## Feature Summary and Revision History

### Summary Data

*Table 1: Summary Data*

Applicable Product(s) or Functional Area	PCF
Applicable Platform(s)	SMI
Feature Default Setting	Disabled – Configuration required to enable
Related Documentation	Not Applicable

### Revision History

*Table 2: Revision History*

Revision Details	Release
Enhancement introduced. PCF supports message threshold per endpoint.	2022.02.0
Enhancement introduced. Added procedure to configure the N7 stale session error codes.	2020.05.01
First introduced.	2020.01.0

# Feature Description

The PCF Ops Center allows you to configure the advanced tuning parameters for PCF. The tuning parameters primarily consist of the async-threading and http2-threading parameters. These parameters provide the flexibility of the tuning threads responsible for PCF's incoming and outgoing requests over HTTP.

**Note** Configure the advanced tuning parameter values only if you have a strong understanding of the PCF deployment.

PCF supports the message threshold per endpoint.

**Note** Message threshold is applicable only for the configured message types in rest-endpoint

# Configuration Support for the Advanced Tuning Parameters

This section describes how to configure the advanced tuning parameters using the CLI. The configuration of the advanced tuning parameters involves:

- Configuring the Async Threading Parameters
- Configuring the HTTP2 Threading Parameters
- Configuring the N7 Stale Session Error Codes
- Configuring the Message Threshold Per Endpoint

## Configuring the Async Threading Parameters

This section describes how to fine tune the async threading parameters.

To configure the http2-threading parameters, use the following configuration in the Policy Ops Center console:

```
config
  advance-tuning
    async-threading
      default-priority default_priority
      default-worker-threads default_worker_threads
      default-queue-size default_queue_size
      default-processing-threads default_processing_threads
      default-drop-oldest-when-full [ true | false ]
      threading-config service_name
      priority priority
      queue-size queue_size
      threads number_threads
    end
```

NOTES:

- **advance-tuning**—Enters the advance tuning configuration mode.
- **async-threading**—Enters the async threading configuration mode.
- **default-priority *default\_priority***—Specify the default priority level.
- **default-worker-threads *default\_worker\_threads***—Specify the default number of worker threads.
- **default-queue-size *default\_queue\_size***—Specify the default size of the queue.
- **default-processing-threads *default\_processing\_threads***—Specify the default number of threads used for processing.
- **default-drop-oldest-when-full [ true | false ]**—Indicates if the oldest message in the queue should be removed when the queue is full.
- **threading-config *service\_name***—Specify the service name for which the threading configuration is enabled.
- **priority *priority***—Specify the priority of the thread.
- **queue-size *queue\_size***—Specify the queue size.
- **threads *number\_threads***—Specify the number of threads to be processed.

## Configuring the HTTP2 Threading Parameters

This section describes how to refine the http2-threading parameters.

To configure the http2-threading parameters, use the following configuration in the Policy Ops Center console:

```
config
    http2-threading
        min-thread-pool-size min_thread_pool
        max-thread-pool-size max_thread_pool
        idle-thread-timeout-ms idle_thread_timeout
        max-queue-capacity max_queue_capacity
        disable-validation [ true | false ]
    end
```

### NOTES:

- **http2-threading *http2\_threading***—Specify the parameters for inbound SBA requests that are received by PCF.
- **min-thread-pool-size *min\_thread\_pool***—Specify the minimum number of threads for processing the inbound SBA request. The accepted range contains integers. Default value is 5.
- **max-thread-pool-size *max\_thread\_pool***—Specify the maximum size of the thread pool.
- **idle-thread-timeout-ms *idle\_thread\_timeout***—Specify the time in milliseconds that the thread can remain idle. *idle\_thread\_timeout* must contain only integers. Default value is 60000.
- **disable-validation [ true | false ]**—Disables the validation of the request sent to PCF. [ **true | false** ] must contain the value as true or false. Default value is false.
- **max-queue-capacity *max\_queue\_capacity***—Specify the maximum number of requests that can wait in the queue for processing. *max\_queue\_capacity* must contain only integers. Default value is 5000.

- **max-thread-pool-size** *max\_thread\_pool*—Specify the maximum number of threads that PCF can accommodate in the pool. *max\_thread\_pool\_size* must contain only integers. Default value is 20.

## Configuring the N7 Stale Session Error Codes

This section describes how to configure the error codes for the N7 stale sessions.

To configure the n7-stale-session-error-codes parameters, use the following configuration in the Policy Ops Center console:

```
config
  advance-tuning
    n7-stale-session-error-codes error_codes
  end
```

### NOTES:

- **n7-stale-session-error-codes** *error\_codes*—Specify the error code values for the N7 sessions. When a session is idle, the PCF revalidates it by using the N7NotifyUpdate request. If the N7NotifyUpdate response includes any one or more specified error codes, then the session expiry time is reverted to original value.

You can specify multiple error codes using comma-separated values.

## Configuring the Message Threshold Per Endpoint

This section describes how to configure the message threshold enhancement.

To configure the message threshold enhancement, use the following configuration in the Policy Ops Center console:

```
config
  advance-tuning
    overload-control
      rest
        global
          action threshold-action { N7_CREATE | N7_DELETE | N7_UPDATE
          | N15_CREATE | N15_DELETE | N15_UPDATE }
            discard-action { DROP | REJECT } threshold-count
threshold_count
  end
```

### NOTES:

- **discard-action** { **DROP** | **REJECT** } **threshold-count** *threshold\_count*—Specify the type of discard-action when the message is received at endpoint. The threshold-count provides the maximum number of inbound messages for each threshold-action configured per endpoint. For example, N7\_CREATE or N7\_DELETE.

## OAM Support

This section describes operations, administration, and maintenance information for this feature.

## Bulk Statistics Support

This section provides the list of statistics and counters that are generated for the monitoring for message threshold enhancement.

**Note** The following values apply to all the statistics:

- Unit - Int64
- Type - Counter
- Nodes - Service

The following metrics track the counter information:

- inbound\_request\_threshold\_exceeded\_total - Captures the total count of the inbound threshold requests exceeded due to overload.

The following labels are defined for this metric:

- interface\_name
- service\_name
- operation\_name
- command
- action
