

Configuring Interface Templates

The following sections provide information about Interface Templates and how to configure and bind Interface Templates to a target:

- [Restrictions for Interface Templates, on page 1](#)
- [Information About Interface Templates, on page 1](#)
- [How to Configure Interface Templates, on page 4](#)
- [Configuration Examples for Interface Templates, on page 12](#)
- [Feature History for Interface Templates, on page 13](#)

Restrictions for Interface Templates

- Remote storing and downloading of templates is not supported.
- To dynamically bind an interface template, the interface template with the same name as referred by AAA Authorization has to be configured on the device.

Information About Interface Templates

This section describes an interface template, its types and usage.

Interface Template Overview

An interface template is a container of configurations or policies that can be applied to specific ports. When an interface template is applied to an access port, it impacts all traffic that is exchanged on the port.

There are two types of interface templates; user and builtin templates. Builtin templates are created by the system.

You can modify builtin templates. If you delete a modified builtin template, the system restores the original definition of the template.

The following are the available builtin templates:

- AP_INTERFACE_TEMPLATE (Access Point)
- DMP_INTERFACE_TEMPLATE (Digital Media Player)

- IP_CAMERA_INTERFACE_TEMPLATE
- IP_PHONE_INTERFACE_TEMPLATE
- LAP_INTERFACE_TEMPLATE (Lightweight Access Point)
- MSP_CAMERA_INTERFACE_TEMPLATE
- MSP_VC_INTERFACE_TEMPLATE (Video Conferencing)
- PRINTER_INTERFACE_TEMPLATE
- ROUTER_INTERFACE_TEMPLATE
- SWITCH_INTERFACE_TEMPLATE
- TP_INTERFACE_TEMPLATE (TelePresence)

Following is an example of a builtin interface template:

```

Template Name       : IP_CAMERA_INTERFACE_TEMPLATE
Modified           : No
Template Definition :
  spanning-tree portfast
  spanning-tree bpduguard enable
  switchport mode access
  switchport block unicast
  switchport port-security
  mls qos trust dscp
  srr-queue bandwidth share 1 30 35 5
  priority-queue out
!
```

You can also create specific user templates with the commands that you want to include.

Note The template name must not contain spaces.

You can create an interface template using the **template** command in global configuration mode. In template configuration mode, enter the required commands. The following commands can be entered in template configuration mode:

Command	Description
access-session	Configures access session-specific interface commands. This is applicable to Identity-Based Networking Services (IBNS) 2.0
authentication	Configures authentication manager Interface Configuration commands. This is applicable to IBNS1.0
carrier-delay	Configures delay for interface transitions.
default	Sets a command to its defaults.
description	Configures interface-specific description.

Command	Description
dot1x	Configures interface configuration commands for IEEE 802.1X.
ip	Configures IP template.
keepalive	Enables keepalive.
load-interval	Specifies interval for load calculation for an interface.
mab	Configures MAC authentication bypass Interface.
peer	Configures peer parameters for point to point interfaces.
service-policy	Configures CPL service policy.
source	Gets configurations from another source.
spanning-tree	Configures spanning tree subsystem
storm-control	Configures storm control.
subscriber	Configures subscriber inactivity timeout value.
switchport	Sets switching mode configurations

Note System builtin templates aren't displayed in the running configuration. These templates show up in the running configuration only if you edit them.

Binding an Interface Template to a Target

Each template can be bound to a target, like an interface or a sub-interface. A template can be attached to a target either statically or dynamically. Static binding of a template involves binding the template to a target, like an interface. Only one template can be bound at a time using static binding. Static binding of another template to the same target will unbind the previously bound template. To configure static binding, use the **source template** command in interface configuration mode.

Any number of templates can be bound dynamically to a target. To configure dynamic binding using builtin policy maps and parameter maps, enable the Autoconf feature using the **autoconf enable** command.

Note You can have statically and dynamically bound templates on the same interface at a time.

Priority for Configurations Using Interface Templates

Configuration applied through dynamically-bound templates has the highest priority, followed by configuration applied directly on the interface, and then configuration applied through statically-bound templates. When similar commands are present at different priority levels, the one at the highest priority is applied. If a

configuration at a higher priority level is not applied, then the configuration with the next highest priority is applied to the target.

Multiple templates can be dynamically bound to a target. When multiple templates are dynamically bound, the template that is applied last has the highest priority.

To delete a template, you must remove the binding to all targets. If you bind a template that does not exist, a new template is created with no configurations.

How to Configure Interface Templates

Perform the following tasks to configure a user interface template and bind it to a target.

Configuring Interface Templates

Perform the following task to create user interface templates:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	template <i>name</i> Example: Device(config)# template user-template1	Creates a user template and enters template configuration mode. Note Builtin templates are system-generated.
Step 4	load-interval <i>interval</i> Example: Device(config-template)# load-interval 60	Configures the sampling interval for statistics collections on the template. Note Builtin templates are system-generated.
Step 5	description <i>description</i> Example: Device(config-template)# description This is a user template	Configures the description for the template.

	Command or Action	Purpose
Step 6	keepalive <i>number</i> Example: Device(config-template)# Keepalive 60	Configures the keepalive timer.
Step 7	end Example: Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

Configuring Static Binding for Interface Templates

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Device(config)# interface GigabitEthernet 1/0/12	Specifies the interface type and number and enters interface configuration mode.
Step 4	source template <i>name</i> Example: Device(config-if)# source template user-templatel	Statically applies an interface template to a target.
Step 5	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Example

To verify static binding use the **show running-config interface** *int-name* and the **show derived-config interface** *int-name* commands.

```
Device# show running-config interface GigabitEthernet 1/0/12
Building configuration...

Current configuration : 71 bytes
!
interface GigabitEthernet1/0/12
source template user-templ1
end

Device# show derived-config interface GigabitEthernet 1/0/12
Building configuration...

Derived configuration : 108 bytes
!
interface GigabitEthernet1/0/12
description This is a user template
load-interval 60
keepalive 60
end
```

Configuring Dynamic Binding of Interface Templates

To configure dynamic binding of interface templates, perform the following tasks:

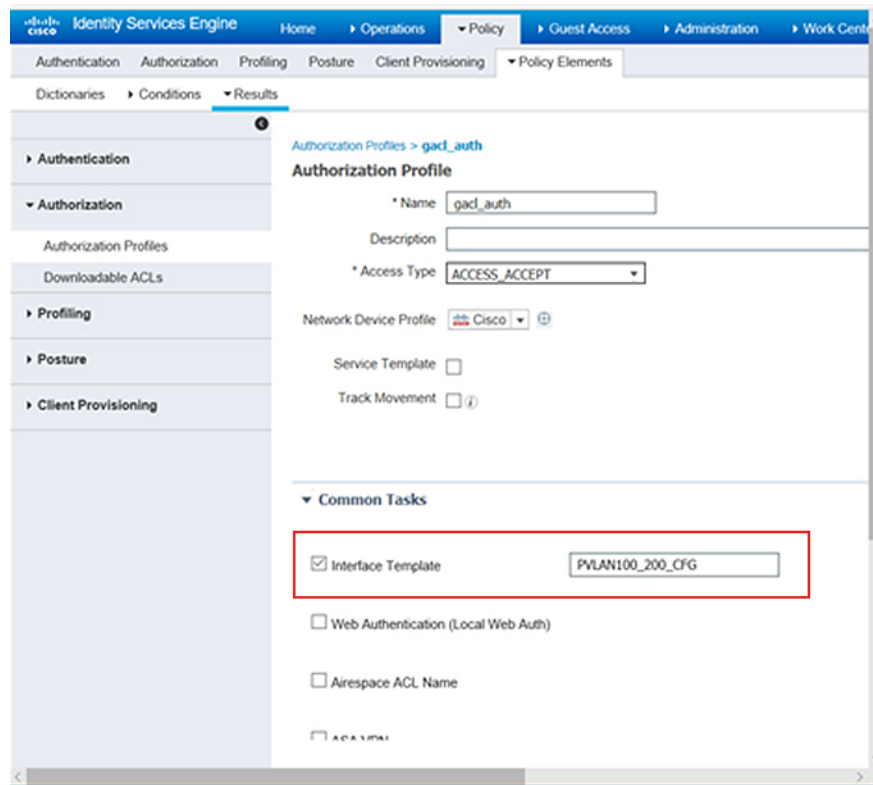

Before you begin

Ensure that 802.1x port-based authentication is configured on the device. When you are using the ISE server to download and assign a template that includes **switchport mode** and vlan change commands, the **access-session interface-template sticky** command is used, which is available only in IBNS 2.0. Hence, VLAN changes using a template require IBNS 2.0.

Procedure

-
- Step 1** Create a template on the device, as specified in the [Configuring Interface Templates, on page 4](#) procedure.
- Step 2** Configure the Identity Services Engine (ISE) or any other RADIUS server to download the template name to the device interface. The template is assigned after the device is authenticated successfully.
- If you're using ISE, go to the **Policy > Policy Elements > Authorization > Authorization Profile** page.
- Check the **Interface Template** check box and enter the name of the template to be assigned to the client interface.

Figure 1: Configure ISE to Assign Interface Template

If you're using a different RADIUS server, configure the attribute **Cisco-AVpair="interface:template=name"** with the name of the template. This configuration pushes the template to the device after the initial client authentication is completed.

- Step 3** To verify that the template name is downloaded to the interface, use the **show authentication sessions interface interface-id details** or **show access-session interface interface-id details** command. To verify that the interface template commands are applied to the interface, use the **show derived-config interface interface-id** command.

Example

The following example shows how to verify that a template named `del_template` is downloaded and applied to the `TwentyFiveGigE1/0/3` interface on the device:

```
Device# show running-config | section del_template
template del_template
access-session port-control auto
no access-session monitor
authentication periodic

Device# show authentication sessions interface tw1/0/3 details
Interface: TwentyFiveGigE1/0/3
IIF-ID: 0x1F9EBBA9
MAC Address: 002f.0100.0001
IPv6 Address: Unknown
IPv4 Address: Unknown
```

```

User-Name: NOAS
Device-type: Un-Classified Device
Device-name: Unknown Device
Status: Authorized
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both
Session timeout: N/A
Common Session ID: 0404140B00004E1C6E569E0B
Acct Session ID: Unknown
Handle: 0xdb000e24
Current Policy: DOT1x

Server Policies:
Interface Template: del_template

Method status list:
Method State
dot1x Authc Success

Device# show derived-config interface tw1/0/3
Building configuration...

Derived configuration : 321 bytes
!
interface TwentyFiveGigE1/0/3
switchport access vlan 44
switchport mode access
switchport port-security violation restrict
switchport port-security
authentication periodic
access-session port-control auto
no access-session monitor
mab
dot1x pae authenticator
service-policy type control subscriber DOT1x
end

```

Verifying Interface Templates

Use one or more of the commands listed below to verify the interface template configuration.

Table 1: Show commands to verify Interface Template Configuration

Command	Purpose
show template interface all {all binding {temp-name all target int-name} brief }	Shows all interface template configurations.
show template interface source {built-in [original] user} {temp-name all}	Shows interface template source configurations.
show template service {all binding target int-name brief source {aaa built-in user {temp-name all}}	Shows all interface template service configurations.

Example: Verifying Interface User Template

```

Device# show template interface source user all
  Template Name : TEST-1
  Template Definition:
  load-interval 60
  description TEST_1_TEMPLATE
  keepalive 200
  !
  Template Name : TEST-2
  Template Definition:
  load-interval 60
  description TEST-1_TEMPLATE
  keepalive 200

```

Example: Verifying all Builtin Templates

```

Device# show template interface source built-in all

Building configuration...

```

Example: Verifying Interface Template Binding for all templates

```

Device# show template interface binding all
    
```

Template-name	Source	Method	Interface
IP_PHONE_INTERFACE_TEMPLATE	Built-in	Dynamic	Gi1/0/1, Gi1/0/2, Gi1/0/3 Gi1/0/4, Gi1/0/5, Gi1/0/6 Gi1/0/7, Gi1/0/8, Gi1/0/9 Gi1/0/10, Gi1/0/11, Gi1/0/12 Gi1/0/13, Gi1/0/14, Gi1/0/15 Gi1/0/16, Gi1/0/17, Gi1/0/18 Gi1/0/19, Gi1/0/20, Gi1/0/21 Gi1/0/22, Gi1/0/23, Gi1/0/24 Gi1/1/1, Gi1/1/2, Gi1/1/3
IP_PHONE_INTERFACE_TEMPLATE	Built-in	Static	Gi4/0/4

Example: Verifying Static Template Binding for a Target Interface

```

Device# show template interface binding target GigabitEthernet 1/0/4
    
```

Interface	Method	Source	Template
Gi1/0/4	Dynamic	built-in	IP_PHONE_INTERFACE_TEMPLATE
	Static	user	TEST
	Dynamic	Modified-built-in	TEST

Example: Verifying Dynamic Template Binding for all templates

```

Device# show template service all

User-defined template:
=====

Template Name      : SVC-1
Template Definition:
vlan 100
    
```

```

access-group acl1

built-in template:
=====

Template Name      : SVC-2
Template Definition:
vlan 100
access-group acl1

aaa downloaded template:
=====

Template Name      : SVC-2
Template Definition:
vlan 100
access-group acl1

```

Example: Verifying Template Binding for a Target Interface

```
Device# show template binding target GigabitEthernet 1/0/4
```

```

Interface Templates:
  Interface          method          Source          Template
  =====          =
  Gi1/0/4            Dynamic         built-in        IP_PHONE_INTERFACE_TEMPLATE
                   Static          user            TEST
                   Dynamic         Modified-built-in TEST

Service Templates:
  Template           Source          Session-Mac
  =====          =
  SVC1               user           aa-bb-cc-dd-ee-ff
  SVC2               built-in       ab-ab-ab-ab-ab-ab
  SVC3               aaa            ac-ac-ac-ac-ac-ac

```

Configuration Examples for Interface Templates

Example: Configuring User Interface Templates

Example: Configuring User Templates

```

Device# enable
Device (config)# configure terminal
Device (config)# template user-templatel
Device (config-template)# load-interval 60
Device (config-template)# description This is a user template
Device (config-template)# Keepalive 60
Device (config)# end

```

Example: Sourcing Interface Templates

```

Device> enable
Device# configure terminal
Device (config)# interface fastethernet 4/0/0

```

```
Device(config-if)# source template user-templ1
Device(config-if)# end
```

Example: Dynamically Binding Interface Templates

Configure a template on the device:

```
Device# configure terminal
Device(config)# tempalte user_template
Device(config-template)# access-session port-control auto
Device(config-template)# no access-session monitor
Device(config-template)# authentication periodic
```

Configure RADIUS Server attribute with the template name:

```
Cisco-AVpair="interface:template=user_template"
```

Feature History for Interface Templates

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	Interface Templates	An interface template provides a mechanism to configure multiple commands at the same time and associate it with a target such as an interface.
Cisco IOS XE Bengaluru 17.5.1	Interface Templates - cts manual command	The command cts manual was introduced. It can be configured in the template configuration mode.
Cisco IOS XE Cupertino 17.7.1	Interface Templates	Support for this feature was introduced on Cisco Catalyst 9600 Series Supervisor 2 Module (C9600X-SUP-2).

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>.
