- Feature Information for Identity Control Policies, on page 21

# **Configuring Identity Control Policies**

Identity control policies define the actions that Cisco Identity Based Networking Services (IBNS) takes in response to specified conditions and subscriber events. A variety of system actions, conditions, and events can be combined using a consistent policy language. This module provides information about how to configure identity control policies for Cisco IBNS.

# **Information About Identity Control Policies**

## **Cisco Identity Based Networking Services Configuration**

To convert all relevant authentication commands to their Class-Based Policy Language(CPL) control policy equivalents, use the **authentication convert-to new-style** command. This command permanently converts the legacy configuration on the switch to identity-based networking services.

Note

This configuration is irreversible. It disables the conversion command – **authentication display [legacy | new-style]**.

Use the **authentication display config-mode** command in EXEC mode to display the current configuration mode; *legacy* if it is legacy mode and **new-style** if it is Identity-Based Networking Services configuration mode.

(Device) # authentication display config-mode Current configuration mode is legacy

Device) # authentication display config-mode Current configuration mode is new-style

## **Concurrent Authentication Methods**

Cisco IBNS allows the concurrent operation of IEEE 802.1x (dot1x), MAC authentication bypass (MAB), and web authentication methods, making it possible to invoke multiple authentication methods in parallel on

a single subscriber session. This allows the client-supported method to complete at the earliest opportunity without the delays associated with serialization.

Typically, the access control method that is used to authorize a host is left up to the endpoint. For example, a printer without an 802.1x supplicant would be authorized through MAB only, an employee desktop through 802.1x only, and a guest through web authentication only. The default priority order is 802.1x, followed by MAB, then web authentication. When method priorities are the same, the first method that successfully authenticates the session prevails.

An example in which more than one method may succeed during the lifetime of a session is when MAB is used to provide interim access pending success of 802.1x. A host could be also be given interim access to a web server to allow credentials to be updated so that 802.1x can succeed after an authentication failure.

## **Configuration Display Mode**

Identity-Based Networking Services introduces new Cisco IOS commands that replace many of the previously supported authentication and policy commands. These commands are available only after enabling the Cisco common classification policy language (C3PL) display mode that supports Identity-Based Networking Services. Identity-Based Networking Services features such as concurrent authentication and web authentication with IPv6 are not supported in legacy mode.

The device defaults to the legacy configuration mode until you do one of the following:

- Enter the **authentication display new-style** command—This command switches to C3PL display mode, temporarily converting your legacy configuration to a Identity-Based Networking Services configuration so you can see how it looks before you make the conversion permanent. You can switch back to legacy mode by using the **authentication display legacy** command. See the Enabling the Display Mode for Cisco Identity Based Networking Services, on page 4 section.
- Enter a Identity-Based Networking Services configuration command—After you enter the first explicit Identity-Based Networking Services command, the configuration converts to C3PL display mode permanently and legacy commands are suppressed. The **authentication display** command is disabled and you can no longer revert to the legacy configuration mode.

# **Control Policies for Cisco Identity Based Networking Services**

A control policy defines the handling of different subscriber life-cycle events. For various events, such as session start or session failure, you can specify actions in the control policy. These actions can be executed conditionally for different subscribers based on various match criteria. Control policies are activated on interfaces and typically control the authentication of subscriber identity and the activation of services on sessions. For example, you can configure a control policy to authenticate specific subscribers and then provide them with access to specific services.

A control policy consists of one or more control policy rules and a decision strategy that governs how the policy rules are evaluated. A control policy rule consists of a control class (a flexible condition clause), an event for which the condition is evaluated, and one or more actions. Actions are general system functions, such as authenticate or activate. You define the specific actions that an event will trigger and some events have default actions.

The figure below illustrates how each control policy contains a list of events that are considered applicable to the subscriber life cycle. Within each event type is a list of control classes with different match criteria for subscriber identity, and under each class is a list of actions to be executed.

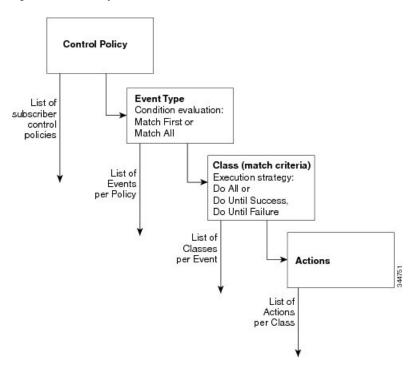

Figure 1: Control Policy Structure

## **Control Policy Configuration Overview**

Control policies express system functionality in terms of an event, a condition, and an action. There are three steps in defining a control policy:

- 1. Create one or more control classes—A control class specifies the conditions that must be met for a control policy to be activated. A control class can contain multiple conditions, each of which will evaluate as either true or false. Match directives specify whether all, any, or none of the individual conditions must evaluate true for the class to evaluate true. Or, you can specify the default control class which does not contain any conditions and always evaluates true.
- 2. Create a control policy—A control policy contains one or more control policy rules. A control policy rule consists of a control class, an event that causes the class to be evaluated, and one or more actions. Actions are numbered and executed sequentially.
- **3.** Apply the control policy—A control policy is activated by applying it to an interface.

# **Parameter Maps for Cisco Identity Based Networking Services**

A parameter map allows you to specify parameters that control the behavior of actions specified under a control policy. For Cisco IBNS, an authentication parameter map defines parameters used for the action specified with the **authenticate using webauth** command. You can configure the following types of parameter maps:

- Authentication bypass (This is also called nonresponsive host [NRH] authentication.)
- Consent
- Web authentication

· Web authentication with consent

Parameter maps are optional. If you do not configure a named parameter map, the software uses the default parameters that are specified in the global parameter map.

## **Per User Inactivity Handling Across Methods**

A common inactivity aging feature extends support for RADIUS attributes 28 (Idle-Timeout) and attribute 29 (Termination-Action) to web authenticated sessions, providing consistent inactivity handling across all authentication methods, including 802.1x, MAC authentication bypass (MAB), and web authentication. The AAA server sends these attributes as part of the user authorization. After a session has been idle for the amount of time specified in attribute 28, or has reached the timeout configured with attribute 29, the session is terminated.

You can also apply the inactivity timeout and absolute timeout to sessions through a locally defined service template. When enabling the inactivity timeout, you can also enable address resolution protocol (ARP) probes that are sent before the session is terminated. For configuration information, see the Configuring Identity Service Templates module.

# **How to Configure Identity Control Policies**

## **Enabling the Display Mode for Cisco Identity Based Networking Services**

Cisco IBNS features are configured in the Cisco common classification policy language (C3PL) display mode. The legacy authentication manager mode is enabled by default. You can use the following procedure to switch to C3PL display mode and temporarily convert any legacy configuration commands to their C3PL equivalents. This allows you to preview your legacy configuration as a Identity-Based Networking Services configuration before making the conversion permanent. After you enter an explicit Cisco IBNS command, the conversion becomes permanent and you can no longer revert to legacy mode.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	authentication display {legacy   new-style}	Sets the display mode for authentication and
	Example:	policy configuration.
	Device# authentication display new-style	The default display mode is legacy.
		You can use this command to switch between legacy and C3PL display mode
		until you execute the first explicit
		Identity-Based Networking Services command. After you enter the first explicit
		Identity-Based Networking Services command, for example when configuring
		a control class or control policy, the system displays a prompt to confirm whether you

Command or Action	Purpose	
	want to continue because this commod will be disabled and you cannot revelegacy mode.	
	Note If you save the configuration whinew-style mode is enabled, and to perform a reload, the display mode permanently set to new-style. The authentication display command disabled and you cannot revert to legacy mode.	hen de is e d is
	For the stack devices and standal devices to revert to legacy mode the new-style configuration in a write erase the device and then perform a reload.	, save

# **Configuring a Control Class**

A control class defines the conditions under which the actions of a control policy are executed. You define whether all, any, or none of the conditions must evaluate true to execute the actions of the control policy. Control classes are evaluated based on the event specified in the control policy.

Note

This procedure shows all of the match conditions that you can configure in a control class. You must specify at least one condition in a control class to make it valid. All other conditions, and their corresponding steps, are optional (steps 4 through 18 below).

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	class-map type control subscriber {match-all   match-any   match-none}	Creates a control class and enters control class-map filter mode.
	control-class-name	• match-all—All of the conditions in the
	Example:	control class must evaluate true.
	<pre>Device(config)# class-map type control   subscriber match-all DOT1X_NO_AGENT</pre>	

	Command or Action	Purpose
		• match-any—At least one of the conditions in the control class must evaluate true.
		• match-none—All of the conditions in the control class must evaluate false.
Step 4	{match   no-match} activated-service-template template-name	(Optional) Creates a condition that evaluates true based on the service template activated on
	Example:	a session.
	Device(config-filter-control-classmap)# match activated-service-template SVC_1	
Step 5	{match   no-match} authorization-status {authorized   unauthorized}	(Optional) Creates a condition that evaluates true based on a session's authorization status.
	Example:	
	Device(config-filter-control-classmap)# match authorization-status authorized	
Step 6	{match   no-match} authorizing-method-priority {eq   gt   lt} priority-value	(Optional) Creates a condition that evaluates true based on the priority of the authorization method.
	Example:	• eq—Current priority is equal to
	Device(config-filter-control-classmap)# match authorizing-method-priority eq	priority-value.
	10	• <b>gt</b> —Current priority is greater than <i>priority-value</i> .
		• lt—Current priority is less than priority-value.
		• <i>priority-value</i> —Priority value to match. Range: 1 to 254, where 1 is the highest priority and 254 is the lowest.
Step 7	{match   no-match} client-type {data   switch   video   voice}	(Optional) Creates a condition that evaluates true based on an event's device type.
	Example:	
	<pre>Device(config-filter-control-classmap)# match client-type data</pre>	
Step 8	{match   no-match} current-method-priority {eq   gt   lt} priority-value	(Optional) Creates a condition that evaluates true based on the priority of the current authentication method.
	Example:	
	Device(config-filter-control-classmap)# match current-method-priority eq 10	

	Command or Action	Purpose
Step 9	<pre>{match   no-match} ip-address ip-address  Example:  Device (config-filter-control-classmap) #   match ip-address 10.10.10.1</pre>	(Optional) Creates a condition that evaluates true based on an event's source IPv4 address.
Step 10	{match   no-match} ipv6-address ipv6-address Example: Device (config-filter-control-classmap) #	(Optional) Creates a condition that evaluates true based on an event's source IPv6 address.
Step 11	<pre>match ipv6-address FE80::1  {match   no-match} mac-address mac-address  Example:  Device (config-filter-control-classmap) #</pre>	(Optional) Creates a condition that evaluates true based on an event's MAC address.
Step 12	match mac-address aabb.cc00.6500  {match   no-match} method {dot1x   mab   webauth}  Example:	(Optional) Creates a condition that evaluates true based on an event's authentication method.
Step 13	Device (config-filter-control-classmap) # match method dot1x  {match   no-match} port-type {12-port   13-port   dot11-port}	(Optional) Creates a condition that evaluates true based on an event's interface type.
	<pre>Example: Device(config-filter-control-classmap)# match port-type 12-port</pre>	
Step 14	<pre>{match   no-match} result-type [method {dot1x   mab   webauth}] result-type  Example:  Device(config-filter-control-classmap) #   match result-type agent-not-found</pre>	<ul> <li>(Optional) Creates a condition that evaluates true based on the specified authentication result.</li> <li>• To display the available result types, use the question mark (?) online help function.</li> </ul>
Step 15	<pre>{match   no-match} service-template template-name  Example:  Device(config-filter-control-classmap) # match service-template svc_1</pre>	(Optional) Creates a condition that evaluates true based on an event's service template.
Step 16	<pre>{match   no-match} tag tag-name  Example:  Device(config-filter-control-classmap) #   match tag tag_1</pre>	(Optional) Creates a condition that evaluates true based on the tag associated with an event.

	Command or Action	Purpose
Step 17	{match   no-match} timer timer-name  Example:	(Optional) Creates a condition that evaluates true based on an event's timer.
	<pre>Device(config-filter-control-classmap)# match timer restart</pre>	
Step 18	{match   no-match} username username  Example:	(Optional) Creates a condition that evaluates true based on an event's username.
	Device(config-filter-control-classmap)# match username josmiths	
Step 19	<pre>end Example:    Device (config-filter-control-classmap) #</pre>	(Optional) Exits control class-map filter configuration mode and returns to privileged EXEC mode.
	end	
Step 20	show class-map type control subscriber {all   name control-class-name}	(Optional) Displays information about Identity-Based Networking Services control classes.
	Example:  Device# show class-map type control subscriber all	Ciuses.

### **Example: Control Class**

The following example shows a control class that is configured with two match conditions:

```
class-map type control subscriber match-all DOT1X_NO_AGENT match method dot1x match result-type agent-not-found
```

# **Configuring a Control Policy**

Control policies determine the actions that the system takes in response to specified events and conditions. The control policy contains one or more control policy rules that associate a control class with one or more actions. The actions that you can configure in a policy rule depend on the type of event that you specify.

Note

This task includes all of the actions that you can configure in a control policy regardless of the event. All of these actions, and their corresponding steps, are optional (steps 6 through 21 below). To display the supported actions for a particular event, use the question mark (?) online help function.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	policy-map type control subscriber control-policy-name	Defines a control policy for subscriber sessions.
	Example:	
	Device(config) # policy-map type control subscriber POLICY_1	
Step 4	event event-name [match-all   match-first]	Specifies the type of event that triggers actions
	Example:	in a control policy if conditions are met.
	<pre>Device(config-event-control-policymap)#   event session-started</pre>	• match-all is the default behavior.
		• To display the available event types, use the question mark (?) online help function. For a complete description of event types, see the <b>event</b> command.
Step 5	<pre>priority-number class {control-class-name   always} [do-all   do-until-failure   do-until-success]  Example: Device (config-class-control-policymap) # 10 class always</pre>	Associates a control class with one or more actions in a control policy.  • A named control class must first be configured before specifying it with the <i>control-class-name</i> argument.
	TO Class always	• do-until-failure is the default behavior.
Step 6	action-number activate {policy type control subscriber control-policy-name [child [no-propagation   concurrent]   service-template template-name [aaa-list list-name] [precedence number] [replace-all]}  Example:	(Optional) Activates a control policy or service template on a subscriber session.
	Device(config-action-control-policymap)# 10 activate service-template FALLBACK	
Step 7	action-number authenticate using {dot1x   mab   webauth} [aaa {authc-list authc-list-name   authz-list authz-list-name]} [merge] [parameter-map map-name] [priority priority-number] [replace   replace-all] [retries number {retry-time seconds}]	(Optional) Initiates the authentication of a subscriber session using the specified method.
	Example:	

	Command or Action	Purpose
	Device(config-action-control-policymap)# 10 authenticate using dot1x priority 10	
Step 8	<pre>action-number authentication-restart seconds Example: Device(config-action-control-policymap)# 20 authentication-restart 60</pre>	authentication process after an authentication or authorization failure.
Step 9	<pre>action-number authorize Example: Device(config-action-control-policymap)# 10 authorize</pre>	(Optional) Initiates the authorization of a subscriber session.
Step 10	<pre>action-number clear-authenticated-data-hosts-on-port Example: Device(config-action-control-policymap)# 20 clear-authenticated-data-hosts-on-port</pre>	(Optional) Clears authenticated data hosts on a port after an authentication failure.
Step 11	<pre>action-number clear-session Example: Device(config-action-control-policymap)# 30 clear-session</pre>	(Optional) Clears an active subscriber session.
Step 12	<pre>action-number deactivate {policy type control subscriber control-policy-name   service-template template-name}  Example:  Device(config-action-control-policymap) # 20 deactivate service-template interface_template</pre>	(Optional) Deactivates a control policy or service template on a subscriber session.
Step 13	<pre>action-number err-disable Example: Device(config-action-control-policymap)# 10 err-disable</pre>	(Optional)Temporarily disables a port after a session violation event.
Step 14	action-number pause reauthentication  Example:  Device(config-action-control-policymap)# 20 pause reauthentication	(Optional) Pauses reauthentication after an authentication failure.
Step 15	<pre>action-number protect Example: Device(config-action-control-policymap)# 10 protect</pre>	(Optional) Silently drops violating packets after a session violation event.

	Command or Action	Purpose
Step 16	<pre>action-number replace Example: Device (config-action-control-policymap) # 10 replace</pre>	(Optional) Clears the existing session and creates a new session after a violation event.
Step 17	<pre>action-number restrict Example: Device(config-action-control-policymap)# 10 restrict</pre>	(Optional) Drops violating packets and generates a syslog entry after a session violation event.
Step 18	action-number resume reauthentication  Example:  Device (config-action-control-policymap) # 20 resume reauthentication	(Optional) Resumes the reauthentication process after an authentication failure.
Step 19	<pre>action-number set-timer timer-name seconds Example: Device(config-action-control-policymap)# 20 set-timer RESTART 60</pre>	(Optional) Starts a named policy timer.
Step 20	<pre>action-number terminate {dot1x   mab   webauth}  Example: Device (config-action-control-policymap) # 20 terminate webauth</pre>	(Optional) Terminates an authentication method on a subscriber session.
Step 21	<pre>action-number unauthorize Example: Device(config-action-control-policymap)# 20 unauthorize</pre>	(Optional) Removes all authorization data from a subscriber session.
Step 22	<pre>end Example: Device(config-action-control-policymap)# end</pre>	(Optional) Exits control policy-map action configuration mode and returns to privileged EXEC mode.
Step 23	<pre>show policy-map type control subscriber {all   name control-policy-name}  Example: Device# show policy-map type control subscriber POLICY_1</pre>	(Optional) Displays information about identity control policies.

## **Example: Control Policy**

The following example shows a simple control policy with the minimum configuration necessary for initiating authentication:

```
policy-map type control subscriber POLICY_1
  event session-started match-all
  10 class always do-until-failure
  10 authenticate using dot1x
```

For detailed examples of control policies for concurrent and sequential authentication, see the Configuration Examples for Cisco Identity-Based Control Policies, on page 17 section.

# **Applying a Control Policy to an Interface**

Control policies typically control the authentication of subscriber identity and the activation of services on sessions. Perform this task to apply a control policy to an interface.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface type number	Specifies an interface and enters interface
	Example:	configuration mode.
	Device(config)# interface GigabitEthernet 1/0/1	
Step 4	service-policy type control subscriber	Applies a previously configured control policy.
	control-policy-name	• To display a list of all configured control
	Example:	policies, use the question mark (?) online
	Device(config-if)# service-policy type control subscriber POLICY_1	help function.
Step 5	subscriber aging {inactivity-timer seconds	Enables an inactivity timer for subscriber
	[probe]   probe}	sessions.
	Example:	Starting with Cisco IOS XE Everest 16.6.1 if
	Device(config-if)# subscriber aging inactivity-timer 60 probe	you configure this command, you must also configure the device-tracking binding reachable-lifetime command in global configuration mode, for probes to work as expected. Configure a reachable lifetime with the same value as the inactivity timer probe. This way, when the reachable lifetime expires the state of the entry changes based on the reachability of the host. For more information, see the device-tracking binding command in

Command or Action	Purpose
	the command reference of the corresponding release.

## **Example: Applying a Control Policy to an Interface**

interface GigabitEthernet 1/0/2
subscriber aging inactivity-timer 60 probe
device-tracking binding reachable-lifetime 60
service-policy type control subscriber POLICY 1

# **Configuring Authentication Features on Ports**

Perform this task to control access to a port, including the port authorization state, host access mode, preauthentication access, and the authentication direction.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface type number	Enters interface configuration mode for the
	Example:	selected interface.
	Device(config)# interface gigabitethernet 1/0/2	
Step 4	access-session port-control {auto	Sets the authorization state of a port.
	force-authorized   force-unauthorized}	• The default value is <b>force-authorized</b> .
	Example:	
	Device(config-if)# access-session port-control auto	
Step 5	access-session host-mode {multi-auth	Allows hosts to gain access to a controlled port.
	multi-domain   multi-host   single-host}	To use this command, you must first
	Example:	enable the access-session port-control
	Device(config-if)# access-session host-mode single-host	auto command.
	noce mode cangle noce	• The default value is <b>multi-auth</b> .
Step 6	access-session closed	Prevents preauthentication access on this port.
	Example:	• The port is set to open access by default.

	Command or Action	Purpose	
	Device(config-if)# access-session closed	3	
Step 7	access-session control-direction {both   in}	Sets the direction of authentication control on	
	Example:	<ul><li>a port.</li><li>The default value is <b>both</b>.</li></ul>	
	Device(config-if)# access-session control-direction in		
Step 8	end	Exits interface configuration mode and return	
	Example:	to privileged EXEC mode.	
	Device(config-if)# end		
Step 9	show access-session interface interface-type interface-number [details]	Displays information about subscriber sessions that match the specified client interface.	
	Example:		
	Device# show access-session interface gigabitethernet 1/0/2 details		

## **Example: Port Authentication**

interface GigabitEthernet 1/0/2
access-session host-mode single-host
access-session closed
access-session port-control auto
access-session control-direction in

# **Configuring a Parameter Map for Web-Based Authentication**

A parameter map allows you to modify parameters that control the behavior of actions configured under a control policy. A parameter map for web-based authentication sets parameters that can be applied to subscriber sessions during authentication. If you do not create a parameter map, the policy uses default parameters.

Perform the following steps to define either a global or named parameter map for web-based authentication.

Note

The configuration commands available in the global parameter map differ from the commands available in a named parameter map.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	

	Command or Action	Purpose
	Device# configure terminal	
Step 3	<pre>parameter-map type webauth {parameter-map-name   global}  Example: Device(config) # parameter-map type webauth MAP_2</pre>	Creates a parameter map and enters parameter-map webauth configuration mode.  • The specific configuration commands supported for a global parameter map defined with the <b>global</b> keyword differ from the commands supported for a named parameter map defined with the parameter-map-name argument.
Step 4	<pre>banner {file location:filename   text banner-text}  Example: Device(config-params-parameter-map) # banner file flash:webauth_banner.html</pre>	(Optional) Displays a banner on the web-authentication login web page.
Step 5	<pre>consent Example: Device(config-params-parameter-map) # type consent</pre>	<ul><li>(Optional) Defines the methods supported by a web-based authentication parameter map.</li><li>This command is supported in named parameter maps only.</li></ul>
Step 6	<pre>consent email  Example:  Device (config-params-parameter-map) # consent email</pre>	<ul><li>(Optional) Requests a user's e-mail address on the web-authentication login web page.</li><li>This command is supported in named parameter maps only.</li></ul>
Step 7	custom-page {failure   login [expired]   success} device location:filename  Example:  Device (config-params-parameter-map) # custom-page login device flash:webauth_login.html  Device (config-params-parameter-map) # custom-page login expired device flash:webauth_expire.html  Device (config-params-parameter-map) # custom-page success device flash:webauth_success.html  Device (config-params-parameter-map) # custom-page failure device flash:webauth_fail.html	(Optional) Displays custom authentication proxy web pages during web-based authentication.  • You must configure all four custom HTML files. If fewer than four files are configured, the internal default HTML pages will be used.
Step 8	max-http-conns number  Example:  Device (config-params-parameter-map) # max-http-conns 5	(Optional) Limits the number of HTTP connections for each web authentication client.

Command or Action	Purpose
redirect {{for-login   on-failure   on-success} url   portal {ipv4 ipv4-address   ipv6 ipv6-address}}	(Optional) Redirects users to a particular URL during web-based authentication.
Example:	
Device(config-params-parameter-map) # redirect portal ipv6 FE80::1 Device(config-params-parameter-map) # redirect on-failure http://10.10.3.34/~sample/failure.html	
timeout init-state sec seconds	(Optional) Sets the Init state timeout for
Example:	web-based authentication sessions.
<pre>Device(config-params-parameter-map)# timeout init-state sec 60</pre>	• The range of seconds is (60-3932100).
type {authbypass   consent   webauth   webconsent}	(Optional) Defines the methods supported by a web-based authentication parameter map.
Example:	This command is supported in named
<pre>Device(config-params-parameter-map) # type consent</pre>	parameter maps only.
virtual-ip {ipv4 ipv4-address   ipv6 ipv6-address}	(Optional) Specifies a virtual IP address for web-based authentication clients.
Example:  Device (config-params-parameter-map) # virtual-ip ipv6 FE80::1	This command is supported in the global parameter map only.
<pre>watch-list {add-item {ipv4 ipv4-address   ipv6 ipv6-address}   dynamic-expiry-timeout minutes   enabled}  Example:  Device (config-params-parameter-map) # watch-list enabled Device (config-params-parameter-map) # watch-list dynamic-expiry-timeout 20 Device (config-params-parameter-map) # watch-list add-item ipv6 FE80::1</pre>	(Optional) Enables a watch list of web-based authentication clients.     • This command is supported in the global parameter map only.
end	(Optional) Exits parameter-map configuration
Example:	mode and returns to privileged EXEC mode.
Device(config-params-parameter-map)# end	
show ip admission status [banners   custom-pages   parameter-map [parameter-map]]	(Optional) Displays information about configured banners and custom pages.
Example:	
Device# show ip admission status custom-pages	
	redirect {{for-login   on-failure   on-success} url   portal {ipv4 ipv4-address   ipv6 ipv6-address}}}  Example:  Device(config-params-parameter-map) # redirect portal ipv6 FE80::1 Device(config-params-parameter-map) # redirect on-failure http://10.10.3.34/~sample/failure.html  timeout init-state sec seconds  Example: Device(config-params-parameter-map) # timeout init-state sec 60  type {authbypass   consent   webauth   webconsent}}  Example: Device(config-params-parameter-map) # type consent  virtual-ip {ipv4 ipv4-address   ipv6 ipv6-address}}  Example: Device(config-params-parameter-map) # virtual-ip ipv6 FE80::1  watch-list {add-item {ipv4 ipv4-address   ipv6 ipv6-address}   dynamic-expiry-timeout minutes   enabled}  Example: Device(config-params-parameter-map) # watch-list enabled Device(config-params-parameter-map) # watch-list dynamic-expiry-timeout 20 Device(config-params-parameter-map) # watch-list add-item ipv6 FE80::1  end  Example: Device(config-params-parameter-map) # watch-list add-item ipv6 FE80::1  end  Example: Device(config-params-parameter-map) # end  Show ip admission status [banners   custom-pages   parameter-map   [parameter-map]]  Example: Device# show ip admission status

### **Example: Parameter Map for Web-Based Authentication**

```
parameter-map type webauth PMAP_2
type webconsent
timeout init-state sec 60
max-http-conns 5
type consent
consent email
custom-page login device flash:webauth_login.html
custom-page success device flash:webauth_success.html
custom-page failure device flash:webauth_fail.html
custom-page login expired device flash:webauth expire.html
```

#### What to do next

Apply the parameter map to sessions by specifying it in the **authenticate using** command when configuring a Control Policy. See the Configuring a Control Policy, on page 8 section.

# **Configuration Examples for Cisco Identity-Based Control Policies**

## **Example: Configuring Control Policy for Concurrent Authentication Methods**

The following example shows a control policy that is configured to allow concurrent authentication. All three methods (dot1x, MAB, and web authentication) are run simultaneously when a session is started. The dot1x method is set to the highest priority and web authentication has the lowest priority, which means that if multiple methods succeed, the highest priority method is honored.

If authentication fails, the session manager checks whether all methods have failed, and if so, it sets the restart timer to 60 seconds, after which it attempts to start all three methods again. On authentication success, the session manager terminates any lower priority methods; for dot1x, this is MAB and webauth; for MAB it is webauth. Lastly, if session manager detects a dot1x client (agent-found) it triggers only dot1x to run.

The class map named ALL-FAILED checks that all three methods have run to completion (result type is none until then) and that none of them was successful. In other words, all three methods have completed and failed.

Note

When configuring a control policy for concurrent authentication, you must include a policy rule that explicitly terminates one method after another method of a higher priority succeeds.

```
class-map type control subscriber match-all ALL_FAILED no-match result-type method dot1x none no-match result-type method dot1x success no-match result-type method mab none no-match result-type method mab success no-match result-type method webauth none no-match result-type method webauth success ! class-map type control subscriber match-all DOT1X match method dot1x !
```

```
class-map type control subscriber match-all MAB
match method mab
policy-map type control subscriber CONCURRENT DOT1X MAB WEBAUTH
event session-started match-all
 10 class always do-until-failure
   10 authenticate using mab priority 20
   20 authenticate using dot1x priority 10
   30 authenticate using webauth parameter-map WEBAUTH DEFAULT priority 30
 event authentication-failure match-first
 10 class ALL FAILED
   10 authentication-restart 60
 event authentication-success match-all
 10 class DOT1X
   10 terminate MAB
   20 terminate webauth
  20 class MAB
   10 terminate webauth
 event agent-found match-all
 10 class always do-until-failure
   10 authenticate using dot1x priority 10
```

## **Example: Configuring Control Policy for Sequential Authentication Methods**

The following example shows a control policy that is configured to allow sequential authentication methods using 802.1X (dot1x), MAB, and web authentication.

```
parameter-map type webauth WEBAUTH_FALLBACK
type webauth
class-map type control subscriber match-all DOT1X NO RESP
match method dot1x
match result-type method dot1x agent-not-found
class-map type control subscriber match-all MAB FAILED
match method mab
match result-type method mab authoritative
policy-map type control subscriber POLICY Gi3/0/10
event session-started match-all
 10 class always do-until-failure
   10 authenticate using dot1x priority 10
 event authentication-failure match-first
  10 class DOT1X NO RESP do-until-failure
  10 terminate dot1x
   20 authenticate using mab priority 20
  20 class MAB FAILED do-until-failure
   10 terminate mab
   20 authenticate using webauth parameter-map WEBAUTH FALLBACK priority 30
  30 class always do-until-failure
  10 terminate dot1x
   20 terminate mab
   30 terminate webauth
   40 authentication-restart 60
 event agent-found match-all
 10 class always do-until-failure
   10 terminate mab
   20 terminate webauth
   30 authenticate using dot1x priority 10
```

The following example shows a control policy that is configured to allow sequential authentication methods using 802.1X and MAB. If authentication fails, a service template for VLAN is activated.

```
service-template VLAN210
vlan 210
class-map type control subscriber match-all DOT1X FAILED
match method dot1x
match result-type method dot1x authoritative
class-map type control subscriber match-all DOT1X NO RESP
{\tt match}\ {\tt method}\ {\tt dot1x}
match result-type method dot1x agent-not-found
class-map type control subscriber match-all MAB_FAILED
match method mab
match result-type method mab authoritative
policy-map type control subscriber POLICY Gi3/0/14
 event session-started match-all
 10 class always do-until-failure
  10 authenticate using dot1x retries 2 retry-time 0 priority 10
 event authentication-failure match-first
 10 class DOT1X NO RESP do-until-failure
   10 terminate dot1x
   20 authenticate using mab priority 20
  20 class MAB FAILED do-until-failure
   10 terminate mab
   20 activate service-template VLAN210
   30 authorize
  30 class DOT1X FAILED do-until-failure
  10 terminate dot1x
   20 authenticate using mab priority 20
  40 class always do-until-failure
   10 terminate dot1x
   20 terminate mab
   30 authentication-restart 60
 event agent-found match-all
  10 class always do-until-failure
   10 terminate mab
   20 authenticate using dot1x retries 2 retry-time 0 priority 10
```

# **Example: Configuring Parameter Maps**

#### **Global Parameter Map**

The following example shows the configuration of a global parameter map:

```
parameter-map type webauth global
  timeout init-state sec 15
  watch-list enabled
  virtual-ip ipv6 FE80::1
  redirect on-failure http://10.10.3.34/~sample/failure.html
  max-http-conns 100
  watch-list dynamic-expiry-timeout 5000
  banner file flash:webauth banner.html
```

# Named Parameter Maps for Web Authentication and Authentication Bypass (nonresponsive host [NRH])

The following example shows the configuration of two named parameter maps; one for web authentication and one for authentication bypass. This example also shows the corresponding control policy configuration.

```
parameter-map type webauth WEBAUTH BANNER
type webauth
banner
parameter-map type webauth WEBAUTH_NRH
type authbypass
class-map type control subscriber match-all NRH FAIL
match method webauth
match current-method-priority eq 254
policy-map type control subscriber WEBAUTH NRH
 event session-started match-all
 10 class always do-until-failure
   10 authenticate using webauth parameter-map WEBAUTH NRH priority 254
 event authentication-failure match-all
 10 class NRH FAIL do-until-failure
   10 terminate webauth
   20 authenticate using webauth parameter-map WEBAUTH BANNER priority 30
```

### **Named Parameter Map for Web Authentication Using Custom Pages**

The following example shows the configuration of a named parameter map for web authentication that defines custom pages for the login process, along with a control policy that uses the parameter map.

```
parameter-map type webauth CUSTOM_WEBAUTH

type webauth

custom-page login device flash:login_page.htm

custom-page success device flash:success_page.htm

custom-page failure device flash:fail_page.htm

custom-page login expired device flash:expire_page.htm

!

policy-map type control subscriber CUSTOM_WEBAUTH

event session-started match-all

10 class always do-until-failure

10 authenticate using webauth parameter-map CUSTOM_WEB retries 2 retry-time 0
```

### **Named Parameter Map for Consent**

The following example shows the configuration of a named parameter map for consent, along with the corresponding control policy that uses the parameter map:

```
parameter-map type webauth CONSENT
  type consent
!
ip access-list extended GUEST_ACL
  permit ip any 172.30.30.0 0.0.0.255
  permit ip any host 172.20.249.252
!
service-template GUEST_POLICY
```

```
access-group GUEST_ACL
!

policy-map type control subscriber CONSENT
  event session-started match-all
  10 class always do-until-failure
   10 authenticate using webauth parameter-map CONSENT
  event authentication-success match-all
  10 class always do-until-failure
  10 activate service-template GUEST POLICY
```

### **Named Parameter Map for Web Authentication with Consent**

The following example shows the configuration of a named parameter map for web authentication with consent, along with the corresponding control policy that uses the parameter map:

```
parameter-map type webauth WEBAUTH_CONSENT
type webconsent
!
ip access-list extended GUEST_ACL
permit ip any 172.30.30.0 0.0.0.255
permit ip any host 172.20.249.252
!
service-template GUEST_POLICY
access-group GUEST_ACL
!
policy-map type control subscriber WEBAUTH_CONSENT
event session-started match-all
10 class always do-until-failure
10 authenticate using webauth parameter-map CONSENT
event authentication-success match-all
10 class always do-until-failure
10 activate service-template GUEST POLICY
```

# **Feature Information for Identity Control Policies**

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

**Table 1: Feature Information for Identity Control Policies** 

Release	Feature Name	Feature Information
Cisco IOS XE Everest 16.6.1	Cisco Common Classification Policy Language-Based Identity Configuration	Identity control policies define the actions taken in response to specified events and conditions.

**Feature Information for Identity Control Policies**
