

# Introduction

---

This release notes document contains information about downloading and installing the latest Intelligent Node (iNode) 1.0 release. It also provides information for hardware/firmware support, limitations, restrictions, and caveats for the iNode Software.

We recommend that you view the field notices for this release to see if your software or hardware platforms are affected. If you have an account on Cisco.com, you can find field notices at [http://www.cisco.com/en/US/customer/support/tsd\\_products\\_field\\_notice\\_summary.html](http://www.cisco.com/en/US/customer/support/tsd_products_field_notice_summary.html) .

If you do not have a Cisco.com login account, you can find field notices at [http://www.cisco.com/en/US/support/tsd\\_products\\_field\\_notice\\_summary.html](http://www.cisco.com/en/US/support/tsd_products_field_notice_summary.html) .

This chapter includes the following sections:

- [Software, on page 1](#)
- [Functionality Supported, on page 2](#)
- [Instructions for DHCP Custom Options, on page 2](#)
- [Obtaining Documentation and Submitting a Service Request, on page 2](#)

## Software

The following release images will be available via Cisco.com account publishing.

- Intelligent Node
  - `inode-oib.01.00.07.tar.gz`
  - `inode-oib.01.00.07.tar.gz.signature`
- If doing a Field upgrade for U-Boot:
  - `u-boot.01.00.07.tar.gz`
  - `u-boot.01.00.07.tar.gz.signature`
- Intelligent Node App (version 1.0 or later) from a trusted source, such as App Store or Google Play

## Functionality Supported

- Provisioning through Local Control Software (LCS) via Intelligent Node App on smart phone or tablet attached to USB on iNode.
- RF accessories eliminated, attenuation and equalization controlled via software (LCS).
- Internal spectrum analysis displayed via software (LCS) on per port basis.
- Local control and monitoring via LCS.
- Power savings mode.
- Remote software upgrade.
- Ability to adjust reverse attenuation via LCS.
- RF port enable/disable via LCS.
- IPv4/IPv6.

## Instructions for DHCP Custom Options

SLAAC is not supported in this release. If the RPD is running a software version 5.2.x or earlier, to avail IPv6 support and download the iNode software successfully, apply the following DHCP custom options.

In addition to the standard DHCP options required by the OIB for software download, the customer must create 2 custom DHCPv6 options and an optional third option if an IPv6 prefix length other than /64 is required for the OIB.

```
# Define custom options to provide IPv6 Default Route, Prefix and any Static Routes:
# this is a short-term work around until you are able to receive RA messages.
option dhcp6.default-route code 214 = array of ip6-address;
option dhcp6.static-routes code 216 = array of ip6-address;
# add if OIB Prefix Length is something other than the /64 default.
option dhcp6.prefix code 215 = unsigned integer 8;
```

`dhcp6.default-route` is assigned two IPv6 address, order is important, the Gateway Router's Link-Local IPv6 address followed by it's Global IPv6 address.

`dhcp6.static-routes` is assigned a list of IPv6 addresses of any servers the OIB needs to reach that are within the same prefix as the OIB.

`option dhcp6.prefix` is the prefix length the OIB would have been assigned by the Router Advertisement message.

SLACC is not supported. The OIB's Global IP address must be assigned by the DHCPv6 server.

## Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see [What's New in Cisco Product Documentation](#).

To receive new and revised Cisco technical content directly to your desktop, you can subscribe to the [What's New in Cisco Product Documentation RSS feed](#) . The RSS feeds are a free service.
