Restrictions for VXLAN-Aware Flexible NetFlow

Traffic capture using VXLAN-aware Flexible NetFlow is limited to unicast traffic.

Information About VXLAN-Aware Flexible NetFlow

Flexible NetFlow (FNF) uses flows to provide statistics for accounting, network monitoring, and network planning. VXLAN-aware FNF provides information about the VXLAN-encapsulated IPV4 and IPV6 packets in the network. VXLAN-aware FNF captures the VXLAN flow information for both bridged and routed traffic.

A flow is a unidirectional stream of packets that arrives on a source interface and has the same values for the keys. A key is an identified value for a field within the packet. You create a flow using a flow record to define the unique keys for your flow. FNF allows you to define an optimal flow record for a particular application by selecting the keys from a large collection of predefined fields. All key values must match for the packet to count in a given flow. Flows are stored in the FNF cache. You can export the data FNF gathers for your flow by using an exporter.

In a BGP EVPN VXLAN fabric, an FNF monitor is configured on the NVE interface on a VTEP and on the physical interface on a spine switch. For more information about FNF, see *Configuring Flexible NetFlow* module of the *Network Management Configuration Guide*.

How to Configure VXLAN-Aware Flexible NetFlow

To configure VXLAN-aware FNF, perform these steps:

1. Create a flow record by specifying key fields and non-key fields to the flow.
2. Create a flow exporter by specifying the export protocol and transport destination port, source, and other parameters.

3. Create a flow monitor based on the flow record and flow exporter.
4. Apply the flow monitor to the network virtualization edge (NVE) interface on the VTEPs.

Note The commands listed in this section are applicable only to VXLAN-aware FNF. For detailed steps to configure FNF, see *How to Configure Flexible Netflow* section in the *Configuring Flexible NetFlow* module of the *Network Management Configuration Guide*.

Configuring a Flow Record

To configure a flow record for VXLAN-aware FNF, perform the following steps:

Note All the **match** commands listed in this configuration task are mandatory.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	flow record <i>flow-record-name</i> Example: Device(config)# flow record vxlan_nf_record_input	<p>Creates a flow record and enters flow record configuration mode.</p> <p>This command also allows you to modify an existing flow record.</p> <p>Note We recommend that you configure a unique flow record for each address family (IPv4 and IPv6) and also for each traffic direction (input and output).</p> <p>Ensure that the flow record for ingress traffic has the match commands configured with the input keyword.</p> <p>Ensure that the flow record for egress traffic has the match commands configured with the output keyword.</p>

	Command or Action	Purpose
Step 4	match datalink vlan {input output} Example: <pre>Device(config-flow-record)# match datalink vlan output</pre>	Configures the VLAN ID (for input or output traffic) as a key field for the FNF flow record. Note Ensure that you configure the vlan input and vlan output fields. These fields are required for VXLAN-aware FNF to work on EVPN input and output traffic flows.
Step 5	match routing vrf input Example: <pre>Device(config-flow-record)# match routing vrf input</pre>	Configures the VRF ID (for input or output traffic) as a key field for the FNF flow record. Note Ensure that you configure the vrf input field. This field is required for VXLAN-aware FNF to work on EVPN input and output traffic flows.
Step 6	match vxlan vtep {input output} Example: <pre>Device(config-flow-record)# match vxlan vtep output</pre>	Configures the VTEP ID as a key field for the FNF flow record. The input keyword shows the VTEP source IP address in the captured flow. The output keyword shows the VTEP destination IP address in the captured flow
Step 7	match vxlan vniid Example: <pre>Device(config-flow-record)# match vxlan vniid</pre>	Configures the VXLAN VNI ID as a key field for the FNF flow record.
Step 8	end Example: <pre>Device(config-flow-record)# end</pre>	Returns to privileged EXEC mode.

Configuring Flow Exporter

To configure flow exporter for VXLAN-aware FNF, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	flow exporter <i>flow-exporter-name</i> Example: Device(config)# flow exporter e1	Creates a flow exporter and enters flow exporter configuration mode.
Step 4	destination <i>ipv4-address</i> Example: Device(config-flow-exporter)# destination 172.16.103.2	Sets the IPv4 destination address or hostname for the exporter.
Step 5	source <i>interface-type interface-number</i> Example: Device(config-flow-exporter)# source TenGigabitEthernet1/5/0/3	<p>Specifies the interface to use to reach the NetFlow collector at the configured destination.</p> <p>Ensure that the source IP address is unique per fabric.</p> <p>Note We recommend that you configure a unique Loopback on each VTEP.</p> <p>Note Flow exporter does not support unnumbered IP interface as source interface.</p>
Step 6	ttl <i>seconds</i> Example: Device(config-flow-exporter)# ttl 4	<p>Configures the time-to-live (TTL) value for datagrams sent by the exporter.</p> <p>The range is from 1 to 255 seconds. The default is 255.</p>
Step 7	transport udp <i>port-number</i> Example: Device(config-flow-exporter)# transport udp 2055	Specifies the UDP port to use to reach the NetFlow collector.
Step 8	export-protocol {ipfix netflow-v9} Example: Device(config-flow-exporter)# export-protocol ipfix	Specifies the version of the NetFlow export protocol used by the exporter.
Step 9	end Example: Device(config-flow-exporter)# end	Returns to privileged EXEC mode.

Configuring a Flow Monitor

To configure a flow monitor for VXLAN-aware FNF, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	flow monitor <i>flow-monitor-name</i> Example: Device(config)# flow monitor vxlan_nf_monitor_input	Creates a flow monitor and enters flow monitor configuration mode. This command also allows you to modify an existing flow monitor.
Step 4	exporter <i>flow-exporter-name</i> Example: Device(config-flow-monitor)# exporter e1	Specifies the name of the flow exporter that was created previously and associates it with the specified flow monitor.
Step 5	record <i>flow-record-name</i> Example: Device(config-flow-monitor)# record vxlan_nf_record_input	Specifies the record for the flow monitor.
Step 6	end Example: Device(config-flow-monitor)# end	Returns to privileged EXEC mode.

Configuring Flexible NetFlow on an NVE Interface

To configure VXLAN-aware FNF on the NVE interface of a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface nve-interface-number Example: Device(config)# interface nve1	Specifies the network virtualization edge (NVE) interface number and enters interface configuration mode.
Step 4	ip flow monitor flow-monitor-name {input output} Example: Device(config-if)# ip flow monitor vxlan_nf_input input	Associates the IPv4 flow monitor to the NVE interface for input or output packets.
Step 5	ipv6 flow monitor flow-monitor-name {input output} Example: Device(config-if)# ipv6 flow monitor vxlan_nf_v6monitor_input input	Associates the IPv6 flow monitor to the NVE interface for input or output packets.
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuration Examples for VXLAN-Aware Flexible NetFlow

This section provides configuration examples for VXLAN-aware FNF using the following topology:

Figure 1: EVPN VXLAN Topology with VXLAN-Aware Flexible NetFlow
