

Cisco Compute Hyperconverged with Nutanix in Intersight Standalone Mode

Design and Deployment Guide

Published: May 2024

About the Cisco Validated Design Program

The Cisco Validated Design (CVD) program consists of systems and solutions designed, tested, and documented to facilitate faster, more reliable, and more predictable customer deployments. For more information, go to: <http://www.cisco.com/go/designzone>.

Executive Summary

Application modernization is the foundation for digital transformation, enabling organizations to integrate advanced technologies. The key technologies include AI, IoT, cloud computing, and data analytics. Once integrated, these technologies enable businesses take advantage of digital innovations and identify opportunities for growth. These applications are diverse, distributed across geographies and deployed across data centers, edge and remote sites. For instance, new AI workloads, demand modern infrastructure to make inferences in branch offices, in retail locations, or at the network edge. The key challenge for IT Administrators is how to quickly deploy and manage infrastructure at scale, whether with many servers at a core data center or with many dispersed locations.

Hyperconverged Infrastructure (HCI) is the solution to many of today's challenges because it offers built-in data redundancy and a smooth path to scaling up computing and storage resources as your needs grow.

The Cisco Compute Hyperconverged (CCHC) with Nutanix (Cisco HCI with Nutanix) solution helps you overcome the challenge of deploying on a global scale with an integrated workflow. The solution uses Cisco Intersight® to deploy and manage physical infrastructure, and Nutanix Prism Central to manage your hyperconverged environment. Cisco and Nutanix engineers have tightly integrated our tools through APIs, establishing a joint cloud-operating model.

Whether it is at the core, edge or remote site, Cisco HCI with Nutanix provides you with a best in class solution, enabling zero touch accelerated deployment through automated workflows, simplified operations with an enhanced solution-support model combined with proactive, automated resiliency, secure cloud-based management and deployment through Cisco Intersight and enhanced flexibility with choice of compute and network infrastructure

This Cisco Validated Design and Deployment Guide provides prescriptive guidance for the design, setup, and configuration to deploy Cisco Compute Hyperconverged with Nutanix in Intersight Standalone mode allowing nodes to be connected to a pair of Top-of-Rack (ToR) switches and servers are centrally managed using Cisco Intersight®.

For more information on Cisco Compute for Hyperconverged with Nutanix, go to: <https://www.cisco.com/go/hci>

Solution Overview

This chapter contains the following:

- [Audience](#)
- [Purpose of this Document](#)
- [Solution Summary](#)

Audience

The intended audience for this document includes sales engineers, field consultants, professional services, IT managers, partner engineering staff, and customers deploying Cisco Compute Hyperconverged Solution with Nutanix. External references are provided wherever applicable, but readers are expected to be familiar with Cisco Compute, Nutanix, plus infrastructure concepts, network switching and connectivity, and the security policies of the customer installation.

Purpose of this Document

This document describes the design, configuration, deployment steps for Cisco Compute Hyperconverged with Nutanix in Intersight Standalone Mode (ISM)

Solution Summary

The Cisco Compute Hyperconverged with Nutanix family of appliances delivers pre-configured UCS servers that are ready to be deployed as nodes to form Nutanix clusters in a variety of configurations. Each server appliance contains three software layers: UCS server firmware, hypervisor (Nutanix AHV), and hyperconverged storage software (Nutanix AOS).

Physically, nodes are deployed into clusters, with a cluster consisting of Cisco Compute Hyperconverged All-Flash Servers. Clusters support a variety of workloads like virtual desktops, general-purpose server virtual machines in edge, data center and mission-critical high-performance environments. Nutanix clusters can be scaled out to the max cluster server limit documented by Nutanix. The minimum depends on the management mode. These servers can be interconnected and managed in two different ways:

UCS Managed mode: The nodes are connected to a pair of Cisco UCS® 6400 Series or a pair of Cisco UCS 6500 Series fabric interconnects and managed as a single system using UCS Manager. The minimum number of nodes in such a cluster is three. These clusters can support both general-purpose deployments and mission-critical high-performance environments.

Intersight Standalone mode: The nodes are connected to a pair of Top-of-Rack (ToR) switches and servers are centrally managed using Cisco Intersight®. While a minimum of three nodes are required to deploy a standard Nutanix cluster, we also offer an option to deploy a single node cluster and a two-node cluster for Edge and branch locations and situations that already have a high-performance network fabric installed.

The present solution elaborates on design and deployment details to deploy Cisco C-Series nodes for Nutanix configured in Intersight Standalone Mode.

Technology Overview

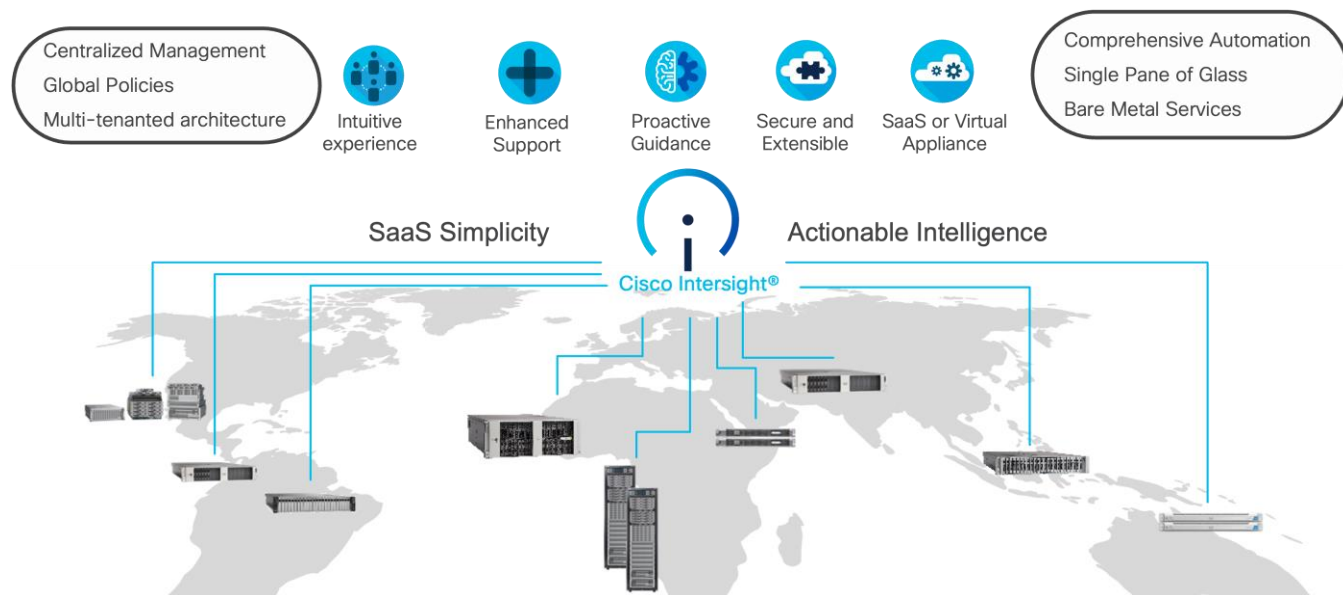

This chapter contains the following:

- [Cisco Intersight Platform](#)
- [Cisco Compute Hyperconverged HClAF240C M7 All-NVMe/All-Flash Servers](#)

The components deployed in this solution are configured using best practices from both Cisco and Nutanix to deliver an enterprise-class data protection solution deployed on Cisco UCS C-Series Rack Servers. The following sections provide a summary of the key features and capabilities available in these components.

Cisco Intersight Platform

As applications and data become more distributed from core data center and edge locations to public clouds, a centralized management platform is essential. IT agility will be a struggle without a consolidated view of the infrastructure resources and centralized operations. Cisco Intersight provides a cloud-hosted, management and analytics platform for all Cisco Compute for Hyperconverged, Cisco UCS, and other supported third-party infrastructure deployed across the globe. It provides an efficient way of deploying, managing, and upgrading infrastructure in the data center, ROBO, edge, and co-location environments.

Cisco Intersight provides:

- No Impact Transition: Embedded connector (Cisco HyperFlex, Cisco UCS) will allow you to start consuming benefits without forklift upgrade.
- SaaS/Subscription Model: SaaS model provides for centralized, cloud-scale management and operations across hundreds of sites around the globe without the administrative overhead of managing the platform.
- Enhanced Support Experience: A hosted platform allows Cisco to address issues platform-wide with the experience extending into TAC supported platforms.
- Unified Management: Single pane of glass, consistent operations model, and experience for managing all systems and solutions.
- Programmability: End to end programmability with native API, SDK's and popular DevOps toolsets will enable you to deploy and manage the infrastructure quickly and easily.

- Single point of automation: Automation using Ansible, Terraform, and other tools can be done through Intersight for all systems it manages.
- Recommendation Engine: Our approach of visibility, insight and action powered by machine intelligence and analytics provide real-time recommendations with agility and scale. Embedded recommendation platform with insights sourced from across Cisco install base and tailored to each customer.

For more information, go to the Cisco Intersight product page on cisco.com.

Cisco Intersight Virtual Appliance and Private Virtual Appliance

In addition to the SaaS deployment model running on Intersight.com, you can purchase on-premises options separately. The Cisco Intersight virtual appliance and Cisco Intersight private virtual appliance are available for organizations that have additional data locality or security requirements for managing systems. The Cisco Intersight virtual appliance delivers the management features of the Cisco Intersight platform in an easy-to-deploy VMware Open Virtualization Appliance (OVA) or Microsoft Hyper-V Server virtual machine that allows you to control the system details that leave your premises. The Cisco Intersight private virtual appliance is provided in a form factor designed specifically for users who operate in disconnected (air gap) environments. The private virtual appliance requires no connection to public networks or to Cisco network.

Licensing Requirements

The Cisco Intersight platform uses a subscription-based license with multiple tiers. You can purchase a subscription duration of 1, 3, or 5 years and choose the required Cisco UCS server volume tier for the selected subscription duration. Each Cisco endpoint automatically includes a Cisco Intersight Base license at no additional cost when you access the Cisco Intersight portal and claim a device. You can purchase any of the following higher-tier Cisco Intersight licenses using the Cisco ordering tool:

- Cisco Intersight Essentials: Essentials includes all the functions of the Base license plus additional features, including Cisco UCS Central software and Cisco Integrated Management Controller (IMC) supervisor entitlement, policy-based configuration with server profiles, firmware management, and evaluation of compatibility with the Cisco Hardware Compatibility List (HCL).
- Cisco Intersight Advantage: Advantage offers all the features and functions of the Base and Essentials tiers. It also includes storage widgets and cross-domain inventory correlation across compute, storage, and virtual environments (VMware ESXi). OS installation for supported Cisco UCS platforms is also included.

Servers in the Cisco Intersight managed mode require at least the Essentials license. For more information about the features provided in the various licensing tiers, go to:

https://www.intersight.com/help/saas/getting_started/licensing_requirements

Cisco Compute Hyperconverged HClAF240C M7 All-NVMe/All-Flash Servers

The Cisco Compute Hyperconverged HClAF240C M7 All-NVMe/All-Flash Servers extends the capabilities of Cisco's Compute Hyperconverged portfolio in a 2U form factor with the addition of the 4th Gen Intel® Xeon® Scalable Processors (codenamed Sapphire Rapids), 16 DIMM slots per CPU for DDR5-4800 DIMMs with DIMM capacity points up to 256GB.

The All-NVMe/all-Flash Server supports 2x 4th Gen Intel® Xeon® Scalable Processors (codenamed Sapphire Rapids) with up to 60 cores per processor. With memory up to 8TB with 32 x 256GB DDR5-4800 DIMMs, in a 2-socket configuration. There are two servers to choose from:

- HClAF240C-M7SN with up to 24 front facing SFF NVMe SSDs (drives are direct-attach to PCIe Gen4 x2)
- HClAF240C-M7SX with up to 24 front facing SFF SAS/SATA SSDs

For more details, go to: [HCIAF240C M7 All-NVMe/All-Flash Server specification sheet](#)

Figure 1. Front View: HCIAF240C M7 All-NVMe/All-Flash Servers

Reference Architecture

This chapter contains the following:

- [Deployment Architecture](#)
- [Licensing](#)
- [Software Components](#)

Deployment Architecture

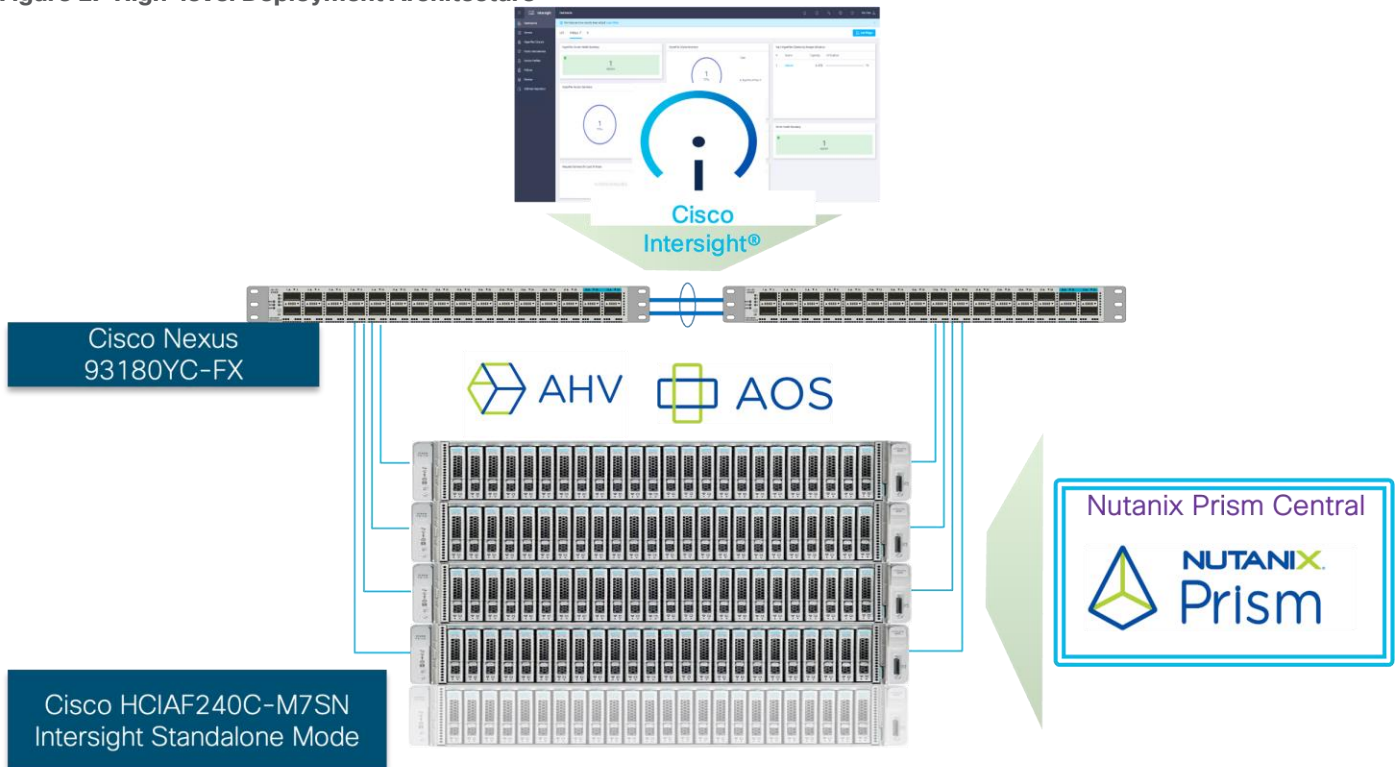

The deployment architecture for Cisco Compute Hyperconverged with Nutanix in Intersight Standalone Mode (ISM) is detailed in [Figure 2](#). The entire Day0 deployment is managed through Cisco Intersight and Nutanix Foundation Central enabled through Prism Central.

Each C240 M7 All NVMe server is configured with the following:

- 2x Intel(R) Xeon(R) Gold I6448H
- 384 GB DDR5 memory
- 2x 240GB M.2 card managed through M.2 RAID controller
- 24x 1.9 TB NVMe
- 1x Cisco VIC 15425 4x 10/25/50G PCIe C-Series w/Secure Boot

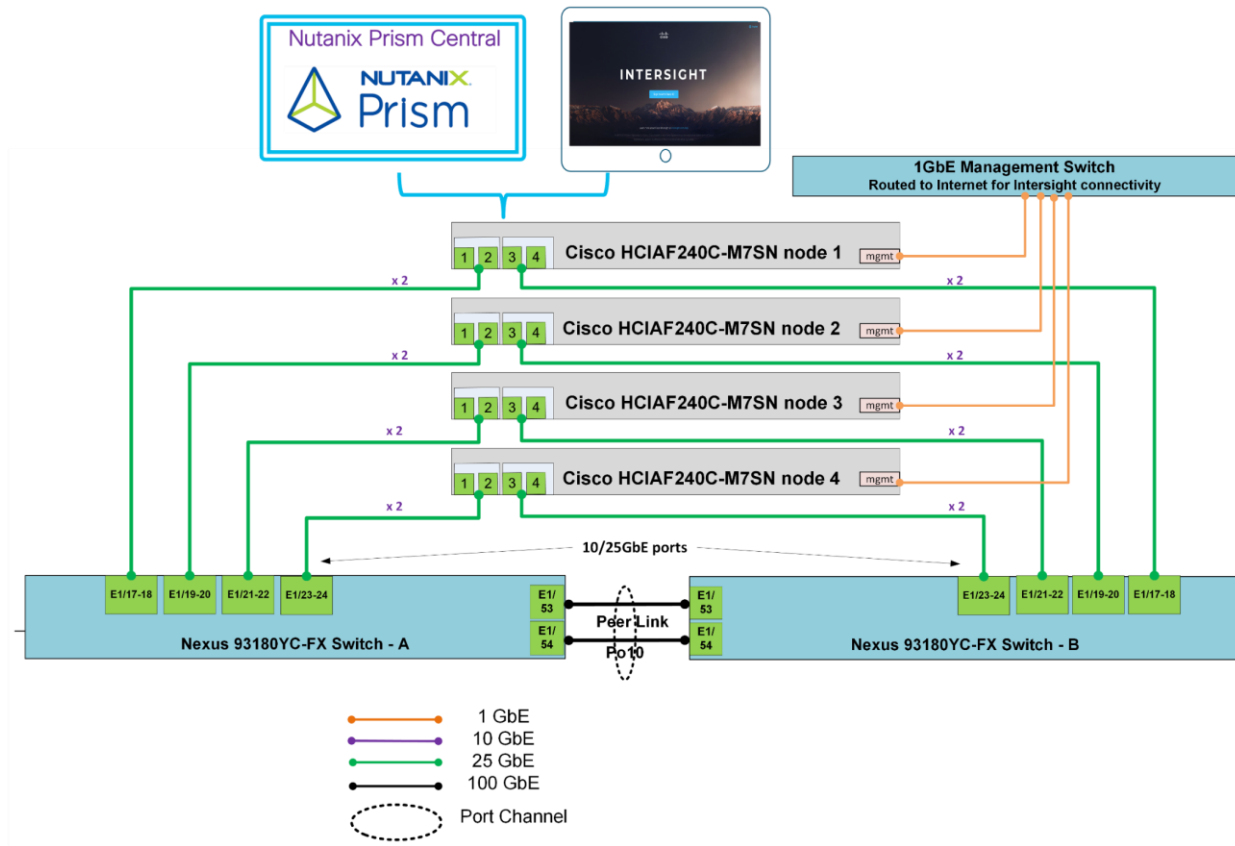

Note: This document illustrates the Cisco HCIAF240C M7 All-NVMe/All-Flash Servers specifications as validated in this document. You have several options to configure CPU, Memory, Network cards, GPUs and storage as detailed in this spec sheet: [Cisco Compute Hyperconverged with Nutanix](#)

Figure 2. High-level Deployment Architecture

[Figure 3](#) illustrates the cabling diagram for CCHC with Nutanix in ISM mode.

Figure 3. Deployment Architecture Cabling

Licensing

Cisco Intersight Licensing

Cisco Intersight uses a subscription-based license with multiple tiers. Each Cisco automatically includes a Cisco Intersight Essential trial license when you access the Cisco Intersight portal and claim a device.

More information about Cisco Intersight Licensing and the features supported in each license can be found here: <https://www.cisco.com/site/us/en/products/computing/hybrid-cloud-operations/intersight-infrastructure-service/licensing.html>

In this solution, using Cisco Intersight Advantage License Tier enables the following:

- Configuration of Server Profiles for Nutanix on Cisco UCS C-Series Rack Servers
- Integration of Cisco Intersight with Foundation Central for Day 0 to Day N operations

Software Components

Table 1 lists the software components and the versions validated for the Cisco Compute Hyperconverged with Nutanix in Intersight Standalone Software Components.

Table 1. Software components and versions

Component	Version
Foundation Central	1.6

Component	Version
Prism Central deployed on ESXi cluster	pc.2022.6.0.10
AOS and AHV bundled	nutanix_installer_package-release-fraser-6.5.5.6
Cisco C240 M7 All NVMe server	4.3(3.240043)

Solution Deployment

This chapter contains the following:

- [Prerequisites](#)
- [Cisco IMC configuration](#)
- [Cisco Intersight Configuration and Keys](#)
- [Claim Servers on Cisco Intersight](#)
- [Configure Foundation Central](#)
- [Nutanix Cluster Creation](#)
- [Post Cluster Creation Task](#)

This chapter describes the solution deployment for Nutanix on Cisco UCS C-Series Rack Servers in Intersight Standalone Mode (ISM), with step-by-step procedures for implementing and managing the deployment. The Intersight Standalone Mode requires the Cisco UCS C-Series Rack Servers to be directly connected to a ethernet switches and the servers are claimed through Cisco Intersight.

Note: If you are deploying a Nutanix ISM cluster, refer to the [Nutanix ISM Field Install Guide](#) for step-by-step guidance. This guide explains the installation and initial configuration of Cisco Compute Hyperconverged with Nutanix systems using Standalone Cisco UCS C-Series servers managed by Cisco Intersight. This guide is intended for technical training and educational purposes, for all who wish to install Nutanix on Cisco UCS based hardware following our supported hardware and software integrations and compatibility lists. This document presents our best practices and recommendations as of the time of publishing and will be updated periodically. Please refer to the document history to ensure you are using the most current version available

[Figure 4](#) shows the high-level configuration of Cisco UCS C-Series nodes in Intersight Standalone Mode for Nutanix.

Figure 4. Cisco UCS C-Series Nodes configured in Intersight Standalone Mode for Nutanix

Prerequisites

Prior to beginning the installation of Nutanix Cluster on Cisco UCS C-Series servers in Intersight Standalone Mode, you should ensure they have deployed Nutanix Prism Central and enabled Nutanix Foundation Central

through Nutanix marketplace available through Prism Central. Foundation Central can create clusters from factory-imaged nodes and reimage existing nodes that are already registered with Foundation Central from Prism Central. This provides benefits such as creating and deploying several clusters on remote sites, such as ROBO, without requiring onsite visits

At a high level, to continue with the deployment of Nutanix on Cisco UCS C-Series servers in Intersight standalone mode (ISM), ensure the following:

- Prism Central is deployed on either a Nutanix Cluster or on ESXi cluster
- Foundation Central 1.6 or later is enabled on Prism Central
- A local webserver is available hosting Nutanix AOS image

Note: Either deploy Prism Central 2023.4 or newer on Nutanix Cluster or deploy Prism Central 2022.6.x available as OVA on ESXi cluster

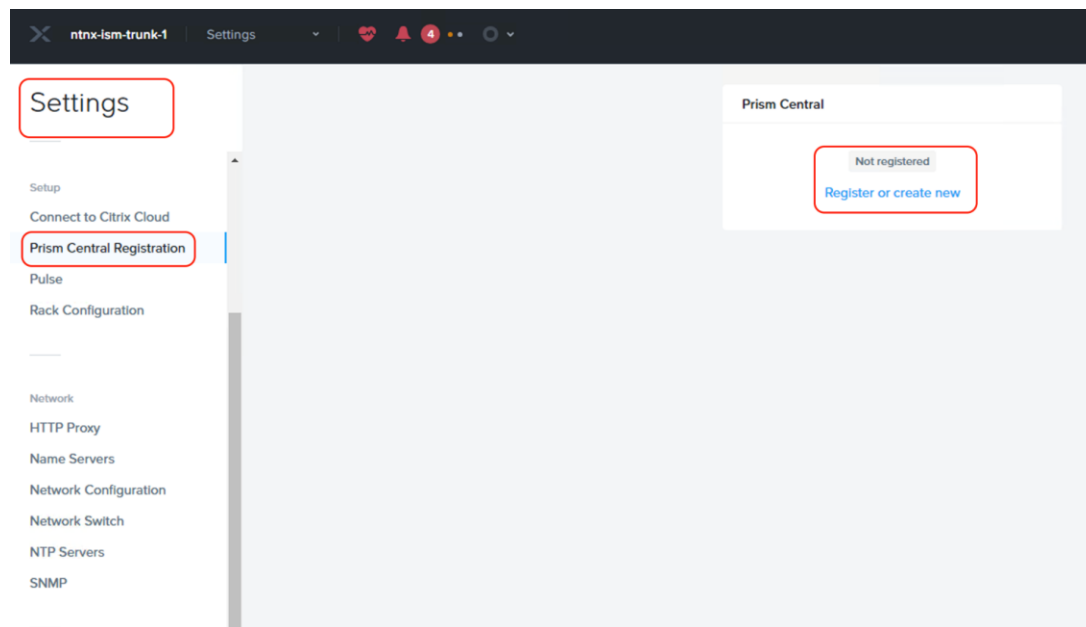

Prism Central Installation

The following high-level steps describe the process to deploy Prism Central either on a Nutanix Cluster or on an ESXi cluster. You should follow either of the procedures for PC installation.

Procedure 1. Deploy PC 2023.4.x on Nutanix Cluster

Note: Skip this step if you already have PC 2023.4 or newer.

Step 1. Login to Prism Element on Nutanix Cluster and navigate to Settings -> Prism Central Registration.

Step 2. Select the option to deploy a new Prism Central instance.

Step 3. Prism Central binaries are available here: <https://portal.nutanix.com/page/downloads?product=prism>, download PC version 2023.4.x or upload to the library.

Prism Central Deployment

Deploy

Procedure 2. Deploy PC 2022.6.x on ESXi Cluster

Note: Skip this step if you already have a Prism Central Instance.

Step 1. Download Prism Central 2022.6.x OVA here:
<https://portal.nutanix.com/page/downloads?product=prism>

Step 2. Identify an ESXi host and deploy OVF template.

Step 3. Identify compute, storage, and network resource on ESXi Cluster and deploy the OVF template.

Step 4. Once the OVA is deployed, power ON the VM. Post installation steps for Prism Central on ESXi are detailed here: https://portal.nutanix.com/page/documents/details?targetId=Acropolis-Upgrade-Guide-v6_5:upg-vm-install-wc-t.html.

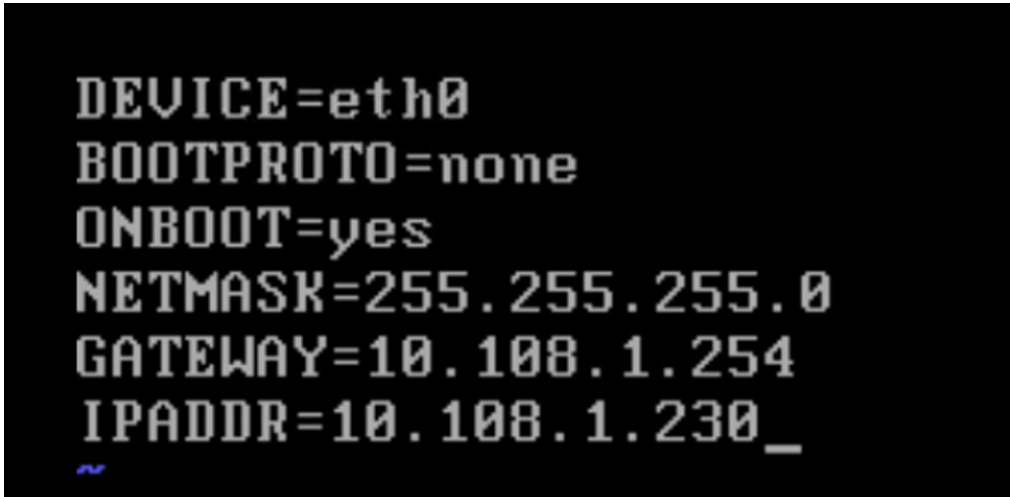

Note: Please wait at least 20-25 minutes before you login to PC instance through ESXi web console.

Step 5. Launch VM web console and login with login: Nutanix password: nutanix/4u.

Step 6. Edit the ifcfg-eth0 with the following settings (/etc/sysconfig/network-scripts/ifcfg-eth0):

```
NETMASK="xxx.xxx.xxx.xxx"
```

```
IPADDR="xxx.xxx.xxx.xxx"  
BOOTPROTO="none"  
GATEWAY="xxx.xxx.xxx.xxx"
```

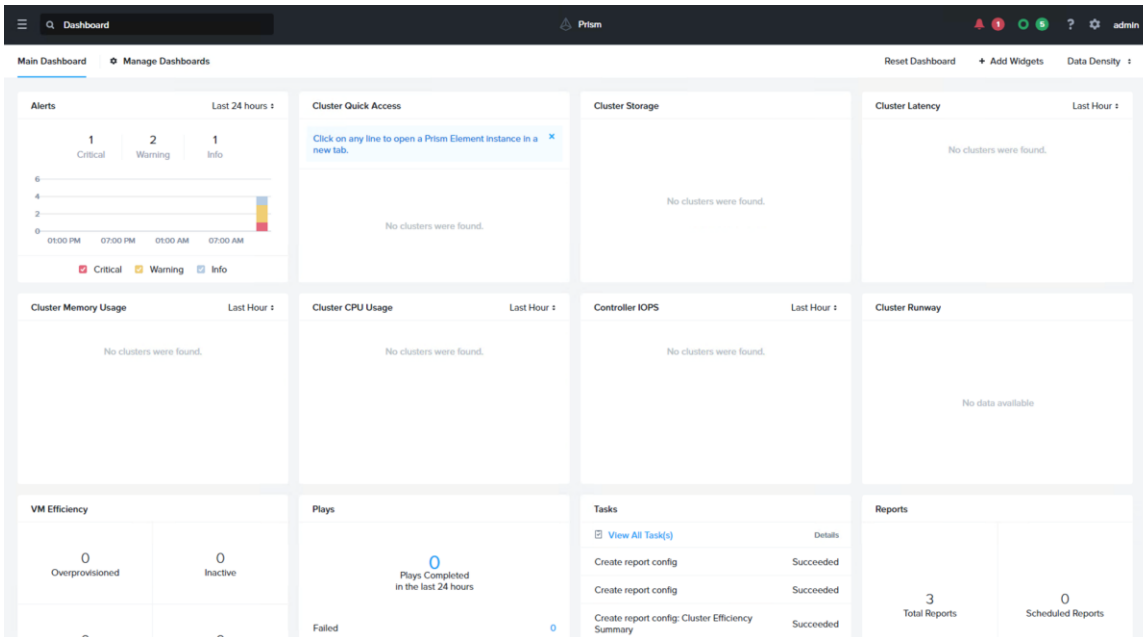

Step 7. Restart the Prism Central VM and login with username Nutanix.

Step 8. Create a Prism Central cluster with the following command:

```
cluster --cluster_function_list="multicluster" -s static_ip_address create
```

```
** SSH to PCVM via 'nutanix' user will be restricted in coming releases. **  
** Please consider using the 'admin' user for basic workflows. **  
nutanix@NTNX-10-108-1-230-A-PCVM:~$ cluster --cluster_function_list="multicluster" -s 10.108.1.230 create
```

Step 9. Once completed, login to Prism Central 2022.6.x.

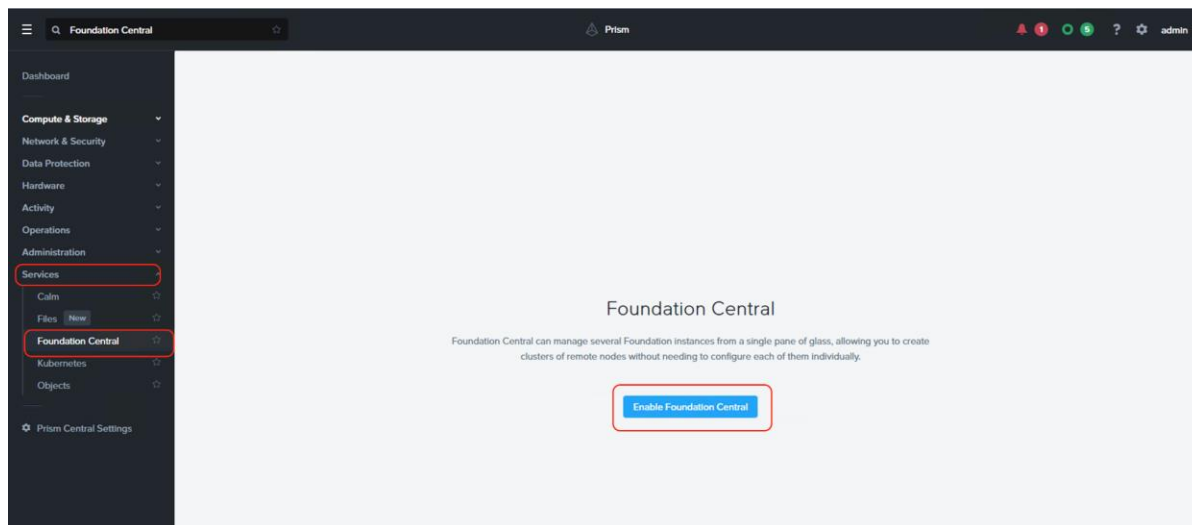

Enable and Upgrade Foundation Central

This section provides the process to enable and upgrade Foundation Central on Prism Central 2022.6.x and 2023.4.x.

Procedure 1. Enable and Upgrade Foundation Central (FC) on PC 2022.6.x

Note: Ensure the DNS (name server) and NTP settings are updated in Prism Central.

Step 1. Go to Services > Foundation Central and enable Foundation Central.

Step 2. Download FC 1.6 from: <https://portal.nutanix.com/page/downloads?product=foundationcentral>

Step 3. Upgrade FC to 1.6 as described here:

https://portal.nutanix.com/page/documents/details?targetId=Foundation-Central-v1_6:v1-upgrade-fc-cli-t.html .

Step 4. SSH into Prism Central VM with user name nutanix.

Step 5. Stop Foundation Central service 'genesis stop foundation_central.'

Step 6. Remove existing Foundation Central files, if exists 'sudo rm -rf /home/docker/foundation_central/*'

Step 7. Extract Foundation Central tar file 'sudo tar -xf foundation-central-installer.tar.xz -C /home/docker/foundation_central/'

Step 8. Change the directory permission to nutanix:Nutanix 'sudo chown -R nutanix:nutanix /home/docker/foundation_central/*'

Step 9. Restart Foundation Central service 'genesis restart.'

Step 10. Foundation Central service will display after some time. You can validate service status by running "genesis status" command on your PC VM.

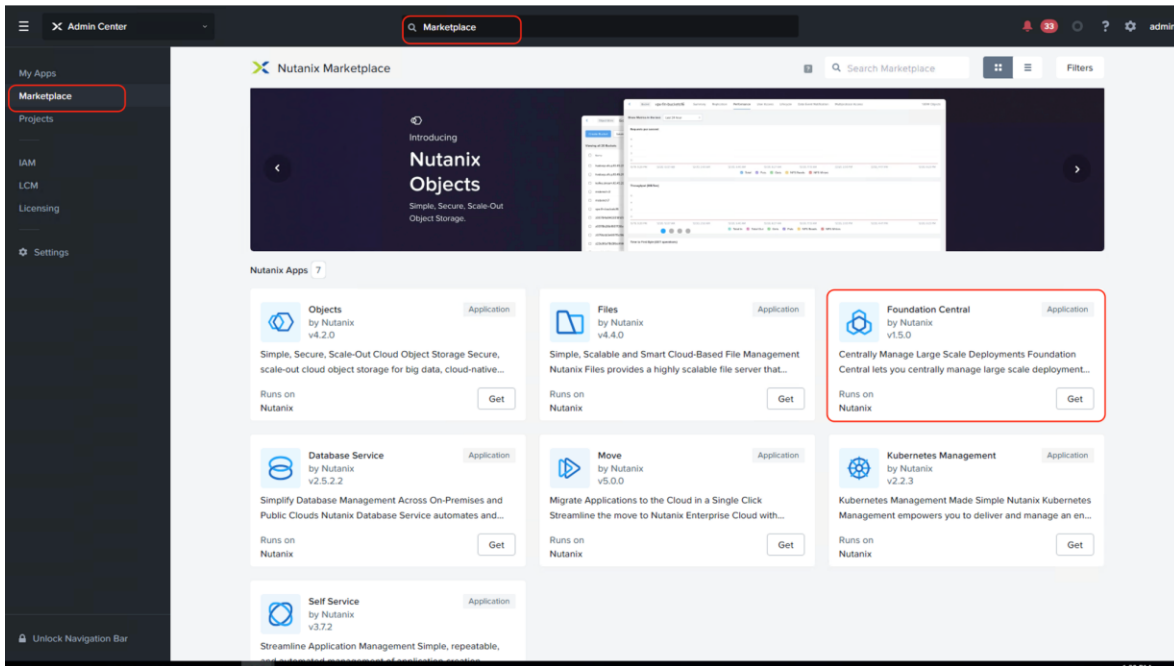

Procedure 2. Enable and Upgrade Foundation Central (FC) on PC 2023.4.x

Note: Ensure the DNS (name server) and NTP settings are updated in Prism Central.

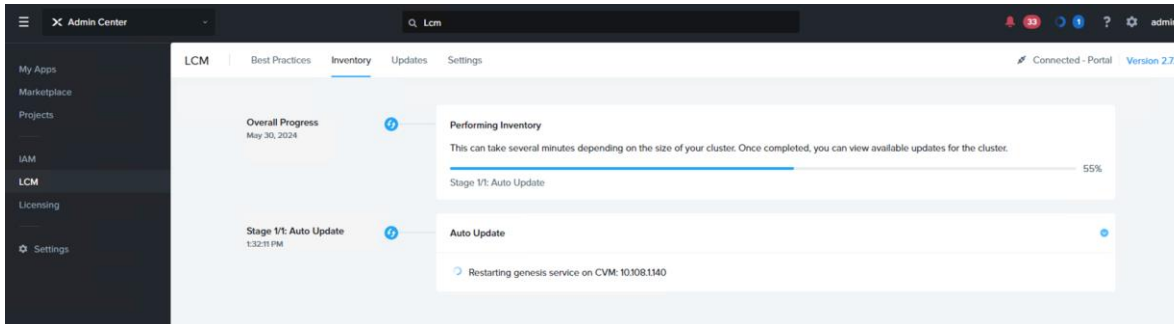

Note: To enable marketplace on Prism Central 2023.4, the Nutanix cluster hosting PC 2023.4 should be registered to Prism Central.

Step 1. Enable marketplace on Prism Central 2023.4.

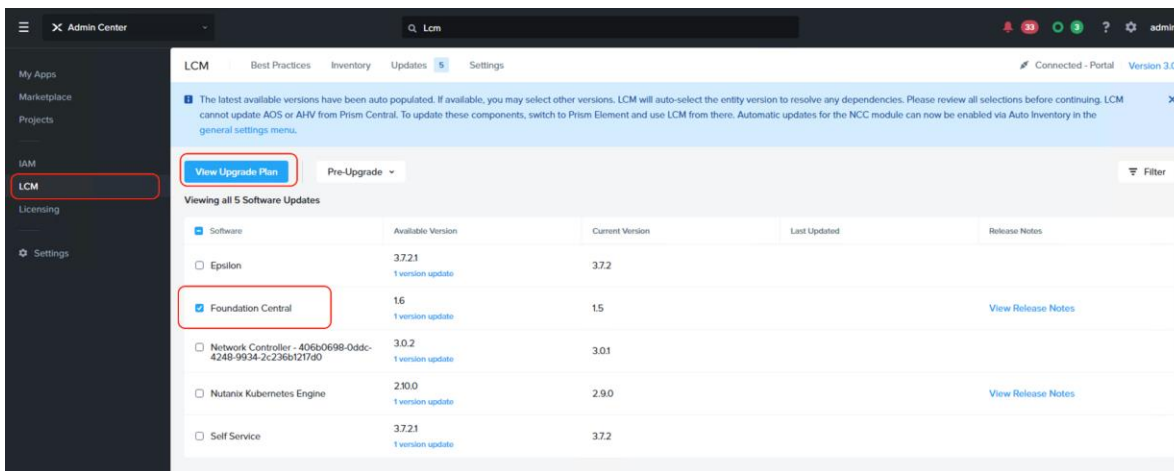

Step 2. Go to marketplace and get Foundation Central Application.

Step 3. Once deployed, upgrade Foundation Central to latest version (1.6) by performing Inventory on LCM.

Step 4. Go to marketplace and get Foundation Central Application.

Step 5. Once Foundation Central is upgraded to 1.6, proceed to the subsequent sections.

Create IMC Configuration (CIMC)

Procedure 1. Configure CIMC

Note: This step has to be completed for all the Cisco UCS C-Series nodes configured for Nutanix cluster.

This procedure provides a Management IP to each of the node enabling connection to Cisco Intersight.

Step 1. Attach a keyboard and monitor to the USB ports on the rear panel of the Cisco UCS C240 Rack Server or by using a KVM cable (Cisco PID N20-BKVM) and connector to access the appliance console.

Step 2. During bootup, press F8 when prompted to open the Cisco IMC Configuration Utility.

Step 3. When prompted enter the default CIMC username (admin) and password (password).

Step 4. When prompted, change the default CIMC (IPMI) username and password. You must enter a strong password.

Step 5. Enable the NIC mode Dedicated field by entering a space.

Step 6. Enable either the IP (Basic) IPV4 field or the IP (Basic) IPV6 field to reflect your networking environment.

Step 7. Arrow down to the IP (Basic) DHCP enabled field and enter a space to disable it.

Step 8. Arrow down to the NIC redundancy None field and enter a space to enable it.

Step 9. Enter appropriate values for your network in the following fields:

- CIMC IP—Specify the IP address to access the Cisco Integrated Management Controller (CIMC) which is similar to IPMI.
- Prefix/Subnet—Specify the Subnet Mask for the CIMC (IPMI) Subnet.
- Gateway—Specify the IP address of the Subnet Gateway for the CIMC (IPMI) network interfaces.
- Pref DNS Server—Specify the IP Addresses of the preferred Domain Name System (DNS) Server.

The details for the CIMC settings for the Cisco UCS C240 Rack Servers are shown below:

```

Step 10. Enter F10 to save the settings.

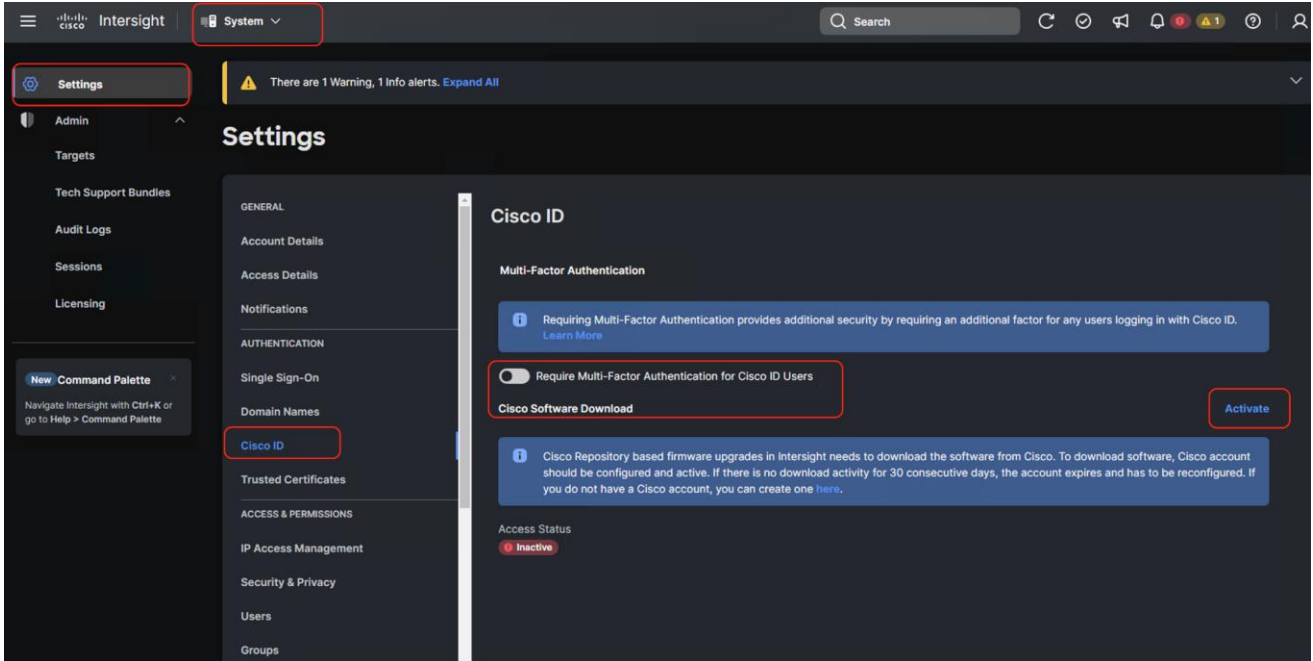

Step 11. Repeats steps 1-10 for all the nodes deployed for Nutanix Cluster in ISM mode.

Cisco Intersight Configuration and Keys

Procedure 1. Enable Intersight software download permission

This option allows Cisco Intersight to download recommend firmware from cisco.com using the user account for cisco.com

Step 1. Login to Cisco Intersight, go to System > Settings > Cisco ID and from the Cisco software download option click Activate.

Step 2. Once activated, the login screen displays. Login with your CEC or Cisco ID.

Generate Security Token

i To upgrade firmware from Cisco Repository, Intersight must be enabled for Cisco Software Download Services. Learn more at [Help Center](#).

Provide your user credentials to generate the security token that enables you to download firmware images from the cloud.

The security token expires if there has been no upgrade activity in the account for 30 days.

Generate

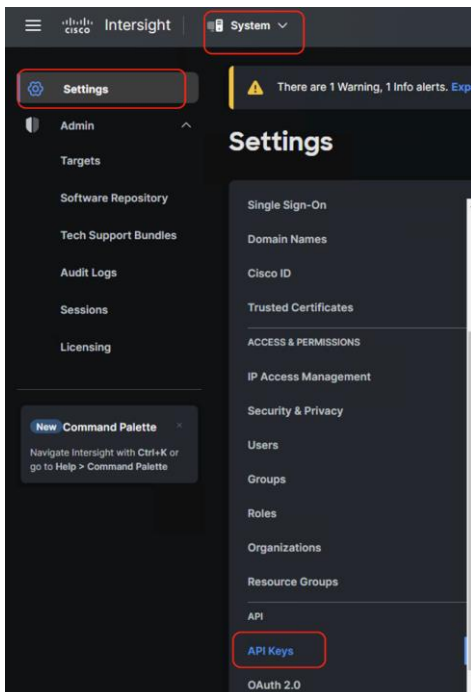

Step 3. Once the user is authenticated, the software download access status will change to the active state.

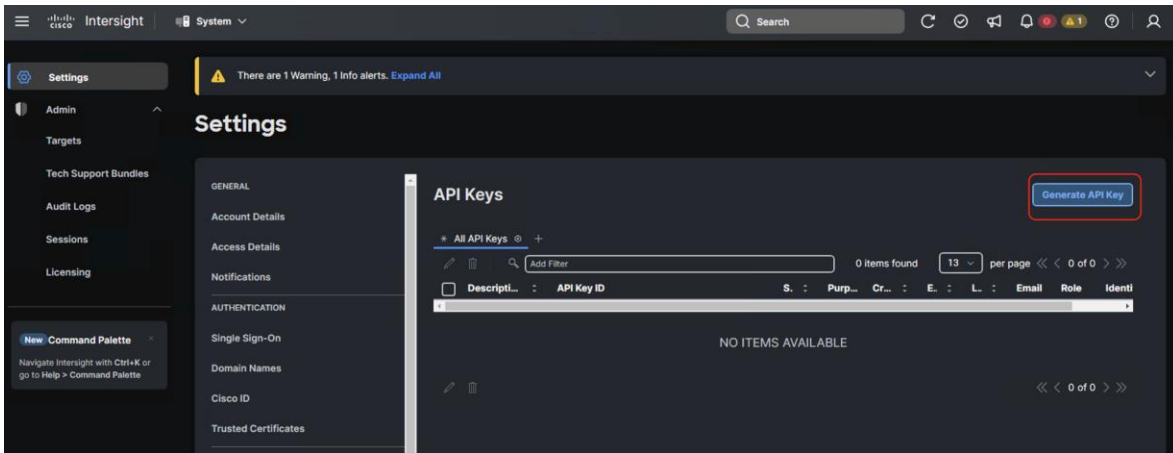

Procedure 2. Generate Cisco Intersight API keys

The Cisco Intersight API keys allows authentication and communication of Nutanix Foundation Central with Cisco Intersight. Further, once the communication channel is setup, Nutanix Foundation Central can identify the Cisco C-Series nodes claimed in Intersight and configure Server profile and upgrade firmware of Cisco UCS C-Series Rack Servers in ISM mode.

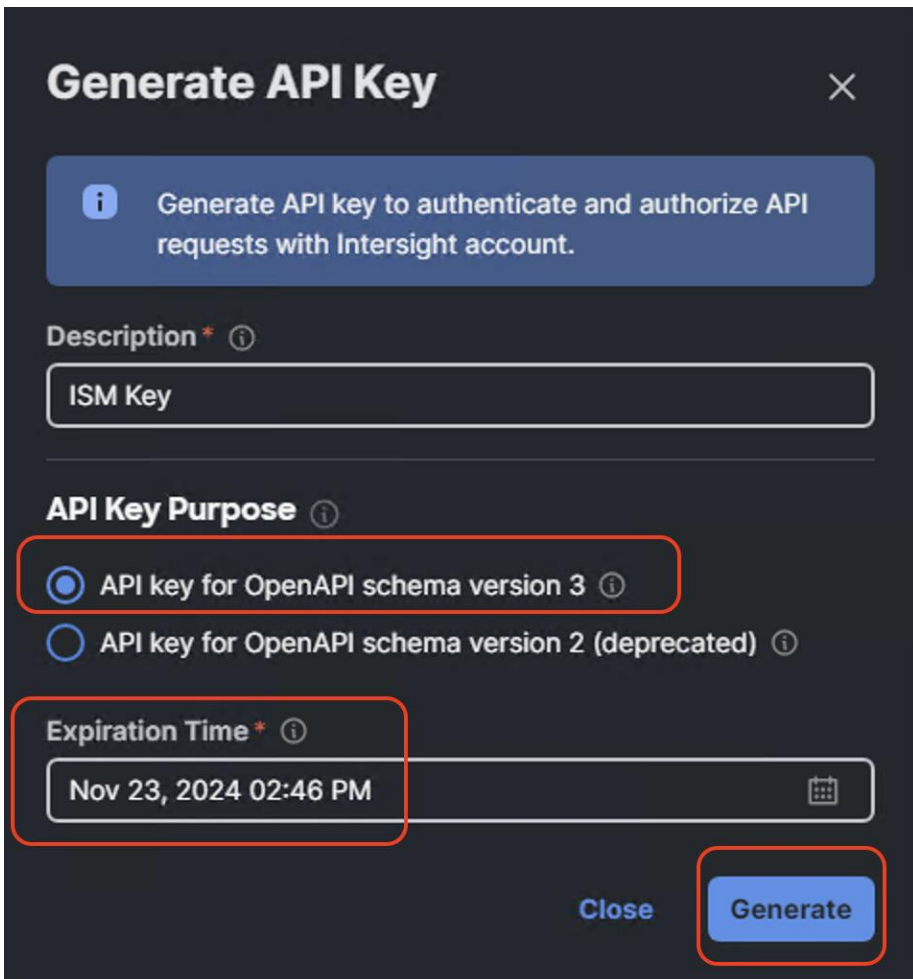

Step 1. Login to Cisco Intersight, go to System > Settings > API keys.

Step 2. Click Generate API Keys.

Step 3. Select the API key for OpenAPI schema version 3, add a description and key expiration date and click Generate.

Step 4. Once generated, save the API key ID and Secret Key at a secure place. This will be subsequently added in Nutanix Foundation Central.

View API Key

i This is the only one time that the secret key can be viewed or downloaded. You cannot recover them later. However, you can create new access keys at any time.

Claim Servers on Cisco Intersight

The following high-level steps describe the process to claim servers on Cisco Intersight. Ensure CIMC of all servers have been configured with proper DNS for Cisco Intersight reachability

Procedure 1. Claim servers on Cisco Intersight

Step 1. Open a web browser and type in Cisco IMC IP, login with the username: admin and the password as configured during CIMC configuration.

 Overall Storage Status: Good

Server Utilization

Overall Utilization (%): N/A
 CPU Utilization (%): N/A
 Memory Utilization (%): N/A
 IO Utilization (%): N/A

Step 3. From the Device Connector page, ensure the server is not connected to Intersight and identify the Device ID and Claim Code. This will be utilized to claim the server on Cisco Intersight.

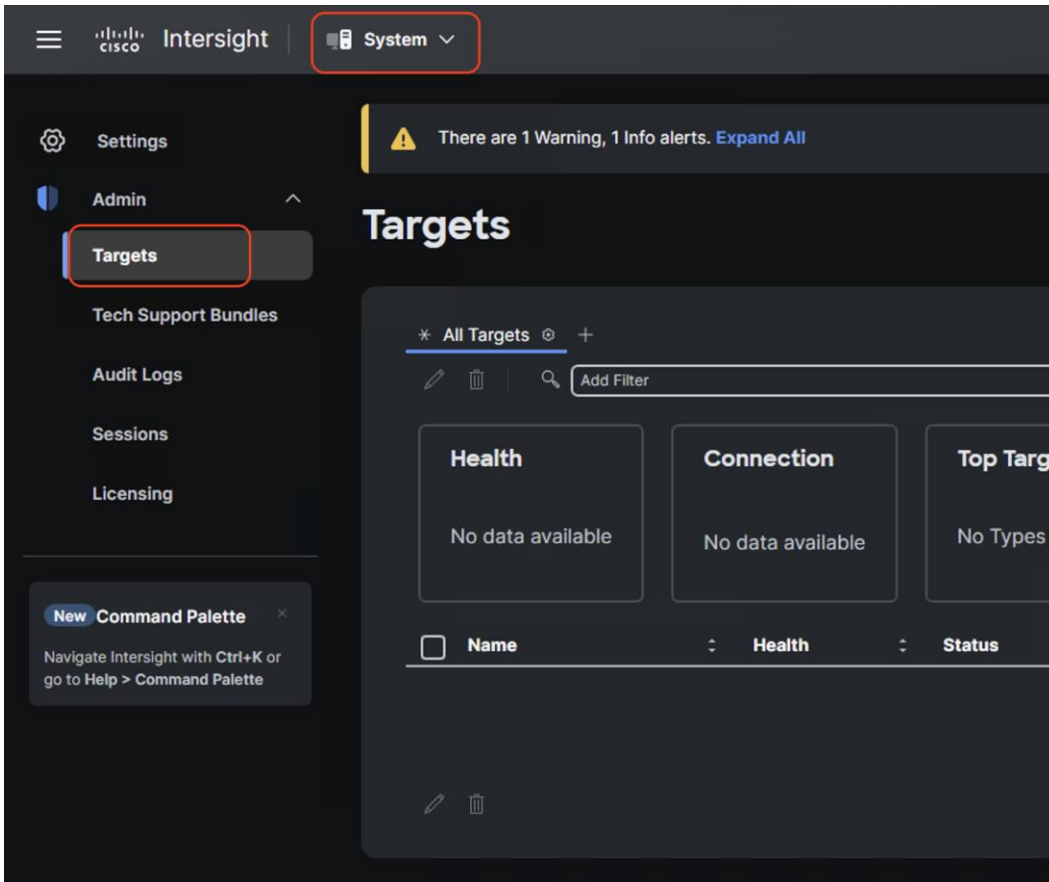

Device Connector

Device ID: WZP2736045T
 Claim Code:

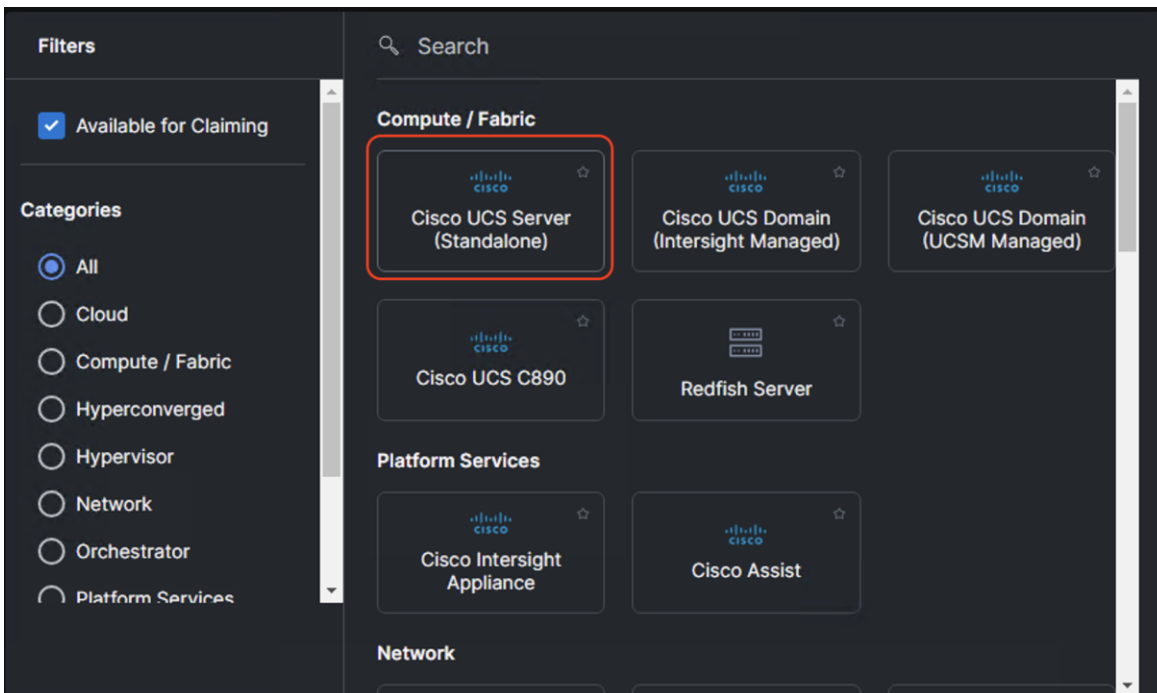

Not Claimed

The connection to the Cisco Intersight Portal is successful, but device is still not claimed. To claim the device open Cisco Intersight, create a new account and follow the guidance or go to the Targets page and click Claim a New Device for Open Intersight

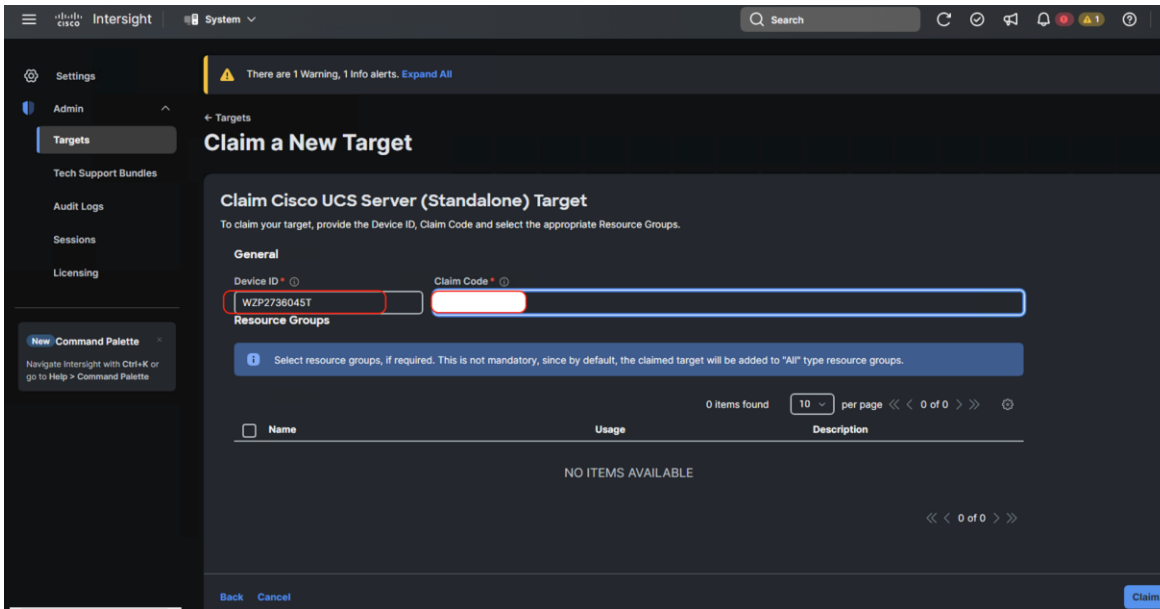

Step 4. Login to Cisco Intersight and navigate to System > Targets.

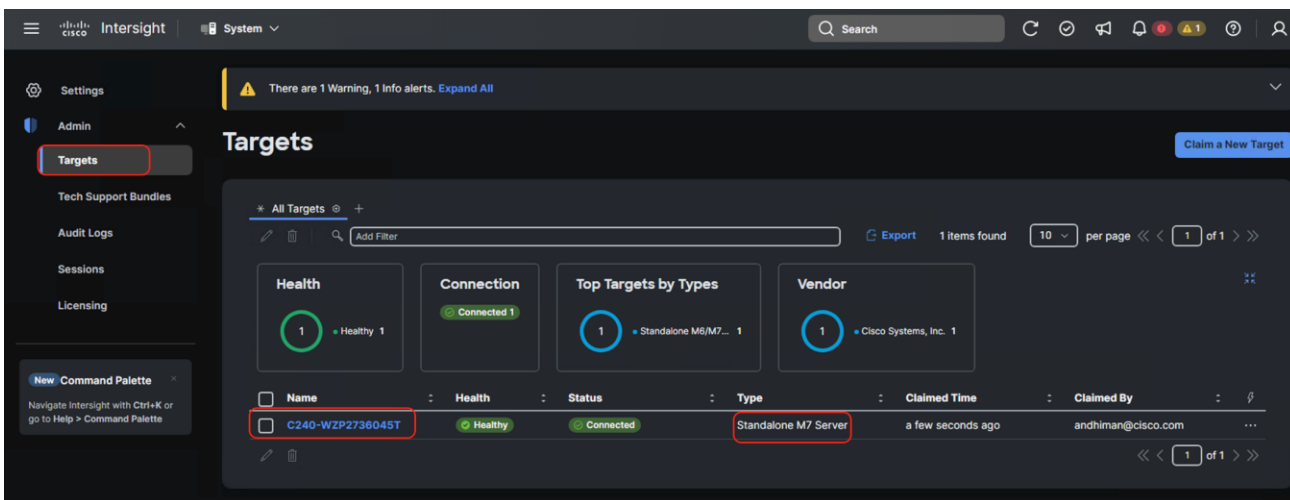

Step 5. Click Claim new target and select Cisco UCS Standalone Server as the target.

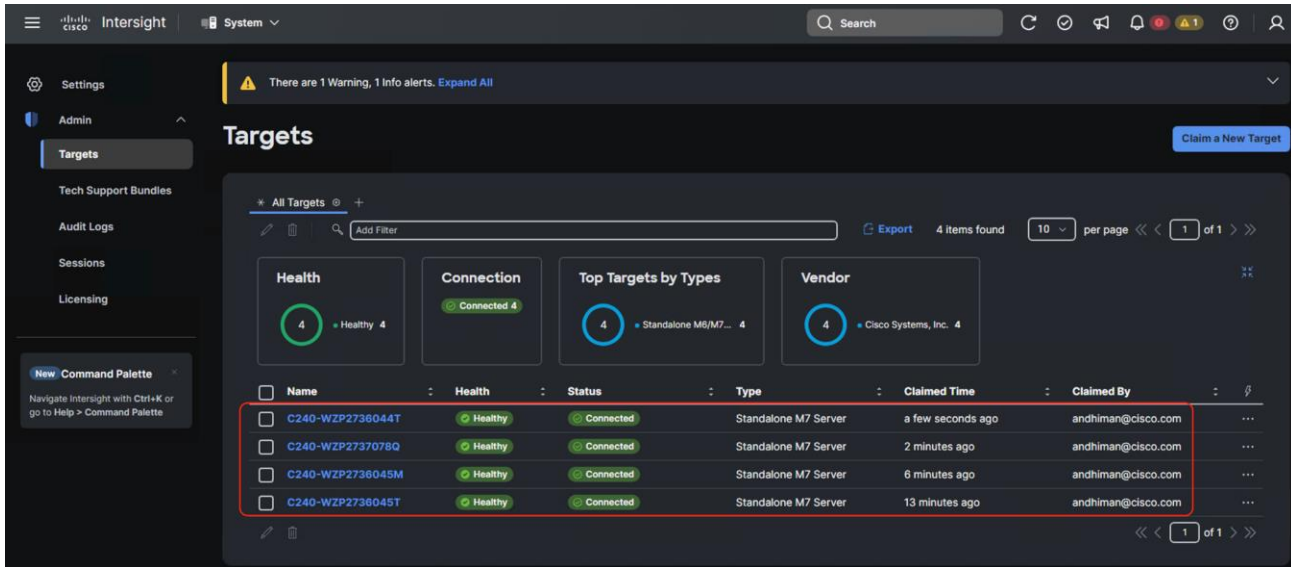

Step 6. Enter the Device ID and Claim code as copied from the Cisco IMC device connector page.

Step 7. Ensure the server is successfully claimed on Cisco Intersight.

Step 8. Repeat Steps 1-7 and claim the remaining servers provisioned for Nutanix cluster with Cisco UCS C240 M7 in ISM mode.

Configure Foundation Central

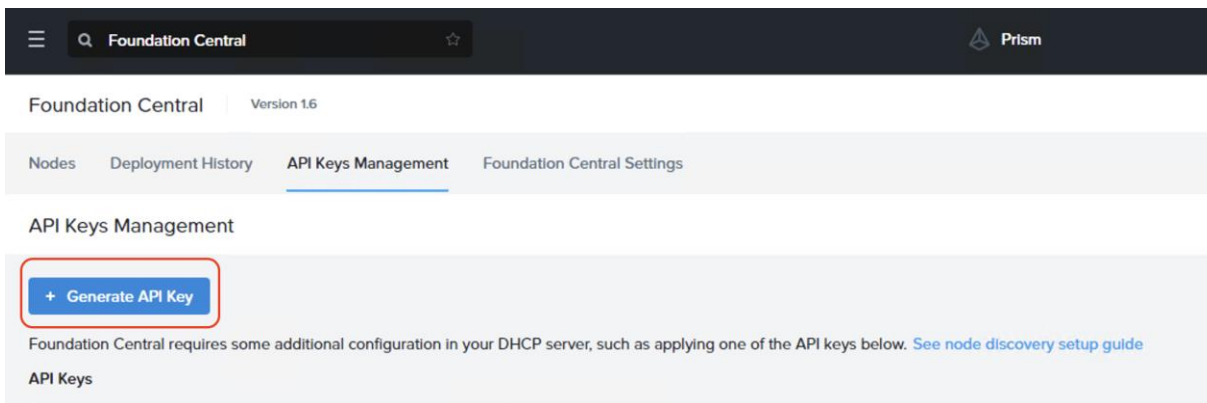

This procedure describes the Foundation Central configuration required for a successful Nutanix cluster creation with Cisco UCS C-Series nodes in ISM mode.

Procedure 1. Generate API key

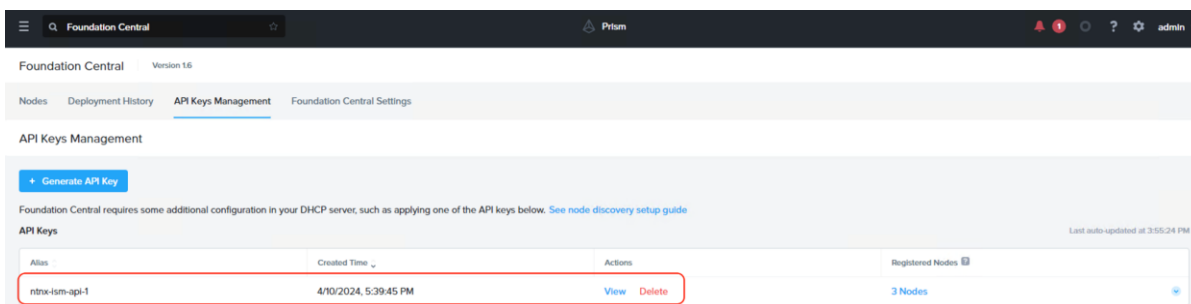

Note: API key authenticates API communication between the Nutanix node and Foundation Central. It is recommended that you create a unique key for each remote site.

Step 1. Login to Prism Central and navigate to Foundation Central.

Step 2. Click Generate API key.

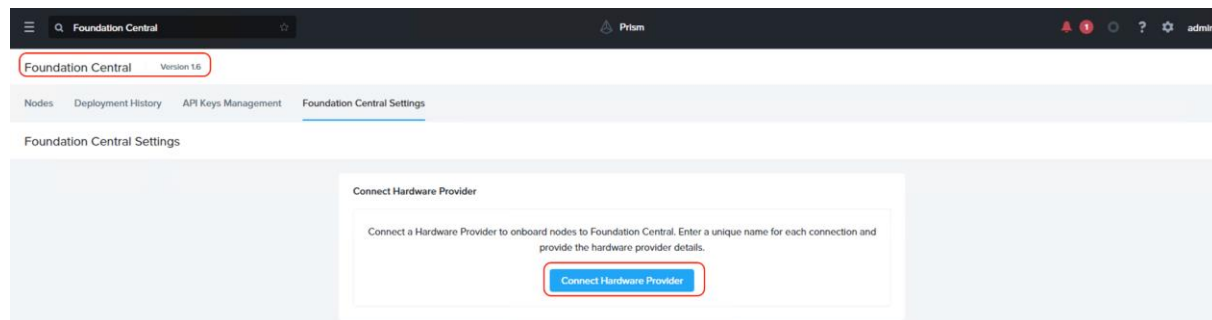

The API key displays. It will be added during the Nutanix cluster creation through Foundation Central.

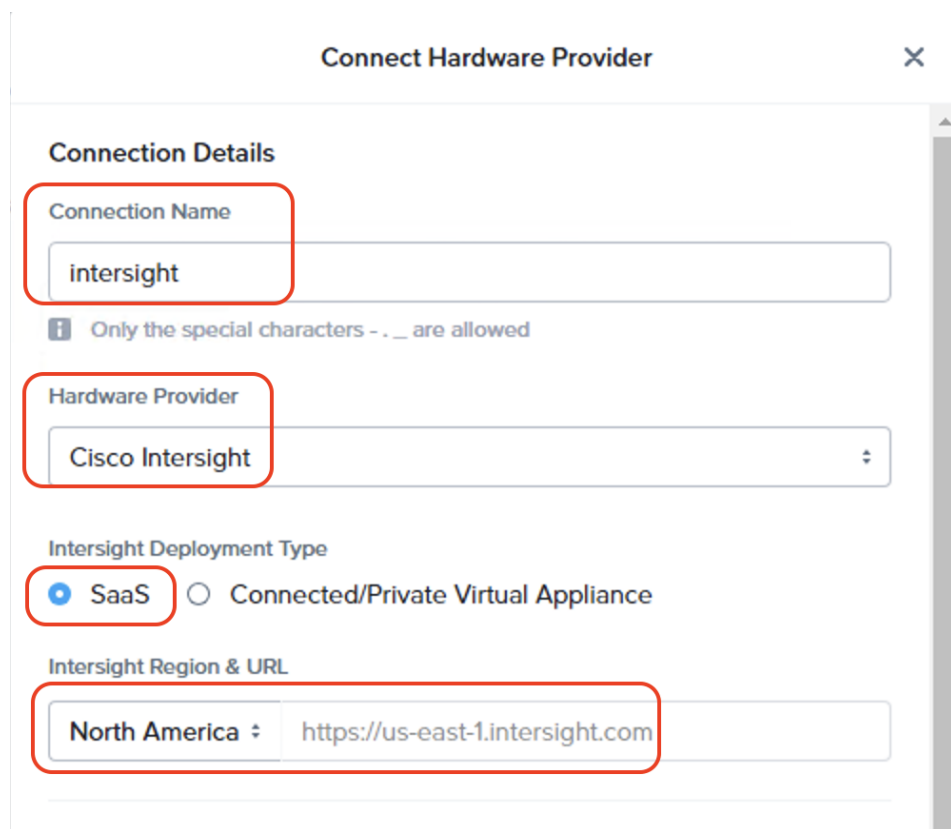

Procedure 2. Cisco intersight connection to Foundation Central

This procedure allows the connection of Foundation Central to Cisco Intersight through the Cisco Intersight API key created in the Intersight configuration. This allows Foundation Central to discover nodes claimed on Cisco Intersight.

Step 1. From Foundation Central, navigate to Foundation Central Settings. Click Connect Hardware Provider.

Step 2. From Connect Hardware Provider, enter a Connection Name and select the Hardware Provider as 'Cisco Intersight' and select the option as 'SaaS'. Intersight URL is automatically displayed as per the region configured in Foundation Central.

Step 3. From Connection Credential, enter the Intersight API key ID and secret Key generated in the previous section through Cisco Intersight. Click Connect.

Connection Credentials

You can find the API key ID and secret key on the Cisco Intersight Settings page. Currently, only Open API schema version 3 is supported.

Intersight API Key ID

66394bec756461330122766d/66394bec7564613301227671/663a4c

Intersight Secret Key

Show

.....
.....

Cancel

Connect

Step 4. Once the authentication to Intersight succeeds, the connection displays under FC settings.

The screenshot shows the Foundation Central interface. The top navigation bar includes 'Foundation Central' and 'Prism'. Below the navigation bar, there are tabs for 'Nodes', 'Deployment History', 'API Keys Management', and 'Foundation Central Settings'. The 'Foundation Central Settings' tab is selected. The main content area is titled 'Foundation Central Settings' and contains a section for 'Connect Hardware Provider'. This section includes a text block explaining that only Cisco Intersight is supported and only a single connection is allowed at a time. Below this text is a table with the following data:

Connection Name	Hardware Provider	URL	
intersight	Cisco Intersight	https://us-east-1.intersight.com	⋮

Nutanix Cluster Creation

This procedure describes the process to onboard the nodes on Foundation Central and thereafter create the cluster for Cisco UCS C-Series nodes managed in Intersight Standalone Mode (ISM).

Procedure 1. Onboard nodes on Foundation Central

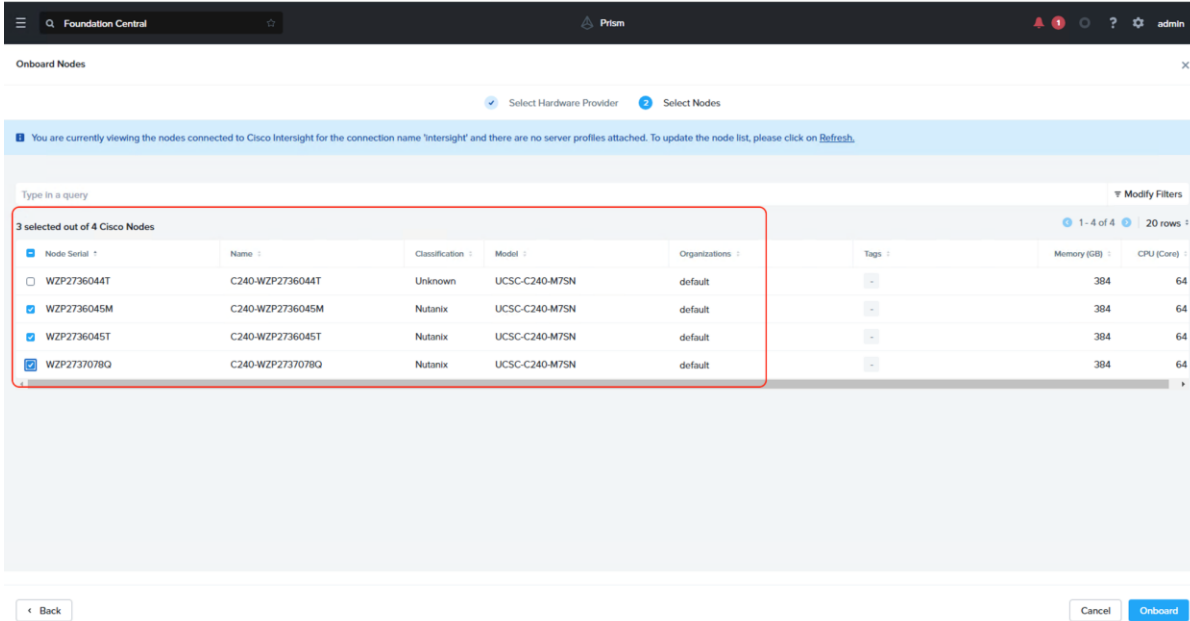

Step 1. Go to Foundation Central, select the Nodes tab and select the Manually Onboarded tab. Click Onboard Nodes.

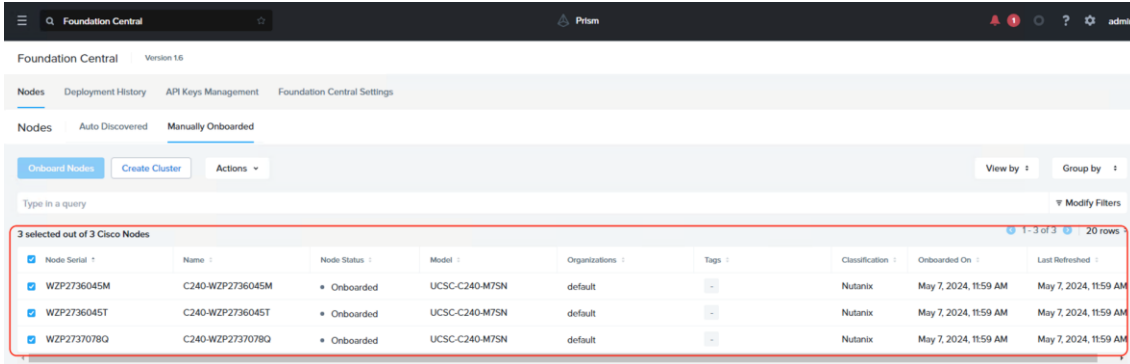

Step 2. The screen displays the connection details configured for Cisco Intersight. Click Next.

Step 3. Foundation Central connects to Cisco Intersight and displays all the unconfigured nodes existing in Intersight. Select the nodes provisioned for Nutanix and click Onboard.

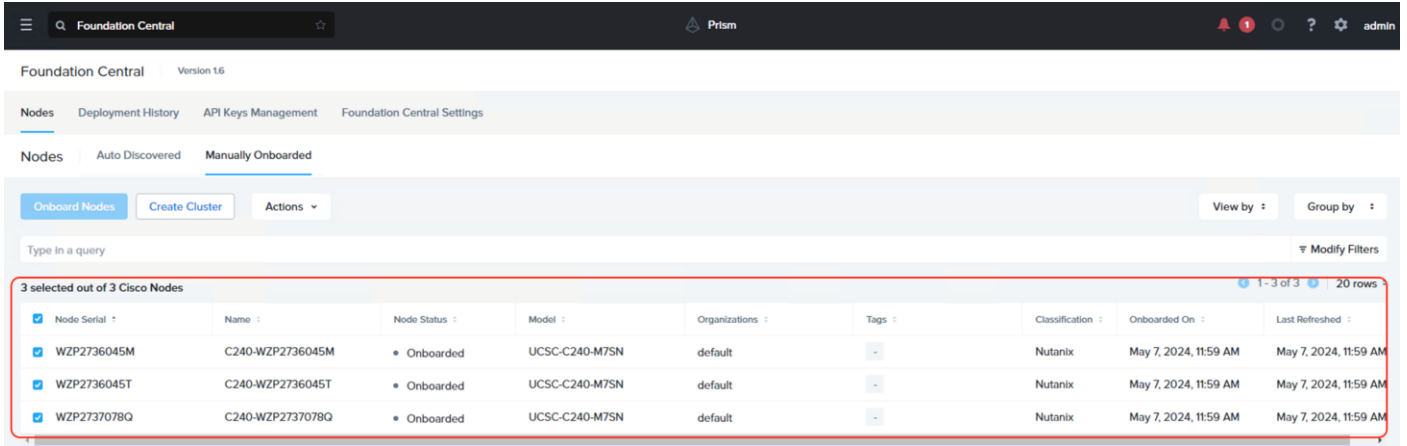

Three Nutanix nodes are onboarded on Foundation Central as shown below:

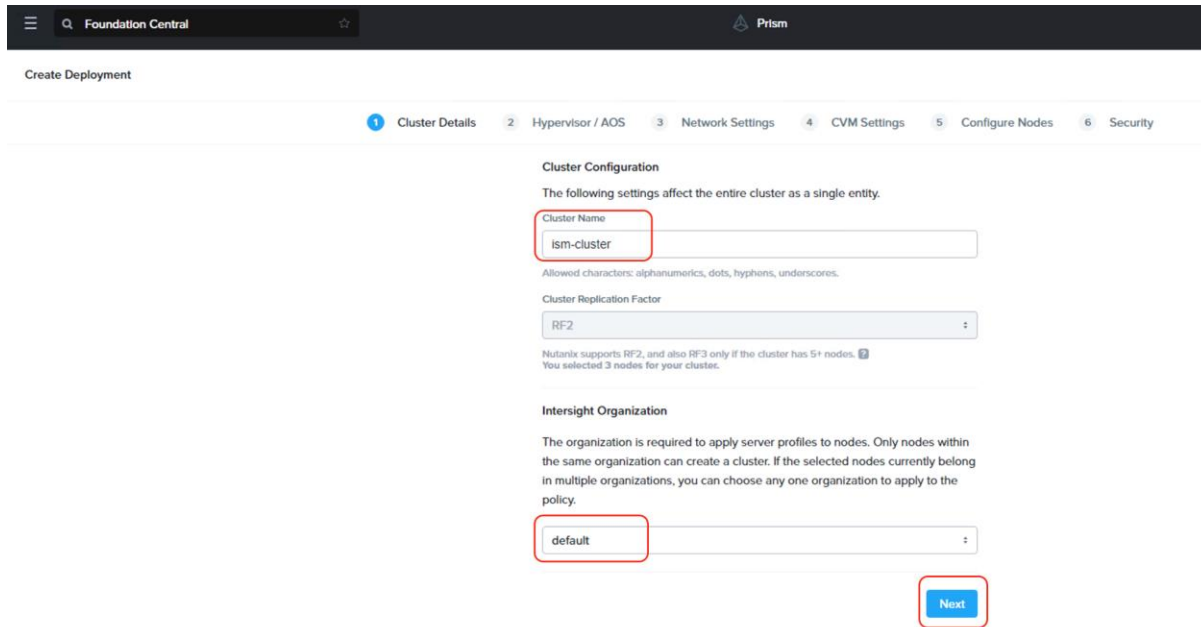

Procedure 2. Setup Nutanix Cluster

Step 1. Go to Foundation Central, select the Nodes tab and select the Manually Onboarded tab. Select Onboard Nodes. The Cisco UCS C-Series nodes onboarded for Nutanix Cluster creation display.

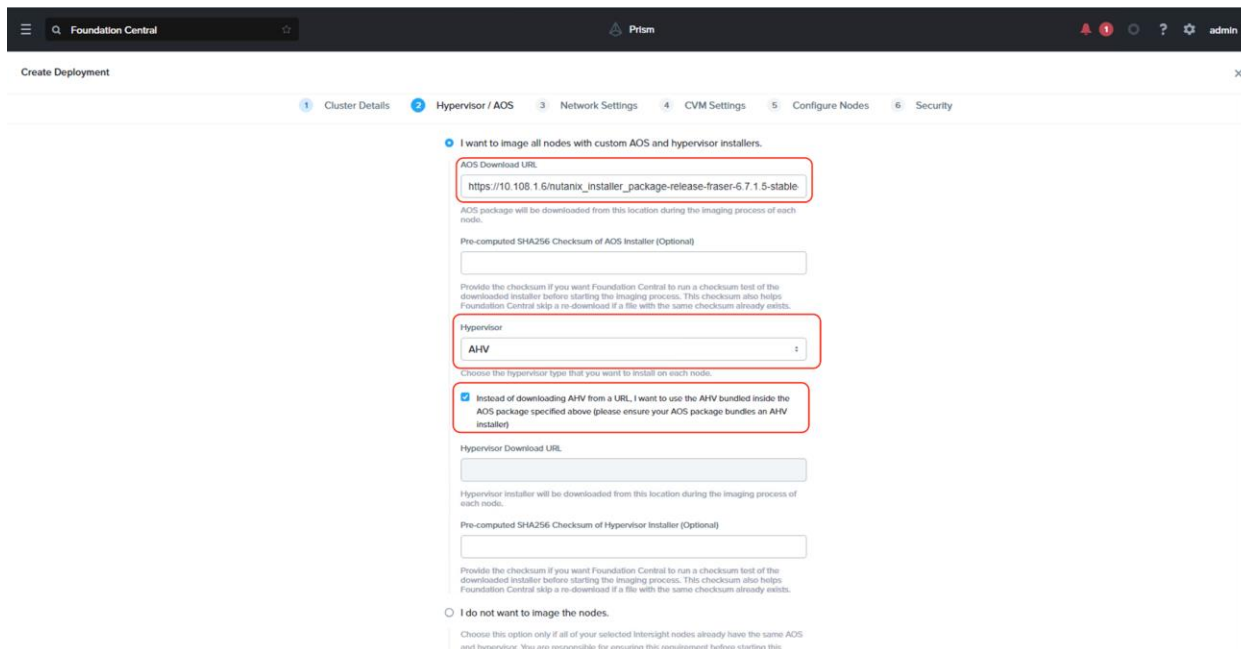

Step 2. Click Create Cluster under the Actions tab.

Step 3. Enter a cluster name, since there are three nodes, the replication factor (RF) of cluster would be RF2, select the Intersight organization in which the servers had been claimed. Click Next.

Step 4. Enter the AOS download URL. You are required to host the Nutanix AOS on a http/https web server. The web server should be reachable from Cisco IMC network. Select hypervisor as AHV and check the option to use the AHV version bundled with AOS package. This option is required if AHV is not imaged from the factory, or the nodes are reimaged. Click Next.

Step 5. Enter the enter subnet, gateway, and Cluster Virtual IP.

- Leave the VLAN tag as blank. This will enable trunk mode on the Cisco VIC ports. The port type on the uplink switch would be trunk and the primary VLAN should be marked as native in the uplink switch configuration.

-
- In the event customers need access ports , VLAN should be defined in the VLAN tag field. The port type on the uplink switch would be 'access' with VLAN defined in the switch
 - You have a choice to enable LACP with AHV. Default mode is active-backup. Go to: <https://portal.nutanix.com/page/documents/solutions/details?targetId=BP-2071-AHV-Networking:bp-ahv-networking-best-practices.html>. Enable LACP after cluster configuration and is supported only during re-imaging of nodes.
 - In the event of LACP configuration failure wherein cluster creation fails with error as “Failed to receive the first heart beat of the node,” go to <https://portal.nutanix.com/page/documents/kbs/details?targetId=kA0VO0000001w0L0AQ> for resolution
 - The default FEC setting is CL91 or AUTO (RS-FEC) applicable for 10/40/50/100 GbE cables and optics. Some models of 25GbE cables and optics require CL74 (FC-FEC) for links to be active. Configure appropriate FEC mode both on the Cisco VIC port configuration and uplink switch configuration.

Create Deployment

- 1 Cluster Details
- 2 Hypervisor / AOS
- 3 Network Settings
- 4 CVM Settings
- 5 Configure Nodes
- 6 Security

Host and CVM Network

Nutanix requires all hosts and CVMs of a cluster to have static IP addresses in the same subnet.

Gateway of Every Host and CVM Reuse Existing
10.108.1.254

Netmask of Every Host and CVM
255.255.255.0

Cluster Virtual IP (Optional)
10.108.1.137

This IP will always point to an online node, even in case of a node failure. Must be in the host-CVM subnet. Your subnet range is: 10.108.1.0 - 10.108.1.255

If you plan to deploy Nutanix Objects, click here to learn about important network requirements.

Create Deployment

Cluster Virtual IP (Optional)
10.108.1.137

This IP will always point to an online node, even in case of a node failure. Must be in the host-CVM subnet. Your subnet range is: 10.108.1.0 - 10.108.1.255

If you plan to deploy Nutanix Objects, click here to learn about important network requirements.

Host and CVM VLAN

If your host-CVM subnet has a VLAN configuration, enter the tag below. All packets leaving the hosts and the CVMs will be wrapped with this VLAN tag.

VLAN Tag of Every Host and CVM (Optional)

Minimum 1, maximum 4094. If left blank, VLAN 0 will be used.

Hypervisor LACP Configuration

Enable LACP

FEC Mode for VIC Adapter

The FEC mode on the VIC adapter must match what is configured on the ports on the vswitch. Set the FEC mode to cl91 is suitable for most cases, but...

cl91
cl74
Off
cl91

Back

Next

Note: In this deployment, the VLAN tag was not defined (trunk mode) and FEC Mode was selected as CL91. The servers were connected to 25G ports on Nexus 93180YC-FX. The port configuration is detailed below.

```
interface Ethernet1/12
  description connection to C240 M7 nutanix
  switchport mode trunk
  spanning-tree port type edge trunk
  fec rs-fec

interface Ethernet1/13
  description connection to C240 M7 nutanix
  switchport mode trunk
  spanning-tree port type edge trunk
  fec rs-fec

interface Ethernet1/14
  description connection to C240 M7 nutanix
  switchport mode trunk
  spanning-tree port type edge trunk
  fec rs-fec
```

Step 6. Enter the Timezone, DNS and NTP server configuration.

The screenshot shows the 'Create Deployment' wizard in Foundation Central. The 'Time Configuration' section is active, showing a dropdown menu for 'Timezone' set to 'America/Los_Angeles'. Below it, the 'NTP Servers (Optional)' field contains '172.20.10.18,172.20.10.15'. The 'DNS Settings' section shows the 'DNS Servers (Optional)' field with '10.108.1.6'. Each of these three fields is highlighted with a red box. The interface includes a 'Back' button and a 'Next' button at the bottom.

Step 7. Enter the Host IP, CVM IP, and hostnames for all the nodes configured for cluster and click Next.

- Data Resiliency
- Configure Witness
- Degraded Node Settings
- Manage VM High Availability**
- Rebuild Capacity Reservation
- Redundancy State

Manage VM High Availability

Enable HA Reservation

High Availability ensures that VMs can be migrated and restarted on another node in the case of a single-host failure.

Enabled: In the current state of cluster up to **376.36 GiB** of memory will be reserved to protect in the event of a single host failure. Please note that the amount of reserved memory will be dynamically updated in the future to match cluster utilization.

Save

Step 6. Go to the VM tab and create a VM network subnet.

Step 7. Run a NCC check and address warnings such as changing AHV and CVM default passwords.
