

Secure Shell Version 2 Support

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

Prerequisites for Secure Shell Version 2 Support

- Before configuring SSH, ensure that the required image is loaded on your device. The SSH server requires you to have a k9 (Triple Data Encryption Standard [3DES]) software image depending on your release.
- You have to use a SSH remote device that supports SSH Version 2 and connect to a Cisco device.
- SCP relies on authentication, authorization, and accounting (AAA) to function correctly. Therefore, AAA must be configured on the device to enable the secure copy protocol on the SSH Server.

Note The SSH Version 2 server and the SSH Version 2 client are supported on your Cisco software, depending on your release. (The SSH client runs both the SSH Version 1 protocol and the SSH Version 2 protocol. The SSH client is supported in k9 images depending on your release.)

Restrictions for Secure Shell Version 2 Support

- Secure Shell (SSH) servers and SSH clients are supported in Triple Data Encryption Standard (3DES) software images.
- Execution Shell, remote command execution, and Secure Copy Protocol (SCP) are the only applications supported.
- Rivest, Shamir, and Adleman (RSA) key generation is an SSH server-side requirement. Devices that act as SSH clients need not generate RSA keys.
- The RSA key pair size must be greater than or equal to 768 bits.
- The following features are not supported:
 - Port forwarding
 - Compression

Information About Secure Shell Version 2 Support

Secure Shell Version 2

The Secure Shell Version 2 Support feature allows you to configure SSH Version 2.

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The **ip ssh version** command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.

Note SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the **ip ssh version** command and specify Version 2.

The **ip ssh rsa keypair-name** command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the **ip ssh rsa keypair-name** command, you can overcome this behavior. If you configure the **ip ssh rsa keypair-name** command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

Note The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

Secure Shell Version 2 Enhancements

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

Note The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The **ip ssh dh min size** command configures the modulus size on the SSH server. In addition to this, the **ssh** command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The **debug ip ssh** command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the **debug ip ssh** command with a keyword, messages are limited to information specified by the keyword.

Secure Shell Version 2 Enhancements for RSA Keys

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.

- User authentication: RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.

An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user's public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

- Server authentication: While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a "Server Authentication Failed" message.

**Note**

- Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.
- RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.
- For server authentication, configure the RSA public key of the server manually and configure the **ip ssh stricthostkeycheck** command on the Cisco SSH client.

SSH And Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

SNMP Trap Generation

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled.

**Note**

When you configure the **snmp-server host** command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server.

You must also enable SNMP debugging using the **debug snmp packet** command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session.

SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

How to Configure Secure Shell Version 2 Support

Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: Device(config)# hostname catalyst9k	Configures a hostname for your device.
Step 4	ip domain name <i>name</i> Example: catalyst9k(config)# ip domain name example.com	Configures a domain name for your device.
Step 5	crypto key generate rsa Example: catalyst9k(config)# crypto key generate rsa	Enables the SSH server for local and remote authentication.
Step 6	ip ssh [time-out <i>seconds</i> authentication-retries <i>integer</i>] Example: catalyst9k(config)# ip ssh time-out 120	(Optional) Configures SSH control variables on your device.
Step 7	ip ssh version [1 2] Example: catalyst9k(config)# ip ssh version 1	(Optional) Specifies the version of SSH to be run on your device.
Step 8	exit Example: catalyst9k(config)# exit	Exits global configuration mode and enters privileged EXEC mode. <ul style="list-style-type: none">• Use no hostname command to return to the default host.

Configuring a Device for SSH Version 2 Using RSA Key Pairs

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip ssh rsa keypair-name <i>keypair-name</i> Example: Device(config)# ip ssh rsa keypair-name sshkeys	Specifies the RSA key pair to be used for SSH. Note A Cisco device can have many RSA key pairs.
Step 4	crypto key generate rsa usage-keys label <i>key-label</i> modulus <i>modulus-size</i> Example: Device(config)# crypto key generate rsa usage-keys label sshkeys modulus 768	Enables the SSH server for local and remote authentication on the device. <ul style="list-style-type: none"> For SSH Version 2, the modulus size must be at least 768 bits. Note To delete the RSA key pair, use the crypto key zeroize rsa command. When you delete the RSA key pair, you automatically disable the SSH server.
Step 5	ip ssh [time-out <i>seconds</i> authentication-retries <i>integer</i>] Example: Device(config)# ip ssh time-out 12	Configures SSH control variables on your device.
Step 6	ip ssh version 2 Example: Device(config)# ip ssh version 2	Specifies the version of SSH to be run on the device.
Step 7	exit Example: Device(config)# exit	Exits global configuration mode and enters privileged EXEC mode.

Configuring the Cisco SSH Server to Perform RSA-Based User Authentication

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname name Example: Device (config)# hostname host1	Specifies the hostname.
Step 4	ip domain name name Example: host1 (config)# ip domain name name1	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.
Step 5	crypto key generate rsa Example: host1 (config)# crypto key generate rsa	Generates RSA key pairs.
Step 6	ip ssh pubkey-chain Example: host1 (config)# ip ssh pubkey-chain	Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode. <ul style="list-style-type: none"> The user authentication is successful if the RSA public key stored on the server is verified with the public or the private key pair stored on the client.
Step 7	username username Example: host1 (conf-ssh-pubkey)# username user1	Configures the SSH username and enters public-key user configuration mode.
Step 8	key-string Example: host1 (conf-ssh-pubkey-user)# key-string	Specifies the RSA public key of the remote peer and enters public-key data configuration mode. Note You can obtain the public key value from an open SSH client; that is, from the <code>.ssh/id_rsa.pub</code> file.

	Command or Action	Purpose
Step 9	key-hash <i>key-type key-name</i> Example: <pre>host1(conf-ssh-pubkey-data)# key-hash ssh-rsa key1</pre>	(Optional) Specifies the SSH key type and version. <ul style="list-style-type: none"> • The key type must be <code>ssh-rsa</code> for the configuration of private public key pairs. • This step is optional only if the key-string command is configured. • You must configure either the key-string command or the key-hash command. <p>Note You can use a hashing software to compute the hash of the public key string, or you can also copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time.</p>
Step 10	end Example: <pre>host1(conf-ssh-pubkey-data)# end</pre>	Exits public-key data configuration mode and returns to privileged EXEC mode. <ul style="list-style-type: none"> • Use no hostname command to return to the default host.

Configuring the Cisco IOS SSH Client to Perform RSA-Based Server Authentication

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: <pre>Device(config)# hostname host1</pre>	Specifies the hostname.

	Command or Action	Purpose
Step 4	ip domain name <i>name</i> Example: host1(config)# ip domain name name1	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.
Step 5	crypto key generate rsa Example: host1(config)# crypto key generate rsa	Generates RSA key pairs.
Step 6	ip ssh pubkey-chain Example: host1(config)# ip ssh pubkey-chain	Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.
Step 7	server <i>server-name</i> Example: host1(conf-ssh-pubkey)# server server1	Enables the SSH server for public-key authentication on the device and enters public-key server configuration mode.
Step 8	key-string Example: host1(conf-ssh-pubkey-server)# key-string	Specifies the RSA public-key of the remote peer and enters public key data configuration mode. Note You can obtain the public key value from an open SSH client; that is, from the .ssh/id_rsa.pub file.
Step 9	exit Example: host1(conf-ssh-pubkey-data)# exit	Exits public-key data configuration mode and enters public-key server configuration mode.
Step 10	key-hash <i>key-type key-name</i> Example: host1(conf-ssh-pubkey-server)# key-hash ssh-rsa key1	(Optional) Specifies the SSH key type and version. <ul style="list-style-type: none"> • The key type must be ssh-rsa for the configuration of private/public key pairs. • This step is optional only if the key-string command is configured. • You must configure either the key-string command or the key-hash command.

	Command or Action	Purpose
		<p>Note You can use a hashing software to compute the hash of the public key string, or you can copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time.</p>
Step 11	<p>end</p> <p>Example:</p> <pre>host1(conf-ssh-pubkey-server)# end</pre>	Exits public-key server configuration mode and returns to privileged EXEC mode.
Step 12	<p>configure terminal</p> <p>Example:</p> <pre>host1# configure terminal</pre>	Enters global configuration mode.
Step 13	<p>ip ssh stricthostkeycheck</p> <p>Example:</p> <pre>host1(config)# ip ssh stricthostkeycheck</pre>	<p>Ensures that server authentication takes place.</p> <ul style="list-style-type: none"> • The connection is terminated in case of a failure. • Use no hostname command to return to the default host.
Step 14	<p>end</p> <p>Example:</p> <pre>host1(config)# end</pre>	Exits global configuration mode and returns to privileged EXEC mode.

Starting an Encrypted Session with a Remote Device

Note The device with which you want to connect must support a Secure Shell (SSH) server that has an encryption algorithm that is supported in Cisco software. Also, you need not enable your device. SSH can be run in disabled mode.

Procedure

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	<pre>ssh [-v {1 2} -c {aes128-ctr aes192-ctr aes256-ctr aes128-cbc 3des aes192-cbc aes256-cbc} -l user-id -l user-id:vrf-name number ip-address ip-address -l user-id:rotary number ip-address -m {hmac-md5-128 hmac-md5-96 hmac-sha1-160 hmac-sha1-96} -o numberofpasswordprompts n -p port-num] {ip-addr hostname} [command -vrf]</pre> <p>Example:</p> <pre>Device# ssh -v 2 -c aes256-ctr -m hmac-sha1-96 -l user2 10.76.82.24</pre>	Starts an encrypted session with a remote networking device.

Verifying the Status of the Secure Shell Connection

Procedure

	Command or Action	Purpose
Step 1	<pre>enable</pre> <p>Example:</p> <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<pre>show ssh</pre> <p>Example:</p> <pre>Device# show ssh</pre>	Displays the status of SSH server connections.
Step 3	<pre>exit</pre> <p>Example:</p> <pre>Device# exit</pre>	Exits privileged EXEC mode and returns to user EXEC mode.

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

```
-----
Device# show ssh

Connection      Version Encryption      State                Username
0               1.5      3DES                Session started     lab
Connection      Version Mode Encryption      Hmac                State                Username
1               2.0      IN   aes128-cbc  hmac-md5            Session started     lab
1               2.0      OUT  aes128-cbc  hmac-md5            Session started     lab
```

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

```
-----
Device# show ssh

Connection Version Mode Encryption Hmac State
Username
1 2.0 IN aes128-cbc hmac-md5 Session started lab
1 2.0 OUT aes128-cbc hmac-md5 Session started lab
%No SSHv1 server connections running.
-----
```

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 1 connection with no Version 2 connection:

```
-----
Device# show ssh

Connection Version Encryption State Username
0 1.5 3DES Session started lab
%No SSHv2 server connections running.
-----
```

Verifying the Secure Shell Version 2 Status

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip ssh Example: Device# show ip ssh	Displays the version and configuration data for SSH.
Step 3	exit Example: Device# exit	Exits privileged EXEC mode and returns to user EXEC mode.

Examples

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

```
-----
Device# show ip ssh

SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
-----
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 2 connection with no Version 1 connection:

```
-----
Device# show ip ssh

SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3
-----
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 1 connection with no Version 2 connection:

```
-----
Device# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
-----
```

Monitoring and Maintaining Secure Shell Version 2

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	debug ip ssh Example: Device# debug ip ssh	Enables debugging of SSH.
Step 3	debug snmp packet Example:	Enables debugging of every SNMP packet sent or received by the device.

	Command or Action	Purpose
	Device# debug snmp packet	

Example

The following sample output from the **debug ip ssh** command shows the connection is an SSH Version 2 connection:

```
Device# debug ip ssh

00:33:55: SSH1: starting SSH control process
00:33:55: SSH1: sent protocol version id SSH-1.99-Cisco-1.25

```

Configuration Examples for Secure Shell Version 2 Support

Example: Configuring Secure Shell Version 2

```

Device> enable
Device# configure terminal
Device(config)# ip ssh version 2
Device(config)# end

```

Example: Configuring Secure Shell Versions 1 and 2

```

Device> enable
Device# configure terminal
Device(config)# no ip ssh version
Device(config)# end

```

Example: Starting an Encrypted Session with a Remote Device

```

Device> enable
Device# ssh -v 2 -c aes256-cbc -m hmac-sha1-160 -l shaship 10.76.82.24

```

```
Device# exit
```

Example: Setting an SNMP Trap

The following example shows how to set an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, 10.1.1.1 is the IP address of the SSH client.

```
Device> enable
Device# configure terminal
Device(config)# snmp-server trap link switchover
Device(config)# snmp-server host 10.1.1.1 public tty
Device(config)# end
```

Examples: SSH Keyboard Interactive Authentication

Example: Enabling Client-Side Debugs

The following example shows that the client-side debugs are turned on, and the maximum number of prompts is six (three for the SSH keyboard interactive authentication method and three for the password authentication method).

```
Password:

*Nov 17 12:51:11.411: SSH2 CLIENT 0: shell request sent
*Nov 17 12:51:11.411: SSH CLIENT0: session open
```

Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

```
Device> enable
Device1# ssh -l cisco 10.1.1.3

Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]
```

Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

```
Device1> enable
Device1# ssh -l cisco 10.1.1.3

Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3

Password:cisco1
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
Re-enter New password: cisco

Device2>
```

Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

```
Device# ssh -l cisco. 10.1.1.3

Password: cisco

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]
```

```

Device1# ssh -l cisco 10.1.1.3

Password: cisco

Device2> exit

Device1# ssh -l cisco 10.1.1.3

Password: cisco

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3

Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Device2>

```

Example: SNMP Debugging

The following is sample output from the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```

Device1# debug snmp packet

SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:

Device2# exit

[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2

Feature History for Secure Shell Version 2 Support

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Secure Shell Version 2 Support	<p>The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2 (SSH Version 1 support was implemented in an earlier Cisco IOS software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. SSH version 2 also supports AES counter-based encryption mode.</p> <p>Support for this feature was introduced on all the models of the Cisco Catalyst 9500 Series Switches.</p>
Cisco IOS XE Fuji 16.8.1a	Secure Shell Version 2 Support	<p>Support for this feature was introduced on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.</p>

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.
