Configuring Multi-Homing in a BGP EVPN VXLAN Fabric

Restrictions for Multi-Homing in a BGP EVPN VXLAN Fabric

- Multi-homing in all-active redundancy mode is not supported.
- Multi-homing in single-active redundancy mode supports only dual-homing, which allows two nodes within a redundancy group.
- Cross-linking between host or access devices and VTEPs is not supported for a dual-homed network.
- A dual-homed network needs internal redundancy to avoid a network split.
- Provision and operational state of EVPN instances must be consistent on both dual-homed VTEPs. Inconsistencies in configuration or operational state of EVPN instances between the VTEPs leads to traffic blackholing.
- Do not configure EVPN-enabled VLAN and non-EVPN-enabled VLAN on an ethernet segment enabled trunk interface. This is because spanning tree protocol (STP) is disabled at the interface level when an ethernet segment is enabled, and may cause Layer 2 loops in non-EVPN-enabled VLANs.

Information About Multi-Homing in a BGP EVPN VXLAN Fabric

Multi-homing feature in a BGP EVPN VXLAN fabric provides redundancy in the connection between a host or Layer 2 switch and the EVPN VXLAN network.

In a BGP EVPN VXLAN fabric, you connect a host or Layer 2 switch to the EVPN VXLAN network either through single-homing or through multi-homing.

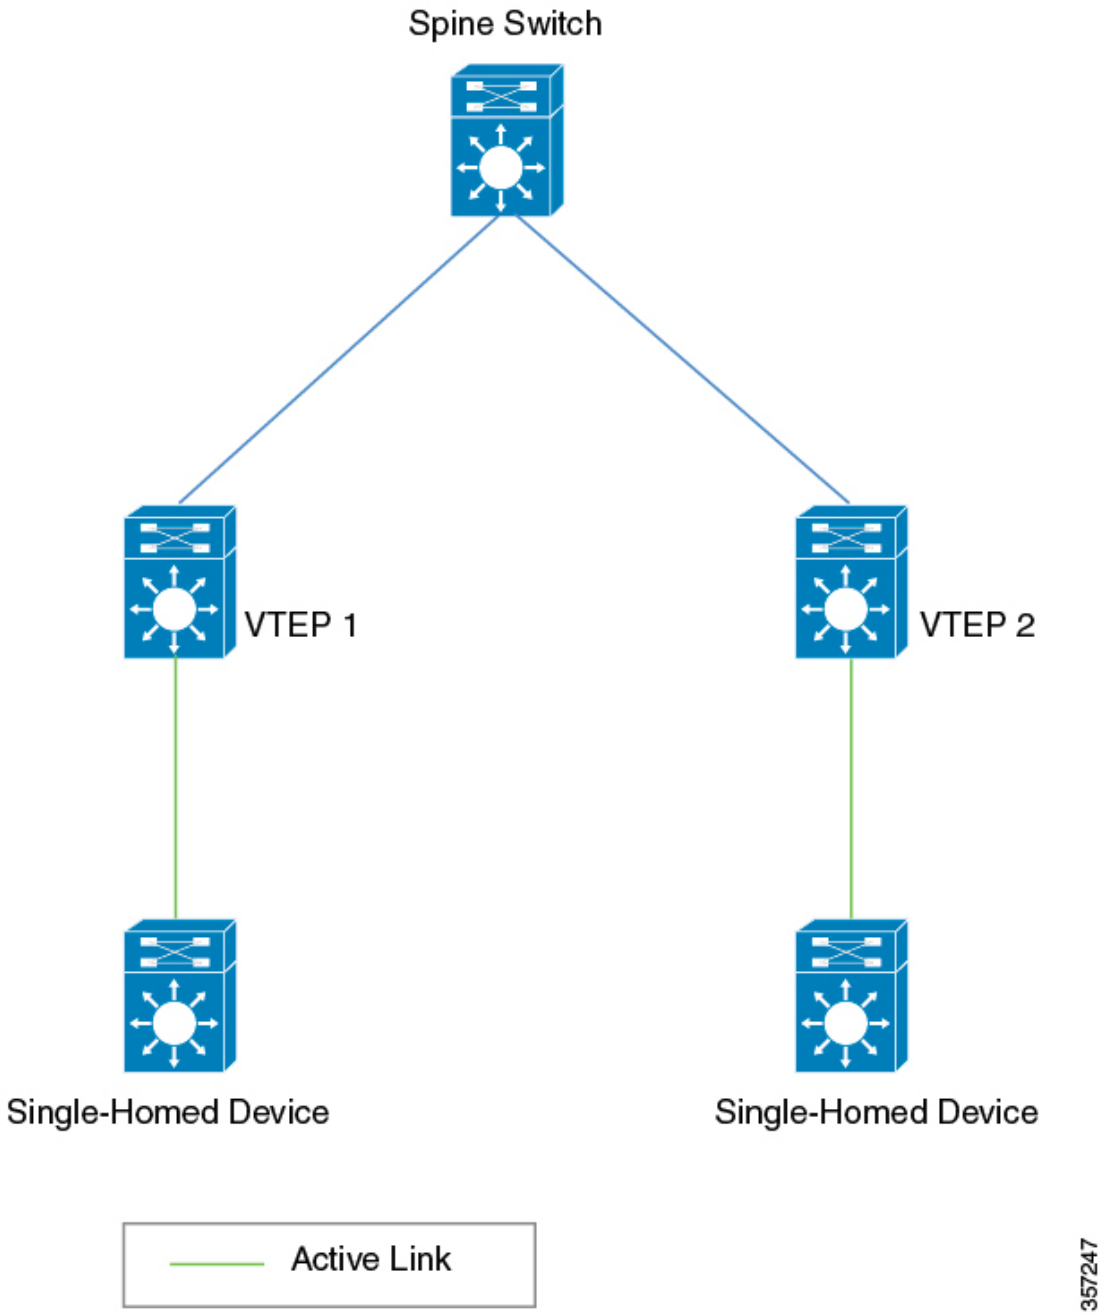
Cisco Catalyst 9000 Series switches support RFC 7432 and RFC 8365 for VXLAN encapsulation-based EVPN multi-homing capabilities.

Single-Homing

Single-homing allows you to connect a host or Layer 2 switch to a single VTEP in the EVPN VXLAN network. Single-homing does not support redundancy in the connection between the host or access device and the VTEP. When the active link breaks down, the connection between the host (or Layer 2 switch) and the VTEP is lost. As a result, single-homed topologies are not always reliable and efficient.

The following figure shows a single-homed topology:

Figure 1: Single-Homed Topology



Multi-Homing

Multi-homing allows you to connect a host or Layer 2 switch to more than one VTEP in the EVPN VXLAN network. This connection provides redundancy and allows network optimization. Redundancy in the connection

with the VTEPs ensures that there's no traffic disruption when there's a network failure. Multi-homed topologies are more reliant, secure, and efficient than single-homed topologies.

Multi-homing operates in single-active and all-active redundancy modes. In both modes, the connected host or access device is represented by an ethernet segment ID. This ethernet segment ID must also be part of the configuration on the VTEP's interface that connects the multihomed host or network device. All traffic forwarded between the VTEPs and the host (or Layer 2 switch) passes through this ethernet segment.

Single-Active Redundancy Mode

In single-active redundancy mode, only a single VTEP, among a group of VTEPs that are attached to a particular Ethernet-segment, is allowed to forward traffic to and from the Ethernet segment. It results in a single-active access link between the VTEPs and the host (or Layer 2 switch) that passes through the Ethernet segment. The single access link can either be a physical link or an ether-channel.

Multi-homing in single-active redundancy mode is supported only in the form of dual-homing. Dual-homing allows a host or access device to be connected to only two VTEPs. A dual-homed topology with single-active redundancy can be deployed in one of the following ways:

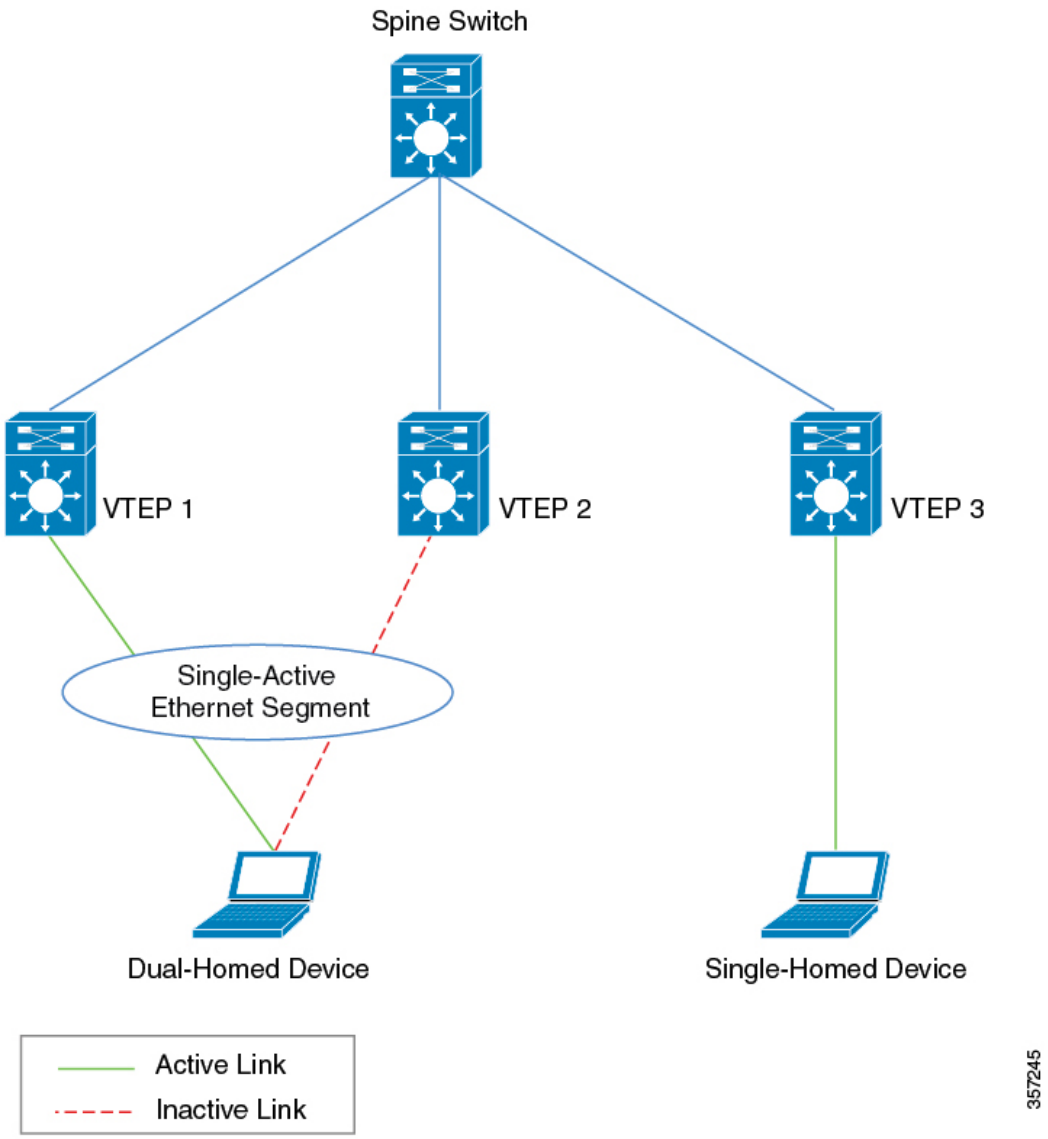
- Dual-homed device
- Dual-homed network

Dual-Homed Device

In single-active dual-homed device topology, a single host or access device is connected to two VTEPs with two links that pass through a single-active Ethernet segment. The Ethernet segment contains two separate links connecting the host or access device to each VTEP, but only one link remains active at any given time. For each VLAN interface on a dual-homed host or access device, only one link remains active. When the active link breaks down, the back-up link takes over and ensures constant connectivity.

The following figure shows a dual-homed device topology:

Figure 2: Dual-Homed Device Topology



Dual-Homed Network

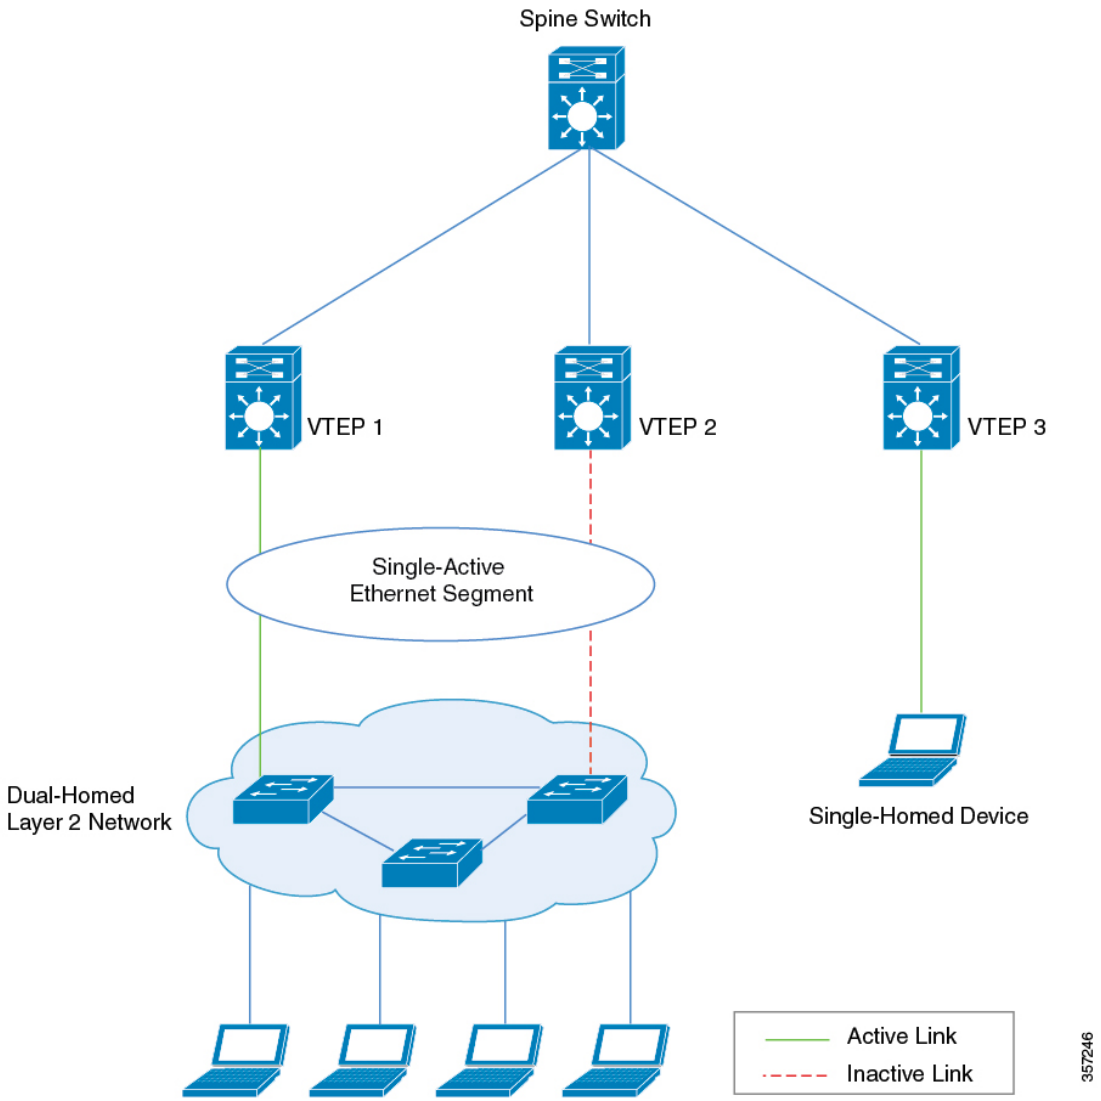
In single-active dual-homed network topology, two host or access devices from the same network are connected to two separate VTEPs through links that pass through a single-active Ethernet segment. At any given time, only one of these links remains active. When the active link breaks down, the back-up link takes over and ensures constant connectivity. The two host or access devices are part of a dual-homed network.

A dual-homed network topology results in a situation where the network splits into two different networks if the connectivity between the host or access devices is lost. To avoid this scenario, redundancy must also be enabled within the dual-homed network.

The following figure shows a dual-homed network topology:

Note Ensure that you enable a spanning tree within the dual-homed Layer 2 network.

Figure 3: Dual-Homed Network Topology



DF Election and Load Balance

A dual-homed network with a single-active Ethernet segment uses a Designated Forwarder (DF) election mechanism to load balance the traffic. The DF election is made at the Layer 2 VNI level, when the access interface from the VTEP is a trunk interface and an Ethernet segment is configured.

In the above topology, some Layer 2 VNIs use the interface connected to VTEP 1 as the active link and the others use the interface connected to VTEP 2 as the active link. This allows effective utilization of bandwidth on both the interfaces in a steady network state. Traffic in each Layer 2 VNI is load balanced for the downstream

dual-homed Layer 2 network. If any of the physical interface link to the downstream Layer 2 device goes down and is not operational, the DF election algorithm recalculates the active link interface. After the link is reestablished and both links are operational again, the DF election algorithm restores the load balancing operation to utilize the bandwidth of both the links effectively.

Migration Between Single-Homed and Multi-Homed Network Topologies

BGP EVPN VXLAN allows you to migrate your network topology from one redundancy mode to another. You can transition from a single-homed topology to a multi-homed topology. Likewise, you can also remove the redundancy from a multi-homed topology to move back to a single-homed topology.

Note When you migrate from one topology to another, ensure you make corresponding changes to the Ethernet segment configuration. If you change either of the two without making corresponding changes to the other, it results in traffic loops and traffic blackholing.

For a sample illustration and detailed steps about how to migrate from a single-homed topology to a single-active dual-homed topology, see Migrating from a Single-Homed Topology to a Single-Active Dual-Homed Topology, on page 9.

For a sample illustration and detailed steps about how to migrate from a single-active dual-homed topology to a single-homed topology, see Migrating from a Single-Active Dual-Homed Topology to a Single-Homed Topology, on page 11.

How to Configure Multi-Homing in a BGP EVPN VXLAN Fabric

Before you configure multi-homing in a BGP EVPN VXLAN fabric, ensure that you configure EVPN VXLAN Layer 2 and Layer 3 overlay networks. See #unique_173 for detailed steps.

Configuring Dual-Homing with Single Active Redundancy in a BGP EVPN VXLAN Fabric

To configure dual-homing with single-active redundancy in a BGP EVPN VXLAN fabric, perform the following set of procedures:

Configuring Redundancy on an Ethernet Segment

To configure redundancy on an ethernet segment, perform the following steps :

Procedure

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. Enter password, if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**l2vpn evpn ethernet-segment** *ethernet-segment-id* **Example:** `Device(config)# l2vpn evpn ethernet-segment 1`	Enters Layer 2 VPN EVPN ethernet segment configuration mode.
Step 4	**identifier type** {**0** *esi-value* | **3 system-mac** *mac-addrress*} **Example:** `Device(config-evpn-es)# identifier type 0 0.0.0.0.0.0.0.0.1`	Configures the ethernet segment identifier type (ESI) and value for the ethernet segment. The following ESI types are supported: • Type 0: This type indicates an arbitrary 9-octet ESI value. The format is 00 + 9-octets of ESI value. • Type 3: This type indicates a MAC-based ESI Value. The format is 03 + system-mac (6 bytes) + value of MAC address (3 bytes).
Step 5	**redundancy** *redundancy-type* **Example:** `Device(config-evpn-es)# redundancy single-active`	Configures the redundancy type for the ethernet segment.
Step 6	**df-election wait-time** *time-period* **Example:** `Device(config-evpn-es)# df-election wait-time 1`	(Optional) Configures the designated forwarder (DF) election wait time for the ethernet segment. The range is 1 to 10 seconds. The default wait time is 3 seconds.
Step 7	**end** **Example:** `Device(config-evpn-es)# end`	Exits Layer 2 VPN EVPN ethernet segment configuration mode and enters privileged EXEC mode.

Associating an Ethernet Segment with an Interface on a VTEP

To associate the ethernet segment with an interface on a VTEP, perform the following steps :

Procedure

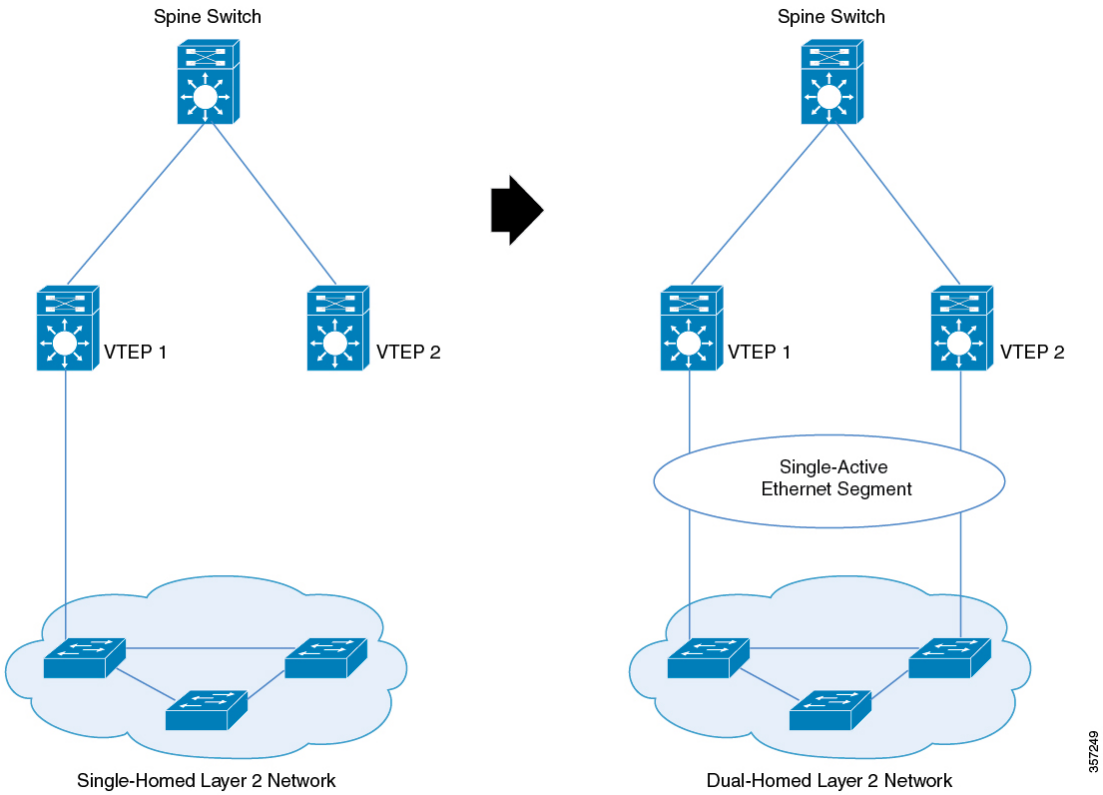
	Command or Action	Purpose
Step 1	**enable** **Example:**	Enters privileged EXEC mode. Enter password, if prompted.

	Command or Action	Purpose
	`Device> enable`	
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *interface-id* **Example:** `Device(config)# interface GigabitEthernet1/0/10`	Specifies the interface, and enters interface configuration mode.
Step 4	**evpn ethernet-segment** *ethernet-segment-id* **Example:** `Device(config-if)# evpn ethernet-segment 1`	Associates the specified Ethernet segment with the interface. Each Ethernet segment is represented by a unique Ethernet segment ID. **Note** Ensure that you configure a unique Ethernet segment ID on any interface. Ensure that you configure the same segment ID on the link that connects the second VTEP and the dual-homed device (the second link through the Ethernet segment).
Step 5	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Migrating from a Single-Homed Topology to a Single-Active Dual-Homed Topology

The following figures illustrate the migration from a single-homed topology to a single-active dual-homed topology:

Figure 4: Migration from a Single-Homed Network to a Single-Active Dual-Homed Network



To migrate from a single-homed network to a single-active dual-homed network, perform the following steps:

Note When you migrate from one topology to another, ensure you make corresponding changes to the Ethernet segment configuration. If you change either of the two without making corresponding changes to the other, it results in traffic loops and traffic blackholing.

1. Before you migrate, we recommend that you do not configure the VTEP as the root bridge of the spanning tree, as the provision of Ethernet segment on the interface of a VTEP excludes it from spanning-tree. If the VTEP is the root bridge, its exclusion from the spanning-tree triggers an immediate spanning tree re-convergence.

Note Do not activate a link between VTEP 2 and a switch in the single-homed network yet. Activate the second only once you configure the Ethernet segment. In case a link is already activated, ensure that you deactivate the link.

2. Provision the Ethernet segment on the interface of the VTEP that has the active link. Provision of the Ethernet segment updates all the MAC addresses that are locally learned on that interface with the Ethernet segment ID of the interface.

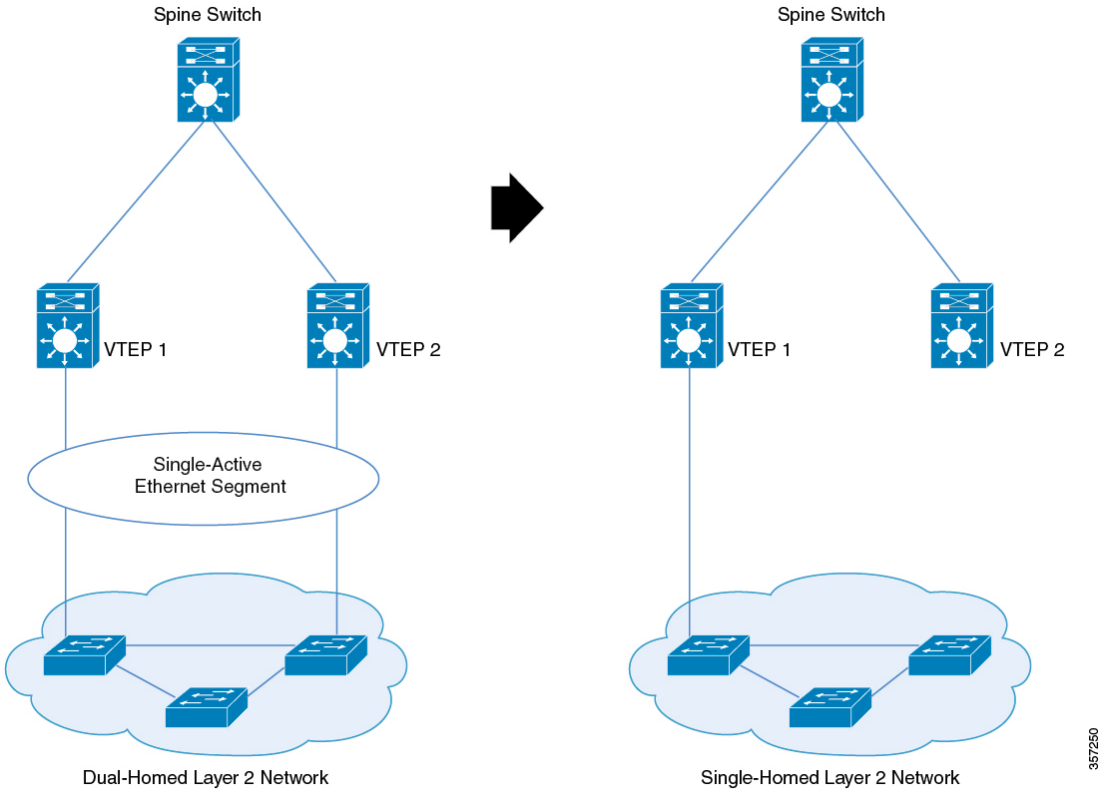
3. Now provision the Ethernet segment on the interface of the second VTEP that needs to be connected to the switch in the single-homed network.
4. Connect the link and bring up the interface of the second VTEP. By doing this, you trigger fast convergence, Ethernet segment auto-discovery, and DF reelection.

   The single-homed network has now migrated to a dual-homed network.

Migrating from a Single-Active Dual-Homed Topology to a Single-Homed Topology

The following figures illustrate the migration from a single-active dual-homed topology to a single-homed topology:

Figure 5: Migration from a Single-Active Dual-Homed Network to a Single-Homed Network



To migrate from a single-active dual-homed network to a single-homed network, perform the following steps:

Note When you migrate from one topology to another, ensure you make corresponding changes to the Ethernet segment configuration. If you change either of the two without making corresponding changes to the other, it results in traffic loops and traffic blackholing.

Note Ensure that the Ethernet segment remains configured on the dual-homed links as long as the links are up. If the Ethernet segment is removed from an active link, it causes traffic loops.

1. Before you migrate, we recommended that you configure portfast on the link you activate. Removal of Ethernet segment from an interface on the VTEP puts it back into the spanning-tree. If the interface is not configured with portfast, the port goes through block-learn-forward states and causes extensive traffic loss.
2. Shut down the interface that needs to be decommissioned. When you shut down the interface, you trigger fast convergence, Ethernet segment auto-discovery, and DF reelection. As a result, all the traffic converges into the active link.
3. Remove the Ethernet segment from the decommissioned interface. Ensure that the interface is down before you disconnect the link.

   The dual-homed network has now migrated to a single-homed network with an Ethernet segment.
4. (Optional) Remove the Ethernet segment from the interface with the active link on the VTEP.

   Removal of the Ethernet segment updates all the MAC addresses that are locally learned on that interface without the Ethernet segment ID.

   The Ethernet segment is now removed from the single-homed network homed network.

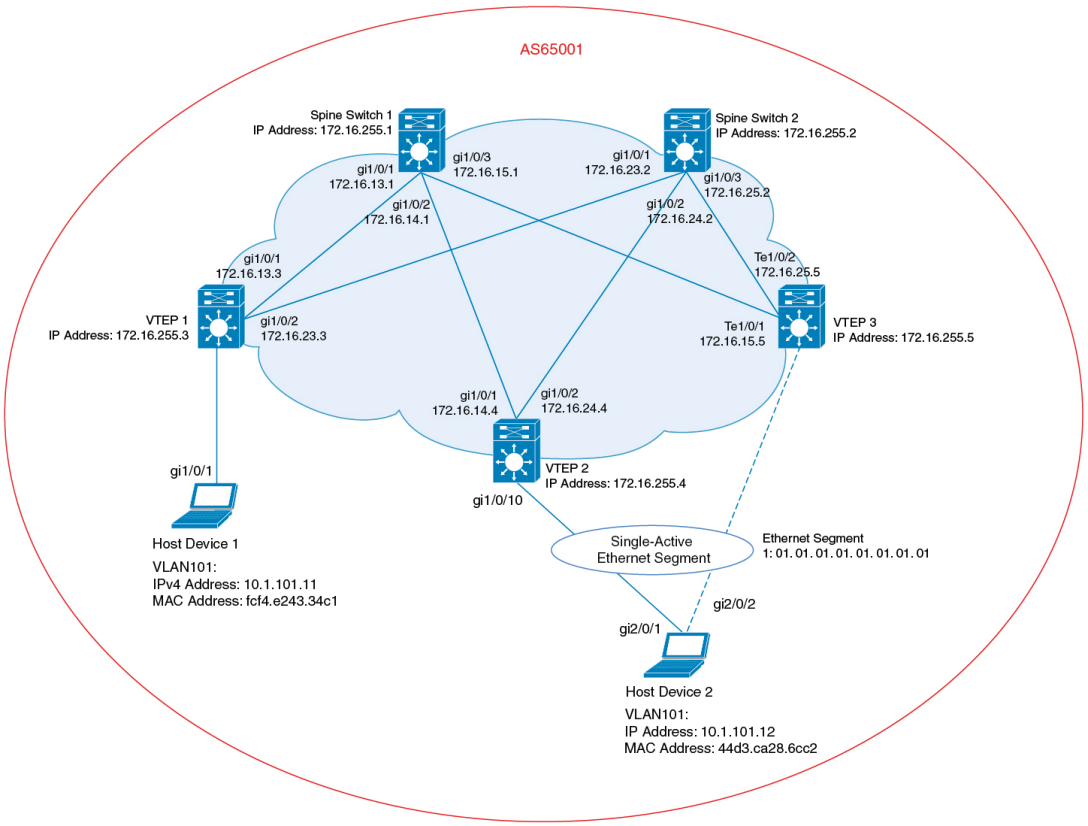
Configuration Examples for Multi-Homing in a BGP EVPN VXLAN Fabric

This section provides configuration examples for multi-homing in a BGP EVPN VXLAN fabric:

Example: Configuring Dual-Homing with Single-Active Redundancy in a BGP EVPN VXLAN Fabric

This example shows how to configure and verify dual-homing with single-active redundancy in a BGP EVPN VXLAN fabric for the following topology:

Figure 6: Dual-Homing with Single-Active Redundancy in a BGP EVPN VXLAN Fabric



The topology shows an EVPN VXLAN network with two spine switches (Spine Switch 1 and Spine Switch 2) and three VTEPs (VTEP 1, VTEP 2, and VTEP 3). Host Device 1 is connected to VTEP 1. Host Device 2 is connected to VTEP 2 and VTEP 3 as a dual-homed single-active connection that passes through Ethernet Segment 1.

Note Ensure that you configure a unique Ethernet segment ID on any interface in the fabric. If an Ethernet segment ID is associated with one of the connecting links passing through the segment, associate the same Ethernet segment ID with the second link.

Note Do not configure a unique Ethernet segment ID per EVPN instance or VLAN or virtual network instance (VNI). For example purpose, EVPN instance 101 is used in the Verifying Dual-Homing with Single-Active Redundancy in a BGP EVPN VXLAN Fabric, on page 18 section.

Spine-01#
```

The following example shows the output for the **show ip route** command on Spine Switch 1:

```
Spine-01# show ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, m - OMP
       n - NAT, Ni - NAT inside, No - NAT outside, Nd - NAT DIA
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       H - NHRP, G - NHRP registered, g - NHRP registration summary
       o - ODR, P - periodic downloaded static route, l - LISP
       a - application route
       + - replicated route, % - next hop override, p - overrides from PfR

Gateway of last resort is not set

      172.16.0.0/16 is variably subnetted, 17 subnets, 2 masks
C        172.16.13.0/24 is directly connected, GigabitEthernet1/0/1

Spine-02#
```

The following example shows the output for the **show ip route** command on Spine Switch 2:

```
Spine-02# show ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, m - OMP
       n - NAT, Ni - NAT inside, No - NAT outside, Nd - NAT DIA
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       H - NHRP, G - NHRP registered, g - NHRP registration summary
       o - ODR, P - periodic downloaded static route, l - LISP
       a - application route
       + - replicated route, % - next hop override, p - overrides from PfR

Gateway of last resort is not set

      172.16.0.0/16 is variably subnetted, 17 subnets, 2 masks
O        172.16.13.0/24
           [110/2] via 172.16.23.3, 05:36:24, GigabitEthernet1/0/1
O        172.16.14.0/24
           [110/2] via 172.16.24.4, 03:37:38, GigabitEthernet1/0/2
O        172.16.15.0/24
           [110/2] via 172.16.25.5, 03:39:11, GigabitEthernet1/0/3
C        172.16.23.0/24 is directly connected, GigabitEthernet1/0/1
L        172.16.23.2/32 is directly connected, GigabitEthernet1/0/1
C        172.16.24.0/24 is directly connected, GigabitEthernet1/0/2
L        172.16.24.2/32 is directly connected, GigabitEthernet1/0/2
C        172.16.25.0/24 is directly connected, GigabitEthernet1/0/3
L        172.16.25.2/32 is directly connected, GigabitEthernet1/0/3
O        172.16.254.3/32
```

```
            [110/2] via 172.16.23.3, 05:36:24, GigabitEthernet1/0/1
O         172.16.254.4/32
            [110/2] via 172.16.24.4, 03:37:28, GigabitEthernet1/0/2
O         172.16.254.5/32
            [110/2] via 172.16.25.5, 03:39:11, GigabitEthernet1/0/3
O         172.16.255.1/32
            [110/3] via 172.16.25.5, 03:39:11, GigabitEthernet1/0/3
            [110/3] via 172.16.24.4, 03:37:38, GigabitEthernet1/0/2
            [110/3] via 172.16.23.3, 05:36:24, GigabitEthernet1/0/1
C         172.16.255.2/32 is directly connected, Loopback0
O         172.16.255.3/32
            [110/2] via 172.16.23.3, 05:36:24, GigabitEthernet1/0/1
O         172.16.255.4/32
            [110/2] via 172.16.24.4, 03:37:34, GigabitEthernet1/0/2
O         172.16.255.5/32
            [110/2] via 172.16.25.5, 03:39:11, GigabitEthernet1/0/3
