## Information About Locally Significant Certificates

This module explains how to configure the Cisco Embedded Wireless Controller on Catalyst Access Points and Lightweight Access Points (LAPs) to use the Locally Significant Certificate (LSC). If you choose the Public Key Infrastructure (PKI) with LSC, you can generate the LSC on the APs and embedded wireless controllers. You can then use the certificates to mutually authenticate the embedded wireless controller and the APs.

In Cisco embedded wireless controllers, you can configure the embedded wireless controller to use an LSC. Use an LSC if you want your own PKI to provide better security, have control of your Certificate Authority (CA), and define policies, restrictions, and usages on the generated certificates.

You need to provision the new LSC certificate on the embedded wireless controller and then the Lightweight Access Point (LAP) from the CA Server.

The LAP communicates with the embedded wireless controller using the CAPWAP protocol. Any request to sign the certificate and issue the CA certificates for LAP and embedded wireless controller itself must be initiated from the embedded wireless controller. The LAP does not communicate directly with the CA server. The CA server details must be configured on the embedded wireless controller and must be accessible.

The embedded wireless controller makes use of the Simple Certificate Enrollment Protocol (SCEP) to forward certReqs generated on the devices to the CA and makes use of SCEP again to get the signed certificates from the CA.

The SCEP is a certificate management protocol that the PKI clients and CA servers use to support certificate enrollment and revocation. It is widely used in Cisco and supported by many CA servers. In SCEP, HTTP is used as the transport protocol for the PKI messages. The primary goal of SCEP is the secure issuance of certificates to network devices. SCEP is capable of many operations, but for our release, SCEP is utilized for the following operations:

- CA and Router Advertisement (RA) Public Key Distribution

- Certificate Enrollment

## Certificate Provisioning in Controllers

The new LSC certificates, both CA and device certificates, must be installed on the controller.

With the help of SCEP, CA certificates are received from the CA server. During this point, there are no certificates in the controller. After the **get** operation of obtaining the CA certificates, are installed on the controller. The same CA certificates are also pushed to the APs when the APs are provisioned with LSCs.

---

**Note** We recommend that you use a new RSA keypair name for the newly configured PKI certificate. If you want to reuse an existing RSA keypair name (that is associated with an old certificate) for a new PKI certificate, do either of the following:

- Do not regenerate a new RSA keypair with an existing RSA keypair name, reuse the existing RSA keypair name. Regenerating a new RSA keypair with an existing RSA keypair name will make all the certificates associated with the existing RSA keypair invalid.
  - Manually remove the old PKI certificate configurations first, before reusing the existing RSA keypair name for the new PKI certificate.
- 

## Device Certificate Enrollment Operation

For both the LAP and the controller that request a CA-signed certificate, the certRequest is sent as a PKCS#10 message. The certRequest contains the Subject Name, Public Key, and other attributes to be included in the X.509 certificate, and must be digitally signed by the Private Key of the requester. These are then sent to the CA, which transforms the certRequest into an X.509 certificate.

The CA that receives a PKCS#10 certRequest requires additional information to authenticate the requester's identity and verify if the request is unaltered. (Sometimes, PKCS#10 is combined with other approaches, such as PKCS#7 to send and receive the certificate request or response.)

The PKCS#10 is wrapped in a PKCS#7 Signed Data message type. This is supported as part of the SCEP client functionality, while the PKCSReq message is sent to the controller. Upon successful enrollment operation, both the CA and device certificates are available on the controller.

## Certificate Provisioning on Lightweight Access Point

In order to provision a new certificate on LAP, while in CAPWAP mode, the LAP must be able to get the new signed X.509 certificate. In order to do this, it sends a certRequest to the controller, which acts as a CA proxy and helps obtain the certRequest signed by the CA for the LAP.

The certReq and the certResponses are sent to the LAP with the LWAPP payloads.

Both the LSC CA and the LAP device certificates are installed in the LAP, and the system reboots automatically. The next time when the system comes up, because it is configured to use LSCs, the AP sends the LSC device certificate to the controller as part of the JOIN Request. As part of the JOIN Response, the controller sends the new device certificate and also validates the inbound LAP certificate with the new CA root certificate.

**What to Do Next**

To configure, authorize, and manage certificate enrollment with the existing PKI infrastructure for controller and AP, you need to use the LSC provisioning functionality.

## Restrictions for Locally Significant Certificates

- LSC workflow is different in FIPS+WLANCC mode. CA server must support Enrollment over Secure Transport (EST) protocol and should be capable of issuing EC certificates in FIPS+WLANCC mode.
- Elliptic Curve Digital Signature Algorithm (ECDSA) cipher works only if both AP and controller are having EC certificates, provisioned with LSC.
- EC certificates (LSC-EC) can be provisioned only if CA server supports EST (and not SCEP).
- FIPS + CC security modes is required to be configured in order to provision EC certificate.

## Provisioning Locally Significant Certificates

### Configuring RSA Key for PKI Trustpoint

**Procedure**

|               | Command or Action  | Purpose   |
|---------------|--|---|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>  | Enters global configuration mode.   |
| <b>Step 2</b> | <b>crypto key generate rsa [exportable]</b><br><b>general-keys modulus <i>key_size</i> label <i>RSA_key</i></b><br><br><b>Example:</b><br>Device(config)# <code>crypto key generate rsa exportable general-keys modulus 2048 label lsc-tp</code> | Configures RSA key for PKI trustpoint.<br><br><b>exportable</b> is an optional keyword. You may or may not want to configure an exportable-key. If selected, you can export the key out of the box, if required<br><br><ul style="list-style-type: none"> <li>• <i>key_size</i>: Size of the key modulus. The valid range is from 2048 to 4096.</li> <li>• <i>RSA_key</i>: RSA key pair label.</li> </ul> |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# <code>end</code>  | Returns to privileged EXEC mode.  |

## Configuring PKI Trustpoint Parameters

### Procedure

|               | Command or Action   | Purpose   |
|---------------|---|---|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>   | Enters global configuration mode.   |
| <b>Step 2</b> | <b>crypto pki trustpoint <i>trustpoint_name</i></b><br><br><b>Example:</b><br>Device(config)# <code>crypto pki trustpoint microsoft-ca</code>   | Creates a new trustpoint for an external CA server. Here, <i>trustpoint_name</i> refers to the trustpoint name.   |
| <b>Step 3</b> | <b>enrollment url <i>HTTP_URL</i></b><br><br><b>Example:</b><br>Device(ca-trustpoint)# <code>enrollment url http://CA_server/certsrv/mscep/mscep.dll</code>                                     | Specifies the URL of the CA on which your router should send certificate requests.<br><br><b>url url:</b> URL of the file system where your router should send certificate requests. An IPv6 address can be added in the URL enclosed in brackets. For example: <code>http://[2001:DB8:1:1::1]:80</code> . For more enrollment method options, see the enrollment url (ca-trustpoint) command page. |
| <b>Step 4</b> | <b>subject-name <i>subject_name</i></b><br><br><b>Example:</b><br>Device(ca-trustpoint)# <code>subject-name C=IN, ST=KA, L=Bengaluru, O=Cisco, CN=eagle-eye/emailAddress=support@abc.com</code> | Creates subject name parameters for the trustpoint.   |
| <b>Step 5</b> | <b>rsakeypair <i>RSA_key key_size</i></b><br><br><b>Example:</b><br>Device(ca-trustpoint)# <code>rsakeypair ewlc-tp1</code>   | Maps RSA key with that of the trustpoint.<br><ul style="list-style-type: none"><li>• <i>RSA_key</i>: RSA key pair label.</li><li>• <i>key_size</i>: Signature key length. Range is from 360 to 4096.</li></ul>  |
| <b>Step 6</b> | <b>revocation {crl   none   ocsf}</b><br><br><b>Example:</b><br>Device(ca-trustpoint)# <code>revocation none</code>   | Checks revocation.  |
| <b>Step 7</b> | <b>end</b><br><br><b>Example:</b><br>Device(ca-trustpoint)# <code>end</code>  | Returns to privileged EXEC mode.  |

## Authenticating and Enrolling a PKI Trustpoint (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **PKI Management** window, click the **Trustpoints** tab.
- Step 3** In the **Add Trustpoint** dialog box, provide the following information:
- In the **Label** field, enter the RSA key label.
  - In the **Enrollment URL** field, enter the enrollment URL.
  - Check the **Authenticate** check box to authenticate the Public Certificate from the enrollment URL.
  - In the **Subject Name** section, enter the **Country Code, State, Location, Organisation, Domain Name, and Email Address**.
  - Check the **Key Generated** check box to view the available RSA keypairs. Choose an option from the **Available RSA Keypairs** drop-down list.
  - Check the **Enroll Trustpoint** check box.
  - In the **Password** field, enter the password.
  - In the **Re-Enter Password** field, confirm the password.
  - Click **Apply to Device**.
- The new trustpoint is added to the trustpoint name list.
- 

## Authenticating and Enrolling the PKI Trustpoint with CA Server (CLI)

### Procedure

|               | Command or Action   | Purpose                           |
|---------------|---|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# configure terminal  | Enters global configuration mode. |
| <b>Step 2</b> | <b>crypto pki authenticate trustpoint_name</b><br><br><b>Example:</b><br>Device(config)# <b>crypto pki authenticate microsoft-ca</b>        | Fetches the CA certificate.       |
| <b>Step 3</b> | <b>yes</b><br><br><b>Example:</b><br>Device(config)# % Do you accept this certificate? [yes/no]:<br>yes Trustpoint CA certificate accepted. |                                   |
| <b>Step 4</b> | <b>crypto pki enroll trustpoint_name</b><br><br><b>Example:</b>   | Enrolls the client certificate.   |

|                | Command or Action  | Purpose  |
|----------------|--|--|
|                | <pre>Device(config)# crypto pki enroll microsoft-ca % % Start certificate enrollment .. % Create a challenge password. You will need to verbally provide this password to the CA Administrator in order to revoke your certificate. For security reasons your password will not be saved in the configuration. Please make a note of it.</pre> |  |
| <b>Step 5</b>  | <pre>password Example: Device(config)# abcd123</pre>   | Enters a challenge password to the CA server.    |
| <b>Step 6</b>  | <pre>password Example: Device(config)# abcd123</pre>   | Re-enters a challenge password to the CA server. |
| <b>Step 7</b>  | <pre>yes Example: Device(config)# % Include the router serial number in the subject name? [yes/no]: yes</pre>  |  |
| <b>Step 8</b>  | <pre>no Example: Device(config)# % Include an IP address in the subject name? [no]: no</pre>   |  |
| <b>Step 9</b>  | <pre>yes Example: Device(config)# Request certificate from CA? [yes/no]: yes % Certificate request sent to Certificate Authority % The 'show crypto pki certificate verbose client' command will show the fingerprint.</pre>   |  |
| <b>Step 10</b> | <pre>end Example: Device(config)# end</pre>  | Returns to privileged EXEC mode.                 |

## Configuring AP Join Attempts with LSC Certificate (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
  - Step 2** In the **All Access Points** window, click the LSC Provision name.
  - Step 3** From the **Status** drop-down list, choose a status to enable LSC.
  - Step 4** From the **Trustpoint Name** drop-down list, choose the trustpoint.
  - Step 5** In the **Number of Join Attempts** field, enter the number of retry attempts that will be permitted.
  - Step 6** Click **Apply**.
- 

## Configuring AP Join Attempts with LSC Certificate (CLI)

### Procedure

|               | Command or Action   | Purpose  |
|---------------|---|--|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>   | Enters global configuration mode.  |
| <b>Step 2</b> | <b>ap lsc-provision join-attempt</b><br><i>number_of_attempts</i><br><br><b>Example:</b><br>Device(config)# <code>ap lsc-provision</code><br><code>join-attempt 10</code> | Specifies the maximum number of AP join failure attempts with the newly provisioned LSC certificate.<br><br>When the number of AP joins exceed the specified limit, AP joins back with the Manufacturer Installed Certificate (MIC). |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# <code>end</code>   | Returns to privileged EXEC mode.<br>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.   |

## Configuring Subject-Name Parameters in LSC Certificate

### Procedure

|               | Command or Action   | Purpose                           |
|---------------|---|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters global configuration mode. |

|               | Command or Action   | Purpose  |
|---------------|---|--|
| <b>Step 2</b> | <p><b>ap lsc-provision subject-name-parameter</b><br/> <b>country</b> <i>country-str</i> <b>state</b> <i>state-str</i> <b>city</b> <i>city-str</i><br/> <b>domain</b> <i>domain-str</i> <b>org</b> <i>org-str</i> <b>email-address</b><br/> <i>email-addr-str</i></p> <p><b>Example:</b></p> <pre>Device(config)# ap lsc-provision subject-name-parameter country India state Karnataka city Bangalore domain domain1 org Right email-address adc@gfe.com</pre> | Specifies the attributes to be included in the subject-name parameter of the certificate request generated by an AP. |
| <b>Step 3</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>   | Returns to privileged EXEC mode.   |

## Configuring Key Size for LSC Certificate

### Procedure

|               | Command or Action   | Purpose   |
|---------------|---|---|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>   | Enters global configuration mode.   |
| <b>Step 2</b> | <p><b>ap lsc-provision key-size { 2048   3072   4096 }</b></p> <p><b>Example:</b></p> <pre>Device(config)# ap lsc-provision key-size 2048</pre> | Specifies the size of keys to be generated for the LSC on AP.   |
| <b>Step 3</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>   | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring Trustpoint for LSC Provisioning on an Access Point

### Procedure

|               | Command or Action   | Purpose                           |
|---------------|---|-----------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre> | Enters global configuration mode. |

|               | Command or Action   | Purpose   |
|---------------|---|---|
| <b>Step 2</b> | <b>ap lsc-provision trustpoint <i>tp-name</i></b><br><b>Example:</b><br>Device(config)# <b>ap lsc-provision trustpoint microsoft-ca</b> | Specifies the trustpoint with which the LCS is provisioned to an AP.<br><br><i>tp-name</i> : The trustpoint name. |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>   | Returns to privileged EXEC mode.  |

## Configuring an AP LSC Provision List (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
- Step 2** In the **All Access Points** window, click the corresponding LSC Provision name.
- Step 3** From the **Status** drop-down list, choose a status to enable LSC.
- Step 4** From the **Trustpoint Name** drop-down list, choose a trustpoint.
- Step 5** In the **Number of Join Attempts** field, enter the number of retry attempts that are allowed.
- Step 6** From the **Key Size** drop-down list, choose a key.
- Step 7** In the **Edit AP Join Profile** window, click the **CAPWAP** tab.
- Step 8** In the **Add APs to LSC Provision List** section, click **Select File** to upload the CSV file that contains AP details.
- Step 9** Click **Upload File**.
- Step 10** In the **AP MAC Address** field, enter the AP MAC address. and add them. (The APs added to the provision list are displayed in the **APs in provision List** .)
- Step 11** In the **Subject Name Parameters** section, enter the following details:
- **Country**
  - **State**
  - **City**
  - **Organisation**
  - **Department**
  - **Email Address**
- Step 12** Click **Apply**.
-

## Configuring an AP LSC Provision List (CLI)

### Procedure

|               | Command or Action  | Purpose   |
|---------------|--|---|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# configure terminal   | Enters global configuration mode.   |
| <b>Step 2</b> | <b>ap lsc-provision mac-address <i>mac-addr</i></b><br><br><b>Example:</b><br>Device(config)# ap lsc-provision<br>mac-address 001b.3400.02f0 | Adds the AP to the LSC provision list.<br><br><b>Note</b> You can provision a list of APs using the <b>ap lsc-provision provision-list</b> command.<br><br>(Or)<br><br>You can provision all the APs using the <b>ap lsc-provision</b> command. |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# end   | Returns to privileged EXEC mode.  |

## Configuring LSC Provisioning for all the APs (GUI)

### Procedure

**Step 1** Choose **Configuration > Wireless > Access Points**.

**Step 2** In the **Access Points** window, expand the **LSC Provision** section.

**Step 3** Set **Status** to **Enabled** state.

**Note** If you set **Status** to **Provision List**, LSC provisioning will be configured only for APs that are a part of the provision list.

**Step 4** From the **Trustpoint Name** drop-down list, choose the appropriate trustpoint for all APs.

**Step 5** In the **Number of Join Attempts** field, enter the number of retry attempts that the APs can make to join the embedded wireless controller.

**Step 6** From the **Key Size** drop-down list, choose the appropriate key size of the certificate:

- 2048
- 3072
- 4096

**Step 7** In the **Add APs to LSC Provision List** section, click **Select File** to upload the CSV file that contains the AP details.

- Step 8** Click **Upload File**.
- Step 9** In the **AP MAC Address** field, enter the AP MAC address. (The APs that are added to the provision list are displayed in the **APs in Provision List** section.)
- Step 10** In the **Subject Name Parameters** section, enter the following details:
- a. **Country**
  - b. **State**
  - c. **City**
  - d. **Organization**
  - e. **Department**
  - f. **Email Address**
- Step 11** Click **Apply**.

## Configuring LSC Provisioning for All APs (CLI)

### Procedure

|               | Command or Action  | Purpose  |
|---------------|--|--|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal     | Enters global configuration mode.  |
| <b>Step 2</b> | <b>ap lsc-provision</b><br><b>Example:</b><br>Device(config)# ap lsc-provision | Enables LSC provisioning for all APs.<br>By default, LSC provisioning is disabled for all APs. |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                           | Returns to privileged EXEC mode.   |

## Configuring LSC Provisioning for the APs in the Provision List

### Procedure

|               | Command or Action  | Purpose                           |
|---------------|--|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal | Enters global configuration mode. |

|               | Command or Action   | Purpose   |
|---------------|---|---|
| <b>Step 2</b> | <b>ap lsc-provision provision-list</b><br><b>Example:</b><br>Device(config)# <b>ap lsc-provision provision-list</b> | Enables LSC provisioning for a set of APs configured in the provision list.   |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>   | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Unprovisioning Local Significant Certificates

To unprovision the Local Significant Certificates (LSC), complete the following steps:

1. Move the chassis to WLAN Common Criteria (WLANCC) mode.
2. Reload the APs by provisioning LSC and the wireless management trustpoint. For more information, refer to [Configuring LSC Provisioning and Management Trustpoint, on page 12](#).
3. Remove Federal Information Processing Standard (FIPS) and WLANCC. For more information, refer to [Removing FIPS and WLAN Common Criteria, on page 13](#).
4. Remove LSC provisioning. For more information, refer to [Removal of LSC Provisioning, on page 14](#).

## Configuring LSC Provisioning and Management Trustpoint

### Before you begin

When EWC HA pair is used note the name of the Standby Access Point. Use the **show chassis** command.

### Procedure

|               | Command or Action   | Purpose  |
|---------------|---|--|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>   | Enters global configuration mode.              |
| <b>Step 2</b> | <b>ap lsc-provision</b><br><b>Example:</b><br>Device(config)# <b>ap lsc-provision</b>   | Configures the AP LSC Provisioning parameters. |
| <b>Step 3</b> | <b>wireless management trustpoint</b><br><i>trustpoint_name</i><br><b>Example:</b><br>Device(config)# wireless management trustpoint <i>trustpoint-name</i> | Configures the management trustpoint to LSC.   |

|               | Command or Action   | Purpose  |
|---------------|---|--|
| <b>Step 4</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config<br>startup-config | Saves the configuration.<br><br>Wait for the standby AP to join the controller.<br>The HA pair will not be formed at this point.                           |
| <b>Step 5</b> | <b>wireless ewc-ap ap reload</b><br><b>Example:</b><br>Device# wireless ewc-ap ap reload                      | Reloads the internal AP. This will also reload<br>the controller on the AP.<br><br>Standby AP starts the controller and becomes<br>new Active for HA pair. |

## Removing FIPS and WLAN Common Criteria

### Procedure

|               | Command or Action  | Purpose                                  |
|---------------|--|--|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>  | Enters global configuration mode.        |
| <b>Step 2</b> | <b>ap dtls-version dtls_1_2</b><br><b>Example:</b><br>Device(config)# <b>ap dtls-version</b><br><b>dtls_1_2</b>  | Configures the AP DTLS version.          |
| <b>Step 3</b> | <b>ap dtls-cipher</b><br><i>ECDHE-ECDSA-AES256-GCM-SHA384</i><br><b>Example:</b><br>Device(config)# ap dtls-cipher<br><i>ECDHE-ECDSA-AES256-GCM-SHA384</i> | Configures the AP DTLS ciphersuite.      |
| <b>Step 4</b> | <b>no wireless wlanc</b><br><b>Example:</b><br>Device(config)# no wireless wlanc   | Disables WLAN CC on the controller.      |
| <b>Step 5</b> | <b>no fips authorization-key</b><br><b>Example:</b><br>Device(config)# no fips authorization-key   | Disables the authorization key for FIPS. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end   | Returns to privileged EXEC mode.         |
| <b>Step 7</b> | <b>write memory</b><br><b>Example:</b>   | Saves the configuration.                 |

|               | Command or Action                                  | Purpose   |
|---------------|--|---|
|               | Device# write memory                               |   |
| <b>Step 8</b> | <b>reload</b><br><b>Example:</b><br>Device# reload | Reloads the internal AP to move on to non-FIPS and non-CC mode. |

## Removal of LSC Provisioning

### Before you begin

Wait for the standby AP to come up.

### Procedure

|               | Command or Action   | Purpose                                      |
|---------------|---|--|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>   | Enters global configuration mode.            |
| <b>Step 2</b> | <b>no ap lsc-provision</b><br><b>Example:</b><br>Device(config)# <b>no ap lsc-provision</b>   | Disables AP LSC provisioning parameters.     |
| <b>Step 3</b> | <b>no ap dtls-cipher<br/>           ECDHE-ECDSA-AES256-GCM-SHA384</b><br><b>Example:</b><br>Device(config)# <b>no ap dtls-cipher<br/>           ECDHE-ECDSA-AES256-GCM-SHA384</b> | Disables AP DTLS cipher suite.               |
| <b>Step 4</b> | <b>no ap dtls-version dtls_1_2</b><br><b>Example:</b><br>Device(config)# <b>no ap dtls-version<br/>           dtls_1_2</b>  | Disables the DTLS version.                   |
| <b>Step 5</b> | <b>no wireless management trustpoint</b><br><b>Example:</b><br>Device(config)# <b>no wireless<br/>           management trustpoint</b>  | Disables the wireless management trustpoint. |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config<br/>           startup-config</b>  | Saves the configuration changes.             |

|               | Command or Action  | Purpose                  |
|---------------|--|--------------------------|
| <b>Step 7</b> | <b>wireless ewc-ap ap reload</b><br><b>Example:</b><br>Device# wireless ewc-ap ap reload | Reloads the internal AP. |

## Verifying LSC Configuration

To view the details of the wireless management trustpoint, use the following command:

```
Device# show wireless management trustpoint
```

```
Trustpoint Name : microsoft-ca
Certificate Info : Available
Certificate Type : LSC
Certificate Hash : 9e5623adba5307facf778e6ea2f5082877ea4beb
Private key Info : Available
```

To view the LSC provision-related configuration details for an AP, use the following command:

```
Device# show ap lsc-provision summary
```

```
AP LSC-provisioning : Disabled
Trustpoint used for LSC-provisioning : microsoft-ca
LSC Revert Count in AP reboots : 10
```

```
AP LSC Parameters :
Country : IN
State : KA
City : BLR
Orgn : ABC
Dept : ABC
Email : support@abc.com
Key Size : 2048
```

```
AP LSC-provision List : Enabled
Total number of APs in provision list: 3
```

```
Mac Address
-----
0038.df24.5fd0
2c5a.0f22.d4ca
e4c7.22cd.b74f
```

## Configuring Management Trustpoint to LSC (GUI)

### Procedure

- 
- Step 1** Choose **Administration > Management > HTTP/HTTPS**.
  - Step 2** In the **HTTP Trust Point Configuration** section, set **Enable Trust Point** to the **Enabled** state.
  - Step 3** From the **Trust Points** drop-down list, choose the appropriate trustpoint.

**Step 4** Save the configuration.

## Configuring Management Trustpoint to LSC (CLI)

After LSC provisioning, the APs will automatically reboot and join at the LSC mode after bootup. Similarly, if you remove the AP LSC provisioning, the APs reboot and join at non-LSC mode.

In EWC, the internal APs will not automatically reboot. You should manually reboot the internal AP to make it work in LSC and non-LSC mode.

### Procedure

|               | Command or Action  | Purpose  |
|---------------|--|--|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>  | Enters global configuration mode.  |
| <b>Step 2</b> | <b>wireless management trustpoint</b><br><i>trustpoint_name</i><br><b>Example:</b><br>Device(config)# <code>wireless management trustpoint microsoft-ca</code> | Configures the management trustpoint to LSC.<br><br>The internal AP will not be able to join before a reload, so follow the steps given below to reload the internal AP. |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>  | Returns to privileged EXEC mode.<br>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.   |
| <b>Step 4</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>  | Saves the configuration.   |
| <b>Step 5</b> | <b>wireless ewc-ap ap reload</b><br><b>Example:</b><br>Device# <code>wireless ewc-ap ap reload</code>  | Reloads the internal AP. This will also reload the controller on the AP.   |
