# **Information About RIP**

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) created for use in small, homogeneous networks. It is a distance-vector routing protocol that uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. The protocol is documented in RFC 1058. You can find detailed information about RIP in *IP Routing Fundamentals*, published by Cisco Press.

#### Note

RIP is supported in the Network Essentials feature set.

Using RIP, the switch sends routing information updates (advertisements) every 30 seconds. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by that router as unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router.

RIP uses hop counts to rate the value of different routes. The hop count is the number of routers that can be traversed in a route. A directly connected network has a hop count of zero; a network with a hop count of 16 is unreachable. This small range (0 to 15) makes RIP unsuitable for large networks.

If the router has a default network path, RIP advertises a route that links the router to the pseudonetwork 0.0.0.0. The 0.0.0.0 network does not exist; it is treated by RIP as a network to implement the default routing feature. The switch advertises the default network if a default was learned by RIP or if the router has a gateway of last resort and RIP is configured with a default metric. RIP sends updates to the interfaces in specified networks. If an interface's network is not specified, it is not advertised in any RIP update.

### **RIP for IPv6**

Routing Information Protocol (RIP) for IPv6 is a distance-vector protocol that uses hop count as a routing metric. It includes support for IPv6 addresses and prefixes and the all-RIP-routers multicast group address FF02::9 as the destination address for RIP update messages.

For configuring RIP for IPv6, see the Configuring RIP for IPv6 section.

For more information about RIP for IPv6, see the "Implementing RIP for IPv6" chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Summary Addresses and Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature usually optimizes communication among multiple routers, especially when links are broken.

# **How to Configure Routing Information Protocol**

The following sections provide configurational information about RIP.

### **Default RIP Configuration**

#### Table 1: Default RIP Configuration

Feature	Default Setting	
Auto summary	Enabled.	
Default-information originate	Disabled.	
Default metric	Built-in; automatic metric translations.	
IP RIP authentication key-chain	No authentication.	
	Authentication mode: clear text.	
IP RIP triggered	Disabled	
IP split horizon	Varies with media.	
Neighbor	None defined.	
Network	None specified.	
Offset list	Disabled.	
Output delay	0 milliseconds.	
Timers basic	• Update: 30 seconds.	
	• Invalid: 180 seconds.	
	• Hold-down: 180 seconds.	
	• Flush: 240 seconds.	

Feature	Default Setting	
Validate-update-source	Enabled.	
Version	Receives RIP Version 1 and 2 packets; sends Version 1 packets.	

# **Configuring Basic RIP Parameters**

To configure RIP, you enable RIP routing for a network and optionally configure other parameters. On the switch, RIP configuration commands are ignored until you configure the network number.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password, if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ip routing	Enables IP routing. (Required only if IP
	Example:	routing is disabled.)
	Device(config)# <b>ip routing</b>	
Step 4	router rip	Enables a RIP routing process, and enter rou configuration mode.
	Example:	
	Device(config)# router rip	
Step 5	network network number	Associates a network with a RIP routing
	Example:	process. You can specify multiple <b>network</b> commands. RIP routing updates are sent and
	Device(config-router)# <b>network 12.0.0.0</b>	received through interfaces only on these
		Note You must configure a network number for the RIP commands to take effect.
Step 6	neighbor ip-address	(Optional) Defines a neighboring router with
	Example:	which to exchange routing information. This step allows routing updates from RIP

	Command or Action	Purpose
	Device(config-router)# neighbor 10.2.5.1	(normally a broadcast protocol) to reach nonbroadcast networks.
Step 7	<pre>offset-list [access-list number   name] {in   out} offset [type number] Example: Device(config-router)# offset-list 103 in 10</pre>	(Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through RIP. You can limit the offset list with an access list or an interface.
Step 8	timers basic update invalid holddown flushExample:	(Optional) Adjusts routing protocol timers. Valid ranges for all timers are 0 to 4294967293 seconds.
	Device(config-router)# timers basic 45 360 400 300	• <i>update</i> —The time between sending routing updates. The default is 30 seconds.
		<ul> <li><i>invalid</i>—The timer after which a route is declared invalid. The default is 180 seconds.</li> </ul>
		• <i>holddown</i> —The time before a route is removed from the routing table. The default is 180 seconds.
		• <i>flush</i> —The amount of time for which routing updates are postponed. The default is 240 seconds.
Step 9	version {1   2}	(Optional) Configures the switch to receive
	<pre>Example: Device(config-router)# version 2</pre>	and send only RIP Version 1 or RIP Version 2 packets. By default, the switch receives Version 1 and 2 but sends only Version 1. You can also use the interface commands <b>ip rip</b> { <b>send</b>   <b>receive</b> } <b>version 1</b>   <b>2</b>   <b>1 2</b> } to control what versions are used for sending and receiving on interfaces.
Step 10	no auto summary	(Optional) Disables automatic summarization
	Example:	By default, the switch summarizes subprefixe when crossing classful network boundaries.
	Device(config-router)# no auto summary	Disable summarization (RIP Version 2 only) to advertise subnet and host routing information to classful network boundaries.
Step 11	output-delay delay	(Optional) Adds interpacket delay for RIP
	Example:	updates sent. By default, packets in a multiple-packet RIP update have no delay added between packets. If you are sending
	Device(config-router)# <b>output-delay 8</b>	packets to a lower-speed device, you can add

Command or Action	Purpose
	an interpacket delay in the range of 8 to 50 milliseconds.
end	Returns to privileged EXEC mode.
Example:	
Device(config-router)# end	
show ip protocols	Verifies your entries.
Example:	
Device# show ip protocols	
copy running-config startup-config	(Optional) Saves your entries in the
Example:	configuration file.
Device# copy running-config startup-config	
	end Example: Device(config-router)# end show ip protocols Example: Device# show ip protocols copy running-config startup-config Example: Device# copy running-config

### **Configuring RIP Authentication**

RIP Version 1 does not support authentication. If you are sending and receiving RIP Version 2 packets, you can enable RIP authentication on an interface. The key chain specifies the set of keys that can be used on the interface. If a key chain is not configured, no authentication is performed, not even the default.

The switch supports two modes of authentication on interfaces for which RIP authentication is enabled: plain text and MD5. The default is plain text.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> <b>enable</b>	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface interface-id	Enters interface configuration mode, and
	Example:	specifies the interface to configure.

	Command or Action	Purpose
	Device(config)# interface gigabitethernet 1/0/1	
Step 4	ip rip authentication key-chain name-of-chain	Enables RIP authentication.
	Example:	
	Device(config-if)# ip rip authentication key-chain trees	
Step 5	ip rip authentication mode {text   md5}	Configures the interface to use plain text
	Example:	authentication (the default) or MD5 digest authentication.
	<pre>Device(config-if) # ip rip authentication   mode md5</pre>	
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Device(config)# <b>end</b>	
Step 7	show running-config	Verifies your entries.
	Example:	
	Device# <b>show running-config</b>	
Step 8	copy running-config startup-config	(Optional) Saves your entries in the
	Example:	configuration file.
	Device# copy running-config startup-config	

## **Configuring RIP for IPv6**

For more information about configuring RIP routing for IPv6, see the "Implementing RIP for IPv6" chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com,

To configure RIP routing for IPv6, perform this procedure:

### Before you begin

Before configuring the switch to run IPv6 RIP, you must enable routing by using the **ip routing** command in global configuration mode, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** command in global configuration mode, and enable IPv6 on any Layer 3 interfaces on which IPv6 RIP is to be enabled.

I

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ipv6 router rip name	Configures an IPv6 RIP routing process, and
	Example:	enters router configuration mode for the
	Device(config) # <b>ipv6 router rip cisco</b>	process.
Step 4	maximum-paths number-paths	(Optional) Define the maximum number of
	Example:	equal-cost routes that IPv6 RIP can support.
	Device(config-router)# maximum-paths 6	The range is from 1 to 32, and the default is 16 routes.
Step 5	exit	Returns to global configuration mode.
·	Example:	
	Device(config-router)# exit	
Step 6	interface interface-id	Enters interface configuration mode, and
	Example:	specifies the Layer 3 interface to configure.
	Device(config)# interface gigabitethernet 1/0/1	
Step 7	ipv6 rip name enable	Enables the specified IPv6 RIP routing process
	Example:	on the interface.
	Device(config-if)# ipv6 rip cisco enable	
Step 8	ipv6 rip name default-information {only	(Optional) Originates the IPv6 default route
	originate}	(::/0) into the RIP routing process updates sent from the specified interface.
	Example:	
	<pre>Device(config-if)# ipv6 rip cisco default-information only</pre>	Note To avoid routing loops after the IPv6 default route (::/0) is originated from any interface, the routing process ignores all default routes received on any interface.
		• <b>only</b> —Select to originate the default route, but suppress all other routes in the updates sent on this interface.

	Command or Action	Purpose
		• <b>originate</b> —Select to originate the default route in addition to all other routes in the updates sent on this interface.
Step 9	end	Returns to privileged EXEC mode.
	<b>Example:</b> Device(config)# <b>end</b>	
Step 10	Use one of the following: • show ipv6 rip [name] [ interface interface-id] [ database ] [ next-hops ] • show ipv6 rip Example: Device# show ipv6 rip cisco interface gigabitethernet 2/0/1 Or Device# show ipv6 rip	<ul> <li>Displays information about current IPv6 RIP processes.</li> <li>Displays the current contents of the IPv6 routing table.</li> </ul>
Step 11	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

## **Configuring Summary Addresses and Split Horizon**

**Note** In general, disabling split horizon is not recommended unless you are certain that your application requires it to properly advertise routes.

If you want to configure an interface running RIP to advertise a summarized local IP address pool on a network access server for dial-up clients, use the **ip summary-address rip** interface configuration command.

_

Note If split horizon is enabled, neither autosummary nor interface IP summary addresses are advertised.

Command or Action	Purpose
enable	Enables privileged EXEC mode.
Example:	• Enter your password if prompted.
	enable

I

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface interface-id	Enters interface configuration mode, and
	Example:	specifies the Layer 3 interface to configure.
	Device(config)# interface gigabitethernet 1/0/1	
Step 4	ip address ip-address subnet-mask	Configures the IP address and IP subnet.
	Example:	
	Device(config-if)# ip address 10.1.1.10 255.255.255.0	
Step 5	<b>ip summary-address rip ip address</b> <i>ip-network</i> <i>mask</i>	Configures the IP address to be summarized and the IP network mask.
	Example:	
	Device(config-if)# ip summary-address rip ip address 10.1.1.30 255.255.255.0	
Step 6	no ip split horizon	Disables split horizon on the interface.
	Example:	
	Device(config-if) # no ip split horizon	
Step 7	end	Returns to privileged EXEC mode.
	Example:	
	Device(config)# <b>end</b>	
Step 8	show ip interface interface-id	Verifies your entries.
	Example:	
	Device# show ip interface gigabitethernet 1/0/1	
Step 9	copy running-config startup-config	(Optional) Saves your entries in the
	Example:	configuration file.

Command or Action	Purpose
Device# copy running-config startup-config	

## **Configuring Split Horizon**

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature can optimize communication among multiple routers, especially when links are broken.

**Note** In general, we do not recommend disabling split horizon unless you are certain that your application requires it to properly advertise routes.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> <b>enable</b>	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface interface-id	Enters interface configuration mode, and
	Example:	specifies the interface to configure.
	Device(config)# interface gigabitethernet 1/0/1	
Step 4	ip address ip-address subnet-mask	Configures the IP address and IP subnet.
	Example:	
	Device(config-if)# ip address 10.1.1.10 255.255.255.0	
Step 5	no ip split-horizon	Disables split horizon on the interface.
	Example:	

	Command or Action	Purpose
	Device(config-if)# no ip split-horizon	
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Device(config)# <b>end</b>	
Step 7	show ip interface interface-id	Verifies your entries.
	Example:	
	Device# show ip interface gigabitethernet 1/0/1	
Step 8	copy running-config startup-config	(Optional) Saves your entries in the
	Example:	configuration file.
	Device# copy running-config startup-config	

# **Configuration Examples for Routing Information Protocol**

The following sections provide configuration examples for RIP.

### **Example: Configuring RIP for IPv6**

This example shows how to enable the RIP routing process *cisco* with a maximum of eight equal-cost routes and to enable it on an interface:

```
Device> enable
Devce# configure terminal
Device(config)# ipv6 router rip cisco
Device(config-router)# maximum-paths 8
Device(config)# exit
Device(config)# interface gigabitethernet2/0/11
Device(config-if)# ipv6 rip cisco enable
```

### **Configuration Example for Summary Addresses and Split Horizon**

In this example, the major net is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0 so that 10.2.0.0 is advertised out interface Gigabit Ethernet port 2, and 10.0.0.0 is not advertised. In the example, if the interface is still in Layer 2 mode (the default), you must enter a **no switchport** interface configuration command before entering the **ip address** interface configuration command.

Note

If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the **ip summary-address rip** router configuration command) are advertised.

```
Device(config) # router rip
Device(config-router) # interface gigabitethernet1/0/2
Device(config-if) # ip address 10.1.5.1 255.255.255.0
Device(config-if) # ip summary-address rip 10.2.0.0 255.255.0.0
Device(config-if) # no ip split-horizon
Device(config-if) # exit
Device(config) # router rip
Device(config-router) # network 10.0.0.0
Device(config-router) # neighbor 2.2.2.2 peer-group mygroup
Device(config-router) # end
```

## Feature History for Routing Information Protocol

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Routing Information Protocol	The Routing Information Protocol is an interior gateway protocol (IGP) created for use in small and homogeneous networks. Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Fuji 16.8.1a	Routing Information Protocol	Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn.
