br>appears if the link is down or if it is connected to an<br>UDLD-incapable device. A bidirectional state appears<br>if the link is a normal two-way connection to a<br>UDLD-capable device. All other values mean<br>miswiring. |

### Table 7: show udld Field Descriptions

I

| Field                     | Description   |
|---------------------------|---|
| Current operational state | The current phase of the UDLD state machine. For a normal bidirectional link, the state machine is most often in the Advertisement phase.   |
| Message interval          | How often advertisement messages are sent from the local device. Measured in seconds.   |
| Time out interval         | The time period, in seconds, that UDLD waits for<br>echoes from a neighbor device during the detection<br>window.   |
| Entry 1                   | Information from the first cache entry, which contains<br>a copy of echo information received from the<br>neighbor.   |
| Expiration time           | The amount of time in seconds remaining before this cache entry is aged out.  |
| Device ID                 | The neighbor device identification.   |
| Current neighbor state    | The neighbor's current state. If both the local and<br>neighbor devices are running UDLD normally, the<br>neighbor state and local state should be bidirectional.<br>If the link is down or the neighbor is not<br>UDLD-capable, no cache entries appear. |
| Device name               | The device name or the system serial number of the neighbor. The system serial number appears if the device name is not set or is set to the default (Switch).  |
| Port ID                   | The neighbor port ID enabled for UDLD.  |
| Neighbor echo 1 device    | The device name of the neighbors' neighbor from which the echo originated.  |
| Neighbor echo 1 port      | The port number ID of the neighbor from which the echo originated.  |
| Message interval          | The rate, in seconds, at which the neighbor is sending advertisement messages.  |
| CDP device name           | The CDP device name or the system serial number.<br>The system serial number appears if the device name<br>is not set or is set to the default (Switch).  |

| and History | Release Modific             |                              |  |
|-------------|-----------------------------|------------------------------|--|
|             | Cisco IOS XE Everest 16.6.1 | This command was introduced. |  |

### Usage Guidelines BackboneFast should be enabled on all of the Cisco devices containing an Ethernet switch network module. BackboneFast provides for fast convergence in the network backbone after a spanning-tree topology change. It enables the switch to detect an indirect link failure and to start the spanning-tree reconfiguration sooner than it would under normal spanning-tree rules.

Use the **show spanning-tree** privileged EXEC command to verify your settings.

**Examples** The following example shows how to enable BackboneFast on the device:

Device(config)# spanning-tree backbonefast

Modification

This command was introduced.

### spanning-tree bridge assurance

To enable bridge assurance on all network ports on the device, use the **spanning-tree bridge assurance** command in global configuration mode. To disable bridge assurance, use the **no** form of this command.

spanning-tree bridge assurance no spanning-tree bridge assurance

Syntax Description This command has no arguments or keywords.

**Command Default** Bridge assurance is enabled.

Command Modes Global configuration (config)

Command History Release

Cisco IOS XE Everest 16.6.1

**Usage Guidelines** Bridge assurance protects against a unidirectional link failure or other software failure and a device that continues to forward data traffic when it is no longer running the spanning tree algorithm.

Bridge assurance is enabled only on spanning tree network ports that are point-to-point links. Both ends of the link must have bridge assurance enabled. If the device on one side of the link has bridge assurance enabled and the device on the other side either does not support bridge assurance or does not have this feature enabled, the connecting port is blocked.

Disabling bridge assurance causes all configured network ports to behave as normal spanning tree ports.

### **Examples** This example shows how to enable bridge assurance on all network ports on the switch:

Device(config)#
spanning-tree bridge assurance
Device(config)#

This example shows how to disable bridge assurance on all network ports on the switch:

Device(config)#
no spanning-tree bridge assurance
Device(config)#

| <b>Related Commands</b> | Command                         | Description   |
|-------------------------|---------------------------------|---|
|                         | show spanning-tree              | Displays information about the spanning-tree state.             |
|                         | spanning-tree loopguard default | Enables loop guard as a default on all ports of a given bridge. |

## spanning-tree link-type

To configure a link type for a port, use the **spanning-tree link-type** command in the interface configuration and template configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree link-type { point-to-point | shared }
no spanning-tree link-type

| Syntax Description | point-to-point  | Specifies that the interface is a point-to-point link.  |                                   |  |  |
|--------------------|---|---|-----------------------------------|--|--|
|                    | shared  | Specifies that the interface is a shared medium.  |                                   |  |  |
| Command Default    | Link type is auto   | matically derived from the duplex setting unless you ex   | plicitly configure the link type. |  |  |
| Command Modes      | Interface configu   | uration (config-if)   |                                   |  |  |
|                    | Template configu  | uration (config-template)   |                                   |  |  |
| Command History    | Release   |   | Modification                      |  |  |
|                    | Cisco IOS XE E  | Everest 16.6.1  | This command was introduced.      |  |  |
| Usage Guidelines   | <ul> <li>Rapid Spanning Tree Protocol Plus (RSTP+) fast transition works only on point-to-point links between two<br/>bridges.</li> </ul>   |   |                                   |  |  |
|                    | By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link. |   |                                   |  |  |
|                    | If you designate  | f you designate a port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.          |                                   |  |  |
|                    | •   | port (local port) to a remote port through a point-to-poi<br>the device negotiates with the remote port and rapidly cha | -                                 |  |  |
| Examples           | This example she  | ows how to configure the port as a shared link:   |                                   |  |  |
|                    | Device(config-<br>Device(config-  | <pre>if)# spanning-tree link-type shared if)#</pre>   |                                   |  |  |
|                    | The following ex  | ample shows how to configure the port as a shared link  | using an interface template:      |  |  |
|                    | Device(config-  | <pre>rure terminal # template user-template1 template)# spanning-tree link-type shared template)# end</pre>             |                                   |  |  |

| Related Commands | Command                      | Description   |  |
|------------------|------------------------------|---|--|
|                  | show spanning-tree interface | Displays information about the spanning-tree state. |  |

### spanning-tree loopguard default

To enable loop guard as a default on all ports of a given bridge, use the **spanning-tree loopguard default** command in global configuration mode. To disable loop guard, use the **no** form of this command.

spanning-tree loopguard default no spanning-tree loopguard default

| Syntax Description | This command has no arguments or keywords.  |
|--------------------|---|
| Syntax Description | This commune has no arguments of hey words. |

**Command Default** Loop guard is disabled.

Command Modes Global configuration (config)

| Command History | Release                     | Modification                 |
|-----------------|-----------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Loop guard provides additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port due to a failure that could lead to a unidirectional link.

Loop guard operates only on ports that are considered point to point by the spanning tree.

The individual loop-guard port configuration overrides this command.

### **Examples** This example shows how to enable loop guard:

Device(config) # spanning-tree loopguard default
Device(config) #

| Related Commands | Command             | Description   |
|------------------|---------------------|---|
|                  | show spanning-tree  | Displays information about the spanning-tree state. |
|                  | spanning-tree guard | Enables or disables the guard mode.                 |

### spanning-tree mode

To switch between Per-VLAN Spanning Tree+ (PVST+), Rapid-PVST+, and Multiple Spanning Tree (MST) modes, use the **spanning-tree mode** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mode [{ pvst | mst | rapid-pvst }]
no spanning-tree mode

| Syntax Description | pvst                       | (Optional) P    | VST+ mode.          |                              |   |
|--------------------|----------------------------|-----------------|---------------------|------------------------------|---|
|                    | mst                        | (Optional) M    | ST mode.            |                              |   |
|                    | rapid-pvst                 | (Optional) Ra   | apid-PVST+ mode.    |                              |   |
| Command Default    | pvst                       |                 |                     |                              |   |
| Command Modes      | Global config              | guration (confi | g)                  |                              |   |

Command

### spanning-tree mst

To set the priority parameters or configure the device as a root for any Multiple Spanning Tree (MST) instance, use the **spanning-tree mst** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst instance-id { priority priority | root { primary | secondary } }
no spanning-tree mst instance-id { { priority priority | root { primary | secondary } } }

| Syntax Description | <b>priority</b> <i>priority</i> Port priority for an instance. The range is from 0 to 61440 in increments of 4096. |                                  |
|--------------------|--|----------------------------------|
|                    | root   | Configures the device as a root. |
| Command Modes      | Interface configuration (config-if)  |                                  |

| l History | Release                     | Modification                 |  |
|-----------|-----------------------------|------------------------------|--|
|           | Cisco IOS XE Everest 16.6.1 | This command was introduced. |  |

**Examples** This example shows how to set the priority:

Device(config-if)#
spanning-tree mst 0 priority 1
Device(config-if)#

This example shows how to set the device as a primary root:

```
Device(config-if)#
spanning-tree mst 0 root primary
Device(config-if)#
```

| Related Commands | Command                | Description                                      |  |
|------------------|------------------------|--|--|
|                  | show spanning-tree mst | Displays the information about the MST protocol. |  |

#### spanning-tree mst configuration

To enter MST-configuration submode, use the **spanning-tree mst configuration** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst configuration no spanning-tree mst configuration

This command has no arguments or keywords. Syntax Description The default value for the Multiple Spanning Tree (MST) configuration is the default value for all its parameters: **Command Default** • No VLANs are mapped to any MST instance (all VLANs are mapped to the Common and Internal Spanning Tree [CIST] instance). • The region name is an empty string. • The revision number is 0. Global configuration (config) **Command Modes Command History** Modification Release Cisco IOS XE Everest 16.6.1 This command was introduced. The MST configuration consists of three main parameters: **Usage Guidelines** • Instance VLAN mapping: See the instance command. • Region name: See the **name** command (MST configuration submode). • Configuration revision number: See the revision command. The abort and exit commands allow you to exit MST configuration submode. The difference between the two commands depends on whether you want to save your changes or not. The exit command commits all the changes before leaving MST configuration submode. If you do not map secondary VLANs to the same instance as the associated primary VLAN, when you exit MST-configuration submode, a warning message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The warning message is as follows: These secondary vlans are not mapped to the same instance as their primary: -> 3 The **abort** command leaves MST-configuration submode without committing any changes. Changing an MST-configuration submode parameter can cause connectivity loss. To reduce service disruptions, when you enter MST-configuration submode, make changes to a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the exit keyword, or you can exit the submode without committing any change to the configuration by using the abort keyword. In the unlikely event that two users commit a new configuration at exactly at the same time, this warning message displays:

% MST CFG:Configuration change lost because of concurrent access

**Examples** 

This example shows how to enter MST-configuration submode:

Device(config) # spanning-tree mst configuration
Device(config-mst) #

This example shows how to reset the MST configuration to the default settings:

```
Device(config) # no spanning-tree mst configuration
Device(config) #
```

| Related Commands | Command                | Description   |
|------------------|------------------------|---|
|                  | instance               | Maps a VLAN or a set of VLANs to an MST instance.   |
|                  | name (MST)             | Sets the name of an MST region.                     |
|                  | revision               | Sets the revision number for the MST configuration. |

#### spanning-tree mst pre-standard

To configure a port to transmit only prestandard bridge protocol data units (BPDUs), use the **spanning-tree mst pre-standard** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst pre-standard no spanning-tree mst pre-standard

Syntax Description This command has no arguments or keywords.

**Command Default** The default is to automatically detect prestandard neighbors.

Command Modes Interface configuration (config-if)

| Command History | Release                     | Modification                 |
|-----------------|-----------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** Even with the default configuration, the port can receive both prestandard and standard BPDUs.

Prestandard BPDUs are based on the Cisco IOS Multiple Spanning Tree (MST) implementation that was created before the IEEE standard was finalized. Standard BPDUs are based on the finalized IEEE standard.

If you configure a port to transmit prestandard BPDUs only, the prestandard flag displays in the **show spanning-tree** commands. The variations of the prestandard flag are as follows:

- Pre-STD (or pre-standard in long format): This flag displays if the port is configured to transmit prestandard BPDUs and if a prestandard neighbor bridge has been detected on this interface.
- Pre-STD-Cf (or pre-standard (config) in long format): This flag displays if the port is configured to transmit prestandard BPDUs but a prestandard BPDU has not been received on the port, the autodetection mechanism has failed, or a misconfiguration, if there is no prestandard neighbor, has occurred.
- Pre-STD-Rx (or pre-standard (rcvd) in long format): This flag displays when a prestandard BPDU has been received on the port but it has not been configured to send prestandard BPDUs. The port will send prestandard BPDUs, but we recommend that you change the port configuration so that the interaction with the prestandard neighbor does not rely only on the autodetection mechanism.

If the MST configuration is not compatible with the prestandard (if it includes an instance ID greater than 15), only standard MST BPDUs are transmitted, regardless of the STP configuration on the port.

**Examples** This example shows how to configure a port to transmit only prestandard BPDUs:

Router(config-if)# spanning-tree mst pre-standard
Router(config-if)#

# spanning-tree mst priority

To set the bridge priority for an instance, use the **spanning-tree mst priority** command in global configuration mode. To return to the default setting, use the **no** form of this command.

spanning-tree mst instance priority priority
no spanning-tree mst priority

| Syntax Description | <i>instance</i> Instance identification number; valid values are from 0 to 4094.  |  |  |                              |  |  |
|--------------------|---|--|--|------------------------------|--|--|
|                    | priority priority   | <b>priority</b> <i>priority</i> Specifies the bridge priority; see the "Usage Guidelines" section for valid values and additional information. |  |                              |  |  |
| Command Default    | <i>priority</i> is <b>32768</b>   |  |  |                              |  |  |
| Command Modes      | Global configuration  | on (config   | 3)   |                              |  |  |
| Command History    | Release   |  |  | Modification                 |  |  |
|                    | Cisco IOS XE Everest 16.6.1   |  |  | This command was introduced. |  |  |
| Usage Guidelines   | You can set the bridge priority in increments of 4096 only. When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. |  |  |                              |  |  |
|                    | You can set the <i>priority</i> to <b>0</b> to make the switch root.  |  |  |                              |  |  |
|                    | You can enter <i>instance</i> as a single instance or a range of instances, for example, 0-3,5,7-9.   |  |  |                              |  |  |
| Examples           | This example shows how to set the bridge priority:  |  |  |                              |  |  |
|                    | Device(config)#<br>Device(config)#  | spanning   | g-tree mst 0 priority 4096                     |                              |  |  |

# spanning-tree mst root

To designate the primary and secondary root switch and set the timer value for an instance, use the **spanning-tree mst root** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst instance root { primary | secondary } [ diameter diameter [ hello-time seconds
]]

no spanning-tree mst instance root

| Syntax Description | instance  | Instance identification number. The range is fro  | om 0 to 4094.                        |  |  |  |
|--------------------|---|---|--------------------------------------|--|--|--|
|                    | primary   | Specifies the high enough priority (low value) to make the root of the spanning-tree instance.        |                                      |  |  |  |
|                    | secondary   | Specifies the switch as a secondary root, should  | I the primary root fail.             |  |  |  |
|                    | diameter diameter   | (Optional) Specifies the timer values for the root diameter. The range is from 1 to 7.                | switch that are based on the network |  |  |  |
|                    | hello-time seconds  | s (Optional) Specifies the duration between the generation of configuration messa by the root switch. |                                      |  |  |  |
| Command Default    | The spanning-tree ms  | t root command has no default settings.   |                                      |  |  |  |
| Command Modes      | Global configuration (config)   |   |                                      |  |  |  |
| Command History    | Release   | Modification  |                                      |  |  |  |
|                    | Cisco IOS XE Everest  | This command was introduced.  |                                      |  |  |  |
| Usage Guidelines   | You can enter <i>instance</i> as a single instance or a range of instances, for example, 0-3,5,7-9.   |   |                                      |  |  |  |
|                    | The spanning-tree mst root secondary value is 16384.  |   |                                      |  |  |  |
|                    | The <b>diameter</b> diameter and <b>hello-time</b> seconds keywords and arguments are available for instance 0 only.  |   |                                      |  |  |  |
|                    | If you do not specify the seconds argument, the value for it is calculated from the network diameter.   |   |                                      |  |  |  |
| Examples           | This example shows how to designate the primary root switch and timer values for an instance:   |   |                                      |  |  |  |
|                    | Router(config)# <b>spanning-tree mst 0 root primary diameter 7 hello-time 2</b><br>Router(config)# <b>spanning-tree mst 5 root primary</b><br>Router(config)# |   |                                      |  |  |  |
| Related Commands   | Command   | Description   |                                      |  |  |  |
|                    |   |   |                                      |  |  |  |

#### spanning-tree mst simulate pvst global

To enable Per-VLAN Spanning Tree (PVST) simulation globally, enter the spanning-tree mst simulate pvst global command in global configuration mode. To disable PVST simulation globally, enter the no form of this command. spanning-tree mst simulate pvst global no spanning-tree mst simulate pvst global This command has no arguments or keywords. **Syntax Description** PVST simulation is enabled. **Command Default** Global configuration (config) **Command Modes Command History** Modification Release Cisco IOS XE Everest 16.6.1 Support for this command was introduced. PVST simulation is enabled by default so that all interfaces on the device interoperate between Multiple **Usage Guidelines** Spanning Tree (MST) and Rapid Per-VLAN Spanning Tree Plus (PVST+). To prevent an accidental connection to a device that does not run MST as the default Spanning Tree Protocol (STP) mode, you can disable PVST simulation. If you disable PVST simulation, the MST-enabled port moves to the blocking state once it detects it is connected to a Rapid PVST+-enabled port. This port remains in the inconsistent state until the port stops receiving Bridge Protocol Data Units (BPDUs), and then the port resumes the normal STP transition process. To override the global PVST simulation setting for a port, enter the **spanning-tree mst simulate pvst** interface command in the interface command mode. **Examples** This example shows how to prevent the switch from automatically interoperating with a connecting device that is running Rapid PVST+: Device(config)# no spanning-tree mst simulate pvst global Device(config)# R

# spanning-tree uplinkfast

To enable UplinkFast, use the **spanning-tree uplinkfast** command in global configuration mode. To disable UplinkFast, use the **no** form of this command.

spanning-tree uplinkfast [ max-update-rate packets-per-second ]
no spanning-tree uplinkfast [max-update-rate]

| Syntax Description | max-update-rate packets-per-second  | (Optional) Specifies the maximum rate (in packets per second) at which update packets are sent. The range is from 0 to 32000. |  |  |
|--------------------|---|---|--|--|
| Command Default    | The defaults are as follows:  |   |  |  |
|                    | • UplinkFast is disabled.   |   |  |  |
|                    | • packets-per-second is 150 packets   | per second.   |  |  |
| Command Modes      | Global configuration (config)   |   |  |  |
| Command History    | Release   | Modification  |  |  |
|                    | Cisco IOS XE Everest 16.6.1   | This command was introduced.  |  |  |
| Usage Guidelines   | Use the <b>spanning-tree uplinkfast max-update-rate</b> command to enable UplinkFast (if it is not already enabled) and change the rate at which update packets are sent. Use the <b>no</b> form of this command to return to the default rate. |   |  |  |
| Examples           | This example shows how to enable UplinkFast and set the maximum rate to 200 packets per second:   |   |  |  |
|                    | Device(config)#<br>spanning-tree uplinkfast max-upo   |   |  |  |

|                  | show spanning-tree | Displays information about the spanning-tree state. |

# spanning-tree vlan

To configure Spanning Tree Protocol (STP) on a per-virtual LAN (VLAN) basis, use the **spanning-tree vlan** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree vlan vlan-id [{ forward-time seconds | hello-time seconds | max-age seconds | priority
priority | root [{ primary | secondary }] }]

| Syntax Description | vlan id   | VLAN identification number. The range is from 1 to 4094.   |  |  |
|--------------------|---|--|--|--|
|                    | forward-time seconds  | (Optional) Sets the STP forward delay time. The range is from 4 to 30 seconds.   |  |  |
|                    | hello-time seconds  | (Optional) Specifies the duration, in seconds, between the generation of configuration messages by the root switch. The range is from 1 to 10 seconds. |  |  |
|                    | max-age seconds   | (Optional) Sets the maximum number of seconds the information in a bridge packet data unit (BPDU) is valid. the range is from 6 to 40 seconds.         |  |  |
|                    | priority priority   | (Optional) Sets the STP bridge priority. the range is from 0 to 65535.   |  |  |
|                    | root primary  | (Optional) Forces this switch to be the root bridge.   |  |  |
|                    | root secondary  | (Optional) Specifies this switch to act as the root switch should the primary root fail.   |  |  |
| Command Default    | <ul> <li>The defaults are:</li> <li>forward-time: 15 seconds</li> </ul>   |  |  |  |
|                    | • hello-time: 2 seconds   |  |  |  |
|                    | • max-age: 20 seconds   |  |  |  |
|                    | • <b>priority</b> : The default with IEEE STP enabled is 32768; the default with STP enabled is 128.                          |  |  |  |
|                    | • root : No STP root  |  |  |  |
|                    | When you issue the <b>no spanning-tree vlan</b> <i>vlan_id</i> command, the following parameters are reset to their defaults: |  |  |  |
|                    | • priority: The default with IEEE STP enabled is 32768; the default with STP enabled is 128.                                  |  |  |  |
|                    | • hello-time: 2 seconds   |  |  |  |
|                    | • forward-time: 15 seconds  |  |  |  |

# switchport

To put an interface that is in Layer 3 mode into Layer 2 mode for Layer 2 configuration, use the switchport command in interface configuration mode. To put an interface in Layer 3 mode, use the no form of this command.

switchport no switchport

By default, all interfaces are in Layer 2 mode. **Command Default** 

| Command Modes    | Interface configuration  |                              |  |  |  |
|------------------|--|------------------------------|--|--|--|
| Command History  | Release Modification   |                              |  |  |  |
|                  | Cisco IOS XE Everest 16.6.1  | This command was introduced. |  |  |  |
| Usage Guidelines | Use the <b>no switchport</b> command (without parameters) to erase all Layer 2 configurations. You must use this oport.  |                              |  |  |  |
|                  | Entering the <b>no switchport</b> command shuts the port down and then reenables it, which might generate messages on the device to which the port is connected.   |                              |  |  |  |
|                  | When you put an interface that is in Layer 2 mode into Layer 3 mode (or the reverse), the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.                    |                              |  |  |  |
|                  |  |                              |  |  |  |
|                  | <b>Note</b> If an interface is configured as a Layer 3 interface, you must first enter the <b>switchport</b> command to configure the interface as a Layer 2 port. Then you can enter the <b>switchport access vlan</b> and <b>switchport mode</b> commands. |                              |  |  |  |
|                  | The <b>switchport</b> command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.   |                              |  |  |  |
|                  | You can verify the port status of an interface by entering the <b>show running-config</b> privileged EXEC command.   |                              |  |  |  |
| Examples         | This example shows how to cause an interface to cease operating as a Layer 2 port and become a Cisco-routed port:  |                              |  |  |  |
|                  | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface gigabitethernet2/0/1</b><br>Device(config-if)# <b>no switchport</b>   |                              |  |  |  |
|                  | This example shows how to cause the port interface to cease operating as a Cisco-routed port and convert to a Layer 2 switched interface:  |                              |  |  |  |
|                  | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface gigabitethernet2/0/1</b><br>Device(config-if)# <b>switchport</b>  |                              |  |  |  |

# switchport access vlan

To configure a port as a static-access port, use the **switchport access vlan** command in interface configuration mode. To reset the access mode to the default VLAN mode for the device, use the **no** form of this command.

switchport access vlan {vlan-id }
no switchport access vlan

| Syntax Description | vlan-id       VLAN ID of the access mode VLAN; the range is 1 to 4094.         The default access VLAN and trunk interface native VLAN is a default VLAN corresponding to the platform or interface hardware. |                              |  |  |
|--------------------|---|------------------------------|--|--|
| Command Default    |   |                              |  |  |
| Command Modes      | Interface configuration   |                              |  |  |
| Command History    | Release Modification  |                              |  |  |
|                    | Cisco IOS XE Everest 16.6.1   | This command was introduced. |  |  |
| Usage Guidelines   | The port must be in access mode before the <b>switchport access vlan</b> command can take effect.   |                              |  |  |
|                    | If the switchport mode is set to <b>access vlan</b> <i>vlan-id</i> , the port operates as a member of the specifi An access port can be assigned to only one VLAN.  |                              |  |  |
|                    | The <b>no switchport access</b> command resets the access mode VLAN to the appropriate default VLAN for the device.   |                              |  |  |
| Examples           | This example shows how to change a switched port interface that is operating in access mode to operate in VLAN 2 instead of the default VLAN:   |                              |  |  |
|                    | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface gigabiteth</b><br>Device(config-if)# <b>switchport access</b>  |                              |  |  |

# switchport mode

To configure the VLAN membership mode of a port, use the **switchport mode** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

switchport mode {access | dynamic | {auto | desirable} | trunk}
noswitchport mode {access | dynamic | {auto | desirable} | trunk}

| Syntax Description |  |  |  |  |
|--------------------|--|--|--|--|
|                    | access Sets the port to access mode (either static-access or dynamic-access depending on the setting of the switchport access vlan interface configuration command). The port is set to access unconditionally and operates as a nontrunking, single VLAN interface the sends and receives nonencapsulated (non-tagged) frames. An access port can be assigned to only one VLAN. |  |  |  |
|                    | dynamic auto   | Sets the port trunking mode dynam convert the link to a trunk link. This | ic parameter to auto to specify that the interface s is the default switchport mode.   |  |
|                    | dynamic<br>desirable   | Sets the port trunking mode dynamic actively attempt to convert the link | ic parameter to desirable to specify that the interface to a trunk link.   |  |
|                    | trunk  | The port sends and receives encaps                                       | ly. The port is a trunking VLAN Layer 2 interface.<br>ulated (tagged) frames that identify the VLAN of<br>bint link between two switches or between a switch |  |
| Command Default    | The default mode   | is <b>dynamic auto</b> .   |  |  |
| Command Modes      | Interface configuration  |  |  |  |
| Command History    | Release  |  | Modification   |  |
|                    | Cisco IOS XE E   | verest 16.6.1  | This command was introduced.   |  |
| Usage Guidelines   | appropriate mode   |  | s takes effect only when you configure the port in the<br>and. The static-access and trunk configuration are   |  |
|                    | When you enter <b>access</b> mode, the interface changes to permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not agree to the change.   |  |  |  |
|                    | When you enter <b>trunk</b> mode, the interface changes to permanent trunking mode and negotiates to convert the link into a trunk link even if the interface connecting to it does not agree to the change.   |  |  |  |
|                    | When you enter <b>dynamic auto</b> mode, the interface converts the link to a trunk link if the neighboring interface is set to <b>trunk</b> or <b>desirable</b> mode.   |  |  |  |
|                    | When you enter <b>dynamic desirable</b> mode, the interface becomes a trunk interface if the neighboring interface is set to <b>trunk</b> , <b>desirable</b> , or <b>auto</b> mode.  |  |  |  |

To autonegotiate trunking, the interfaces must be in the same VLAN Trunking Protocol (VTP) domain. Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations. To avoid this problem, configure interfaces connected to devices that do not support DTP to not forward DTP frames, which turns off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** command in interface configuration mode to disable trunking.
- To enable trunking to a device that does not support DTP, use the switchport mode trunk and switchport nonegotiate commands in interface configuration mode to cause the interface to become a trunk but to not generate DTP frames.

Access ports and trunk ports are mutually exclusive.

The IEEE 802.1x feature interacts with switchport modes in these ways:

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- If you try to enable IEEE 802.1x on a port set to **dynamic auto** or **dynamic desirable**, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to **dynamic auto** or **dynamic desirable**, the port mode is not changed.
- If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** command in privileged EXEC mode and examining information in the *Administrative Mode* and *Operational Mode* rows.

#### **Examples**

This example shows how to configure a port for access mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode access
```

This example shows how set the port to dynamic desirable mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode dynamic desirable
```

This example shows how to configure a port for trunk mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode trunk
```

#### switchport nonegotiate

To specify that Dynamic Trunking Protocol (DTP) negotiation packets are not sent on the Layer 2 interface, use the **switchport nonegotiate** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

# switchport nonegotiate no switchport nonegotiate

**Command Default** The default is to use DTP negotiation to learn the trunking status.

**Command Modes** Interface configuration

| Command History  | Release   | Modification                 |  |
|------------------|---|------------------------------|--|
|                  | Cisco IOS XE Everest 16.6.1   | This command was introduced. |  |
| Usage Guidelines | The <b>no switchport nonegotiate</b> command removes nonegotiate status.  |                              |  |
|                  | This command is valid only when the interface switchport mode is access or trunk (configured by using th <b>switchport mode access</b> or the <b>switchport mode trunk</b> interface configuration command). This comman returns an error if you attempt to execute it in dynamic (auto or desirable) mode. |                              |  |
|                  | Internetworking devices that do not support DTP might forward DTP frames improperly and cause misconfigurations. To avoid this problem, turn off DTP by using the switchport poperation command to  |                              |  |

misconfigurations. To avoid this problem, turn off DTP by using the **switchport nonegotiate** command to configure the interfaces connected to devices that do not support DTP to not forward DTP frames.

When you enter the **switchport nonegotiate** command, DTP negotiation packets are not sent on the interface. The device does or does not trunk according to the **mode** parameter: **access** or **trunk**.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking on a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

This example shows how to cause a port to refrain from negotiating trunking mode and to act as a trunk or access port (depending on the mode set):

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport nonegotiate
```

You can verify your setting by entering the **show interfaces** *interface-id* **switchport** command in privileged EXEC mode.

# switchport voice vlan

To configure voice VLAN on the port, use the **switchport voice vlan** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

```
switchport voice vlan {vlan-id | dot1p | none | untagged | name vlan_name}
no switchport voice vlan
```

| Syntax Description | <i>vlan-id</i> The VLAN to be used for voice traffic. The range is 1 to 4094. By default, the IP phone forwards the voice traffic with an IEEE 802.1Q priority of 5.   |   |  |  |  |
|--------------------|--|---|--|--|--|
|                    | dot1pConfigures the telephone to use IEEE 802.1p priority tagging and uses VLAN 0 (the<br>native VLAN). By default, the Cisco IP phone forwards the voice traffic with an IEE<br>802.1p priority of 5.   |   |  |  |  |
|                    | none   | Does not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad. |  |  |  |
|                    | untagged   | Configures the telephone to send untagged voice traffic. This is the default for the telephone.                           |  |  |  |
|                    | name vlan_name   | (Optional) Specifies the VLAN name to be used for voice traffic. You can enter up to 128 characters.                      |  |  |  |
| Command Default    | The default is not t   | o automatically configure the telephone (none).   |  |  |  |
|                    | The telephone defa   | ult is not to tag frames.   |  |  |  |
| Command Modes      | Interface configura  | tion  |  |  |  |
| Command History    | Release  | Modification  |  |  |  |
|                    | Cisco IOS XE Eve   | erest 16.6.1 This command was introduced.   |  |  |  |
| Usage Guidelines   | - You should configu   | ure voice VLAN on Layer 2 access ports.   |  |  |  |
|                    | You must enable Cisco Discovery Protocol (CDP) on the switch port connected to the Cisco IP phone for the device to send configuration information to the phone. CDP is enabled by default globally and on the interface.  |   |  |  |  |
|                    | When you enter a VLAN ID, the IP phone forwards voice traffic in IEEE 802.1Q frames, tagged with the specified VLAN ID. The device puts IEEE 802.1Q voice traffic in the voice VLAN.   |   |  |  |  |
|                    | When you select <b>dot1p</b> , <b>none</b> , or <b>untagged</b> , the device puts the indicated voice traffic in the access VLAN.  |   |  |  |  |
|                    | In all configurations, the voice traffic carries a Layer 2 IP precedence value. The default is 5 for voice traffic.  |   |  |  |  |
|                    | When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to 2. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but not on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone. |   |  |  |  |

If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.

You cannot configure static secure MAC addresses in the voice VLAN.

The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

This example show how to first populate the VLAN database by associating a VLAN ID with a VLAN name, and then configure the VLAN (using the name) on an interface, in the access mode: You can also verify your configuration by entering the **show interfaces** *interface-id* **switchport** in privileged EXEC command and examining information in the Voice VLAN: row.

Part 1 - Making the entry in the VLAN database:

Device> enable Device# configure terminal Device(config)# vlan 55 Device(config-vlan)# name test Device(config-vlan)# end

Part 2 - Checking the VLAN database:

```
Device> enable
Device# show vlan id 55
VLAN Name Status Ports
55 test active
VLAN Type SAID MTU Parent RingNo BridgeNo Stp BrdgMode Trans1 Trans2
_
                                     0
                                             0
55 enet 100055 1500 -
                         _
                               - -
Remote SPAN VLAN
_____
Disabled
Primary Secondary Type Ports
```

Part 3- Assigning VLAN to the interface by using the name of the VLAN:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet3/1/1
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan name test
Device(config-if)# end
Device#
```

Part 4 - Verifying configuration:

```
Device> enable
Device# show running-config
interface gigabitethernet3/1/1
Building configuration...
Current configuration : 113 bytes
!
interface GigabitEthernet3/1/1
switchport voice vlan 55
switchport mode access
Switch#
```

Part 5 - Also can be verified in interface switchport:

Device> enable Device# show interface GigabitEthernet3/1/1 switchport Name: Gi3/1/1 Switchport: Enabled Administrative Mode: static access Operational Mode: static access Administrative Trunking Encapsulation: dotlq Operational Trunking Encapsulation: native Negotiation of Trunking: Off Access Mode VLAN: 1 (default) Trunking Native Mode VLAN: 1 (default) Administrative Native VLAN tagging: enabled Voice VLAN: 55 (test) Administrative private-vlan host-association: none Administrative private-vlan mapping: none Administrative private-vlan trunk native VLAN: none Administrative private-vlan trunk Native VLAN tagging: enabled Administrative private-vlan trunk encapsulation: dot1q Administrative private-vlan trunk normal VLANs: none Administrative private-vlan trunk associations: none Administrative private-vlan trunk mappings: none Operational private-vlan: none Trunking VLANs Enabled: ALL Pruning VLANs Enabled: 2-1001 Capture Mode Disabled Capture VLANs Allowed: ALL Unknown unicast blocked: disabled Unknown multicast blocked: disabled Appliance trust: none

#### udld

To enable aggressive or normal mode in the UniDirectional Link Detection (UDLD) and to set the configurable message timer time, use the **udld** command in global configuration mode. To disable aggressive or normal mode UDLD on all fiber-optic ports, use the **no** form of the command.

udld {aggressive | enable | message time message-timer-interval}
no udld {aggressive | enable | message}

| Syntax Description | aggressive   | Enables UDLD in aggressi   | ve mode on all fiber-optic interfaces. |  |  |
|--------------------|--|--|--|--|--|
|                    | enable   | enable Enables UDLD in normal mode on all fiber-optic interfaces.  |  |  |  |
|                    | message time<br>message-timer-interval   | Configures the period of time between UDLD probe messages on ports<br>that are in the advertisement phase and are determined to be bidirectional<br>The range is 1 to 90 seconds. The default is 15 seconds. |  |  |  |
| Command Default    | UDLD is disabled on all interfaces.<br>The message timer is set at 15 seconds.   |  |  |  |  |
| Command Modes      | Global configuration   |  |  |  |  |
| Command History    | Release  |  | Modification                           |  |  |
|                    | Cisco IOS XE Everest 16.6.   | .1   | This command was introduced.           |  |  |
| Usage Guidelines   | UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links. |  |  |  |  |
|                    | If you change the message time between probe packets, you are making a compromise between the detection speed and the CPU load. By decreasing the time, you can make the detection-response faster but increase the load on the CPU.   |  |  |  |  |
|                    | This command affects fiber-optic interfaces only. Use the <b>udld</b> interface configuration command to enable UDLD on other interface types.   |  |  |  |  |
|                    | You can use these commands to reset an interface shut down by UDLD:  |  |  |  |  |
|                    | • The udld reset privileged EXEC command to reset all interfaces shut down by UDLD.  |  |  |  |  |
|                    | • The shutdown and no shutdown interface configuration commands.   |  |  |  |  |
|                    | • The <b>no udld enable</b> global configuration command followed by the <b>udld {aggressive   enable}</b> global configuration command to reenable UDLD globally.   |  |  |  |  |
|                    | • The <b>no udld port</b> interface configuration command followed by the <b>udld port</b> or <b>udld port aggressive</b> interface configuration command to reenable UDLD on the specified interface.   |  |  |  |  |
|                    | • The <b>errdisable recovery cause udld</b> and <b>errdisable recovery interval</b> <i>interval</i> global configuration commands to automatically recover from the UDLD error-disabled state.   |  |  |  |  |
|                    |  |  |  |  |  |

This example shows how to enable UDLD on all fiber-optic interfaces:

Device> enable Device# configure terminal Device(config)# udld enable

udld

You can verify your setting by entering the show udld command in privileged EXEC mode.

# udld port

I

|                    | To enable UniDirectional Link Detection (UDLD) on an individual interface or to prevent a fiber-optic interface from being enabled by the <b>udld</b> command in global configuration mode, use the <b>udld port</b> command in interface configuration mode. To return to the <b>udld</b> command setting in global configuration mode or to disable UDLD if entered for a nonfiber-optic port, use the <b>no</b> form of this command. |   |  |  |  |
|--------------------|--|---|--|--|--|
|                    | udld port [aggressive]<br>no udld port [aggressive]  |   |  |  |  |
| Syntax Description | aggressive (Optional) Enables UDLD in ag   | gressive mode on the specified interface.   |  |  |  |
| Command Default    | On fiber-optic interfaces, UDLD is disabled and fiber-optic interfaces enable UDLD according to the the <b>udld enable</b> or <b>udld aggressive</b> command global configuration mode.  |   |  |  |  |
|                    | On nonfiber-optic interfaces, UDLD is disable  | ed.   |  |  |  |
| Command Modes      | Interface configuration  |   |  |  |  |
| Command History    | Release  | Modification  |  |  |  |
|                    | Cisco IOS XE Everest 16.6.1  | This command was introduced.  |  |  |  |
| Usage Guidelines   | A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another device.   |   |  |  |  |
|                    | UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links.   |   |  |  |  |
|                    | To enable UDLD in normal mode, use the <b>udld port</b> command in interface configuration mode. To enable UDLD in aggressive mode, use the <b>udld port aggressive</b> command in interface configuration mode.   |   |  |  |  |
|                    | Use the <b>no udld port</b> command on fiber-optic ports to return control of UDLD to the <b>udld enable</b> global configuration command or to disable UDLD on nonfiber-optic ports.  |   |  |  |  |
|                    | Use the <b>udld port aggressive</b> command on fiber-optic ports to override the setting of the <b>udld enable</b> or <b>udld aggressive</b> command in global configuration mode. Use the <b>no</b> form on fiber-optic ports to remove this setting and to return control of UDLD enabling to the <b>udld</b> command in global configuration mode or to disable UDLD on nonfiber-optic ports.   |   |  |  |  |
|                    | You can use these commands to reset an interf  | face shut down by UDLD:   |  |  |  |
|                    | • The <b>udld reset</b> command in privileged E  | XEC mode resets all interfaces shut down by UDLD.   |  |  |  |
|                    | • The shutdown and no shutdown command in interface configuration mode.  |   |  |  |  |
|                    | • The <b>no udld enable</b> command in global configuration mode, followed by the <b>udld {aggressive   enable}</b> command in global configuration mode reenables UDLD globally.  |   |  |  |  |
|                    | —  | configuration mode, followed by the <b>udld port</b> or <b>udld port</b> irration mode reenables UDLD on the specified interface. |  |  |  |

• The **errdisable recovery cause udld** and **errdisable recovery interval** *interval* commands in global configuration mode automatically recover from the UDLD error-disabled state.

This example shows how to enable UDLD on an port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet6/0/1
Device(config-if)# udld port
```

This example shows how to disable UDLD on a fiber-optic interface despite the setting of the **udld** command in global configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet6/0/1
Device(config-if)# no udld port
```

You can verify your settings by entering the **show running-config** or the **show udld** *interface* command in privileged EXEC mode.

#### udld reset

To reset all interfaces disabled by UniDirectional Link Detection (UDLD) and permit traffic to begin passing through them again (though other features, such as spanning tree, Port Aggregation Protocol (PAgP), and Dynamic Trunking Protocol (DTP) still have their normal effects, if enabled), use the **udld reset** command in privileged EXEC mode.

|                  | udld reset Privileged EXEC  |   |  |  |
|------------------|---|---|--|--|
| Command Modes    |   |   |  |  |
| Command History  | Release   | Modification  |  |  |
|                  | Cisco IOS XE Everest 16.6.1   | This command was introduced.  |  |  |
| Usage Guidelines | If the interface configuration is still enabled for U for the same reason if the problem has not been | JDLD, these ports begin to run UDLD again and are disabled corrected. |  |  |
|                  | This example shows how to reset all interfaces of   | lisabled by UDLD:   |  |  |
|                  | Device> <b>enable</b><br>Device# <b>udld reset</b><br>1 ports shutdown by UDLD were reset.            |   |  |  |

# vlan dot1q tag native

To enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports, use the **vlan dot1q tag native** command in global configuration mode. To return to the default setting, use the **no** form of this command.

vlan dot1q tag native no vlan dot1q tag native

| Syntax Description  | This command has no arguments or keywords.  |                                       |  |  |
|---|---|---------------------------------------|--|--|
| Command Default   | The IEEE 802.1Q native V  | LAN tagging is disabled.              |  |  |
| Command Modes   | Global configuration  |                                       |  |  |
| Command History   | Release   | Modification                          | -  |  |
|   | Cisco IOS XE Gibraltar 16.  | .12.1 This command was introduced.    | -  |  |
| Usage Guidelines  | When enabled, native VLA  | AN packets going out of all IEEE 802  | -<br>2.1Q trunk ports are tagged.            |  |
| When disabled, native VLAN packets going out of all IEEE 802.1Q trunk |   |                                       | 2.1Q trunk ports are not tagged.             |  |
|   | You can use this command with the IEEE 802.1Q tunneling feature. This feature operates on an edg<br>of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and<br>the tagged packets. You must use IEEE 802.1Q trunk ports for sending packets to the service-provider<br>However, packets going through the core of the service-provider network might also be carried on I<br>802.1Q trunks. If the native VLANs of an IEEE 802.1Q trunks match the native VLAN of a tunneli<br>on the same device, traffic on the native VLAN is not tagged on the sending trunk port. This command<br>that native VLAN packets on all IEEE 802.1Q trunk ports are tagged. |                                       |  |  |
|   | For more information about  | tt IEEE 802.1Q tunneling, see the sof | ftware configuration guide for this release. |  |
|   | This example shows how t  | o enable IEEE 802.1Q tagging on na    | tive VLAN frames:                            |  |
|   | Device> <b>enable</b><br>Device# <b>configure term</b><br>Device(config)# <b>vlan de</b><br>Device(config)# <b>end</b>  |                                       |  |  |

You can verify your settings by entering the show vlan dot1q tag native privileged EXEC command.
