## Cisco Bug Search Tool

[Cisco Bug Search Tool](#) (BST) is a gateway to the Cisco bug-tracking system, which maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. The BST provides you with detailed defect information about your products and software.

## Documentation Feedback

To provide feedback about Cisco technical documentation, use the feedback form available in the right pane of every online document.

# Bias Free Language

## MODBUS Protocol

Modicon Communication Bus (MODBUS) is an application layer protocol for client-server communication between a switch (server) and a device in the network running MODBUS client software (client). You can use MODBUS over a serial line to connect a computer to a remote terminal unit (RTU) in supervisory control and data acquisition (SCADA) systems.

MODBUS also runs on Ethernet TCP/IP networks. Use MODBUS TCP over an Ethernet network when connecting the switch to devices such as intelligent electronic devices (IEDs), distributed controllers, substation routers, IP phones, Wireless Access Points, and other network devices such as redundant substation switches.

The client can be an IED or a human machine interface (HMI) application that remotely configures and manages devices running MODBUS TCP. The switch functions as the server.

The switch encapsulates a request or response message in a MODBUS TCP application data unit (ADU). A client sends a message to a TCP port on the switch.

---

**Note** MODBUS is supported only on standalone Cisco Catalyst IE9300 Rugged Series Switches.

---

## Cisco Catalyst IE9300 MODBUS TCP Registers

This document lists the read-only registers for IE9300 switches. MODBUS clients use them to communicate with a MODBUS server (the switch). There are no writable registers.

### System Information Registers

Address spaces 0x0800 through 0x0FFF are system information read-only registers. These 2048 registers are accessible by MODBUS function code 0x03 Read Multiple Registers.

**Table 1: System Information Registers**

Address	Number of Registers	Description	R/W	Format
0x0800	64	Product ID	R	Text
0x0840	64	Software image name	R	Text
0x0880	64	Software image version	R	Text
0x08C0	64	Host Name	R	Text
0x0900	1	Number of Gigabit Ethernet ports	R	Uint 16
0x0901	1	Number of 10 Gigabit Ethernet ports	R	Uint 16
0x0902	1	Number of power supplies	R	Uint 16
0x0903	1	Power supply 1 status	R	Uint 16
0x0904	1	Power supply 2 status	R	Uint 16
0x0905	1	System or sensor ID 0 temperature	R	Uint 16

### Port Information Registers

Address spaces 0x1000 through 0x3FFF are port information read-only registers. These 12,000 registers are accessible by MODBUS function code 0x03 Read Multiple Registers. They are updated every time upon receiving a read request to the register(s).

The following table shows the memory map for all interface registers, with 64-bit counters (Address space 0x1000 through 0x2FFF, 8,000 registers).

**Table 2: Values for Getting Generic Port Information**

Address	Number of Registers	Description	R/W	Format
0x1000	64	LAN Port 1 name	R	Text
0x1040	64	LAN Port 2 name	R	Text
0x1080	64	LAN Port 3 name	R	Text
0x10C0	64	LAN Port 4 name	R	Text
0x1100	64	LAN Port 5 name	R	Text

Address	Number of Registers	Description	R/W	Format
0x1140	64	LAN Port 6 name	R	Text

## Interpreting the Port State Value

This section provides information for determining the port state.

In the following table, the upper byte represents the interface state, and the lower byte represents the line protocol state.

Address	Description	Value
0x1700 to 0x171B	Port state information	Upper byte: <ul style="list-style-type: none"> <li>• 0x0: Interface is down</li> <li>• 0x1: Interface is going down</li> <li>• 0x2: Interface is in the initializing state</li> <li>• 0x3: Interface is coming up</li> <li>• 0x4: Interface is up and running</li> <li>• 0x5: Interface is reset by the user</li> <li>• 0x6: Interface is shut down by the user</li> <li>• 0x7: Interface is being deleted</li> </ul>
		The lower byte: <ul style="list-style-type: none"> <li>• 0x0: Line protocol state is down</li> <li>• 0x1: Line protocol state is up</li> </ul>

## Configure MODBUS

The MODBUS TCP server listens for MODBUS client requests on TCP port 502 by default. Port 502 is enabled when MODBUS server is started unless you configure a different port for MODBUS communications. The MODBUS server is disabled by default.

**Note** MODBUS is supported only on standalone Cisco Catalyst IE9300 Rugged Series Switches.

To configure MODBUS:

### Before you begin

If a firewall or other security services are enabled, the switch TCP port might be blocked, and the switch and the client cannot communicate. If a firewall and other security services are disabled, a denial-of-service attack might occur on the switch. To add security when using MODBUS TCP, configure an ACL to permit traffic from specific clients or configure QoS to rate-limit traffic.

**Step 1** Enter global configuration mode:  
**configure terminal**

**Step 2** Enable MODBUS TCP on the switch:

**scada modbus tcp server**

To disable MODBUS on the switch and return to the default settings, enter the **no scada modbus tcp server** global configuration command.

The system displays a message to warn you that starting the MODBUS TCP server is a security risk:

*WARNING: Starting Modbus TCP server is a security risk. Please understand the security issues involved before proceeding further. Do you still want to start the server? [yes/no]:*

**Step 3** Enter **yes** to confirm that you understand the security issues and to proceed with starting the server.

**Step 4** (Optional) Set the TCP port to which clients send messages:

**scada modbus tcp server port** *tcp-port-number*

The range for *tcp-port-number* is 1 to 65535. The default is 502.

**Step 5** (Optional) Set the number of simultaneous connection requests sent to the switch:

**scada modbus tcp server connection** *connection-requests*

The range for *connection-requests* is 1 to 5. The default is 1.

**Step 6** Return to privileged EXEC mode:

**end**

**Example**

```
Switch# configure terminal
Switch(config)# scada modbus tcp server
WARNING: Starting Modbus TCP server is a security risk. Please understand the security
issues involved
before proceeding further. Do you still want to start the server? [yes/no]: y
Switch(config)# end
```

## Displaying MODBUS Commands

Use the commands listed below to display information for MODBUS TCP.

Command	Purpose
show scada modbus tcp server	Displays the server information and statistics
show scada modbus tcp server connections	Shows information and statistics for each client connection
clear scada modbus tcp server statistics	Clears all the statistics for the Modbus server, including statistics for each client connection

The following is an example of the **show scada modbus tcp server** command and its output:

```
Switch# show scada modbus tcp server
Summary: enabled, running, process id 142
```

```
Conn Stats: listening on port 801, 4 max simultaneous connections
             0 current client connections
             0 total accepted connections, 0 accept connection errors
             0 closed connections, 0 close connection errors
Send Stats: 0 tcp msgs sent, 0 tcp bytes sent, 0 tcp errors
             0 responses sent, 0 exceptions sent, 0 send errors
Recv Stats: 0 tcp msgs received, 0 tcp bytes received, 0 tcp errors
             0 requests received, 0 receive errors
```

## Feature History

The following table provides release and related information for the features that are documented in this guide. The features are available in all the releases after the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Dublin 17.12.1	MODBUS	Beginning in this release, Cisco Catalyst IE9300 Rugged Series Switches are supported for Modicon Communication Bus (MODBUS).
