## [Introducción](#)

Este documento indica cómo configurar una Traducción de dirección de red transversal (NAT-T) entre Clientes Cisco VPN ubicado detrás de un dispositivo de una Traducción de dirección de puerto (PAT)/NAT y un Concentrador remoto de Cisco VPN. La NAT-T se puede utilizar entre los clientes VPN y un concentrador VPN o bien, entre los concentradores detrás de un dispositivo NAT/PAT. La NAT-T se puede también utilizar al establecer una conexión a un router de Cisco que ejecute Cisco IOS® Software y firewall PIX; sin embargo, estas configuraciones no se abordan en este documento.

## [Prerequisites](#)

## [Requirements](#)

No hay requisitos específicos para este documento.

## Componentes Utilizados

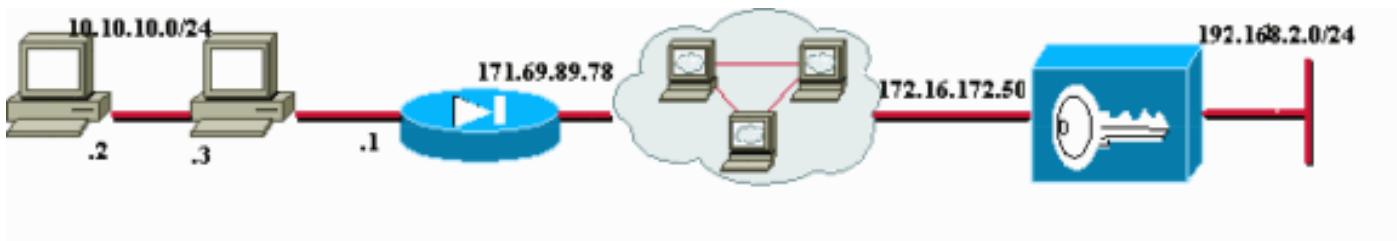

La información que contiene este documento se basa en las siguientes versiones de software y hardware.

- Concentrador VPN 3000 4.0(1)B de Cisco
- Clientes de Cisco VPN: 3.6.1 y 4.0(3) Rel
- Cisco PIX Firewall (dispositivo PAT) versión 6.3(3)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Diagrama de la red

En este documento, se utiliza esta configuración de red:

Existen clientes VPN en las dos PC (10.10.10.2 y 10.10.10.3) detrás de PIX Firewall. El PIX en este escenario se usa simplemente como un dispositivo de PAT y conduce la PAT en estas direcciones al 171.69.89.78. Aquí se puede utilizar cualquier dispositivo que sea capaz de traducir la dirección de puerto (PAT) de varias conexiones internas. La dirección pública del Concentrador VPN 3000 es 172.16.172.50. El siguiente ejemplo muestra cómo configurar los clientes y el concentrador para que NAT-T se utilice durante la negociación IKE.

## Convenciones

For more information on document conventions, refer to the [Cisco Technical Tips Conventions](#).

## Antecedentes

Luego de que se completa la negociación de NAT-T, el iniciador puede utilizar cualquier puerto (Y) de Protocolo de datagrama del usuario (UDP) de manera aleatoria. El puerto de destino debe ser UDP 4500, como en UDP (Y, 4500) y el respondedor utiliza UDP (4500, Y). Todas las negociaciones y el cambio de claves de Internet (IKE) posteriores se realizan en estos puertos. Durante las negociaciones NAT-T, ambos pares IPSec negocian los puertos UDP y también determinan si están detrás de un dispositivo NAT/PAT. El par IPSec detrás del dispositivo NAT/PAT envía el paquete de señal de mantenimiento NAT IPSec sobre UDP al par IPSec que no está detrás de un dispositivo NAT/PAT. NAT-T encapsula el tráfico IPSec en datagramas UDP utilizando el puerto 4500 brindando así información del puerto a los dispositivos NAT. NAT - T detecta automáticamente cualquier dispositivo NAT y sólo encapsula el tráfico IPSec cuando es necesario.

Cuando se implementa IPSec sobre la traducción NAT en el concentrador VPN 3000, IPSec sobre TCP tiene prioridad en primer lugar, luego NAT-T y luego IPSec sobre UDP. De forma predeterminada, NAT-T está desactivado. Debe habilitar NAT-T mediante una casilla de verificación ubicada en NAT Transparency (Transparencia NAT), bajo la configuración IPSec ubicada en Tunneling Protocols (Protocolos de tunelización). Además, para un túnel de LAN a LAN, debe activar NAT-T en el campo NAT-T de IPSec para configuraciones de LAN a LAN.

Para utilizar NAT-T, debe completar estos pasos:

1. Abra el puerto 4500 sobre cualquier escudo de protección que haya configurado en frente del concentrador de VPN.
2. Ajuste nuevamente las configuraciones IPSec/UDP mediante el puerto 4500 a un puerto diferente.
3. Elija **Configuration > Interfaces > Ethernet**, y elija la segunda o tercera opciones para el parámetro Fragmentation Policy .Estas opciones permiten que el tráfico viaje a través de dispositivos NAT que no soportan la fragmentación IP; no impiden el funcionamiento de los dispositivos NAT que admiten la fragmentación IP.

## Configure el PIX

Aquí se muestra los resultados importantes de la configuración PIX:

```
Firewall PIX

pix501(config)#
: Saved
:
PIX Version 6.3(3)
nameif ethernet0 outside security0
nameif ethernet1 inside security100
ip address outside 171.69.89.78 255.255.254.0
ip address inside 10.10.10.1 255.255.255.0
...
global (outside) 1 interface
nat (inside) 1 0.0.0.0 0.0.0.0 0 0
...
route outside 0.0.0.0 0.0.0.0 171.69.88.1 1
http server enable
http 10.10.10.2 255.255.255.255 inside
...
Cryptochecksum:6990adf6e0e2800ed409ae7364eecc9d
: end

[OK]
```

## Configurar el concentrador VPN 3000

Este ejemplo de configuración presupone que ya se configuró el Concentrador VPN 3000 para conectividad IP y que ya se establecieron las conexiones VPN estándar (no NAT-T).

Para habilitar NAT-T en una versión del concentrador VPN 3000 anterior a la versión 4.1, elija **Configuraciones > Sistema > Protocolos de tunelización > IPSec > Transparencia NAT**, luego verifique la opción **IPSec sobre NAT-T** en el concentrador como se muestra en el siguiente

ejemplo. La opción NAT-T se encuentra desactivada en forma predeterminada.

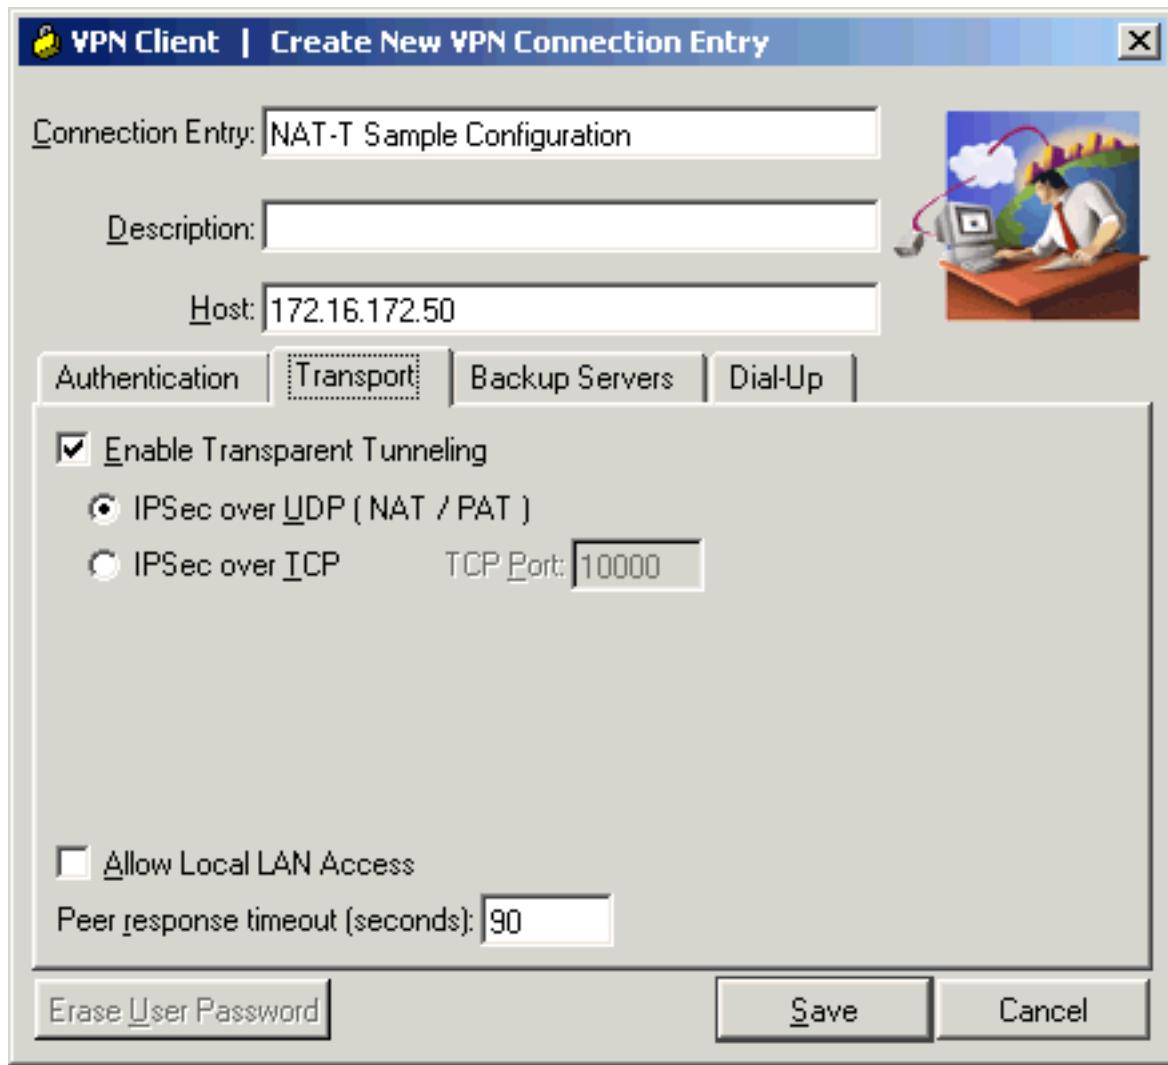

Para habilitar NAT-T en un concentrador VPN versión 4.1 y posterior, navegue a la misma ventana de Transparencia NAT eligiendo Configuration > Tunneling and Security > IPSec > NAT Transparency.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager interface. The left sidebar contains a navigation tree with sections like IPsec, Firewall, Events Management, Tunneling Protocols, IPsec, and User Management. The main content area is titled "NAT Transparency" under the "IPSec" section. It includes two configuration fields: "IPSec over TCP" (checked) and "TCP Port(s) 10000", and "IPSec over NAT-T" (unchecked). Below these fields are "Apply" and "Cancel" buttons. The top right of the window shows the user is logged in as "admin".

## Configure el cliente VPN

Para usar NAT-T, marque Enable Transparent Tunneling (Habilitar tunelización transparente). El siguiente ejemplo lo demuestra en un cliente VPN superior a la versión 4.0.

**Nota:** La misma opción de configuración está disponible en VPN Client versión 3.x.

## Verificación

En esta sección encontrará información que puede utilizar para confirmar que su configuración esté funcionando correctamente.

La herramienta [Output Interpreter](#) (sólo para clientes registrados) permite utilizar algunos comandos “show” y ver un análisis del resultado de estos comandos.

Se puede encontrar información adicional sobre la resolución de problemas en [Solución de problemas de seguridad IP - Introducción y uso de los comandos debug](#).

### Verificar la configuración de PIX

Estos comandos se utilizan para verificar la configuración PIX.

- **show xlate:** como se muestra en el resultado a continuación, el PIX está utilizando diferentes puertos de origen para los dos clientes VPN, pero los puertos de destino son los mismos. Todos los paquetes de datos IPSec se han replegado mediante la utilización de UDP en el puerto 4500. En las negociaciones de nueva codificación posteriores también se utilizan los mismos puertos de origen y de destino.

```
pix501(config)# show xlate
3 in use, 4 most used
PAT Global 171.69.89.78(1025) Local 10.10.10.3(4500)
```

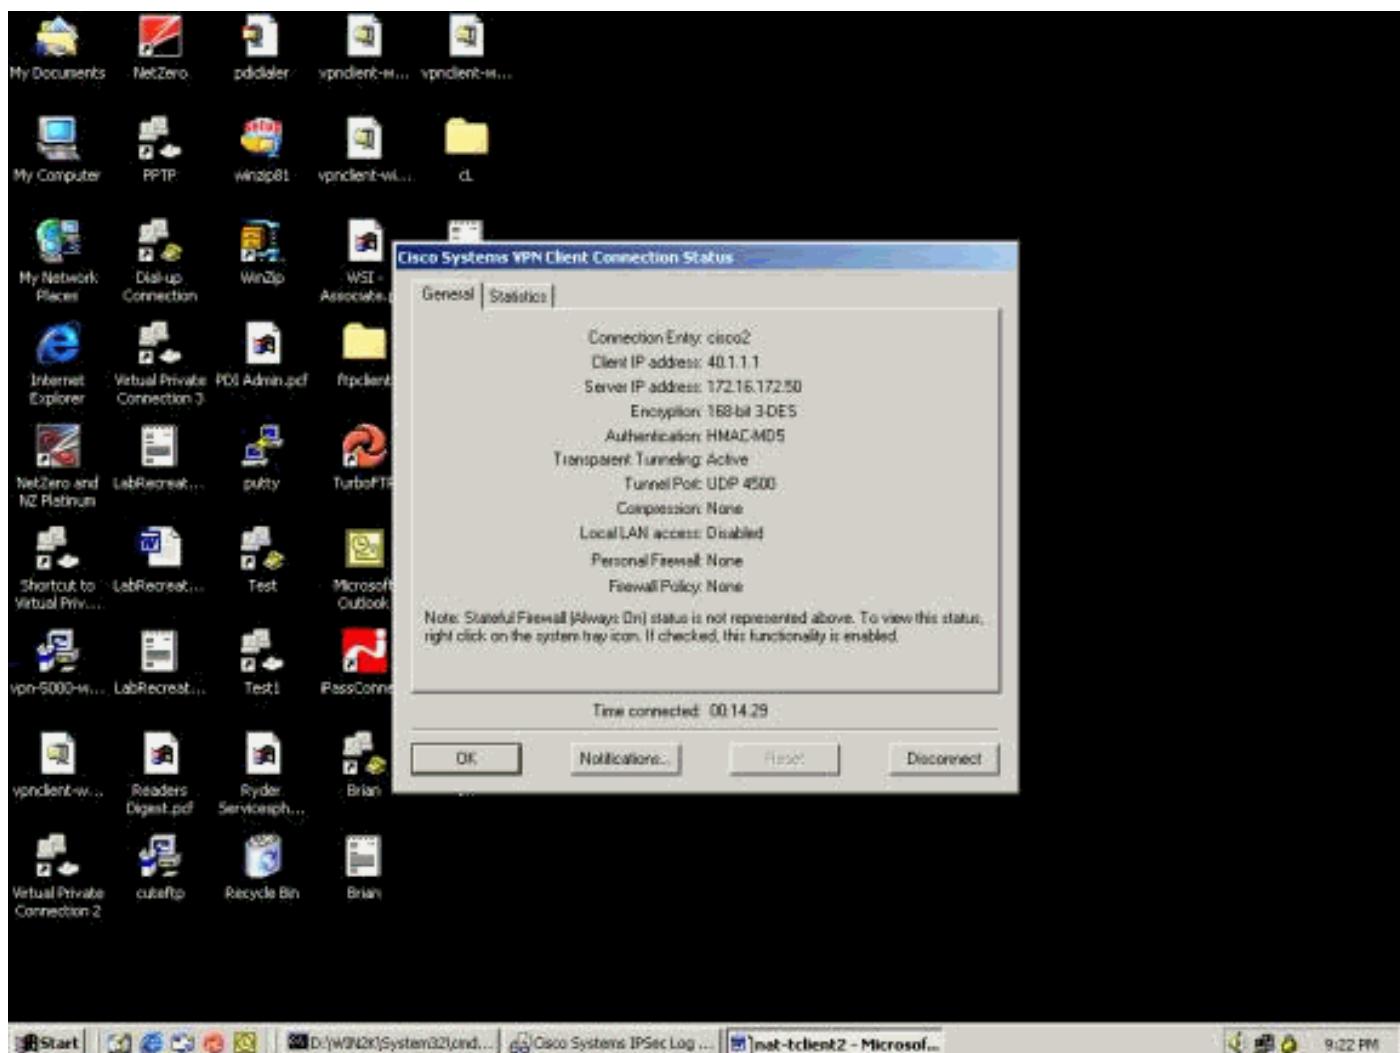

```
PAT Global 171.69.89.78(1026) Local 10.10.10.2(4500)
PAT Global 171.69.89.78(4) Local 10.10.10.2(500)
```

- **show arp:** utilice este comando para mostrar la tabla del protocolo de resolución de direcciones (ARP) y determinar si se están procesando las solicitudes ARP.

```
pix501(config)# show arp
  outside 171.69.88.3 00d0.0132.e40a
  outside 171.69.88.2 00d0.0133.3c0a
  outside 171.69.88.1 0000.0c07.ac7b
  inside 10.10.10.3 0050.dabb.f093
  inside 10.10.10.2 0001.0267.55cc
pix501(config)#
```

## Estadísticas de cliente VPN

Una vez establecido el túnel VPN, haga clic con el botón derecho del ratón en el bloqueo amarillo y elija **Estado**. A continuación se muestra una ventana similar. Observe que el puerto del túnel es UDP 4500, lo cual prueba que está utilizando NAT-T.

## Estadísticas del Concentrador VPN

Complete estos pasos:

1. En el concentrador VPN, elija **Administration > Administrator Session**. La sesión del cliente VPN puede observarse bajo las sesiones de acceso remoto. El siguiente ejemplo muestra las sesiones de los dos clientes después de haber establecido un túnel IPSec al

concentrador VPN. Ambos están utilizando la dirección IP pública 171.69.89.78 y se les asignó 40.1.1.1 y 40.1.1.2, respectivamente.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager interface. The left sidebar contains a navigation tree with sections like IKE Proposals, NAT Transparency, RMP Routing, RMP Management Protocols, RMP Events, RMP General, RMP Client Update, Load Balancing, User Management, Base Group, Groups, Users, Policy Management, Administration (with sub-options like Administer Sessions, Software Update, System Reboot, Etc., Monitoring Refresh, Access Rights, File Management, Certificate Management), Monitoring (with sub-options like Routing Table, Filterable Event Log, Live Event Log, System Status, Sessions, Statistics), and Cisco Systems. The main content area has tabs for Group, LAN-to-LAN Sessions, and Remote Access Sessions. Under Group, it shows a 'Logout All' link for PPTP, L2TP, IPSec, and LAN-to-LAN users. The 'Session Summary' table shows 0 Active LAN-to-LAN Sessions, 2 Active Remote Access Sessions, 1 Active Management Sessions, 3 Total Active Sessions, 4 Peak Concurrent Sessions, 100 Concurrent Sessions Limit, and 52 Total Cumulative Sessions. The 'LAN-to-LAN Sessions' table is empty, showing 'No LAN-to-LAN Sessions'. The 'Remote Access Sessions' table lists two entries: 'vncclient1' (Assigned IP Address: 40.1.1.1, Public IP Address: 171.69.89.78, Group: ciscovpn, Protocol Encryption: IPSec/NAT-T 3DES-168, Login Time Duration: Oct 20 20 13:35 0:04:04, Client Type Version: WinNT 3.6.1 (Rel), Bytes Tx: 768, Bytes Rx: 768) and 'vncclient2' (Assigned IP Address: 40.1.1.2, Public IP Address: 171.69.89.78, Group: ciscovpn, Protocol Encryption: IPSec/NAT-T 3DES-168, Login Time Duration: Oct 20 20 14:02 0:03:37, Client Type Version: WinNT 3.6.2 (Rel), Bytes Tx: 512, Bytes Rx: 512). The bottom status bar shows 'Internet' and the date/time 'Oct 20 20 13:35 0:04:04'.

2. Haga doble clic sobre el nombre de usuario de un cliente. Se muestran las estadísticas IPSec/IKE, como se observa en el siguiente ejemplo. El puerto de origen UDP usado por el cliente es el 1029 y el puerto de destino usado es el 4500.

## Troubleshoot

En esta sección encontrará información que puede utilizar para solucionar problemas de configuración.

**Nota:** Antes de ejecutar un comando **debug**, consulte [Información Importante sobre Comandos Debug](#).

**Nota:** Se puede encontrar información adicional sobre la solución de problemas de PIX en [Solución de problemas de seguridad IP - Introducción y uso de los comandos debug](#).

## Registros de cliente VPN

En la PC en la que está instalado VPN Client, abra el Log Viewer antes de establecer una conexión con el VPN Concentrator. La salida del registro destaca los mensajes específicos NAT-T:

## Resolución de otros problemas

NAT-T encapsula tráfico IPSec en datagramas UDP por medio del puerto 4500. Si NAT-T no se verifica en el VPN Concentrador o si la transparencia NAT no se verifica en el VPN Client, se establece el túnel IPSec; sin embargo, no puede pasar ningún dato. Para que el NAT funcione, se debe verificar el NAT-T en el concentrador y la transparencia (en el UDP) en el cliente.

El ejemplo a continuación muestra un caso en el que NAT-T no fue verificada en el concentrador. En el cliente, se verificó la tunelización transparente. En este caso, se establece el túnel IPSec entre el cliente y el concentrador. No obstante, dado que fallaron las negociaciones de puerto del túnel IPSec, no pasan datos entre el cliente y el concentrador. Como resultado, los bytes transmitidos y recibidos son cero para las sesiones de acceso remoto.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager interface. The left sidebar contains a navigation tree with sections like Administration, Monitoring, and User Management. The main content area has three tabs: Session Summary, LAN-to-LAN Sessions, and Remote Access Sessions.

**Session Summary:**

| Active LAN-to-LAN Sessions | Active Remote Access Sessions | Active Management Sessions | Total Active Sessions | Peak Concurrent Sessions | Concurrent Sessions Limit | Total Cumulative Sessions |
|----------------------------|-------------------------------|----------------------------|-----------------------|--------------------------|---------------------------|---------------------------|
| 0                          | 2                             | 1                          | 3                     | 4                        | 100                       | 69                        |

**LAN-to-LAN Sessions:**

| Connection Name        | IP Address | Protocol | Encryption | Login Time | Duration | Bytes Tx | Bytes Rx | Actions |
|------------------------|------------|----------|------------|------------|----------|----------|----------|---------|
| No LAN-to-LAN Sessions |            |          |            |            |          |          |          |         |

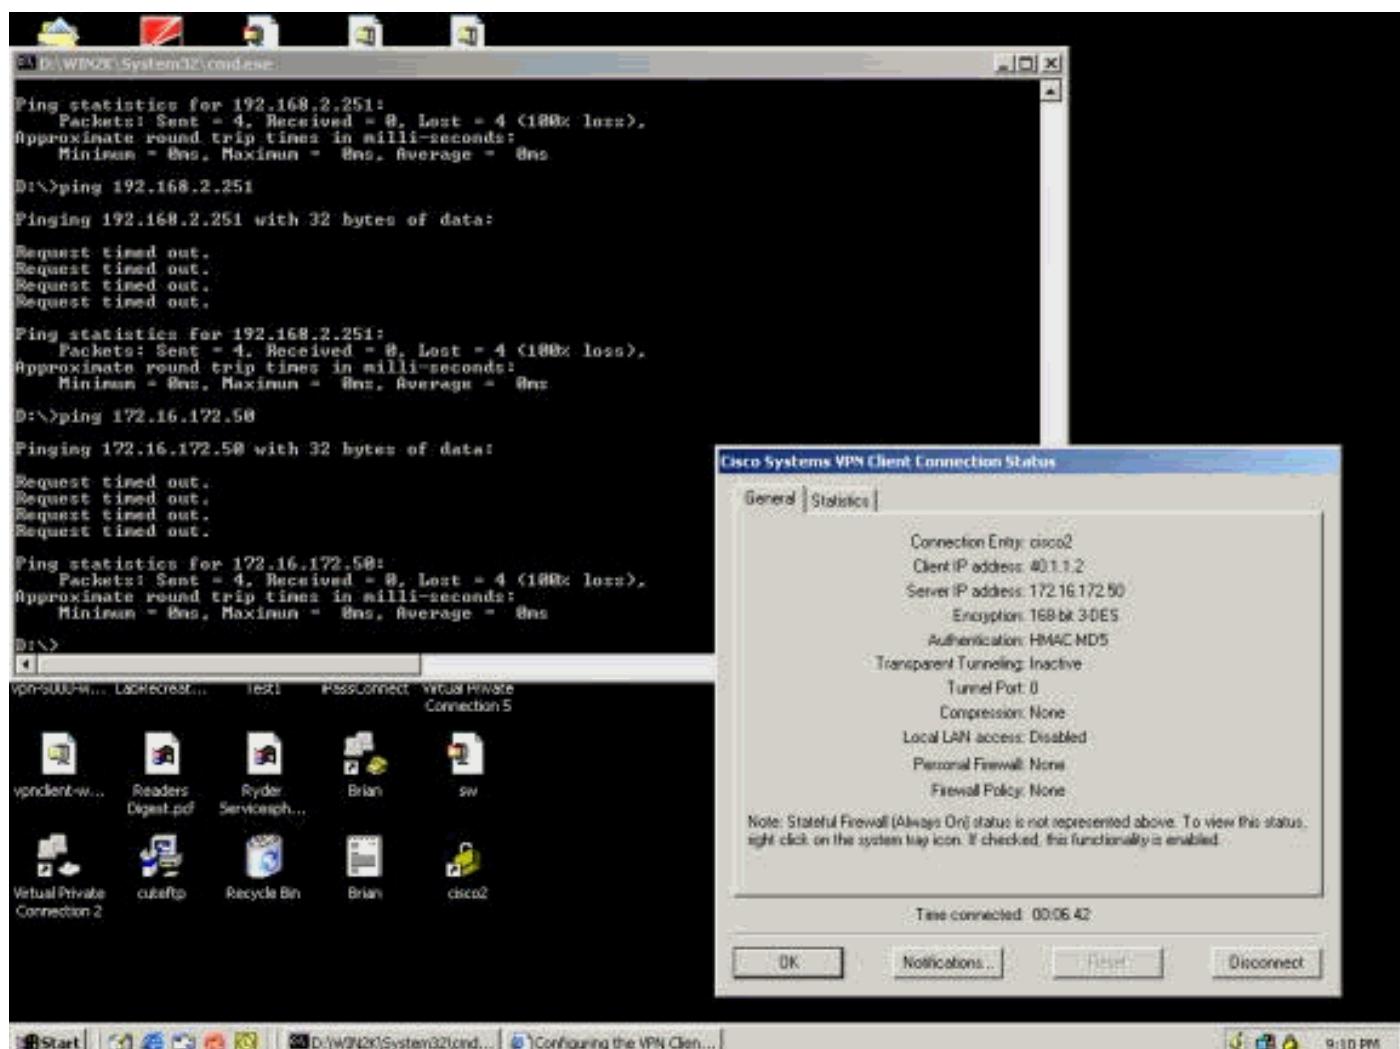

**Remote Access Sessions:**

| [ LAN-to-LAN Sessions   Management Sessions ] |  |          |                        |                           |                        |                      |                 |
|---|--|----------|------------------------|---------------------------|------------------------|----------------------|-----------------|
| Username                                      | Assigned IP Address<br>Public IP Address | Group    | Protocol<br>Encryption | Login Time<br>Duration    | Client Type<br>Version | Bytes Tx<br>Bytes Rx | Actions         |

| No Management Sessions                           |  |  |  |  |  |  |  |

El ejemplo a continuación muestra las estadísticas del VPN Client. Observe que el puerto de túnel negociado es 0. Existe un intento de hacer ping en 192.168.2.251 (interfaz privada del concentrador VPN 3000) y a 172.16.172.50 desde el indicador de DOS. Sin embargo, estos pings fallan porque ningún túnel del puerto ha sido negociado y, así, los datos IPSec se descartan en el servidor VPN remoto.

El siguiente ejemplo muestra que el VPN Client está enviando datos cifrados (13 paquetes). Pero la cantidad de paquetes desencriptados es cero para el servidor VPN remoto y no ha devuelto datos encriptados. Dado que no se ha negociado ningún puerto de túnel, el servidor VPN remoto descarta los paquetes y no envía ningún dato de respuesta.
