Introduction

Ce document décrit comment valider la programmation et le transfert matériels de couche 2 sur les commutateurs de la gamme Catalyst 9400.

Conditions préalables

Exigences

Aucune exigence spécifique n'est associée à ce document.

Composants utilisés

Les informations de ce document sont basées sur le commutateur de la gamme Catalyst 9400 (UADP 2.0).

-
-  Remarque : la version logicielle utilisée dans ce document est 16.6.1, mais elle reste applicable aux versions ultérieures de Cisco IOS®.
-
-  Remarque : vous pouvez utiliser ce document pour d'autres types de commutateurs Catalyst 9000, mais ignorez toute commande qui fait référence à une carte de ligne.
-

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. Si votre réseau est en ligne, assurez-vous de bien comprendre l'incidence possible des commandes.

Informations générales

Le Catalyst 9400 Supervisor1 (C9400-SUP-1) dispose de 3 ASIC de transfert UADP 2.0 (0, 1, 2).

Chaque ASIC de transfert UADP 2.0 possède :

- Un double cœur (0, 1) - cela n'existe pas dans les générations précédentes d'ASICS UADP 2.0.
- SIF (Stack Interfaces) : utilisé pour la connexion aux deux autres ASIC UADP 2.0 via un anneau de pile interne.
- Interfaces réseau (NIF) : utilisées pour connecter au moins une carte de ligne via le fond de panier.
- Toutes les décisions de transfert de paquets pour les cartes de ligne et les interfaces de liaison ascendante du superviseur sont prises par les 3 ASIC de transfert UADP 2.0 sur le superviseur actif.
- Les cartes de ligne utilisées dans cet exemple ont 1 carte de ligne ASIC d'extrémité à cœur unique qui n'intervient pas dans les décisions de transfert de paquets.
- L'ASIC d'extrémité de carte de ligne de la carte de ligne se connecte à un ou plusieurs des 3 ASIC de transfert UADP 2.0 sur le superviseur via le fond de panier.
- Les 3 ASIC de transfert UADP 2.0 sur le superviseur prennent toutes les décisions de transfert de paquets.

Terminologie

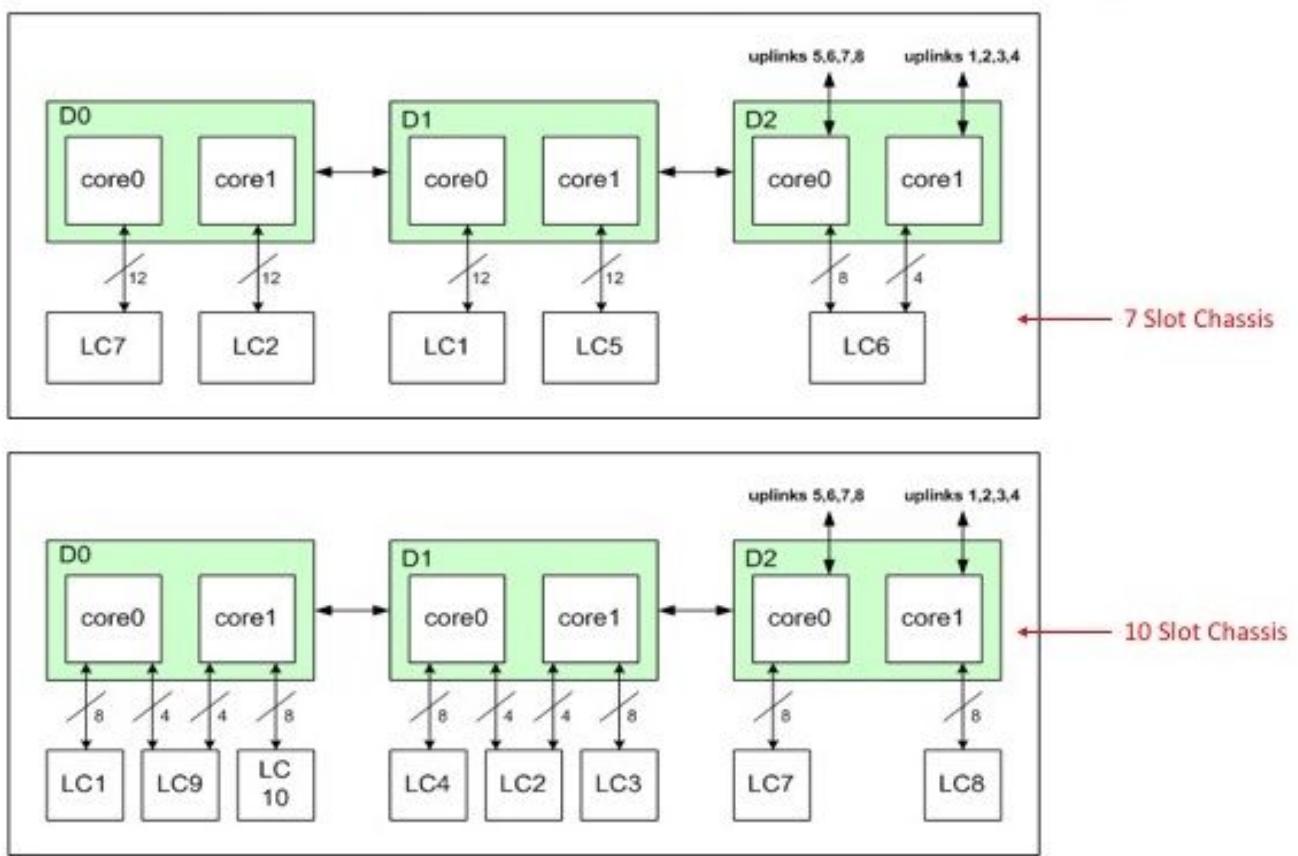

| Acronyme | Définition |
|-----------------------|---|
| RP | Processeur de routage |
| FP | Processeur de transfert |
| NOURRIR | Pilote du moteur de transfert. Processus logiciel qui programme le circuit ASIC de transfert de superviseur. |
| Gestionnaire d'objets | Entrées MAC logicielles FP stockées en tant qu'objets asynchrones dans la base de données d'objets. |
| LSMPI | Interface de point de mémoire partagée Linux. Transport entre le plan de données (hardware-UADP 2.0) et le plan de contrôle (software-CPU). |
| FIM | Processus du logiciel Interface Manager. |
| IF_ID | IDentifier de l'interface est une valeur unique qui représente une interface spécifique. Il est utilisé lors de la programmation interne dans le commutateur. |
| Inst | Instance. Indique que l'interface Asic/Core UADP 2.0 est connectée à : 0=Asic0/Core0, 1=Asic0/Core1, 2=Asic1/Core0, 3=Asic1/Core1, 4=Asic2/Core0, 5=Asic2/Core1. |
| Asic | Spécifie à quelle interface UADP 2.0 est associée : 0=UADP 2.0 #0, 1=UADP 2.0 #1, 2= UADP 2.0 #2. |
| Noyau | Spécifie à quel cœur de l'interface UADP 2.0 est associé : 0=core0, 1=core1. |
| Port | Numéro d'instance ordinal d'un port dans un logement. Dans le même logement, tous les numéros de port sont uniques. |
| SousPort | Identifie un port dans un groupe de ports (Cntx) pour les ports du panneau avant qui sont sous-portés (Cntx et SubPort identifient ensemble un port unique qui est sous-porté). |

| | |
|----------------|--|
| Mac | Identificateur d'interface utilisé lorsqu'une interface exécute MACsec (authentification et chiffrement de sécurité). |
| Cntx | Contexte. Numéro de groupe auquel un port appartient lorsqu'une interface du panneau avant est sous-portée (Cntx et SubPort identifient ensemble un port unique qui est sous-porté). |
| LPN | Numéro de port logique associé à une interface. |
| GPN | Numéro de port global associé à une interface. |
| Type NIF | Interface réseau ; NRU = liaison ascendante redondante du réseau |
| IF_IS | IDentifier interface. Il s'agit d'une valeur unique représentant une interface spécifique. Il est utilisé lors de diverses programmations internes dans le commutateur. |
| Port_LE | Entité logique de port. Il s'agit de la configuration d'interface. |
| AOM | Gestionnaire d'objets asynchrone. Le FP programme les informations dans la base de données d'objets en tant qu'objet. |
| Vice-président | Port virtuel |
| MATM | Gestionnaire de table d'adresses MAC |
| RP | Processeur de routage |
| OM_PTR | Pointeur Gestionnaire d'objets |
| ID_table | Identificateur de table = vlan |
| CMAN | Gestionnaire de châssis |
| FP | Processeur de transfert |

| | |
|-----------|---|
| fp_port | Les ports du panneau avant. |
| Sif | Interface de pile (vers les 2 autres ASIC de transfert UADP 2.0 sur le superviseur). |
| Nif | Interface réseau (vers l'interface du panneau avant) |
| RCI/RGE | Entrée / Sortie |
| QI | Planificateur de file d'attente |
| SQS | Planificateur de file |
| PBC | Complexe de tampons de paquets |
| MOQ | Gestion active des files d'attente. Ceci effectue des contrôles de gestion de congestion. |
| AQMR | Gestion active des files d'attente Détection précoce aléatoire. |
| EQC | Contrôleur de file d'attente |
| ESM | Gestion du planificateur de sortie |
| RWE | Moteur de réécriture. Ajoute ou supprime des informations d'en-tête du paquet. |
| IOMD | Pilote du module d'entrée-sortie |
| fp_port | Port du panneau avant. |
| Nif | Interface réseau (vers l'interface du panneau avant) |
| SLI | Interface de liaison système (vers le superviseur) |
| RGI/RGE = | Entrée / Sortie |

| | |
|----------------------------|---|
| AQMR | Gestion active des files d'attente Détection précoce aléatoire. |
| OIE | Interface de contrôle hors bande = canal de communication interne entre la carte de ligne et le superviseur actif |
| MATM | Gestionnaire de table d'adresses MAC |
| Nombre de déplacements MAC | Il s'agit du nombre de déplacements (ou d'acquisition) d'une adresse MAC sur une nouvelle interface. Le nombre de déplacements peut se produire lorsqu'un hôte final est physiquement déplacé d'une interface à une autre, lorsqu'un hôte sans fil se déplace d'un point d'accès (AP) à un autre point d'accès connecté sur une autre interface, ou lorsque le chemin Spanning Tree change ou boucle. |

 Remarque : les commandes show platform peuvent nécessiter l'inclusion de la commande de configuration globale service internal dans l'instruction.

Programmation D'Interface

Mappage de l'interface avec l'instance UADP 2.0

La commande de programmation d'interface affiche le mappage d'interface du panneau avant pour toutes les cartes de ligne vers l'un des 3 ASIC de transfert UADP 2.0 sur le superviseur actif.

Exemple de sortie

Cet exemple montre que :

- L'interface Gig1/0/3 est connectée à : UADP 2.0 instance 2 (UADP 2.0 Asic 1, Core 0) sur le superviseur.
- L'interface Gig5/0/21 est connectée à : UADP 2.0 instance 3 (UADP 2.0 Asic 1, Core 1) sur le superviseur.

```

Programmation Etherchannel

Dans ces sorties d'exemple de programmation Etherchannel, le RP programme le FP, le FP programme le FED, le FED programme ensuite le matériel ASIC de transfert du superviseur. Les entrées logicielles RP sont stockées en tant qu'objets dans la base de données d'objets et les entrées logicielles FP sont stockées en tant qu'objets asynchrones dans la base de données d'objets.

Programmation matérielle réussie

Toutes les fonctionnalités (qu'il s'agisse d'une adresse MAC, d'une interface, d'un VLAN, etc.) sont stockées dans la base de données d'objets et programmées dans le matériel en tant qu'objets.

Le RP programme le FP, le FP programme le FED, et le FED programme enfin le matériel ASIC de transfert du superviseur. Les entrées logicielles RP sont stockées en tant qu'objets dans la base de données d'objets et les entrées logicielles FP sont stockées en tant qu'objets asynchrones dans la base de données d'objets.

Lorsque le FP programme le FED (qui à son tour programme le ASIC de transfert du superviseur), le FED renvoie un accusé de réception au FP. Le PC le transmet ensuite au RP pour indiquer que la programmation matérielle s'est correctement déroulée. Si la programmation matérielle FED est manquante ou incorrecte, vous pouvez utiliser cette commande suivante pour rechercher des problèmes et/ou des accusés de réception.

<#root>

```
C9400#
```

```
show platform software object-manager fp active statistics
```

Forwarding Manager Asynchronous Object Manager Statistics

```
Object update: Pending-issue: 0, Pending-acknowledgement: 0
Batch begin: Pending-issue: 0, Pending-acknowledgement: 0
Batch end: Pending-issue: 0, Pending-acknowledgement: 0
Command: Pending-acknowledgement: 0
Total-objects: 3269
Stale-objects: 0
Resolve-objects: 0
Error-objects: 0
Paused-types: 0
```

Si la commande précédente affiche des objets non nuls en état d'émission en attente, utilisez cette commande pour rechercher le numéro d'objet concerné :

```
<#root>
```

```
C9400#
```

```
show platform software object-manager fp active pending-issue-update
```

Utilisez ensuite cette commande pour déterminer le processus bloqué associé au numéro d'objet :

```
<#root>
```

```
C9400#
```

```
show platform software object-manager fp active object {object#}
```

Côté RP, utilisez cette commande pour vérifier la suppression en attente (Del Pend) d'un objet que le RP n'a pas reconnu.

```
<#root>
```

```
C9400#
```

```
show platform software object-manager rp active object-type-info
```

| Object type | Name | Count | Del | Pend | Layer |

| --snip-- | | | | |

Contrôle de santé

Trafic et politique du plan de contrôle

Recherchez les abandons CoPP (Control Plane Policy) dans hardware-UADP 2.0 pour le trafic acheminé vers software-CPU. Cela peut avoir un impact sur l'apprentissage MAC et la stabilité Spanning Tree.

```
<#root>  
C9400#  
show policy-map control-plane
```

```
Control Plane  
Service-policy input: system-cpp-policy
```

```
--snip--  
  
Class-map: system-cpp-police-sw-forward (match-any)  
 0 packets, 0 bytes  
 5 minute offered rate 0000 bps, drop rate 0000 bps  
Match: none  
police:  
  rate 1000 pps, burst 244 packets  
  conformed 1298 bytes; actions:  
    transmit  
  exceeded 0 bytes; actions:  
    drop
```

```
--snip--  
  
Class-map: system-cpp-police-12-control (match-any)  
 0 packets, 0 bytes  
 5 minute offered rate 0000 bps, drop rate 0000 bps  
Match: none  
police:  
  rate 500 pps, burst 122 packets  
  conformed 239197001 bytes; actions:  
    transmit  
  exceeded 0 bytes; actions:  
    drop
```

```
--snip--  
  
Class-map: system-cpp-default (match-any)  
 0 packets, 0 bytes  
 5 minute offered rate 0000 bps, drop rate 0000 bps  
Match: none  
police:  
  rate 1000 pps, burst 244 packets
```

```

conformed 0 bytes; actions:
  transmit
exceeded 0 bytes; actions:
  drop

Class-map: class-default (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: any

```

La même sortie CoPP que l'exemple précédent est présentée ici dans un format plus granulaire et plus simple à lire (compressé).

Statistiques du superviseur - Chemin des données du superviseur à la carte de ligne

Vérifiez les statistiques ASIC de transfert Supervisor UADP 2.0 actives qui sont associées à une interface de panneau avant spécifique. Dans cet exemple, l'interface Gig1/0/13 est utilisée.

Exemple de sortie :

- Vérifiez quelles interfaces de la carte de ligne font partie du même groupe de ports.
- Chaque groupe de ports partageait 8 Gbits/s de bande passante entre le module ASIC d'extrémité de carte de ligne et le module ASIC de transfert du superviseur.
- Chaque groupe de ports est associé à l'une des interfaces SLI (System Link Interface) du circuit ASIC d'extrémité de carte de ligne vers le circuit ASIC de transfert du superviseur.

Statistiques de carte de ligne - Chemin de données du superviseur à la carte de ligne

Vérifiez les statistiques ASIC d'extrême de carte de ligne associées à une interface spécifique du panneau avant. Dans cet exemple, l'interface Gig1/0/13 est le focus.

Exemple de résultat :

- Les paquets reçus de Gig 1/0/13 entrent dans le port de réception de l'interface réseau et progressent via IQS vers l'interface de pile.
- À partir de là, un paquet sort de l'interface de pile vers un autre ASIC de superviseur , ou revient par SQS, AQM, EQC, ESM, RWE, puis sort de la transmission d'interface réseau de Gig 1/0/13.
- Les paquets envoyés depuis d'autres interfaces ASIC de superviseur qui sortent de Gig 1/0/13 entrent dans Sif, puis passent par SQS, AQM, EQC, ESM, RWE et sortent ensuite le NifTx de Gig 1/0/13.
- Pour AQM il y a 8 files d'attente Tx. Si vous voyez des abandons de ces files d'attente, vous pouvez utiliser cette commande pour déterminer laquelle des files d'attente subit des abandons : show platform hardware fed active go queue stats interface Gig 1/0/13

Vérifiez l'état du contrôle de flux du point de vue de la carte de ligne pour l'interface du panneau avant. Cela permet d'identifier tout encombrement sur l'interface.

- Les valeurs sont "-" lorsqu'il n'y a pas de contrôle de flux, sinon le numéro de la file d'attente connaissant un contrôle de flux (encombrement) est indiqué.
- Le contrôle de flux reçu par l'interface est transmis de l'ASIC de la carte de ligne à l'ASIC du superviseur sur le superviseur, où des abandons AQM sont généralement visibles sur l'ASIC du superviseur. L'OCI (Out-of-band Control Interface) est le canal de communication interne entre la carte de ligne et le superviseur actif qui est utilisé pour signaler le contrôle de flux de la carte de ligne au superviseur.

Vérifiez que le trafic de contrôle circule d'une perspective ASIC d'extrémité de carte de ligne entre l'ASIC d'extrémité de carte de ligne sur la carte de ligne et l'ASIC de transfert de superviseur sur les superviseurs actifs et en veille via les interfaces OCI.

- OCI = interface de contrôle hors bande = canaux de communication internes entre la carte de ligne et les superviseurs actifs et en veille

```

Vérifiez quelles interfaces de la carte de ligne font partie du même groupe de ports qui partage 8 Gbits/s de bande passante entre le module ASIC d'extrémité de carte de ligne de la carte de ligne et le module ASIC de transfert du superviseur du superviseur actif. Chaque groupe de ports est associé à l'une des interfaces SLI (System Link Interface) de l'ASIC d'extrémité de carte de ligne vers le superviseur.
