

Remote LANs

- [Information About Remote LANs, on page 1](#)
- [Configuring Remote LANs \(RLANs\), on page 3](#)

Information About Remote LANs

A Remote LAN (RLAN) is used for authenticating wired clients using the controller. Once the wired client successfully joins the controller, the LAN ports switch the traffic between central or local switching modes. The traffic from wired client is treated as wireless client traffic.

The RLAN in Access Point (AP) sends the authentication request to authenticate the wired client. The authentication of wired client in RLAN is similar to the central authenticated wireless client.

The supported AP models are:

- Cisco Catalyst 9105AXW
- Cisco Aironet OEAP 1810 series
- Cisco Aironet 1815T series
- Cisco Aironet 1810W series
- Cisco Aironet 1815W

Information About Ethernet (AUX) Port

The second Ethernet port in Cisco Aironet 1850, 2800, and 3800 Series APs is used as a link aggregation (LAG) port, by default. It is possible to use this LAG port as an RLAN port when LAG is disabled.

The following APs use LAG port as an RLAN port:

- 1852E
- 1852I
- 2802E
- 2802I
- 3802E
- 3802I

- 3802P
- 4802

Limitation for RLAN

- RLAN supports only a maximum of four wired clients regardless of the AP model.
- RLAN support with Virtual Routing and Forwarding (VRF) is not available.

Limitations for Using AUX port in Cisco 2700 Access Points

- RLAN supports AUX port and non-native VLAN for this port.
- Local mode supports wired client traffic on central switch. Whereas, FlexConnect mode does not support central switch.
- FlexConnect mode supports wired client traffic on local switch and not on central switch.
- AUX port cannot be used as a trunk port. Even switches or bridges cannot be added behind the port.
- AUX port does not support dot1x.

Role of Controller

- The controller acts as an authenticator, and Extensible Authentication Protocol (EAP) over LAN (EAPOL) messages from the wired client reaching the controller through an AP.
- The controller communicates with the configured Authentication, Authorization, and Accounting (AAA) server.
- The controller configures the LAN ports for an AP and pushes them to the corresponding AP.

Note

- RLAN is supported in APs that have more than one Ethernet port.
 - In RLAN (local mode - local switching mode), if you want to use the AP native VLAN for client IP, the VLAN should be configured as either **no vlan** or **vlan 1** in the RLAN policy profile. For example, if the native VLAN ID is 80, do not use the number 80 in the RLAN policy profile. Also, do not use VLAN name *VLANxxx* to configure VLAN in the RLAN policy profile.

When a new client is connected to an AP, the client's details are available in the controller initially. However, after the CAPWAP DOWN/UP state, the client details are no longer listed in the controller.
 - APs in local mode central switching do not support VLAN tagged traffic from RLAN clients, and the traffic gets dropped.
 - The VLAN name (without any numerals) configured in remote-lan-policy does not provide the mapped VLAN ID for central switching.
-

Configuring Remote LANs (RLANs)

Enabling or Disabling all RLANs

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	[no] ap remote-lan shutdown Example: Device(config)# <code>[no] ap remote-lan shutdown</code>	Enables or disables all RLANs.
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Creating RLAN Profile (GUI)

Procedure

-
- Step 1** Choose **Configuration > Tags & Profiles > Remote LAN**.
 - Step 2** Click **Add**.
 - Step 3** Enter the **Profile Name**, **RLAN ID** and enable or disable the **Status** toggle button. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
 - Step 4** Click **Apply to Device**.
-

Creating RLAN Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<p>ap remote-lan profile-name <i>remote-lan-profile-name rlan-id</i></p> <p>Example:</p> <pre>Device(config)# ap remote-lan profile-name rlan_profile_name 3</pre>	<p>Configures remote LAN profile.</p> <ul style="list-style-type: none"> • <i>remote-lan-profile</i>—Is the remote LAN profile name. Range is from 1 to 32 alphanumeric characters. • <i>rlan-id</i>—Is the remote LAN identifier. Range is from 1 to 128. <p>Note You can create a maximum of 128 RLANs. You cannot use the <i>rlan-id</i> of an existing RLAN while creating another RLAN.</p> <p>Both RLAN and WLAN profile cannot have the same names. Similarly, RLAN and WLAN policy profile cannot have the same names.</p>

Configuring RLAN Profile Parameters (GUI)

Procedure

-
- Step 1** Choose **Configuration > Tags & Profiles > Remote LAN**.
- Step 2** On the **RLAN Profile** tab, click **Add**.
The **Add RLAN Profile** window is displayed.
- Step 3** In the **General** tab:
- Enter a **Name** and **RLAN ID** for the RLAN profile. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
 - Set the number of client connections per RLAN in the **Client Association Limit** field.
The range depends on the maximum number of clients supported by the platform.
 - To enable the profile, set the status as **Enable**.
- Step 4** In the **Security > Layer2** tab
- To enable 802.1x for an RLAN, set the **802.1x** status as **Enabled**.
Note You can activate either web or 802.1x authentication list at a time.
 - Choose the authorization list name from the **MAC Filtering** drop-down list.
 - Choose the 802.1x for an RLAN authentication list name from the **Authentication List** drop-down list.
- Step 5** In the **Security > Layer3** tab
- To enable web authentication for an RLAN, set the **Web Auth** status as **Enabled**.
Note You can activate either web or 802.1x authentication list at a time.
 - Choose the web authentication parameter map from the **Webauth Parameter Map** drop-down list.

c) Choose the web authentication list name from the **Authentication List** drop-down list.

Step 6 In the **Security > AAA** tab

a) Set the **Local EAP Authentication** to enabled. Also, choose the required **EAP Profile Name** from the drop-down list.

Step 7 Save the configuration.

Configuring RLAN Profile Parameters (CLI)

Before you begin

The configurations in this section are not mandatory for an RLAN profile.

In case of central switching mode, you need to configure both central switching and central DHCP.

Procedure

	Command or Action	Purpose
Step 1	client association limit <i>client-connections</i> Example: Device(config-remote-lan) # client association limit 1	Configures client connections per RLAN. <i>client-connections</i> —Is the maximum client connections per RLAN. Range is from 0 to 10000. 0 refers to unlimited.
Step 2	ip access-group web <i>IPv4-acl-name</i> Example: Device(config-remote-lan) # ip access-group web acl_name	Configures RLAN IP configuration commands. <i>IPv4-acl-name</i> —Refers to the IPv4 ACL name or ID.
Step 3	local-auth <i>profile name</i> Example: Device(config-remote-lan) # local-auth profile_name	Sets EAP Profile on an RLAN. <i>profile name</i> —Is the EAP profile on an RLAN.
Step 4	mac-filtering <i>mac-filter-name</i> Example: Device(config-remote-lan) # mac-filtering mac_filter	Sets MAC filtering support on an RLAN. <i>mac-filter-name</i> —Is the authorization list name.
Step 5	security dot1x authentication-list <i>list-name</i> Example: Device(config-remote-lan) # security dot1x authentication-list dot1_auth_list	Configures 802.1X for an RLAN. <i>list-name</i> —Is the authentication list name.
Step 6	security web-auth authentication-list <i>list-name</i> Example:	Configures web authentication for an RLAN. <i>list-name</i> —Is the authentication list name.

	Command or Action	Purpose
	Device(config-remote-lan)# security web-auth authentication-list web_auth_list	Note You can activate either web or dot1x authentication list at a time.
Step 7	[no] shutdown Example: Device(config-remote-lan)# shutdown	Enables or disables RLAN profile.
Step 8	end Example: Device(config-remote-lan)# end	Returns to privileged EXEC mode.

Creating RLAN Policy Profile (GUI)

Procedure

-
- Step 1** Choose **Configuration > Wireless > Remote LAN > RLAN Policy**
 - Step 2** Click **Add**.
 - Step 3** In the **General** tab, enter the **Policy Name**.
 - Step 4** Click **Apply to Device**.
-

Creating RLAN Policy Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ap remote-lan-policy policy-name profile name Example: Device(config)# ap remote-lan-policy policy-name rlan_policy_prof_name	Configures RLAN policy profile and enters wireless policy configuration mode.

Configuring RLAN Policy Profile Parameters (GUI)

Procedure

- Step 1** Choose **Configuration > Wireless > Remote LAN**.
- Step 2** On the **Remote LAN** page, click **RLAN Policy** tab.
- Step 3** On the **RLAN Policy** page, click the name of the **Policy** or click **Add** to create a new one.
The **Add/Edit RLAN Policy** window is displayed.
- Step 4** In the **General** tab:
- Enter a **Name** and **Description** for the policy profile.
 - Set **Central Authentication** to **Enabled** state.
 - Set **Central DHCP** to **Enabled** state.
 - Set the **PoE** check box to enable or disable state.
 - To enable the policy, set the status as **Enable**.
- Step 5** In the **Access Policies** Tab, choose the VLAN name or number from the **VLAN** drop-down list.
- Note** When central switching is disabled, the VLAN in the RLAN policy cannot be configured as the AP's native VLAN. To use the AP's native VLAN for client IP, the VLAN should be configured as either **no vlan** or **vlan 1** in the RLAN policy profile.
- Step 6** From the **Host Mode** drop-down list, choose the **Host Mode** for the remote-LAN802.1x from the following options:
- Single-Host Mode—Is the default host mode. In this mode, the switch port allows only a single host to be authenticated and passes traffic one by one.
 - Multi-Host Mode—The first device to authenticate opens up to the switch port, so that all other devices can use the port. You need not authenticate other devices independently, if the authenticated device becomes authorized the switch port is closed.
 - Multi-Domain Mode—The authenticator allows one host from the data domain and another from the voice domain. This is a typical configuration on switch ports with IP phones connected.
- Note**
- For an RLAN profile with open-auth configuration, you must map the RLAN-policy with single host mode. Mapping RLAN-policy with multi-host or multi-domain mode is not supported.
 - The controller does not assign data versus voice VLAN, based on traffic. RLAN only supports multiple VLAN assignments through 802.1x AAA override. You must create data and voice VLANs and then assign these VLANs to respective clients, based on their authentication through the 802.1x AAA override.
- Step 7** Configure IPv6 ACL or Flexible NetFlow.
- Under the **Access Policies > Remote LAN ACL** section, choose the **IPv6 ACL** from the drop-down list.
 - Under the **Access Policies > AVC > Flow Monitor IPv6** section, check the **Egress Status** and **Ingress Status** check boxes and choose the policies from the drop-down lists.
- Step 8** Click the **Advanced** tab.

- a) Configure the violation mode for Remote-LAN 802.1x from the **Violation Mode** drop-down list, choose the violation mode type from the following options:
- Shutdown—Disables the port
 - Replace—Removes the current session and initiates authentication for the new host. This is the default behavior.
 - Protect—Drops packets with unexpected MAC addresses without generating a system message.
- b) Enter the **Session Timeout (sec)** value to define the client's duration of a session.
The range is between 20 and 86400 seconds.
- c) Under **AAA Policy Params** section, check the **AAA Override** check box to enable AAA override.
- d) Under the **Exclusionlist Params** section, check the **Exclusionlist** check box and enter the **Exclusionlist Timeout** value.
This sets the exclusion time for a client. The range is between 0 and 2147483647 seconds. 0 refers to no timeout.

Step 9 Save the configuration.

Configuring RLAN Policy Profile Parameters (CLI)

Before you begin

RLAN does not support the following features:

- Central Web Authentication (CWA)
- Quality of Service (QoS)
- Bi-Directional Rate Limiting (BDRL)
- Identity PSK (iPSK)

Procedure

	Command or Action	Purpose
Step 1	central switching Example: Device (config-remote-lan-policy) # central switching	Configures central switching.
Step 2	central dhcp Example: Device (config-remote-lan-policy) # central dhcp	Configures central DHCP.
Step 3	exclusionlist timeout <i>timeout</i>	Sets exclusion-listing on RLAN.

	Command or Action	Purpose
	Example: Device (config-remote-lan-policy) # exclusionlist timeout 200	<i>timeout</i> —Sets the time, up to which the client will be in excluded state. Range is from 0 to 2147483647 seconds. 0 refers to no timeout.
Step 4	vlan <i>vlan</i> Example: Device (config-remote-lan-policy) # vlan vlan1	Configures VLAN name or ID. - <i>vlan</i> —Is the vlan name.
Step 5	Example: Device (config-remote-lan-policy) # ipv6 acl ipv6_acl	
Step 6	aaa-override Example: Device (config-remote-lan-policy) # aaa-override	Configures AAA policy override.
Step 7	session-timeout <i>timeout in seconds</i> Example: Device (config-remote-lan-policy) # session-timeout 21	Configures client session timeout. <i>timeout in seconds</i> —Defines the duration of a session. Range is from 20 to 86400 seconds.
Step 8	host-mode { multidomain <i>voice domain</i> multihost singlehost } Example: Device (config-remote-lan-policy) # host-mode multidomain	Configures host mode for remote-LAN 802.1x. <i>voice domain</i> —Is the RLAN voice domain VLAN ID. Range is from 0 to 65535. You can configure the following IEEE 802.1X authentication modes: <ul style="list-style-type: none"> • Multi-Domain Mode—The authenticator allows one host from the data domain and another from the voice domain. This is a typical configuration on switch ports with IP phones connected. • Multi-Host Mode—The first device to authenticate opens up to the switch port, so that all other devices can use the port. You need not authenticate other devices independently, if the authenticated device becomes authorized the switch port is closed. • Single-Host Mode—Is the default host mode. In this mode, the switch port allows only a single host to be authenticated and passes traffic one by one.

	Command or Action	Purpose
Step 9	violation-mode {protect replace shutdown} Example: Device (config-remote-lan-policy) # violation-mode protect	Configures violation mode for Remote-LAN 802.1x. When a security violation occurs, a port is protected based on the following configured violation actions: <ul style="list-style-type: none"> • Shutdown—Disables the port. • Replace—Removes the current session and initiates authentication for the new host. This is the default behavior. • Protect—Drops packets with unexpected MAC addresses without generating a system message. In the single-host authentication mode, a violation is triggered when more than one device is detected in data VLAN. In a multi-host authentication mode, a violation is triggered when more than one device is detected in data VLAN or voice VLAN.
Step 10	[no] poe Example: Device (config-remote-lan-policy) # poe	Enables or disables PoE.
Step 11	[no] shutdown Example: Device (config-remote-lan-policy) # shutdown	Enables or disables an RLAN policy profile.
Step 12	end Example: Device (config-remote-lan-policy) # end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Policy Tag and Mapping an RLAN Policy Profile to an RLAN Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	wireless tag policy <i>policy-tag-name</i> Example: Device(config)# wireless tag policy remote-lan-policy-tag	Configures policy tag and enters policy tag configuration mode.
Step 3	remote-lan <i>remote-lan-profile-name</i> policy <i>rlan-policy-profile-name</i> port-id <i>port-id</i> Example: Device(config-policy-tag)# remote-lan rlan_profile_name <i>policy</i> rlan_policy_profile <i>port-id</i> 2	Maps an RLAN policy profile to an RLAN profile. <ul style="list-style-type: none"> • <i>remote-lan-profile-name</i>—Is the name of the RLAN profile. • <i>rlan-policy-profile-name</i>—Is the name of the policy profile. • <i>port-id</i>—Is the LAN port number on the access point. Range is from 1 to 4.
Step 4	end Example: Device(config-policy-tag)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring LAN Port (CLI)

Procedure

	Command or Action	Purpose
Step 1	ap name <i>ap name</i> lan port-id <i>lan port id</i> { disable enable } Example: Device# ap name L2_1810w_2 lan port-id 1 enable	Configures a LAN port. <ul style="list-style-type: none"> • enable—Enables the LAN port. • disable—Disables the LAN port.

Attaching Policy Tag to an Access Point (GUI)

Procedure

-
- Step 1** Choose **Configuration > Wireless > Access Points**.
- Step 2** Select the AP to attach the Policy Tag.
- Step 3** Under the **Tags** section, use the **Policy** drop-down to select a policy tag.
- Step 4** Click **Update & Apply to Device**.
-

Attaching Policy Tag to an Access Point (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ap ap-ethernet-mac Example: Device(config)# <code>ap 00a2.891c.21e0</code>	Configures MAP address for an AP and enters AP configuration mode.
Step 3	policy-tag policy-tag-name Example: Device(config-ap-tag)# <code>policy-tag remote-lan-policy-tag</code>	Attaches policy tag to the access point. <i>policy-tag-name</i> —Is the name of the policy tag defined earlier.
Step 4	end Example: Device(config-ap-tag)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Verifying RLAN Configuration

To view the summary of all RLANs, use the following command:

```
Device# show remote-lan summary
```

```
Number of RLANs: 1
```

```

RLAN          Profile Name          Status
-----
1             rlan_test_1          Enabled

```

To view the RLAN configuration by ID, use the following command:

```
Device# show remote-lan id <id>
```

```

Remote-LAN Profile Name          : rlan_test_1
=====
Identifier                        : 1
Status                            : Enabled
Mac-filtering                     : Not Configured
Number of Active Clients          : 1
Security_8021X                    : Disabled
8021.x Authentication list name   : Not Configured
Local Auth eap Profile Name       : Not Configured
Web Auth Security                 : Disabled
Webauth Authentication list name  : Not Configured

```
Device# show remote-lan policy summary
```

```
Number of Policy Profiles: 1
```

Profile Name	Description	Status
rlan_named_pp1	Testing RLAN policy profile	Enabled

To view the LAN port configuration of a Cisco AP, use the following command:

```

Device# show ap name <ap_name> lan port summary
LAN Port status for AP L2_1815w_1
Port ID      status      vlanId      poe
-----
LAN1         Enabled     20          Disabled
LAN2         Enabled     20          NA
LAN3         Disabled    0           NA

```

To view the summary of all clients, use the following command:

```

Device# show wireless client summary
Number of Local Clients: 1

```

MAC Address	AP Name	WLAN	State	Protocol	Method	Role
d8eb.97b6.fcc6	L2_1815w_1	1	* Run	Ethernet	None	Local

To view the client details with the specified username, use the following command:

```

Device# show wireless client username cisco

```

MAC Address	AP Name	Status	WLAN	Auth Protocol
0014.d1da.a977	L2_1815w_1	Run 1 *	Yes	Ethernet
d8eb.97b6.fcc6	L2_1815w_1	Run 1 *	Yes	Ethernet

To view the detailed information for a client by MAC address, use the following command:

```

Device# show wireless client mac-address d8eb.97b6.fcc6 detail

```

```
